30280 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/39 is applied, changing “corresponding  
value” to “corresponding error value” in the ERRORS section.

**Issue 7**

30281  
30282 Austin Group Interpretation 1003.1-2001 #013 is applied.

30283 **NAME**  
 30284 `freelocale` — free resources allocated for a locale object

30285 **SYNOPSIS**

30286 CX `#include <locale.h>`  
 30287 `void freelocale(locale_t locobj);`

30288 **DESCRIPTION**

30289 The `freelocale()` function shall cause the resources allocated for a locale object returned by a call  
 30290 to the `newlocale()` or `duplocale()` functions to be released.

30291 Any use of a locale object that has been freed results in undefined behavior.

30292 **RETURN VALUE**

30293 None.

30294 **ERRORS**

30295 None.

30296 **EXAMPLES**

30297 **Freeing Up a Locale Object**

30298 The following example shows a code fragment to free a locale object created by `newlocale()`:

```
30299 #include <locale.h>
30300 ...
30301 /* Every locale object allocated with newlocale() should be
30302 * freed using freelocale():
30303 */
30304 locale_t loc;
30305 /* Get the locale. */
30306 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
30307 /* ... Use the locale object ... */
30308 ...
30309 /* Free the locale object resources. */
30310 freelocale (loc);
```

30311 **APPLICATION USAGE**

30312 None.

30313 **RATIONALE**

30314 None.

30315 **FUTURE DIRECTIONS**

30316 None.

30317 **SEE ALSO**

30321

**CHANGE HISTORY**

First released in Issue 7.

## 30322 NAME

30323 freopen — open a stream

## 30324 SYNOPSIS

30325 #include &lt;stdio.h&gt;

30326 FILE \*freopen(const char \*restrict filename, const char \*restrict mode,  
30327 FILE \*restrict stream);

## 30328 DESCRIPTION

30329 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30330 conflict between the requirements described here and the ISO C standard is unintentional. This  
30331 volume of POSIX.1-200x defers to the ISO C standard.30332 The *freopen()* function shall first attempt to flush the stream associated with *stream* as if by a call  
30333 to *fflush(stream)*. Failure to flush the stream successfully shall be ignored. If *filename* is not a null  
30334 pointer, *freopen()* shall close any file descriptor associated with *stream*. Failure to close the file  
30335 descriptor successfully shall be ignored. The error and end-of-file indicators for the stream shall  
30336 be cleared.30337 The *freopen()* function shall open the file whose pathname is the string pointed to by *filename*  
30338 and associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in  
30339 *fopen()*. The *freopen()* function shall allocate a file descriptor in the same way as *open()*.

30340 The original stream shall be closed regardless of whether the subsequent open succeeds.

30341 If *filename* is a null pointer, the *freopen()* function shall attempt to change the mode of the stream  
30342 to that specified by *mode*, as if the name of the file currently associated with the stream had been  
30343 used. In this case, the file descriptor associated with the stream need not be closed if the call to  
30344 *freopen()* succeeds. It is implementation-defined which changes of mode are permitted (if any),  
30345 and under what circumstances.30346 XSI After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the  
30347 encoding rule shall be cleared, and the associated **mbstate\_t** object shall be set to describe an  
30348 initial conversion state.30349 CX The largest value that can be represented correctly in an object of type **off\_t** shall be established  
30350 as the offset maximum in the open file description.

## 30351 RETURN VALUE

30352 Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer  
30353 CX shall be returned, and *errno* shall be set to indicate the error.

## 30354 ERRORS

30355 The *freopen()* function shall fail if:30356 CX [EACCES] Search permission is denied on a component of the path prefix, or the file  
30357 exists and the permissions specified by *mode* are denied, or the file does not  
30358 exist and write permission is denied for the parent directory of the file to be  
30359 created.30360 CX [EBADF] The file descriptor underlying the stream is not a valid file descriptor when  
30361 *filename* is a null pointer.30362 CX [EINTR] A signal was caught during *freopen()*.30363 CX [EISDIR] The named file is a directory and *mode* requires write access.

|       |    |                |                                                                                                                                                      |
|-------|----|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 30364 | CX | [ELOOP]        | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.                                                           |
| 30365 |    |                |                                                                                                                                                      |
| 30366 | CX | [EMFILE]       | All file descriptors available to the process are currently open.                                                                                    |
| 30367 | CX | [ENAMETOOLONG] |                                                                                                                                                      |
| 30368 |    |                | The length of the <i>filename</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.                                     |
| 30369 |    |                |                                                                                                                                                      |
| 30370 | CX | [ENFILE]       | The maximum allowable number of files is currently open in the system.                                                                               |
| 30371 | CX | [ENOENT]       | A component of <i>filename</i> does not name an existing file or <i>filename</i> is an empty string.                                                 |
| 30372 |    |                |                                                                                                                                                      |
| 30373 | CX | [ENOSPC]       | The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.                  |
| 30374 |    |                |                                                                                                                                                      |
| 30375 | CX | [ENOTDIR]      | A component of the path prefix is not a directory.                                                                                                   |
| 30376 | CX | [ENXIO]        | The named file is a character special or block special file, and the device associated with this special file does not exist.                        |
| 30377 |    |                |                                                                                                                                                      |
| 30378 | CX | [EOVERFLOW]    | The named file is a regular file and the size of the file cannot be represented correctly in an object of type <b>off_t</b> .                        |
| 30379 |    |                |                                                                                                                                                      |
| 30380 | CX | [EROFS]        | The named file resides on a read-only file system and <i>mode</i> requires write access.                                                             |
| 30381 |    |                |                                                                                                                                                      |
| 30382 |    |                | The <i>freopen()</i> function may fail if:                                                                                                           |
| 30383 | CX | [EBADF]        | The mode with which the file descriptor underlying the stream was opened does not support the requested mode when <i>filename</i> is a null pointer. |
| 30384 |    |                |                                                                                                                                                      |
| 30385 | CX | [EINVAL]       | The value of the <i>mode</i> argument is not valid.                                                                                                  |
| 30386 | CX | [ELOOP]        | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.                                               |
| 30387 |    |                |                                                                                                                                                      |
| 30388 | CX | [ENAMETOOLONG] |                                                                                                                                                      |
| 30389 |    |                | Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.                                              |
| 30390 |    |                |                                                                                                                                                      |
| 30391 | CX | [ENOMEM]       | Insufficient storage space is available.                                                                                                             |
| 30392 | CX | [ENXIO]        | A request was made of a nonexistent device, or the request was outside the capabilities of the device.                                               |
| 30393 |    |                |                                                                                                                                                      |
| 30394 | CX | [ETXTBSY]      | The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.                                        |
| 30395 |    |                |                                                                                                                                                      |

## EXAMPLES

### Directing Standard Output to a File

The following example logs all standard output to the `/tmp/logfile` file.

```

30399 #include <stdio.h>
30400 ...
30401 FILE *fp;
30402 ...
30403 fp = freopen ("/tmp/logfile", "a+", stdout);
30404 ...

```

**APPLICATION USAGE**

The *freopen()* function is typically used to attach the preopened *streams* associated with *stdin*, *stdout*, and *stderr* to other files.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*fclose()*, *fdopen()*, *fflush()*, *fmemopen()*, *fopen()*, *mbsinit()*, *open()*, *open\_memstream()*

XBD **<stdio.h>**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the conversion state of the stream is set to an initial conversion state by a successful call to the *freopen()* function.

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [Eoverflow] condition is added. This change is to support large files.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *freopen()* prototype is updated.
- The DESCRIPTION is updated.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/40 is applied, adding the following sentence to the DESCRIPTION: “In this case, the file descriptor associated with the stream need not be closed if the call to *freopen()* succeeds.”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/41 is applied, adding an mandatory [EBADF] error, and an optional [EBADF] error to the ERRORS section.

|       |                                                                                                        |   |
|-------|--------------------------------------------------------------------------------------------------------|---|
| 30444 | <b>Issue 7</b>                                                                                         |   |
| 30445 | Austin Group Interpretation 1003.1-2001 #043 is applied, clarifying that the <i>freopen()</i> function | - |
| 30446 | allocates a file descriptor as per <i>open()</i> .                                                     |   |
| 30447 | SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.                               | + |
| 30448 | SD5-XSH-ERN-150 is applied.                                                                            |   |

30449 **NAME**30450 `frexp`, `frexpf`, `frexpl` — extract mantissa and exponent from a double precision number30451 **SYNOPSIS**30452 `#include <math.h>`30453 `double frexp(double num, int *exp);`30454 `float frexpf(float num, int *exp);`30455 `long double frexpl(long double num, int *exp);`30456 **DESCRIPTION**30457 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any  
30458 conflict between the requirements described here and the ISO C standard is unintentional. This  
30459 volume of POSIX.1-200x defers to the ISO C standard.30460 These functions shall break a floating-point number *num* into a normalized fraction and an  
30461 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.30462 **RETURN VALUE**30463 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the  
30464 interval  $[\frac{1}{2}, 1)$  or 0, and *num* equals *x* times 2 raised to the power *\*exp*.30465 **MX** If *num* is NaN, a NaN shall be returned, and the value of *\*exp* is unspecified.30466 If *num* is  $\pm 0$ ,  $\pm 0$  shall be returned, and the value of *\*exp* shall be 0.30467 If *num* is  $\pm \text{Inf}$ , *num* shall be returned, and the value of *\*exp* is unspecified.30468 **ERRORS**

30469 No errors are defined.

30470 **EXAMPLES**

30471 None.

30472 **APPLICATION USAGE**

30473 None.

30474 **RATIONALE**

30475 None.

30476 **FUTURE DIRECTIONS**

30477 None.

**Issue 6**

The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

30493 **NAME**  
 30494 `fscanf, scanf, sscanf` — convert formatted input

30495 **SYNOPSIS**

```
30496 #include <stdio.h>
30497
30497 int fscanf(FILE *restrict stream, const char *restrict format, ...);
30498 int scanf(const char *restrict format, ...);
30499 int sscanf(const char *restrict s, const char *restrict format, ...);
```

30500 **DESCRIPTION**

30501 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30502 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30503 volume of POSIX.1-200x defers to the ISO C standard.

30504 The `fscanf()` function shall read from the named input *stream*. The `scanf()` function shall read  
 30505 from the standard input stream *stdin*. The `sscanf()` function shall read from the string *s*. Each  
 30506 function reads bytes, interprets them according to a *format*, and stores the results in its  
 30507 arguments. Each expects, as arguments, a control string *format* described below, and a set of  
 30508 *pointer* arguments indicating where the converted input should be stored. The result is  
 30509 undefined if there are insufficient arguments for the *format*. If the *format* is exhausted while  
 30510 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

30511 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 30512 to the next unused argument. In this case, the conversion specifier character `%` (see below) is  
 30513 replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range `[1, {NL_ARGMAX}]`.  
 30514 This feature provides for the definition of format strings that select arguments in an order  
 30515 appropriate to specific languages. In format strings containing the `"%n$"` form of conversion  
 30516 specifications, it is unspecified whether numbered arguments in the argument list can be  
 30517 referenced from the format string more than once.

30518 The *format* can contain either form of a conversion specification—that is, `%` or `"%n$"`—but the  
 30519 two forms cannot be mixed within a single *format* string. The only exception to this is that `%%` or  
 30520 `%*` can be mixed with the `"%n$"` form. When numbered argument specifications are used,  
 30521 specifying the *N*th argument requires that all the leading arguments, from the first to the  
 30522 (*N*–1)th, are pointers.

30523 The `fscanf()` function in all its forms shall allow detection of a language-dependent radix  
 30524 character in the input string. The radix character is defined in the locale of the process (category  
 30525 `LC_NUMERIC`). In the POSIX locale, or in a locale where the radix character is not defined, the  
 30526 radix character shall default to a period (`'.'`).

30527 The *format* is a character string, beginning and ending in its initial shift state, if any, composed  
 30528 of zero or more directives. Each directive is composed of one of the following: one or more  
 30529 white-space characters (`<space>`s, `<tab>`s, `<newline>`s, `<vertical-tab>`s, or `<form-feed>`s); an  
 30530 ordinary character (neither `'%'` nor a white-space character); or a conversion specification. Each  
 30531 CX conversion specification is introduced by the character `'%'` or the character sequence `"%n$"`,  
 30532 after which the following appear in sequence:

- 30533 • An optional assignment-suppressing character `'*'`.
- 30534 • An optional non-zero decimal integer that specifies the maximum field width.
- 30535 CX • An optional assignment-allocation character `'m'`.
- 30536 • An option length modifier that specifies the size of the receiving object.

- 30537                   • A *conversion specifier* character that specifies the type of conversion to be applied. The valid  
30538                   conversion specifiers are described below.
- 30539                   The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as  
30540                   detailed below, the function shall return. Failures are described as input failures (due to the  
30541                   unavailability of input bytes) or matching failures (due to inappropriate input).
- 30542                   A directive composed of one or more white-space characters shall be executed by reading input  
30543                   until no more valid input can be read, or up to the first byte which is not a white-space character,  
30544                   which remains unread.
- 30545                   A directive that is an ordinary character shall be executed as follows: the next byte shall be read  
30546                   from the input and compared with the byte that comprises the directive; if the comparison  
30547                   shows that they are not equivalent, the directive shall fail, and the differing and subsequent  
30548                   bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a  
30549                   character from being read, the directive shall fail.
- 30550                   A directive that is a conversion specification defines a set of matching input sequences, as  
30551                   described below for each conversion character. A conversion specification shall be executed in  
30552                   the following steps.
- 30553                   Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion  
30554                   specification includes a *l*, *c*, *C*, or *n* conversion specifier.
- 30555                   An item shall be read from the input, unless the conversion specification includes an *n*  
30556                   conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to  
30557                   any specified maximum field width, which may be measured in characters or bytes dependent  
30558                   on the conversion specifier) which is an initial subsequence of a matching sequence. The first  
30559                   byte, if any, after the input item shall remain unread. If the length of the input item is 0, the  
30560                   execution of the conversion specification shall fail; this condition is a matching failure, unless  
30561                   end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is  
30562                   an input failure.
- 30563                   Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion  
30564                   specification, the count of input bytes) shall be converted to a type appropriate to the conversion  
30565                   character. If the input item is not a matching sequence, the execution of the conversion  
30566                   specification fails; this condition is a matching failure. Unless assignment suppression was  
30567                   indicated by a *'\*'*, the result of the conversion shall be placed in the object pointed to by the  
30568                   first argument following the *format* argument that has not already received a conversion result if  
30569                   the conversion specification is introduced by *%*, or in the *n*th argument if introduced by the  
30570                   character sequence "*%n\$*". If this object does not have an appropriate type, or if the result of the  
30571                   conversion cannot be represented in the space provided, the behavior is undefined.
- 30572                   CX       The *%s*, *%S*, and *%[* conversion specifiers shall accept an optional assignment-allocation  
30573                   character *'m'*, which shall cause a memory buffer to be allocated to hold the string converted  
30574                   including a terminating null character. In such a case, the argument corresponding to the  
30575                   conversion specifier should be a reference to a pointer variable that will receive a pointer to the  
30576                   allocated buffer. The system shall allocate a buffer as if *malloc()* had been called. The application  
30577                   shall be responsible for freeing the memory after usage. If there is insufficient memory to  
30578                   allocate a buffer, the function shall set *errno* to [ENOMEM] and a conversion error shall result. In  
30579                   that case, any memory successfully allocated for other parameters using assignment-allocation  
30580                   character *'m'* by this call shall be freed.                   +
- 30581                   The length modifiers and their meanings are:
- 30582                   hh       Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an  
30583                   argument with type pointer to **signed char** or **unsigned char**.

**fscanf()**

| 30634 | s  | Matches a sequence of bytes that are not white-space characters. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence and a terminating null character code, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <br> <br> <br>+ |

| 30640 |    | If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character shall be converted to a wide character as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .                                                                                                                                                                                                                           | <br> <br> <br>+ |
| 30641 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                 |

| 30649 | [  | Matches a non-empty sequence of bytes from a set of expected bytes (the <i>scanset</i> ). The normal skip over white-space characters shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> , or <b>unsigned char</b> large enough to accept the sequence and a terminating null byte, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>char</b> .                                                                                                                                                                                                                                                                                                                                                           | <br> <br> <br>+ |
| 30650 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                 |

| 30656 |    | If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character in the sequence shall be converted to a wide character as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the sequence and the terminating null wide character, which shall be added automatically. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> .                                                                                                                                                                                                           | <br> <br> <br>+ |
| 30657 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                 |

| 30665 |    | The conversion specification includes all subsequent bytes in the <i>format</i> string up to and including the matching right square bracket (']'). The bytes between the square brackets (the <i>scanlist</i> ) comprise the <i>scanset</i> , unless the byte after the left square bracket is a circumflex ('^'), in which case the <i>scanset</i> contains all bytes that do not appear in the <i>scanlist</i> between the circumflex and the right square bracket. If the conversion specification begins with "[ ]" or "[^]", the right square bracket is included in the <i>scanlist</i> and the next right square bracket is the matching right square bracket that ends the conversion specification; otherwise, the first right square bracket is the one that ends the conversion specification. If a '-' is in the <i>scanlist</i> and is not the first character, nor the second where the first character is a '^', nor the last character, the behavior is implementation-defined. |                 |

| 30676 | c  | Matches a sequence of bytes of the number specified by the field width (1 if no field width is present in the conversion specification). No null byte is added. The normal skip over white-space characters shall be suppressed in this case. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to the initial byte of an array of <b>char</b> , <b>signed char</b> ,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <br> <br> <br>  |
| 30677 |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                 |

| 30683 |     | If an <b>l</b> (ell) qualifier is present, the input shall be a sequence of characters that begins in the initial shift state. Each character in the sequence is converted to a wide character as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an <b>mbstate_t</b> object initialized to zero before the first character is converted. No null wide character is added. If the 'm' assignment-allocation character is not specified, the application shall ensure that the corresponding argument is a pointer to an array of <b>wchar_t</b> large enough to accept the resulting sequence of wide characters. Otherwise, the application shall ensure that the corresponding argument is a pointer to a pointer to a <b>wchar_t</b> . |

| 30692 | p   | Matches an implementation-defined set of sequences, which shall be the same as the set of sequences that is produced by the %p conversion specification of the corresponding <i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a pointer to a pointer to <b>void</b> . The interpretation of the input item is implementation-defined. If the input item is a value converted earlier during the same program execution, the pointer that results shall compare equal to that value; otherwise, the behavior of the %p conversion specification is undefined.                                                                                                                                                                         |

| 30698 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30699 | n   | No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which shall be written the number of bytes read from the input so far by this call to the <i>fscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing character or a field width, the behavior is undefined.                                                                                                                                                                                                      |

| 30713 |     | If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs before any bytes matching the current conversion specification (except for %n) have been read (other than leading white-space characters, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.                                                                                                                                                                                                       |

| 30719 |     | Reaching the end of the string in <i>sscanf()</i> shall be equivalent to encountering end-of-file for <i>fscanf()</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 30720 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30721 |     | If conversion terminates on a conflicting input, the offending input is left unread in the input. Any trailing white space (including <newline>s) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 30722 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30723 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30724 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30725 | CX  | The <i>fscanf()</i> and <i>scanf()</i> functions may mark the last data access timestamp of the file associated with <i>stream</i> for update. The last data access timestamp shall be marked for update by the first successful execution of <i>fgetc()</i> , <i>fgets()</i> , <i>fread()</i> , <i>getc()</i> , <i>getchar()</i> , <i>gets()</i> , <i>fscanf()</i> , or <i>scanf()</i> using <i>stream</i> that returns data not supplied by a prior call to <i>ungetc()</i> .                                                                                                                                                                                                                                                                                                 |
| 30726 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30727 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 30728 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**RETURN VALUE**

Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs, the error indicator for the stream is set, EOF shall be returned, and *errno* shall be set to indicate the error.

**ERRORS**

For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or *fgetwc()*.

In addition, the *fscanf()* functions shall fail if:

[ENOMEM]      Insufficient storage space is available.

The *fscanf()* functions may fail if:

[EILSEQ]      Input byte sequence does not form a valid character.

[EINVAL]      There are insufficient arguments.

**EXAMPLES**

The call:

```
int i, n; float x; char name[50];
n = scanf("%d%f%s", &i, &x, name);
```

with the input line:

```
25 54.32E-1 Hamster
```

assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string "Hamster".

The call:

```
int i; float x; char name[50];
(void) scanf("%2d%f*d %[0123456789]", &i, &x, name);
```

with input:

```
56789 0123 56a72
```

assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to *getchar()* shall return the character 'a'.

**Reading Data into an Array**

The following call uses *fscanf()* to read three floating-point numbers from standard input into the *input* array.

```
float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

**APPLICATION USAGE**

If the application calling *fscanf()* has any objects of type **wint\_t** or **wchar\_t**, it must also include the **<wchar.h>** header to have these objects defined.

**RATIONALE**

This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few "obvious" things were not included. Specifically, the set of characters allowed in a scanset is limited to single-byte characters. In other similar places, multi-byte characters have been permitted, but for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications needing this could use the corresponding wide-character functions to achieve the desired results.

| 30777 | <b>CHANGE HISTORY</b>                                                                                                           |   |
| 30778 | First released in Issue 1. Derived from Issue 1 of the SVID.                                                                    |   |
| 30779 | <b>Issue 5</b>                                                                                                                  |   |
| 30780 | Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the l (ell) qualifier is                                     |   |
| 30781 | now defined for the c, s, and [ conversion specifiers.                                                                          |   |
| 30782 | The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the                                         |   |
| 30783 | <i>fprintf()</i> family of functions, then they are recognized by the <i>fscanf()</i> family.                                   |   |
| 30784 | <b>Issue 6</b>                                                                                                                  |   |
| 30785 | The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several                                                 |   |
| 30786 | occurrences of “characters” in the text which have been replaced with the term “bytes”.                                         |   |
| 30787 | The normative text is updated to avoid use of the term “must” for application requirements.                                     |   |
| 30788 | The following changes are made for alignment with the ISO/IEC 9899:1999 standard:                                               |   |
| 30789 | • The prototypes for <i>fscanf()</i> , <i>scanf()</i> , and <i>sscanf()</i> are updated.                                        |   |
| 30790 | • The DESCRIPTION is updated.                                                                                                   |   |
| 30791 | • The hh, ll, j, t, and z length modifiers are added.                                                                           |   |
| 30792 | • The a, A, and F conversion characters are added.                                                                              |   |
| 30793 | The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion                                              |   |
| 30794 | specification” consistently.                                                                                                    |   |
| 30795 | <b>Issue 7</b>                                                                                                                  |   |
| 30796 | SD5-XSH-ERN-9 is applied, correcting <i>fscanf()</i> to <i>scanf()</i> in the DESCRIPTION.                                      |   |
| 30797 | SD5-XSH-ERN-132 is applied, adding the assignment-allocation character ‘m’.                                                     | + |
| 30798 | Functionality relating to the %n\$ form of conversion specification is moved from the XSI option                                |   |
| 30799 | to the Base.                                                                                                                    |   |
| 30800 | Changes are made related to support for finegrained timestamps.                                                                 | + |

30801 **NAME**  
 30802 `fseek, fseeko` — reposition a file-position indicator in a stream

30803 **SYNOPSIS**  
 30804 `#include <stdio.h>`  
 30805 `int fseek(FILE *stream, long offset, int whence);`  
 30806 CX `int fseeko(FILE *stream, off_t offset, int whence);`

### 30807 DESCRIPTION

30808 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30809 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30810 volume of POSIX.1-200x defers to the ISO C standard.

30811 The `fseek()` function shall set the file-position indicator for the stream pointed to by `stream`. If a  
 30812 read or write error occurs, the error indicator for the stream shall be set and `fseek()` fails.

30813 The new position, measured in bytes from the beginning of the file, shall be obtained by adding  
 30814 `offset` to the position specified by `whence`. The specified point is the beginning of the file for  
 30815 `SEEK_SET`, the current value of the file-position indicator for `SEEK_CUR`, or end-of-file for  
 30816 `SEEK_END`.

30817 If the stream is to be used with wide-character input/output functions, the application shall  
 30818 ensure that `offset` is either 0 or a value returned by an earlier call to `ftell()` on the same stream and  
 30819 `whence` is `SEEK_SET`.

30820 A successful call to `fseek()` shall clear the end-of-file indicator for the stream and undo any effects  
 30821 of `ungetc()` and `ungetwc()` on the same stream. After an `fseek()` call, the next operation on an  
 30822 update stream may be either input or output.

30823 CX If the most recent operation, other than `ftell()`, on a given stream is `fflush()`, the file offset in the  
 30824 underlying open file description shall be adjusted to reflect the location specified by `fseek()`.

30825 The `fseek()` function shall allow the file-position indicator to be set beyond the end of existing  
 30826 data in the file. If data is later written at this point, subsequent reads of data in the gap shall  
 30827 return bytes with the value 0 until data is actually written into the gap.

30828 The behavior of `fseek()` on devices which are incapable of seeking is implementation-defined.  
 30829 The value of the file offset associated with such a device is undefined.

30830 If the stream is writable and buffered data had not been written to the underlying file, `fseek()`  
 30831 shall cause the unwritten data to be written to the file and shall mark the last data modification  
 30832 and last file status change timestamps of the file for update.

30833 In a locale with state-dependent encoding, whether `fseek()` restores the stream's shift state is  
 30834 implementation-defined.

30835 The `fseeko()` function shall be equivalent to the `fseek()` function except that the `offset` argument is  
 30836 of type `off_t`.

### 30837 RETURN VALUE

30838 CX The `fseek()` and `fseeko()` functions shall return 0 if they succeed.

30839 CX Otherwise, they shall return `-1` and set `errno` to indicate the error.

**fseek()****ERRORS**

- 30840
- 30841 CX The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream's*
- 30842 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or
- 30843 *write()* to be invoked, and:
- 30844 CX [EAGAIN] The O\_NONBLOCK flag is set for the file descriptor and the thread would be
- 30845 delayed in the write operation.
- 30846 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the
- 30847 stream's buffer needed to be flushed and the file is not open.
- 30848 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.
- 30849 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the
- 30850 process.
- 30851 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
- 30852 offset maximum associated with the corresponding stream.
- 30853 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
- 30854 was transferred.
- 30855 CX [EINVAL] The *whence* argument is invalid. The resulting file-position indicator would be
- 30856 set to a negative value.
- 30857 CX [EIO] A physical I/O error has occurred, or the process is a member of a background
- 30858 process group attempting to perform a *write()* to its controlling terminal,
- 30859 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the
- 30860 process group of the process is orphaned. This error may also be returned
- 30861 under implementation-defined conditions.
- 30862 CX [ENOSPC] There was no free space remaining on the device containing the file.
- 30863 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
- 30864 capabilities of the device.
- 30865 CX [EOVERFLOW] For *fseek()*, the resulting file offset would be a value which cannot be
- 30866 represented correctly in an object of type **long**.
- 30867 CX [EOVERFLOW] For *fseeko()*, the resulting file offset would be a value which cannot be
- 30868 represented correctly in an object of type **off\_t**.
- 30869 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading
- 30870 by any process; a SIGPIPE signal shall also be sent to the thread.
- 30871 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *fseeko()* function is added.
- The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

The following change is incorporated for alignment with the FIPS requirements:

- The [EINTR] error is no longer an indication that the implementation does not report partial transfers.

The normative text is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and then on error the error indicator is set and *fseek()* fails. This is for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/42 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

**Issue 7**

Changes are made related to support for finegrained timestamps.

+

30907 **NAME**30908 `fsetpos` — set current file position30909 **SYNOPSIS**30910 `#include <stdio.h>`30911 `int fsetpos(FILE *stream, const fpos_t *pos);`30912 **DESCRIPTION**30913 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30914 conflict between the requirements described here and the ISO C standard is unintentional. This  
30915 volume of POSIX.1-200x defers to the ISO C standard.30916 The `fsetpos()` function shall set the file position and state indicators for the stream pointed to by  
30917 `stream` according to the value of the object pointed to by `pos`, which the application shall ensure is  
30918 a value obtained from an earlier call to `fgetpos()` on the same stream. If a read or write error  
30919 occurs, the error indicator for the stream shall be set and `fsetpos()` fails.30920 A successful call to the `fsetpos()` function shall clear the end-of-file indicator for the stream and  
30921 undo any effects of `ungetc()` on the same stream. After an `fsetpos()` call, the next operation on an  
30922 update stream may be either input or output.30923 CX The behavior of `fsetpos()` on devices which are incapable of seeking is implementation-defined.  
30924 The value of the file offset associated with such a device is undefined.30925 **RETURN VALUE**30926 The `fsetpos()` function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and  
30927 set `errno` to indicate the error.30928 **ERRORS**30929 CX The `fsetpos()` function shall fail if, either the `stream` is unbuffered or the `stream`'s buffer needed to  
30930 be flushed, and the call to `fsetpos()` causes an underlying `lseek()` or `write()` to be invoked, and:30931 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor and the thread would be  
30932 delayed in the write operation.30933 CX **[EBADF]** The file descriptor underlying the stream file is not open for writing or the  
30934 stream's buffer needed to be flushed and the file is not open.30935 CX **[EFBIG]** An attempt was made to write a file that exceeds the maximum file size.30936 XSI **[EFBIG]** An attempt was made to write a file that exceeds the file size limit of the  
30937 process.30938 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the  
30939 offset maximum associated with the corresponding stream.30940 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data  
30941 was transferred.30942 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background  
30943 process group attempting to perform a `write()` to its controlling terminal,  
30944 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the  
30945 process group of the process is orphaned. This error may also be returned  
30946 under implementation-defined conditions.30947 CX **[ENOSPC]** There was no free space remaining on the device containing the file.

- 30948 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
30949 capabilities of the device.
- 30950 CX [EPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.
- 30951 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading  
30952 by any process; a SIGPIPE signal shall also be sent to the thread.

XBD &lt;stdio.h&gt;

**CHANGE HISTORY**

First released in Issue 4. Derived from the ISO C standard.

**Issue 6**

Extensions beyond the ISO C standard are marked.

An additional [ESPIPE] error condition is added for sockets.

The normative text is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or write error. This is for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous [EINVAL] error case from the ERRORS section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/43 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

30977 **NAME**30978 `fstat` — get file status30979 **SYNOPSIS**30980 `#include <sys/stat.h>`30981 `int fstat(int fildev, struct stat *buf);`30982 **DESCRIPTION**30983 The `fstat()` function shall obtain information about an open file associated with the file  
30984 descriptor *fildev*, and shall write it to the area pointed to by *buf*.30985 SHM If *fildev* references a shared memory object, the implementation shall update in the **stat** structure  
30986 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
30987 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
30988 valid. The implementation may update other fields and flags.30989 TYM If *fildev* references a typed memory object, the implementation shall update in the **stat** structure  
30990 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
30991 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
30992 valid. The implementation may update other fields and flags.30993 The *buf* argument is a pointer to a **stat** structure, as defined in `<sys/stat.h>`, into which  
30994 information is placed concerning the file.30995 For all other file types defined in this volume of POSIX.1-200x, the structure members *st\_mode*,  
30996 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
30997 value of the *st\_nlink* member shall be set to the number of links to the file.30998 An implementation that provides additional or alternative file access control mechanisms may,  
30999 under implementation-defined conditions, cause `fstat()` to fail.31000 The `fstat()` function shall update any time-related fields (as described in XBD [Section 4.8](#), on  
31001 page 97), before writing into the **stat** structure.31002 **RETURN VALUE**31003 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to  
31004 indicate the error.31005 **ERRORS**31006 The `fstat()` function shall fail if:31007 [EBADF] The *fildev* argument is not a valid file descriptor.

31008 [EIO] An I/O error occurred while reading from the file system.

31009 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
31010 serial number cannot be represented correctly in the structure pointed to by  
31011 *buf*.31012 The `fstat()` function may fail if:31013 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf*  
31014 argument.

31015 **EXAMPLES**31016 **Obtaining File Status Information**

31017 The following example shows how to obtain file status information for a file named  
 31018 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The  
 31019 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file  
 31020 descriptor *filides*.

```
31021 #include <sys/types.h>
31022 #include <sys/stat.h>
31023 #include <fcntl.h>

31024 struct stat buffer;
31025 int status;
31026 ...
31027 filides = open("/home/cnd/mod1", O_RDWR);
31028 status = fstat(filides, &buffer);
```

31029 **APPLICATION USAGE**

31030 None.

31031 **RATIONALE**

31038 **CHANGE HISTORY**

31039 First released in Issue 1. Derived from Issue 1 of the SVID.

31040 **Issue 5**

31041 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

31042 Large File Summit extensions are added.

31043 **Issue 6**

31044 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

31045 The following new requirements on POSIX implementations derive from alignment with the  
 31046 Single UNIX Specification:

- 31047 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was  
 31048 required for conforming implementations of previous POSIX specifications, it was not  
 31049 required for UNIX applications.
- 31050 • The [EIO] mandatory error condition is added.
- 31051 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
 31052 files.
- 31053 • The [EOVERFLOW] optional error condition is added.

31054 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that  
 31055 shared memory object semantics apply to typed memory objects.

- 31056 **Issue 7**
- 31057 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify which file types *st\_nlink*
- 31058 applies to.
- 31059 Changes are made related to support for finegrained timestamps. +

31060 **NAME**  
 31061 fstatat, lstat, stat — get file status

31062 **SYNOPSIS**  
 31063 #include <sys/stat.h>  
 31064 int fstatat(int fd, const char \*restrict path,  
 31065 struct stat \*restrict buf, int flag);  
 31066 int lstat(const char \*restrict path, struct stat \*restrict buf);  
 31067 int stat(const char \*restrict path, struct stat \*restrict buf);

31068 **DESCRIPTION**  
 31069 The *stat()* function shall obtain information about the named file and write it to the area pointed  
 31070 to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or  
 31071 execute permission of the named file is not required. An implementation that provides  
 31072 additional or alternate file access control mechanisms may, under implementation-defined  
 31073 conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file  
 31074 specified by *path*.

31075 If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using  
 31076 the contents of the symbolic link, and shall return information pertaining to the resulting file if  
 31077 the file exists.

31078 The *buf* argument is a pointer to a **stat** structure, as defined in the <sys/stat.h> header, into  
 31079 which information is placed concerning the file.

31080 The *stat()* function shall update any time-related fields (as described in XBD Section 4.8, on page  
 31081 97), before writing into the **stat** structure.

31082 SHM If the named file is a shared memory object, the implementation shall update in the **stat** structure  
 31083 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 31084 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 31085 valid. The implementation may update other fields and flags.

31086 TYM If the named file is a typed memory object, the implementation shall update in the **stat** structure  
 31087 pointed to by the *buf* argument the *st\_uid*, *st\_gid*, *st\_size*, and *st\_mode* fields, and only the  
 31088 S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP, S\_IROTH, and S\_IWOTH file permission bits need be  
 31089 valid. The implementation may update other fields and flags.

31090 For all other file types defined in this volume of POSIX.1-200x, the structure members *st\_mode*,  
 31091 *st\_ino*, *st\_dev*, *st\_uid*, *st\_gid*, *st\_atim*, *st\_ctim*, and *st\_mtim* shall have meaningful values and the  
 31092 value of the member *st\_nlink* shall be set to the number of links to the file.

31093 The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In  
 31094 that case *lstat()* shall return information about the link, while *stat()* shall return information  
 31095 about the file the link references.

31096 For symbolic links, the *st\_mode* member shall contain meaningful information when used with  
 31097 the file type macros, and the *st\_size* member shall contain the length of the pathname contained  
 31098 in the symbolic link. File mode bits and the contents of the remaining members of the **stat**  
 31099 structure are unspecified. The value returned in the *st\_size* member is the length of the contents  
 31100 of the symbolic link, and does not count any trailing null.

31101 The *fstatat()* function shall be equivalent to the *stat()* or *lstat()* function, depending on the value  
 31102 of *flag* (see below), except in the case where *path* specifies a relative path. In this case the status  
 31103 shall be retrieved from a file relative to the directory associated with the file descriptor *fd* instead  
 31104 of the current working directory. It is unspecified whether directory searches are permitted  
 31105 based on whether the file was opened with search permission or on the current permissions of

- 31106 the directory underlying the file descriptor.
- 31107 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined  
31108 in `<fcntl.h>`:
- 31109 AT\_SYMLINK\_NOFOLLOW  
31110 If *path* names a symbolic link, the status of the symbolic link is returned.
- 31111 If *fstatat()* is passed the special value AT\_FDCWD in the *fd* parameter, the current working  
31112 directory is used and the behavior shall be identical to a call to *stat()* or *lstat()* respectively,  
31113 depending on whether or not the AT\_SYMLINK\_NOFOLLOW bit is set in *flag*.
- 31114 **RETURN VALUE**
- 31115 Upon successful completion, these functions shall return 0. Otherwise, these functions shall  
31116 return -1 and set *errno* to indicate the error.
- 31117 **ERRORS**
- 31118 These functions shall fail if:
- 31119 [EACCES] Search permission is denied for a component of the path prefix.
- 31120 [EIO] An error occurred while reading from the file system.
- 31121 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
31122 argument.
- 31123 [ENAMETOOLONG]  
31124 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
31125 component is longer than {NAME\_MAX}.
- 31126 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 31127 [ENOTDIR] A component of the path prefix is not a directory.
- 31128 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file  
31129 serial number cannot be represented correctly in the structure pointed to by  
31130 *buf*.
- 31131 The *fstatat()* function shall fail if:
- 31132 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is  
31133 neither AT\_FDCWD nor a valid file descriptor open for reading.
- 31134 These functions may fail if:
- 31135 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
31136 resolution of the *path* argument.
- 31137 [ENAMETOOLONG]  
31138 As a result of encountering a symbolic link in resolution of the *path* argument,  
31139 the length of the substituted pathname string exceeded {PATH\_MAX}.
- 31140 [EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.
- 31141 The *fstatat()* function may fail if:
- 31142 [EINVAL] The value of the *flag* argument is not valid.
- 31143 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
31144 file descriptor associated with a directory.

31145 **EXAMPLES**31146 **Obtaining File Status Information**

31147 The following example shows how to obtain file status information for a file named  
31148 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
31149 #include <sys/types.h>
31150 #include <sys/stat.h>
31151 #include <fcntl.h>
31152
31153 struct stat buffer;
31154 int status;
31155 ...
31156 status = stat("/home/cnd/mod1", &buffer);
```

31156 **Getting Directory Information**

31157 The following example fragment gets status information for each entry in a directory. The call to  
31158 the *stat()* function stores file information in the **stat** structure pointed to by *statbuf*. The lines  
31159 that follow the *stat()* call format the fields in the **stat** structure for presentation to the user of the  
31160 program.

```
31161 #include <sys/types.h>
31162 #include <sys/stat.h>
31163 #include <dirent.h>
31164 #include <pwd.h>
31165 #include <grp.h>
31166 #include <time.h>
31167 #include <locale.h>
31168 #include <langinfo.h>
31169 #include <stdio.h>
31170 #include <stdint.h>
31171
31172 struct dirent *dp;
31173 struct stat statbuf;
31174 struct passwd *pwd;
31175 struct group *grp;
31176 struct tm *tm;
31177 char datestring[256];
31178 ...
31179 /* Loop through directory entries. */
31180 while ((dp = readdir(dir)) != NULL) {
31181 /* Get entry's information. */
31182 if (stat(dp->d_name, &statbuf) == -1)
31183 continue;
31184
31185 /* Print out type, permissions, and number of links. */
31186 printf("%10.10s", sperm (statbuf.st_mode));
31187 printf("%4d", statbuf.st_nlink);
31188
31189 /* Print out owner's name if it is found using getpwuid(). */
31190 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
31191 printf(" %-8.8s", pwd->pw_name);
31192 else
31193 printf(" %-8d", statbuf.st_uid);
31194
31195 /* Print out group name if it is found using getgrgid(). */
```

```

31192 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
31193 printf(" %-8.8s", grp->gr_name);
31194 else
31195 printf(" %-8d", statbuf.st_gid);
31196
31196 /* Print size of file. */
31197 printf(" %9jd", (intmax_t)statbuf.st_size);
31198
31198 tm = localtime(&statbuf.st_mtime);
31199
31199 /* Get localized date string. */
31200 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
31201 printf(" %s %s\n", datestring, dp->d_name);
31202 }

```

### 31203 Obtaining Symbolic Link Status Information

31204 The following example shows how to obtain status information for a symbolic link named  
31205 **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path*  
31206 argument specified the filename for the file pointed to by the symbolic link (**/home/cnd/mod1**),  
31207 the results of calling the function would be the same as those returned by a call to the *stat()*  
31208 function.

```

31209 #include <sys/stat.h>
31210 struct stat buffer;
31211 int status;
31212 ...
31213 status = lstat("/modules/pass1", &buffer);

```

### 31214 APPLICATION USAGE

31215 None.

### 31216 RATIONALE

31217 The intent of the paragraph describing “additional or alternate file access control mechanisms”  
31218 is to allow a secure implementation where a process with a label that does not dominate the  
31219 file’s label cannot perform a *stat()* function. This is not related to read permission; a process with  
31220 a label that dominates the file’s label does not need read permission. An implementation that  
31221 supports write-up operations could fail *fstat()* function calls even though it has a valid file  
31222 descriptor open for writing.

31223 The *lstat()* function is not required to update the time-related fields if the named file is not a  
31224 symbolic link. While the *st\_uid*, *st\_gid*, *st\_atim*, *st\_mtim*, and *st\_ctim* members of the **stat** structure  
31225 may apply to a symbolic link, they are not required to do so. No functions in POSIX.1-200x are  
31226 required to maintain any of these time fields.

31227 The purpose of the *fstatat()* function is to obtain the status of files in directories other than the  
31228 current working directory without exposure to race conditions. Any part of the path of a file  
31229 could be changed in parallel to a call to *stat()*, resulting in unspecified behavior. By opening a  
31230 file descriptor for the target directory and using the *fstatat()* function it can be guaranteed that  
31231 the file for which status is returned is located relative to the desired directory.

### 31232 FUTURE DIRECTIONS

31233 None.

31234 **SEE ALSO**31235 *access()*, *chmod*, *fdopendir()*, *fstat()*, *mknod()*, *readlink()*, *symlink()*31236 XBD Section 4.8 (on page 97), *<fcntl.h>*, *<sys/stat.h>*, *<sys/types.h>* |31237 **CHANGE HISTORY**

31238 First released in Issue 1. Derived from Issue 1 of the SVID.

31239 **Issue 5**

31240 Large File Summit extensions are added.

31241 **Issue 6**31242 In the SYNOPSIS, the optional include of the *<sys/types.h>* header is removed.31243 The following new requirements on POSIX implementations derive from alignment with the  
31244 Single UNIX Specification:

- 31245 • The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was  
31246 required for conforming implementations of previous POSIX specifications, it was not  
31247 required for UNIX applications.
- 31248 • The [EIO] mandatory error condition is added.
- 31249 • The [ELOOP] mandatory error condition is added.
- 31250 • The [EOVERFLOW] mandatory error condition is added. This change is to support large  
31251 files.
- 31252 • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are  
31253 added.

31254 The following changes were made to align with the IEEE P1003.1a draft standard:

- 31255 • Details are added regarding the treatment of symbolic links.
- 31256 • The [ELOOP] optional error condition is added.

31257 The normative text is updated to avoid use of the term “must” for application requirements.

31258 The **restrict** keyword is added to the *stat()* prototype for alignment with the ISO/IEC 9899:1999  
31259 standard.31260 **Issue 7**31261 XSH-SD5-ERN-161 is applied, updating the DESCRIPTION to clarify which file types *st\_nlink* +  
31262 applies to. +31263 The *fstatat()* function is added from The Open Group Technical Standard, 2006, Extended API  
31264 Set Part 2.

31265 Changes are made related to support for finegrained timestamps. |

31266 **NAME**31267 `fstatvfs, statvfs` — get file system information31268 **SYNOPSIS**31269 `#include <sys/statvfs.h>`31270 `int fstatvfs(int fildev, struct statvfs *buf);`31271 `int statvfs(const char *restrict path, struct statvfs *restrict buf);`31272 **DESCRIPTION**31273 The `fstatvfs()` function shall obtain information about the file system containing the file  
31274 referenced by *fildev*.31275 The `statvfs()` function shall obtain information about the file system containing the file named by  
31276 *path*.31277 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,  
31278 write, or execute permission of the named file is not required.31279 The following flags can be returned in the *f\_flag* member:31280 **ST\_RDONLY** Read-only file system.31281 **ST\_NOSUID** Setuid/setgid bits ignored by *exec*.31282 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file  
31283 systems.31284 **RETURN VALUE**31285 Upon successful completion, `statvfs()` shall return 0. Otherwise, it shall return -1 and set *errno* to  
31286 indicate the error.31287 **ERRORS**31288 The `fstatvfs()` and `statvfs()` functions shall fail if:31289 **[EIO]** An I/O error occurred while reading the file system.31290 **[EINTR]** A signal was caught during execution of the function.31291 **[EOVERFLOW]** One of the values to be returned cannot be represented correctly in the  
31292 structure pointed to by *buf*.31293 The `fstatvfs()` function shall fail if:31294 **[EBADF]** The *fildev* argument is not an open file descriptor.31295 The `statvfs()` function shall fail if:31296 **[EACCES]** Search permission is denied on a component of the path prefix.31297 **[ELOOP]** A loop exists in symbolic links encountered during resolution of the *path*  
31298 argument.31299 **[ENAMETOOLONG]**31300 The length of a pathname exceeds `{PATH_MAX}` or a pathname component is  
31301 longer than `{NAME_MAX}`.31302 **[ENOENT]** A component of *path* does not name an existing file or *path* is an empty string.31303 **[ENOTDIR]** A component of the path prefix of *path* is not a directory.

