<b>ISO/IEC JTC1/SGFS</b>	
Title:	ISO/IEC JTC1 Special Group on Functional Standardization
Secretariat:	NNI (Netherlands)

**Title:** First Working Draft of ISO/IEC/TR 10000-3:

**Information Technology - Framework and Taxonomy of International Standardized Profiles - Part 3: Principles and Taxonomy for Open System Environment Profiles.**

**Source:** Editor, TR 10000-3

**Date:** October 1992

**Status:** This first working draft provides for the extension of scope of SGFS to include profiles for the Open System Environment based on the output of the SGFS meeting in June 1992.

**Action:** For review and development at the SGFS Authorized Subgroup meeting, December 1992.

**Editor's Note:** This is the initial draft. In future drafts, changes from will be shown by means of bold text with marginal marks for additions, and by ~~struck out text for deletions~~. **[Editor's comments are in bold text in square brackets].**

For ease of discussion and subsequent editing, the presentation of the text has been simplified to single column font. Line numbers have been added.

## 1 Foreword

2 ISO (the International Organization for Standardization) and IEC (the International  
3 Electrotechnical Commission) together form a system for worldwide standardization as a whole.  
4 National bodies that are members of ISO or IEC participate in the development of International  
5 Standards and Technical Reports through technical committees established by the respective  
6 organization to deal with particular fields of technical activity. ISO and IEC technical committees  
7 collaborate in fields of mutual interest. Other international organizations, governmental and non-  
8 governmental, in liaison with ISO and IEC, also take part in the work.

9 The main task of a technical committee is to prepare International Standards but in exceptional  
10 circumstances, the publication of a Technical Report of one of the following types may be  
11 proposed:

12 - type 1, when the required support cannot be obtained for the publication of an  
13 International Standard, despite repeated efforts;

14 - type 2, when the subject is still under technical development or where for any other  
15 reason there is the future but not immediate possibility of an agreement on an  
16 International Standard;

17 - type 3, when a technical committee has collected data of a different kind from that  
18 which is normally published as an International Standard ("state of the art", for  
19 example).

20 Technical Reports of types 1 and 2 are subject to review within three years of publication, to  
21 decide whether they can be transformed into International Standards. Technical reports of type  
22 do not necessarily have to be reviewed until the data they provide are considered to be no  
23 longer valid or useful.

24 ISO/IEC/TR 10000, which is a Technical Report of type 3, was prepared by the Special Group  
25 on Functional Standardization of ISO/IEC JTC 1, *Information technology*.

26 The structure of ISO/IEC/TR 10000 is as follows:

- 27• Part 1: General Principles and Framework
- 28• Part 2: Principles and Taxonomy for OSI Profiles
- 29• Part 3: Principles and Taxonomy for OSE Profiles
- 30• Other parts to be defined as necessary.

## 1 Introduction

2 The context of Functional Standardization is one part of the overall field of IT  
3 standardization activities covering

- 4 • Base Standards, which define fundamentals and generalized procedures.  
5 They provide an infrastructure that can be used by a variety of applications,  
6 each of which can make its own selection from the options offered by them.
- 7 • Profiles, which define combinations of base standards used to provide  
8 specific functions. Profiles identify, where applicable, the use of particular  
9 subsets or options available in the base standards, and provide a basis for  
10 the development of uniform, internationally recognized, conformance tests.
- 11 • Registration Mechanisms, which provide the means to specify detailed  
12 parameterization within the framework of the base standards or Profiles.

13 Within ISO/IEC JTC 1, the process of Functional Standardization is concerned with  
14 the methodology of defining Profiles, and their publication in documents called  
15 "International Standardized Profiles" (ISPs).

16 In addition to ISO/IEC/TR 10000, the secretariat of the Special Group on Functional  
17 Standardization maintains a standing document (SD-4) entitled "Directory of ISPs and  
18 Profiles contained therein" This is a factual record of which ISPs exist, or are in  
19 preparation, together with an executive summary of each Profile. It is subject to  
20 regular updating by the Secretariat of ISO/IEC JTC 1/SGFS.

# 1 Information Technology - Framework and 2 Taxonomy of International Standardized 3 Profiles -

## 4 Part 3: 5 6 Principles and Taxonomy for 7 Open System Environment Profiles

### 8 Scope

9 This part of ISO/IEC/TR 10000 provides a context for functional standardization in  
10 support of Open System Environments (OSE). It defines the basic OSE objectives  
11 and concepts, and defines an approach and format for OSE and Application  
12 Environment Profiles (AEP) introduced as International Standardized Profiles. This  
13 text gives guidance to organizations proposing Draft OSE International  
14 Standardized Profiles, on the nature and content of the documents.

15 The OSE is defined as a comprehensive set of interfaces, services, and  
16 supporting formats, plus user aspects, for interoperability and/or portability of  
17 applications, data, or people, as specified by information technology standards and  
18 profiles. This document defines the scope of the OSE and the basis on which it is  
19 partitioned into Generic Environments, for which Profiles can be constructed.

20 Application Environment Profiles are those OSE profiles which specify a complete  
21 and coherent subset of the Open System Environment necessary to support a  
22 class of applications. Each profile is created to satisfy a clearly specified set of  
23 user requirements.

24 **[Ed.Note: On examining the definitions it is not clear whether there are OSE  
25 profiles other than AEPs.]**

26 A taxonomy, or structured classification, of OSE profiles is provided in clause 7 of  
27 this document. The purpose of this taxonomy is to provide a labeling scheme to  
28 identify profiles uniquely, and to indicate by their place in the structure, their  
29 functional relationship to each other. The taxonomy also indicates the basis on  
30 which other functional profiles ( including OSI) and new functions are referenced  
31 and utilized.

Figure 1 Classes of Profiles

14 A small set of generic OSE profiles will be defined to support the creation of what  
 15 may be a substantial number of OSE profiles created to support specific  
 16 industries. These generic profiles will also draw on and support the definition of  
 17 functional profiles such as OSI profiles.

18 ISO/IEC/TR 10000-2 defines the principles and classification for OSI Profiles  
 19 which may be or have been submitted for ratification as International Standardized  
 20 Profiles. These OSI profiles specify OSI standards and those base standards  
 21 concerned with interchange formats and data representation which are expected  
 22 to be used in conjunction with them.

23 ISO/IEC/TR 10000-3 defines the principles and classification for OSE and  
 24 Application Environment Profiles which may be or have been submitted for  
 25 ratification as ISPs.

26 Further parts of ISO/IEC/TR 10000 may be developed to define other domains of  
 27 functional standardization.

28 ISO/IEC/TR 10000 is applicable to all International Standardized Profiles of ISO  
 29 and IEC. Its primary focus is the area of competence of ISO/IEC JTC1, but by  
 30 mutual agreement with JTC1, other Technical Committees may undertake similar  
 31 functional standardization activities leading to the inclusion of additional material in  
 32 this Technical Report.

## 2 Normative References

The following standards contain provisions which, through reference in this text, constitute provisions of this part of ISO/IEC/TR 10000. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this part of ISO/IEC/TR 10000 are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

A number of other ISO Standards and CCITT Recommendations are quoted in examples which do not constitute provisions of this part of ISO/IEC/TR 10000. They are listed in annex D.

### 3 Definitions

For the purposes of this part of ISO/IEC/TR 10000, the following definitions apply-

#### 3.1 Terms defined in this part of ISO/IEC/TR 10000

##### 3.1.1 Application (general):

[Practical] employment of means.

Bringing [of something] to bear upon a particular case.

putting to practical use.

[OED]

NOTE: When the term is used for a more specific concept, the term should be qualified.

