

# Range constructor for std::string\_view

Document #: P1391R1  
Date: 2019-03-08  
Project: Programming Language C++  
Audience: LWG  
Reply-to: Corentin Jabot <[corentin.jabot@gmail.com](mailto:corentin.jabot@gmail.com)>

## 1 Abstract

This paper proposes that `string_view` be constructible from any contiguous range of characters. The idea was extracted from P1206.

## 2 Tony tables

Before	After
<pre>void foo(string_view); vector&lt;char8_t&gt; vec = get_some_unicode(); foo(string_view{vec.data(), vec.size()});</pre>	<pre>void foo(string_view); vector&lt;char8_t&gt; vec = get_some_unicode(); foo(vec);</pre>

## 3 History

### 3.1 Revision 1

Typos and Improved wording

## 4 Motivation

While P1206 gives a general motivation for range constructors, it's especially important for `string_view` because there exist in a lot of codebases string types that would benefit from being convertible to `string_view`. For example, `llvm::StringRef`, `QByteArray`, `fbstring`, `boost::container::string` ...

Manipulating the content of a vector as a string is also useful.

Finally, this makes contiguous views operating on characters easier to use with `string_view`.

## 5 Design considerations

- instantiations of `basic_string` are specifically excluded because `std::basic_string` already provides a conversion operator and more importantly, strings with different `char_traits` should not be implicitly convertible
- Because `basic_string_view` doesn't mutate the underlying data, there is no reason to accept a range by something other than `const lvalue reference`.
- The construction is implicit because it is cheap and a contiguous range of character is the same platonic thing as a `string_view`.

## 6 Proposed wording

Change in [string.view] 20.4.2:

```
template<class charT, class traits = char_traits<charT>>
class basic_string_view {
public:
    [...]

    // construction and assignment
    constexpr basic_string_view() noexcept;
    constexpr basic_string_view(const basic_string_view&) noexcept = default;
    constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
    constexpr basic_string_view(const charT* str);
    constexpr basic_string_view(const charT* str, size_type len);

    template <ContiguousRange R>
    requires ranges::SizedRange<const R> && Same<iter_value_t<iterator_t<const R>>, charT>
    constexpr basic_string_view(const R& r);

    template <ContiguousIterator It, Sentinel<It> End>
    requires Same<iter_value_t<It>, charT>
    constexpr basic_string_view(It begin, End end);

    [...]
};
```

Change in [string.view.cons] 20.4.2.1:

Add after 7

```
template <ranges::ContiguousRange R>
requires ranges::SizedRange<const R> && Same<iter_value_t<iterator_t<const R>>, charT>
constexpr basic_string_view(const R& r);
```

*Constraints:*

- `is_array<R>` is `false`.
- `T` is not publicly and unambiguously derived from a specialization of `basic_string` or `basic_string_view`

*Effects:* Constructs a `basic_string_view` over the `ContiguousRange r`.

*Throws:* If `data(r)` or `size(r)` throw

```
template <ContiguousIterator It, Sentinel<It> End>
requires Same<iter_value_t<It>>, charT>
constexpr basic_string_view(It begin, End end );
```

*Constraints:*

- `It` and `End` are not of the same type or `End` is not convertible to a pointer of `charT`

*Effects:* Constructs a `basic_string_view` over the range `[begin, end)`.