- 31304 The *statvfs()* function may fail if:
- 31305 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
31306 resolution of the *path* argument.
- 31307 [ENAMETOOLONG]  
31308 Pathname resolution of a symbolic link produced an intermediate result  
31309 whose length exceeds {PATH\_MAX}.

**EXAMPLES****Obtaining File System Information Using *fstatvfs()***

The following example shows how to obtain file system information for the file system upon which the file named */home/cnd/mod1* resides, using the *fstatvfs()* function. The */home/cnd/mod1* file is opened with read/write privileges and the open file descriptor is passed to the *fstatvfs()* function.

```
31316 #include <sys/statvfs.h>
31317 #include <fcntl.h>
31318 struct statvfs buffer;
31319 int status;
31320 ...
31321 fildes = open("/home/cnd/mod1", O_RDWR);
31322 status = fstatvfs(fildes, &buffer);
```

**Obtaining File System Information Using *statvfs()***

The following example shows how to obtain file system information for the file system upon which the file named */home/cnd/mod1* resides, using the *statvfs()* function.

```
31326 #include <sys/statvfs.h>
31327 struct statvfs buffer;
31328 int status;
31329 ...
31330 status = statvfs("/home/cnd/mod1", &buffer);
```

**CHANGE HISTORY**

31341 First released in Issue 4, Version 2.

**Issue 5**

31342 Moved from X/OPEN UNIX extension to BASE.

31343 Large File Summit extensions are added.

**fstatvfs()**

31346

**Issue 6**

31347

The normative text is updated to avoid use of the term “must” for application requirements.

31348

31349

The **restrict** keyword is added to the *statvfs()* prototype for alignment with the ISO/IEC 9899:1999 standard.

31350

31351

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

31352

**Issue 7**

31353

The *fstatvfs()* and *statvfs()* functions are moved from the XSI option to the Base.

31354

SD5-XSH-ERN-68 is applied, correcting the EXAMPLES section.

31355 **NAME**

31356 fsync — synchronize changes to a file

31357 **SYNOPSIS**

```
31358 FSC #include <unistd.h>
31359 int fsync(int fildev);
```

31360 **DESCRIPTION**

31361 The *fsync()* function shall request that all data for the open file descriptor named by *fildev* is to be  
 31362 transferred to the storage device associated with the file described by *fildev*. The nature of the  
 31363 transfer is implementation-defined. The *fsync()* function shall not return until the system has  
 31364 completed that action or until an error is detected.

31365 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued  
 31366 I/O operations associated with the file indicated by file descriptor *fildev* to the synchronized I/O  
 31367 completion state. All I/O operations shall be completed as defined for synchronized I/O file  
 31368 integrity completion.

31369 **RETURN VALUE**

31370 Upon successful completion, *fsync()* shall return 0. Otherwise, `-1` shall be returned and *errno* set  
 31371 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed  
 31372 to have been completed.

31373 **ERRORS**31374 The *fsync()* function shall fail if:

- |       |          |                                                                                          |
|-------|----------|------------------------------------------------------------------------------------------|
| 31375 | [EBADF]  | The <i>fildev</i> argument is not a valid descriptor.                                    |
| 31376 | [EINTR]  | The <i>fsync()</i> function was interrupted by a signal.                                 |
| 31377 | [EINVAL] | The <i>fildev</i> argument does not refer to a file on which this operation is possible. |
| 31378 | [EIO]    | An I/O error occurred while reading from or writing to the file system.                  |

31379 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions  
 31380 defined for *read()* and *write()*.

31381 **EXAMPLES**

31382 None.

31383 **APPLICATION USAGE**

31384 The *fsync()* function should be used by programs which require modifications to a file to be  
 31385 completed before continuing; for example, a program which contains a simple transaction  
 31386 facility might use it to ensure that all modifications to a file or files caused by a transaction are  
 31387 recorded.

31388 **RATIONALE**

31389 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to  
 31390 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is  
 31391 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and  
 31392 “non-volatile storage” are not defined here, the wording has to be more abstract.

31393 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance  
 31394 document to tell the user what can be expected from the system. It is explicitly intended that a  
 31395 null implementation is permitted. This could be valid in the case where the system cannot assure  
 31396 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the  
 31397 functionality is not required. In the middle ground between these extremes, *fsync()* might or

31398 might not actually cause data to be written where it is safe from a power failure. The  
 31399 conformance document should identify at least that one configuration exists (and how to obtain  
 31400 that configuration) where this can be assured for at least some files that the user can select to use  
 31401 for critical data. It is not intended that an exhaustive list is required, but rather sufficient  
 31402 information is provided so that if critical data needs to be saved, the user can determine how the  
 31403 system is to be configured to allow the data to be written to non-volatile storage.

31404 It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite.  
 31405 That does not make the function any less valuable, just more difficult to test. A formal  
 31406 conformance test should probably force a system crash (power shutdown) during the test for  
 31407 this condition, but it needs to be done in such a way that automated testing does not require this  
 31408 to be done except when a formal record of the results is being made. It would also not be  
 31409 unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation  
 31410 issue.

#### 31411 **FUTURE DIRECTIONS**

31412 None.

#### 31413 **SEE ALSO**

31414 *sync()*

31415 XBD <[unistd.h](#)>

#### 31416 **CHANGE HISTORY**

31417 First released in Issue 3.

#### 31418 **Issue 5**

31419 Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and  
 31420 RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate  
 31421 that *fsync()* can return the error conditions defined for *read()* and *write()*.

#### 31422 **Issue 6**

31423 This function is marked as part of the File Synchronization option.

31424 The following new requirements on POSIX implementations derive from alignment with the  
 31425 Single UNIX Specification:

- 31426 • The [EINVAL] and [EIO] mandatory error conditions are added.

31427 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/44 is applied, applying an editorial  
 31428 rewording of the DESCRIPTION. No change in meaning is intended.

31429 **NAME**

31430 ftell, ftello — return a file offset in a stream

31431 **SYNOPSIS**

31432 #include &lt;stdio.h&gt;

31433 long ftell(FILE \*stream);

31434 CX off\_t ftello(FILE \*stream);

31435 **DESCRIPTION**31436 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31437 conflict between the requirements described here and the ISO C standard is unintentional. This  
31438 volume of POSIX.1-200x defers to the ISO C standard.31439 The *ftell()* function shall obtain the current value of the file-position indicator for the stream  
31440 pointed to by *stream*.31441 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type **off\_t**.31442 **RETURN VALUE**31443 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position  
31444 indicator for the stream measured in bytes from the beginning of the file.31445 CX Otherwise, *ftell()* and *ftello()* shall return  $-1$ , cast to **long** and **off\_t** respectively, and set *errno* to  
31446 indicate the error.31447 **ERRORS**31448 CX The *ftell()* and *ftello()* functions shall fail if:31449 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.31450 CX [EOVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of  
31451 type **long**.31452 CX [EOVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object  
31453 of type **off\_t**.31454 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.31455 The *ftell()* function may fail if:31456 CX [ESPIPE] The file descriptor underlying *stream* is associated with a socket.31457 **EXAMPLES**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *ftello()* function is added.
- The [Eoverflow] error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

31479 **NAME**

31480 ftok — generate an IPC key

31481 **SYNOPSIS**

```
31482 xSI #include <sys/ipc.h>
31483 key_t ftok(const char *path, int id);
```

31484 **DESCRIPTION**

31485 The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to  
 31486 *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the  
 31487 pathname of an existing file that the process is able to *stat()*.

31488 The *ftok()* function shall return the same key value for all paths that name the same file, when  
 31489 called with the same *id* value, and return different key values when called with different *id*  
 31490 values or with paths that name different files existing on the same file system at the same time. It  
 31491 is unspecified whether *ftok()* shall return the same key value when called again after the file  
 31492 named by *path* is removed and recreated with the same name.

31493 Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits  
 31494 are 0.

31495 **RETURN VALUE**

31496 Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return (**key\_t**)-1  
 31497 and set *errno* to indicate the error.

31498 **ERRORS**

31499 The *ftok()* function shall fail if:

- |                         |                                         |                                                                                                              |
|-------------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------|
| 31500                   | [EACCES]                                | Search permission is denied for a component of the path prefix.                                              |
| 31501<br>31502          | [ELOOP]                                 | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.                   |
| 31503<br>31504<br>31505 | [ENAMETOOLONG]                          | The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}. |
| 31506                   | [ENOENT]                                | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.                 |
| 31507                   | [ENOTDIR]                               | A component of the path prefix is not a directory.                                                           |
| 31508                   | The <i>ftok()</i> function may fail if: |                                                                                                              |
| 31509<br>31510          | [ELOOP]                                 | More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.       |
| 31511<br>31512<br>31513 | [ENAMETOOLONG]                          | Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.      |

31514 **EXAMPLES**31515 **Getting an IPC Key**

31516 The following example gets a unique key that can be used by the IPC functions *semget()*,  
 31517 *msgget()*, and *shmget()*. The key returned by *ftok()* for this example is based on the ID value *S*  
 31518 and the pathname */tmp*.

```
31519 #include <sys/ipc.h>
31520 ...
31521 key_t key;
31522 char *path = "/tmp";
31523 int id = 'S';
31524 key = ftok(path, id);
```

31525 **Saving an IPC Key**

31526 The following example gets a unique key based on the pathname */tmp* and the ID value *a*. It  
 31527 also assigns the value of the resulting key to the *semkey* variable so that it will be available to a  
 31528 later call to *semget()*, *msgget()*, or *shmget()*.

```
31529 #include <sys/ipc.h>
31530 ...
31531 key_t semkey;
31532 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
31533 perror("IPC error: ftok"); exit(1);
31534 }
```

31535 **APPLICATION USAGE**

31536 For maximum portability, *id* should be a single-byte character.

31537 **RATIONALE**

31538 None.

31539 **FUTURE DIRECTIONS**

31540 None.

31541 **SEE ALSO**

31542 *msgget()*, *semget()*, *shmget()*

31543 XBD [<sys/ipc.h>](#)

31544 **CHANGE HISTORY**

31545 First released in Issue 4, Version 2.

31546 **Issue 5**

31547 Moved from X/OPEN UNIX extension to BASE.

31548 **Issue 6**

31549 The normative text is updated to avoid use of the term “must” for application requirements.

31550 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
 31551 [ELOOP] error condition is added.

31552 **NAME**31553 `ftruncate` — truncate a file to a specified length31554 **SYNOPSIS**31555 `#include <unistd.h>`31556 `int ftruncate(int fildev, off_t length);`31557 **DESCRIPTION**31558 If *fildev* is not a valid file descriptor open for writing, the `ftruncate()` function shall fail.

31559 If *fildev* refers to a regular file, the `ftruncate()` function shall cause the size of the file to be  
 31560 truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no  
 31561 longer be available to reads on the file. If the file previously was smaller than this size,  
 31562 `ftruncate()` shall increase the size of the file. If the file size is increased, the extended area shall  
 31563 appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to  
 31564 `ftruncate()`.

31565 Upon successful completion, if *fildev* refers to a regular file, `ftruncate()` shall mark for update the  
 31566 last data modification and last file status change timestamps of the file and the `S_ISUID` and  
 31567 `S_ISGID` bits of the file mode may be cleared. If the `ftruncate()` function is unsuccessful, the file is  
 31568 unaffected.

31569 XSI If the request would cause the file size to exceed the soft file size limit for the process, the  
 31570 request shall fail and the implementation shall generate the `SIGXFSZ` signal for the thread.

31571 If *fildev* refers to a directory, `ftruncate()` shall fail.31572 If *fildev* refers to any other file type, except a shared memory object, the result is unspecified.

31573 SHM If *fildev* refers to a shared memory object, `ftruncate()` shall set the size of the shared memory  
 31574 object to *length*.

31575 SHM If the effect of `ftruncate()` is to decrease the size of a memory mapped file or a shared memory  
 31576 object and whole pages beyond the new end were previously mapped, then the whole pages  
 31577 beyond the new end shall be discarded.

31578 References to discarded pages shall result in the generation of a `SIGBUS` signal.

31579 If the effect of `ftruncate()` is to increase the size of a memory object, it is unspecified whether the  
 31580 contents of any mapped pages between the old end-of-file and the new are flushed to the  
 31581 underlying object.

31582 **RETURN VALUE**

31583 Upon successful completion, `ftruncate()` shall return 0; otherwise, `-1` shall be returned and `errno`  
 31584 set to indicate the error.

31585 **ERRORS**31586 The `ftruncate()` function shall fail if:

31587 [EINTR] A signal was caught during execution.

31588 [EINVAL] The *length* argument was less than 0.

31589 [EFBIG] or [EINVAL]

31590 The *length* argument was greater than the maximum file size.

31591 [EFBIG] The file is a regular file and *length* is greater than the offset maximum  
 31592 established in the open file description associated with *fildev*.

**ftruncate()**

31593 [EIO] An I/O error occurred while reading from or writing to a file system.  
 31594 [EBADF] or [EINVAL]  
 31595 The *fildest* argument is not a file descriptor open for writing.

**EXAMPLES**

31596 None.  
 31597

**APPLICATION USAGE**

31598 None.  
 31599

**RATIONALE**

31600 None.

**CHANGE HISTORY**

31607 First released in Issue 4, Version 2.  
 31608

**Issue 5**

31609 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX  
 31610 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is  
 31611 added to the list of mandatory errors that can be returned by *ftruncate()*.  
 31612

31613 Large File Summit extensions are added.

**Issue 6**

31614 The *truncate()* function is split out into a separate reference page.  
 31615

31616 The following new requirements on POSIX implementations derive from alignment with the  
 31617 Single UNIX Specification:

- The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a regular file, the S\_ISUID and S\_ISGID bits in the file mode may be cleared.

31620 The following changes were made to align with the IEEE P1003.1a draft standard:

- The DESCRIPTION text is updated.

31622 XSI-conformant systems are required to increase the size of the file if the file was previously  
 31623 smaller than the size requested.

**Issue 7**

31624 Austin Group Interpretation 1003.1-2001 #056 is applied, revising the ERRORS section (although  
 31625 the [EINVAL] “may fail” error was subsequently removed during review of the XSI option).  
 31626

31627 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to  
 31628 the Base.

31629 The DESCRIPTION is updated so that a call to *ftruncate()* when the file is smaller than the size  
 31630 requested will increase the size of the file. Previously, non-XSI-conforming implementations  
 31631 were allowed to increase the size of the file or fail.

31632 Changes are made related to support for finegrained timestamps.

31633 **NAME**  
31634 ftrylockfile — stdio locking functions

31635 **SYNOPSIS**

31636 CX `#include <stdio.h>`  
31637 `int ftrylockfile(FILE *file);`

31638 **DESCRIPTION**

31639 Refer to *flockfile()*.

31640 **NAME**

31641 ftw — traverse (walk) a file tree

31642 **SYNOPSIS**

```
31643 OB XSI #include <ftw.h>
31644
31644 int ftw(const char *path, int (*fn)(const char *,
31645 const struct stat *ptr, int flag), int ndirs);
```

31646 **DESCRIPTION**

31647 The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each  
 31648 object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a null-  
 31649 terminated character string containing the name of the object, a pointer to a **stat** structure  
 31650 containing information about the object, filled in as if *stat()* or *lstat()* had been called to retrieve  
 31651 the information. Possible values of the integer, defined in the **<ftw.h>** header, are:

31652 FTW\_D For a directory.

31653 FTW\_DNR For a directory that cannot be read.

31654 FTW\_F For a file.

31655 FTW\_SL For a symbolic link (but see also FTW\_NS below).

31656 FTW\_NS For an object other than a symbolic link on which *stat()* could not successfully be  
 31657 executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether  
 31658 *ftw()* passes FTW\_SL or FTW\_NS to the user-supplied function.

31659 If the integer is FTW\_DNR, descendants of that directory shall not be processed. If the integer is  
 31660 FTW\_NS, the **stat** structure contains undefined values. An example of an object that would  
 31661 cause FTW\_NS to be passed to the function pointed to by *fn* would be a file in a directory with  
 31662 read but without execute (search) permission.

31663 The *ftw()* function shall visit a directory before visiting any of its descendants.31664 The *ftw()* function shall use at most one file descriptor for each level in the tree.31665 The argument *ndirs* should be in the range [1,{OPEN\_MAX}].

31666 The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a  
 31667 non-zero value, or some error, other than [EACCES], is detected within *ftw()*.

31668 The *ndirs* argument shall specify the maximum number of directory streams or file descriptors  
 31669 or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any  
 31670 directory streams and file descriptors it uses not counting any opened by the application-  
 31671 supplied *fn* function.

31672 The results are unspecified if the application-supplied *fn* function does not preserve the current  
 31673 working directory.

31674 The *ftw()* function need not be thread-safe. A function that is not required to be thread-safe is  
 31675 not required to be reentrant.

31676 **RETURN VALUE**

31677 If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero  
 31678 value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function  
 31679 pointed to by *fn*. If *ftw()* detects an error, it shall return -1 and set *errno* to indicate the error.

31680 If *ftw()* encounters an error other than [EACCES] (see FTW\_DNR and FTW\_NS above), it shall  
 31681 return -1 and set *errno* to indicate the error. The external variable *errno* may contain any error

31682 value that is possible when a directory is opened or when one of the *stat* functions is executed on  
31683 a directory or file.

**ERRORS**

31684 The *ftw()* function shall fail if:  
31685

31686 [EACCES] Search permission is denied for any component of *path* or read permission is  
31687 denied for *path*.

31688 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*  
31689 argument.

31690 [ENAMETOOLONG]  
31691 The length of the *path* argument exceeds {PATH\_MAX} or a pathname  
31692 component is longer than {NAME\_MAX}.

31693 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

31694 [ENOTDIR] A component of *path* is not a directory.

31695 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current  
31696 programming environment for one or more files found in the file hierarchy.

31697 The *ftw()* function may fail if:

31698 [EINVAL] The value of the *ndirs* argument is invalid.

31699 [ELOOP] More than {SYMLOOP\_MAX} symbolic links were encountered during  
31700 resolution of the *path* argument.

31701 [ENAMETOOLONG]  
31702 Pathname resolution of a symbolic link produced an intermediate result  
31703 whose length exceeds {PATH\_MAX}.

31704 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set  
31705 accordingly.

**EXAMPLES****Walking a Directory Structure**

31707 The following example walks the current directory structure, calling the *fn* function for every  
31708 directory entry, using at most 10 file descriptors:  
31709

```
31710 #include <ftw.h>
31711 ...
31712 if (ftw(".", fn, 10) != 0) {
31713 perror("ftw"); exit(2);
31714 }
```

**APPLICATION USAGE**

31715 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly  
31716 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*  
31717 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains  
31718 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has  
31719 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next  
31720 invocation.  
31721

31722 Applications should use the *nftw()* function instead of the obsolescent *ftw()* function.

31723  
31724  
31725

31730  
31731  
31732  
31733  
31734  
31735  
31736  
31737  
31738  
31739  
31740  
31741  
31742  
31743  
31744**RATIONALE**

None.

**FUTURE DIRECTIONS**The *ftw()* function may be removed in a future version.**SEE ALSO***fdopendir()*, *fstatat()*, *longjmp()*, *malloc()*, *nftw()*, *siglongjmp()*XBD <*ftw.h*>, <*sys/stat.h*>**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

**Issue 6**

The ERRORS section is updated as follows:

- The wording of the mandatory [ELOOP] error condition is updated.
- A second optional [ELOOP] error condition is added.
- The [Eoverflow] mandatory error condition is added.

A note is added to the DESCRIPTION indicating that this function need not be reentrant, and that the results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

**Issue 7**

SD5-XBD-ERN-61 is applied.

The *ftw()* function is marked obsolescent.

31745 **NAME**  
31746 funlockfile — stdio locking functions

31747 **SYNOPSIS**

31748 CX `#include <stdio.h>`  
31749 `void funlockfile(FILE *file);`

31750 **DESCRIPTION**

31751 Refer to *flockfile()*.

## 31752 NAME

31753 futimens, utimensat, utimes — set file access and modification times |

## 31754 SYNOPSIS

31755 #include &lt;sys/stat.h&gt; +

31756 int futimens(int *fd*, const struct timespec *times*[2]); +31757 int utimensat(int *fd*, const char \**path*, const struct timespec *times*[2], +31758 int *flag*); +

31759 XSI #include &lt;sys/time.h&gt;

31760 int utimes(const char \**path*, const struct timeval *times*[2]); |

## 31761 DESCRIPTION

31762 The *futimens()* and *utimensat()* functions shall set the access and modification times of a file to |  
 31763 the values of the *times* argument. The *futimens()* function changes the times of the file associated |  
 31764 with the file descriptor *fd*. The *utimensat()* function changes the times of the file pointed to by |  
 31765 the *path* argument, relative to the directory associated with the file descriptor *fd*. Both functions |  
 31766 allow time specifications accurate to the nanosecond. |

31767 For *futimens()* and *utimensat()*, the *times* argument is an array of two **timespec** structures. The |  
 31768 first array member represents the date and time of last access, and the second member |  
 31769 represents the date and time of last modification. The times in the **timespec** structure are |  
 31770 measured in seconds and nanoseconds since the Epoch. The file's relevant timestamp shall be set |  
 31771 to the greatest value supported by the file system that is not greater than the specified time. |

31772 If the *tv\_nsec* field of a **timespec** structure has the special value **UTIME\_NOW**, the file's relevant |  
 31773 timestamp shall be set to the greatest value supported by the file system that is not greater than |  
 31774 the current time. If the *tv\_nsec* field has the special value **UTIME\_OMIT**, the file's relevant |  
 31775 timestamp shall not be changed. In either case, the *tv\_sec* field shall be ignored. |

31776 If the *times* argument is a null pointer, both the access and modification timestamps shall be set |  
 31777 to the greatest value supported by the file system that is not greater than the current time. If |  
 31778 *utimensat()* is passed a relative path in the *path* argument, the file to be used shall be relative to |  
 31779 the directory associated with the file descriptor *fd* instead of the current working directory. If |  
 31780 *utimensat()* is passed the special value **AT\_FDCWD** in the *fd* parameter, the current working |  
 31781 directory shall be used. |

31782 Only a process with the effective user ID equal to the user ID of the file, or with write access to |  
 31783 the file, or with appropriate privileges may use *utimensat()* with a null pointer as the *times* |  
 31784 argument or with both *tv\_nsec* fields set to the special value **UTIME\_NOW**. Only a process with |  
 31785 the effective user ID equal to the user ID of the file or with appropriate privileges may use |  
 31786 *utimensat()* with a non-null *times* argument that does not have both *tv\_nsec* fields set to |  
 31787 **UTIME\_NOW** and does not have both *tv\_nsec* fields set to **UTIME\_OMIT**. If both *tv\_nsec* fields |  
 31788 are set to **UTIME\_OMIT**, no ownership or permissions check shall be performed for the file, but |  
 31789 other error conditions may still be detected (including [EACCES] errors related to the path |  
 31790 prefix). |

31791 Values for the *flag* argument of *utimensat()* are constructed by a bitwise-inclusive OR of flags |  
 31792 from the following list, defined in <fcntl.h>: |

31793 AT\_SYMLINK\_NOFOLLOW |

31794 If *path* names a symbolic link, then the access and modification times of the symbolic link |  
 31795 are changed. |

31796 Upon completion, *futimens()* and *utimensat()* shall mark the last file status change timestamp for |

31797

update.

31798

31799

31800

31801

The *utimes()* function shall be equivalent to the *utimensat()* function with the special value *AT\_FDCWD* as the *fd* argument and the *flag* argument set to zero, except that the *times* argument is a **timeval** structure rather than a **timespec** structure, and accuracy is only to the microsecond, not nanosecond, and rounding towards the nearest second may occur.

31802

**RETURN VALUE**

31803

31804

Upon successful completion, these functions shall return 0. Otherwise, these functions shall return  $-1$  and set *errno* to indicate the error. If  $-1$  is returned, the file times shall not be affected.

31805

**ERRORS**

31806

These functions shall fail if:

31807

31808

[EACCES] The *times* argument is a null pointer and the effective user ID of the process does not match the owner of the file and write access is denied.

31809

31810

31811

[EINVAL] Either of the *times* argument structures specified a *tv\_nsec* value that was neither *UTIME\_NOW* nor *UTIME\_OMIT*, and was a value less than zero or greater than or equal to 1 000 million.

31812

31813

[EINVAL] A new file timestamp would be a value whose *tv\_sec* component is not a value supported by the file system.

31814

31815

31816

31817

31818

[EPERM] The *times* argument is not a null pointer, does not have both *tv\_nsec* fields set to *UTIME\_NOW*, does not have both *tv\_nsec* fields set to *UTIME\_OMIT*, the calling process' effective user ID has write access to the file but does not match the owner of the file, and the calling process does not have the appropriate privileges.

31819

[EROFS] The file system containing the file is read-only.

31820

The *futimens()* function shall fail if:

31821

[EBADF] The *fd* argument is not a valid file descriptor.

31822

The *utimensat()* function shall fail if:

31823

31824

[EBADF] The *path* argument does not specify an absolute path and the *fd* argument is neither *AT\_FDCWD* nor a valid file descriptor open for reading.

31825

The *utimensat()* and *utimes()* functions shall fail if:

31826

[EACCES] Search permission is denied by a component of the path prefix.

31827

31828

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

31829

31830

31831

[ENAMETOOLONG] The length of the *path* argument exceeds  $\{\text{PATH\_MAX}\}$  or a pathname component is longer than  $\{\text{NAME\_MAX}\}$ .

31832

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

31833

[ENOTDIR] A component of the path prefix is not a directory.

31834

These functions may fail if:

31835

31836

[ELOOP] More than  $\{\text{SYMLOOP\_MAX}\}$  symbolic links were encountered during resolution of the *path* argument.

31837

31838

31839

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds  $\{\text{PATH\_MAX}\}$ .

31840 The *utimensat*() function may fail if:

31841 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT\_FDCWD nor a  
31842 file descriptor associated with a directory.

#### EXAMPLES

31843 None.  
31844

#### APPLICATION USAGE

31845 None.  
31846

#### RATIONALE

31847 The purpose of the *utimensat*() function is to set the access and modification time of files in  
31848 directories other than the current working directory without exposure to race conditions. Any  
31849 part of the path of a file could be changed in parallel to a call to *utimes*(), resulting in unspecified  
31850 behavior. By opening a file descriptor for the target directory and using the *utimensat*() function  
31851 it can be guaranteed that the changed file is located relative to the desired directory.  
31852

31853 The standard developers considered including a special case for the permissions required by  
31854 *utimensat*() when one *tv\_nsec* field is *UTIME\_NOW* and the other is *UTIME\_OMIT*. One  
31855 possibility would be to include this case in with the cases where *times* is a null pointer or both  
31856 fields are *UTIME\_NOW*, where the call is allowed if the process has write permission for the file.  
31857 However, associating write permission with an update to just the last data access timestamp  
31858 (which is normally updated by *read*()) did not seem appropriate. The other possibility would be  
31859 to specify that this one case is allowed if the process has read permission, but this was felt to be  
31860 too great a departure from the *utime*() and *utimes*() functions on which *utimensat*() is based. If  
31861 an application needs to set the last data access timestamp to the current time for a file on which  
31862 it has read permission but is not the owner, it can do so by opening the file, reading one or more  
31863 bytes (or reading a directory entry, if the file is a directory), and then closing it.

#### FUTURE DIRECTIONS

31864 None.  
31865

#### CHANGE HISTORY

31869 First released in Issue 4, Version 2.  
31870

##### Issue 5

31871 Moved from X/OPEN UNIX extension to BASE.  
31872

##### Issue 6

31873 This function is marked LEGACY.  
31874

31875 The normative text is updated to avoid use of the term “must” for application requirements.

31876 The wording of the mandatory [ELOOP] error condition is updated, and a second optional  
31877 [ELOOP] error condition is added.

##### Issue 7

31878 The LEGACY marking is removed.  
31879

31880 The *utimensat*() function (renamed from *futimesat*()) is added from The Open Group Technical  
31881 Standard, 2006, Extended API Set Part 2, and changed to allow modifying a symbolic link by  
31882 adding a *flag* argument.

31883 The *futimens*() function is added.

31884 Changes are made related to support for finegrained timestamps.  
31885

31886 **NAME**31887 `fwide` — set stream orientation31888 **SYNOPSIS**31889 `#include <stdio.h>`31890 `#include <wchar.h>`31891 `int fwide(FILE *stream, int mode);`31892 **DESCRIPTION**31893 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
31894 conflict between the requirements described here and the ISO C standard is unintentional. This  
31895 volume of POSIX.1-200x defers to the ISO C standard.31896 The `fwide()` function shall determine the orientation of the stream pointed to by `stream`. If `mode` is  
31897 greater than zero, the function first attempts to make the stream wide-oriented. If `mode` is less  
31898 than zero, the function first attempts to make the stream byte-oriented. Otherwise, `mode` is zero  
31899 and the function does not alter the orientation of the stream.31900 If the orientation of the stream has already been determined, `fwide()` shall not change it.31901 CX Since no return value is reserved to indicate an error, an application wishing to check for error  
31902 situations should set `errno` to 0, then call `fwide()`, then check `errno`, and if it is non-zero, assume  
31903 an error has occurred.31904 **RETURN VALUE**31905 The `fwide()` function shall return a value greater than zero if, after the call, the stream has wide-  
31906 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no  
31907 orientation.31908 **ERRORS**31909 The `fwide()` function may fail if:31910 CX [EBADF] The `stream` argument is not a valid stream.31911 **EXAMPLES**

31912 None.

31913 **APPLICATION USAGE**31914 A call to `fwide()` with `mode` set to zero can be used to determine the current orientation of a  
31915 stream.31916 **RATIONALE**

31917 None.

31918 **FUTURE DIRECTIONS**

31919 None.

31920 **SEE ALSO**31921 XBD [<wchar.h>](#)31922 **CHANGE HISTORY**31923 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995  
31924 (E).31925 **Issue 6**

31926 Extensions beyond the ISO C standard are marked.

31927 **NAME**

31928 fwprintf, swprintf, wprintf — print formatted wide-character output

31929 **SYNOPSIS**

31930 #include &lt;stdio.h&gt;

31931 #include &lt;wchar.h&gt;

31932 int fwprintf(FILE \*restrict stream, const wchar\_t \*restrict format, ...);

31933 int swprintf(wchar\_t \*restrict ws, size\_t n,

31934 const wchar\_t \*restrict format, ...);

31935 int wprintf(const wchar\_t \*restrict format, ...);

31936 **DESCRIPTION**

31937 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 31938 conflict between the requirements described here and the ISO C standard is unintentional. This  
 31939 volume of POSIX.1-200x defers to the ISO C standard.

31940 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function  
 31941 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place  
 31942 output followed by the null wide character in consecutive wide characters starting at *\*ws*; no  
 31943 more than *n* wide characters shall be written, including a terminating null wide character, which  
 31944 is always added (unless *n* is zero).

31945 Each of these functions shall convert, format, and print its arguments under control of the *format*  
 31946 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-characters*,  
 31947 which are simply copied to the output stream, and *conversion specifications*, each of which results  
 31948 in the fetching of zero or more arguments. The results are undefined if there are insufficient  
 31949 arguments for the *format*. If the *format* is exhausted while arguments remain, the excess  
 31950 arguments are evaluated but are otherwise ignored.

31951 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than  
 31952 to the next unused argument. In this case, the conversion specifier wide character % (see below)  
 31953 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range  
 31954 [1,{NL\_ARGMAX}], giving the position of the argument in the argument list. This feature  
 31955 provides for the definition of *format* wide-character strings that select arguments in an order  
 31956 appropriate to specific languages (see the EXAMPLES section).

31957 The *format* can contain either numbered argument specifications (that is, "%n\$" and "\*m\$"), or  
 31958 unnumbered argument conversion specifications (that is, % and \*), but not both. The only  
 31959 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered  
 31960 and unnumbered argument specifications in a *format* wide-character string are undefined. When  
 31961 numbered argument specifications are used, specifying the *N*th argument requires that all the  
 31962 leading arguments, from the first to the (*N*-1)th, are specified in the *format* wide-character string.

31963 In *format* wide-character strings containing the "%n\$" form of conversion specification,  
 31964 numbered arguments in the argument list can be referenced from the *format* wide-character  
 31965 string as many times as required.

31966 In *format* wide-character strings containing the % form of conversion specification, each  
 31967 argument in the argument list shall be used exactly once.

31968 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character  
 31969 in the output string, output as a wide-character value. The radix character is defined in the  
 31970 locale of the process (category *LC\_NUMERIC*). In the POSIX locale, or in a locale where the  
 31971 radix character is not defined, the radix character shall default to a period ('.').