3.1.2 Application (information processing): The use of capabilities (services/facilities) provided by an information system specific to the satisfaction of a set of user requirements. [TSG-1]

NOTE: These capabilities include hardware, software and data.

3.1.3 Application Environment Profile (AEP): The specification of a complete and coherent subset of the Open System Environment, together with the identification of the applicable classes, subsets, options and parameters of the referenced standards, necessary to support a class of applications.

3.1.4 Application Environment Profile (AEP): The specification of a complete and coherent subset of an open system environment together with the options and parameters necessary to support a class of applications for interoperability or application portability, including consistency of data access and human interfaces. [TSG-1]

3.1.5 Application platform: A set of resources on which an application will run. [TSG-1]

3.1.6 Application portability: See: Portability (application). [TSG-1]

3.1.7 Application Profile interface (API): t.b.s.

3.1.8 Application software: Software specific to the solution of an application problem. [ISO 2382-20]

3.1.9 Base Standard: An approved International Standard, or CCITT Recommendation which is used in the definition of a Profile. [ISO TR 10000-1]

3.1.10 Conformance: See: Conformity. [Webster]

1 **3.1.11 Conformity:** Fulfilment by a product, process or service of all  
 2 requirements specified.  
 3 [ISO/IEC/GUIDE2]

4 **3.1.12 Domain (general):** Sphere, field or province of thought, knowledge,  
 5 activity [OED]

6 NOTE: When the term is used for a more specific concept, the term should be  
 7 qualified.

8 **3.1.13 Domain (in information technology):** The set of possible values of an  
 9 attribute. [IS 2382-17]

10 **3.1.14 Environment (of information system):** That part of the real world  
 11 containing the users which exchange messages with the information system. [ISO 9007]

12 **3.1.15 Function:** Special activity or purpose of a person or thing. [OED]

13 NOTE: When the term is used for a more specific concept, the term should be  
 14 qualified.

15 -----

16 **3.1.16 Interface:** 1) A surface forming a common boundry between adjacent  
 17 regions. 2) a point at which independant systems or diverse group interact. [Webster]

18 **3.1.17 Interface:** A shared boundary between two functional units, defined by  
 19 functional characteristics, common physical interconnection characteristics, signal  
 20 characteristics, or other characteristics, as appropriate. [ISO 2382-1]

21 NOTE: The concept involves the specification of the connection of two devices  
 22 having different functions.

23 -----

24 **3.1.18 International Standardized Profile (ISP):** An internationally agreed-to,  
 25 harmonized document which identifies a standard or group of standards, together  
 26 with options and parameters, necessary to accomplish a function or set of  
 27 functions. [ISO TR 10000-1]

28 **3.1.19 Interoperability:** The ability of two or more systems to exchange  
 29 information and to mutually use the information that has been exchanged. [IEEE 729]

30 -----

31 **3.1.20 Open System Environment:** The comprehensive set of interfaces,  
 32 services and supporting formats for interoperability or for portability of  
 33 applications, data or people, as specified by information technology standards and  
 34 profiles. [TSG-1]

35 **3.1.21 Open System Environment:** The comprehensive set of interfaces,  
 36 services, and supporting formats, plus user aspects, for interoperability or for  
 and

1 portability of applications, data or people, as specified by information technology  
 2 standards and profiles.

3 -----

4 **3.1.22 Portability (Software):** The ease with which software can be transferred  
 5 from one information processing system to another. [TSG-1]

6 **3.1.23 Portability (application):** The ease with which an application can be  
 7 transferred from one application platform to another. [TSG-1]

8 **3.1.24 Portability (of a program):** The capability of a program to be executed on  
 9 various types of data processing systems without converting it to a different  
 10 language and with little or no modification. [ISO 2382-1]

11 **3.1.25 Profile (for ISO standardization):** A set of one or more base standards,  
 12 and, where applicable, the identification of chosen classes, subsets, options and  
 13 parameters of those base standards, necessary for accomplishing a particular  
 14 function. [ISO TR 10000-1]

15 NOTE: An International Standardized Profile includes the specification of one or  
 16 more Profiles.

17 **3.1.26 Software:** All or part of the programs, procedures, rules and associated  
 18 documentation of a data processing system. [ISO 2382-1]

19 NOTE: Software is an intellectual creation that is independent of the medium on  
 20 which it is recorded.

21 **3.1.27 Software Portability:** See: Portability (Software).

22 **3.1.28 Standard (ISO):** Document, established by consensus and approved by  
 23 a recognized body, that provides, for common and repeated use, rules, guidelines  
 24 or characteristics for activities or their results, aimed at the achievement of the  
 25 optimum degree of order in a given context.

26 NOTE: Standards should be based on the consolidated results of science,  
 27 technology and experience, and aimed at the promotion of optimum  
 28 community benefits. [ISO/IEC/GUIDE2]

29 Remark: (International) Standards are often referred to as  
 30 Normative Standards, or "de jure" Standards, or Official  
 31 Standards.

32 Contrary to the terms above, the terms Informative  
 33 Standards, or "de facto" Standards, or Inofficial Standards  
 34 exist.

35 **3.1.29 Standardization:** Activity of establishing, with regard to actual or  
 36 potential problems, provisions for common and repeated use, aimed at the  
 37 achievement of the optimum degree of order in a given context.

- 1 NOTES 1. In particular, the activity consists of the processes of formulating,  
 2 issuing and implementing standards.  
 3 2. Important benefits of standardization are improvement of the  
 4 suitability of products, processes and services for their intended  
 5 purposes, prevention of barriers to trade and facilitation of  
 6 technological cooperation. [ISO/IEC/GUIDE2]

7 **3.1.30 System:**

- 8 A set of connected things, parts, elements working together in a regular  
 9 relation.  
 10 A set of connected things, parts, or elements working together to achieve  
 11 a common objective.  
 12 Ordered set of ideas, concepts, principles. [OED]

13 NOTE: When the term is used for a more specific concept, the term should be  
 14 qualified.

15 **3.1.31 System Program:** An application independent program that supports the  
 16 running of application programs. [TSG-1]

17 **3.1.32 System Software:** Application independent software that supports the  
 18 running of application software. [ISO 2382-1]

19 **3.1.33 User:** Any person or anything that issues commands or messages to an  
 20 information processing system or receives messages from the information  
 21 processing system. [ISO 2382-1]

22 **3.1.34 User Requirements (general):** A desire, need or constraint expressed by  
 23 persons or organization to apply information technology to an identified user  
 24 problem. [TSG-1]

25 **3.1.35 User Requirements (portability):** A desire, need or constraint for  
 26 application portability expressed by persons or organizations. [TSG-1]

27 **3.2 Terms defined in ISO/IEC 9646-1**

28 [Ed. Note: To be updated with terms actually used in this part of TR 10000]

29 This part of ISO/IEC/TR 10000 uses the following terms defined in ISO/IEC  
 30 9646-1:

- 31 a) Conformance testing  
 32 b) Conforming implementation  
 33 c) Profile Implementation Conformance Statement (PICS)  
 34 [Ed. Note: note change]  
 35 d) PICS proforma

1 **4 Abbreviations**

2 [Ed. Note: To be updated with terms actually used in this part of TR 10000] |

- 3 AEP Application Environment Profile
- 4 ISP International Standardized Profile
- 5 ~~IPRL~~ ISPICS Requirements List
- 6 ~~ISPICS~~ ISP Implementation Conformance Statement
- 7 OSE Open System Environment

## 1 5 OSE Concepts

### 2 5.1 OSE Objectives

- 3 The following objectives are key in establishing an Open System Environment.  
4 The concepts defined are those required to clearly state the objectives, and to  
5 define the standards and profiles required to satisfy them.