- 31972 CX Each conversion specification is introduced by the '`%`' wide character or by the wide-character  
31973 sequence "`%n$`", after which the following appear in sequence:
- 31974 • Zero or more *flags* (in any order), which modify the meaning of the conversion  
31975 specification.
  - 31976 • An optional minimum *field width*. If the converted value has fewer wide characters than  
31977 the field width, it shall be padded with spaces by default on the left; it shall be padded on  
31978 the right, if the left-adjustment flag ('`-`'), described below, is given to the field width. The  
31979 field width takes the form of an asterisk ('`*`'), described below, or a decimal integer.
  - 31980 • An optional *precision* that gives the minimum number of digits to appear for the `d`, `i`, `o`, `u`,  
31981 `x`, and `X` conversion specifiers; the number of digits to appear after the radix character for  
31982 the `a`, `A`, `e`, `E`, `f`, and `F` conversion specifiers; the maximum number of significant digits for  
31983 the `g` and `G` conversion specifiers; or the maximum number of wide characters to be  
31984 printed from a string in the `s` conversion specifiers. The precision takes the form of a  
31985 period ('`.`') followed either by an asterisk ('`*`'), described below, or an optional decimal  
31986 digit string, where a null digit string is treated as 0. If a precision appears with any other  
31987 conversion wide character, the behavior is undefined.
  - 31988 • An optional length modifier that specifies the size of the argument.
  - 31989 • A *conversion specifier* wide character that indicates the type of conversion to be applied.
- 31990 A field width, or precision, or both, may be indicated by an asterisk ('`*`'). In this case an  
31991 argument of type `int` supplies the field width or precision. Applications shall ensure that  
31992 arguments specifying field width, or precision, or both appear in that order before the argument,  
31993 if any, to be converted. A negative field width is taken as a '`-`' flag followed by a positive field  
31994 width. A negative precision is taken as if the precision were omitted. In *format* wide-character  
31995 strings containing the "`%n$`" form of a conversion specification, a field width or precision may  
31996 be indicated by the sequence "`*m$`", where `m` is a decimal integer in the range  
31997 `[1, {NL_ARGMAX}]` giving the position in the argument list (after the *format* argument) of an  
31998 integer argument containing the field width or precision, for example:
- ```
31999 wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```
- 32000 The flag wide characters and their meanings are:
- 32001 CX '`'` The integer portion of the result of a decimal conversion (`%i`, `%d`, `%u`, `%f`, `%F`, `%g`, or `%G`)
32002 shall be formatted with thousands' grouping wide characters. For other conversions,
32003 the behavior is undefined. The numeric grouping wide character is used.
 - 32004 `-` The result of the conversion shall be left-justified within the field. The conversion shall
32005 be right-justified if this flag is not specified.
 - 32006 `+` The result of a signed conversion shall always begin with a sign ('`+`' or '`-`'). The
32007 conversion shall begin with a sign only when a negative value is converted if this flag is
32008 not specified.
 - 32009 `<space>` If the first wide character of a signed conversion is not a sign, or if a signed conversion
32010 results in no wide characters, a `<space>` shall be prefixed to the result. This means that
32011 if the `<space>` and '`+`' flags both appear, the `<space>` flag shall be ignored.
 - 32012 `#` Specifies that the value is to be converted to an alternative form. For `o` conversion, it
32013 increases the precision (if necessary) to force the first digit of the result to be 0. For `x` or
32014 `X` conversion specifiers, a non-zero result shall have `0x` (or `0X`) prefixed to it. For `a`, `A`, `e`,
32015 `E`, `f`, `F`, `g`, and `G` conversion specifiers, the result shall always contain a radix character,
32016 even if no digits follow it. Without this flag, a radix character appears in the result of
32017 these conversions only if a digit follows it. For `g` and `G` conversion specifiers, trailing
32018 zeros shall *not* be removed from the result as they normally are. For other conversion
32019 specifiers, the behavior is undefined.

32020 0 For `d`, `i`, `o`, `u`, `x`, `X`, `a`, `A`, `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, leading zeros
 32021 (following any indication of sign or base) are used to pad to the field width; no space
 32022 padding is performed. If the `'0'` and `'-'` flags both appear, the `'0'` flag shall be
 32023 ignored. For `d`, `i`, `o`, `u`, `x`, and `X` conversion specifiers, if a precision is specified, the `'0'`
 32024 CX flag shall be ignored. If the `'0'` and `'.'` flags both appear, the grouping wide
 32025 characters are inserted before zero padding. For other conversions, the behavior is
 32026 undefined.

32027 The length modifiers and their meanings are:

32028 hh Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **signed char**
 32029 or **unsigned char** argument (the argument will have been promoted according to the
 32030 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
 32031 before printing); or that a following `n` conversion specifier applies to a pointer to a
 32032 **signed char** argument.

32033 h Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **short** or
 32034 **unsigned short** argument (the argument will have been promoted according to the
 32035 integer promotions, but its value shall be converted to **short** or **unsigned short** before
 32036 printing); or that a following `n` conversion specifier applies to a pointer to a **short**
 32037 argument.

32038 l (ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long** or
 32039 **unsigned long** argument; that a following `n` conversion specifier applies to a pointer to
 32040 a **long** argument; that a following `c` conversion specifier applies to a **wint_t** argument;
 32041 that a following `s` conversion specifier applies to a pointer to a **wchar_t** argument; or
 32042 has no effect on a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier.

32043 ll (ell-ell) Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **long long**
 32044 or **unsigned long long** argument; or that a following `n` conversion specifier applies to a
 32045 pointer to a **long long** argument.
 32046

32047 j Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to an **intmax_t**
 32048 or **uintmax_t** argument; or that a following `n` conversion specifier applies to a pointer
 32049 to an **intmax_t** argument.

32050 z Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **size_t** or the
 32051 corresponding signed integer type argument; or that a following `n` conversion specifier
 32052 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

32053 t Specifies that a following `d`, `i`, `o`, `u`, `x`, or `X` conversion specifier applies to a **ptrdiff_t** or
 32054 the corresponding **unsigned** type argument; or that a following `n` conversion specifier
 32055 applies to a pointer to a **ptrdiff_t** argument.

32056 L Specifies that a following `a`, `A`, `e`, `E`, `f`, `F`, `g`, or `G` conversion specifier applies to a **long**
 32057 **double** argument.

32058 If a length modifier appears with any conversion specifier other than as specified above, the
 32059 behavior is undefined.

32060 The conversion specifiers and their meanings are:

32061 `d`, `i` The **int** argument shall be converted to a signed decimal in the style "`[-]dddd`". The
 32062 precision specifies the minimum number of digits to appear; if the value being
 32063 converted can be represented in fewer digits, it shall be expanded with leading zeros.
 32064 The default precision shall be 1. The result of converting zero with an explicit precision
 32065 of zero shall be no wide characters.

- 32066 o The **unsigned** argument shall be converted to unsigned octal format in the style
32067 "dddd". The precision specifies the minimum number of digits to appear; if the value
32068 being converted can be represented in fewer digits, it shall be expanded with leading
32069 zeros. The default precision shall be 1. The result of converting zero with an explicit
32070 precision of zero shall be no wide characters.
- 32071 u The **unsigned** argument shall be converted to unsigned decimal format in the style
32072 "dddd". The precision specifies the minimum number of digits to appear; if the value
32073 being converted can be represented in fewer digits, it shall be expanded with leading
32074 zeros. The default precision shall be 1. The result of converting zero with an explicit
32075 precision of zero shall be no wide characters.
- 32076 x The **unsigned** argument shall be converted to unsigned hexadecimal format in the style
32077 "dddd"; the letters "abcdef" are used. The precision specifies the minimum number
32078 of digits to appear; if the value being converted can be represented in fewer digits, it
32079 shall be expanded with leading zeros. The default precision shall be 1. The result of
32080 converting zero with an explicit precision of zero shall be no wide characters.
- 32081 X Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead
32082 of "abcdef".
- 32083 f, F The **double** argument shall be converted to decimal notation in the style
32084 "[-]ddd.d_{ddd}", where the number of digits after the radix character shall be equal to
32085 the precision specification. If the precision is missing, it shall be taken as 6; if the
32086 precision is explicitly zero and no '#' flag is present, no radix character shall appear. If
32087 a radix character appears, at least one digit shall appear before it. The value shall be
32088 rounded in an implementation-defined manner to the appropriate number of digits.
- 32089 A **double** argument representing an infinity shall be converted in one of the styles
32090 "[-]inf" or "[-]infinity"; which style is implementation-defined. A **double**
32091 argument representing a NaN shall be converted in one of the styles "[-]nan" or
32092 "[-]nan(*n-char-sequence*)"; which style, and the meaning of any *n-char-sequence*,
32093 is implementation-defined. The F conversion specifier produces "INF", "INFINITY",
32094 or "NAN" instead of "inf", "infinity", or "nan", respectively.
- 32095 e, E The **double** argument shall be converted in the style "[-]d.ddde±dd", where there
32096 shall be one digit before the radix character (which is non-zero if the argument is non-
32097 zero) and the number of digits after it shall be equal to the precision; if the precision is
32098 missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no
32099 radix character shall appear. The value shall be rounded in an implementation-defined
32100 manner to the appropriate number of digits. The E conversion wide character shall
32101 produce a number with 'E' instead of 'e' introducing the exponent. The exponent
32102 shall always contain at least two digits. If the value is zero, the exponent shall be zero.
- 32103 A **double** argument representing an infinity or NaN shall be converted in the style of
32104 an f or F conversion specifier.
- 32105 g, G The **double** argument representing a floating-point number shall be converted in the |
32106 style f or e (or in the style F or E in the case of a G conversion specifier), depending on |
32107 the value converted and the precision. Let P equal the precision if non-zero, 6 if the |
32108 precision is omitted, or 1 if the precision is zero. Then, if a conversion with style E |
32109 would have an exponent of X: |
- 32110 — If $P > X \geq -4$, the conversion shall be with style f (or F) and precision $P - (X + 1)$. |
32111 — Otherwise, the conversion shall be with style e (or E) and precision $P - 1$. |
- 32112 Finally, unless the '#' flag is used, any trailing zeros shall be removed from the |
32113 fractional portion of the result and the decimal-point character shall be removed if there |
32114 is no fractional portion remaining. |

32115			A double argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
32116			
32117	a, A		A double argument representing a floating-point number shall be converted in the style " <code>[-]0xh.hhhhp±d</code> ", where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be sufficient to distinguish values of type double , except that trailing zeros may be omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point wide character shall appear. The letters "abcdef" are used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with <code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.
32118			
32119			
32120			
32121			
32122			
32123			
32124			
32125			
32126			
32127			
32128			
32129			
32130			
32131			A double argument representing an infinity or NaN shall be converted in the style of an <code>f</code> or <code>F</code> conversion specifier.
32132			
32133	c		If no <code>l</code> (ell) qualifier is present, the int argument shall be converted to a wide character as if by calling the <code>btowc()</code> function and the resulting wide character shall be written. Otherwise, the wint_t argument shall be converted to wchar_t , and written.
32134			
32135			
32136	s		If no <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <code>mbrtowc()</code> function, with the conversion state described by an mbstate_t object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.
32137			
32138			
32139			
32140			
32141			
32142			
32143			
32144			
32145			If an <code>l</code> (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type wchar_t . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.
32146			
32147			
32148			
32149			
32150			
32151	p		The application shall ensure that the argument is a pointer to void . The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.
32152			
32153			
32154	n		The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the <code>fwprintf()</code> functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.
32155			
32156			
32157			
32158			
32159	XSI	C	Equivalent to <code>lc</code> .
32160	XSI	S	Equivalent to <code>ls</code> .
32161		%	Output a <code>'%'</code> wide character; no argument shall be converted. The entire conversion specification shall be <code>%%</code> .
32162			
32163			If a conversion specification does not match one of the above forms, the behavior is undefined.

32164 In no case does a nonexistent or small field width cause truncation of a field; if the result of a
 32165 conversion is wider than the field width, the field shall be expanded to contain the conversion
 32166 result. Characters generated by *fwprintf()* and *wprintf()* shall be printed as if *fputwc()* had been
 32167 called.

32168 For a and A conversions, if FLT_RADIX is not a power of 2 and the result is not exactly
 32169 representable in the given precision, the result should be one of the two adjacent numbers in
 32170 hexadecimal floating style with the given precision, with the extra stipulation that the error
 32171 should have a correct sign for the current rounding direction.

32172 For e, E, f, F, g, and G conversion specifiers, if the number of significant decimal digits is at
 32173 most DECIMAL_DIG, then the result should be correctly rounded. If the number of significant
 32174 decimal digits is more than DECIMAL_DIG but the source value is exactly representable with
 32175 DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.
 32176 Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
 32177 DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L \leq$
 32178 $D \leq U$, with the extra stipulation that the error should have a correct sign for the current
 32179 rounding direction.

32180 CX The last data modification and last file status change timestamps of the file shall be marked for
 32181 update between the call to a successful execution of *fwprintf()* or *wprintf()* and the next
 32182 successful completion of a call to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or
 32183 *abort()*.

32184 RETURN VALUE

32185 Upon successful completion, these functions shall return the number of wide characters
 32186 transmitted, excluding the terminating null wide character in the case of *swprintf()*, or a negative
 32187 value if an output error was encountered, and set *errno* to indicate the error.

32188 If n or more wide characters were requested to be written, *swprintf()* shall return a negative
 32189 value, and set *errno* to indicate the error.

32190 ERRORS

32191 For the conditions under which *fwprintf()* and *wprintf()* fail and may fail, refer to *fputwc()*.

32192 In addition, all forms of *fwprintf()* may fail if:

32193 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been
 32194 detected.

32195 CX [EINVAL] There are insufficient arguments.

32196 In addition, *fwprintf()* and *wprintf()* may fail if:

32197 CX [ENOMEM] Insufficient storage space is available.

32198 The *swprintf()* shall fail if:

32199 CX [EOVERFLOW] The value of n is greater than {INT_MAX} or the number of bytes needed to
 32200 hold the output excluding the terminating null is greater than {INT_MAX}.

32201 EXAMPLES

32202 To print the language-independent date and time format, the following statement could be used:

32203 `wprintf(format, weekday, month, day, hour, min);`

32204 For American usage, *format* could be a pointer to the wide-character string:

32205 `L"%s, %s %d, %d:%.2d\n"`

32206 producing the message:

32207 Sunday, July 3, 10:02

32208 whereas for German usage, *format* could be a pointer to the wide-character string:

32209 L"%1\$s, %3\$d. %2\$s, %4\$d:%5\$.2d\n"

32210 producing the message:

32211 Sonntag, 3. Juli, 10:02

32212 APPLICATION USAGE

32213 None.

32214 RATIONALE

32215 None.

32216 FUTURE DIRECTIONS

32217 None.

32221 CHANGE HISTORY

32222 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
32223 (E).

32224 Issue 6

32225 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing
32226 the case if *n* or more wide characters are requested to be written using *swprintf()*.

32227 The normative text is updated to avoid use of the term “must” for application requirements.

32228 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 32229 • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 32230 • The DESCRIPTION is updated.
- 32231 • The *hh*, *ll*, *j*, *t*, and *z* length modifiers are added.
- 32232 • The *a*, *A*, and *F* conversion characters are added.
- 32233 • XSI shading is removed from the description of character string representations of infinity
32234 and NaN floating-point values.

32235 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
32236 specification” consistently.

32237 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

32238 Issue 7

32239 Functionality relating to the “%n\$” form of conversion specification and the ‘ ’ (apostrophe)
32240 flag is moved from the XSI option to the Base.

32241 The [Eoverflow] error is added for *swprintf()*.

32242 Changes are made related to support for finegrained timestamps. +

32243 ISO C TC2 #68 is applied.

32244 **NAME**

32245 fwrite — binary output

32246 **SYNOPSIS**

32247 #include <stdio.h>

32248 size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
32249 FILE *restrict stream);32250 **DESCRIPTION**32251 CX The functionality described on this reference page is aligned with the ISO C standard. Any
32252 conflict between the requirements described here and the ISO C standard is unintentional. This
32253 volume of POSIX.1-200x defers to the ISO C standard.32254 The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose
32255 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be
32256 made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly
32257 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by
32258 the number of bytes successfully written. If an error occurs, the resulting value of the file-
32259 position indicator for the stream is unspecified.32260 CX The last data modification and last file status change timestamps of the file shall be marked for
32261 update between the successful execution of *fwrite()* and the next successful completion of a call
32262 to *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.32263 **RETURN VALUE**32264 The *fwrite()* function shall return the number of elements successfully written, which may be
32265 less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the
32266 state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for
32267 CX the stream shall be set, and *errno* shall be set to indicate the error.32268 **ERRORS**32269 Refer to *fputc()*.32270 **EXAMPLES**

32271 None.

32272 **APPLICATION USAGE**32273 Because of possible differences in element length and byte ordering, files written using *fwrite()*
32274 are application-dependent, and possibly cannot be read using *fread()* by a different application
32275 or by the same application on a different processor.32276 **RATIONALE**

32277 None.

32278 **FUTURE DIRECTIONS**

32279 None.

32282 XBD <stdio.h>

32283 **CHANGE HISTORY**

32284 First released in Issue 1. Derived from Issue 1 of the SVID.

- 32285 **Issue 6**
- 32286 Extensions beyond the ISO C standard are marked.
- 32287 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 32288 • The *fwrite()* prototype is updated.
 - 32289 • The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.
- 32290 **Issue 7**
- 32291 Changes are made related to support for finegrained timestamps. +

32292 NAME

32293 fwscanf, swscanf, wscanf — convert formatted wide-character input

32294 SYNOPSIS

32295 #include <stdio.h>

32296 #include <wchar.h>

32297 int fwscanf(FILE *restrict stream, const wchar_t *restrict format, ...); |

32298 int swscanf(const wchar_t *restrict ws, |

32299 const wchar_t *restrict format, ...); |

32300 int wscanf(const wchar_t *restrict format, ...); |

32301 DESCRIPTION

32302 CX The functionality described on this reference page is aligned with the ISO C standard. Any
32303 conflict between the requirements described here and the ISO C standard is unintentional. This
32304 volume of POSIX.1-200x defers to the ISO C standard.32305 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read
32306 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character
32307 string *ws*. Each function reads wide characters, interprets them according to a format, and stores
32308 the results in its arguments. Each expects, as arguments, a control wide-character string *format*
32309 described below, and a set of *pointer* arguments indicating where the converted input should be
32310 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is
32311 exhausted while arguments remain, the excess arguments are evaluated but are otherwise
32312 ignored.32313 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
32314 to the next unused argument. In this case, the conversion specifier wide character % (see below)
32315 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range
32316 [1,{NL_ARGMAX}]. This feature provides for the definition of *format* wide-character strings that
32317 select arguments in an order appropriate to specific languages. In *format* wide-character strings
32318 containing the "%n\$" form of conversion specifications, it is unspecified whether numbered
32319 arguments in the argument list can be referenced from the *format* wide-character string more
32320 than once.32321 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the
32322 two forms cannot normally be mixed within a single *format* wide-character string. The only
32323 exception to this is that %% or %* can be mixed with the "%n\$" form. When numbered argument
32324 specifications are used, specifying the *N*th argument requires that all the leading arguments,
32325 from the first to the (*N*−1)th, are pointers.32326 The *fwscanf()* function in all its forms allows for detection of a language-dependent radix
32327 character in the input string, encoded as a wide-character value. The radix character is defined
32328 in the locale of the process (category *LC_NUMERIC*). In the POSIX locale, or in a locale where
32329 the radix character is not defined, the radix character shall default to a period (' . ').32330 The *format* is a wide-character string composed of zero or more directives. Each directive is
32331 composed of one of the following: one or more white-space wide characters (<space>s, <tab>s,
32332 <newline>s, <vertical-tab>s, or <form-feed>s); an ordinary wide character (neither ' % ' nor a
32333 white-space character); or a conversion specification.32334 CX Each conversion specification is introduced by the ' % ' or by the character sequence "%n\$",
32335 after which the following appear in sequence:

- 32336
- An optional assignment-suppressing character ' * '.

32337		<ul style="list-style-type: none"> • An optional non-zero decimal integer that specifies the maximum field width. 	
32338	CX	<ul style="list-style-type: none"> • An optional assignment-allocation character 'm'. 	+
32339		<ul style="list-style-type: none"> • An optional length modifier that specifies the size of the receiving object. 	
32340		<ul style="list-style-type: none"> • A conversion specifier wide character that specifies the type of conversion to be applied. 	
32341		The valid conversion specifiers are described below.	
32342		The <i>fwscanf()</i> functions shall execute each directive of the format in turn. If a directive fails, as	
32343		detailed below, the function shall return. Failures are described as input failures (due to the	
32344		unavailability of input bytes) or matching failures (due to inappropriate input).	
32345		A directive composed of one or more white-space wide characters is executed by reading input	
32346		until no more valid input can be read, or up to the first wide character which is not a white-	
32347		space wide character, which remains unread.	
32348		A directive that is an ordinary wide character shall be executed as follows. The next wide	
32349		character is read from the input and compared with the wide character that comprises the	
32350		directive; if the comparison shows that they are not equivalent, the directive shall fail, and the	
32351		differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding	
32352		error, or a read error prevents a wide character from being read, the directive shall fail.	
32353		A directive that is a conversion specification defines a set of matching input sequences, as	
32354		described below for each conversion wide character. A conversion specification is executed in	
32355		the following steps.	
32356		Input white-space wide characters (as specified by <i>isspace()</i>) shall be skipped, unless the	
32357		conversion specification includes a <i>l</i> , <i>c</i> , or <i>n</i> conversion specifier.	
32358		An item shall be read from the input, unless the conversion specification includes an <i>n</i>	
32359		conversion specifier wide character. An input item is defined as the longest sequence of input	
32360		wide characters, not exceeding any specified field width, which is an initial subsequence of a	
32361		matching sequence. The first wide character, if any, after the input item shall remain unread. If	
32362		the length of the input item is zero, the execution of the conversion specification shall fail; this	
32363		condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented	
32364		input from the stream, in which case it is an input failure.	
32365		Except in the case of a <i>%</i> conversion specifier, the input item (or, in the case of a <i>%n</i> conversion	
32366		specification, the count of input wide characters) shall be converted to a type appropriate to the	
32367		conversion wide character. If the input item is not a matching sequence, the execution of the	
32368		conversion specification shall fail; this condition is a matching failure. Unless assignment	
32369		suppression was indicated by a <i>'*'</i> , the result of the conversion shall be placed in the object	
32370		pointed to by the first argument following the <i>format</i> argument that has not already received a	
32371	CX	conversion result if the conversion specification is introduced by <i>%</i> , or in the <i>n</i> th argument if	
32372		introduced by the wide-character sequence " <i>%n\$</i> ". If this object does not have an appropriate	
32373		type, or if the result of the conversion cannot be represented in the space provided, the behavior	
32374		is undefined.	
32375	CX	The <i>%s</i> , <i>%S</i> , and <i>%[</i> conversion specifiers shall accept an optional assignment-allocation	+
32376		character 'm', which shall cause a memory buffer to be allocated to hold the wide-character	+
32377		string converted including a terminating null wide character. In such a case, the argument	+
32378		corresponding to the conversion specifier should be a reference to a pointer value that will	+
32379		receive a pointer to the allocated buffer. The system shall allocate a buffer as if <i>malloc()</i> had been	+
32380		called. The application shall be responsible for freeing the memory after usage. If there is	+
32381		insufficient memory to allocate a buffer, the function shall set <i>errno</i> to [ENOMEM] and a	+
32382		conversion error shall result. In that case, any memory successfully allocated for other	+
32383		parameters using assignment-allocation character 'm' by this call shall be freed.	+
32384		The length modifiers and their meanings are:	

32385	hh	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to signed char or unsigned char .
32386		
32387	h	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to short or unsigned short .
32388		
32389	l (ell)	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to long or unsigned long ; that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to double ; or that a following c, s, or [conversion specifier applies to an argument with type pointer to wchar_t . If the 'm' assignment-allocation character is specified, the conversion applies to an argument with the type pointer to a pointer to wchar_t .
32390		
32391		
32392		
32393	CX	
32394		
32395	ll (ell-ell)	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to long long or unsigned long long .
32396		
32397		
32398	j	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to intmax_t or uintmax_t .
32399		
32400	z	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to size_t or the corresponding signed integer type.
32401		
32402	t	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to ptrdiff_t or the corresponding unsigned type.
32403		
32404	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to long double .
32405		
32406		If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.
32407		
32408		The following conversion specifier wide characters are valid:
32409	d	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>wcstol()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
32410		
32411		
32412		
32413	i	Matches an optionally signed integer, whose format is the same as expected for the subject sequence of <i>wcstol()</i> with 0 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
32414		
32415		
32416		
32417	o	Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 8 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
32418		
32419		
32420		
32421	u	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
32422		
32423		
32424		
32425	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
32426		
32427		
32428		
32429	a, e, f, g	Matches an optionally signed floating-point number, infinity, or NaN whose format is the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size
32430		
32431		

32432		modifier, the application shall ensure that the corresponding argument is a pointer to
32433		float .
32434		If the <i>fwprintf()</i> family of functions generates character string representations for
32435		infinity and NaN (a symbolic entity encoded in floating-point format) to support
32436		IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.
32437	s	Matches a sequence of non-white-space wide characters. If no 1 (ell) qualifier is present,
32438		characters from the input field shall be converted as if by repeated calls to the
32439		<i>wcrtomb()</i> function, with the conversion state described by an mbstate_t object
32440		initialized to zero before the first wide character is converted. If the 'm' assignment-
32441		allocation character is not specified, the application shall ensure that the corresponding
32442		argument is a pointer to a character array large enough to accept the sequence and the
32443	CX	terminating null character, which shall be added automatically. Otherwise, the
32444		application shall ensure that the corresponding argument is a pointer to a pointer to a
32445		wchar_t .
32446		If the 1 (ell) qualifier is present and the 'm' assignment-allocation character is not
32447		specified, the application shall ensure that the corresponding argument is a pointer to
32448		an array of wchar_t large enough to accept the sequence and the terminating null wide
32449	CX	character, which shall be added automatically. If the 1 (ell) qualifier is present and the
32450		'm' assignment-allocation character is present, the application shall ensure that the
32451		corresponding argument is a pointer to a pointer to a wchar_t .
32452	[Matches a non-empty sequence of wide characters from a set of expected wide
32453		characters (the <i>scanset</i>). If no 1 (ell) qualifier is present, wide characters from the input
32454		field shall be converted as if by repeated calls to the <i>wcrtomb()</i> function, with the
32455		conversion state described by an mbstate_t object initialized to zero before the first
32456		wide character is converted. If the 'm' assignment-allocation character is not specified,
32457		the application shall ensure that the corresponding argument is a pointer to a character
32458		array large enough to accept the sequence and the terminating null character, which
32459	CX	shall be added automatically. Otherwise, the application shall ensure that the
32460		corresponding argument is a pointer to a pointer to a wchar_t .
32461		If an 1 (ell) qualifier is present and the 'm' assignment-allocation character is not
32462		specified, the application shall ensure that the corresponding argument is a pointer to
32463		an array of wchar_t large enough to accept the sequence and the terminating null wide
32464	CX	character. If an 1 (ell) qualifier is present and the 'm' assignment-allocation character
32465		is specified, the application shall ensure that the corresponding argument is a pointer to
32466		a pointer to a wchar_t .
32467		The conversion specification includes all subsequent wide characters in the <i>format</i>
32468		string up to and including the matching right square bracket (']'). The wide
32469		characters between the square brackets (the <i>scanlist</i>) comprise the scanset, unless the
32470		wide character after the left square bracket is a circumflex ('^'), in which case the
32471		scanset contains all wide characters that do not appear in the scanlist between the
32472		circumflex and the right square bracket. If the conversion specification begins with
32473		"[]" or "[^]", the right square bracket is included in the scanlist and the next right
32474		square bracket is the matching right square bracket that ends the conversion
32475		specification; otherwise, the first right square bracket is the one that ends the
32476		conversion specification. If a '-' is in the scanlist and is not the first wide character,
32477		nor the second where the first wide character is a '^', nor the last wide character, the
32478		behavior is implementation-defined.
32479	c	Matches a sequence of wide characters of exactly the number specified by the field
32480		width (1 if no field width is present in the conversion specification).
32481		If no 1 (ell) length modifier is present, characters from the input field shall be converted

32482			as if by repeated calls to the <i>wcrtomb()</i> function, with the conversion state described by
32483			an mbstate_t object initialized to zero before the first wide character is converted. The
32484			corresponding argument shall be a pointer to the initial element of a character array
32485			large enough to accept the sequence. No null character is added.
32486			No null wide character is added. If an l (ell) length modifier is present and the 'm'
32487			assignment-allocation character is not specified, the application shall ensure that the
32488			corresponding argument shall be a pointer to the initial element of an array of wchar_t
32489	CX		large enough to accept the sequence. If an l (ell) qualifier is present and the 'm'
32490			assignment-allocation character is specified, the application shall ensure that the
32491			corresponding argument is a pointer to a pointer to a wchar_t .
32492		p	Matches an implementation-defined set of sequences, which shall be the same as the set
32493			of sequences that is produced by the %p conversion specification of the corresponding
32494			<i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a
32495			pointer to a pointer to void . The interpretation of the input item is implementation-
32496			defined. If the input item is a value converted earlier during the same program
32497			execution, the pointer that results shall compare equal to that value; otherwise, the
32498			behavior of the %p conversion is undefined.
32499		n	No input is consumed. The application shall ensure that the corresponding argument is
32500			a pointer to the integer into which is to be written the number of wide characters read
32501			from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n
32502			conversion specification shall not increment the assignment count returned at the
32503			completion of execution of the function. No argument shall be converted, but one shall
32504			be consumed. If the conversion specification includes an assignment-suppressing wide
32505			character or a field width, the behavior is undefined.
32506	XSI	C	Equivalent to lc .
32507	XSI	S	Equivalent to ls .
32508		%	Matches a single '%' wide character; no conversion or assignment shall occur. The
32509			complete conversion specification shall be %% .
32510			If a conversion specification is invalid, the behavior is undefined.
32511			The conversion specifiers A , E , F , G , and X are also valid and shall be equivalent to, respectively,
32512			a , e , f , g , and x .
32513			If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before
32514			any wide characters matching the current conversion specification (except for %n) have been
32515			read (other than leading white-space, where permitted), execution of the current conversion
32516			specification shall terminate with an input failure. Otherwise, unless execution of the current
32517			conversion specification is terminated with a matching failure, execution of the following
32518			conversion specification (if any) shall be terminated with an input failure.
32519			Reaching the end of the string in <i>swscanf()</i> shall be equivalent to encountering end-of-file for
32520			<i>fwscanf()</i> .
32521			If conversion terminates on a conflicting input, the offending input shall be left unread in the
32522			input. Any trailing white space (including <newline>) shall be left unread unless matched by a
32523			conversion specification. The success of literal matches and suppressed assignments is only
32524			directly determinable via the %n conversion specification.
32525	CX		The <i>fwscanf()</i> and <i>wscanf()</i> functions may mark the last data access timestamp of the file
32526			associated with <i>stream</i> for update. The last data access timestamp shall be marked for update by
32527			the first successful execution of <i>fgetc()</i> , <i>fgetwc()</i> , <i>fgets()</i> , <i>fgetws()</i> , <i>fread()</i> , <i>getc()</i> , <i>getwc()</i> ,
32528			<i>getchar()</i> , <i>getwchar()</i> , <i>gets()</i> , <i>fscanf()</i> , or <i>fwscanf()</i> using <i>stream</i> that returns data not supplied by a
32529			prior call to <i>ungetc()</i> .

fwscanf()*System Interfaces*32530 **RETURN VALUE**

32531 Upon successful completion, these functions shall return the number of successfully matched
 32532 and assigned input items; this number can be zero in the event of an early matching failure. If
 32533 the input ends before the first matching failure or conversion, EOF shall be returned. If a read
 32534 error occurs, the error indicator for the stream is set, EOF shall be returned, and *errno* shall be
 32535 set to indicate the error.

32536 **ERRORS**

32537 For the conditions under which the *fwscanf()* functions shall fail and may fail, refer to *fgetwc()*.

32538 In addition, the *fwscanf()* functions shall fail if:

32539 [ENOMEM] Insufficient storage space is available.

32540 The *fwscanf()* functions may fail if:

32541 CX [EILSEQ] Input byte sequence does not form a valid character.

32542 CX [EINVAL] There are insufficient arguments.

32543 **EXAMPLES**

32544 The call:

```
32545 int i, n; float x; char name[50];
32546 n = wscanf(L"%d%f%s", &i, &x, name);
```

32547 with the input line:

```
32548 25 54.32E-1 Hamster
```

32549 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
 32550 "Hamster".

32551 The call:

```
32552 int i; float x; char name[50];
32553 (void) wscanf(L"%2d%f*d %[0123456789]", &i, &x, name);
```

32554 with input:

```
32555 56789 0123 56a72
```

32556 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to
 32557 *getchar()* shall return the character 'a'.

32558 **APPLICATION USAGE**

32559 In format strings containing the '%' form of conversion specifications, each argument in the
 32560 argument list is used exactly once.

32561 **RATIONALE**

32562 None.

32563 **FUTURE DIRECTIONS**

32564 None.

32568 **CHANGE HISTORY**

32569 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 32570 (E).

32571

Issue 6

32572

The normative text is updated to avoid use of the term “must” for application requirements.

32573

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

32574

- The prototypes for *fwscanf()* and *swscanf()* are updated.

32575

- The DESCRIPTION is updated.

32576

- The hh, ll, j, t, and z length modifiers are added.

32577

- The a, A, and F conversion characters are added.

32578

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” consistently.

32579

32580

Issue 7

32581

SD5-XSH-ERN-132 is applied, adding the assignment-allocation character ‘m’.

+

32582

Functionality relating to the “%n\$” form of conversion specification is moved from the XSI option to the Base.

32583

32584

Changes are made related to support for finegrained timestamps.

+

32585 **NAME**32586 `gai_strerror` — address and name information error description32587 **SYNOPSIS**32588 `#include <netdb.h>`32589 `const char *gai_strerror(int ecode);`32590 **DESCRIPTION**32591 The `gai_strerror()` function shall return a text string describing an error value for the `getaddrinfo()`
32592 and `getnameinfo()` functions listed in the `<netdb.h>` header.32593 When the `ecode` argument is one of the following values listed in the `<netdb.h>` header:

32594	[EAI_AGAIN]	[EAI_NONAME]
32595	[EAI_BADFLAGS]	[EAI_OVERFLOW]
32596	[EAI_FAIL]	[EAI_SERVICE]
32597	[EAI_FAMILY]	[EAI_SOCKTYPE]
32598	[EAI_MEMORY]	[EAI_SYSTEM]

32599 the function return value shall point to a string describing the error. If the argument is not one
32600 of those values, the function shall return a pointer to a string whose contents indicate an
32601 unknown error.32602 **RETURN VALUE**32603 Upon successful completion, `gai_strerror()` shall return a pointer to an implementation-defined
32604 string.32605 **ERRORS**

32606 No errors are defined.

32619 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

32620 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from
32621 `char *` to `const char *`. This is for coordination with the IPnG Working Group.32622 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the
32623 [EAI_OVERFLOW] error code.

32624 **NAME**
32625 getaddrinfo — get address information

32626 **SYNOPSIS**

```
32627       #include <sys/socket.h>  
32628       #include <netdb.h>  
  
32629       int getaddrinfo(const char *restrict nodename,  
32630                      const char *restrict servname,  
32631                      const struct addrinfo *restrict hints,  
32632                      struct addrinfo **restrict res);
```

32633 **DESCRIPTION**

32634 Refer to *freeaddrinfo()*.

32635 **NAME**

32636 getc — get a byte from a stream

32637 **SYNOPSIS**

32638 #include <stdio.h>

32639 int getc(FILE *stream);

32640 **DESCRIPTION**32641 CX The functionality described on this reference page is aligned with the ISO C standard. Any
32642 conflict between the requirements described here and the ISO C standard is unintentional. This
32643 volume of POSIX.1-200x defers to the ISO C standard.32644 The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it
32645 may evaluate *stream* more than once, so the argument should never be an expression with side
32646 effects.32647 **RETURN VALUE**32648 Refer to *fgetc()*.32649 **ERRORS**32650 Refer to *fgetc()*.32651 **EXAMPLES**

32652 None.

32653 **APPLICATION USAGE**32654 If the integer value returned by *getc()* is stored into a variable of type **char** and then compared
32655 against the integer constant EOF, the comparison may never succeed, because sign-extension of
32656 a variable of type **char** on widening to integer is implementation-defined.32657 Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with
32658 side effects. In particular, *getc(*f++)* does not necessarily work as expected. Therefore, use of this
32659 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.32660 **RATIONALE**

32661 None.

32662 **FUTURE DIRECTIONS**

32663 None.

32664 **SEE ALSO**32665 *fgetc()*

32666 XBD <stdio.h>

32667 **CHANGE HISTORY**

32668 First released in Issue 1. Derived from Issue 1 of the SVID.

32669 **NAME**

32670 getc_unlocked, getchar_unlocked, putc_unlocked, putchar_unlocked — stdio with explicit client
32671 locking

32672 **SYNOPSIS**

```
32673 CX      #include <stdio.h>
32674
32675      int getc_unlocked(FILE *stream);
32676      int getchar_unlocked(void);
32677      int putc_unlocked(int c, FILE *stream);
32678      int putchar_unlocked(int c);
```

32678 **DESCRIPTION**

32679 Versions of the functions *getc()*, *getchar()*, *putc()*, and *putchar()* respectively named
32680 *getc_unlocked()*, *getchar_unlocked()*, *putc_unlocked()*, and *putchar_unlocked()* shall be provided
32681 which are functionally equivalent to the original versions, with the exception that they are not
32682 required to be implemented in a thread-safe manner. They may only safely be used within a
32683 scope protected by *flockfile()* (or *ftrylockfile()*) and *funlockfile()*. These functions may safely be
32684 used in a multi-threaded program if and only if they are called while the invoking thread owns
32685 the (FILE *) object, as is the case after a successful call to the *flockfile()* or *ftrylockfile()* functions.

32686 **RETURN VALUE**

32687 See *getc()*, *getchar()*, *putc()*, and *putchar()*.

32688 **ERRORS**

32689 See *getc()*, *getchar()*, *putc()*, and *putchar()*.

32690 **EXAMPLES**

32691 None.

32692 **APPLICATION USAGE**

32693 Since they may be implemented as macros, *getc_unlocked()* and *putc_unlocked()* may treat
32694 incorrectly a *stream* argument with side effects. In particular, *getc_unlocked>(*f++)* and
32695 *putc_unlocked(*f++)* do not necessarily work as expected. Therefore, use of these functions in
32696 such situations should be preceded by the following statement as appropriate:

```
32697      #undef getc_unlocked
32698      #undef putc_unlocked
```

32699 **RATIONALE**

32700 Some I/O functions are typically implemented as macros for performance reasons (for example,
32701 *putc()* and *getc()*). For safety, they need to be synchronized, but it is often too expensive to
32702 synchronize on every character. Nevertheless, it was felt that the safety concerns were more
32703 important; consequently, the *getc()*, *getchar()*, *putc()*, and *putchar()* functions are required to be
32704 thread-safe. However, unlocked versions are also provided with names that clearly indicate the
32705 unsafe nature of their operation but can be used to exploit their higher performance. These
32706 unlocked versions can be safely used only within explicitly locked program regions, using
32707 exported locking primitives. In particular, a sequence such as:

```
32708      flockfile(fileptr);
32709      putc_unlocked('1', fileptr);
32710      putc_unlocked('\n', fileptr);
32711      fprintf(fileptr, "Line 2\n");
32712      funlockfile(fileptr);
```

32713 is permissible, and results in the text sequence:

32714 1
32715 Line 2

32716 being printed without being interspersed with output from other threads.

32717 It would be wrong to have the standard names such as *getc()*, *putc()*, and so on, map to the
32718 “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still
32719 want to inspect all uses of *getc()*, *putc()*, and so on, by hand when converting existing code.
32720 Choosing the safe bindings as the default, at least, results in correct code and maintains the
32721 “atomicity at the function” invariant. To do otherwise would introduce gratuitous
32722 synchronization errors into converted code. Other routines that modify the *stdio* (**FILE ***)
32723 structures or buffers are also safely synchronized.

32724 Note that there is no need for functions of the form *getc_locked()*, *putc_locked()*, and so on, since
32725 this is the functionality of *getc()*, *putc()*, *et al.* It would be inappropriate to use a feature test
32726 macro to switch a macro definition of *getc()* between *getc_locked()* and *getc_unlocked()*, since the
32727 ISO C standard requires an actual function to exist, a function whose behavior could not be
32728 changed by the feature test macro. Also, providing both the *xxx_locked()* and *xxx_unlocked()*
32729 forms leads to the confusion of whether the suffix describes the behavior of the function or the
32730 circumstances under which it should be used.

32731 Three additional routines, *flockfile()*, *ftrylockfile()*, and *funlockfile()* (which may be macros), are
32732 provided to allow the user to delineate a sequence of I/O statements that are executed
32733 synchronously.

32734 The *ungetc()* function is infrequently called relative to the other functions/macros so no
32735 unlocked variation is needed.

32736 FUTURE DIRECTIONS

32737 None.

32778 **CHANGE HISTORY**

32779 First released in Issue 1. Derived from Issue 1 of the SVID.

getchar_unlocked()*System Interfaces*

32780 **NAME**
32781 getchar_unlocked — stdio with explicit client locking

32782 **SYNOPSIS**

32783 CX #include <stdio.h>
32784 int getchar_unlocked(void);

32785 **DESCRIPTION**

32786 Refer to *getc_unlocked()*.

32787 **NAME**

32788 getcwd — get the pathname of the current working directory

32789 **SYNOPSIS**

32790 #include <unistd.h>

32791 char *getcwd(char *buf, size_t size);

32792 **DESCRIPTION**

32793 The *getcwd()* function shall place an absolute pathname of the current working directory in the
 32794 array pointed to by *buf*, and return *buf*. The pathname copied to the array shall contain no
 32795 components that are symbolic links. The *size* argument is the size in bytes of the character array
 32796 pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd()* is unspecified.

32797 **RETURN VALUE**

32798 Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall
 32799 return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by
 32800 *buf* are then undefined.

32801 **ERRORS**32802 The *getcwd()* function shall fail if:32803 [EINVAL] The *size* argument is 0.32804 [ERANGE] The *size* argument is greater than 0, but is smaller than the length of the
32805 pathname +1.32806 The *getcwd()* function may fail if:

32807 [EACCES] Read or search permission was denied for a component of the pathname.

32808 [ENOMEM] Insufficient storage space is available.

32809 **EXAMPLES**32810 **Determining the Absolute Pathname of the Current Working Directory**

32811 The following example returns a pointer to an array that holds the absolute pathname of the
 32812 current working directory. The pointer is returned in the *ptr* variable, which points to the *buf*
 32813 array where the pathname is stored.

```
32814       #include <stdlib.h>
32815       #include <unistd.h>
32816       ...
32817       long size;
32818       char *buf;
32819       char *ptr;

32820       size = pathconf(".", _PC_PATH_MAX);
32821       if ((buf = (char *)malloc((size_t)size)) != NULL)
32822           ptr = getcwd(buf, (size_t)size);
32823       ...
```

32824 **APPLICATION USAGE**

32825 None.

RATIONALE

Since the maximum pathname length is arbitrary unless `{PATH_MAX}` is defined, an application generally cannot supply a *buf* with *size* `{{PATH_MAX}+1}`.

Having `getcwd()` take no arguments and instead use the `malloc()` function to produce space for the returned argument was considered. The advantage is that `getcwd()` knows how big the working directory pathname is and can allocate an appropriate amount of space. But the programmer would have to use the `free()` function to free the resulting object, or each use of `getcwd()` would further reduce the available memory. Also, `malloc()` and `free()` are used nowhere else in this volume of POSIX.1-200x. Finally, `getcwd()` is taken from the SVID where it has the two arguments used in this volume of POSIX.1-200x.

The older function `getwd()` was rejected for use in this context because it had only a buffer argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except to depend on the programmer to provide a large enough buffer.

On some implementations, if *buf* is a null pointer, `getcwd()` may obtain *size* bytes of memory using `malloc()`. In this case, the pointer returned by `getcwd()` may be used as the argument in a subsequent call to `free()`. Invoking `getcwd()` with *buf* as a null pointer is not recommended in conforming applications.

If a program is operating in a directory where some (grand)parent directory does not permit reading, `getcwd()` may fail, as in most implementations it must read the directory to determine the name of the file. This can occur if search, but not read, permission is granted in an intermediate directory, or if the program is placed in that directory by some more privileged process (for example, login). Including the `[EACCES]` error condition makes the reporting of the error consistent and warns the application developer that `getcwd()` can fail for reasons beyond the control of the application developer or user. Some implementations can avoid this occurrence (for example, by implementing `getcwd()` using `pwd`, where `pwd` is a set-user-root process), thus the error was made optional. Since this volume of POSIX.1-200x permits the addition of other errors, this would be a common addition and yet one that applications could not be expected to deal with without this addition.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The `[ENOMEM]` optional error condition is added.

32865 **NAME**

32866 getdate — convert user format date and time

32867 **SYNOPSIS**

```
32868 XSI #include <time.h>
32869 struct tm *getdate(const char *string);
```

32870 **DESCRIPTION**

32871 The *getdate()* function shall convert a string representation of a date or time into a broken-down
 32872 time.

32873 The external variable or macro *getdate_err* is used by *getdate()* to return error values.

32874 Templates are used to parse and interpret the input string. The templates are contained in a text
 32875 file identified by the environment variable *DATEMSK*. The *DATEMSK* variable should be set to
 32876 indicate the full pathname of the file that contains the templates. The first line in the template
 32877 that matches the input specification is used for interpretation and conversion into the internal
 32878 time format.

32879 The following conversion specifications shall be supported:

32880	%%	Equivalent to %.
32881	%a	Abbreviated weekday name.
32882	%A	Full weekday name.
32883	%b	Abbreviated month name.
32884	%B	Full month name.
32885	%c	Locale's appropriate date and time representation.
32886	%C	Century number [00,99]; leading zeros are permitted but not required.
32887	%d	Day of month [01,31]; the leading 0 is optional.
32888	%D	Date as %m/%d/%y.
32889	%e	Equivalent to %d.
32890	%h	Abbreviated month name.
32891	%H	Hour [00,23].
32892	%I	Hour [01,12].
32893	%m	Month number [01,12].
32894	%M	Minute [00,59].
32895	%n	Equivalent to <newline>.
32896	%p	Locale's equivalent of either AM or PM.
32897	%r	The locale's appropriate representation of time in AM and PM notation. In the POSIX 32898 locale, this shall be equivalent to %I:%M:%S %p.
32899	%R	Time as %H:%M.
32900	%S	Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap 32901 seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap 32902 second data must come from some external source.

32903	%t	Equivalent to <tab>.
32904	%T	Time as %H:%M:%S.
32905	%w	Weekday number (Sunday = [0,6]).
32906	%x	Locale's appropriate date representation.
32907	%X	Locale's appropriate time representation.
32908	%y	Year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.
32911	Note:	It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
32912		
32913		
32914	%Y	Year as "ccyy" (for example, 2001).
32915	%Z	Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result. The <i>getdate()</i> function calculates an expected timezone based on information supplied to the function (such as the hour, day, and month).
32916		
32917		
32918		
32919		The match between the template and input specification performed by <i>getdate()</i> shall be case-insensitive.
32920		
32921		The month and weekday names can consist of any combination of upper and lowercase letters. The process can request that the input date or time specification be in a specific language by setting the <i>LC_TIME</i> category (see <i>setlocale()</i>).
32922		
32923		
32924		Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most two digits are allowed for those descriptors, including leading zeros. Extra whitespace in either the template file or in <i>string</i> shall be ignored.
32925		
32926		
32927		The results are undefined if the conversion specifications %c, %x, and %X include unsupported conversion specifications.
32928		
32929		The following rules apply for converting the input specification into the internal format:
32930		• If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on the current local time as if <i>localtime()</i> had been called.
32931		
32932		
32933		• If only the weekday is given, the day chosen shall be the day, starting with today and moving into the future, which first matches the named day.
32934		
32935		• If only the month (and no year) is given, the month chosen shall be the month, starting with the current month and moving into the future, which first matches the named month. The first day of the month shall be assumed if no day is given.
32936		
32937		
32938		• If no hour, minute, and second are given, the current hour, minute, and second shall be assumed.
32939		
32940		• If no date is given, the hour chosen shall be the hour, starting with the current hour and moving into the future, which first matches the named hour.
32941		
32942		If a conversion specification in the DATEMSK file does not correspond to one of the conversion specifications above, the behavior is unspecified.
32943		
32944		The <i>getdate()</i> function need not be thread-safe. A function that is not required to be thread-safe is not required to be reentrant.
32945		

32946
32947
32948**RETURN VALUE**

Upon successful completion, *getdate()* shall return a pointer to a **struct tm**. Otherwise, it shall return a null pointer and set *getdate_err* to indicate the error.

32949
32950
32951**ERRORS**

The *getdate()* function shall fail in the following cases, setting *getdate_err* to the value shown in the list below. Any changes to *errno* are unspecified.

32952
32953
32954
32955
32956
32957
32958
32959
32960

1. The *DATETIME* environment variable is null or undefined.
2. The template file cannot be opened for reading.
3. Failed to get file status information.
4. The template file is not a regular file.
5. An I/O error is encountered while reading the template file.
6. Memory allocation failed (not enough memory available).
7. There is no line in the template that matches the input.
8. Invalid input specification. For example, February 31; or a time is specified that cannot be represented in a **time_t** (representing the time in seconds since the Epoch).

32961

EXAMPLES32962
32963
32964
32965
32966
32967
32968
32969
32970
32971

1. The following example shows the possible contents of a template:

```
%m
%A %B %d, %Y, %H:%M:%S
%A
%B
%m/%d/%y %I %p
%d, %m, %Y %H:%M
at %A the %dst of %B in %Y
run job at %I %p, %B %dnd
%A den %d. %B %Y %H.%M Uhr
```

32972
32973
32974
32975
32976
32977
32978

2. The following are examples of valid input specifications for the template in Example 1:

```
getdate("10/1/87 4 PM");
getdate("Friday");
getdate("Friday September 18, 1987, 10:30:30");
getdate("24,9,1986 10:30");
getdate("at monday the 1st of december in 1986");
getdate("run job at 3 PM, december 2nd");
```

32979
32980

If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name and *oktober* as a month name, the following would be valid:

32981

```
getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

32982
32983

3. The following example shows how local date and time specification can be defined in the template:

32984
32985
32986
32987
32988

Invocation	Line in Template
<code>getdate("11/27/86")</code>	<code>%m/%d/%y</code>
<code>getdate("27.11.86")</code>	<code>%d.%m.%y</code>
<code>getdate("86-11-27")</code>	<code>%y-%m-%d</code>
<code>getdate("Friday 12:00:00")</code>	<code>%A %H:%M:%S</code>

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

Input	Line in Template	Date
Mon	%a	Mon Sep 22 12:19:47 EDT 1986
Sun	%a	Sun Sep 28 12:19:47 EDT 1986
Fri	%a	Fri Sep 26 12:19:47 EDT 1986
September	%B	Mon Sep 1 12:19:47 EDT 1986
January	%B	Thu Jan 1 12:19:47 EST 1987
December	%B	Mon Dec 1 12:19:47 EST 1986
Sep Mon	%b %a	Mon Sep 1 12:19:47 EDT 1986
Jan Fri	%b %a	Fri Jan 2 12:19:47 EST 1987
Dec Mon	%b %a	Mon Dec 1 12:19:47 EST 1986
Jan Wed 1989	%b %a %Y	Wed Jan 4 12:19:47 EST 1989
Fri 9	%a %H	Fri Sep 26 09:00:00 EDT 1986
Feb 10:30	%b %H:%S	Sun Feb 1 10:00:30 EST 1987
10:30	%H:%M	Tue Sep 23 10:30:00 EDT 1986
13:30	%H:%M	Mon Sep 22 13:30:00 EDT 1986

APPLICATION USAGE

Although historical versions of *getdate()* did not require that `<time.h>` declare the external variable *getdate_err*, this volume of POSIX.1-200x does require it. The standard developers encourage applications to remove declarations of *getdate_err* and instead incorporate the declaration by including `<time.h>`.

Applications should use %Y (4-digit years) in preference to %y (2-digit years).

RATIONALE

In standard locales, the conversion specifications %c, %x, and %X do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

FUTURE DIRECTIONS

None.

XBD `<time.h>`

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The %C conversion specification is added, and the exact meaning of the %y conversion specification is clarified in the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The %R conversion specification is changed to follow historical practice.

Issue 6

The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time* functions.

The description of %S is updated so that the valid range is [00,60] rather than [00,61].

33035

33036

The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions.

33037 **NAME**33038 `getdelim, getline` — read a delimited record from *stream*33039 **SYNOPSIS**

```

33040 CX      #include <stdio.h>
33041         ssize_t getdelim(char **lineptr, size_t *n, int delimiter,
33042         FILE *stream);
33043         ssize_t getline(char **lineptr, size_t *n, FILE *stream);

```

33044 **DESCRIPTION**

33045 The `getdelim()` function shall read from *stream* until it encounters a character matching the
 33046 *delimiter* character. The *delimiter* argument is an **int**, the value of which the application shall
 33047 ensure is a character representable as an **unsigned char** of equal value that terminates the read
 33048 process. If the *delimiter* argument has any other value, the behavior is undefined.

33049 The application shall ensure that *lineptr* is a valid argument that could be passed to the `free()`
 33050 function. If **n* is non-zero, the application shall ensure that *lineptr* points to an object of size at
 33051 least **n* bytes.

33052 The size of the object pointed to by *lineptr* shall be increased to fit the incoming line, if it isn't
 33053 already large enough. The characters read shall be stored in the string pointed to by the *lineptr*
 33054 argument.

33055 The `getline()` function shall be equivalent to the `getdelim()` function with the *delimiter* character
 33056 equal to the `<newline>` character.

33057 **RETURN VALUE**

33058 Upon successful completion, the `getdelim()` function shall return the number of characters
 33059 written into the buffer, including the delimiter character if one was encountered before EOF.
 33060 Otherwise, it shall return `-1` and set *errno* to indicate the error.

33061 **ERRORS**

33062 These functions shall fail if:

33063 [EINVAL] When *lineptr* or *n* are a null pointer.

33064 [ENOMEM] Insufficient memory is available.

33065 These functions may fail if:

33066 [EINVAL] *stream* is not a valid file descriptor.33067 [EOVERFLOW] More than {SSIZE_MAX} characters were read without encountering the
33068 *delimiter* character.33069 **EXAMPLES**

```

33070         #include <stdio.h>
33071         #include <stdlib.h>
33072
33073         int main(void)
33074         {
33075             FILE *fp;
33076             char *line = NULL;
33077             size_t len = 0;
33078             ssize_t read;
33079             fp = fopen("/etc/motd", "r");
33079             if (fp == NULL)

```

```

33080         exit(1);
33081     while ((read = getline(&line, &len, fp)) != -1) {
33082         printf("Retrieved line of length %zu :\n", read);
33083         printf("%s", line);
33084     }
33085     free(line);
33086     fclose(fp);
33087     return 0;
33088 }

```

APPLICATION USAGE

Setting **lineptr* to a null pointer and **n* to zero are allowed and a recommended way to start parsing a file.

RATIONALE

These functions are widely used to solve the problem that the *fgets()* function has with long lines. The functions automatically enlarge the target buffers if needed. These are especially useful since they reduce code needed for applications.

FUTURE DIRECTIONS

None.

DRAFT

33103 **NAME**33104 `getegid` — get the effective group ID33105 **SYNOPSIS**33106 `#include <unistd.h>`
33107 `gid_t getegid(void);`33108 **DESCRIPTION**33109 The `getegid()` function shall return the effective group ID of the calling process.33110 **RETURN VALUE**33111 The `getegid()` function shall always be successful and no return value is reserved to indicate an
33112 error.33113 **ERRORS**

33114 No errors are defined.

33115 **EXAMPLES**

33116 None.

33117 **APPLICATION USAGE**

33118 None.

33119 **RATIONALE**

33120 None.

33121 **FUTURE DIRECTIONS**

33122 None.

33123 **SEE ALSO**33124 [*geteuid\(\), getgid\(\), getuid\(\), setegid\(\), seteuid\(\), setgid\(\), setregid\(\), setreuid\(\), setuid\(\)*](#)33125 XBD [*<sys/types.h>*](#), [*<unistd.h>*](#)33126 **CHANGE HISTORY**

33127 First released in Issue 1. Derived from Issue 1 of the SVID.

33128 **Issue 6**33129 In the SYNOPSIS, the optional include of the [*<sys/types.h>*](#) header is removed.33130 The following new requirements on POSIX implementations derive from alignment with the
33131 Single UNIX Specification:

- 33132
- The requirement to include [*<sys/types.h>*](#) has been removed. Although [*<sys/types.h>*](#) was
33133 required for conforming implementations of previous POSIX specifications, it was not
33134 required for UNIX applications.

33135 **NAME**
 33136 `getenv` — get value of an environment variable

33137 **SYNOPSIS**
 33138 `#include <stdlib.h>`

33139 `char *getenv(const char *name);`

33140 DESCRIPTION

33141 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 33142 conflict between the requirements described here and the ISO C standard is unintentional. This
 33143 volume of POSIX.1-200x defers to the ISO C standard.

33144 The `getenv()` function shall search the environment of the calling process (see XBD Chapter 8, on
 33145 page 159) for the environment variable *name* if it exists and return a pointer to the value of the
 33146 environment variable. If the specified environment variable cannot be found, a null pointer shall
 33147 be returned. The application shall ensure that it does not modify the string pointed to by the
 33148 `getenv()` function.

33149 CX The string pointed to may be overwritten by a subsequent call to `getenv()`, `setenv()`, `unsetenv()`,
 33150 XSI or `putenv()` but shall not be overwritten by a call to any other function in this volume of
 33151 POSIX.1-200x.

33152 CX If the application modifies *environ* or the pointers to which it points, the behavior of `getenv()` is
 33153 undefined.

33154 The `getenv()` function need not be thread-safe. A function that is not required to be thread-safe is
 33155 not required to be reentrant.

33156 RETURN VALUE

33157 Upon successful completion, `getenv()` shall return a pointer to a string containing the *value* for
 33158 the specified *name*. If the specified *name* cannot be found in the environment of the calling
 33159 process, a null pointer shall be returned.

33160 ERRORS

33161 No errors are defined.

33162 EXAMPLES

33163 Getting the Value of an Environment Variable

33164 The following example gets the value of the *HOME* environment variable.

```
33165 #include <stdlib.h>
33166 ...
33167 const char *name = "HOME";
33168 char *value;
33169
33170 value = getenv(name);
```

33170 APPLICATION USAGE

33171 None.

33172 RATIONALE

33173 The `clearenv()` function was considered but rejected. The `putenv()` function has now been
 33174 included for alignment with the Single UNIX Specification.

33175 The `getenv()` function is inherently not reentrant because it returns a value pointing to static
 33176 data.

33177 Conforming applications are required not to modify *environ* directly, but to use only the
 33178 functions described here to manipulate the process environment as an abstract object. Thus, the
 33179 implementation of the environment access functions has complete control over the data
 33180 structure used to represent the environment (subject to the requirement that *environ* be
 33181 maintained as a list of strings with embedded equal signs for applications that wish to scan the
 33182 environment). This constraint allows the implementation to properly manage the memory it
 33183 allocates, either by using allocated storage for all variables (copying them on the first invocation
 33184 of *setenv()* or *unsetenv()*), or keeping track of which strings are currently in allocated space and
 33185 which are not, via a separate table or some other means. This enables the implementation to free
 33186 any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when
 33187 *unsetenv()* is called. A C runtime start-up procedure (that which invokes *main()* and perhaps
 33188 initializes *environ*) can also initialize a flag indicating that none of the environment has yet been
 33189 copied to allocated storage, or that the separate table has not yet been initialized.

33190 In fact, for higher performance of *getenv()*, the implementation could also maintain a separate
 33191 copy of the environment in a data structure that could be searched much more quickly (such as
 33192 an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when
 33193 *setenv()* or *unsetenv()* is invoked.

33194 Performance of *getenv()* can be important for applications which have large numbers of
 33195 environment variables. Typically, applications like this use the environment as a resource
 33196 database of user-configurable parameters. The fact that these variables are in the user's shell
 33197 environment usually means that any other program that uses environment variables (such as *ls*,
 33198 which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC_ALL*, and so on) is
 33199 similarly slowed down by the linear search through the variables.

33200 An implementation that maintains separate data structures, or even one that manages the
 33201 memory it consumes, is not currently required as it was thought it would reduce consensus
 33202 among implementors who do not want to change their historical implementations.

33203 The POSIX Threads Extension states that multi-threaded applications must not modify *environ*
 33204 directly, and that POSIX.1-200x is providing functions which such applications can use in the
 33205 future to manipulate the environment in a thread-safe manner. Thus, moving away from
 33206 application use of *environ* is desirable from that standpoint as well.

33207 FUTURE DIRECTIONS

33208 None.

33212 CHANGE HISTORY

33213 First released in Issue 1. Derived from Issue 1 of the SVID.

33214 Issue 5

33215 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 33216 VALUE section.

33217 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

33218 Issue 6

33219 The following changes were made to align with the IEEE P1003.1a draft standard:

- 33220 • References added to the new *setenv()* and *unsetenv()* functions.

33221 The normative text is updated to avoid use of the term “must” for application requirements.

33222
33223
33224**Issue 7**

Austin Group Interpretation 1003.1-2001 #062 is applied, clarifying that a call to *putenv()* may also cause the string to be overwritten.

33225 **NAME**

33226 geteuid — get the effective user ID

33227 **SYNOPSIS**33228 #include <unistd.h>
33229 uid_t geteuid(void);33230 **DESCRIPTION**33231 The *geteuid()* function shall return the effective user ID of the calling process.33232 **RETURN VALUE**33233 The *geteuid()* function shall always be successful and no return value is reserved to indicate an
33234 error.33235 **ERRORS**

33236 No errors are defined.

33280 **CHANGE HISTORY**

33281 First released in Issue 1. Derived from Issue 1 of the SVID.

33282 **Issue 6**

33283 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

33284 The following new requirements on POSIX implementations derive from alignment with the
33285 Single UNIX Specification:

- 33286 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
33287 required for conforming implementations of previous POSIX specifications, it was not
33288 required for UNIX applications.

getgrent()

33289 **NAME**
33290 getgrent — get the group database entry

33291 **SYNOPSIS**

33292 XSI #include <grp.h>
33293 struct group *getgrent(void);

33294 **DESCRIPTION**

33295 Refer to *endgrent()*.

33296 **NAME**
 33297 `getgrgid, getgrgid_r` — get group database entry for a group ID

33298 **SYNOPSIS**
 33299 `#include <grp.h>`
 33300 `struct group *getgrgid(gid_t gid);`
 33301 `int getgrgid_r(gid_t gid, struct group *grp, char *buffer,`
 33302 `size_t bufsize, struct group **result);`

33303 **DESCRIPTION**
 33304 The `getgrgid()` function shall search the group database for an entry with a matching `gid`.
 33305 The `getgrgid()` function need not be thread-safe. A function that is not required to be thread-safe
 33306 is not required to be reentrant.

33307 The `getgrgid_r()` function shall update the **group** structure pointed to by `grp` and store a pointer
 33308 to that structure at the location pointed to by `result`. The structure shall contain an entry from
 33309 the group database with a matching `gid`. Storage referenced by the group structure is allocated
 33310 from the memory provided with the `buffer` parameter, which is `bufsize` bytes in size. A call to
 33311 `sysconf(_SC_GETGR_R_SIZE_MAX)` returns either `-1` without changing `errno` or an initial value
 33312 suggested for the size of this buffer. A NULL pointer shall be returned at the location pointed to
 33313 by `result` on error or if the requested entry is not found.

33314 **RETURN VALUE**
 33315 Upon successful completion, `getgrgid()` shall return a pointer to a **struct group** with the structure
 33316 defined in `<grp.h>` with a matching entry if one is found. The `getgrgid()` function shall return a
 33317 null pointer if either the requested entry was not found, or an error occurred. On error, `errno`
 33318 shall be set to indicate the error.

33319 The return value may point to a static area which is overwritten by a subsequent call to
 33320 `getgrent()`, `getgrgid()`, or `getgrnam()`.

33321 If successful, the `getgrgid_r()` function shall return zero; otherwise, an error number shall be
 33322 returned to indicate the error.

33323 **ERRORS**
 33324 The `getgrgid()` and `getgrgid_r()` functions may fail if:
 33325 [EIO] An I/O error has occurred.
 33326 [EINTR] A signal was caught during `getgrgid()`.
 33327 [EMFILE] All file descriptors available to the process are currently open.
 33328 [ENFILE] The maximum allowable number of files is currently open in the system.
 33329 The `getgrgid_r()` function may fail if:
 33330 [ERANGE] Insufficient storage was supplied via `buffer` and `bufsize` to contain the data to be
 33331 referenced by the resulting **group** structure.

EXAMPLES

Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getgrgid_r()`.

    buffer = newbuffer;
}
if (e != 0)
    ...handle error...

```

Finding an Entry in the Group Database

The following example uses `getgrgid()` to search the group database for a group ID that was previously stored in a `stat` structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
...

```

APPLICATION USAGE

Applications wishing to check for error situations should set `errno` to 0 before calling `getgrgid()`. If `errno` is set on return, an error occurred.

The `getgrgid_r()` function is thread-safe and shall return values in a user-supplied buffer instead

33382 of possibly using a static data area that may be overwritten by each call.

33383 Portable applications should take into account that it is usual for an implementation to return `-1` +
 33384 from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

33392 CHANGE HISTORY

33393 First released in Issue 1. Derived from System V Release 2.0.

33394 Issue 5

33395 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 33396 VALUE section.

33397 The `getgrgid_r()` function is included for alignment with the POSIX Threads Extension.

33398 A note indicating that the `getgrgid()` function need not be reentrant is added to the
 33399 DESCRIPTION.

33400 Issue 6

33401 The `getgrgid_r()` function is marked as part of the Thread-Safe Functions option.

33402 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION
 33403 describing matching the `gid`.

33404 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

33405 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

33406 The following new requirements on POSIX implementations derive from alignment with the
 33407 Single UNIX Specification:

- 33408 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
- 33409 required for conforming implementations of previous POSIX specifications, it was not
- 33410 required for UNIX applications.
- 33411 • In the RETURN VALUE section, the requirement to set `errno` on error is added.
- 33412 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

33413 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 33414 its avoidance of possibly using a static data area.

33415 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
 33416 buffer from `bufsize` characters to bytes.

33417 Issue 7

33418 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

33419 SD5-XSH-ERN-166 is applied. +

33420 The `getgrgid_r()` function is moved from the Thread-Safe Functions option to the Base.

33421 **NAME**

33422 getgrnam, getgrnam_r — search group database for a name

33423 **SYNOPSIS**

33424 #include <grp.h>

33425 struct group *getgrnam(const char *name);

33426 int getgrnam_r(const char *name, struct group *grp, char *buffer,
33427 size_t bufsize, struct group **result);33428 **DESCRIPTION**33429 The *getgrnam()* function shall search the group database for an entry with a matching *name*.33430 The *getgrnam()* function need not be thread-safe. A function that is not required to be thread-
33431 safe is not required to be reentrant.33432 The *getgrnam_r()* function shall update the **group** structure pointed to by *grp* and store a pointer
33433 to that structure at the location pointed to by *result*. The structure shall contain an entry from
33434 the group database with a matching *gid* or *name*. Storage referenced by the **group** structure is
33435 allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A
33436 call to *sysconf(_SC_GETGR_R_SIZE_MAX)* returns either -1 without changing *errno* or an initial
33437 value suggested for the size of this buffer. A NULL pointer is returned at the location pointed to
33438 by *result* on error or if the requested entry is not found.33439 **RETURN VALUE**33440 The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in
33441 <grp.h> with a matching entry if one is found. The *getgrnam()* function shall return a null
33442 pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be
33443 set to indicate the error.33444 The return value may point to a static area which is overwritten by a subsequent call to
33445 *getgrent()*, *getgrgid()*, or *getgrnam()*.33446 The *getgrnam_r()* function shall return zero on success or if the requested entry was not found
33447 and no error has occurred. If any error has occurred, an error number shall be returned to
33448 indicate the error.33449 **ERRORS**33450 The *getgrnam()* and *getgrnam_r()* functions may fail if:

33451 [EIO] An I/O error has occurred.

33452 [EINTR] A signal was caught during *getgrnam()*.

33453 [EMFILE] All file descriptors available to the process are currently open.

33454 [ENFILE] The maximum allowable number of files is currently open in the system.

33455 The *getgrnam_r()* function may fail if:33456 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
33457 referenced by the resulting **group** structure.

EXAMPLES

Note that `sysconf(_SC_GETGR_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getgrnam_r()`.

```

33458
33459     long int initlen = sysconf(_SC_GETGR_R_SIZE_MAX);
33460     size_t len;
33461     if (initlen == -1)
33462         /* Default initial length. */
33463         len = 1024;
33464     else
33465         len = (size_t) initlen;
33466     struct group result;
33467     struct group *resultp;
33468     char *buffer = malloc(len);
33469     if (buffer == NULL)
33470         ...handle error...
33471     int e;
33472     while ((e = getgrnam_r("somegroup", &result, buffer, len, &resultp))
33473           == ERANGE)
33474     {
33475         size_t newlen = 2 * len;
33476         if (newlen < len)
33477             ...handle error...
33478         len = newlen;
33479         char *newbuffer = realloc(buffer, len);
33480         if (newbuffer == NULL)
33481             ...handle error...
33482         buffer = newbuffer;
33483     }
33484     if (e != 0)
33485         ...handle error...

```

APPLICATION USAGE

Applications wishing to check for error situations should set `errno` to 0 before calling `getgrnam()`. If `errno` is set on return, an error occurred.

The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return `-1` from `sysconf()` indicating that there is no maximum for `_SC_GETGR_R_SIZE_MAX`.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

33505 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
33506 VALUE section.
33507

33508 The *getgrnam_r()* function is included for alignment with the POSIX Threads Extension.

33509 A note indicating that the *getgrnam()* function need not be reentrant is added to the
33510 DESCRIPTION.

Issue 6

33511 The *getgrnam_r()* function is marked as part of the Thread-Safe Functions option.

33512 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

33513 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

33514 The following new requirements on POSIX implementations derive from alignment with the
33515 Single UNIX Specification:
33516

- 33517 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
33518 required for conforming implementations of previous POSIX specifications, it was not
33519 required for UNIX applications.
- 33520 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 33521 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

33522 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
33523 its avoidance of possibly using a static data area.

33524 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
33525 buffer from *bufsize* characters to bytes.

Issue 7

33526 Austin Group Interpretation 1003.1-2001 #081 is applied, clarifying the RETURN VALUE section. +

33527 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

33528 SD5-XSH-ERN-166 is applied. |

33530 The *getgrnam_r()* function is moved from the Thread-Safe Functions option to the Base.

33531 **NAME**33532 `getgroups` — get supplementary group IDs33533 **SYNOPSIS**33534 `#include <unistd.h>`33535 `int getgroups(int gidsetsize, gid_t grouplist[]);`33536 **DESCRIPTION**33537 The `getgroups()` function shall fill in the array `grouplist` with the current supplementary group
33538 IDs of the calling process. It is implementation-defined whether `getgroups()` also returns the
33539 effective group ID in the `grouplist` array.33540 The `gidsetsize` argument specifies the number of elements in the array `grouplist`. The actual
33541 number of group IDs stored in the array shall be returned. The values of array entries with
33542 indices greater than or equal to the value returned are undefined.33543 If `gidsetsize` is 0, `getgroups()` shall return the number of group IDs that it would otherwise return
33544 without modifying the array pointed to by `grouplist`.33545 If the effective group ID of the process is returned with the supplementary group IDs, the value
33546 returned shall always be greater than or equal to one and less than or equal to the value of
33547 `{NGROUPS_MAX}+1`.33548 **RETURN VALUE**33549 Upon successful completion, the number of supplementary group IDs shall be returned. A
33550 return value of `-1` indicates failure and `errno` shall be set to indicate the error.33551 **ERRORS**33552 The `getgroups()` function shall fail if:33553 `[EINVAL]` The `gidsetsize` argument is non-zero and less than the number of group IDs
33554 that would have been returned.33555 **EXAMPLES**33556 **Getting the Supplementary Group IDs of the Calling Process**33557 The following example places the current supplementary group IDs of the calling process into
33558 the `group` array.33559 `#include <sys/types.h>`
33560 `#include <unistd.h>`
33561 `...`
33562 `gid_t *group;`
33563 `int nogroups;`
33564 `long ngroups_max;`

33565 `ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;`
33566 `group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));`

33567 `ngroups = getgroups(ngroups_max, group);`33568 **APPLICATION USAGE**

RATIONALE

The related function *setgroups()* is a privileged operation and therefore is not covered by this volume of POSIX.1-200x.

As implied by the definition of supplementary groups, the effective group ID may appear in the array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but the application needs to call *getegid()* to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups()* to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of “set”). (The history of a process and its parents could affect the details of the result.)

Application developers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

Issue 6

In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.

33664 **CHANGE HISTORY**

33665 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

33666 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from
 33667 *socklen_t* to *size_t*.

33668 **NAME**33669 `getitimer, setitimer` — get and set value of interval timer33670 **SYNOPSIS**

```

33671 OB XSI #include <sys/time.h>
33672
33672 int getitimer(int which, struct itimerval *value);
33673 int setitimer(int which, const struct itimerval *restrict value,
33674              struct itimerval *restrict ovalue);

```

33675 **DESCRIPTION**

33676 The `getitimer()` function shall store the current value of the timer specified by *which* into the
 33677 structure pointed to by *value*. The `setitimer()` function shall set the timer specified by *which* to the
 33678 value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store the
 33679 previous value of the timer in the structure pointed to by *ovalue*.

33680 A timer value is defined by the **itimerval** structure, specified in **<sys/time.h>**. If *it_value* is non-
 33681 zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall
 33682 specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall
 33683 disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer
 33684 after its next expiration (assuming *it_value* is non-zero).

33685 Implementations may place limitations on the granularity of timer values. For each interval
 33686 timer, if the requested timer value requires a finer granularity than the implementation supports,
 33687 the actual timer value shall be rounded up to the next supported value.

33688 An XSI-conforming implementation provides each process with at least three interval timers,
 33689 which are indicated by the *which* argument:

33690 **ITIMER_PROF** Decrements both in process virtual time and when the system is running
 33691 on behalf of the process. It is designed to be used by interpreters in
 33692 statistically profiling the execution of interpreted programs. Each time the
 33693 **ITIMER_PROF** timer expires, the **SIGPROF** signal is delivered.

33694 **ITIMER_REAL** Decrements in real time. A **SIGALRM** signal is delivered when this timer
 33695 expires.

33696 **ITIMER_VIRTUAL** Decrements in process virtual time. It runs only when the process is
 33697 executing. A **SIGVTALRM** signal is delivered when it expires.

33698 The interaction between `setitimer()` and `alarm()` or `sleep()` is unspecified.

33699 **RETURN VALUE**

33700 Upon successful completion, `getitimer()` or `setitimer()` shall return 0; otherwise, `-1` shall be
 33701 returned and *errno* set to indicate the error.

33702 **ERRORS**

33703 The `setitimer()` function shall fail if:

33704 **[EINVAL]** The *value* argument is not in canonical form. (In canonical form, the number of
 33705 microseconds is a non-negative integer less than 1 000 000 and the number of
 33706 seconds is a non-negative integer.)

33707 The `getitimer()` and `setitimer()` functions may fail if:

33708 **[EINVAL]** The *which* argument is not recognized.

EXAMPLES

None.

APPLICATION USAGE

Applications should use the *timer_gettime()* and *timer_settime()* functions instead of the obsolescent *getitimer()* and *setitimer()* functions, respectively.

RATIONALE

None.

FUTURE DIRECTIONS

The *getitimer()* and *setitimer()* functions may be removed in a future version.

SEE ALSO

alarm(), *exec*, *sleep*, *timer_getoverrun()*

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

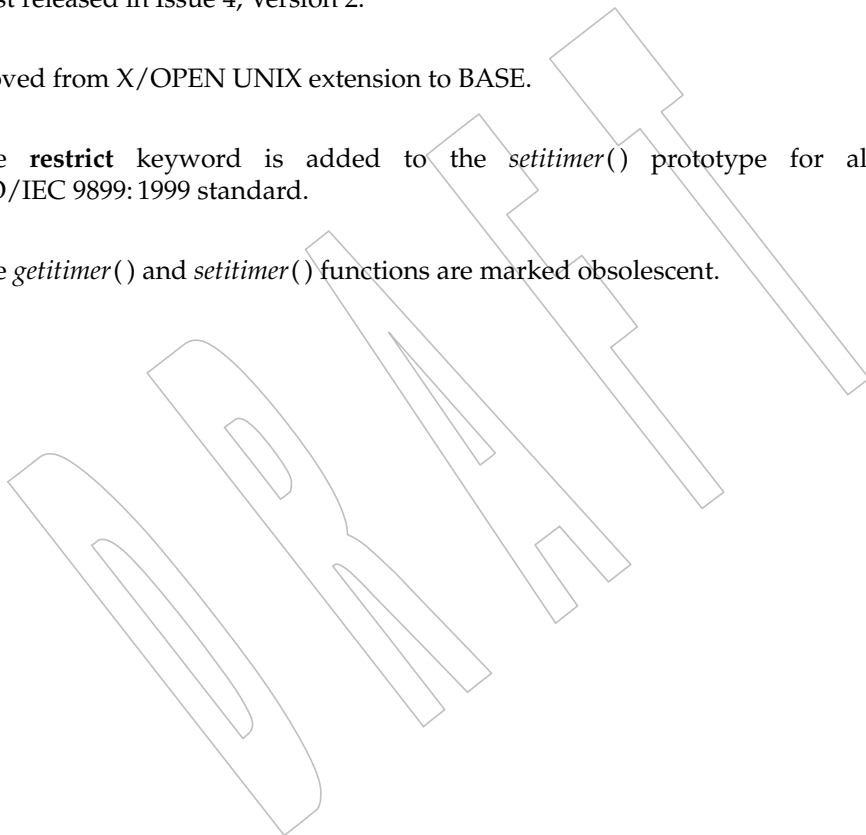

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The **restrict** keyword is added to the *setitimer()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *getitimer()* and *setitimer()* functions are marked obsolescent.

getline()

33730

NAME

33731

getline — read a delimited record from *stream*

33732

SYNOPSIS

33733

CX `#include <stdio.h>`

33734

`ssize_t getline(char **lineptr, size_t *n, FILE *stream);`

33735

DESCRIPTION

33736

Refer to [*getdelim\(\)*](#).

33737 **NAME**
 33738 getlogin, getlogin_r — get login name

33739 **SYNOPSIS**
 33740 #include <unistd.h>
 33741 char *getlogin(void);
 33742 int getlogin_r(char *name, size_t namesize);

33743 **DESCRIPTION**
 33744 The *getlogin()* function shall return a pointer to a string containing the user name associated by
 33745 the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-
 33746 null pointer, then that pointer points to the name that the user logged in under, even if there are
 33747 several login names with the same user ID.

33748 The *getlogin()* function need not be thread-safe. A function that is not required to be thread-safe
 33749 is not required to be reentrant.

33750 The *getlogin_r()* function shall put the name associated by the login activity with the controlling
 33751 terminal of the current process in the character array pointed to by *name*. The array is *namesize*
 33752 characters long and should have space for the name and the terminating null character. The
 33753 maximum size of the login name is {LOGIN_NAME_MAX}.

33754 If *getlogin_r()* is successful, *name* points to the name the user used at login, even if there are
 33755 several login names with the same user ID.

33756 **RETURN VALUE**
 33757 Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer
 33758 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to
 33759 indicate the error.

33760 The return value from *getlogin()* may point to static data whose content is overwritten by each
 33761 call.

33762 If successful, the *getlogin_r()* function shall return zero; otherwise, an error number shall be
 33763 returned to indicate the error.

33764 **ERRORS**
 33765 The *getlogin()* and *getlogin_r()* functions may fail if:

- 33766 [EMFILE] All file descriptors available to the process are currently open.
- 33767 [ENFILE] The maximum allowable number of files is currently open in the system.
- 33768 [ENXIO] The calling process has no controlling terminal.

33769 The *getlogin_r()* function may fail if:

- 33770 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
 33771 including the terminating null character.

EXAMPLES

Getting the User Login Name

The following example calls the `getlogin()` function to obtain the name of the user associated with the calling process, and passes this information to the `getpwnam()` function to get the associated user database information.

```

33772
33773
33774 #include <unistd.h>
33775 #include <sys/types.h>
33776 #include <pwd.h>
33777 #include <stdio.h>
33778 ...
33779 char *lgn;
33780 struct passwd *pw;
33781 ...
33782 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
33783     fprintf(stderr, "Get of user information failed.\n"); exit(1);
33784 }
33785
33786
33787

```

APPLICATION USAGE

Three names associated with the current process can be determined: `getpwuid(geteuid())` shall return the name associated with the effective user ID of the process; `getlogin()` shall return the name associated with the current login activity; and `getpwuid(getuid())` shall return the name associated with the real user ID of the process.

The `getlogin_r()` function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The `getlogin()` function returns a pointer to the user's login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of `getlogin()` should be used to provide the argument to the `getpwnam()` function. (This might be used to determine the user's login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the `cuserid()` function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of `cuserid()` can be obtained by:

```
getpwuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

33833

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getlogin_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getlogin()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getlogin_r()* function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

Issue 7

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The *getlogin_r()* function is moved from the Thread-Safe Functions option to the Base.

33834 NAME

33835 getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)

33836 SYNOPSIS

```

33837 OB XSR #include <stropts.h>
33838
33838 int getmsg(int fildev, struct strbuf *restrict ctlptr,
33839           struct strbuf *restrict dataptr, int *restrict flagsp);
33840 int getpmsg(int fildev, struct strbuf *restrict ctlptr,
33841            struct strbuf *restrict dataptr, int *restrict bandp,
33842            int *restrict flagsp);

```

33843 DESCRIPTION

33844 The *getmsg()* function shall retrieve the contents of a message located at the head of the
 33845 STREAM head read queue associated with a STREAMS file and place the contents into one or
 33846 more buffers. The message contains either a data part, a control part, or both. The data and
 33847 control parts of the message shall be placed into separate buffers, as described below. The
 33848 semantics of each part are defined by the originator of the message.

33849 The *getpmsg()* function shall be equivalent to *getmsg()*, except that it provides finer control over
 33850 the priority of the messages received. Except where noted, all requirements on *getmsg()* also
 33851 pertain to *getpmsg()*.

33852 The *fildev* argument specifies a file descriptor referencing a STREAMS-based file.

33853 The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points
 33854 to a buffer in which the data or control information is to be placed, and the *maxlen* member
 33855 indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall
 33856 contain the number of bytes of data or control information actually received. The *len* member
 33857 shall be set to 0 if there is a zero-length control or data part and *len* shall be set to -1 if no data or
 33858 control information is present in the message.

33859 When *getmsg()* is called, *flagsp* should point to an integer that indicates the type of message the
 33860 process is able to receive. This is described further below.

33861 The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold
 33862 the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is -1, the
 33863 control (or data) part of the message shall not be processed and shall be left on the STREAM
 33864 head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to -1. If the
 33865 *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part
 33866 shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0
 33867 and there are more than 0 bytes of control (or data) information, that information shall be left on
 33868 the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the
 33869 control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder
 33870 of the message shall be left on the STREAM head read queue and a non-zero return value shall
 33871 be provided.

33872 By default, *getmsg()* shall process the first available message on the STREAM head read queue.
 33873 However, a process may choose to retrieve only high-priority messages by setting the integer
 33874 pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg()* shall only process the next message if it is
 33875 a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall
 33876 be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a
 33877 high-priority message was retrieved, or 0 otherwise.

33878 For *getpmsg()*, the flags are different. The *flagsp* argument points to a bitmask with the following
 33879 mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg()*,

33880 *getpmsg()* shall process the first available message on the STREAM head read queue. A process
 33881 may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to
 33882 MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process
 33883 the next message if it is a high-priority message. In a similar manner, a process may choose to
 33884 retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to
 33885 MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case,
 33886 *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than,
 33887 the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the
 33888 first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the
 33889 integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-
 33890 priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer
 33891 pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to
 33892 MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

33893 If O_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type
 33894 specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is
 33895 set and a message of the specified type is not present at the front of the read queue, *getmsg()* and
 33896 *getpmsg()* shall fail and set *errno* to [EAGAIN].

33897 If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()*
 33898 shall continue to operate normally, as described above, until the STREAM head read queue is
 33899 empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

33900 RETURN VALUE

33901 Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value
 33902 of 0 indicates that a full message was read successfully. A return value of MORECTL indicates
 33903 that more control information is waiting for retrieval. A return value of MOREDATA indicates
 33904 that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL
 33905 and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and
 33906 *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher
 33907 priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()*
 33908 shall retrieve that higher-priority message before retrieving the remainder of the previous
 33909 message.

33910 If the high priority control part of the message is consumed, the message shall be placed back on
 33911 the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve
 33912 the remainder of the message. If, however, a priority message arrives or already exists on the
 33913 STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority
 33914 message before retrieving the remainder of the message that was put back.

33915 Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

33916 ERRORS

33917 The *getmsg()* and *getpmsg()* functions shall fail if:

- | | | |
|-------|-----------|--|
| 33918 | [EAGAIN] | The O_NONBLOCK flag is set and no messages are available. |
| 33919 | [EBADF] | The <i>fildev</i> argument is not a valid file descriptor open for reading. |
| 33920 | [EBADMSG] | The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a pending file descriptor is at the STREAM head. |
| 33922 | [EINTR] | A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> . |
| 33923 | [EINVAL] | An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer. |
| 33924 | | |
| 33925 | | |

33926 [ENOSTR] A STREAM is not associated with *files*.

33927 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an
 33928 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
 33929 *getmsg()* or *getpmsg()* but reflects the prior error.

33930 EXAMPLES

33931 Getting Any Message

33932 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call
 33933 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,
 33934 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,
 33935 respectively.

```
33936 #include <stropts.h>
33937 ...
33938 int fd;
33939 char ctrlbuf[128];
33940 char databuf[512];
33941 struct strbuf ctrl;
33942 struct strbuf data;
33943 int flags = 0;
33944 int ret;

33945 ctrl.buf = ctrlbuf;
33946 ctrl.maxlen = sizeof(ctrlbuf);

33947 data.buf = databuf;
33948 data.maxlen = sizeof(databuf);
33949 ret = getmsg (fd, &ctrl, &data, &flags);
```

33950 Getting the First Message off the Queue

33951 In the following example, the call to *getpmsg()* retrieves the first available message on the
 33952 associated STREAM-head read queue.

```
33953 #include <stropts.h>
33954 ...
33955 int fd;
33956 char ctrlbuf[128];
33957 char databuf[512];
33958 struct strbuf ctrl;
33959 struct strbuf data;
33960 int band = 0;
33961 int flags = MSG_ANY;
33962 int ret;

33963 ctrl.buf = ctrlbuf;
33964 ctrl.maxlen = sizeof(ctrlbuf);

33965 data.buf = databuf;
33966 data.maxlen = sizeof(databuf);
33967 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

33968 **APPLICATION USAGE**

33969 None.

33970 **RATIONALE**

33971 None.

33972 **FUTURE DIRECTIONS**33973 The *getmsg()* and *getpmsg()* functions may be removed in a future version.33974 **SEE ALSO**33975 [Section 2.6](#) (on page 473), *poll()*, *putmsg()*, *read*, *write*33976 XBD [<stropts.h>](#)33977 **CHANGE HISTORY**

33978 First released in Issue 4, Version 2.

33979 **Issue 5**

33980 Moved from X/OPEN UNIX extension to BASE.

33981 A paragraph regarding “high-priority control parts of messages” is added to the RETURN
33982 VALUE section.33983 **Issue 6**

33984 This function is marked as part of the XSI STREAMS Option Group.

33985 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the
33986 ISO/IEC 9899:1999 standard.33987 **Issue 7**33988 The *getmsg()* and *getpmsg()* functions are marked obsolescent.

33989 **NAME**33990 `getnameinfo` — get name information33991 **SYNOPSIS**33992 `#include <sys/socket.h>`33993 `#include <netdb.h>`

```
33994 int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
33995 char *restrict node, socklen_t nodelen, char *restrict service,
33996 socklen_t servicelen, int flags);
```

33997 **DESCRIPTION**

33998 The `getnameinfo()` function shall translate a socket address to a node name and service location, all of which are defined as in `freaddrinfo()`.

34000 The `sa` argument points to a socket address structure to be translated.

34001 IP6 If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node name for that IPv4 address.

34004 If the address is the IPv6 unspecified address ("::"), a lookup shall not be performed and the behavior shall be the same as when the node's name cannot be located.

34006 If the `node` argument is non-NULL and the `nodelen` argument is non-zero, then the `node` argument points to a buffer able to contain up to `nodelen` characters that receives the node name as a null-terminated string. If the `node` argument is NULL or the `nodelen` argument is zero, the node name shall not be returned. If the node's name cannot be located, the numeric form of the address contained in the socket address structure pointed to by the `sa` argument is returned instead of its name.

34012 If the `service` argument is non-NULL and the `servicelen` argument is non-zero, then the `service` argument points to a buffer able to contain up to `servicelen` bytes that receives the service name as a null-terminated string. If the `service` argument is NULL or the `servicelen` argument is zero, the service name shall not be returned. If the service's name cannot be located, the numeric form of the service address (for example, its port number) shall be returned instead of its name.

34017 The `flags` argument is a flag that changes the default actions of the function. By default the fully-qualified domain name (FQDN) for the host shall be returned, but:

- 34019 • If the flag bit `NI_NOFQDN` is set, only the node name portion of the FQDN shall be returned for local hosts.
- 34020
- 34021 • If the flag bit `NI_NUMERICHOST` is set, the numeric form of the address contained in the socket address structure pointed to by the `sa` argument shall be returned instead of its name.
- 34022
- 34023
- 34024 • If the flag bit `NI_NAMEREQD` is set, an error shall be returned if the host's name cannot be located.
- 34025
- 34026 • If the flag bit `NI_NUMERICSERV` is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name.
- 34027
- 34028 • If the flag bit `NI_NUMERICSERVICE` is set, the numeric form of the service address shall be returned (for example, its port number) instead of its name.
- 34029
- 34030 • If the flag bit `NI_NUMERICSERVICE` is set, the numeric form of the scope identifier shall be returned (for example, interface index) instead of its name. This flag shall be ignored if the `sa` argument is not an IPv6 address.

- 34031 • If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
 34032 (SOCK_DGRAM). The default behavior shall assume that the service is a stream service
 34033 (SOCK_STREAM).

34034 **Notes:**

- 34035 1. The two NI_NUMERICxxx flags are required to support the `-n` flag that many
 34036 commands provide.
- 34037 2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for
 34038 example, [512,514]) that represent different services for UDP and TCP.

34039 The `getnameinfo()` function shall be thread-safe.

34040 RETURN VALUE

34041 A zero return value for `getnameinfo()` indicates successful completion; a non-zero return value
 34042 indicates failure. The possible values for the failures are listed in the ERRORS section.

34043 Upon successful completion, `getnameinfo()` shall return the *node* and *service* names, if requested,
 34044 in the buffers provided. The returned names are always null-terminated strings.

34045 ERRORS

34046 The `getnameinfo()` function shall fail and return the corresponding value if:

- 34047 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.
- 34048 [EAI_BADFLAGS]
 34049 The *flags* had an invalid value.
- 34050 [EAI_FAIL] A non-recoverable error occurred.
- 34051 [EAI_FAMILY] The address family was not recognized or the address length was invalid for
 34052 the specified family.
- 34053 [EAI_MEMORY] There was a memory allocation failure.
- 34054 [EAI_NONAME] The name does not resolve for the supplied parameters.
 34055 NI_NAMEREQD is set and the host's name cannot be located, or both
 34056 *nodename* and *servname* were null.
- 34057 [EAI_OVERFLOW]
 34058 An argument buffer overflowed. The buffer pointed to by the *node* argument
 34059 or the *service* argument was too small.
- 34060 [EAI_SYSTEM] A system error occurred. The error code can be found in *errno*.

34061 EXAMPLES

34062 None.

34063 APPLICATION USAGE

34064 If the returned values are to be used as part of any further name resolution (for example, passed
 34065 to `getaddrinfo()`), applications should provide buffers large enough to store any result possible on
 34066 the system.

34067 Given the IPv4-mapped IPv6 address "`::ffff:1.2.3.4`", the implementation performs a
 34068 lookup as if the socket address structure contains the IPv4 address "`1.2.3.4`".

34069 The IPv6 unspecified address ("`:::`") and the IPv6 loopback address ("`:::1`") are not
 34070 IPv4-compatible addresses.

SEE ALSO*endservent(), freeaddrinfo(), gai_strerror(), inet_ntop(), socket()*XBD [<netdb.h>](#), [<sys/socket.h>](#)**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *getnameinfo()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in the SYNOPSIS and DESCRIPTION for alignment with IPv6.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the [EAI_OVERFLOW] error to the ERRORS section.

Issue 7

SD5-XSH-ERN-127 is applied, clarifying the behavior if the address is the IPv6 unspecified address.

34089 **NAME**
34090 getnetbyaddr, getnetbyname, getnetent — network database functions

34091 **SYNOPSIS**
34092 #include <netdb.h>
34093 struct netent *getnetbyaddr(uint32_t net, int type);
34094 struct netent *getnetbyname(const char *name);
34095 struct netent *getnetent(void);

34096 **DESCRIPTION**
34097 Refer to *endnetent()*.

34098 **NAME**
 34099 `getopt, optarg, opterr, optind, optopt` — command option parsing

34100 **SYNOPSIS**
 34101 `#include <unistd.h>`
 34102 `int getopt(int argc, char * const argv[], const char *optstring);`
 34103 `extern char *optarg;`
 34104 `extern int opterr, optind, optopt;`

34105 **DESCRIPTION**
 34106 The `getopt()` function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,
 34107 6, 7, 9, and 10 in XBD [Section 12.2](#) (on page 201).

34108 The parameters `argc` and `argv` are the argument count and argument array as passed to `main()`
 34109 (see [exec](#)). The argument `optstring` is a string of recognized option characters; if a character is
 34110 followed by a colon, the option takes an argument. All option characters allowed by Utility
 34111 Syntax Guideline 3 are allowed in `optstring`. The implementation may accept other characters as
 34112 an extension.

34113 The variable `optind` is the index of the next element of the `argv[]` vector to be processed. It shall
 34114 be initialized to 1 by the system, and `getopt()` shall update it when it finishes with each element
 34115 of `argv[]`. When an element of `argv[]` contains multiple option characters, it is unspecified how
 34116 `getopt()` determines which options have already been processed.

34117 The `getopt()` function shall return the next option character (if one is found) from `argv` that
 34118 matches a character in `optstring`, if there is one that matches. If the option takes an argument,
 34119 `getopt()` shall set the variable `optarg` to point to the option-argument as follows:

- 34120 1. If the option was the last character in the string pointed to by an element of `argv`, then
 34121 `optarg` shall contain the next element of `argv`, and `optind` shall be incremented by 2. If the
 34122 resulting value of `optind` is greater than `argc`, this indicates a missing option-argument,
 34123 and `getopt()` shall return an error indication.
- 34124 2. Otherwise, `optarg` shall point to the string following the option character in that element
 34125 of `argv`, and `optind` shall be incremented by 1.

34126 If, when `getopt()` is called:

34127 `argv[optind]` is a null pointer
 34128 `*argv[optind]` is not the character `-`
 34129 `argv[optind]` points to the string `"-"`

34130 `getopt()` shall return `-1` without changing `optind`. If:

34131 `argv[optind]` points to the string `"--"`

34132 `getopt()` shall return `-1` after incrementing `optind`.

34133 If `getopt()` encounters an option character that is not contained in `optstring`, it shall return the
 34134 question-mark (`' ? '`) character. If it detects a missing option-argument, it shall return the colon
 34135 character (`' : '`) if the first character of `optstring` was a colon, or a question-mark character (`' ? '`)
 34136 otherwise. In either case, `getopt()` shall set the variable `optopt` to the option character that caused
 34137 the error. If the application has not set the variable `opterr` to 0 and the first character of `optstring` is
 34138 not a colon, `getopt()` shall also print a diagnostic message to `stderr` in the format specified for the
 34139 `getopts` utility.

34140 The `getopt()` function need not be thread-safe. A function that is not required to be thread-safe is
 34141 not required to be reentrant.

34142 **RETURN VALUE**34143 The *getopt()* function shall return the next option character specified on the command line.34144 A colon (':') shall be returned if *getopt()* detects a missing argument and the first character of
34145 *optstring* was a colon (':').34146 A question mark ('?') shall be returned if *getopt()* encounters an option character not in
34147 *optstring* or detects a missing argument and the first character of *optstring* was not a colon (':').34148 Otherwise, *getopt()* shall return -1 when all command line options are parsed.34149 **ERRORS**

34150 No errors are defined.

34151 **EXAMPLES**34152 **Parsing Command Line Options**34153 The following code fragment shows how you might process the arguments for a utility that can
34154 take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require
34155 arguments:

```

34156 #include <unistd.h>
34157 int
34158 main(int argc, char *argv[ ])
34159 {
34160     int c;
34161     int bflg, aflg, errflg;
34162     char *ifile;
34163     char *ofile;
34164     extern char *optarg;
34165     extern int optind, optopt;
34166     . . .
34167     while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
34168         switch(c) {
34169             case 'a':
34170                 if (bflg)
34171                     errflg++;
34172                 else
34173                     aflg++;
34174                 break;
34175             case 'b':
34176                 if (aflg)
34177                     errflg++;
34178                 else {
34179                     bflg++;
34180                     bproc();
34181                 }
34182                 break;
34183             case 'f':
34184                 ifile = optarg;
34185                 break;
34186             case 'o':
34187                 ofile = optarg;
34188                 break;
34189             case ':': /* -f or -o without operand */
34190                 fprintf(stderr,

```

```

34191         "Option -%c requires an operand\n", optopt);
34192         errflg++;
34193         break;
34194     case '?':
34195         fprintf(stderr,
34196             "Unrecognized option: -%c\n", optopt);
34197         errflg++;
34198     }
34199 }
34200 if (errflg) {
34201     fprintf(stderr, "usage: . . . ");
34202     exit(2);
34203 }
34204 for ( ; optind < argc; optind++) {
34205     if (access(argv[optind], R_OK)) {
34206         . . .
34207     }

```

34208 This code accepts any of the following as equivalent:

```

34209 cmd -ao arg path path
34210 cmd -a -o arg path path
34211 cmd -o arg -a path path
34212 cmd -a -o arg -- path path
34213 cmd -a -oarg path path
34214 cmd -aoarg path path

```

34215 Checking Options and Arguments

34216 The following example parses a set of command line options and prints messages to standard
34217 output for each option and argument that it encounters.

```

34218 #include <unistd.h>
34219 #include <stdio.h>
34220 ...
34221 int c;
34222 char *filename;
34223 extern char *optarg;
34224 extern int optind, optopt, opterr;
34225 ...
34226 while ((c = getopt(argc, argv, ":abf:")) != -1) {
34227     switch(c) {
34228     case 'a':
34229         printf("a is set\n");
34230         break;
34231     case 'b':
34232         printf("b is set\n");
34233         break;
34234     case 'f':
34235         filename = optarg;
34236         printf("filename is %s\n", filename);
34237         break;
34238     case ':':
34239         printf("-%c without filename\n", optopt);
34240         break;
34241     case '?':

```

```

34242         printf("unknown arg %c\n", optopt);
34243         break;
34244     }
34245 }

```

34246 Selecting Options from the Command Line

34247 The following example selects the type of database routines the user wants to use based on the
 34248 *Options* argument.

```

34249 #include <unistd.h>
34250 #include <string.h>
34251 ...
34252 char *Options = "hdbt1";
34253 ...
34254 int dbtype, i;
34255 char c;
34256 char *st;
34257 ...
34258 dbtype = 0;
34259 while ((c = getopt(argc, argv, Options)) != -1) {
34260     if ((st = strchr(Options, c)) != NULL) {
34261         dbtype = st - Options;
34262         break;
34263     }
34264 }

```

34265 APPLICATION USAGE

34266 The *getopt()* function is only required to support option characters included in Utility Syntax
 34267 Guideline 3. Many historical implementations of *getopt()* support other characters as options.
 34268 This is an allowed extension, but applications that use extensions are not maximally portable.
 34269 Note that support for multi-byte option characters is only possible when such characters can be
 34270 represented as type **int**.

34271 RATIONALE

34272 The *optopt* variable represents historical practice and allows the application to obtain the identity
 34273 of the invalid option.

34274 The description has been written to make it clear that *getopt()*, like the *getopts* utility, deals with
 34275 option-arguments whether separated from the option by <blank>s or not. Note that the
 34276 requirements on *getopt()* and *getopts* are more stringent than the Utility Syntax Guidelines.

34277 The *getopt()* function shall return -1 , rather than EOF, so that **<stdio.h>** is not required.

34278 The special significance of a colon as the first character of *optstring* makes *getopt()* consistent
 34279 with the *getopts* utility. It allows an application to make a distinction between a missing
 34280 argument and an incorrect option letter without having to examine the option letter. It is true
 34281 that a missing argument can only be detected in one case, but that is a case that has to be
 34282 considered.

34283 FUTURE DIRECTIONS

34284 None.

IEEE PASC Interpretation 1003.2 #150 is applied.

34294 **NAME**

34295 getpeername — get the name of the peer socket

34296 **SYNOPSIS**

34297 #include <sys/socket.h>

34298 int getpeername(int *socket*, struct sockaddr *restrict *address*,
34299 socklen_t *restrict *address_len*);34300 **DESCRIPTION**34301 The *getpeername()* function shall retrieve the peer address of the specified socket, store this
34302 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this
34303 address in the object pointed to by the *address_len* argument.34304 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
34305 the stored address shall be truncated.34306 If the protocol permits connections by unbound clients, and the peer is not bound, then the
34307 value stored in the object pointed to by *address* is unspecified.34308 **RETURN VALUE**34309 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
34310 indicate the error.34311 **ERRORS**34312 The *getpeername()* function shall fail if:34313 [EBADF] The *socket* argument is not a valid file descriptor.

34314 [EINVAL] The socket has been shut down.

34315 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

34316 [ENOTSOCK] The *socket* argument does not refer to a socket.

34317 [EOPNOTSUPP] The operation is not supported for the socket protocol.

34318 The *getpeername()* function may fail if:

34319 [ENOBUFS] Insufficient resources were available in the system to complete the call.

CHANGE HISTORY

34332

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

34333

The **restrict** keyword is added to the *getpeername()* prototype for alignment with the ISO/IEC 9899:1999 standard.

34334

34335 **NAME**
 34336 getpgid — get the process group ID for a process

34337 **SYNOPSIS**
 34338 #include <unistd.h>
 34339 pid_t getpgid(pid_t pid);

34340 **DESCRIPTION**
 34341 The *getpgid()* function shall return the process group ID of the process whose process ID is equal
 34342 to *pid*. If *pid* is equal to 0, *getpgid()* shall return the process group ID of the calling process.

34343 **RETURN VALUE**
 34344 Upon successful completion, *getpgid()* shall return a process group ID. Otherwise, it shall return
 34345 (**pid_t**)-1 and set *errno* to indicate the error.

34346 **ERRORS**
 34347 The *getpgid()* function shall fail if:
 34348 [EPERM] The process whose process ID is equal to *pid* is not in the same session as the
 34349 calling process, and the implementation does not allow access to the process
 34350 group ID of that process from the calling process.
 34351 [ESRCH] There is no process with a process ID equal to *pid*.

34352 The *getpgid()* function may fail if:
 34353 [EINVAL] The value of the *pid* argument is invalid.

34354 **EXAMPLES**
 34355 None.