#### 6 5.1.1 Application Portability at the Source Code Level

- 7 A comprehensive and consistent set of source code level specifications enables  
8 porting of application software (which is expressed in user terms) among  
9 application platform implementations. Portability of other application software  
10 representations are secondary user objectives.

#### 11 5.1.2 Application Interoperability

- 12 Communications services and format specifications would enable two application  
13 software entities to exchange and make mutual use of data. These specifications  
14 should provide for situations where the communicating entities are running on the  
15 same or different platforms. Where different platforms are assumed, the  
16 specifications should accommodate either homogeneous or heterogeneous platform  
17 implementations.

#### 18 5.1.3 User Portability

- 19 People should be able to interact with a wide range of application platform  
20 implementations without retraining. Variations in interaction methods which are  
21 not based on functional differences or unique requirements are counter-  
22 productive.

#### 23 5.1.4 Accommodation of Standards

- 24 The OSE and OSE profiles should promote the use of existing standards, and  
25 should accommodate imminent and new information technology standards as they  
26 become available. If OSE profiles were constrained to current standards and  
27 technology, they would quickly become obsolete. The OSE and OSE profiles  
28 must evolve as standards emerge and as the technology and requirements  
29 change.

#### 30 5.1.5 Accommodation of New Technology

- 31 Even though OSE standards should be decoupled from the underlying technology  
32 as much as possible, some connection will always be necessary. An element of  
33 judgement is therefore required due to the tension between the conflicting needs  
34 for stable standards and provision for enhancement.

Add Reuseability

In selecting base stds,

### 1 5.1.6 Application Platform Scalability

2 Where similar services are required and provided on different types of application  
3 platforms (for example, workstations and supercomputers) the same standards  
4 should be applied to each if possible.

### 5 5.1.7 Distributed System Scalability

6 The number and variety of application platform types should not be limited by any  
7 structural aspects of OSE concepts or profiles.

### 8 5.1.8 Implementation Transparency

9 The OSE interface specifications should be defined in such a way as to hide the  
10 mechanism used to implement the service. The complexity of the implementation  
11 hidden from the service user behind the interface, and is therefore "transparent"  
12 to the user. From the application software perspective, this reduces the size and  
13 cost of the application program, and is the basis for technology migration.

### 14 5.1.9 Support Clear Statement of User Requirements

15 A clear identification of the specific user requirements associated with satisfied by  
16 a profile serves to guide and focus the development of a profile, and to apply it  
17 appropriately. Profile production is an extremely expensive process. With limited  
18 resource available for development and evolution of OSE standards, this allows  
19 the standards community to focus on activities which are most useful.

## 20 5.2 Framework Concepts

21 The relationship among user requirements, technology building blocks which  
22 implement those requirements, and the specifications which characterize those  
23 building blocks may be described by relating three frameworks. Each framework  
24 reflects a different view of the same functionality: the first from the user view, the  
25 second from the technology view, and the third from the perspective of the  
26 standards community.  
27 the desired consistency.

### 28 5.2.1 OSE Frameworks

29 The Framework for User Requirements (FUR) provides a consistent context for  
30 user organizations to state their particular requirements for information systems.  
31 This may be used to define the requirements and priorities for OSE specifications.

32 The Framework for Technical Integration (FTI) provides a context for for  
33 translating unambiguous expressions of user requirements into technology based  
34 solutions. These solutions are defined in terms of interface, service, and data  
35 format specifications.

36 The Framework for Technical Specifications (FTS) provides a context for selecting  
37 interface, service, and data format specifications to satisfy specific requirements.  
38 The framework for technical specifications should be structured yet flexible

Merge?

Spe  
Separate between  
OSE & OSE profiles

1 enough to accommodate the variety of OSE profiles identified as a result of actual  
2 profiling experiences.

3 It is important to maintain the consistency among these frameworks. This is  
4 accomplished by definition of an OSE reference model. The model defines those  
5 concepts and terminology which are common to all of the frameworks, providing  
6 the desired consistency.

### 7 **5.2.2 Building Blocks, Interfaces, Services, and Specifications**

8 An interface is a boundary between two (or more) entities and may be referenced  
9 in the definition of a relationship between them.

10 A service is a capability which a service provider entity makes available to a  
11 service user entity at the interface between those two entities.

12 An interface specification is a document which specifies how a particular service  
13 is invoked at a specific interface. This implies that where either:

- 14 - a specific service is available at multiple interfaces, or
- 15 - multiple services are available at a single interface,

16 separate specifications may be needed for each service/interface pair.

17 Note that while the meaning of these three terms may seem intuitive, they are  
18 often used interchangeably. This has led to considerable confusion at times, since  
19 they are quite different concepts. The importance of unambiguous terminology is  
20 clear when discussions rely on the concept of specifications defined in satisfaction  
21 of the requirement for a service at an interface.

22 Open Systems depend on the fact that solutions can be created by combining  
23 parts of the system from different sources. A Building Block is an implementation  
24 which provides services. The mechanism which implements those services is  
25 hidden behind an interface. The building block is characterized by the behavior at  
26 its interfaces, and interaction with the building block is defined by its interface  
27 specifications.

5.3 OSE Interfaces and Services

The TSG-1 model (ISO/IEC JTC1 N1335, 1 May 91) "TSG-1: Standards Necessary to Define Interfaces for Application Portability (IAP) - Final Report", describes two kinds of interfaces that are important for application portability:

- The Application Program Interface (API) is the "internal" interface between application software and the application platform;
- The Platform External Interface (PEI) is the "external" interface between application platform and the external world.

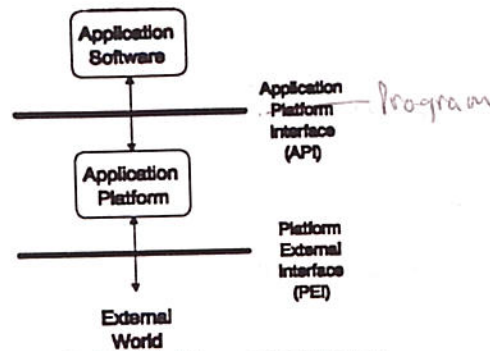

Figure 2 OSE Entities and Interfaces

Note that the relationships depicted in figure 2 could be represented in a number of ways. Clear identification of the key interfaces and entities is the objective of this discussion rather than a selection of a particular graphical representation.

*See 3.17*

### 1 5.3.1 Application Program Interface (API) Concepts

2 Definition of a clear interface between the application software and application  
3 portability is fundamental to enabling application portability. The scope of  
4 services which are provided at the API may be defined in two groups as follows:

5 - Services which provide application software (and therefore the  
6 programmer) access to or control of some operations which may have an  
7 effect at application platform external interface. This includes access to  
8 human user interaction services, information storage and retrieval  
9 services, and services which enable communications between application  
10 software entities.

11 - Services provided directly by the application platform, such as time  
12 services, execution control, and exception handling.

13 The API is the boundary across which application software uses facilities of a  
14 programming language to invoke services. These facilities may include  
15 procedures or operations, shared data objects and resolution of identifiers. API  
16 specifications document services available at the interface between the  
17 application software and application platform, and access methods for invoking  
18 those services.

19 API specifications take the form of one of the following:

- 20 • programming language specifications;
- 21 • language independent API specifications;
- 22 • language specific API specifications;

23 Programming language specifications are descriptions of general purpose  
24 languages used by programmers to define the sequence of operations to be  
25 executed by application program. These languages include those defined within  
26 the program of work of SC22, including for example, Fortran, Ada, and C.

27 Language independent API specifications are descriptions of services in terms of  
28 abstract syntax and abstract data types.

29 Language specific API specifications are descriptions of services in terms of the  
30 syntax and data types of a specific programming language. These specifications  
31 are used by programmers writing in a particular programming language, to invoke  
32 services provided by the application platform. These specifications are often  
33 referred to as "language bindings". Note that an invocation of a service may in  
34 fact be provided by another application software entity.

35 Language independent API specifications are primarily useful in defining services,  
36 and as a reference for assuring consistency across different language bindings to  
37 similar services. However, one or more language bindings to a specific language  
38 (for example COBOL or C) must also exist.

### 1 5.3.2 Platform External Interface (PEI) Concepts

*Data Storage Retrieval interface*

2 The PEI consists of the Human User Interface, the Information Services interface,  
3 and the Communication Services Interface.

4 The Human User Interface PEI is the boundary across which physical interaction  
5 between a person and information technology takes place. The Information  
6 Services PEI defines a boundry across which external, persistant storage is  
7 provided, where only the format and syntax is required to be specified for data  
8 portability and interoperability. The Communications PEI provides access to  
9 services for interaction between internal applications software entities and  
10 application platform external entities.  
11 ~~(for example COBOL or C) must also exist.~~

### 12 5.4 User Requirements and "Gaps"

13 A profile provides a clear identification of the specific user requirements which are  
14 satisfied by the profile. Occasionally, satisfaction of some of these requirements  
15 requires a base standard which is not available. This is defined as a "gap" in  
16 available standards.

17 These "gaps" cannot be "filled" within ISPs via citation of specifications other  
18 than standards. However, the gap may be explicitly identified to provide guidance  
19 for base standards activities (see section 6.2.3).

*⇒ part 1*

## 1 6 OSE Profile Concepts

2 The concept of a Profile, which fulfils the purposes defined in clause 5, is  
3 considered first in an abstract sense, with particular emphasis on the significance  
4 of the claim of conformance to a Profile. This concept of an individual Profile is  
5 then extended to include defining its relationship to other Profiles, i.e. the concept  
6 of a Taxonomy of Profiles, and its place within it. Finally, since a Profile has to  
7 have a concrete existence in order for it to be used effectively, these conceptual  
8 aspects are related to a formal documentation system.

9 Clauses 6 and 7 concentrate on defining the concept and taxonomy of the  
10 Profiles, independently of the way they are documented in ISPs. Clause 8 defines  
11 the actual documentation scheme and shows how there is not necessarily one  
12 separate document (ISP) for each Profile definition.

13 Profiles are related to Base Standards, to Registration Mechanisms, and to  
14 Conformance Tests of the systems which implement them. The practical  
15 implications of these relationships are developed in the following sub-clauses,  
16 some of which specify requirements that shall be satisfied by Profiles defined in  
17 ISPs.

### 18 6.1 The purpose of OSE profiles

19 Profiles define combinations of base standards for the purpose of

- 20 • identifying the base standards, together with appropriate classes, subsets,  
21 options and parameters, which are necessary to accomplish identified  
22 functions for application portability and interoperability;
- 23 • providing a system of referencing the various uses of base standards  
24 which is meaningful to both users and suppliers;
- 25 • providing a means to enhance the availability for procurement of  
26 consistent implementations of functionally defined groups of base  
27 standards, which are expected to be the major components of real  
28 application systems;
- 29 • promoting uniformity in the development of conformance tests for systems  
30 that implement the functions associated with the Profiles.

31 Various bodies throughout the world are undertaking work, in either regional or  
32 topic-oriented groups, in the area of Functional Standardization. Various names  
33 are given to the results of this work (such as Profiles, Functional Standards,  
34 Implementation Agreements, Specifications) and various approaches are being  
35 taken to the scope of the Profiles and to the style in which they are documented.  
36 This Framework of International Standardized Profiles has been developed by  
37 ISO/IEC JTC 1 in order to create a common classification scheme, (The  
38 Taxonomy) and a common documentation scope and style, into which the work of  
39 Functional Standardization bodies can be submitted, along with corresponding

1 work from the members technical committees and subcommittees of ISO and IEC  
2 JTC 1.

3 It is not sufficient, however, just to create a framework of this sort. Product  
4 development and procurement need to be seen on a global, and not just on a  
5 regional or sectional scale. Therefore an objective of ISO/IEC JTC 1 is to create  
6 the climate for the production of harmonized Profiles, where a wide measure of  
7 agreement is reached before proposals are submitted to ISO/IEC JTC 1.

8 One of the most important roles for an International Standardized Profile is to  
9 serve as the basis for the establishment of internationally recognized conformance  
10 test suites and test laboratories. ISPs are produced not simply to "legitimize" a  
11 particular choice of base standards and options, but to promote real system  
12 interoperability and application portability. The development and widespread  
13 acceptance of conformance testing based on ISPs is crucial to the successful  
14 realization of this goal.

## 15 **6.2 The relationship to base standards**

### 16 **6.2.1 Reduction of options**

17 Base standards which specify procedures, interfaces and formats, provide  
18 options, anticipating the needs of a variety of applications and taking into account  
19 different capabilities of real systems and networks.

20 Profiles promote portability and interoperability by defining how to use a  
21 combination of base standards for a given function and environment. In addition to  
22 the selection of base standards, a choice is made of permitted options for each  
23 base standard and of suitable values for parameters left unspecified in the base  
24 standard.

25 Profiles shall not contradict base standards but shall make specific choices where  
26 options and ranges of values are available. The choice of the base standard  
27 options should be restricted so as to maximise the probability of achieving the  
28 objective of the Profile; for example interworking between systems, or porting an  
29 application between systems, where the systems have implemented different  
30 selections of options of the Profile.

### 31 **6.2.2 Normative References**

32 An approved ISP shall make normative reference only to base standards or other  
33 ISPs.

34 In exceptional circumstances, described below, normative reference may be made  
35 to ISO/IEC Technical Reports. Such reference, which requires that the following  
36 conditions are met, shall be justified on a case-by-case basis:

- 37 • no base standard addressing the requirements is available, but a  
38 Technical Report is;

- 1 • the use is identified and discussed in the Explanatory Report which  
2 accompanies the proposed draft for an ISP, justifying that use;
  - 3 • the JTC1 body responsible for that Technical Report agrees that a  
4 normative reference is an appropriate use of that Technical Report;
  - 5 • the National Bodies approve this usage in the draft ISP ballot.
- 6 NOTE - Entry of a Profile into the Taxonomy may occur before the referenced base standards are all  
7 stable and approved. In these circumstances, regional or sectional bodies may make use of interim or  
8 preliminary draft versions of Profiles in their own controlled environment.

### 9 6.2.3 Informative References

10 It may be useful to make informative reference to other documents in the process  
11 of defining a Profile. Any such reference shall be placed in an informative annex  
12 to the ISP, or in a separate, non-normative, part of a multi-part ISP. The usage  
13 shall be justified on a case-by-case basis. Approval of an ISP by ISO/IEC  
14 members does not change the status of any documents referenced by it.

15 For example:

16 a) reference may be made to applicable regional or national standards for  
17 such details as:

- 18 • physical connectors
- 19 • electrical characteristics
- 20 • safety requirements
- 21 • character repertoires

22 Such reference to regional or national standards, shall be either as a  
23 consequence of the lack of appropriate functionality in International  
24 Standards, or because of the existence of national or regional regulatory  
25 requirements. It shall be accompanied by details of the body responsible  
26 for the distribution and maintenance of the standard.