34356 **APPLICATION USAGE**
 34357 None.

34358 **RATIONALE**
 34359 None.

34360 **FUTURE DIRECTIONS**
 34361 None.

34362 **SEE ALSO**

 34364 XBD <unistd.h>

34365 **CHANGE HISTORY**
 34366 First released in Issue 4, Version 2.

34367 **Issue 5**
 34368 Moved from X/OPEN UNIX extension to BASE.

34369 **Issue 7**
 34370 The *getpgid()* function is moved from the XSI option to the Base.

34371 **NAME**
 34372 `getpgrp` — get the process group ID of the calling process

34373 **SYNOPSIS**
 34374 `#include <unistd.h>`
 34375 `pid_t getpgrp(void);`

34376 **DESCRIPTION**
 34377 The `getpgrp()` function shall return the process group ID of the calling process.

34378 **RETURN VALUE**
 34379 The `getpgrp()` function shall always be successful and no return value is reserved to indicate an
 34380 error.

34381 **ERRORS**
 34382 No errors are defined.

34383 **EXAMPLES**
 34384 None.

34385 **APPLICATION USAGE**
 34386 None.

34387 **RATIONALE**
 34388 4.3 BSD provides a `getpgrp()` function that returns the process group ID for a specified process.
 34389 Although this function supports job control, all known job control shells always specify the
 34390 calling process with this function. Thus, the simpler System V `getpgrp()` suffices, and the added
 34391 complexity of the 4.3 BSD `getpgrp()` is provided by the XSI extension `getpgid()`.

34392 **FUTURE DIRECTIONS**
 34393 None.

34478 required for UNIX applications.

34479 **NAME**34480 `getpriority, setpriority` — get and set the nice value34481 **SYNOPSIS**

```
34482 XSI      #include <sys/resource.h>
34483
34483      int getpriority(int which, id_t who);
34484      int setpriority(int which, id_t who, int value);
```

34485 **DESCRIPTION**

34486 The `getpriority()` function shall obtain the nice value of a process, process group, or user. The
 34487 `setpriority()` function shall set the nice value of a process, process group, or user to
 34488 `value+{NZERO}`.

34489 Target processes are specified by the values of the `which` and `who` arguments. The `which`
 34490 argument may be one of the following values: `PRIO_PROCESS`, `PRIO_PGRP`, or `PRIO_USER`,
 34491 indicating that the `who` argument is to be interpreted as a process ID, a process group ID, or an
 34492 effective user ID, respectively. A 0 value for the `who` argument specifies the current process,
 34493 process group, or user.

34494 The nice value set with `setpriority()` shall be applied to the process. If the process is multi-
 34495 threaded, the nice value shall affect all system scope threads in the process.

34496 If more than one process is specified, `getpriority()` shall return value `{NZERO}` less than the
 34497 lowest nice value pertaining to any of the specified processes, and `setpriority()` shall set the nice
 34498 values of all of the specified processes to `value+{NZERO}`.

34499 The default nice value is `{NZERO}`; lower nice values shall cause more favorable scheduling.
 34500 While the range of valid nice values is `[0,{NZERO}*2-1]`, implementations may enforce more
 34501 restrictive limits. If `value+{NZERO}` is less than the system's lowest supported nice value,
 34502 `setpriority()` shall set the nice value to the lowest supported value; if `value+{NZERO}` is greater
 34503 than the system's highest supported nice value, `setpriority()` shall set the nice value to the
 34504 highest supported value.

34505 Only a process with appropriate privileges can lower its nice value.

34506 PS|TPS Any processes or threads using `SCHED_FIFO` or `SCHED_RR` shall be unaffected by a call to
 34507 `setpriority()`. This is not considered an error. A process which subsequently reverts to
 34508 `SCHED_OTHER` need not have its priority affected by such a `setpriority()` call.

34509 The effect of changing the nice value may vary depending on the process-scheduling algorithm
 34510 in effect.

34511 Since `getpriority()` can return the value `-1` on successful completion, it is necessary to set `errno` to
 34512 0 prior to a call to `getpriority()`. If `getpriority()` returns the value `-1`, then `errno` can be checked to
 34513 see if an error occurred or if the value is a legitimate nice value.

34514 **RETURN VALUE**

34515 Upon successful completion, `getpriority()` shall return an integer in the range `-{NZERO}` to
 34516 `{NZERO}-1`. Otherwise, `-1` shall be returned and `errno` set to indicate the error.

34517 Upon successful completion, `setpriority()` shall return 0; otherwise, `-1` shall be returned and `errno`
 34518 set to indicate the error.

ERRORS

- 34519 The *getpriority()* and *setpriority()* functions shall fail if:
- 34520
- 34521 [ESRCH] No process could be located using the *which* and *who* argument values
- 34522 specified.
- 34523 [EINVAL] The value of the *which* argument was not recognized, or the value of the *who*
- 34524 argument is not a valid process ID, process group ID, or user ID.
- 34525 In addition, *setpriority()* may fail if:
- 34526 [EPERM] A process was located, but neither the real nor effective user ID of the
- 34527 executing process match the effective user ID of the process whose nice value
- 34528 is being changed.
- 34529 [EACCES] A request was made to change the nice value to a lower numeric value and the
- 34530 current process does not have appropriate privileges.

EXAMPLES**Using *getpriority()***

34532 The following example returns the current scheduling priority for the process ID returned by the

34533 call to *getpid()*.

34534

```
34535 #include <sys/resource.h>
34536 ...
34537 int which = PRIO_PROCESS;
34538 id_t pid;
34539 int ret;
34540
34541 pid = getpid();
34542 ret = getpriority(which, pid);
```

Using *setpriority()*

34543 The following example sets the priority for the current process ID to -20.

```
34544 #include <sys/resource.h>
34545 ...
34546 int which = PRIO_PROCESS;
34547 id_t pid;
34548 int priority = -20;
34549 int ret;
34550
34551 pid = getpid();
34552 ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

34553 The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value

34554 -{NZERO}). The nice value is in the range [0,2*{NZERO} -1], while the return value for

34555 *getpriority()* and the third parameter for *setpriority()* are in the range [-{NZERO},{NZERO} -1].

RATIONALE

CHANGE HISTORY

34564

First released in Issue 4, Version 2.

34565

Issue 5

34566

Moved from X/OPEN UNIX extension to BASE.

34567

The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion with functionality in the POSIX Realtime Extension.

34568

34569 **NAME**
34570 `getprotobyname, getprotobynumber, getprotent` — network protocol database functions

34571 **SYNOPSIS**
34572 `#include <netdb.h>`
34573 `struct protoent *getprotobyname(const char *name);`
34574 `struct protoent *getprotobynumber(int proto);`
34575 `struct protoent *getprotoent(void);`

34576 **DESCRIPTION**
34577 Refer to *endprotoent()*.

getpwent()

34578

NAME

34579

getpwent — get user database entry

34580

SYNOPSIS

34581

XSI `#include <pwd.h>`

34582

`struct passwd *getpwent(void);`

34583

DESCRIPTION

34584

Refer to *endpwent()*.

34585 **NAME**
 34586 `getpwnam, getpwnam_r` — search user database for a name

34587 **SYNOPSIS**
 34588 `#include <pwd.h>`
 34589 `struct passwd *getpwnam(const char *name);`
 34590 `int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,`
 34591 `size_t bufsize, struct passwd **result);`

34592 **DESCRIPTION**
 34593 The `getpwnam()` function shall search the user database for an entry with a matching *name*.
 34594 The `getpwnam()` function need not be thread-safe. A function that is not required to be thread-
 34595 safe is not required to be reentrant.

34596 Applications wishing to check for error situations should set *errno* to 0 before calling
 34597 `getpwnam()`. If `getpwnam()` returns a null pointer and *errno* is non-zero, an error occurred.

34598 The `getpwnam_r()` function shall update the **passwd** structure pointed to by *pwd* and store a
 34599 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
 34600 from the user database with a matching *name*. Storage referenced by the structure is allocated
 34601 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. A call to
 34602 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either -1 without changing *errno* or an initial value
 34603 suggested for the size of this buffer. A NULL pointer shall be returned at the location pointed to
 34604 by *result* on error or if the requested entry is not found.

34605 **RETURN VALUE**
 34606 The `getpwnam()` function shall return a pointer to a **struct passwd** with the structure as defined
 34607 in `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested
 34608 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.

34609 The return value may point to a static area which is overwritten by a subsequent call to
 34610 `getpwent()`, `getpwnam()`, or `getpwuid()`.

34611 The `getpwnam_r()` function shall return zero on success or if the requested entry was not found
 34612 and no error has occurred. If an error has occurred, an error number shall be returned to indicate
 34613 the error.

34614 **ERRORS**
 34615 The `getpwnam()` and `getpwnam_r()` functions may fail if:

34616 [EIO] An I/O error has occurred.
 34617 [EINTR] A signal was caught during `getpwnam()`.
 34618 [EMFILE] All file descriptors available to the process are currently open.
 34619 [ENFILE] The maximum allowable number of files is currently open in the system.
 34620 The `getpwnam_r()` function may fail if:
 34621 [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to be
 34622 referenced by the resulting **passwd** structure.

EXAMPLES

Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getpwnam_r()`.

```

34627 long int initlen = sysconf(_SC_GETPW_R_SIZE_MAX);
34628 size_t len;
34629 if (initlen == -1)
34630     /* Default initial length. */
34631     len = 1024;
34632 else
34633     len = (size_t) initlen;
34634 struct passwd result;
34635 struct passwd *resultp;
34636 char *buffer = malloc(len);
34637 if (buffer == NULL)
34638     ...handle error...
34639 int e;
34640 while ((e = getpwnam_r("someuser", &result, buffer, len, &resultp))
34641     == ERANGE)
34642     {
34643     size_t newlen = 2 * len;
34644     if (newlen < len)
34645         ...handle error...
34646     len = newlen;
34647     char *newbuffer = realloc(buffer, len);
34648     if (newbuffer == NULL)
34649         ...handle error...
34650     buffer = newbuffer;
34651     }
34652 if (e != 0)
34653     ...handle error...

```

Getting an Entry for the Login Name

The following example uses the `getlogin()` function to return the name of the user who logged in; this information is passed to the `getpwnam()` function to get the user database entry for that user.

```

34657 #include <sys/types.h>
34658 #include <pwd.h>
34659 #include <unistd.h>
34660 #include <stdio.h>
34661 #include <stdlib.h>
34662 ...
34663 char *lgn;
34664 struct passwd *pw;
34665 ...
34666 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
34667     fprintf(stderr, "Get of user information failed.\n"); exit(1);
34668 }
34669 ...

```

APPLICATION USAGE

Three names associated with the current process can be determined: *getpwuid(getuid())* returns the name associated with the effective user ID of the process; *getlogin()* returns the name associated with the current login activity; and *getpwuid(getuid())* returns the name associated with the real user ID of the process.

The *getpwnam_r()* function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

Portable applications should take into account that it is usual for an implementation to return -1 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The *getpwnam_r()* function is included for alignment with the POSIX Threads Extension.

A note indicating that the *getpwnam()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

The *getpwnam_r()* function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the *name*.

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.

getpwnam()

34711

Issue 7

34712

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

34713

SD5-XSH-ERN-166 is applied.

34714

The *getpwnam_r()* function is moved from the Thread-Safe Functions option to the Base.

+

34715 **NAME**34716 `getpwuid, getpwuid_r` — search user database for a user ID34717 **SYNOPSIS**34718 `#include <pwd.h>`34719 `struct passwd *getpwuid(uid_t uid);`34720 `int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,`
34721 `size_t bufsize, struct passwd **result);`34722 **DESCRIPTION**34723 The `getpwuid()` function shall search the user database for an entry with a matching `uid`.34724 The `getpwuid()` function need not be thread-safe. A function that is not required to be thread-safe
34725 is not required to be reentrant.34726 Applications wishing to check for error situations should set `errno` to 0 before calling `getpwuid()`.
34727 If `getpwuid()` returns a null pointer and `errno` is set to non-zero, an error occurred.34728 The `getpwuid_r()` function shall update the `passwd` structure pointed to by `pwd` and store a
34729 pointer to that structure at the location pointed to by `result`. The structure shall contain an entry
34730 from the user database with a matching `uid`. Storage referenced by the structure is allocated
34731 from the memory provided with the `buffer` parameter, which is `bufsize` bytes in size. A call to
34732 `sysconf(_SC_GETPW_R_SIZE_MAX)` returns either -1 without changing `errno` or an initial value
34733 suggested for the size of this buffer. A NULL pointer shall be returned at the location pointed to
34734 by `result` on error or if the requested entry is not found.34735 **RETURN VALUE**34736 The `getpwuid()` function shall return a pointer to a `struct passwd` with the structure as defined in
34737 `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested entry
34738 is not found, or an error occurs. On error, `errno` shall be set to indicate the error.34739 The return value may point to a static area which is overwritten by a subsequent call to
34740 `getpwent()`, `getpwnam()`, or `getpwuid()`.34741 If successful, the `getpwuid_r()` function shall return zero; otherwise, an error number shall be
34742 returned to indicate the error.34743 **ERRORS**34744 The `getpwuid()` and `getpwuid_r()` functions may fail if:

34745 [EIO] An I/O error has occurred.

34746 [EINTR] A signal was caught during `getpwuid()`.

34747 [EMFILE] All file descriptors available to the process are currently open.

34748 [ENFILE] The maximum allowable number of files is currently open in the system.

34749 The `getpwuid_r()` function may fail if:34750 [ERANGE] Insufficient storage was supplied via `buffer` and `bufsize` to contain the data to be
34751 referenced by the resulting `passwd` structure.

EXAMPLES

Note that `sysconf(_SC_GETPW_R_SIZE_MAX)` may return `-1` if there is no hard limit on the size of the buffer needed to store all the groups returned. This example shows how an application can allocate a buffer of sufficient size to work with `getpwuid_r()`.

    buffer = newbuffer;
}
if (e != 0)
    ...handle error...

```

Getting an Entry for the Root User

The following example gets the user database entry for the user with user ID 0 (root).

```

#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;

pwd = getpwuid(id);

```

Finding the Name for the Effective User ID

The following example defines `pws` as a pointer to a structure of type `passwd`, which is used to store the structure pointer returned by the call to the `getpwuid()` function. The `geteuid()` function shall return the effective user ID of the calling process; this is used as the search criteria for the `getpwuid()` function. The call to `getpwuid()` shall return a pointer to the structure containing that user ID value.

```

#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...

```

```

34800     struct passwd *pws;
34801     pws = getpwuid(geteuid());

```

34802 Finding an Entry in the User Database

34803 The following example uses *getpwuid()* to search the user database for a user ID that was
 34804 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not
 34805 found, the program prints the numeric value of the user ID for the entry.

```

34806     #include <sys/types.h>
34807     #include <pwd.h>
34808     #include <stdio.h>
34809     ...
34810     struct stat statbuf;
34811     struct passwd *pwd;
34812     ...
34813     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
34814         printf(" %-8.8s", pwd->pw_name);
34815     else
34816         printf(" %-8d", statbuf.st_uid);

```

34817 APPLICATION USAGE

34818 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns
 34819 the name associated with the effective user ID of the process; *getlogin()* returns the name
 34820 associated with the current login activity; and *getpwuid(getuid())* returns the name associated
 34821 with the real user ID of the process.

34822 The *getpwuid_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 34823 possibly using a static data area that may be overwritten by each call.

34824 Portable applications should take into account that it is usual for an implementation to return -1 +
 34825 from *sysconf()* indicating that there is no maximum for `_SC_GETPW_R_SIZE_MAX`.

34861 The *getpwuid_r()* function is moved from the Thread-Safe Functions option to the Base.

34862 **NAME**
 34863 getrlimit, setrlimit — control maximum resource consumption

34864 **SYNOPSIS**

```
34865 XSI #include <sys/resource.h>
34866 int getrlimit(int resource, struct rlimit *rlp);
34867 int setrlimit(int resource, const struct rlimit *rlp);
```

34868 **DESCRIPTION**

34869 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption
 34870 of a variety of resources.

34871 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as
 34872 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur*
 34873 member specifies the current or soft limit and the *rlim_max* member specifies the maximum or
 34874 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the
 34875 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or
 34876 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both
 34877 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints
 34878 described above.

34879 The value RLIM_INFINITY, defined in **<sys/resource.h>**, shall be considered to be larger than
 34880 any other limit value. If a call to *getrlimit()* returns RLIM_INFINITY for a resource, it means the
 34881 implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any
 34882 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource
 34883 limit.

34884 The following resources are defined:

34885 RLIMIT_CORE This is the maximum size of a **core** file, in bytes, that may be created by a
 34886 process. A limit of 0 shall prevent the creation of a **core** file. If this limit is
 34887 exceeded, the writing of a **core** file shall terminate at this size.

34888 RLIMIT_CPU This is the maximum amount of CPU time, in seconds, used by a process.
 34889 If this limit is exceeded, SIGXCPU shall be generated for the process. If
 34890 the process is catching or ignoring SIGXCPU, or all threads belonging to
 34891 that process are blocking SIGXCPU, the behavior is unspecified.

34892 RLIMIT_DATA This is the maximum size of a data segment of the process, in bytes. If
 34893 this limit is exceeded, the *malloc()* function shall fail with *errno* set to
 34894 [ENOMEM].

34895 RLIMIT_FSIZE This is the maximum size of a file, in bytes, that may be created by a
 34896 process. If a write or truncate operation would cause this limit to be
 34897 exceeded, SIGXFSZ shall be generated for the thread. If the thread is
 34898 blocking, or the process is catching or ignoring SIGXFSZ, continued
 34899 attempts to increase the size of a file from end-of-file to beyond the limit
 34900 shall fail with *errno* set to [EFBIG].

34901 RLIMIT_NOFILE This is a number one greater than the maximum value that the system
 34902 may assign to a newly-created descriptor. If this limit is exceeded,
 34903 functions that allocate a file descriptor shall fail with *errno* set to
 34904 [EMFILE]. This limit constrains the number of file descriptors that a
 34905 process may allocate.

34906	RLIMIT_STACK	This is the maximum size of the initial thread's stack, in bytes. The implementation does not automatically grow the stack beyond this limit. If this limit is exceeded, SIGSEGV shall be generated for the thread. If the thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.
34907		
34908		
34909		
34910		
34911		
34912	RLIMIT_AS	This is the maximum size of total available memory of the process, in bytes. If this limit is exceeded, the <i>malloc()</i> and <i>mmap()</i> functions shall fail with <i>errno</i> set to [ENOMEM]. In addition, the automatic stack growth fails with the effects outlined above.
34913		
34914		
34915		

34916 When using the *getrlimit()* function, if a resource limit can be represented correctly in an object
 34917 of type **rlim_t**, then its representation is returned; otherwise, if the value of the resource limit is
 34918 equal to that of the corresponding saved hard limit, the value returned shall be
 34919 RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.

34920 When using the *setrlimit()* function, if the requested new limit is RLIM_INFINITY, the new limit
 34921 shall be "no limit"; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit
 34922 shall be the corresponding saved hard limit; otherwise, if the requested new limit is
 34923 RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the
 34924 new limit shall be the requested value. In addition, if the corresponding saved limit can be
 34925 represented correctly in an object of type **rlim_t** then it shall be overwritten with the new limit.

34926 The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless
 34927 a previous call to *getrlimit()* returned that value as the soft or hard limit for the corresponding
 34928 resource limit.

34929 The determination of whether a limit can be correctly represented in an object of type **rlim_t** is
 34930 implementation-defined. For example, some implementations permit a limit whose value is
 34931 greater than RLIM_INFINITY and others do not.

34932 The *exec* family of functions shall cause resource limits to be saved.

34933 RETURN VALUE

34934 Upon successful completion, *getrlimit()* and *setrlimit()* shall return 0. Otherwise, these functions
 34935 shall return -1 and set *errno* to indicate the error.

34936 ERRORS

34937 The *getrlimit()* and *setrlimit()* functions shall fail if:

34938	[EINVAL]	An invalid <i>resource</i> was specified; or in a <i>setrlimit()</i> call, the new <i>rlim_cur</i> 34939 exceeds the new <i>rlim_max</i> .
34940	[EPERM]	The limit specified to <i>setrlimit()</i> would have raised the maximum limit value, 34941 and the calling process does not have appropriate privileges.

34942 The *setrlimit()* function may fail if:

34943	[EINVAL]	The limit specified cannot be lowered because current usage is already higher 34944 than the limit.

EXAMPLES

None.

APPLICATION USAGE

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value of `{_POSIX_OPEN_MAX}` from `<limits.h>`, unexpected behavior may occur.

If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the highest currently open file descriptor +1, unexpected behavior may occur.

RATIONALE

It should be noted that RLIMIT_STACK applies “at least” to the stack of the initial thread in the process, and not to the sum of all the stacks in the process, as that would be very limiting unless the value is so big as to provide no value at all with a single thread.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

An APPLICATION USAGE section is added.

Large File Summit extensions are added.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest currently open file descriptor +1.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/46 is applied, updating the definition of RLIMIT_STACK in the DESCRIPTION from “the maximum size of a process stack” to “the maximum size of the initial thread’s stack”. Text is added to the RATIONALE section.

34976 **NAME**
 34977 getrusage — get information about resource utilization

34978 **SYNOPSIS**

34979 XSI `#include <sys/resource.h>`
 34980 `int getrusage(int who, struct rusage *r_usage);`

34981 **DESCRIPTION**

34982 The *getrusage()* function shall provide measures of the resources used by the current process or
 34983 its terminated and waited-for child processes. If the value of the *who* argument is
 34984 RUSAGE_SELF, information shall be returned about resources used by the current process. If the
 34985 value of the *who* argument is RUSAGE_CHILDREN, information shall be returned about
 34986 resources used by the terminated and waited-for children of the current process. If the child is
 34987 never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to
 34988 SIG_IGN), the resource information for the child process is discarded and not included in the
 34989 resource information provided by *getrusage()*.

34990 The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned
 34991 information is stored.

34992 **RETURN VALUE**

34993 Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*
 34994 set to indicate the error.

34995 **ERRORS**

34996 The *getrusage()* function shall fail if:
 34997 [EINVAL] The value of the *who* argument is not valid.

34998 **EXAMPLES**

34999 **Using getrusage()**

35000 The following example returns information about the resources used by the current process.

```
35001 #include <sys/resource.h>
35002 ...
35003 int who = RUSAGE_SELF;
35004 struct rusage usage;
35005 int ret;
35006
35007 ret = getrusage(who, &usage);
```

35007 **APPLICATION USAGE**

35008 None.

35009 **RATIONALE**

35010 None.

35011 **FUTURE DIRECTIONS**

35012 None.

35018

Issue 5

35019

Moved from X/OPEN UNIX extension to BASE.

gets()35020 **NAME**

35021 gets — get a string from a stdin stream

35022 **SYNOPSIS**

```
35023 OB #include <stdio.h>
35024 char *gets(char *s);
```

35025 **DESCRIPTION**

35026 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 35027 conflict between the requirements described here and the ISO C standard is unintentional. This
 35028 volume of POSIX.1-200x defers to the ISO C standard.

35029 The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed
 35030 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall
 35031 be discarded and a null byte shall be placed immediately after the last byte read into the array.

35032 CX The *gets()* function may mark the last data access timestamp of the file associated with *stream* for
 35033 update. The last data access timestamp shall be marked for update by the first successful
 35034 execution of *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that
 35035 returns data not supplied by a prior call to *ungetc()*.

35036 **RETURN VALUE**

35037 Upon successful completion, *gets()* shall return *s*. If the end-of-file indicator for the stream is set,
 35038 or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and *gets()*
 35039 shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set,
 35040 CX *gets()* shall return a null pointer, and set *errno* to indicate the error.

35041 **ERRORS**35042 Refer to *fgetc()*.35043 **EXAMPLES**

35044 None.

35045 **APPLICATION USAGE**

35046 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of
 35047 *fgets()* is recommended.

35048 Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is
 35049 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in
 35050 such a way as to cause applications to fail, or possible system security violations.

35051 Applications should use the *fgets()* function instead of the obsolescent *gets()* function. |

35052 **RATIONALE**

35053 The standard developers decided to mark the *gets()* function as obsolescent even though it is in |
 35054 the ISO C standard due to the possibility of buffer overflow.

35055 **FUTURE DIRECTIONS**

35056 The *gets()* function may be removed in a future version. |

35057 **SEE ALSO**35058 *feof()*, *ferror()*, *fgets()*35059 XBD [<stdio.h>](#) |

35060	CHANGE HISTORY
35061	First released in Issue 1. Derived from Issue 1 of the SVID.
35062	Issue 6

35064	Issue 7
35065	Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.
35066	The <i>gets()</i> function is marked obsolescent. +
35067	Changes are made related to support for finegrained timestamps.

35068 **NAME**
35069 getservbyname, getservbyport, getservent — network services database functions

35070 **SYNOPSIS**
35071 #include <netdb.h>
35072 struct servent *getservbyname(const char *name, const char *proto);
35073 struct servent *getservbyport(int port, const char *proto);
35074 struct servent *getservent(void);

35075 **DESCRIPTION**
35076 Refer to *endservent()*.

35077 **NAME**

35078 getsid — get the process group ID of a session leader

35079 **SYNOPSIS**

35080 #include <unistd.h>

35081 pid_t getsid(pid_t pid);

35082 **DESCRIPTION**35083 The *getsid()* function shall obtain the process group ID of the process that is the session leader of
35084 the process specified by *pid*. If *pid* is (**pid_t**)0, it specifies the calling process.35085 **RETURN VALUE**35086 Upon successful completion, *getsid()* shall return the process group ID of the session leader of
35087 the specified process. Otherwise, it shall return (**pid_t**)-1 and set *errno* to indicate the error.35088 **ERRORS**35089 The *getsid()* function shall fail if:35090 [EPERM] The process specified by *pid* is not in the same session as the calling process,
35091 and the implementation does not allow access to the process group ID of the
35092 session leader of that process from the calling process.35093 [ESRCH] There is no process with a process ID equal to *pid*.35094 **EXAMPLES**

35095 None.

35096 **APPLICATION USAGE**

35097 None.

35098 **RATIONALE**

35099 None.

35107 **Issue 5**

35108 Moved from X/OPEN UNIX extension to BASE.

35109 **Issue 7**35110 The *getsid()* function is moved from the XSI option to the Base.

getsockname()35111 **NAME**35112 `getsockname` — get the socket name35113 **SYNOPSIS**35114 `#include <sys/socket.h>`35115 `int getsockname(int socket, struct sockaddr *restrict address,`
35116 `socklen_t *restrict address_len);`35117 **DESCRIPTION**35118 The `getsockname()` function shall retrieve the locally-bound name of the specified socket, store
35119 this address in the **sockaddr** structure pointed to by the `address` argument, and store the length of
35120 this address in the object pointed to by the `address_len` argument.35121 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
35122 the stored address shall be truncated.35123 If the socket has not been bound to a local name, the value stored in the object pointed to by
35124 `address` is unspecified.35125 **RETURN VALUE**35126 Upon successful completion, 0 shall be returned, the `address` argument shall point to the address
35127 of the socket, and the `address_len` argument shall point to the length of the address. Otherwise, -1
35128 shall be returned and `errno` set to indicate the error.35129 **ERRORS**35130 The `getsockname()` function shall fail if:35131 [EBADF] The `socket` argument is not a valid file descriptor.35132 [ENOTSOCK] The `socket` argument does not refer to a socket.

35133 [EOPNOTSUPP] The operation is not supported for this socket's protocol.

35134 The `getsockname()` function may fail if:

35135 [EINVAL] The socket has been shut down.

35136 [ENOBUFS] Insufficient resources were available in the system to complete the function.

35148

CHANGE HISTORY

35149

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35150

The **restrict** keyword is added to the *getsockname()* prototype for alignment with the ISO/IEC 9899:1999 standard.

35151

35152 **NAME**

35153 getsockopt — get the socket options

35154 **SYNOPSIS**

```
35155 #include <sys/socket.h>
35156
35157 int getsockopt(int socket, int level, int option_name,
35158               void *restrict option_value, socklen_t *restrict option_len);
```

35158 **DESCRIPTION**35159 The *getsockopt()* function manipulates options associated with a socket.

35160 The *getsockopt()* function shall retrieve the value for the option specified by the *option_name*
 35161 argument for the socket specified by the *socket* argument. If the size of the option value is greater
 35162 than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be
 35163 silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified
 35164 to indicate the actual length of the value.

35165 The *level* argument specifies the protocol level at which the option resides. To retrieve options at
 35166 the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels,
 35167 supply the appropriate level identifier for the protocol controlling the option. For example, to
 35168 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to
 35169 IPPROTO_TCP as defined in the **<netinet/in.h>** header.

35170 The socket in use may require the process to have appropriate privileges to use the *getsockopt()*
 35171 function.

35172 The *option_name* argument specifies a single option to be retrieved. It can be one of the following
 35173 values defined in **<sys/socket.h>**:

35174 SO_DEBUG Reports whether debugging information is being recorded. This option
 35175 shall store an **int** value. This is a Boolean option.

35176 SO_ACCEPTCONN Reports whether socket listening is enabled. This option shall store an **int**
 35177 value. This is a Boolean option.

35178 SO_BROADCAST Reports whether transmission of broadcast messages is supported, if this
 35179 is supported by the protocol. This option shall store an **int** value. This is a
 35180 Boolean option.

35181 SO_REUSEADDR Reports whether the rules used in validating addresses supplied to *bind()*
 35182 should allow reuse of local addresses, if this is supported by the protocol.
 35183 This option shall store an **int** value. This is a Boolean option.

35184 SO_KEEPALIVE Reports whether connections are kept active with periodic transmission
 35185 of messages, if this is supported by the protocol.

35186 If the connected socket fails to respond to these messages, the connection
 35187 shall be broken and threads writing to that socket shall be notified with a
 35188 SIGPIPE signal. This option shall store an **int** value. This is a Boolean
 35189 option.

35190 SO_LINGER Reports whether the socket lingers on *close()* if data is present. If
 35191 SO_LINGER is set, the system shall block the calling thread during *close()*
 35192 until it can transmit the data or until the end of the interval indicated by
 35193 the *l_linger* member, whichever comes first. If SO_LINGER is not
 35194 specified, and *close()* is issued, the system handles the call in a way that
 35195 allows the calling thread to continue as quickly as possible. This option
 35196 shall store a **linger** structure.

35197	SO_OOBINLINE	Reports whether the socket leaves received out-of-band data (data marked urgent) inline. This option shall store an int value. This is a Boolean option.
35198		
35199		
35200	SO_SNDBUF	Reports send buffer size information. This option shall store an int value.
35201	SO_RCVBUF	Reports receive buffer size information. This option shall store an int value.
35202		
35203	SO_ERROR	Reports information about error status and clears it. This option shall store an int value.
35204		
35205	SO_TYPE	Reports the socket type. This option shall store an int value. Socket types are described in Section 2.10.6 (on page 497).
35206		
35207	SO_DONTROUTE	Reports whether outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option shall store an int value. This is a Boolean option.
35208		
35209		
35210		
35211		
35212		
35213	SO_RCVLOWAT	Reports the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option shall store an int value. Note that not all implementations allow this option to be retrieved.
35214		
35215		
35216		
35217		
35218		
35219		
35220		
35221		
35222	SO_RCVTIMEO	Reports the timeout value for input operations. This option shall store a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was received. The default for this option is zero, which indicates that a receive operation shall not time out. Note that not all implementations allow this option to be retrieved.
35223		
35224		
35225		
35226		
35227		
35228		
35229		
35230	SO_SNDLOWAT	Reports the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option shall store an int value. Note that not all implementations allow this option to be retrieved.
35231		
35232		
35233		
35234		
35235	SO_SNDTIMEO	Reports the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was sent. The default for this option is zero, which indicates that a send operation shall not time out. The option shall store a timeval structure. Note that not all implementations allow this option to be retrieved.
35236		
35237		
35238		
35239		
35240		
35241		
35242		
35243		
		For Boolean options, a zero value indicates that the option is disabled and a non-zero value indicates that the option is enabled.

getsockopt()35244 **RETURN VALUE**

35245 Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno*
 35246 set to indicate the error.

35247 **ERRORS**

35248 The *getsockopt()* function shall fail if:

35249 [EBADF] The *socket* argument is not a valid file descriptor.

35250 [EINVAL] The specified option is invalid at the specified socket level.

35251 [ENOPROTOOPT]

35252 The option is not supported by the protocol.

35253 [ENOTSOCK] The *socket* argument does not refer to a socket.

35254 The *getsockopt()* function may fail if:

35255 [EACCES] The calling process does not have the appropriate privileges.

35256 [EINVAL] The socket has been shut down.

35257 [ENOBUFS] Insufficient resources are available in the system to complete the function.

35258 **EXAMPLES**

35259 None.

35269 **CHANGE HISTORY**

35270 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35271 The **restrict** keyword is added to the *getsockopt()* prototype for alignment with the
 35272 ISO/IEC 9899:1999 standard.

35273 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/47 is applied, updating the description of
 35274 SO_LINGER in the DESCRIPTION so that it blocks the calling thread rather than the process.

35275 **NAME**
 35276 `getsubopt` — parse suboption arguments from a string

35277 **SYNOPSIS**
 35278 `#include <stdlib.h>`

35279 `int getsubopt(char **optionp, char * const *keylistp, char **valuep);`

35280 DESCRIPTION

35281 The `getsubopt()` function shall parse suboption arguments in a flag argument. Such options often
 35282 result from the use of `getopt()`.

35283 The `getsubopt()` argument *optionp* is a pointer to a pointer to the option argument string. The
 35284 suboption arguments shall be separated by commas and each may consist of either a single
 35285 token, or a token-value pair separated by an equal sign.

35286 The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified
 35287 by a null pointer. Each entry in the vector is one of the possible tokens that might be found in
 35288 **optionp*. Since commas delimit suboption arguments in *optionp*, they should not appear in any of
 35289 the strings pointed to by *keylistp*. Similarly, because an equal sign separates a token from its
 35290 value, the application should not include an equal sign in any of the strings pointed to by
 35291 *keylistp*.

35292 The *valuep* argument is the address of a value string pointer.

35293 If a comma appears in *optionp*, it shall be interpreted as a suboption separator. After commas
 35294 have been processed, if there are one or more equal signs in a suboption string, the first equal
 35295 sign in any suboption string shall be interpreted as a separator between a token and a value.
 35296 Subsequent equal signs in a suboption string shall be interpreted as part of the value.

35297 If the string at **optionp* contains only one suboption argument (equivalently, no commas),
 35298 `getsubopt()` shall update **optionp* to point to the null character at the end of the string. Otherwise,
 35299 it shall isolate the suboption argument by replacing the comma separator with a null character,
 35300 and shall update **optionp* to point to the start of the next suboption argument. If the suboption
 35301 argument has an associated value (equivalently, contains an equal sign), `getsubopt()` shall update
 35302 **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The
 35303 calling application may use this information to determine whether the presence or absence of a
 35304 value for the suboption is an error.

35305 Additionally, when `getsubopt()` fails to match the suboption argument with a token in the *keylistp*
 35306 array, the calling application should decide if this is an error, or if the unrecognized option
 35307 should be processed in another way.

35308 RETURN VALUE

35309 The `getsubopt()` function shall return the index of the matched token string, or `-1` if no token
 35310 strings were matched.

35311 ERRORS

35312 No errors are defined.

35313

EXAMPLES

```

35314     #include <stdio.h>
35315     #include <stdlib.h>

35316     int do_all;
35317     const char *type;
35318     int read_size;
35319     int write_size;
35320     int read_only;

35321     enum
35322     {
35323         RO_OPTION = 0,
35324         RW_OPTION,
35325         READ_SIZE_OPTION,
35326         WRITE_SIZE_OPTION
35327     };

35328     const char *mount_opts[] =
35329     {
35330         [RO_OPTION] = "ro",
35331         [RW_OPTION] = "rw",
35332         [READ_SIZE_OPTION] = "rsize",
35333         [WRITE_SIZE_OPTION] = "wsize",
35334         NULL
35335     };

35336     int
35337     main(int argc, char *argv[])
35338     {
35339         char *subopts, *value;
35340         int opt;

35341         while ((opt = getopt(argc, argv, "at:o:")) != -1)
35342             switch(opt)
35343             {
35344                 case 'a':
35345                     do_all = 1;
35346                     break;
35347                 case 't':
35348                     type = optarg;
35349                     break;
35350                 case 'o':
35351                     subopts = optarg;
35352                     while (*subopts != '\0')
35353                         switch(getsubopt(&subopts, mount_opts, &value))
35354                         {
35355                             case RO_OPTION:
35356                                 read_only = 1;
35357                                 break;
35358                             case RW_OPTION:
35359                                 read_only = 0;
35360                                 break;
35361                             case READ_SIZE_OPTION:
35362                                 if (value == NULL)
35363                                     abort();

```

```

35364         read_size = atoi(value);
35365         break;
35366     case WRITE_SIZE_OPTION:
35367         if (value == NULL)
35368             abort();
35369         write_size = atoi(value);
35370         break;
35371     default:
35372         /* Unknown suboption. */
35373         printf("Unknown suboption '%s'\n", value);
35374         break;
35375     }
35376     break;
35377     default:
35378         abort();
35379     }
35380     /* Do the real work. */
35381     return 0;
35382 }

```

35383 Parsing Suboptions

35384 The following example uses the *getsubopt()* function to parse a *value* argument in the *optarg*
 35385 external variable returned by a call to *getopt()*.

```

35386 #include <stdlib.h>
35387 ...
35388 char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
35389 char *value;
35390 int opt, index;
35391 while ((opt = getopt(argc, argv, "e:")) != -1) {
35392     switch(opt) {
35393     case 'e':
35394         while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
35395             switch(index) {
35396             ...
35397             }
35398             break;
35399         ...
35400     }
35401     }
35402     ...

```

35419

Issue 7

35420

The *getsubopt()* function is moved from the XSI option to the Base.

35421 **NAME**
 35422 gettimeofday — get the date and time

35423 **SYNOPSIS**

```
35424 OB XSI #include <sys/time.h>
35425      int gettimeofday(struct timeval *restrict tp, void *restrict tzp);
```

35426 **DESCRIPTION**

35427 The *gettimeofday()* function shall obtain the current time, expressed as seconds and microseconds
 35428 since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The resolution of the
 35429 system clock is unspecified.

35430 If *tzp* is not a null pointer, the behavior is unspecified.

35431 **RETURN VALUE**

35432 The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

35433 **ERRORS**

35434 No errors are defined.

35435 **EXAMPLES**

35436 None.

35437 **APPLICATION USAGE**

35438 Applications should use the *clock_gettime()* function instead of the obsolescent *gettimeofday()*
 35439 function.

35440 **RATIONALE**

35441 None.

35442 **FUTURE DIRECTIONS**

35443 The *gettimeofday()* function may be removed in a future version.

35444 **SEE ALSO**

35445 *clock_getres()*, *ctime()*

35446 XBD [<sys/time.h>](#)

35447 **CHANGE HISTORY**

35448 First released in Issue 4, Version 2.

35449 **Issue 5**

35450 Moved from X/OPEN UNIX extension to BASE.

35451 **Issue 6**

35452 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
 35453 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
 35454 functions.

35455 The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the
 35456 ISO/IEC 9899:1999 standard.

35457 **Issue 7**

35458 The *gettimeofday()* function is marked obsolescent.

35459 **NAME**35460 `getuid` — get a real user ID35461 **SYNOPSIS**35462 `#include <unistd.h>`
35463 `uid_t getuid(void);`35464 **DESCRIPTION**35465 The `getuid()` function shall return the real user ID of the calling process.35466 **RETURN VALUE**35467 The `getuid()` function shall always be successful and no return value is reserved to indicate the
35468 error.35469 **ERRORS**

35470 No errors are defined.

35471 **EXAMPLES**35472 **Setting the Effective User ID to the Real User ID**35473 The following example sets the effective user ID and the real user ID of the current process to the
35474 real user ID of the caller.35475 `#include <unistd.h>`
35476 `#include <sys/types.h>`
35477 `...`
35478 `setreuid(getuid(), getuid());`
35479 `...`35480 **APPLICATION USAGE**

35481 None.

35482 **RATIONALE**

35483 None.

35484 **FUTURE DIRECTIONS**

35485 None.

35486 **SEE ALSO**35487 [*getegid\(\), geteuid\(\), getgid\(\), setegid\(\), seteuid\(\), setgid\(\), setregid\(\), setreuid\(\), setuid\(\)*](#)35488 XBD [*<sys/types.h>*](#), [*<unistd.h>*](#)35489 **CHANGE HISTORY**

35490 First released in Issue 1. Derived from Issue 1 of the SVID.

35491 **Issue 6**35492 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.35493 The following new requirements on POSIX implementations derive from alignment with the
35494 Single UNIX Specification:

- 35495
- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
35496 required for conforming implementations of previous POSIX specifications, it was not
35497 required for UNIX applications.

35498

NAME35499
35500 getutxent, getutxid, getutxline — get user accounting database entries**SYNOPSIS**35501 XSI

```

```

DESCRIPTION35506 Refer to *endutxent()*.

35507

35508 **NAME**35509 `getwc` — get a wide character from a stream35510 **SYNOPSIS**35511 `#include <stdio.h>`35512 `#include <wchar.h>`35513 `wint_t getwc(FILE *stream);`35514 **DESCRIPTION**35515 CX The functionality described on this reference page is aligned with the ISO C standard. Any
35516 conflict between the requirements described here and the ISO C standard is unintentional. This
35517 volume of POSIX.1-200x defers to the ISO C standard.35518 The `getwc()` function shall be equivalent to `fgetwc()`, except that if it is implemented as a macro it
35519 may evaluate `stream` more than once, so the argument should never be an expression with side
35520 effects.35521 **RETURN VALUE**35522 Refer to `fgetwc()`.35523 **ERRORS**35524 Refer to `fgetwc()`.35525 **EXAMPLES**

35526 None.

35527 **APPLICATION USAGE**35528 Since it may be implemented as a macro, `getwc()` may treat incorrectly a `stream` argument with
35529 side effects. In particular, `getwc(*f++)` does not necessarily work as expected. Therefore, use of
35530 this function is not recommended; `fgetwc()` should be used instead.35531 **RATIONALE**

35532 None.

35533 **FUTURE DIRECTIONS**

35534 None.

35535 **SEE ALSO**35536 `fgetwc()`35537 XBD `<stdio.h>`, `<wchar.h>`35538 **CHANGE HISTORY**35539 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
35540 draft.35541 **Issue 5**35542 The Optional Header (OH) marking is removed from `<stdio.h>`.

35543 **NAME**
 35544 `getwchar` — get a wide character from a stdin stream

35545 **SYNOPSIS**
 35546 `#include <wchar.h>`
 35547 `wint_t getwchar(void);`

35548 **DESCRIPTION**
 35549 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 35550 conflict between the requirements described here and the ISO C standard is unintentional. This
 35551 volume of POSIX.1-200x defers to the ISO C standard.

35552 The `getwchar()` function shall be equivalent to `getwc(stdin)`.

35553 **RETURN VALUE**
 35554 Refer to `fgetwc()`.

35555 **ERRORS**
 35556 Refer to `fgetwc()`.

35557 **EXAMPLES**
 35558 None.

35559 **APPLICATION USAGE**
 35560 If the `wint_t` value returned by `getwchar()` is stored into a variable of type `wchar_t` and then
 35561 compared against the `wint_t` macro `WEOF`, the result may be incorrect. Only the `wint_t` type is
 35562 guaranteed to be able to represent any wide character and `WEOF`.

35563 **RATIONALE**
 35564 None.

35565 **FUTURE DIRECTIONS**
 35566 None.

35567 **SEE ALSO**
 35568 `fgetwc()`, `getwc()`

35569 XBD `<wchar.h>`

35570 **CHANGE HISTORY**
 35571 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
 35572 draft.

35573 **NAME**
 35574 glob, globfree — generate pathnames matching a pattern

35575 **SYNOPSIS**
 35576 #include <glob.h>
 35577 int glob(const char *restrict pattern, int flags,
 35578 int (*errfunc)(const char *epath, int eerrno),
 35579 glob_t *restrict pglob);
 35580 void globfree(glob_t *pglob);

35581 **DESCRIPTION**
 35582 The *glob()* function is a pathname generator that shall implement the rules defined in XCU |
 35583 Section 2.13 (on page 2278), with optional support for rule 3 in XCU Section 2.13.3 (on page |
 35584 2279).

35585 The structure type **glob_t** is defined in <glob.h> and includes at least the following members:

Member Type	Member Name	Description
size_t	gl_pathc	Count of paths matched by <i>pattern</i> .
char **	gl_pathv	Pointer to a list of matched pathnames.
size_t	gl_offs	Slots to reserve at the beginning of <i>gl_pathv</i> .

35590 The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function
 35591 shall match all accessible pathnames against this pattern and develop a list of all pathnames that
 35592 match. In order to have access to a pathname, *glob()* requires search permission on every
 35593 component of a path except the last, and read permission on each directory of any filename
 35594 component of *pattern* that contains any of the following special characters: '*', '?', and '['.

35595 The *glob()* function shall store the number of matched pathnames into *pglob->gl_pathc* and a
 35596 pointer to a list of pointers to pathnames into *pglob->gl_pathv*. The pathnames shall be in sort
 35597 order as defined by the current setting of the *LC_COLLATE* category; see XBD Section 7.3.2 (on |
 35598 page 132). The first pointer after the last pathname shall be a null pointer. If the pattern does not |
 35599 match any pathnames, the returned number of matched paths is set to 0, and the contents of |
 35600 *pglob->gl_pathv* are implementation-defined.