27 b) the need to define some aspect of the required functionality of a Profile  
28 where suitable base standards or ISPs do not yet exist. Informative  
29 reference to the missing material may be made, including, where  
30 appropriate, a pointer to the existence of a non-normative specification.

31 This should only be done where the missing functionality is a relatively  
32 small proportion of the total Profile. Where larger sections of functionality  
33 are missing, it would be preferable to redefine the scope of the Profile in  
34 the Taxonomy to match available base standards, and to insert in the  
35 Taxonomy a placeholder for a future, more extensive, Profile.

36 In such cases, where the development of an ISP may indicate the need to modify  
37 or to add to the requirements specified in a base standard, or to create new base

1 standards, it is necessary for the ISP developer to liaise with the standards group  
2 responsible for that base standard so that the required changes may be made  
3 through established methods such as defect reporting, amendment procedures, or  
4 the introduction of new work.

### 5 **6.3 The relationship to Registration Authorities**

6 The base standards referenced in Profiles may include objects such as abstract  
7 syntaxes, document types, Virtual Terminal Environments and control objects,  
8 which require a Registration Authority to administer them. Profiles should  
9 specifically define the use of such objects (i.e. indicate whether they are included  
10 in the Profile or not) and shall refer to the objects using the registered name in the  
11 base standard. Profiles may, in addition to the registered name, define particular  
12 registered values associated with the name for use in the Profile.

13 When a type of information object requires a registration agent with a technical  
14 rôle as defined in ISO/IEC 9834-1, and the type of information object concerned  
15 falls within the scope of one of the classes of Profile defined in a taxonomy in this  
16 Technical Report, a multi-part ISP may be used as the registration agent  
17 concerned. In this case, the provisions of this part of ISO/IEC TR 10000, of  
18 ISO/IEC 9834-1, and of any other part or parts of ISO/IEC 9834 that concern this  
19 type of information object, shall all be applicable.

20 Where registration mechanisms are not yet set up, objects of this kind shall in the  
21 meantime be maintained in an informative annex to the ISP which defines the  
22 Profile. Entry of an object into such an annex does not imply registration.

23 NOTE - It is for further study whether a Profile could create the requirement to register a type of object  
24 that is not already accommodated by the Registration Authority mechanism for the base standards  
25 referenced.

## 26 **6.4 Principles of Profile Content**

### 27 **6.4.1 General Principles**

28 A Profile makes explicit the relationships between a set of base standards used  
29 together (relationships which are implicit in the definitions of the base standards  
30 themselves), and may also specify particular details of each base standard being  
31 used.

32 A Profile may refer to other International Standardized Profiles in order to make  
33 use of the functions and interfaces already defined by them, and thus limit its own  
34 direct reference to base standards.

35 It follows that a Profile:

- 36 a) shall restrict the choice of base standard options to the extent necessary  
37 to maximise the probability of achieving the objective of the Profile; for  
38 example interworking between systems, or porting an application between  
39 systems, where the systems have implemented different selections of  
40 options of the Profile. Thus a Profile may retain base standard options as

- 1 options of the Profile provided that they do not affect interworking or  
2 portability.
- 3 b) shall not specify any requirements that would contradict or cause non-  
4 conformance to the base standards to which it refers;
- 5 c) may contain conformance requirements which are more specific and  
6 limited in scope than those of the base standards to which it refers. Whilst  
7 the capabilities and behaviour specified in a Profile will always be valid in  
8 terms of the base standards, a Profile may exclude some valid optional  
9 capabilities and optional behaviour permitted in those base standards.

10 Thus conformance to a Profile implies by definition conformance to the set of  
11 base standards which it references. However, conformance to that set of base  
12 standards does not necessarily imply conformance to the Profile.

### 13 6.4.2 Main elements of a Profile Definition

14 The definition of a Profile shall comprise the following elements:

- 15 a) a concise definition of the scope of the function for which the Profile is  
16 defined, and of its purpose;
- 17 b) an illustration of the scenario within which the function is applicable,  
18 giving, where applicable, a diagrammatic representation of the systems,  
19 applications and interfaces which are relevant;
- 20 c) normative reference to a single set of base standards or ISPs, including  
21 precise identification of the actual texts of the base standards or ISPs  
22 being used and of any approved amendments and technical corrigenda  
23 (errata), conformance to which is identified as potentially having an impact  
24 on achieving interoperation using the Profile;
- 25 d) informative reference to any other relevant source documents;
- 26 e) specifications of the application of each referenced base standard or ISP,  
27 covering recommendations on the choice of classes or subsets, and on  
28 the selection of options, ranges of parameter values, etc, and reference to  
29 registered objects;
- 30 f) a statement defining the requirements to be observed by systems  
31 claiming conformance to the Profile, including any remaining permitted  
32 options of the referenced base standards or ISPs, which thus become  
33 options of the Profile.

34 Where systems can perform different but complementary roles (e.g. an initiator-  
35 responder, a client-server, or a master-slave relationship), the Profile shall identify  
36 the separate roles which may be adopted by a system, and these shall be stated  
37 as either mandatory requirements or options of the Profile, as appropriate.

38 NOTE - Clause 8 provides information on the way in which a Profile shall be defined in an ISP.

1 Different classes of Profile, corresponding to the major divisions of the Taxonomy,  
2 may have unique aspects to their definition. For example, an OSI Profile specifies  
3 the application of one or more OSI base standards in support of a specific  
4 requirement for interworking between systems. While it adheres to the structure  
5 defined by the Basic Reference Model for OSI, it does not define the total OSI  
6 functionality of a system, but only that part relevant to the function being defined.

7 [Ed. Note: Other types of profiles could be listed here, along with common  
8 characteristics - Need to tailor this section to OSE]

## 9 6.5 The Meaning of Conformance to a Profile

### 10 6.5.1 General

11 A Profile shall be defined in such a way that testing of an implementation of it can  
12 be carried out in the most complete way possible, given the available testing  
13 methodologies.

14 These requirements are stated in an ISP Implementation Conformance Statement  
15 (ISPICS), using the PICS Proformas of the referenced base standards and an  
16 ISPICS Requirements List (IPRL - details as given in 8.4).

17 NOTE - Where such PICS proformas do not exist in a base standard, the appropriate means of stating  
18 implementation conformance shall be used.

19 In order to conform to a Profile, a system shall perform correctly all the  
20 capabilities defined in the ISPICS as mandatory and also any options of the ISP  
21 which it claims to include. Conformance to a base standard in this context is  
22 conformance to a particular identified publication of a referenced base standard as  
23 defined in 6.3.2 (c), irrespective of however many additional technical corrigenda  
24 to it may have been published.

25 But a system may have the ability to operate according to several Profiles which  
26 make use of different capabilities of the same base standards, and either to  
27 negotiate between such different uses, or to be configured appropriately.

### 28 6.5.2 OSI Profiles

29 The concepts of static conformance, dynamic conformance and Protocol  
30 Implementation Conformance Statements (see ISO/IEC 9646 parts 1 and 2) are  
31 incorporated in the concept of Profiles.

32 In the context of OSI, a real system is said to exhibit conformance if it complies  
33 with the requirements of applicable OSI standards in its communication with other  
34 real systems.

35 Since OSI standards form a set of inter-related standards which combine to define  
36 behaviour of open systems in their communication, it is necessary to express  
37 conformance of real systems with reference to this set.

1 NOTE - ISO/IEC 9646 is under development to include the subject of testing concepts and  
2 methodology for such Profiles, and will be referenced from this Technical Report when these  
3 extensions have been completed. In the mean time, nothing in this Technical Report shall be taken to  
4 contradict statements made in subsequently published ISO/IEC standards.