35601 It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function
 35602 shall allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree()*
 35603 function shall free any space associated with *pglob* from a previous call to *glob()*.

35604 The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-
 35605 inclusive OR of zero or more of the following constants, which are defined in <glob.h>:

35606	GLOBAL_APPEND	Append pathnames generated to the ones from a previous call to <i>glob()</i> .
35607	GLOBAL_DOOFFS	Make use of <i>pglob->gl_offs</i> . If this flag is set, <i>pglob->gl_offs</i> is used to 35608 specify how many null pointers to add to the beginning of 35609 <i>pglob->gl_pathv</i> . In other words, <i>pglob->gl_pathv</i> shall point to 35610 <i>pglob->gl_offs</i> null pointers, followed by <i>pglob->gl_pathc</i> pathname 35611 pointers, followed by a null pointer.
35612	GLOBAL_ERR	Cause <i>glob()</i> to return when it encounters a directory that it cannot open 35613 or read. Ordinarily, <i>glob()</i> continues to find matches.
35614	GLOBAL_MARK	Each pathname that is a directory that matches <i>pattern</i> shall have a slash 35615 appended.

35616 GLOB_NOCHECK Supports rule 3 in XCU [Section 2.13.3](#) (on page 2279). If *pattern* does not
 35617 match any pathname, then *glob()* shall return a list consisting of only
 35618 *pattern*, and the number of matched pathnames is 1.

35619 GLOB_NOESCAPE Disable backslash escaping.

35620 GLOB_NOSORT Ordinarily, *glob()* sorts the matching pathnames according to the current
 35621 setting of the *LC_COLLATE* category; see XBD [Section 7.3.2](#) (on page 132).
 35622 When this flag is used, the order of pathnames returned is unspecified.

35623 The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a
 35624 previous call to *glob()*. The following rules apply to applications when two or more calls to
 35625 *glob()* are made with the same value of *pglob* and without intervening calls to *globfree()*:

- 35626 1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.
- 35627 2. All the calls shall set GLOB_DOOFFS, or all shall not set it.
- 35628 3. After the second call, *pglob->gl_pathv* points to a list containing the following:
 - 35629 a. Zero or more null pointers, as specified by GLOB_DOOFFS and *pglob->gl_offs*.
 - 35630 b. Pointers to the pathnames that were in the *pglob->gl_pathv* list before the call, in
 35631 the same order as before.
 - 35632 c. Pointers to the new pathnames generated by the second call, in the specified order.
- 35633 4. The count returned in *pglob->gl_pathc* shall be the total number of pathnames from the
 35634 two calls.
- 35635 5. The application can change any of the fields after a call to *glob()*. If it does, the
 35636 application shall reset them to the original value before a subsequent call, using the same
 35637 *pglob* value, to *globfree()* or *glob()* with the GLOB_APPEND flag.

35638 If, during the search, a directory is encountered that cannot be opened or read and *errfunc* is not
 35639 a null pointer, *glob()* calls (**errfunc()*) with two arguments:

- 35640 1. The *epath* argument is a pointer to the path that failed.
- 35641 2. The *errno* argument is the value of *errno* from the failure, as set by *opendir()*, *readdir()*, or
 35642 *stat()*. (Other values may be used to report other errors not explicitly documented for
 35643 those functions.)

35644 If (**errfunc()*) is called and returns non-zero, or if the GLOB_ERR flag is set in *flags*, *glob()* shall
 35645 stop the scan and return GLOB_ABORTED after setting *gl_pathc* and *gl_pathv* in *pglob* to reflect
 35646 the paths already scanned. If GLOB_ERR is not set and either *errfunc* is a null pointer or
 35647 (**errfunc()*) returns 0, the error shall be ignored.

35648 The *glob()* function shall not fail because of large files.

35649 RETURN VALUE

35650 Upon successful completion, *glob()* shall return 0. The argument *pglob->gl_pathc* shall return the
 35651 number of matched pathnames and the argument *pglob->gl_pathv* shall contain a pointer to a
 35652 null-terminated list of matched and sorted pathnames. However, if *pglob->gl_pathc* is 0, the
 35653 content of *pglob->gl_pathv* is undefined.

35654 The *globfree()* function shall not return a value.

35655 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in
 35656 **<glob.h>**. The arguments *pglob->gl_pathc* and *pglob->gl_pathv* are still set as defined above.

ERRORS

35657
35658 The *glob()* function shall fail and return the corresponding value if:

35659 GLOB_ABORTED The scan was stopped because GLOB_ERR was set or (**errfunc()*)
35660 returned non-zero.

35661 GLOB_NOMATCH The pattern does not match any existing pathname, and
35662 GLOB_NOCHECK was not set in flags.

35663 GLOB_NOSPACE An attempt to allocate memory failed.

EXAMPLES

35664 One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with
35665 *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the
35666 equivalent of:
35667

```
35668 ls -l *.c
```

35669 but for some reason:

```
35670 system("ls -l *.c")
```

35671 is not acceptable. The application could obtain approximately the same result using the
35672 sequence:

```
35673 globbuf.gl_offs = 2;  
35674 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
35675 globbuf.gl_pathv[0] = "ls";  
35676 globbuf.gl_pathv[1] = "-l";  
35677 execvp("ls", &globbuf.gl_pathv[0]);
```

35678 Using the same example:

```
35679 ls -l *.c *.h
```

35680 could be approximately simulated using GLOB_APPEND as follows:

```
35681 globbuf.gl_offs = 2;  
35682 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
35683 glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);  
35684 ...
```

APPLICATION USAGE

35685 This function is not provided for the purpose of enabling utilities to perform pathname
35686 expansion on their arguments, as this operation is performed by the shell, and utilities are
35687 explicitly not expected to redo this. Instead, it is provided for applications that need to do
35688 pathname expansion on strings obtained from other sources, such as a pattern typed by a user or
35689 read from a file.
35690

35691 If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

35692 Note that *gl_pathc* and *gl_pathv* have meaning even if *glob()* fails. This allows *glob()* to report
35693 partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if
35694 *glob()* did not return an error.

35695 The GLOB_NOCHECK option could be used when an application wants to expand a pathname
35696 if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility
35697 might use this for option-arguments, for example.

35698 The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted
35699 together with the previous pathnames. This mirrors the way that the shell handles pathname
35700 expansion when multiple expansions are done on a command line.

35701 Applications that need tilde and parameter expansion should use *wordexp()*.

RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
new = (char **)malloc((n + pglob->gl_pathc + 1)
    * sizeof(char *));
(void) memcpy(new+n, pglob->gl_pathv,
    pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately created using *malloc()*. This is not necessarily the case. An application should make no assumptions about how the memory referenced by fields in *pglob* was allocated. It might have been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have been created using a different memory allocator. It is not the intent of the standard developers to specify or imply how the memory used by *glob()* is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different patterns into a single list.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999 standard.

35732 **NAME**

35733 gmtime, gmtime_r — convert a time value to a broken-down UTC time

35734 **SYNOPSIS**

35735 #include <time.h>

35736 struct tm *gmtime(const time_t *timer);

35737 CX struct tm *gmtime_r(const time_t *restrict timer,
35738 struct tm *restrict result);35739 **DESCRIPTION**35740 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C
35741 standard. Any conflict between the requirements described here and the ISO C standard is
35742 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.35743 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into
35744 a broken-down time, expressed as Coordinated Universal Time (UTC).35745 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*
35746 and the **tm** structure (defined in the <time.h> header) is that the result shall be as specified in
35747 the expression given in the definition of seconds since the Epoch (see XBD [Section 4.15](#), on page
35748 100), where the names in the structure and in the expression correspond.35749 The same relationship shall apply for *gmtime_r()*.35750 The *gmtime()* function need not be thread-safe. A function that is not required to be thread-safe
35751 is not required to be reentrant.35752 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
35753 objects: a broken-down time structure and an array of type **char**. Execution of any of the
35754 functions may overwrite the information returned in either of these objects by any of the other
35755 functions.35756 The *gmtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
35757 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down
35758 time is stored in the structure referred to by *result*. The *gmtime_r()* function shall also return the
35759 address of the same structure.35760 **RETURN VALUE**35761 CX Upon successful completion, the *gmtime()* function shall return a pointer to a **struct tm**. If an
35762 error is detected, *gmtime()* shall return a null pointer and set *errno* to indicate the error.35763 Upon successful completion, *gmtime_r()* shall return the address of the structure pointed to by
35764 the argument *result*. If an error is detected, *gmtime_r()* shall return a null pointer and set *errno* to
35765 indicate the error.35766 **ERRORS**35767 CX The *gmtime()* and *gmtime_r()* functions shall fail if:

35768 CX [EOVERFLOW] The result cannot be represented.

XBD Section 4.15 (on page 100), **<time.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the *gmtime()* function need not be reentrant is added to the DESCRIPTION.

The *gmtime_r()* function is included for alignment with the POSIX Threads Extension.

Issue 6

The *gmtime_r()* function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The **restrict** keyword is added to the *gmtime_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [Eoverflow] error.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/48 is applied, updating the error handling for *gmtime_r()*.

Issue 7

The *gmtime_r()* function is moved from the Thread-Safe Functions option to the Base.

35800 **NAME**

35801 grantpt — grant access to the slave pseudo-terminal device

35802 **SYNOPSIS**

```
35803 XSI #include <stdlib.h>
35804 int grantpt(int fildes);
```

35805 **DESCRIPTION**

35806 The *grantpt()* function shall change the mode and ownership of the slave pseudo-terminal
 35807 device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file
 35808 descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to
 35809 the real UID of the calling process and the group ID shall be set to an unspecified group ID. The
 35810 permission mode of the slave pseudo-terminal shall be set to readable and writable by the
 35811 owner, and writable by the group.

35812 The behavior of the *grantpt()* function is unspecified if the application has installed a signal
 35813 handler to catch SIGCHLD signals.

35814 **RETURN VALUE**

35815 Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to
 35816 indicate the error.

35817 **ERRORS**

35818 The *grantpt()* function may fail if:

- | | | |
|-------|----------|--|
| 35819 | [EBADF] | The <i>fildes</i> argument is not a valid open file descriptor. |
| 35820 | [EINVAL] | The <i>fildes</i> argument is not associated with a master pseudo-terminal device. |
| 35821 | [EACCES] | The corresponding slave pseudo-terminal device could not be accessed. |

35833 **CHANGE HISTORY**

35834 First released in Issue 4, Version 2.

35835 **Issue 5**

35836 Moved from X/OPEN UNIX extension to BASE.

35837 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

35838 **NAME**
 35839 `hcreate`, `hdestroy`, `hsearch` — manage hash search table

SYNOPSIS

```
35841 XSI #include <search.h>
35842
35842 int hcreate(size_t nel);
35843 void hdestroy(void);
35844 ENTRY *hsearch(ENTRY item, ACTION action);
```

DESCRIPTION

35845 The `hcreate()`, `hdestroy()`, and `hsearch()` functions shall manage hash search tables.

35847 The `hcreate()` function shall allocate sufficient space for the table, and the application shall
 35848 ensure it is called before `hsearch()` is used. The `nel` argument is an estimate of the maximum
 35849 number of entries that the table shall contain. This number may be adjusted upward by the
 35850 algorithm in order to obtain certain mathematically favorable circumstances.

35851 The `hdestroy()` function shall dispose of the search table, and may be followed by another call to
 35852 `hcreate()`. After the call to `hdestroy()`, the data can no longer be considered accessible.

35853 The `hsearch()` function is a hash-table search routine. It shall return a pointer into a hash table
 35854 indicating the location at which an entry can be found. The `item` argument is a structure of type
 35855 **ENTRY** (defined in the `<search.h>` header) containing two pointers: `item.key` points to the
 35856 comparison key (a `char *`), and `item.data` (a `void *`) points to any other data to be associated with
 35857 that key. The comparison function used by `hsearch()` is `strcmp()`. The `action` argument is a
 35858 member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be
 35859 found in the table. **ENTER** indicates that the item should be inserted in the table at an
 35860 appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is
 35861 indicated by the return of a null pointer.

35862 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 35863 required to be reentrant.

RETURN VALUE

35864 The `hcreate()` function shall return 0 if it cannot allocate sufficient space for the table; otherwise,
 35865 it shall return non-zero.

35867 The `hdestroy()` function shall not return a value.

35868 The `hsearch()` function shall return a null pointer if either the action is **FIND** and the item could
 35869 not be found or the action is **ENTER** and the table is full.

ERRORS

35870 The `hcreate()` and `hsearch()` functions may fail if:
 35871
 35872 [ENOMEM] Insufficient storage space is available.

EXAMPLES

The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

DRAFT

35935 **NAME**
 35936 htonl, htons, ntohl, ntohs — convert values between host and network byte order

35937 **SYNOPSIS**
 35938 #include <arpa/inet.h>
 35939 uint32_t htonl(uint32_t *hostlong*);
 35940 uint16_t htons(uint16_t *hostshort*);
 35941 uint32_t ntohl(uint32_t *netlong*);
 35942 uint16_t ntohs(uint16_t *netshort*);

35943 **DESCRIPTION**
 35944 These functions shall convert 16-bit and 32-bit quantities between network byte order and host
 35945 byte order.

35946 On some implementations, these functions are defined as macros.

35947 The **uint32_t** and **uint16_t** types are defined in **<inttypes.h>**.

35948 **RETURN VALUE**
 35949 The *htonl()* and *htons()* functions shall return the argument value converted from host to
 35950 network byte order.

35951 The *ntohl()* and *ntohs()* functions shall return the argument value converted from network to
 35952 host byte order.

35953 **ERRORS**
 35954 No errors are defined.

35955 **EXAMPLES**
 35956 None.

35957 **APPLICATION USAGE**
 35958 These functions are most often used in conjunction with IPv4 addresses and ports as returned by
 35959 *gethostent()* and *getservent()*.

35960 **RATIONALE**
 35961 None.

35962 **FUTURE DIRECTIONS**
 35963 None.

35964 **SEE ALSO**
 35965 *endhostent()*, *endservent()*
 35966 XBD **<arpa/inet.h>**, **<inttypes.h>**

35967 **CHANGE HISTORY**
 35968 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

35969 **NAME**
 35970 hypot, hypotf, hypotl — Euclidean distance function

35971 **SYNOPSIS**
 35972 #include <math.h>
 35973 double hypot(double x, double y);
 35974 float hypotf(float x, float y);
 35975 long double hypotl(long double x, long double y);

35976 DESCRIPTION

35977 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 35978 conflict between the requirements described here and the ISO C standard is unintentional. This
 35979 volume of POSIX.1-200x defers to the ISO C standard.

35980 These functions shall compute the value of the square root of x^2+y^2 without undue overflow or
 35981 underflow.

35982 An application wishing to check for error situations should set *errno* to zero and call
 35983 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 35984 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 35985 zero, an error has occurred.

35986 RETURN VALUE

35987 Upon successful completion, these functions shall return the length of the hypotenuse of a right-
 35988 angled triangle with sides of length *x* and *y*.

35989 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and
 35990 *hypotl()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 35991 respectively.

35992 MX If *x* or *y* is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned (even if one of *x* or *y* is NaN).

35993 If *x* or *y* is NaN, and the other is not $\pm\text{Inf}$, a NaN shall be returned.

35994 If both arguments are subnormal and the correct result is subnormal, a range error may occur
 35995 and the correct result is returned.

35996 ERRORS

35997 These functions shall fail if:

35998 Range Error The result overflows.

35999 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 36000 then *errno* shall be set to [ERANGE]. If the integer expression
 36001 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 36002 floating-point exception shall be raised.

36003 These functions may fail if:

36004 MX Range Error The result underflows.

36005 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 36006 then *errno* shall be set to [ERANGE]. If the integer expression
 36007 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 36008 floating-point exception shall be raised.

36038
36039
36040

EXAMPLES

See the EXAMPLES section in *atan2()*.

APPLICATION USAGE

hypot(x,y), *hypot(y,x)*, and *hypot(x, -y)* are equivalent.

hypot(x, ±0) is equivalent to *fabs(x)*.

Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also subnormal.

These functions take precautions against overflow during intermediate steps of the computation.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 4.19 (on page 104), <math.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *hypot()* function is no longer marked as an extension.

The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/49 is applied, updating the EXAMPLES section.

36041 **NAME**

36042 iconv — codeset conversion function

36043 **SYNOPSIS**

36044 #include <iconv.h>

```
36045 size_t iconv(iconv_t cd, char **restrict inbuf,
36046             size_t *restrict inbytesleft, char **restrict outbuf,
36047             size_t *restrict outbytesleft);
```

36048 **DESCRIPTION**

36049 The *iconv()* function shall convert the sequence of characters from one codeset, in the array
 36050 specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array
 36051 specified by *outbuf*. The codesets are those specified in the *iconv_open()* call that returned the
 36052 conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first
 36053 character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer
 36054 to be converted. The *outbuf* argument points to a variable that points to the first available byte in
 36055 the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the
 36056 buffer.

36057 For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by
 36058 a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()* is
 36059 called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft*
 36060 points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change
 36061 the output buffer to its initial shift state. If the output buffer is not large enough to hold the
 36062 entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as
 36063 other than a null pointer or a pointer to a null pointer cause the conversion to take place from
 36064 the current state of the conversion descriptor.

36065 If a sequence of input bytes does not form a valid character in the specified codeset, conversion
 36066 shall stop after the previous successfully converted character. If the input buffer ends with an
 36067 incomplete character or shift sequence, conversion shall stop after the previous successfully
 36068 converted bytes. If the output buffer is not large enough to hold the entire converted input,
 36069 conversion shall stop just prior to the input bytes that would cause the output buffer to
 36070 overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last
 36071 byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be
 36072 decremented to reflect the number of bytes still not converted in the input buffer. The variable
 36073 pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted
 36074 output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of
 36075 bytes still available in the output buffer. For state-dependent encodings, the conversion
 36076 descriptor shall be updated to reflect the shift state in effect at the end of the last successfully
 36077 converted byte sequence.

36078 If *iconv()* encounters a character in the input buffer that is valid, but for which an identical
 36079 character does not exist in the target codeset, *iconv()* shall perform an implementation-defined
 36080 conversion on this character.

36081 **RETURN VALUE**

36082 The *iconv()* function shall update the variables pointed to by the arguments to reflect the extent
 36083 of the conversion and return the number of non-identical conversions performed. If the entire
 36084 string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input
 36085 conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft*
 36086 shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv()* shall
 36087 return (*size_t*)-1 and set *errno* to indicate the error.

ERRORS

- 36088 The *iconv()* function shall fail if:
- 36089
- 36090 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the
- 36091 input codeset.
- 36092 [E2BIG] Input conversion stopped due to lack of space in the output buffer.
- 36093 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at
- 36094 the end of the input buffer.
- 36095 The *iconv()* function may fail if:
- 36096 [EBADF] The *cd* argument is not a valid open conversion descriptor.

EXAMPLES

- 36097 None.
- 36098

APPLICATION USAGE

- 36100 The *inbuf* argument indirectly points to the memory area which contains the conversion input
- 36101 data. The *outbuf* argument indirectly points to the memory area which is to contain the result of
- 36102 the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to
- 36103 containing data that is directly representable in the ISO C standard language **char** data type. The
- 36104 type of *inbuf* and *outbuf*, **char ****, does not imply that the objects pointed to are interpreted as
- 36105 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that
- 36106 represents a character in a given character set encoding scheme is done internally within the
- 36107 codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can
- 36108 contain all zero octets that are not interpreted as string terminators but as coded character data
- 36109 according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and
- 36110 so on) read or stored in the objects is not specified, but may be inferred for both the input and
- 36111 output data by the converters determined by the *fromcode* and *to code* arguments of *iconv_open()*.
- 36112 Regardless of the data type inferred by the converter, the size of the remaining space in both
- 36113 input and output objects (the *inbytesleft* and *outbytesleft* arguments) is always measured in bytes.
- 36114 For implementations that support the conversion of state-dependent encodings, the conversion
- 36115 descriptor must be able to accurately reflect the shift-state in effect at the end of the last
- 36116 successful conversion. It is not required that the conversion descriptor itself be updated, which
- 36117 would require it to be a pointer type. Thus, implementations are free to implement the
- 36118 descriptor as a handle (other than a pointer type) by which the conversion information can be
- 36119 accessed and updated.

Issue 7

36134

The *iconv()* function is moved from the XSI option to the Base.

36135 **NAME**
 36136 `iconv_close` — codeset conversion deallocation function

36137 **SYNOPSIS**
 36138 `#include <iconv.h>`
 36139 `int iconv_close(iconv_t cd);`

36140 **DESCRIPTION**
 36141 The `iconv_close()` function shall deallocate the conversion descriptor `cd` and all other associated
 36142 resources allocated by `iconv_open()`.

36143 If a file descriptor is used to implement the type `iconv_t`, that file descriptor shall be closed.

36144 **RETURN VALUE**
 36145 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and `errno` set to
 36146 indicate the error.

36147 **ERRORS**
 36148 The `iconv_close()` function may fail if:
 36149 [EBADF] The conversion descriptor is invalid.

36150 **EXAMPLES**
 36151 None.

36152 **APPLICATION USAGE**
 36153 None.

36154 **RATIONALE**
 36155 None.

36156 **FUTURE DIRECTIONS**
 36157 None.

36158 **SEE ALSO**
 36159 [iconv](#), [iconv_open\(\)](#)
 36160 XBD [<iconv.h>](#)

36161 **CHANGE HISTORY**
 36162 First released in Issue 4. Derived from the HP-UX Manual.

36163 **Issue 7**
 36164 The `iconv_close()` function is moved from the XSI option to the Base.

36165 **NAME**
 36166 iconv_open — codeset conversion allocation function

36167 **SYNOPSIS**
 36168 #include <iconv.h>

36169 iconv_t iconv_open(const char *tocode, const char *fromcode);

36170 DESCRIPTION

36171 The *iconv_open()* function shall return a conversion descriptor that describes a conversion from
 36172 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified
 36173 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion
 36174 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with
 36175 *iconv()*.

36176 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

36177 A conversion descriptor shall remain valid until it is closed by *iconv_close()* or an implicit close.

36178 If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be
 36179 set; see <fcntl.h>.

36180 RETURN VALUE

36181 Upon successful completion, *iconv_open()* shall return a conversion descriptor for use on
 36182 subsequent calls to *iconv()*. Otherwise, *iconv_open()* shall return (*iconv_t*)-1 and set *errno* to
 36183 indicate the error.

36184 ERRORS

36185 The *iconv_open()* function may fail if:

36186 [EMFILE] All file descriptors available to the process are currently open.

36187 [ENFILE] Too many files are currently open in the system.

36188 [ENOMEM] Insufficient storage space is available.

36189 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the
 36190 implementation.

36191 EXAMPLES

36192 None.

36193 APPLICATION USAGE

36194 Some implementations of *iconv_open()* use *malloc()* to allocate space for internal buffer areas.
 36195 The *iconv_open()* function may fail if there is insufficient storage space to accommodate these
 36196 buffers.

36197 Conforming applications must assume that conversion descriptors are not valid after a call to
 36198 one of the *exec* functions.

36199 Application developers should consult the system documentation to determine the supported
 36200 codesets and their naming schemes.

36201 RATIONALE

36202 None.

36203 FUTURE DIRECTIONS

36237 CHANGE HISTORY

36238 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36239 NAME

36240 `if_indexname` — map a network interface index to its corresponding name

36241 SYNOPSIS

36242 `#include <net/if.h>`

36243 `char *if_indexname(unsigned ifindex, char *ifname);`

36244 DESCRIPTION

36245 The `if_indexname()` function shall map an interface index to its corresponding name.

36246 When this function is called, *ifname* shall point to a buffer of at least {IF_NAMESIZE} bytes. The
36247 function shall place in this buffer the name of the interface with index *ifindex*.

36248 RETURN VALUE

36249 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which
36250 points to a buffer now containing the interface name. Otherwise, the function shall return a
36251 NULL pointer and set *errno* to indicate the error.

36252 ERRORS

36253 The `if_indexname()` function shall fail if:

36254 [ENXIO] The interface does not exist.

36255 EXAMPLES

36256 None.

36257 APPLICATION USAGE

36258 None.

36323 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36324 **NAME**
 36325 `ilogb, ilogbf, ilogbl` — return an unbiased exponent

36326 **SYNOPSIS**
 36327 `#include <math.h>`
 36328 `int ilogb(double x);`
 36329 `int ilogbf(float x);`
 36330 `int ilogbl(long double x);`

36331 DESCRIPTION

36332 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36333 conflict between the requirements described here and the ISO C standard is unintentional. This
 36334 volume of POSIX.1-200x defers to the ISO C standard.

36335 These functions shall return the exponent part of their argument x . Formally, the return value is
 36336 the integral part of $\log_r |x|$ as a signed integral value, for non-zero x , where r is the radix of the
 36337 machine's floating-point arithmetic, which is the value of `FLT_RADIX` defined in `<float.h>`.

36338 An application wishing to check for error situations should set `errno` to zero and call
 36339 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 36340 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 36341 zero, an error has occurred.

36342 RETURN VALUE

36343 Upon successful completion, these functions shall return the exponent part of x as a signed
 36344 integer value. They are equivalent to calling the corresponding `logb()` function and casting the
 36345 returned value to type `int`.

36346 XSI If x is 0, the value `FP_ILOGB0` shall be returned. On XSI-conformant systems, a domain error
 36347 shall occur;

36348 CX otherwise, a domain error may occur.

36349 XSI If x is $\pm\text{Inf}$, the value `{INT_MAX}` shall be returned. On XSI-conformant systems, a domain
 36350 error shall occur;

36351 CX otherwise, a domain error may occur.

36352 XSI If x is a NaN, the value `FP_ILOGBNAN` shall be returned. On XSI-conformant systems, a
 36353 domain error shall occur;

36354 CX otherwise, a domain error may occur.

36355 MX If the correct value is greater than `{INT_MAX}`, a domain error shall occur and an unspecified
 36356 XSI value shall be returned. On XSI-conformant systems, a domain error shall occur and
 36357 `{INT_MAX}` shall be returned.

36358 MX If the correct value is less than `{INT_MIN}`, a domain error shall occur and an unspecified value
 36359 XSI shall be returned. On XSI-conformant systems, a domain error shall occur and `{INT_MIN}` shall
 36360 be returned.

36361 ERRORS

36362 These functions shall fail if:

36363 XSI|MX **Domain Error** The correct value is not representable as an integer.

36364 XSI The x argument is zero, NaN, or $\pm\text{Inf}$.

36365 XSI|MX If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 36366 then `errno` shall be set to `[EDOM]`. If the integer expression `(math_errhandling
 36367 & MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception

36368 shall be raised.

36369 These functions may fail if:

36370 Domain Error The x argument is zero, NaN, or $\pm\text{Inf}$.

36371 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 36372 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling* &
 36373 MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 36374 shall be raised.

36375 EXAMPLES

36376 None.

36377 APPLICATION USAGE

36378 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 36379 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

36380 RATIONALE

36381 The errors come from taking the expected floating-point value and converting it to **int**, which is
 36382 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not
 36383 representable in a type **int**), so should be a domain error.

36384 There are no known implementations that overflow. For overflow to happen, {INT_MAX} must
 36385 be less than $\text{LDBL_MAX_EXP} \cdot \log_2(\text{FLT_RADIX})$ or {INT_MIN} must be greater than
 36386 $\text{LDBL_MIN_EXP} \cdot \log_2(\text{FLT_RADIX})$ if subnormals are not supported, or {INT_MIN} must be
 36387 greater than $(\text{LDBL_MIN_EXP} - \text{LDBL_MANT_DIG}) \cdot \log_2(\text{FLT_RADIX})$ if subnormals are
 36388 supported.

36389 FUTURE DIRECTIONS

36390 None.

36396 Issue 5

36397 Moved from X/OPEN UNIX extension to BASE.

36398 Issue 6

36399 The *ilogb()* function is no longer marked as an extension.

36400 The *ilogbf()* and *ilogbl()* functions are added for alignment with the ISO/IEC 9899:1999
 36401 standard.

36402 The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

36403 Functionality relating to the XSI option is marked.

36404 Issue 7

36405 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #48 (SD5-XSH-ERN-71), #49, and #79
 36406 (SD5-XSH-ERN-72) are applied.

36407 **NAME**
 36408 `imaxabs` — return absolute value

36409 **SYNOPSIS**
 36410 `#include <inttypes.h>`
 36411 `intmax_t imaxabs(intmax_t j);`

36412 **DESCRIPTION**
 36413 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36414 conflict between the requirements described here and the ISO C standard is unintentional. This
 36415 volume of POSIX.1-200x defers to the ISO C standard.

36416 The `imaxabs()` function shall compute the absolute value of an integer *j*. If the result cannot be
 36417 represented, the behavior is undefined.

36418 **RETURN VALUE**
 36419 The `imaxabs()` function shall return the absolute value.

36420 **ERRORS**
 36421 No errors are defined.

36422 **EXAMPLES**
 36423 None.

36424 **APPLICATION USAGE**
 36425 The absolute value of the most negative number cannot be represented in two's complement.

36426 **RATIONALE**
 36427 None.

36428 **FUTURE DIRECTIONS**
 36429 None.

36433 **CHANGE HISTORY**
 36434 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

36435 **NAME**
 36436 `imaxdiv` — return quotient and remainder

36437 **SYNOPSIS**
 36438 `#include <inttypes.h>`
 36439 `imaxdiv_t imaxdiv(intmax_t numer, intmax_t denom);`

36440 **DESCRIPTION**
 36441 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36442 conflict between the requirements described here and the ISO C standard is unintentional. This
 36443 volume of POSIX.1-200x defers to the ISO C standard.

36444 The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.

36445 **RETURN VALUE**
 36446 The *imaxdiv()* function shall return a structure of type **imaxdiv_t**, comprising both the quotient
 36447 and the remainder. The structure shall contain (in either order) the members *quot* (the quotient)
 36448 and *rem* (the remainder), each of which has type **intmax_t**.

36449 If either part of the result cannot be represented, the behavior is undefined.

36450 **ERRORS**
 36451 No errors are defined.

36452 **EXAMPLES**
 36453 None.

36454 **APPLICATION USAGE**
 36455 None.

36456 **RATIONALE**
 36457 None.

36458 **FUTURE DIRECTIONS**
 36459 None.

36460 **SEE ALSO**

 36462 XBD [<inttypes.h>](#)

36463 **CHANGE HISTORY**
 36464 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

36465 **NAME**
 36466 `inet_addr, inet_ntoa` — IPv4 address manipulation

36467 **SYNOPSIS**
 36468 `#include <arpa/inet.h>`
 36469 `in_addr_t inet_addr(const char *cp);`
 36470 `char *inet_ntoa(struct in_addr in);`

36471 **DESCRIPTION**
 36472 The `inet_addr()` function shall convert the string pointed to by `cp`, in the standard IPv4 dotted
 36473 decimal notation, to an integer value suitable for use as an Internet address.

36474 The `inet_ntoa()` function shall convert the Internet host address specified by `in` to a string in the
 36475 Internet standard dot notation.

36476 The `inet_ntoa()` function need not be thread-safe. A function that is not required to be thread-safe
 36477 is not required to be reentrant.

36478 All Internet addresses shall be returned in network order (bytes ordered from left to right).

36479 Values specified using IPv4 dotted decimal notation take one of the following forms:

36480 `a.b.c.d` When four parts are specified, each shall be interpreted as a byte of data and
 36481 assigned, from left to right, to the four bytes of an Internet address.

36482 `a.b.c` When a three-part address is specified, the last part shall be interpreted as a 16-bit
 36483 quantity and placed in the rightmost two bytes of the network address. This makes
 36484 the three-part address format convenient for specifying Class B network addresses
 36485 as "`128.net.host`".

36486 `a.b` When a two-part address is supplied, the last part shall be interpreted as a 24-bit
 36487 quantity and placed in the rightmost three bytes of the network address. This
 36488 makes the two-part address format convenient for specifying Class A network
 36489 addresses as "`net.host`".

36490 `a` When only one part is given, the value shall be stored directly in the network
 36491 address without any byte rearrangement.

36492 All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or
 36493 hexadecimal, as specified in the ISO C standard (that is, a leading `0x` or `0X` implies hexadecimal;
 36494 otherwise, a leading `'0'` implies octal; otherwise, the number is interpreted as decimal).

36495 **RETURN VALUE**
 36496 Upon successful completion, `inet_addr()` shall return the Internet address. Otherwise, it shall
 36497 return `(in_addr_t)(-1)`.

36498 The `inet_ntoa()` function shall return a pointer to the network address in Internet standard dot
 36499 notation.

36500 **ERRORS**
 36501 No errors are defined.

CHANGE HISTORY

36515

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

DRAFT

36516 **NAME**36517 `inet_ntop, inet_pton` — convert IPv4 and IPv6 addresses between binary and text form36518 **SYNOPSIS**36519

```
#include <arpa/inet.h>
```

36520

```
const char *inet_ntop(int af, const void *restrict src,  
char *restrict dst, socklen_t size);
```

36522

```
int inet_pton(int af, const char *restrict src, void *restrict dst);
```

36523 **DESCRIPTION**

36524 The `inet_ntop()` function shall convert a numeric address into a text string suitable for
 36525 IP6 presentation. The `af` argument shall specify the family of the address. This can be `AF_INET` or
 36526 `AF_INET6`. The `src` argument points to a buffer holding an IPv4 address if the `af` argument is
 36527 IP6 `AF_INET`, or an IPv6 address if the `af` argument is `AF_INET6`; the address must be in network
 36528 byte order. The `dst` argument points to a buffer where the function stores the resulting text string;
 36529 it shall not be NULL. The `size` argument specifies the size of this buffer, which shall be large
 36530 IP6 enough to hold the text string (`INET_ADDRSTRLEN` characters for IPv4,
 36531 `INET6_ADDRSTRLEN` characters for IPv6).

36532 The `inet_pton()` function shall convert an address in its standard text presentation form into its
 36533 IP6 numeric binary form. The `af` argument shall specify the family of the address. The `AF_INET` and
 36534 `AF_INET6` address families shall be supported. The `src` argument points to the string being
 36535 passed in. The `dst` argument points to a buffer into which the function stores the numeric
 36536 IP6 address; this shall be large enough to hold the numeric address (32 bits for `AF_INET`, 128 bits
 36537 for `AF_INET6`).

36538 If the `af` argument of `inet_pton()` is `AF_INET`, the `src` string shall be in the standard IPv4 dotted-
 36539 decimal form:

36540 `ddd . ddd . ddd . ddd`

36541 where "ddd" is a one to three digit decimal number between 0 and 255 (see `inet_addr()`). The
 36542 `inet_pton()` function does not accept other formats (such as the octal numbers, hexadecimal
 36543 numbers, and fewer than four numbers that `inet_addr()` accepts).

36544 IP6 If the `af` argument of `inet_pton()` is `AF_INET6`, the `src` string shall be in one of the following
 36545 standard IPv6 text forms:

- 36546 1. The preferred form is "`x:x:x:x:x:x:x:x`", where the 'x's are the hexadecimal values
 36547 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be
 36548 omitted, but there shall be at least one numeral in every field.
- 36549 2. A string of contiguous zero fields in the preferred form can be shown as "`:::`". The "`:::`"
 36550 can only appear once in an address. Unspecified addresses ("`0:0:0:0:0:0:0:0`") may
 36551 be represented simply as "`:::`".
- 36552 3. A third form that is sometimes more convenient when dealing with a mixed environment
 36553 of IPv4 and IPv6 nodes is "`x:x:x:x:x:x.d.d.d.d`", where the 'x's are the
 36554 hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the
 36555 decimal values of the four low-order 8-bit pieces of the address (standard IPv4
 36556 representation).

36557 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in
 36558 RFC 2373.

inet_ntop()36559 **RETURN VALUE**

36560 The *inet_ntop()* function shall return a pointer to the buffer containing the text string if the
 36561 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

36562 The *inet_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by
 36563 IP6 *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string
 36564 or a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is
 36565 unknown.

36566 **ERRORS**

36567 The *inet_ntop()* and *inet_pton()* functions shall fail if:

36568 [EAFNOSUPPORT]

36569 The *af* argument is invalid.

36570 [ENOSPC] The size of the *inet_ntop()* result buffer is inadequate.

36571 **EXAMPLES**

36572 None.

36573 **APPLICATION USAGE**

36574 None.

36575 **RATIONALE**

36576 None.

36577 **FUTURE DIRECTIONS**

36578 None.

36579 **SEE ALSO**

36580 XBD <[arpa/inet.h](#)>

36581 **CHANGE HISTORY**

36582 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

36583 IPv6 extensions are marked.

36584 The **restrict** keyword is added to the *inet_ntop()* and *inet_pton()* prototypes for alignment with
 36585 the ISO/IEC 9899:1999 standard.

36586 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must
 36587 be in network byte order” to the end of the fourth sentence of the first paragraph in the
 36588 DESCRIPTION.

36589 **NAME**36590 `initstate`, `random`, `setstate`, `srandom` — pseudo-random number functions36591 **SYNOPSIS**

```

36592 XSI      #include <stdlib.h>
36593
36593 char *initstate(unsigned seed, char *state, size_t size);
36594 long random(void);
36595 char *setstate(const char *state);
36596 void srandom(unsigned seed);

```

36597 **DESCRIPTION**

36598 The `random()` function shall use a non-linear additive feedback random-number generator
 36599 employing a default state array size of 31 **long** integers to return successive pseudo-random
 36600 numbers in the range from 0 to $2^{31}-1$. The period of this random-number generator is
 36601 approximately $16 \times (2^{31}-1)$. The size of the state array determines the period of the random-
 36602 number generator. Increasing the state array size shall increase the period.

36603 With 256 bytes of state information, the period of the random-number generator shall be greater
 36604 than 2^{69} .

36605 Like `rand()`, `random()` shall produce by default a sequence of numbers that can be duplicated by
 36606 calling `srandom()` with 1 as the seed.

36607 The `srandom()` function shall initialize the current state array using the value of `seed`.

36608 The `initstate()` and `setstate()` functions handle restarting and changing random-number
 36609 generators. The `initstate()` function allows a state array, pointed to by the `state` argument, to be
 36610 initialized for future use. The `size` argument, which specifies the size in bytes of the state array,
 36611 shall be used by `initstate()` to decide what type of random-number generator to use; the larger
 36612 the state array, the more random the numbers. Values for the amount of state information are 8,
 36613 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one
 36614 of these values. If `initstate()` is called with $8 \leq \text{size} < 32$, then `random()` shall use a simple linear
 36615 congruential random number generator. The `seed` argument specifies a starting point for the
 36616 random-number sequence and provides for restarting at the same point. The `initstate()` function
 36617 shall return a pointer to the previous state information array.

36618 If `initstate()` has not been called, then `random()` shall behave as though `initstate()` had been called
 36619 with `seed=1` and `size=128`.

36620 Once a state has been initialized, `setstate()` allows switching between state arrays. The array
 36621 defined by the `state` argument shall be used for further random-number generation until
 36622 `initstate()` is called or `setstate()` is called again. The `setstate()` function shall return a pointer to the
 36623 previous state array.

36624 **RETURN VALUE**

36625 If `initstate()` is called with `size` less than 8, it shall return NULL.

36626 The `random()` function shall return the generated pseudo-random number.

36627 The `srandom()` function shall not return a value.

36628 Upon successful completion, `initstate()` and `setstate()` shall return a pointer to the previous state
 36629 array; otherwise, a null pointer shall be returned.

36630 ERRORS

36631 No errors are defined.

36632 EXAMPLES

36633 None.

36634 APPLICATION USAGE

36635 After initialization, a state array can be restarted at a different point in one of two ways:

- 36636 1. The *initstate()* function can be used, with the desired seed, state array, and size of the
- 36637 array.
- 36638 2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with
- 36639 the desired seed. The advantage of using both of these functions is that the size of the
- 36640 state array does not have to be saved once it is initialized.

36641 Although some implementations of *random()* have written messages to standard error, such

36642 implementations do not conform to POSIX.1-200x.

36643 Issue 5 restored the historical behavior of this function.

36644 Threaded applications should use *erand48()*, *nrand48()*, or *rand48()* instead of *random()* when

36645 an independent random number sequence in multiple threads is required.

36646 RATIONALE

36647 None.

36648 FUTURE DIRECTIONS

36649 None.

36650 SEE ALSO

36651 *drand48()*, *rand()*

36652 XBD [<stdlib.h>](#)

36653 CHANGE HISTORY

36654 First released in Issue 4, Version 2.

36655 Issue 5

36656 Moved from X/OPEN UNIX extension to BASE.

36657 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than

36658 or equal to 8, or less than 32”, “*size*<8” is replaced with “ $8 \leq \textit{size} < 32$ ”, and a new first paragraph

36659 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE

36660 indicating that these changes restore the historical behavior of the function.

36661 Issue 6

36662 In the DESCRIPTION, duplicate text “For values greater than or equal to 8 . . .” is removed.

36663 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand_r()* from the

36664 list of suggested functions in the APPLICATION USAGE section.

36665 **NAME**
 36666 insque, remque — insert or remove an element in a queue

36667 SYNOPSIS

```
36668 XSI      #include <search.h>
36669
36669 void insque(void *element, void *pred);
36670 void remque(void *element);
```

36671 DESCRIPTION

36672 The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The
 36673 queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it
 36674 defines a structure in which the first two members of the structure are pointers to the same type
 36675 of structure, and any further members are application-specific. The first member of the structure
 36676 is a forward pointer to the next entry in the queue. The second member is a backward pointer to
 36677 the previous entry in the queue. If the queue is linear, the queue is terminated with null
 36678 pointers. The names of the structure and of the pointer members are not subject to any special
 36679 restriction.

36680 The *insque()* function shall insert the element pointed to by *element* into a queue immediately
 36681 after the element pointed to by *pred*.

36682 The *remque()* function shall remove the element pointed to by *element* from a queue.

36683 If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the
 36684 initial element of the queue, shall initialize the forward and backward pointers of *element* to null
 36685 pointers.

36686 If the queue is to be used as a circular list, the application shall ensure it initializes the forward
 36687 pointer and the backward pointer of the initial element of the queue to the element's own
 36688 address.

36689 RETURN VALUE

36690 The *insque()* and *remque()* functions do not return a value.

36691 ERRORS

36692 No errors are defined.

36693 EXAMPLES

36694 Creating a Linear Linked List

36695 The following example creates a linear linked list.

```
36696 #include <search.h>
36697 ...
36698 struct myque element1;
36699 struct myque element2;
36700
36700 char *data1 = "DATA1";
36701 char *data2 = "DATA2";
36702 ...
36703 element1.data = data1;
36704 element2.data = data2;
36705
36705 insque (&element1, NULL);
36706 insque (&element2, &element1);
```

36707 **Creating a Circular Linked List**

36708 The following example creates a circular linked list.

```

36709 #include <search.h>
36710 ...
36711 struct myque element1;
36712 struct myque element2;
36713
36714 char *data1 = "DATA1";
36715 char *data2 = "DATA2";
36716 ...
36717 element1.data = data1;
36718 element2.data = data2;
36719
36720 element1.fwd = &element1;
36721 element1.bck = &element1;
36722
36723 insque (&element2, &element1);

```

36721 **Removing an Element**36722 The following example removes the element pointed to by *element1*.

```

36723 #include <search.h>
36724 ...
36725 struct myque element1;
36726 ...
36727 remque (&element1);

```

36728 **APPLICATION USAGE**

36729 The historical implementations of these functions described the arguments as being of type
 36730 **struct qelem *** rather than as being of type **void *** as defined here. In those implementations,
 36731 **struct qelem** was commonly defined in **<search.h>** as:

```

36732 struct qelem {
36733     struct qelem *q_forw;
36734     struct qelem *q_back;
36735 };

```

36736 Applications using these functions, however, were never able to use this structure directly since
 36737 it provided no room for the actual data contained in the elements. Most applications defined
 36738 structures that contained the two pointers as the initial elements and also provided space for, or
 36739 pointers to, the object's data. Applications that used these functions to update more than one
 36740 type of table also had the problem of specifying two or more different structures with the same
 36741 name, if they literally used **struct qelem** as specified.

36742 As described here, the implementations were actually expecting a structure type where the first
 36743 two members were forward and backward pointers to structures. With C compilers that didn't
 36744 provide function prototypes, applications used structures as specified in the DESCRIPTION
 36745 above and the compiler did what the application expected.

36746 If this method had been carried forward with an ISO C standard compiler and the historical
 36747 function prototype, most applications would have to be modified to cast pointers to the
 36748 structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By
 36749 specifying **void *** as the argument type, applications do not need to change (unless they
 36750 specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

The normative text is updated to avoid use of the term “must” for application requirements.

36763 **NAME**
 36764 ioctl — control a STREAMS device (**STREAMS**)

36765 **SYNOPSIS**

```
36766 OB XSR #include <stropts.h>
36767 int ioctl(int fildev, int request, ... /* arg */);
```

36768 **DESCRIPTION**

36769 The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-
 36770 STREAMS devices, the functions performed by this call are unspecified. The *request* argument
 36771 and an optional third argument (with varying type) shall be passed to and interpreted by the
 36772 appropriate part of the STREAM associated with *fildev*.

36773 The *fildev* argument is an open file descriptor that refers to a device.

36774 The *request* argument selects the control function to be performed and shall depend on the
 36775 STREAMS device being addressed.

36776 The *arg* argument represents additional information that is needed by this specific STREAMS
 36777 device to perform the requested function. The type of *arg* depends upon the particular control
 36778 request, but it shall be either an integer or a pointer to a device-specific data structure.

36779 The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply
 36780 to each individual command are described below.

36781 The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS
 36782 files:

36783 **I_PUSH** Pushes the module whose name is pointed to by *arg* onto the top of the current
 36784 STREAM, just below the STREAM head. It then calls the *open()* function of the
 36785 newly-pushed module.