### 5 6.5.3 Profiles for Interchange Formats and Representation

6 The concept of static conformance (as given in 6.6) shall be applied to  
7 Interchange Format and Representation Profiles.

8 Interchange Format and Representation Profiles should if appropriate include an  
9 IPRL based on a PICS-style proforma, which may vary from the PICS defined in  
10 ISO/IEC 9646 Parts 1 and 2.

11 In the case of Profiles for Office Document Architecture, conformance centres on  
12 the requirements for valid ODA data streams. The conformance methodology for  
13 ODA data streams (defined in ISO/IEC 8613-1) is differentiated from the  
14 implementation testing methodology (defined in ISO/IEC TR 10183), which deals  
15 with the way that data streams are generated and received.

16 Other sub-classes of Interchange Format and Representation Profiles will similarly  
17 have specific definitions of conformance methodology.

### 18 6.5.4 OSE and Application Environment Profiles

19 An approach to conformance which addresses the full OSE scope is an issue  
20 which will require further study.

21 Considerable work has been done in JTC1 SC21/WG1 on the extension of  
22 ISO/IEC 9646 to address profile conformance. The extension towards  
23 interoperability testing which is occurring for OSI Profiles will also have some  
24 relevance to OSE, including an element of proving practical portability of  
25 implementations.

26 JTC1 SC22/WG15 has produced a test methodology for API specifications which  
27 is based on Test Assertions. This work primarily supports the conformance of  
28 individual base standards, and is in the preliminary stages of addressing profile  
29 conformance.

30 A full integration of these two techniques would be a significant advance in  
31 conformance testing. Major additional test concepts and work would be required  
32 to address the full scope of OSE conformance, although this can be expected to  
33 take some time.

34 Clear definitions of conformance and testability are essential for standards API  
35 specifications. Not all required functions can be effectively tested. However,  
36 where possible, test methods should be readily derivable from the standard. The  
37 following statements will apply:

- 38 - API specifications shall specify the mapping between conformance  
39 levels defined by the API standard and conformance levels defined

- 1 by the standards defining the associated programming language and  
2 service.
- 3 - The "conformance clauses" and conformance requirements specified  
4 in standard API specifications shall distinguish between the  
5 requirements on conforming service implementations and those on  
6 conforming applications.
- 7 - API conformance requirements shall include sufficient level of  
8 specificity that verification test methods can be derived.
- 9 - The use of API specification methods that support the use of  
10 automated test procedures should be encouraged.

## 11 6.6 Conformance requirements of OSE Profiles

12 The conformance requirements of a Profile shall relate to the conformance  
13 requirements in the base standards in the following ways.

- 14 a) **Mandatory requirements in the base standards:** these shall remain  
15 mandatory in the Profile.
- 16 b) **Conditional requirements in the base standards:** these shall remain  
17 conditional in the Profile with the exception that if the condition always  
18 evaluates to True or False given the requirements of the Profile, then the  
19 status can be changed to the result obtained. (See clause C.4 for  
20 additional information).
- 21 c) **Optional requirements in the base standards:** these may be changed  
22 in various ways within the profile:
- 23 • **Mandatory:** support may be made mandatory.
  - 24 • **Optional:** support may remain optional.
  - 25 • **Out of Scope:** optional requirements which are not relevant to the  
26 Profile. For example, functional units of layer (n-1) which are unused  
27 by layer (n) in the context of the Profile.
  - 28 • **Conditional:** optional requirements may be made conditional within  
29 the Profile.
  - 30 • **Excluded:** the use of an optional feature may be prohibited in the  
31 context of the Profile. This should only be used to restrict the  
32 dynamic behaviour in terms of the transmission of protocol elements.

33 **NOTE - Exclusion of an optional feature in a base standard should be done only with**  
34 **great care. An example of an appropriate situation would be when use of an optional**  
35 **feature would lead directly to future interoperability problems.**

1 d) **Non-applicable features in the base standards:** (i.e. those that are  
2 logically impossible, according to the base standard) these shall remain  
3 non-applicable in the Profile.

4 e) **Excluded requirements in the base standards:** these shall remain  
5 excluded in the Profile.

6 See 8.4 for the way in which these types of conformance requirements are  
7 handled in the ISP Implementation Conformance Statement (ISPICS).

## 8 6.7 Conformance

### 9 6.7.1 General

10 The choices of options made in a Profile's conformance requirements are specific  
11 to that Profile and provide added value to the base standards.

12 The choices are not, therefore, arbitrary but need to be consistent with the  
13 purpose of the Profile and consistent across all base standards referenced by it.

14 In order to avoid ambiguity between the Profiles and the base standards, the  
15 static conformance requirements of a Profile shall be specified, where possible, by  
16 reference to the conformance requirements of the referenced base standards (see  
17 8.4.3).

### 18 6.7.2 Structure

19 The statement of conformance requirements shall be structured as follows:

20 a) An overview of major subsets or implementation categories which  
21 provides an overall rationale for the more detailed selection of classes  
22 and options made in the Profile.

23 b) The major conformance requirements which relate to these subsets or  
24 implementation categories.

25 c) For each base standard selected in the Profile, a set of conformance  
26 requirements referring both to the base standard conformance  
27 requirements and to the choices made for the Profile (details as given in  
28 6.5).

29 See clause 8, and especially figure 3, for the way in which these requirements are  
30 reflected in the ISPICS Requirements List.

### 31 6.7.3 Sending/Receiving Asymmetry

32 Conformance requirements may be different in respect of sending and receiving,  
33 or initiating and responding. This asymmetry may apply at any level of detail, from

1 the capability of an implementation to initiate or respond to a connection, to the  
2 capability of receiving and correctly interpreting a wider range of parameter  
3 encodings than those used for sending.

4 Many base standards specifically identify only the connection initiate-respond  
5 asymmetry under static conformance in the conformance clause. There is a need  
6 to make it clear in the Profile either that there is no asymmetry, or, if there are  
7 asymmetrical requirements, what they are.

## 7 Taxonomy of OSE Profiles

### 7.1 Nature and Purpose of the Taxonomy

The Taxonomy is the structure and classification within which Profiles will fit. It gives a first-level specification of Profiles, including any determined technical constraints due to their position in the structure, it classifies them and it specifies a number of relationships between them.

The process of drafting and approving ISPs requires a technical framework within which to operate. ISPs will, in general, be written, evaluated and used by experts in specific areas of standardization. There is therefore a prima facie case for identifying classes of Profiles which correspond to these main areas of expertise.

Having defined such classes, there is then a need to make further subdivisions, related to the inherent real-world divisions of functionality which are supported by the base standards concerned. These sub-classes correspond to functional elements which are meaningful to both users and suppliers; they correspond to points where choices are made, such as whether or not to use/offer a particular subset of an application service, or which communications sub-network environment is to be accessed, or what types of portability need to be provided by a system.

In defining the elements of the taxonomy, a major source of determining factors can be provided by analysis of user requirements. Grouping together elements of functionality into a Profile should correspond to identifiable, real-world, units of application or system design.

The granularity of the Taxonomy is important from the point of view of satisfying the requirement for common methods of interworking using Profiles; too many nearly-similar Profiles within a sub-class of the Taxonomy will increase the likelihood that users will be unable to agree on a single Profile choice to interwork successfully; too few Profiles may lead to the provision of so many options to a Profile that it accomplishes little in the way of selection and simplification.

The Taxonomy therefore provides a structure within which these choices can be made and recorded, and the embodiment of the Taxonomy is the structured identifier system. ISO/IEC/TR 10000-2 provides the detail of this system.