36786 The *ioctl()* function with the I_PUSH command shall fail if:

36787 [EINVAL] Invalid module name.
 36788 [ENXIO] Open function of new module failed.
 36789 [ENXIO] Hangup received on *fildev*.

36790 **I_POP** Removes the module just below the STREAM head of the STREAM pointed to
 36791 by *fildev*. The *arg* argument should be 0 in an I_POP request.

36792 The *ioctl()* function with the I_POP command shall fail if:

36793 [EINVAL] No module present in the STREAM.
 36794 [ENXIO] Hangup received on *fildev*.

36795 **I_LOOK** Retrieves the name of the module just below the STREAM head of the
 36796 STREAM pointed to by *fildev*, and places it in a character string pointed to by
 36797 *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,
 36798 where FMNAMESZ is defined in **<stropts.h>**.

36799 The *ioctl()* function with the I_LOOK command shall fail if:

36800 [EINVAL] No module present in the STREAM.

36801	I_FLUSH	Flushes read and/or write queues, depending on the value of <i>arg</i> . Valid <i>arg</i>
36802		values are:
36803	FLUSHR	Flush all read queues.
36804	FLUSHW	Flush all write queues.
36805	FLUSHRW	Flush all read and all write queues.
36806		The <i>ioctl()</i> function with the I_FLUSH command shall fail if:
36807	[EINVAL]	Invalid <i>arg</i> value.
36808	[EAGAIN] or [ENOSR]	Unable to allocate buffers for flush message.
36809		
36810	[ENXIO]	Hangup received on <i>fildev</i> .
36811	I_FLUSHBAND	Flushes a particular band of messages. The <i>arg</i> argument points to a bandinfo
36812		structure. The <i>bi_flag</i> member may be one of FLUSHR, FLUSHW, or
36813		FLUSHRW as described above. The <i>bi_pri</i> member determines the priority
36814		band to be flushed.
36815	I_SETSIG	Requests that the STREAMS implementation send the SIGPOLL signal to the
36816		calling process when a particular event has occurred on the STREAM
36817		associated with <i>fildev</i> . I_SETSIG supports an asynchronous processing
36818		capability in STREAMS. The value of <i>arg</i> is a bitmask that specifies the events
36819		for which the process should be signaled. It is the bitwise-inclusive OR of any
36820		combination of the following constants:
36821	S_RDNORM	A normal (priority band set to 0) message has arrived at the
36822		head of a STREAM head read queue. A signal shall be
36823		generated even if the message is of zero length.
36824	S_RDBAND	A message with a non-zero priority band has arrived at the
36825		head of a STREAM head read queue. A signal shall be
36826		generated even if the message is of zero length.
36827	S_INPUT	A message, other than a high-priority message, has arrived
36828		at the head of a STREAM head read queue. A signal shall be
36829		generated even if the message is of zero length.
36830	S_HIPRI	A high-priority message is present on a STREAM head read
36831		queue. A signal shall be generated even if the message is of
36832		zero length.
36833	S_OUTPUT	The write queue for normal data (priority band 0) just below
36834		the STREAM head is no longer full. This notifies the process
36835		that there is room on the queue for sending (or writing)
36836		normal data downstream.
36837	S_WRNORM	Equivalent to S_OUTPUT.
36838	S_WRBAND	The write queue for a non-zero priority band just below the
36839		STREAM head is no longer full. This notifies the process
36840		that there is room on the queue for sending (or writing)
36841		priority data downstream.
36842	S_MSG	A STREAMS signal message that contains the SIGPOLL
36843		signal has reached the front of the STREAM head read
36844		queue.

36845		S_ERROR	Notification of an error condition has reached the STREAM head.
36846			
36847		S_HANGUP	Notification of a hangup has reached the STREAM head.
36848		S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
36849			
36850			
36851			If <i>arg</i> is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with <i>fdes</i> .
36852			
36853			Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.
36854			
36855			
36856			
36857			The <i>ioctl()</i> function with the I_SETSIG command shall fail if:
36858		[EINVAL]	The value of <i>arg</i> is invalid.
36859		[EINVAL]	The value of <i>arg</i> is 0 and the calling process is not registered to receive the SIGPOLL signal.
36860			
36861		[EAGAIN]	There were insufficient resources to store the signal request.
36862	L_GETSIG		Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an int pointed to by <i>arg</i> , where the events are those specified in the description of I_SETSIG above.
36863			
36864			
36865			
36866			The <i>ioctl()</i> function with the I_GETSIG command shall fail if:
36867		[EINVAL]	Process is not registered to receive the SIGPOLL signal.
36868	L_FIND		Compares the names of all modules currently present in the STREAM to the name pointed to by <i>arg</i> , and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.
36869			
36870			
36871			The <i>ioctl()</i> function with the I_FIND command shall fail if:
36872		[EINVAL]	<i>arg</i> does not contain a valid module name.
36873	L_PEEK		Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to <i>getmsg()</i> except that this command does not remove the message from the queue. The <i>arg</i> argument points to a strpeek structure.
36874			
36875			
36876			
36877			The application shall ensure that the <i>maxlen</i> member in the ctlbuf and databuf structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The <i>flags</i> member may be marked RS_HIPRI or 0, as described by <i>getmsg()</i> . If the process sets <i>flags</i> to RS_HIPRI, for example, L_PEEK shall only look for a high-priority message on the STREAM head read queue.
36878			
36879			
36880			
36881			
36882			
36883			L_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in <i>flags</i> and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, ctlbuf specifies information in the control buffer, databuf specifies information in the data buffer, and <i>flags</i> contains the value RS_HIPRI or 0.
36884			
36885			
36886			
36887			
36888			

36889	I_SRDOPT	Sets the read mode using the value of the argument <i>arg</i> . Read modes are described in <i>read</i> . Valid <i>arg</i> flags are:
36890		
36891		RNORM Byte-stream mode, the default.
36892		RMSGD Message-discard mode.
36893		RMSGN Message-nondiscard mode.
36894		The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in the other flag overriding RNORM which is the default.
36895		
36896		
36897		In addition, treatment of control messages by the STREAM head may be changed by setting any of the following flags in <i>arg</i> :
36898		
36899		RPROTNORM Fail <i>read</i> () with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
36900		
36901		RPROTDAT Deliver the control part of a message as data when a process issues a <i>read</i> () .
36902		
36903		RPROTDIS Discard the control part of a message, delivering any data portion, when a process issues a <i>read</i> () .
36904		
36905		The <i>ioctl</i> () function with the I_SRDOPT command shall fail if:
36906		[EINVAL] The <i>arg</i> argument is not valid.
36907	I_GRDOPT	Returns the current read mode setting, as described above, in an int pointed to by the argument <i>arg</i> . Read modes are described in <i>read</i> .
36908		
36909	I_NREAD	Counts the number of data bytes in the data part of the first message on the STREAM head read queue and places this value in the int pointed to by <i>arg</i> . The return value for the command shall be the number of messages on the STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl</i> () return value is greater than 0, this indicates that a zero-length message is next on the queue.
36910		
36911		
36912		
36913		
36914		
36915	I_FDINSERT	Creates a message from specified buffer(s), adds information about another STREAM, and sends the message downstream. The message contains a control part and an optional data part. The data and control parts to be sent are distinguished by placement in separate buffers, as described below. The <i>arg</i> argument points to a strfdinsert structure.
36916		
36917		
36918		
36919		
36920		The application shall ensure that the <i>len</i> member in the ctlbuf strbuf structure is set to the size of a t_uscalar_t plus the number of bytes of control information to be sent with the message. The <i>fildev</i> member specifies the file descriptor of the other STREAM, and the <i>offset</i> member, which must be suitably aligned for use as a t_uscalar_t , specifies the offset from the start of the control buffer where I_FDINSERT shall store a t_uscalar_t whose interpretation is specific to the STREAM end. The application shall ensure that the <i>len</i> member in the databuf strbuf structure is set to the number of bytes of data information to be sent with the message, or to 0 if no data part is to be sent.
36921		
36922		
36923		
36924		
36925		
36926		
36927		
36928		
36929		
36930		The <i>flags</i> member specifies the type of message to be created. A normal message is created if <i>flags</i> is set to 0, and a high-priority message is created if <i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full
36931		
36932		
36933		
36934		
36935		

36936 and O_NONBLOCK is set. Instead, it fails and sets *errno* to [EAGAIN].

36937 I_FDINSERT also blocks, unless prevented by lack of internal resources,
36938 waiting for the availability of message blocks in the STREAM, regardless of
36939 priority or whether O_NONBLOCK has been specified. No partial message is
36940 sent.

36941 The *ioctl()* function with the I_FDINSERT command shall fail if:

36942 [EAGAIN] A non-priority message is specified, the O_NONBLOCK
36943 flag is set, and the STREAM write queue is full due to
36944 internal flow control conditions.

36945 [EAGAIN] or [ENOSR]
36946 Buffers cannot be allocated for the message that is to be
36947 created.

36948 [EINVAL] One of the following:

- 36949 — The *fildev* member of the **strfdinsert** structure is not a
36950 valid, open STREAM file descriptor.
- 36951 — The size of a **t_uscalar_t** plus *offset* is greater than the
36952 *len* member for the buffer specified through **ctlbuf**.
- 36953 — The *offset* member does not specify a properly-aligned
36954 location in the data buffer.
- 36955 — An undefined value is stored in *flags*.

36956 [ENXIO] Hangup received on the STREAM identified by either the
36957 *fildev* argument or the *fildev* member of the **strfdinsert**
36958 structure.

36959 [ERANGE] The *len* member for the buffer specified through **databuf**
36960 does not fall within the range specified by the maximum
36961 and minimum packet sizes of the topmost STREAM
36962 module; or the *len* member for the buffer specified through
36963 **databuf** is larger than the maximum configured size of the
36964 data part of a message; or the *len* member for the buffer
36965 specified through **ctlbuf** is larger than the maximum
36966 configured size of the control part of a message.

36967 I_STR Constructs an internal STREAMS *ioctl()* message from the data pointed to by
36968 *arg*, and sends that message downstream.

36969 This mechanism is provided to send *ioctl()* requests to downstream modules
36970 and drivers. It allows information to be sent with *ioctl()*, and returns to the
36971 process any information sent upstream by the downstream recipient. I_STR
36972 shall block until the system responds with either a positive or negative
36973 acknowledgement message, or until the request times out after some period of
36974 time. If the request times out, it shall fail with *errno* set to [ETIME].

36975 At most, one I_STR can be active on a STREAM. Further I_STR calls shall
36976 block until the active I_STR completes at the STREAM head. The default
36977 timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has
36978 no effect on this call.

36979 To send requests downstream, the application shall ensure that *arg* points to a
36980 **strioc** structure.

36981 The *ic_cmd* member is the internal *ioctl()* command intended for a

36982 downstream module or driver and *ic_timeout* is the number of seconds
 36983 (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified)
 36984 an I_STR request shall wait for acknowledgement before timing out. *ic_len* is
 36985 the number of bytes in the data argument, and *ic_dp* is a pointer to the data
 36986 argument. The *ic_len* member has two uses: on input, it contains the length of
 36987 the data argument passed in, and on return from the command, it contains the
 36988 number of bytes being returned to the process (the buffer pointed to by *ic_dp*
 36989 should be large enough to contain the maximum amount of data that any
 36990 module or the driver in the STREAM can return).

36991 The STREAM head shall convert the information pointed to by the **strioc**
 36992 structure to an internal *ioctl()* command message and send it downstream.

36993 The *ioctl()* function with the I_STR command shall fail if:

36994 [EAGAIN] or [ENOSR]

36995 Unable to allocate buffers for the *ioctl()* message.

36996 [EINVAL] The *ic_len* member is less than 0 or larger than the
 36997 maximum configured size of the data part of a message, or
 36998 *ic_timeout* is less than −1.

36999 [ENXIO] Hangup received on *fil*des.

37000 [ETIME] A downstream *ioctl()* timed out before acknowledgement
 37001 was received.

37002 An I_STR can also fail while waiting for an acknowledgement if a message
 37003 indicating an error or a hangup is received at the STREAM head. In addition,
 37004 an error code can be returned in the positive or negative acknowledgement
 37005 message, in the event the *ioctl()* command sent downstream fails. For these
 37006 cases, I_STR shall fail with *errno* set to the value in the message.

37007 I_SWROPT Sets the write mode using the value of the argument *arg*. Valid bit settings for
 37008 *arg* are:

37009 SNDZERO Send a zero-length message downstream when a *write()* of 0
 37010 bytes occurs. To not send a zero-length message when a
 37011 *write()* of 0 bytes occurs, the application shall ensure that
 37012 this bit is not set in *arg* (for example, *arg* would be set to 0).

37013 The *ioctl()* function with the I_SWROPT command shall fail if:

37014 [EINVAL] *arg* is not the above value.

37015 I_GWROPT Returns the current write mode setting, as described above, in the **int** that is
 37016 pointed to by the argument *arg*.

37017 I_SENDFD Creates a new reference to the open file description associated with the file
 37018 descriptor *arg*, and writes a message on the STREAMS-based pipe *fil*des
 37019 containing this reference, together with the user ID and group ID of the calling
 37020 process.

37021 The *ioctl()* function with the I_SENDFD command shall fail if:

37022 [EAGAIN] The sending STREAM is unable to allocate a message block
 37023 to contain the file pointer; or the read queue of the receiving
 37024 STREAM head is full and cannot accept the message sent by
 37025 I_SENDFD.

37026		[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
37027		[EINVAL]	The <i>fildev</i> argument is not connected to a STREAM pipe.
37028		[ENXIO]	Hangup received on <i>fildev</i> .
37029	I_RECVFD		Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The <i>arg</i> argument is a pointer to a strrecvfd data structure as defined in <stropts.h> .
37030			
37031			
37032			
37033			
37034			The <i>fd</i> member is a file descriptor. The <i>uid</i> and <i>gid</i> members are the effective user ID and effective group ID, respectively, of the sending process.
37035			
37036			If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with <i>errno</i> set to [EAGAIN] if no message is present at the STREAM head.
37037			
37038			
37039			If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the <i>fd</i> member of the strrecvfd structure pointed to by <i>arg</i> .
37040			
37041			
37042			
37043			The <i>ioctl()</i> function with the I_RECVFD command shall fail if:
37044		[EAGAIN]	A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.
37045			
37046		[EBADMSG]	The message at the STREAM head read queue is not a message containing a passed file descriptor.
37047			
37048		[EMFILE]	All file descriptors available to the process are currently open.
37049			
37050		[ENXIO]	Hangup received on <i>fildev</i> .
37051	I_LIST		Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If <i>arg</i> is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by <i>fildev</i> . This lets the process allocate enough space for the module names. Otherwise, it should point to a str_list structure.
37052			
37053			
37054			
37055			
37056			The <i>sl_nmods</i> member indicates the number of entries the process has allocated in the array. Upon return, the <i>sl_modlist</i> member of the str_list structure shall contain the list of module names, and the number of entries that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member (the number includes the number of modules including the driver). The return value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules (<i>sl_nmods</i>) is satisfied.
37057			
37058			
37059			
37060			
37061			
37062			
37063			
37064			The <i>ioctl()</i> function with the I_LIST command shall fail if:
37065		[EINVAL]	The <i>sl_nmods</i> member is less than 1.
37066		[EAGAIN] or [ENOSR]	
37067			Unable to allocate buffers.
37068	I_ATMARK		Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The <i>arg</i> argument determines how the checking is done when there may be multiple marked messages on the STREAM head read queue. It may take on the following values:
37069			
37070			
37071			

37072	ANYMARK	Check if the message is marked.
37073	LASTMARK	Check if the message is the last one marked on the queue.
37074		The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is permitted.
37075		
37076		The return value shall be 1 if the mark condition is satisfied; otherwise, the value shall be 0.
37077		
37078		The <i>ioctl()</i> function with the I_ATMARK command shall fail if:
37079	[EINVAL]	Invalid <i>arg</i> value.
37080	I_CKBAND	Checks if the message of a given priority band exists on the STREAM head read queue. This shall return 1 if a message of the given priority exists, 0 if no such message exists, or -1 on error. <i>arg</i> should be of type int .
37081		
37082		
37083		The <i>ioctl()</i> function with the I_CKBAND command shall fail if:
37084	[EINVAL]	Invalid <i>arg</i> value.
37085	I_GETBAND	Returns the priority band of the first message on the STREAM head read queue in the integer referenced by <i>arg</i> .
37086		
37087		The <i>ioctl()</i> function with the I_GETBAND command shall fail if:
37088	[ENODATA]	No message on the STREAM head read queue.
37089	I_CANPUT	Checks if a certain band is writable. <i>arg</i> is set to the priority band in question. The return value shall be 0 if the band is flow-controlled, 1 if the band is writable, or -1 on error.
37090		
37091		
37092		The <i>ioctl()</i> function with the I_CANPUT command shall fail if:
37093	[EINVAL]	Invalid <i>arg</i> value.
37094	I_SETCLTIME	This request allows the process to set the time the STREAM head shall delay when a STREAM is closing and there is data on the write queues. Before closing each module or driver, if there is data on its write queue, the STREAM head shall delay for the specified amount of time to allow the data to drain. If, after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a pointer to an integer specifying the number of milliseconds to delay, rounded up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM, an implementation-defined default timeout interval is used.
37095		
37096		
37097		
37098		
37099		
37100		
37101		
37102		The <i>ioctl()</i> function with the I_SETCLTIME command shall fail if:
37103	[EINVAL]	Invalid <i>arg</i> value.
37104	I_GETCLTIME	Returns the close time delay in the integer pointed to by <i>arg</i> .
37105		
37106		
37107		
37108	I_LINK	Connects two STREAMs, where <i>fdes</i> is the file descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the file descriptor of the STREAM connected to another driver. The STREAM designated by <i>arg</i> is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and -1 on
37109		
37110		
37111		
37112		
37113		
37114		

Multiplexed STREAMS Configurations

The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.

I_LINK Connects two STREAMs, where *fdes* is the file descriptor of the STREAM connected to the multiplexing driver, and *arg* is the file descriptor of the STREAM connected to another driver. The STREAM designated by *arg* is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and -1 on

37115		failure.
37116		The <i>ioctl()</i> function with the I_LINK command shall fail if:
37117	[ENXIO]	Hangup received on <i>fildev</i> .
37118	[ETIME]	Timeout before acknowledgement message was received at
37119		STREAM head.
37120	[EAGAIN] or [ENOSR]	
37121		Unable to allocate STREAMS storage to perform the
37122		I_LINK.
37123	[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
37124	[EINVAL]	The <i>fildev</i> argument does not support multiplexing; or <i>arg</i> is
37125		not a STREAM or is already connected downstream from a
37126		multiplexer; or the specified I_LINK operation would
37127		connect the STREAM head in more than one place in the
37128		multiplexed STREAM.
37129		An I_LINK can also fail while waiting for the multiplexing driver to
37130		acknowledge the request, if a message indicating an error or a hangup is
37131		received at the STREAM head of <i>fildev</i> . In addition, an error code can be
37132		returned in the positive or negative acknowledgement message. For these
37133		cases, I_LINK fails with <i>errno</i> set to the value in the message.
37134	I_UNLINK	Disconnects the two STREAMs specified by <i>fildev</i> and <i>arg</i> . <i>fildev</i> is the file
37135		descriptor of the STREAM connected to the multiplexing driver. The <i>arg</i>
37136		argument is the multiplexer ID number that was returned by the I_LINK
37137		<i>ioctl()</i> command when a STREAM was connected downstream from the
37138		multiplexing driver. If <i>arg</i> is MUXID_ALL, then all STREAMs that were
37139		connected to <i>fildev</i> shall be disconnected. As in I_LINK, this command requires
37140		acknowledgement.
37141		The <i>ioctl()</i> function with the I_UNLINK command shall fail if:
37142	[ENXIO]	Hangup received on <i>fildev</i> .
37143	[ETIME]	Timeout before acknowledgement message was received at
37144		STREAM head.
37145	[EAGAIN] or [ENOSR]	
37146		Unable to allocate buffers for the acknowledgement
37147		message.
37148	[EINVAL]	Invalid multiplexer ID number.
37149		An I_UNLINK can also fail while waiting for the multiplexing driver to
37150		acknowledge the request if a message indicating an error or a hangup is
37151		received at the STREAM head of <i>fildev</i> . In addition, an error code can be
37152		returned in the positive or negative acknowledgement message. For these
37153		cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.
37154	I_PLINK	Creates a <i>persistent connection</i> between two STREAMs, where <i>fildev</i> is the file
37155		descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the
37156		file descriptor of the STREAM connected to another driver. This call shall
37157		create a persistent connection which can exist even if the file descriptor <i>fildev</i>
37158		associated with the upper STREAM to the multiplexing driver is closed. The
37159		STREAM designated by <i>arg</i> gets connected via a persistent connection below
37160		the multiplexing driver. I_PLINK requires the multiplexing driver to send an
37161		acknowledgement message to the STREAM head. This call shall return a

37162 multiplexer ID number (an identifier that may be used to disconnect the
37163 multiplexer; see I_PUNLINK) on success, and -1 on failure.

37164 The *ioctl()* function with the I_PLINK command shall fail if:

- 37165 [ENXIO] Hangup received on *fildev*.
- 37166 [ETIME] Timeout before acknowledgement message was received at
37167 STREAM head.
- 37168 [EAGAIN] or [ENOSR]
37169 Unable to allocate STREAMS storage to perform the
37170 I_PLINK.
- 37171 [EBADF] The *arg* argument is not a valid, open file descriptor.
- 37172 [EINVAL] The *fildev* argument does not support multiplexing; or *arg* is
37173 not a STREAM or is already connected downstream from a
37174 multiplexer; or the specified I_PLINK operation would
37175 connect the STREAM head in more than one place in the
37176 multiplexed STREAM.

37177 An I_PLINK can also fail while waiting for the multiplexing driver to
37178 acknowledge the request, if a message indicating an error or a hangup is
37179 received at the STREAM head of *fildev*. In addition, an error code can be
37180 returned in the positive or negative acknowledgement message. For these
37181 cases, I_PLINK shall fail with *errno* set to the value in the message.

37182 I_PUNLINK Disconnects the two STREAMS specified by *fildev* and *arg* from a persistent
37183 connection. The *fildev* argument is the file descriptor of the STREAM
37184 connected to the multiplexing driver. The *arg* argument is the multiplexer ID
37185 number that was returned by the I_PLINK *ioctl()* command when a STREAM
37186 was connected downstream from the multiplexing driver. If *arg* is
37187 MUXID_ALL, then all STREAMS which are persistent connections to *fildev*
37188 shall be disconnected. As in I_PLINK, this command requires the multiplexing
37189 driver to acknowledge the request.

37190 The *ioctl()* function with the I_PUNLINK command shall fail if:

- 37191 [ENXIO] Hangup received on *fildev*.
- 37192 [ETIME] Timeout before acknowledgement message was received at
37193 STREAM head.
- 37194 [EAGAIN] or [ENOSR]
37195 Unable to allocate buffers for the acknowledgement
37196 message.
- 37197 [EINVAL] Invalid multiplexer ID number.

37198 An I_PUNLINK can also fail while waiting for the multiplexing driver to
37199 acknowledge the request if a message indicating an error or a hangup is
37200 received at the STREAM head of *fildev*. In addition, an error code can be
37201 returned in the positive or negative acknowledgement message. For these
37202 cases, I_PUNLINK shall fail with *errno* set to the value in the message.

37203 RETURN VALUE

37204 Upon successful completion, *ioctl()* shall return a value other than -1 that depends upon the
37205 STREAMS device control function. Otherwise, it shall return -1 and set *errno* to indicate the
37206 error.

ERRORS37207
37208

Under the following general conditions, *ioctl()* shall fail if:

37209

[EBADF] The *fildev* argument is not a valid open file descriptor.

37210

[EINTR] A signal was caught during the *ioctl()* operation.

37211

[EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or indirectly) downstream from a multiplexer.

37212

37213

If an underlying device driver detects an error, then *ioctl()* shall fail if:

37214

[EINVAL] The *request* or *arg* argument is not valid for this device.

37215

[EIO] Some physical I/O error has occurred.

37216

[ENOTTY] The file associated with the *fildev* argument is not a STREAMS device that accepts control functions.

37217

37218

[ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service requested cannot be performed on this particular sub-device.

37219

37220

[ENODEV] The *fildev* argument refers to a valid STREAMS device, but the corresponding device driver does not support the *ioctl()* function.

37221

37222

If a STREAM is connected downstream from a multiplexer, any *ioctl()* command except *I_UNLINK* and *I_PUNLINK* shall set *errno* to [EINVAL].

37223

EXAMPLES

37224

None.

37225

APPLICATION USAGE

37226

The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

37227

RATIONALE

37228

None.

37229

FUTURE DIRECTIONS

37230

The *ioctl()* function may be removed in a future version.

37235

CHANGE HISTORY

37236

First released in Issue 4, Version 2.

37237

Issue 5

37238

Moved from X/OPEN UNIX extension to BASE.

37239

Issue 6

37240

The Open Group Corrigendum U028/4 is applied, correcting text in the *I_FDINSERT* [EINVAL] case to refer to *ctlbuf*.

37241

37242

This function is marked as part of the XSI STREAMS Option Group.

37243

The normative text is updated to avoid use of the term “must” for application requirements.

37244

Issue 7

37245

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

37246

The *ioctl()* function is marked obsolescent.

37247

37248 **NAME**
 37249 isalnum, isalnum_l — test for an alphanumeric character

37250 SYNOPSIS

```
37251 #include <ctype.h>
37252
37252 int isalnum(int c);
37253 CX int isalnum_l(int c, locale_t locale);
```

37254 DESCRIPTION

37255 CX For *isalnum()*: The functionality described on this reference page is aligned with the ISO C
 37256 standard. Any conflict between the requirements described here and the ISO C standard is
 37257 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37258 CX The *isalnum()* and *isalnum_l()* functions shall test whether *c* is a character of class **alpha** or
 37259 CX **digit** in the current locale of the process, or in the locale represented by *locale*, respectively; see
 37260 XBD Chapter 7 (on page 121).

37261 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
 37262 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
 37263 behavior is undefined.

37264 RETURN VALUE

37265 CX The *isalnum()* and *isalnum_l()* functions shall return non-zero if *c* is an alphanumeric character;
 37266 otherwise, they shall return 0.

37267 ERRORS

37268 The *isalnum_l()* function may fail if:

37269 CX [EINVAL] *locale* is not a valid locale object handle.

37270 EXAMPLES

37271 None.

37272 APPLICATION USAGE

37273 To ensure applications portability, especially across natural languages, only these functions and
 37274 the functions in the reference pages listed in the SEE ALSO section should be used for character
 37275 classification.

37276 RATIONALE

37277 None.

37278 FUTURE DIRECTIONS

37279 None.

37280 SEE ALSO

37281 *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

37284 CHANGE HISTORY

37285 First released in Issue 1. Derived from Issue 1 of the SVID.

37286 Issue 6

37287 The normative text is updated to avoid use of the term “must” for application requirements.

37288

Issue 7

37289

The *isalnum_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

37290

37291 **NAME**
 37292 isalpha, isalpha_l — test for an alphabetic character

37293 **SYNOPSIS**

37294 #include <ctype.h>
 37295 int isalpha(int c);
 37296 CX int isalpha_l(int c, locale_t locale);

37297 **DESCRIPTION**

37298 CX For *isalpha()*: The functionality described on this reference page is aligned with the ISO C
 37299 standard. Any conflict between the requirements described here and the ISO C standard is
 37300 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37301 CX The *isalpha()* and *isalpha_l()* functions shall test whether *c* is a character of class **alpha** in the
 37302 current locale of the process, or in the locale represented by *locale*, respectively; see XBD
 37303 Chapter 7 (on page 121).

37304 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
 37305 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
 37306 behavior is undefined.

37307 **RETURN VALUE**

37308 CX The *isalpha()* and *isalpha_l()* functions shall return non-zero if *c* is an alphabetic character;
 37309 otherwise, they shall return 0.

37310 **ERRORS**

37311 The *isalpha_l()* function may fail if:

37312 CX [EINVAL] *locale* is not a valid locale object handle.

37313 **EXAMPLES**

37314 None.

37315 **APPLICATION USAGE**

37316 To ensure applications portability, especially across natural languages, only these functions and
 37317 the functions in the reference pages listed in the SEE ALSO section should be used for character
 37318 classification.

37319 **RATIONALE**

37320 None.

37321 **FUTURE DIRECTIONS**

37322 None.

37328 First released in Issue 1. Derived from Issue 1 of the SVID.

37329 **Issue 6**

37330 The normative text is updated to avoid use of the term “must” for application requirements.

37331
37332
37333**Issue 7**

The *isalpha_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

37334 **NAME**
 37335 isascii — test for a 7-bit US-ASCII character

37336 **SYNOPSIS**

37337 OB XSI `#include <ctype.h>`
 37338 `int isascii(int c);`

37339 **DESCRIPTION**

37340 The *isascii()* function shall test whether *c* is a 7-bit US-ASCII character code.

37341 The *isascii()* function is defined on all integer values.

37342 **RETURN VALUE**

37343 The *isascii()* function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and
 37344 octal 0177 inclusive; otherwise, it shall return 0.

37345 **ERRORS**

37346 No errors are defined.

37347 **EXAMPLES**

37348 None.

37349 **APPLICATION USAGE**

37350 The *isascii()* function cannot be used portably in a localized application.

37351 **RATIONALE**

37352 None.

37353 **FUTURE DIRECTIONS**

37354 The *isascii()* function may be removed in a future version.

37355 **SEE ALSO**

37356 XBD [<ctype.h>](#)

37357 **CHANGE HISTORY**

37358 First released in Issue 1. Derived from Issue 1 of the SVID.

37359 **Issue 7**

37360 The *isascii()* function is marked obsolescent.

37361 **NAME**
 37362 `isastream` — test a file descriptor (**STREAMS**)

37363 **SYNOPSIS**

37364 OB XSR `#include <stropts.h>`
 37365 `int isastream(int fildev);`

37366 **DESCRIPTION**

37367 The `isastream()` function shall test whether *fildev*, an open file descriptor, is associated with a
 37368 STREAMS-based file.

37369 **RETURN VALUE**

37370 Upon successful completion, `isastream()` shall return 1 if *fildev* refers to a STREAMS-based file
 37371 and 0 if not. Otherwise, `isastream()` shall return `-1` and set `errno` to indicate the error.

37372 **ERRORS**

37373 The `isastream()` function shall fail if:
 37374 [EBADF] The *fildev* argument is not a valid open file descriptor.

37375 **EXAMPLES**

37376 None.

37377 **APPLICATION USAGE**

37378 None.

37379 **RATIONALE**

37380 None.

37381 **FUTURE DIRECTIONS**

37382 The `isastream()` function may be removed in a future version.

37383 **SEE ALSO**

37384 XBD [<stropts.h>](#)

37385 **CHANGE HISTORY**

37386 First released in Issue 4, Version 2.

37387 **Issue 5**

37388 Moved from X/OPEN UNIX extension to BASE.

37389 **Issue 7**

37390 The `isastream()` function is marked obsolescent.

37391 **NAME**

37392 isatty — test for a terminal device

37393 **SYNOPSIS**

37394 #include <unistd.h>

37395 int isatty(int *fd*);

37396 **DESCRIPTION**

37397 The *isatty()* function shall test whether *fd*, an open file descriptor, is associated with a

37398 terminal device.

37399 **RETURN VALUE**

37400 The *isatty()* function shall return 1 if *fd* is associated with a terminal; otherwise, it shall return

37401 0 and may set *errno* to indicate the error.

37402 **ERRORS**

37403 The *isatty()* function may fail if:

37404 [EBADF] The *fd* argument is not a valid open file descriptor.

37405 [ENOTTY] The file associated with the *fd* argument is not a terminal.

37406 **EXAMPLES**

37407 None.

37408 **APPLICATION USAGE**

37409 The *isatty()* function does not necessarily indicate that a human being is available for interaction

37410 via *fd*. It is quite possible that non-terminal devices are connected to the communications

37411 line.

37412 **RATIONALE**

37413 None.

37414 **FUTURE DIRECTIONS**

37415 None.

37416 **SEE ALSO**

37417 XBD <unistd.h>

37418 **CHANGE HISTORY**

37419 First released in Issue 1. Derived from Issue 1 of the SVID.

37420 **Issue 6**

37421 The following new requirements on POSIX implementations derive from alignment with the

37422 Single UNIX Specification:

37423

- The optional setting of *errno* to indicate an error is added.
- The [EBADF] and [ENOTTY] optional error conditions are added.

37424

37425 **Issue 7**

37426 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

37427 **NAME**
 37428 `isblank, isblank_l` — test for a blank character

37429 **SYNOPSIS**
 37430 `#include <ctype.h>`
 37431 `int isblank(int c);`
 37432 CX `int isblank_l(int c, locale_t locale);`

37433 **DESCRIPTION**
 37434 CX For `isblank()`: The functionality described on this reference page is aligned with the ISO C
 37435 standard. Any conflict between the requirements described here and the ISO C standard is
 37436 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37437 CX The `isblank()` and `isblank_l()` functions shall test whether `c` is a character of class **blank** in the
 37438 current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 37439 Chapter 7 (on page 121).

37440 The `c` argument is a type **int**, the value of which the application shall ensure is a character
 37441 representable as an **unsigned char** or equal to the value of the macro `EOF`. If the argument has
 37442 any other value, the behavior is undefined.

37443 **RETURN VALUE**
 37444 CX The `isblank()` and `isblank_l()` functions shall return non-zero if `c` is a <blank>; otherwise, they
 37445 shall return 0.

37446 **ERRORS**
 37447 The `isblank_l()` function may fail if:
 37448 CX `[EINVAL]` `locale` is not a valid locale object handle.

37449 **EXAMPLES**
 37450 None.

37451 **APPLICATION USAGE**
 37452 To ensure applications portability, especially across natural languages, only these functions and
 37453 the functions in the reference pages listed in the SEE ALSO section should be used for character
 37454 classification.

37455 **RATIONALE**
 37456 None.

37457 **FUTURE DIRECTIONS**
 37458 None.

37459 **SEE ALSO**
 37460 `isalnum()`, `isalpha()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`, `isupper()`,
 37461 `isxdigit()`, `setlocale()`, `uselocale()`
 37462 XBD Chapter 7 (on page 121), `<ctype.h>`, `<locale.h>`

37463 **CHANGE HISTORY**
 37464 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37465 **Issue 7**
 37466 The `isblank_l()` function is added from The Open Group Technical Standard, 2006, Extended API
 37467 Set Part 4.

37468 **NAME**
 37469 iscntrl, iscntrl_l — test for a control character

37470 **SYNOPSIS**

```
37471       #include <ctype.h>
37472       int iscntrl(int c);
37473 CX     int iscntrl_l(int c, locale_t locale);
```

37474 **DESCRIPTION**

37475 CX For *iscntrl()*: The functionality described on this reference page is aligned with the ISO C
 37476 standard. Any conflict between the requirements described here and the ISO C standard is
 37477 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37478 CX The *iscntrl()* and *iscntrl_l()* functions shall test whether *c* is a character of class **cntrl** in the
 37479 current locale of the process, or in the locale represented by *locale*, respectively; see XBD
 37480 Chapter 7 (on page 121).

37481 The *c* argument is a type **int**, the value of which the application shall ensure is a character
 37482 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 37483 any other value, the behavior is undefined.

37484 **RETURN VALUE**

37485 CX The *iscntrl()* and *iscntrl_l()* functions shall return non-zero if *c* is a control character; otherwise,
 37486 they shall return 0.

37487 **ERRORS**

37488 The *iscntrl_l()* function may fail if:

37489 CX [EINVAL] *locale* is not a valid locale object handle.

37490 **EXAMPLES**

37491 None.

37492 **APPLICATION USAGE**

37493 To ensure applications portability, especially across natural languages, only these functions and
 37494 the functions in the reference pages listed in the SEE ALSO section should be used for character
 37495 classification.

37496 **RATIONALE**

37547 **CHANGE HISTORY**

37548 First released in Issue 1. Derived from Issue 1 of the SVID.

37549 **Issue 6**

37550 The normative text is updated to avoid use of the term “must” for application requirements.

37551
37552
37553**Issue 7**

The *isdigit_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

37554 **NAME**
 37555 isfinite — test for finite value

37556 **SYNOPSIS**
 37557 #include <math.h>
 37558 int isfinite(real-floating x);

37559 **DESCRIPTION**
 37560 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37561 conflict between the requirements described here and the ISO C standard is unintentional. This
 37562 volume of POSIX.1-200x defers to the ISO C standard.

37563 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or
 37564 normal, and not infinite or NaN). First, an argument represented in a format wider than its
 37565 semantic type is converted to its semantic type. Then determination is based on the type of the
 37566 argument.

37567 **RETURN VALUE**
 37568 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.

37569 **ERRORS**
 37570 No errors are defined.

37571 **EXAMPLES**
 37572 None.

37573 **APPLICATION USAGE**
 37574 None.

37575 **RATIONALE**
 37576 None.

37577 **FUTURE DIRECTIONS**
 37578 None.

 37580 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

37581 XBD <math.h>

37582 **CHANGE HISTORY**
 37583 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37584 **NAME**
 37585 `isgraph, isgraph_l` — test for a visible character

37586 **SYNOPSIS**
 37587 `#include <ctype.h>`
 37588 `int isgraph(int c);`
 37589 CX `int isgraph_l(int c, locale_t locale);`

37590 **DESCRIPTION**
 37591 CX For `isgraph()`: The functionality described on this reference page is aligned with the ISO C
 37592 standard. Any conflict between the requirements described here and the ISO C standard is
 37593 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37594 CX The `isgraph()` and `isgraph_l()` functions shall test whether `c` is a character of class **graph** in the
 37595 CX current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 37596 Chapter 7 (on page 121).

37597 The `c` argument is an **int**, the value of which the application shall ensure is a character
 37598 representable as an **unsigned char** or equal to the value of the macro `EOF`. If the argument has
 37599 any other value, the behavior is undefined.

37600 **RETURN VALUE**
 37601 CX The `isgraph()` and `isgraph_l()` functions shall return non-zero if `c` is a character with a visible
 37602 representation; otherwise, they shall return 0.

37603 **ERRORS**
 37604 The `isgraph_l()` function may fail if:

37605 CX `[EINVAL]` `locale` is not a valid locale object handle.

37606 **EXAMPLES**
 37607 None.

37608 **APPLICATION USAGE**
 37609 To ensure applications portability, especially across natural languages, only these functions and
 37610 the functions in the reference pages listed in the SEE ALSO section should be used for character
 37611 classification.

37612 **RATIONALE**
 37613 None.

37614 **FUTURE DIRECTIONS**
 37615 None.

37616 **SEE ALSO**
 37617 `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `isdigit()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`, `isupper()`,

 37619 XBD Chapter 7 (on page 121), `<ctype.h>`, `<locale.h>`

37620 **CHANGE HISTORY**
 37621 First released in Issue 1. Derived from Issue 1 of the SVID.

37622 **Issue 6**
 37623 The normative text is updated to avoid use of the term “must” for application requirements.

37624
37625
37626**Issue 7**

The *isgraph_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

37627 **NAME**37628 `isgreater` — test if x greater than y 37629 **SYNOPSIS**37630 `#include <math.h>`37631 `int isgreater(real-floating x , real-floating y);`37632 **DESCRIPTION**37633 CX The functionality described on this reference page is aligned with the ISO C standard. Any
37634 conflict between the requirements described here and the ISO C standard is unintentional. This
37635 volume of POSIX.1-200x defers to the ISO C standard.37636 The `isgreater()` macro shall determine whether its first argument is greater than its second
37637 argument. The value of `isgreater(x , y)` shall be equal to $(x) > (y)$; however, unlike $(x) > (y)$,
37638 `isgreater(x , y)` shall not raise the invalid floating-point exception when x and y are unordered.37639 **RETURN VALUE**37640 Upon successful completion, the `isgreater()` macro shall return the value of $(x) > (y)$.37641 If x or y is NaN, 0 shall be returned.37642 **ERRORS**

37643 No errors are defined.

37644 **EXAMPLES**

37645 None.

37646 **APPLICATION USAGE**37647 The relational and equality operators support the usual mathematical relationships between
37648 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
37649 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
37650 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
37651 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
37652 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
37653 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
37654 indicates that the argument shall be an expression of **real-floating** type.37655 **RATIONALE**

37656 None.

37657 **FUTURE DIRECTIONS**

37658 None.

37659 **SEE ALSO**37660 [*isgreaterequal\(\)*](#), [*isless\(\)*](#), [*islessequal\(\)*](#), [*islessgreater\(\)*](#), [*isunordered\(\)*](#)37661 XBD `<math.h>`37662 **CHANGE HISTORY**

37663 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37664 **NAME**
 37665 `isgreaterequal` — test if x is greater than or equal to y

37666 **SYNOPSIS**
 37667 `#include <math.h>`
 37668 `int isgreaterequal(real-floating x , real-floating y);`

37669 **DESCRIPTION**
 37670 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37671 conflict between the requirements described here and the ISO C standard is unintentional. This
 37672 volume of POSIX.1-200x defers to the ISO C standard.

37673 The `isgreaterequal()` macro shall determine whether its first argument is greater than or equal to
 37674 its second argument. The value of `isgreaterequal(x , y)` shall be equal to $(x) \geq (y)$; however, unlike
 37675 $(x) \geq (y)$, `isgreaterequal(x , y)` shall not raise the invalid floating-point exception when x and y are
 37676 unordered.

37677 **RETURN VALUE**
 37678 Upon successful completion, the `isgreaterequal()` macro shall return the value of $(x) \geq (y)$.
 37679 If x or y is NaN, 0 shall be returned.

37680 **ERRORS**
 37681 No errors are defined.

37682 **EXAMPLES**
 37683 None.

37684 **APPLICATION USAGE**
 37685 The relational and equality operators support the usual mathematical relationships between
 37686 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
 37687 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
 37688 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
 37689 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
 37690 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
 37691 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
 37692 indicates that the argument shall be an expression of **real-floating** type.

37693 **RATIONALE**

37805 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37806 **NAME**
 37807 islessgreater — test if x is less than or greater than y

37808 **SYNOPSIS**
 37809 #include <math.h>
 37810 int islessgreater(real-floating x , real-floating y);

37811 **DESCRIPTION**
 37812 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37813 conflict between the requirements described here and the ISO C standard is unintentional. This
 37814 volume of POSIX.1-200x defers to the ISO C standard.

37815 The *islessgreater()* macro shall determine whether its first argument is less than or greater than
 37816 its second argument. The *islessgreater(x , y)* macro is similar to $(x) < (y) \parallel (x) > (y)$; however,
 37817 *islessgreater(x , y)* shall not raise the invalid floating-point exception when x and y are unordered
 37818 (nor shall it evaluate x and y twice).

37819 **RETURN VALUE**
 37820 Upon successful completion, the *islessgreater()* macro shall return the value of
 37821 $(x) < (y) \parallel (x) > (y)$.
 37822 If x or y is NaN, 0 shall be returned.

37823 **ERRORS**
 37824 No errors are defined.

37825 **EXAMPLES**
 37826 None.

37827 **APPLICATION USAGE**
 37828 The relational and equality operators support the usual mathematical relationships between
 37829 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
 37830 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
 37831 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
 37832 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
 37833 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
 37834 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**

 37842 XBD <math.h>

37843 **CHANGE HISTORY**
 37844 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

37845 **NAME**
 37846 `islower, islower_l` — test for a lowercase letter

37847 **SYNOPSIS**
 37848 `#include <ctype.h>`
 37849 `int islower(int c);`
 37850 CX `int islower_l(int c, locale_t locale);`

37851 **DESCRIPTION**
 37852 CX For `islower()`: The functionality described on this reference page is aligned with the ISO C
 37853 standard. Any conflict between the requirements described here and the ISO C standard is
 37854 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

37855 CX The `islower()` and `islower_l()` functions shall test whether `c` is a character of class **lower** in the
 37856 current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 37857 Chapter 7 (on page 121).

37858 The `c` argument is an **int**, the value of which the application shall ensure is a character
 37859 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 37860 any other value, the behavior is undefined.

37861 **RETURN VALUE**
 37862 CX The `islower()` and `islower_l()` functions shall return non-zero if `c` is a lowercase letter; otherwise,
 37863 they shall return 0.

37864 **ERRORS**
 37865 The `islower_l()` function may fail if:
 37866 CX **[EINVAL]** `locale` is not a valid locale object handle.

37867 EXAMPLES

37868 Testing for a Lowercase Letter

37869 Two examples follow, the first using `islower()`, the second using multiple concurrent locales and
 37870 `islower_l()`.

37871 The examples test whether the value is a lowercase letter, based on the locale of the user, then
 37872 use it as part of a key value.

```
37873 /* Example 1 -- using islower() */
37874 #include <ctype.h>
37875 #include <stdlib.h>
37876 #include <locale.h>
37877 ...
37878 char *keystr;
37879 int elementlen, len;
37880 char c;
37881 ...
37882 setlocale(LC_ALL, "");
37883 ...
37884 len = 0;
37885 while (len < elementlen) {
37886     c = (char) (rand() % 256);
37887     ...
37888     if (islower(c))
```

```

37889         keystr[len++] = c;
37890     }
37891     ...
37892     /* Example 2 -- using islower_l() */
37893     #include <ctype.h>
37894     #include <stdlib.h>
37895     #include <locale.h>
37896     ...
37897     char *keystr;
37898     int elementlen, len;
37899     char c;
37900     ...
37901     locale_t loc = newlocale (LC_ALL_MASK, "", (locale_t) 0);
37902     ...
37903     len = 0;
37904     while (len < elementlen) {
37905         c = (char) (rand() % 256);
37906         ...
37907         if (islower_l(c, loc))
37908             keystr[len++] = c;
37909     }
37910     ...