### 7.2 OSE Taxonomy Description

This clause contains the Taxonomy of OSE Profiles as is currently envisioned. It should be noted however that the entries have only an informative nature, and that further user and supplier consultation is required before they can be regarded as correct and usable.

This taxonomy must be capable of providing the means of categorising all conceivable profiles within the intended scope of Open Systems. In addition, the

Much should  
go into -1.

1 profile development methodology must support the content requirements of all  
 2 such profiles.

3 This taxonomy must be based on an analytical examination of the functions which  
 4 meet the real requirements of users. Such a method is being proposed by  
 5 BSI/DISC in its Framework for User Requirements (FUR). EWOS seeks to ensure  
 6 that it includes user interests in its OSE work, and is in contact with various User-  
 7 led groups, from which input to its work is obtained.

8 This taxonomy is concerned with Generic profiles, which form the basis for  
 9 subsequent definition, by users or by other standardisation groups, of specific  
 10 profiles (e.g. a generic workstation profile can be used as basis for a financial  
 11 institution's workstation). Hence this limits the scope of this taxonomy.

12	P	OSE Profiles	AEP
13		POB	Base Environment Profiles
14		POB1	Generic Base Environment
15		POB2	.... (to be extended if necessary)
16		POE	Generic Environment Profiles
17		POE1	Work Station Environments
18			POE10 Terminal Environment
19			POE11 Personal Workstation Environment
20			POE12 Professional Workstation Environment
21		POE2	Utility Server Environments
22			POE20 Electronic Message Serving Environment
23			POE21 Directory Serving Environment
24			POE22 Access Control Serving Environment
25		POE3	Information Server Environments
26			POE30 DBMS Serving Environment
27			POE31 Document Serving Environment
28		POE4	Transaction Processing Environments
29			POE40 Simple TP Environment
30			POE41 Enhanced TP Environment
31		POE5	Real Time Environments
32			POE50 Real Time Environment, seconds
33			POE51 Real Time Environment, milli-seconds
34		POE6	Super Computing Environments

35 Note: Such a profile taxonomy can be applied to stand-alone environments, communicating  
 36 environments as well as to distributed environments. It may also be subject to extension by means of  
 37 the addition of Attributes.

## 1 8 Structure of Documentation for Profiles

### 2 8.1 Principles

3 The requirements for content and format of ISPs are based on the following  
4 principles:

- 5 a) Profiles shall be directly related to base standards, and conformance to  
6 Profiles shall imply conformance to base standards.
- 7 b) ISPs shall follow the IEC/ISO Rules for the drafting and presentation of  
8 International Standards. See Annex A for relevant extracts from these  
9 rules, adapted for use in ISPs.
- 10 c) ISPs are intended to be concise documents, which do not repeat the text  
11 of the documents to which they refer. The reliance on references to base  
12 standards, their PICS proformas (in the case of OSI Profiles), and the use  
13 of registered names of objects, are thus essential for the production of  
14 concise ISPs.
- 15 d) Profiles making identical use of particular base standards shall be  
16 consistent, down to the level of identical wording in the ISPs for identical  
17 requirements.

### 18 8.2 Multi-part ISPs

19 Many Profiles will be documented and published as individual ISPs. However,  
20 where close relationships exist between two or more Profiles (for example those  
21 relationships documented in general terms in clause 7 of this part of ISO/IEC TR  
22 10000, and in detail in subsequent parts Part 2), a more appropriate technique  
23 can be used.

24 The need for common text between related Profiles is essential to ensure  
25 consistency and interworking, to avoid unnecessary duplication of text, and to aid  
26 writers and reviewers of ISPs. Items of common text comprise the definition of a  
27 distinct section of a Profile, together with that part of the SPICS Requirements  
28 List relating to the use of one or more base standards by that section of the  
29 Profile.

30 An ISP can be produced in a number of separate parts, on the analogy of multi-  
31 part International Standards, where each part is capable of being separately  
32 written, submitted to an ISO/IEC Technical Committee, and approved.

33 A single-part ISP, or one part of a multi-part ISP, shall not contain the definition of  
34 more than one Profile.

35 The following rules apply to multi-part ISPs:

- 1 a) A multi-part ISP shall contain the definition of a complete Profile or of a  
2 related set of Profiles.
- 3 b) A part of a multi-part ISP may contain a section of the definition of one or  
4 more Profiles.
- 5 c) Where a multi-part ISP covers more than one Profile, the part structure  
6 shall permit each Profile to be the subject of a separate ISP ballot; i.e. its  
7 constituent Profiles shall be clearly identifiable, and the multi-part  
8 structure shall ensure that this can be accomplished.
- 9 d) Wherever possible, the references made from one part to another should  
10 be to complete parts. However, controlled use of one-way references to  
11 clauses of other parts is permitted in order to obtain a reasonable multi-  
12 part structure.

13 Because there may also be potential disadvantages from over-use of the multi-  
14 part ISP capability, such as difficulties in gaining approval for a complex linked set  
15 of parts, or reduction of the content of a part to a small amount of text,  
16 considerable care should be taken with its use.

17 See annex B for further more detailed illustrations of the way in which multi-part  
18 ISPs can be constructed and used.

#### 19 NOTES

- 20 1 When a section of text appears in several Profiles, then possibilities exist for sharing  
21 the corresponding code (etc.) for the implementation of several Profiles, and the  
22 tests applicable to the use of the referenced base standards will be applicable to the  
23 testing of several Profiles.
- 24 2 It follows that it is in the interests of the implementers of OSI to promote the  
25 identification of common sections of text as parts of ISPs, but even more to  
26 promote, in future standardization and Profile work, the use of already defined parts  
27 of ISPs, so that Profiles fall into a few "common moulds". In particular, this allows  
28 implementation of a part of an ISP with confidence that it may be used in the  
29 implementation of Profiles as yet undefined, so that products are open to future  
30 development.
- 31 3 The definition of one Profile may include a reference to the definition of another  
32 Profile in its totality.

### 33 8.3 Structure of OSE Profiles

34 The document structure for OSE Profiles follows the generic rules defined in TR  
35 10000-1 Annex A, and extensions and more specific descriptions are required in  
36 TR 10000-3.

37 In addition to specificatory material, an ISP for an OSE Profile should record the  
38 rationale for the technical choices made during the development of the Profile.  
39 Capturing this rationale facilitates the use, reuse and maintenance of OSE  
40 profiles.

1 An OSE Profile specification when published as an ISP, shall contain clauses  
2 and annexes as follows.

3		Title
4		Foreword
5		Introduction
6	1	Scope
7	2	Normative References
8	3	Definitions
9	4	Abbreviations
10	5	Conformance
11	6	Profile Specification (as many clauses are needed)

12	Anx A	Profile Requirements List
13	Anx B	Profile Structure
14	Anx C	Rationale
15	Anx D	User Requirements (inc architectural constraints)
16	Anx E	Identification of informative references

#### 17 Title

18 The title of the OSE Profile, including its Identifier as derived from the OSE  
19 Taxonomy, the identifier should be stated here. See TR 10000-1 Anx 4.1

#### 20 Foreword

21 As required by TR 10000-1 A.3.1

#### 22 Introduction

23 As required by TR 10000-1 A.3.4

#### 24 Scope

25 Follow the structure of TR 10000-1 A.4.2.

#### 26 a) General

27 This clause documents in user terms the exact objectives for the  
28 Profile.

29 OSE Profiles should include an informative description of the purpose  
30 of the profile in general terms, its relation to other profiles and  
31 standards, and suitable explanations to facilitate the use of the  
32 profile.

33 This clause should point to Annex C for rationale of development  
34 from user requirements.

#### 35 b) Position within Taxonomy

36 Reference to the Taxonomy for OSE Generic Profiles in TR 10000-3

1 c) Scenario

2 Illustrative representation of the scope of the Profile, including all  
 3 specified external interfaces (including interoperability and distributed  
 4 operation functions) and all specified internal interfaces between  
 5 building blocks, defined either as functional profiles or as direct  
 6 reference to base standards. The existence of "gaps" in the  
 7 specification of the Profile, for which reference to Publicly Accessible  
 8 Specifications may be appropriate, should also be noted.

9 **Normative References**

10 As required by TR 10000-1 A.4.3

11 **Definitions**

12 As required by TR 10000-1 A.5.1

13 **Abbreviations**

14 As required by TR 10000-1 A.5.2

15 **Conformance**

16 This clause identifies the major types of conformance by which implementations  
 17 of the Profile can be assessed. A detailed Profile Requirements List in Annex A  
 18 gives specific information about conformance to each referenced base standard or  
 19 functional profile.

20 Publicly Accessible Specifications, though not a formal part of the definition of a  
 21 Profile in an ISP, require similar indication of conformance requirements when  
 22 they are invoked in the application of a Profile.

23  
 24 Conformance can be defined at different levels:

- 25 a) conformance to the architecture of the Profile (Not strictly  
 26 conformance in the conventional sense, but may have use in the  
 27 procurement environment - "The product is built in accordance with  
 28 the overall structure identified within this Profile")
- 29 b) conformance to the required external interfaces of the Profile
- 30 c) conformance to the interfaces required between the Building Blocks  
 31 of the Profile.

32 **Conformance Requirements**

33 The OSE Profile shall identify the exact conformance requirements  
 34 and indicate which of them must be subject to measurement by test  
 35 technology, and which could be subject to validation by other means.

## 1 **Conformance Testing**

2 Testing methodologies vary at least according to the five different  
3 interface types described in the subsequent clauses. Also, testing of  
4 conformance is better understood for services offered by Building  
5 Blocks than for services consumed by them.

## 6 **Profile Specification**

7 The following sections are a complete list of the functionality the OSE profile  
8 specifies. This is detailed functionality as seen by the user of the Profile (provider  
9 or consumer).

10 In order to provide the required functionality of the Profile, individual Base  
11 Standards or ISPs and relevant options are identified.

12 If there is no suitable base standard or ISP available to satisfy a technical  
13 requirement, the need for new standardisation work can be identified. TR 10000-1  
14 to be developed to record the procedure when no such standard is, or is likely  
15 to be. The expected resolution is that an OSE Profile should specify the required  
16 functionality and indicate through references in Annex E the source of possible  
17 specifications to meet this need.

18 If a Base Standard or ISP is slightly incompatible with the technical requirement a  
19 change request should be issued to the appropriate standards body. In no case  
20 shall a modified Base Standard or ISP be defined in an OSE Profile.

21 This specification documents the technical requirements for the interfaces  
22 between the building blocks identified in Annex B, as well as to the external  
23 environment.

24 Each interface requirement describes an interface between two building blocks  
25 within the Profile, or between a building block and an external entity. External  
26 entities are described only in terms of their interaction with the profile. For  
27 example, a protocol may provide connectivity to a different system which is not  
28 detailed, or an API may be exported for use by applications which are not named.  
29

30 The interfaces are classified according to the main aspects of openness: Human  
31 User Interaction, Data Format, Application Program Interfaces, Protocols.

32 This classification is further described below. It should be realised that the  
33 different categories of interfaces reflect the different levels of details in the  
34 interface.

35 The interface classes and associated requirements follow.

## 36 **Human/Computer Interaction**

37 These are requirements on an interface between Information  
38 Technology and a human being. The requirement deals with the  
39 audio-visual and manual aspects of the interface.

## 40 **Data Formats**

*6.1.4 part 1*

1 These are requirements on BBs that they be able to exchange and  
 2 process data in a certain representation. The exchange mechanism  
 3 may be unspecified, or carried out using the following Interface  
 4 Classes. Data interchange is the context for the Format definitions,  
 5 including media based interchange.

6 **Application Program Interfaces**

7 a) Source Program Interfaces

8 These are requirements for a language bindings of the interface (for  
 9 example, APIs).

10 b) Binary Program Interfaces

11 These are requirements for a binary binding of the interface, (often  
 12 called ABIs). Currently these are not generally the subject of formal  
 13 standardisation.

14 **Protocols**

15 These are requirements on the mechanism for communication  
 16 between Building Blocks.

17 **Attributes**

18 Some additional requirements may be added to the Profile to fulfil its  
 19 objectives. Some of the attributes which could be included in this  
 20 section are:

- 21 - security characteristics
- 22 - degree of availability (e.g. non-stop computing)
- 23 - national adaptation (localisation)
- 24 - responsiveness (e.g. realtime or TP)
- 25 - languages and associated bindings
- 26 - type of information processed and presented to the user
- 27 (e.g. windowing, 2D or 3D graphic, multi-media).

28 **Note:** Attributes will in most cases have a pervasive influence on a profile and  
 29 should therefore not be handled as options or parameters to a profile.  
 30 Rather, their existence should be suitably noted in the Profile title. The  
 31 detailed treatment of attributes will be studied further during the  
 32 development of pilot profiles.

## 1 Annex A Profile Requirements List

2 The nature of a PRL for an OSE Profile is to be the subject of further work. The  
 3 general principles of such requirements lists have been well developed in ISO/IEC  
 4 DIS 9646-6 for OSI Profiles, and it is expected that relevant material and  
 5 terminology can be extracted to define a meaningful concept for OSE Profiles.  
 6 However, as the nature of conformance statements in referenced base standards  
 7 for OSE Profiles is not constrained by a document such as ISO/IEC 9646, there is  
 8 unlikely to be as simple and neat a solution for defining precisely the conformance  
 9 requirements of an OSE Profile.

10

## 11 Annex B Profile Structure

12 Lists the building blocks which together support the functionality of the Profile as  
 13 described in the main text.

14 Each building block is a component of the profile definition; interfaces are the  
 15 "points of stability" in the Profile, while the implementation of the building blocks  
 16 may evolve independently.

## 17 Annex C Rationale

18 This annex includes the rationale for the breakdown of user requirements into  
 19 elements of the Profile specification, and the points of stability identified by the  
 20 interfaces, ideally by pointing to the user requirements/objectives Annex which  
 21 follows.

## 22 Annex D User Requirements

23 This annex defines the detailed requirements as a list of functions and a list of  
 24 attributes and architectural constraints.

25 This section is created at an early stage of the Profile's development, since it  
 26 forms the rationale for the selection of standards and their options.

27 Some variations in requirements could be handled by the use of options on  
 28 requirements, provided that they only affect well contained parts of the profile  
 29 specification. Options must not seriously affect the openness of the profile. They  
 30 may apply to functions, attributes or architectural constraints.

31 This Annex can also specify user required architectural aspects which go beyond  
 32 the specification of functions and attributes, and can include (for instance):

- 33 - preference for certain standards or paradigms
- 34 - degree of distribution
- 35 - inclusion of existing OSE profiles
- 36 - coexistence with legacy environments
- 37 - visibility of certain internal interfaces.

1 **Annex E Identification of Informative References.**

2 TR 10000-1 requires all documents referenced within an ISP to be formally  
3 identified in an Annex. In the case of OSE Profiles, such references may include  
4 Publicly Accessible Specifications (depending on successful resolution of the  
5 "Gaps" Issue 17 (N624).

6 1. To be published