```

APPLICATION USAGE

To ensure applications portability, especially across natural languages, only these functions and the functions in the reference pages listed in the SEE ALSO section should be used for character classification.

RATIONALE

None.

FUTURE DIRECTIONS

None.

37996 **NAME**
 37997 `isprint, isprint_l` — test for a printable character

37998 **SYNOPSIS**
 37999 `#include <ctype.h>`
 38000 `int isprint(int c);`
 38001 CX `int isprint_l(int c, locale_t locale);`

38002 **DESCRIPTION**
 38003 CX For `isprint()`: The functionality described on this reference page is aligned with the ISO C
 38004 standard. Any conflict between the requirements described here and the ISO C standard is
 38005 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38006 CX The `isprint()` and `isprint_l()` functions shall test whether `c` is a character of class **print** in the
 38007 current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 38008 Chapter 7 (on page 121).

38009 The `c` argument is an **int**, the value of which the application shall ensure is a character
 38010 representable as an **unsigned char** or equal to the value of the macro `EOF`. If the argument has
 38011 any other value, the behavior is undefined.

38012 **RETURN VALUE**
 38013 CX The `isprint()` and `isprint_l()` functions shall return non-zero if `c` is a printable character;
 38014 otherwise, they shall return 0.

38015 **ERRORS**
 38016 The `isprint_l()` function may fail if:
 38017 CX `[EINVAL]` `locale` is not a valid locale object handle.

38018 **EXAMPLES**
 38019 None.

38020 **APPLICATION USAGE**
 38021 To ensure applications portability, especially across natural languages, only these functions and
 38022 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38023 classification.

38024 **RATIONALE**
 38025 None.

38026 **FUTURE DIRECTIONS**
 38027 None.

38028 **SEE ALSO**
 38029 `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `ispunct()`, `isspace()`, `isupper()`,

38032 **CHANGE HISTORY**
 38033 First released in Issue 1. Derived from Issue 1 of the SVID.

38034 **Issue 6**
 38035 The normative text is updated to avoid use of the term “must” for application requirements.

38036
38037
38038**Issue 7**

The *isprint_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38039 **NAME**
 38040 `ispunct, ispunct_l` — test for a punctuation character

38041 **SYNOPSIS**
 38042 `#include <ctype.h>`
 38043 `int ispunct(int c);`
 38044 CX `int ispunct_l(int c, locale_t locale);`

38045 **DESCRIPTION**
 38046 CX For *ispunct()*: The functionality described on this reference page is aligned with the ISO C
 38047 standard. Any conflict between the requirements described here and the ISO C standard is
 38048 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38049 CX The *ispunct()* and *ispunct_l()* functions shall test whether *c* is a character of class **punct** in the
 38050 current locale of the process, or in the locale represented by *locale*, respectively; see XBD
 38051 Chapter 7 (on page 121).

38052 The *c* argument is an **int**, the value of which the application shall ensure is a character
 38053 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 38054 any other value, the behavior is undefined.

38055 **RETURN VALUE**
 38056 CX The *ispunct()* and *ispunct_l()* functions shall return non-zero if *c* is a punctuation character;
 38057 otherwise, they shall return 0.

38058 **ERRORS**
 38059 The *ispunct_l()* function may fail if:

38060 CX **[EINVAL]** *locale* is not a valid locale object handle.

38061 **EXAMPLES**
 38062 None.

38063 **APPLICATION USAGE**
 38064 To ensure applications portability, especially across natural languages, only these functions and
 38065 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38066 classification.

38067 **RATIONALE**
 38068 None.

38069 **FUTURE DIRECTIONS**
 38070 None.

38071 **SEE ALSO**
 38072 *isalnum()*, *isalpha()*, *isblank()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *isspace()*, *isupper()*,
 38073 *isxdigit()*, *setlocale()*, *uselocale()*

38075 **CHANGE HISTORY**
 38076 First released in Issue 1. Derived from Issue 1 of the SVID.

38077 **Issue 6**
 38078 The normative text is updated to avoid use of the term “must” for application requirements.

38079
38080
38081**Issue 7**

The *ispunct_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38082 **NAME**
 38083 `isspace, isspace_l` — test for a white-space character

38084 **SYNOPSIS**
 38085 `#include <ctype.h>`
 38086 `int isspace(int c);`
 38087 CX `int isspace_l(int c, locale_t locale);`

38088 **DESCRIPTION**
 38089 CX For `isspace()`: The functionality described on this reference page is aligned with the ISO C
 38090 standard. Any conflict between the requirements described here and the ISO C standard is
 38091 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38092 CX The `isspace()` and `isspace_l()` functions shall test whether `c` is a character of class **space** in the
 38093 current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 38094 Chapter 7 (on page 121).

38095 The `c` argument is an **int**, the value of which the application shall ensure is a character
 38096 representable as an **unsigned char** or equal to the value of the macro `EOF`. If the argument has
 38097 any other value, the behavior is undefined.

38098 **RETURN VALUE**
 38099 CX The `isspace()` and `isspace_l()` functions shall return non-zero if `c` is a white-space character;
 38100 otherwise, they shall return 0.

38101 **ERRORS**
 38102 The `isspace_l()` function may fail if:
 38103 CX `[EINVAL]` `locale` is not a valid locale object handle.

38104 **EXAMPLES**
 38105 None.

38106 **APPLICATION USAGE**
 38107 To ensure applications portability, especially across natural languages, only these functions and
 38108 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38109 classification.

38110 **RATIONALE**
 38111 None.

38112 **FUTURE DIRECTIONS**
 38113 None.

38114 **SEE ALSO**
 38115 `isalnum()`, `isalpha()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isupper()`,
 38116 `isxdigit()`, `setlocale()`, `uselocale()`
 38117 XBD Chapter 7 (on page 121), `<ctype.h>`, `<locale.h>`

38118 **CHANGE HISTORY**
 38119 First released in Issue 1. Derived from Issue 1 of the SVID.

38120 **Issue 6**
 38121 The normative text is updated to avoid use of the term “must” for application requirements.

38122
38123
38124**Issue 7**

The *isspace_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38125 **NAME**38126 `isunordered` — test if arguments are unordered38127 **SYNOPSIS**38128 `#include <math.h>`38129 `int isunordered(real-floating x, real-floating y);`38130 **DESCRIPTION**38131 CX The functionality described on this reference page is aligned with the ISO C standard. Any
38132 conflict between the requirements described here and the ISO C standard is unintentional. This
38133 volume of POSIX.1-200x defers to the ISO C standard.38134 The *isunordered()* macro shall determine whether its arguments are unordered.38135 **RETURN VALUE**38136 Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are
38137 unordered, and 0 otherwise.38138 If *x* or *y* is NaN, 1 shall be returned.38139 **ERRORS**

38140 No errors are defined.

38141 **EXAMPLES**

38142 None.

38143 **APPLICATION USAGE**38144 The relational and equality operators support the usual mathematical relationships between
38145 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
38146 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
38147 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
38148 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
38149 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
38150 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
38151 indicates that the argument shall be an expression of **real-floating** type.38152 **RATIONALE**

38153 None.

38154 **FUTURE DIRECTIONS**

38155 None.

38156 **SEE ALSO**38157 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*38158 XBD **<math.h>**38159 **CHANGE HISTORY**

38160 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38161 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/50 is applied, correcting the RETURN
38162 VALUE section when *x* or *y* is NaN.

38163 **NAME**
 38164 `isupper, isupper_l` — test for an uppercase letter

38165 **SYNOPSIS**
 38166 `#include <ctype.h>`
 38167 `int isupper(int c);`
 38168 CX `int isupper_l(int c, locale_t locale);`

38169 **DESCRIPTION**
 38170 CX For `isupper()`: The functionality described on this reference page is aligned with the ISO C
 38171 standard. Any conflict between the requirements described here and the ISO C standard is
 38172 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38173 CX The `isupper()` and `isupper_l()` functions shall test whether `c` is a character of class **upper** in the
 38174 current locale of the process, or in the locale represented by `locale`, respectively; see XBD
 38175 Chapter 7 (on page 121).

38176 The `c` argument is an **int**, the value of which the application shall ensure is a character
 38177 representable as an **unsigned char** or equal to the value of the macro `EOF`. If the argument has
 38178 any other value, the behavior is undefined.

38179 **RETURN VALUE**
 38180 CX The `isupper()` and `isupper_l()` functions shall return non-zero if `c` is an uppercase letter;
 38181 otherwise, they shall return 0.

38182 **ERRORS**
 38183 The `isupper_l()` function may fail if:

38184 CX `[EINVAL]` `locale` is not a valid locale object handle.

38185 **EXAMPLES**
 38186 None.

38187 **APPLICATION USAGE**
 38188 To ensure applications portability, especially across natural languages, only these functions and
 38189 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38190 classification.

38191 **RATIONALE**
 38192 None.

38193 **FUTURE DIRECTIONS**
 38194 None.

38195 **SEE ALSO**
 38196 `isalnum()`, `isalpha()`, `isblank()`, `iscntrl()`, `isdigit()`, `isgraph()`, `islower()`, `isprint()`, `ispunct()`, `isspace()`,

 38198 XBD Chapter 7 (on page 121), `<ctype.h>`, `<locale.h>`

38199 **CHANGE HISTORY**
 38200 First released in Issue 1. Derived from Issue 1 of the SVID.

38201 **Issue 6**
 38202 The normative text is updated to avoid use of the term “must” for application requirements.

38203
38204
38205**Issue 7**

The *isupper_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38206 **NAME**

38207 iswalnum, iswalnum_l — test for an alphanumeric wide-character code

38208 **SYNOPSIS**

38209 #include <wctype.h>

38210 int iswalnum(wint_t wc);

38211 CX int iswalnum_l(wint_t wc, locale_t locale);

38212 **DESCRIPTION**38213 CX For *iswalnum()*: The functionality described on this reference page is aligned with the ISO C
38214 standard. Any conflict between the requirements described here and the ISO C standard is
38215 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.38216 CX The *iswalnum()* and *iswalnum_l()* functions shall test whether *wc* is a wide-character code
38217 representing a character of class **alpha** or **digit** in the current locale of the process, or in the
38218 locale represented by *locale*, respectively; see XBD Chapter 7 (on page 121).38219 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
38220 code corresponding to a valid character in the current locale, or equal to the value of the macro
38221 WEOF. If the argument has any other value, the behavior is undefined.38222 **RETURN VALUE**38223 CX The *iswalnum()* and *iswalnum_l()* functions shall return non-zero if *wc* is an alphanumeric
38224 wide-character code; otherwise, they shall return 0.38225 **ERRORS**38226 The *iswalnum_l()* function may fail if:38227 CX [EINVAL] *locale* is not a valid locale object handle.38228 **EXAMPLES**

38229 None.

38230 **APPLICATION USAGE**38231 To ensure applications portability, especially across natural languages, only these functions and
38232 the functions in the reference pages listed in the SEE ALSO section should be used for character
38233 classification.38234 **RATIONALE**

38235 None.

38236 **FUTURE DIRECTIONS**

38237 None.

38238 **SEE ALSO**38239 *iswalphabet()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

38241 XBD Chapter 7 (on page 121), <locale.h>, <stdio.h>, <wctype.h>

38242 **CHANGE HISTORY**

38243 First released as a World-wide Portability Interface in Issue 4.

38244 **Issue 5**38245 The following change has been made in this version for alignment with
38246 ISO/IEC 9899:1990/Amendment 1:1995 (E):

iswalnum()

38247

38248

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

38249

Issue 6

38250

The normative text is updated to avoid use of the term “must” for application requirements.

38251

Issue 7

38252

The `iswalnum_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38253

38254 **NAME**

38255 iswalpha, iswalpha_l — test for an alphabetic wide-character code

38256 **SYNOPSIS**

38257 #include <wctype.h>

38258 int iswalpha(wint_t wc);

38259 CX int iswalpha_l(wint_t wc, locale_t locale);

38260 **DESCRIPTION**38261 CX For *iswalpha()*: The functionality described on this reference page is aligned with the ISO C
38262 standard. Any conflict between the requirements described here and the ISO C standard is
38263 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.38264 CX The *iswalpha()* and *iswalpha_l()* functions shall test whether *wc* is a wide-character code
38265 representing a character of class **alpha** in the current locale of the process, or in the locale
38266 represented by *locale*, respectively; see XBD Chapter 7 (on page 121).38267 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
38268 code corresponding to a valid character in the current locale, or equal to the value of the macro
38269 WEOF. If the argument has any other value, the behavior is undefined.38270 **RETURN VALUE**38271 CX The *iswalpha()* and *iswalpha_l()* functions shall return non-zero if *wc* is an alphabetic wide-
38272 character code; otherwise, they shall return 0.38273 **ERRORS**38274 The *iswalpha_l()* function may fail if:38275 CX [EINVAL] *locale* is not a valid locale object handle.38276 **EXAMPLES**

38277 None.

38278 **APPLICATION USAGE**38279 To ensure applications portability, especially across natural languages, only these functions and
38280 the functions in the reference pages listed in the SEE ALSO section should be used for character
38281 classification.38282 **RATIONALE**

38283 None.

38284 **FUTURE DIRECTIONS**

38285 None.

38286 **SEE ALSO**38287 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,

38336 *iswpunct()*, *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, *uselocale()*

38337 XBD Chapter 7 (on page 121), <locale.h>, <stdio.h>, <wctype.h>

38338 **CHANGE HISTORY**

38339 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38340 **Issue 7**38341 The *iswblank_l()* function is added from The Open Group Technical Standard, 2006, Extended
38342 API Set Part 4.

38343 **NAME**
 38344 `iswcntrl, iswcntrl_l` — test for a control wide-character code

38345 **SYNOPSIS**
 38346 `#include <wctype.h>`
 38347 `int iswcntrl(wint_t wc);`
 38348 CX `int iswcntrl_l(wint_t wc, locale_t locale);`

38349 **DESCRIPTION**
 38350 CX For `iswcntrl()`: The functionality described on this reference page is aligned with the ISO C
 38351 standard. Any conflict between the requirements described here and the ISO C standard is
 38352 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38353 CX The `iswcntrl()` and `iswcntrl_l()` functions shall test whether `wc` is a wide-character code
 38354 CX representing a character of class **cntrl** in the current locale of the process, or in the locale
 38355 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).

38356 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 38357 code corresponding to a valid character in the current locale, or equal to the value of the macro
 38358 WEOF. If the argument has any other value, the behavior is undefined.

38359 **RETURN VALUE**
 38360 CX The `iswcntrl()` and `iswcntrl_l()` functions shall return non-zero if `wc` is a control wide-character
 38361 code; otherwise, they shall return 0.

38362 **ERRORS**
 38363 The `iswcntrl_l()` function may fail if:
 38364 CX **[EINVAL]** `locale` is not a valid locale object handle.

38365 **EXAMPLES**
 38366 None.

38367 **APPLICATION USAGE**
 38368 To ensure applications portability, especially across natural languages, only these functions and
 38369 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38370 classification.

38371 **RATIONALE**
 38372 None.

38373 **FUTURE DIRECTIONS**
 38374 None.

38375 **SEE ALSO**
 38376 `iswalnum()`, `iswalpha()`, `iswctype()`, `iswdigit()`, `iswgraph()`, `iswlower()`, `iswprint()`, `iswpunct()`,

38387

The normative text is updated to avoid use of the term “must” for application requirements.

38388

Issue 7

38389

The `iswcntrl_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38390

38391 **NAME**
 38392 `iswctype`, `iswctype_l` — test character for a specified class

SYNOPSIS

```
38394 #include <wctype.h>
38395
38395 int iswctype(wint_t wc, wctype_t charclass);
38396 CX int iswctype_l(wint_t wc, wctype_t charclass,
38397 locale_t locale);
```

DESCRIPTION

38398
 38399 CX For `iswctype()`: The functionality described on this reference page is aligned with the ISO C
 38400 standard. Any conflict between the requirements described here and the ISO C standard is
 38401 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38402 CX The `iswctype()` and `iswctype_l()` functions shall determine whether the wide-character code `wc`
 38403 has the character class `charclass`, returning true or false. The `iswctype()` and `iswctype_l()`
 38404 functions are defined on WEOF and wide-character codes corresponding to the valid character
 38405 encodings in the current locale, or in the locale represented by `locale`, respectively. If the `wc`
 38406 argument is not in the domain of the function, the result is undefined. If the value of `charclass` is
 38407 invalid (that is, not obtained by a call to `wctype()` or `charclass` is invalidated by a subsequent call
 38408 to `setlocale()` that has affected category `LC_CTYPE`) the result is unspecified.

RETURN VALUE

38409 CX The `iswctype()` and `iswctype_l()` functions shall return non-zero (true) if and only if `wc` has the
 38410 property described by `charclass`. If `charclass` is 0, these functions shall return 0.

ERRORS

38412 The `iswctype_l()` function may fail if:

38413
 38414 CX [EINVAL] `locale` is not a valid locale object handle.

EXAMPLES**Testing for a Valid Character**

```
38416 #include <wctype.h>
38417 ...
38418 int yes_or_no;
38419 wint_t wc;
38420 wctype_t valid_class;
38421 ...
38422 if ((valid_class=wctype("vowel")) == (wctype_t)0)
38423     /* Invalid character class. */
38424     yes_or_no=iswctype(wc,valid_class);
```

APPLICATION USAGE

38426 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",
 38427 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard
 38428 character classes. In the table below, the functions in the left column are equivalent to the
 38429 functions in the right column.

38431	<code>iswalnum(wc)</code>	<code>iswctype(wc, wctype("alnum"))</code>
38432	<code>iswalnum_l(wc, locale)</code>	<code>iswctype_l(wc, wctype("alnum"), locale)</code>
38433	<code>iswalpha(wc)</code>	<code>iswctype(wc, wctype("alpha"))</code>
38434	<code>iswalpha_l(wc, locale)</code>	<code>iswctype_l(wc, wctype("alpha"), locale)</code>

```

38435      iswblank(wc)          iswctype(wc, wctype("blank"))
38436      iswblank_l(wc, locale) iswctype_l(wc, wctype("blank"), locale)
38437      iswcntrl(wc)         iswctype(wc, wctype("cntrl"))
38438      iswcntrl_l(wc, locale) iswctype_l(wc, wctype("cntrl"), locale)
38439      iswdigit(wc)         iswctype(wc, wctype("digit"))
38440      iswdigit_l(wc, locale) iswctype_l(wc, wctype("digit"), locale)
38441      iswgraph(wc)        iswctype(wc, wctype("graph"))
38442      iswgraph_l(wc, locale) iswctype_l(wc, wctype("graph"), locale)
38443      iswlower(wc)        iswctype(wc, wctype("lower"))
38444      iswlower_l(wc, locale) iswctype_l(wc, wctype("lower"), locale)
38445      iswprint(wc)        iswctype(wc, wctype("print"))
38446      iswprint_l(wc, locale) iswctype_l(wc, wctype("print"), locale)
38447      iswpunct(wc)        iswctype(wc, wctype("punct"))
38448      iswpunct_l(wc, locale) iswctype_l(wc, wctype("punct"), locale)
38449      iswspace(wc)        iswctype(wc, wctype("space"))
38450      iswspace_l(wc, locale) iswctype_l(wc, wctype("space"), locale)
38451      iswupper(wc)        iswctype(wc, wctype("upper"))
38452      iswupper_l(wc, locale) iswctype_l(wc, wctype("upper"), locale)
38453      iswxdigit(wc)       iswctype(wc, wctype("xdigit"))
38454      iswxdigit_l(wc, locale) iswctype_l(wc, wctype("xdigit"), locale)

```

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released as World-wide Portability Interfaces in Issue 4.

Issue 5

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

Issue 6

The behavior of $n=0$ is now described.

An example is added.

A new function, *iswblank()*, is added to the list in the APPLICATION USAGE.

Issue 7

The *iswctype_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38477 **NAME**38478 `iswdigit, iswdigit_l` — test for a decimal digit wide-character code38479 **SYNOPSIS**38480 `#include <wctype.h>`38481 `int iswdigit(wint_t wc);`38482 CX `int iswdigit_l(wint_t wc, locale_t locale);`38483 **DESCRIPTION**38484 CX For `iswdigit()`: The functionality described on this reference page is aligned with the ISO C
38485 standard. Any conflict between the requirements described here and the ISO C standard is
38486 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.38487 CX The `iswdigit()` and `iswdigit_l()` functions shall test whether `wc` is a wide-character code
38488 representing a character of class **digit** in the current locale of the process, or in the locale
38489 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).38490 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
38491 code corresponding to a valid character in the current locale, or equal to the value of the macro
38492 WEOF. If the argument has any other value, the behavior is undefined.38493 **RETURN VALUE**38494 CX The `iswdigit()` and `iswdigit_l()` functions shall return non-zero if `wc` is a decimal digit wide-
38495 character code; otherwise, they shall return 0.38496 **ERRORS**38497 The `iswdigit_l()` function may fail if:38498 CX **[EINVAL]** `locale` is not a valid locale object handle.38499 **EXAMPLES**

38500 None.

38501 **APPLICATION USAGE**38502 To ensure applications portability, especially across natural languages, only these functions and
38503 the functions in the reference pages listed in the SEE ALSO section should be used for character
38504 classification.38505 **RATIONALE**

38506 None.

38507 **FUTURE DIRECTIONS**

38508 None.

38509 **SEE ALSO**38510 `iswalnum()`, `iswalpunct()`, `iswalpha()`, `iswcntrl()`, `iswctype()`, `iswgraph()`, `iswlower()`, `iswprint()`, `iswpunct()`,
38511 `iswspace()`, `iswupper()`, `iswxdigit()`, `setlocale()`, `uselocale()`38512 XBD Chapter 7 (on page 121), `<locale.h>`, `<wctype.h>`38513 **CHANGE HISTORY**

38514 First released in Issue 4.

38515 **Issue 5**38516 The following change has been made in this version for alignment with
38517 ISO/IEC 9899:1990/Amendment 1:1995 (E):

38518

38519

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

38520

Issue 6

38521

The normative text is updated to avoid use of the term “must” for application requirements.

38522

Issue 7

38523

The `iswdigit_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38524

38525 **NAME**38526 `iswgraph, iswgraph_l` — test for a visible wide-character code38527 **SYNOPSIS**38528 `#include <wctype.h>`38529 `int iswgraph(wint_t wc);`38530 CX `int iswgraph_l(wint_t wc, locale_t locale);`38531 **DESCRIPTION**38532 CX For `iswgraph()`: The functionality described on this reference page is aligned with the ISO C
38533 standard. Any conflict between the requirements described here and the ISO C standard is
38534 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.38535 CX The `iswgraph()` and `iswgraph_l()` functions shall test whether `wc` is a wide-character code
38536 representing a character of class **graph** in the current locale of the process, or in the locale
38537 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).38538 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
38539 code corresponding to a valid character in the current locale, or equal to the value of the macro
38540 WEOF. If the argument has any other value, the behavior is undefined.38541 **RETURN VALUE**38542 CX The `iswgraph()` and `iswgraph_l()` functions shall return non-zero if `wc` is a wide-character code
38543 with a visible representation; otherwise, they shall return 0.38544 **ERRORS**38545 The `iswgraph_l()` function may fail if:38546 CX **[EINVAL]** `locale` is not a valid locale object handle.38547 **EXAMPLES**

38548 None.

38549 **APPLICATION USAGE**38550 To ensure applications portability, especially across natural languages, only these functions and
38551 the functions in the reference pages listed in the SEE ALSO section should be used for character
38552 classification.38553 **RATIONALE**

38554 None.

38555 **FUTURE DIRECTIONS**

38556 None.

38557 **SEE ALSO**38558 `iswalnum()`, `iswalpha()`, `iswcntrl()`, `iswctype()`, `iswdigit()`, `iswlower()`, `iswprint()`, `iswpunct()`,
38559 `iswspace()`, `iswupper()`, `iswxdigit()`, `setlocale()`, `uselocale()`38560 XBD Chapter 7 (on page 121), `<locale.h>`, `<wctype.h>`38561 **CHANGE HISTORY**

38562 First released in Issue 4.

38563 **Issue 5**38564 The following change has been made in this version for alignment with
38565 ISO/IEC 9899:1990/Amendment 1:1995 (E):

38566

38567

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

38568

Issue 6

38569

The normative text is updated to avoid use of the term “must” for application requirements.

38570

Issue 7

38571

The `iswgraph_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38572

38573 **NAME**
 38574 `iswlower, iswlower_l` — test for a lowercase letter wide-character code

38575 **SYNOPSIS**
 38576 `#include <wctype.h>`
 38577 `int iswlower(wint_t wc);`
 38578 CX `int iswlower_l(wint_t wc, locale_t locale);`

38579 **DESCRIPTION**
 38580 CX For `iswlower()`: The functionality described on this reference page is aligned with the ISO C
 38581 standard. Any conflict between the requirements described here and the ISO C standard is
 38582 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38583 CX The `iswlower()` and `iswlower_l()` functions shall test whether `wc` is a wide-character code
 38584 CX representing a character of class **lower** in the current locale of the process, or in the locale
 38585 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).

38586 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 38587 code corresponding to a valid character in the current locale, or equal to the value of the macro
 38588 WEOF. If the argument has any other value, the behavior is undefined.

38589 **RETURN VALUE**
 38590 CX The `iswlower()` and `iswlower_l()` functions shall return non-zero if `wc` is a lowercase letter wide-
 38591 character code; otherwise, they shall return 0.

38592 **ERRORS**
 38593 The `iswlower_l()` function may fail if:
 38594 CX **[EINVAL]** `locale` is not a valid locale object handle.

38595 **EXAMPLES**
 38596 None.

38597 **APPLICATION USAGE**
 38598 To ensure applications portability, especially across natural languages, only these functions and
 38599 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38600 classification.

38601 **RATIONALE**
 38602 None.

38603 **FUTURE DIRECTIONS**
 38604 None.

38605 **SEE ALSO**
 38606 `iswalnum()`, `iswalpha()`, `iswcntrl()`, `iswctype()`, `iswdigit()`, `iswgraph()`, `iswprint()`, `iswpunct()`,

 38608 XBD Chapter 7 (on page 121), `<locale.h>`, `<wctype.h>`

38609 **CHANGE HISTORY**
 38610 First released in Issue 4.

38611 **Issue 5**
 38612 The following change has been made in this version for alignment with
 38613 ISO/IEC 9899:1990/Amendment 1:1995 (E):

38614

38615

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

38616

Issue 6

38617

The normative text is updated to avoid use of the term “must” for application requirements.

38618

Issue 7

38619

The `iswlower_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38620

38621 **NAME**
 38622 `iswprint, iswprint_l` — test for a printable wide-character code

38623 **SYNOPSIS**

38624 `#include <wctype.h>`
 38625 `int iswprint(wint_t wc);`
 38626 CX `int iswprint_l(wint_t wc, locale_t locale);`

38627 **DESCRIPTION**

38628 CX For `iswprint()`: The functionality described on this reference page is aligned with the ISO C
 38629 standard. Any conflict between the requirements described here and the ISO C standard is
 38630 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38631 CX The `iswprint()` and `iswprint_l()` functions shall test whether `wc` is a wide-character code
 38632 representing a character of class **print** in the current locale of the process, or in the locale
 38633 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).

38634 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 38635 code corresponding to a valid character in the current locale, or equal to the value of the macro
 38636 WEOF. If the argument has any other value, the behavior is undefined.

38637 **RETURN VALUE**

38638 CX The `iswprint()` and `iswprint_l()` functions shall return non-zero if `wc` is a printable wide-
 38639 character code; otherwise, they shall return 0.

38640 **ERRORS**

38641 The `iswprint_l()` function may fail if:

38642 CX **[EINVAL]** `locale` is not a valid locale object handle.

38643 **EXAMPLES**

38644 None.

38645 **APPLICATION USAGE**

38646 To ensure applications portability, especially across natural languages, only these functions and
 38647 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38648 classification.

38649 **RATIONALE**

38650 None.

38651 **FUTURE DIRECTIONS**

38652 None.

38762

Issue 7

38763

38764

The `iswspace_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38765 **NAME**
 38766 `iswupper, iswupper_l` — test for an uppercase letter wide-character code

38767 **SYNOPSIS**
 38768 `#include <wctype.h>`
 38769 `int iswupper(wint_t wc);`
 38770 CX `int iswupper_l(wint_t wc, locale_t locale);`

38771 **DESCRIPTION**
 38772 CX For `iswupper()`: The functionality described on this reference page is aligned with the ISO C
 38773 standard. Any conflict between the requirements described here and the ISO C standard is
 38774 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

38775 CX The `iswupper()` and `iswupper_l()` functions shall test whether `wc` is a wide-character code
 38776 representing a character of class **upper** in the current locale of the process, or in the locale
 38777 represented by `locale`, respectively; see XBD Chapter 7 (on page 121).

38778 The `wc` argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 38779 code corresponding to a valid character in the current locale, or equal to the value of the macro
 38780 WEOF. If the argument has any other value, the behavior is undefined.

38781 **RETURN VALUE**
 38782 CX The `iswupper()` and `iswupper_l()` functions shall return non-zero if `wc` is an uppercase letter
 38783 wide-character code; otherwise, they shall return 0.

38784 **ERRORS**
 38785 The `iswupper_l()` function may fail if:

38786 CX **[EINVAL]** `locale` is not a valid locale object handle.

38787 **EXAMPLES**
 38788 None.

38789 **APPLICATION USAGE**
 38790 To ensure applications portability, especially across natural languages, only these functions and
 38791 the functions in the reference pages listed in the SEE ALSO section should be used for character
 38792 classification.

38793 **RATIONALE**
 38794 None.

38795 **FUTURE DIRECTIONS**

38897 **CHANGE HISTORY**
 38898 First released in Issue 1. Derived from Issue 1 of the SVID.

38899 **Issue 6**
 38900 The normative text is updated to avoid use of the term “must” for application requirements.

38901
38902
38903**Issue 7**

The *isxdigit_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

38904 **NAME**
 38905 `j0, j1, jn` — Bessel functions of the first kind

38906 **SYNOPSIS**

```
38907 XSI      #include <math.h>
38908
38908 double j0(double x);
38909 double j1(double x);
38910 double jn(int n, double x);
```

38911 **DESCRIPTION**

38912 The `j0()`, `j1()`, and `jn()` functions shall compute Bessel functions of x of the first kind of orders 0,
 38913 1, and n , respectively.

38914 An application wishing to check for error situations should set `errno` to zero and call
 38915 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 38916 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 38917 zero, an error has occurred.

38918 **RETURN VALUE**

38919 Upon successful completion, these functions shall return the relevant Bessel value of x of the
 38920 first kind.

38921 If the x argument is too large in magnitude, or the correct result would cause underflow, 0 shall
 38922 be returned and a range error may occur.

38923 If x is NaN, a NaN shall be returned.

38924 **ERRORS**

38925 These functions may fail if:

38926 **Range Error** The value of x was too large in magnitude, or an underflow occurred.

38927 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 38928 then `errno` shall be set to [ERANGE]. If the integer expression
 38929 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow
 38930 floating-point exception shall be raised.

38931 No other errors shall occur.

38932 **EXAMPLES**

38933 None.

38934 **APPLICATION USAGE**

38935 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
 38936 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

38937 **RATIONALE**

38938 None.

38939 **FUTURE DIRECTIONS**

38940 None.

CHANGE HISTORY

38945

First released in Issue 1. Derived from Issue 1 of the SVID.

38946

Issue 5

38947

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

38948

38949

Issue 6

38950

The may fail [EDOM] error is removed for the case for NaN.

38951

The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling with the ISO/IEC 9899:1999 standard.

38952

jrand48()38953 **NAME**

38954 jrand48 — generate a uniformly distributed pseudo-random long signed integer

38955 **SYNOPSIS**38956 XSI #include <stdlib.h>
38957 long jrand48(unsigned short xsubi[3]);38958 **DESCRIPTION**38959 Refer to *drand48()*.

38960 **NAME**
 38961 kill — send a signal to a process or a group of processes

38962 **SYNOPSIS**

```
38963 CX #include <signal.h>
38964 int kill(pid_t pid, int sig);
```

38965 **DESCRIPTION**

38966 The *kill()* function shall send a signal to a process or a group of processes specified by *pid*. The
 38967 signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is
 38968 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can
 38969 be used to check the validity of *pid*.

38970 For a process to have permission to send a signal to a process designated by *pid*, unless the
 38971 sending process has appropriate privileges, the real or effective user ID of the sending process
 38972 shall match the real or saved set-user-ID of the receiving process.

38973 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

38974 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)
 38975 whose process group ID is equal to the process group ID of the sender, and for which the process
 38976 has permission to send a signal.

38977 If *pid* is -1, *sig* shall be sent to all processes (excluding an unspecified set of system processes) for
 38978 which the process has permission to send that signal.

38979 If *pid* is negative, but not -1, *sig* shall be sent to all processes (excluding an unspecified set of
 38980 system processes) whose process group ID is equal to the absolute value of *pid*, and for which
 38981 the process has permission to send a signal.

38982 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for
 38983 the calling thread and if no other thread has *sig* unblocked or is waiting in a *sigwait()* function
 38984 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending
 38985 thread before *kill()* returns.

38986 The user ID tests described above shall not be applied when sending SIGCONT to a process that
 38987 is a member of the same session as the sending process.

38988 An implementation that provides extended security controls may impose further
 38989 implementation-defined restrictions on the sending of signals, including the null signal. In
 38990 particular, the system may deny the existence of some or all of the processes specified by *pid*.

38991 The *kill()* function is successful if the process has permission to send *sig* to any of the processes
 38992 specified by *pid*. If *kill()* fails, no signal shall be sent.

38993 **RETURN VALUE**

38994 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 38995 indicate the error.

38996 **ERRORS**

38997 The *kill()* function shall fail if:

- | | | |
|-------|----------|---|
| 38998 | [EINVAL] | The value of the <i>sig</i> argument is an invalid or unsupported signal number. |
| 38999 | [EPERM] | The process does not have permission to send the signal to any receiving process. |
| 39000 | | |

39001 [ESRCH] No process or process group can be found corresponding to that specified by
 39002 *pid*.

EXAMPLES

39003 None.
 39004

APPLICATION USAGE

39005 None.
 39006

RATIONALE

39007 The semantics for permission checking for *kill()* differed between System V and most other
 39008 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of
 39009 POSIX.1-200x agree with System V. Specifically, a set-user-ID process cannot protect itself against
 39010 signals (or at least not against SIGKILL) unless it changes its real user ID. This choice allows the
 39011 user who starts an application to send it signals even if it changes its effective user ID. The other
 39012 semantics give more power to an application that wants to protect itself from the user who ran
 39013 it.
 39014

39015 Some implementations provide semantic extensions to the *kill()* function when the absolute
 39016 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a
 39017 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not
 39018 included in this volume of POSIX.1-200x, although a conforming implementation could provide
 39019 such an extension.

39020 The unspecified processes to which a signal cannot be sent may include the scheduler or *init*.

39021 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the
 39022 calling process and that signal is not blocked, that signal would be delivered before *kill()*
 39023 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.
 39024 However, historical implementations that provide only the *signal()* function make only the
 39025 weaker guarantee in this volume of POSIX.1-200x, because they only deliver one signal each
 39026 time a process enters the kernel. Modifications to such implementations to support the
 39027 *sigaction()* function generally require entry to the kernel following return from a signal-catching
 39028 function, in order to restore the signal mask. Such modifications have the effect of satisfying the
 39029 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.
 39030 The standard developers considered making the stronger requirement except when *signal()* is
 39031 used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the
 39032 stronger requirement whenever possible. In practice, the weaker requirement is the same, except
 39033 in the rare case when two signals arrive during a very short window. This reasoning also applies
 39034 to a similar requirement for *sigprocmask()*.

39035 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID
 39036 security checks. This allows a job control shell to continue a job even if processes in the job have
 39037 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of
 39038 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any
 39039 process in the same session regardless of user ID security checks. This is less restrictive than BSD
 39040 in the sense that ancestor processes (in the same session) can now be the recipient. It is more
 39041 restrictive than BSD in the sense that descendant processes that form new sessions are now
 39042 subject to the user ID checks. A similar relaxation of security is not necessary for the other job
 39043 control signals since those signals are typically sent by the terminal driver in recognition of
 39044 special characters being typed; the terminal driver bypasses all security checks.

39045 In secure implementations, a process may be restricted from sending a signal to a process having
 39046 a different security label. In order to prevent the existence or nonexistence of a process from
 39047 being used as a covert channel, such processes should appear nonexistent to the sender; that is,
 39048 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

39049 Existing implementations vary on the result of a *kill()* with *pid* indicating an inactive process (a
 39050 terminated process that has not been waited for by its parent). Some indicate success on such a

39051 call (subject to permission checking), while others give an error of [ESRCH]. Since the definition
 39052 of process lifetime in this volume of POSIX.1-200x covers inactive processes, the [ESRCH] error
 39053 as described is inappropriate in this case. In particular, this means that an application cannot
 39054 have a parent process check for termination of a particular child with *kill()*. (Usually this is done
 39055 with the null signal; this can be done reliably with *waitpid()*.)

39056 There is some belief that the name *kill()* is misleading, since the function is not always intended
 39057 to cause process termination. However, the name is common to all historical implementations,
 39058 and any change would be in conflict with the goal of minimal changes to existing application
 39059 code.

39060 FUTURE DIRECTIONS

39061 None.

39062 SEE ALSO

39063 *getpid()*, *raise()*, *setsid()*, *sigaction()*, *sigqueue()*, *wait*

39064 XBD [<signal.h>](#), [<sys/types.h>](#)

39065 CHANGE HISTORY

39066 First released in Issue 1. Derived from Issue 1 of the SVID.

39067 Issue 5

39068 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

39069 Issue 6

39070 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

39071 The following new requirements on POSIX implementations derive from alignment with the
 39072 Single UNIX Specification:

- 39073 • In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-
 39074 user-ID of the calling process is checked in place of its effective user ID. This is a FIPS
 39075 requirement.
- 39076 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
 39077 required for conforming implementations of previous POSIX specifications, it was not
 39078 required for UNIX applications.
- 39079 • The behavior when *pid* is -1 is now specified. It was previously explicitly unspecified in
 39080 the POSIX.1-1988 standard.

39081 The normative text is updated to avoid use of the term “must” for application requirements.

39082 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/51 is applied, correcting the RATIONALE
 39083 section.

39084 **NAME**
 39085 `killpg` — send a signal to a process group

39086 **SYNOPSIS**
 39087 XSI

```
#include <signal.h>
```

 39088

```
int killpg(pid_t pgrp, int sig);
```

39089 **DESCRIPTION**
 39090 The `killpg()` function shall send the signal specified by `sig` to the process group specified by `pgrp`.
 39091 If `pgrp` is greater than 1, `killpg(pgrp, sig)` shall be equivalent to `kill(-pgrp, sig)`. If `pgrp` is less than or
 39092 equal to 1, the behavior of `killpg()` is undefined.

39093 **RETURN VALUE**
 39094 Refer to *kill*.

39095 **ERRORS**
 39096 Refer to *kill*.

39097 **EXAMPLES**

39098 **Sending a Signal to All Other Members of a Process Group**

39099 The following example shows how the calling process could send a signal to all other members
 39100 of its process group. To prevent itself from receiving the signal it first makes itself immune to the
 39101 signal by ignoring it.

```
39102 #include <signal.h>
39103 #include <unistd.h>
39104 ...
39105     if (signal(SIGUSR1, SIG_IGN) == SIG_ERR)
39106         /* Handle error */;
39107
39108     if (killpg(getpgrp(), SIGUSR1) == -1)
39109         /* Handle error */;
```

39109 **APPLICATION USAGE**

39166 SD5-XSH-ERN-152 is applied, correcting the RETURN VALUE section. +

39167 **NAME**

39168 lchown — change the owner and group of a symbolic link

39169 **SYNOPSIS**

39170 #include <unistd.h>

39171 int lchown(const char *path, uid_t owner, gid_t group);

39172 **DESCRIPTION**

39173 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a
 39174 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,
 39175 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

39176 **RETURN VALUE**

39177 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 39178 indicate an error.

39179 **ERRORS**39180 The *lchown()* function shall fail if:

- 39181 [EACCES] Search permission is denied on a component of the path prefix of *path*.
- 39182 [EINVAL] The owner or group ID is not a value supported by the implementation.
- 39183 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 39184 argument.
- 39185 [ENAMETOOLONG]
 39186 The length of a pathname exceeds {PATH_MAX} or a pathname component is
 39187 longer than {NAME_MAX}.
- 39188 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 39189 [ENOTDIR] A component of the path prefix of *path* is not a directory.
- 39190 [EOPNOTSUPP] The *path* argument names a symbolic link and the implementation does not
 39191 support setting the owner or group of a symbolic link.
- 39192 [EPERM] The effective user ID does not match the owner of the file and the process does
 39193 not have appropriate privileges.
- 39194 [EROFS] The file resides on a read-only file system.
- 39195 The *lchown()* function may fail if:
- 39196 [EIO] An I/O error occurred while reading or writing to the file system.
- 39197 [EINTR] A signal was caught during execution of the function.
- 39198 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 39199 resolution of the *path* argument.
- 39200 [ENAMETOOLONG]
 39201 Pathname resolution of a symbolic link produced an intermediate result
 39202 whose length exceeds {PATH_MAX}.

39203 **EXAMPLES**39204 **Changing the Current Owner of a File**

39205 The following example shows how to change the ownership of the symbolic link named
39206 **/modules/pass1** to the user ID associated with "jones" and the group ID associated with "cnd".

39207 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric
39208 value for the group ID is obtained by using the *getgrnam()* function.

```
39209 #include <sys/types.h>
39210 #include <unistd.h>
39211 #include <pwd.h>
39212 #include <grp.h>

39213 struct passwd *pwd;
39214 struct group *grp;
39215 char          *path = "/modules/pass1";
39216 ...
39217 pwd = getpwnam("jones");
39218 grp = getgrnam("cnd");
39219 lchown(path, pwd->pw_uid, grp->gr_gid);
```

39220 **APPLICATION USAGE**

39221 On implementations which support symbolic links as directory entries rather than files, *lchown()*
39222 may fail.

39223 **RATIONALE**

39224 None.

39225 **FUTURE DIRECTIONS**

39226 None.

39227 **SEE ALSO**

39228 *chown*, *symlink()*

39230 **CHANGE HISTORY**

39231 First released in Issue 4, Version 2.

39232 **Issue 5**

39233 Moved from X/OPEN UNIX extension to BASE.

39234 **Issue 6**

39235 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
39236 [ELOOP] error condition is added.

39237 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the
39238 APPLICATION USAGE.

39239 **Issue 7**

39240 The *lchown()* function is moved from the XSI option to the Base.

lcong48()39241 **NAME**

39242 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

39243 **SYNOPSIS**39244 XSI #include <stdlib.h>
39245 void lcong48(unsigned short param[7]);39246 **DESCRIPTION**39247 Refer to *drand48()*.

39248 **NAME**
 39249 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

39250 **SYNOPSIS**
 39251 #include <math.h>
 39252 double ldexp(double x, int exp);
 39253 float ldexpf(float x, int exp);
 39254 long double ldexpl(long double x, int exp);

39255 **DESCRIPTION**
 39256 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39257 conflict between the requirements described here and the ISO C standard is unintentional. This
 39258 volume of POSIX.1-200x defers to the ISO C standard.

39259 These functions shall compute the quantity $x * 2^{exp}$.
 39260 An application wishing to check for error situations should set *errno* to zero and call
 39261 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 39262 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 39263 zero, an error has occurred.

39264 **RETURN VALUE**
 39265 Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power
 39266 *exp*.

39267 If these functions would cause overflow, a range error shall occur and *ldexp()*, *ldexpf()*, and
 39268 *ldexpl()* shall return \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL (according to the sign of
 39269 *x*), respectively.

39270 If the correct value would cause underflow, and is not representable, a range error may occur,
 39271 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

39272 MX If *x* is NaN, a NaN shall be returned.

39273 If *x* is ± 0 or \pm Inf, *x* shall be returned.

39274 If *exp* is 0, *x* shall be returned.

39275 If the correct value would cause underflow, and is representable, a range error may occur and
 39276 the correct value shall be returned.

39277 **ERRORS**

39278 These functions shall fail if:

39279 Range Error The result overflows.

39280 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39281 then *errno* shall be set to [ERANGE]. If the integer expression
 39282 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 39283 floating-point exception shall be raised.

39284 These functions may fail if:

39285 Range Error The result underflows.

39286 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39287 then *errno* shall be set to [ERANGE]. If the integer expression
 39288 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 39289 floating-point exception shall be raised.

XBD Section 4.19 (on page 104), [<math.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *ldexpf()* and *ldexpl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

39314 **NAME**

39315 ldiv, lldiv — compute quotient and remainder of a long division

39316 **SYNOPSIS**

39317 #include <stdlib.h>

39318 ldiv_t ldiv(long numer, long denom);

39319 lldiv_t lldiv(long long numer, long long denom);

39320 **DESCRIPTION**

39321 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39322 conflict between the requirements described here and the ISO C standard is unintentional. This
 39323 volume of POSIX.1-200x defers to the ISO C standard.

39324 These functions shall compute the quotient and remainder of the division of the numerator
 39325 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**
 39326 integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude
 39327 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is
 39328 undefined; otherwise, *quot * denom + rem* shall equal *numer*.

39329 **RETURN VALUE**

39330 The *ldiv()* function shall return a structure of type **ldiv_t**, comprising both the quotient and the
 39331 remainder. The structure shall include the following members, in any order:

```
39332 long    quot;    /* Quotient */
39333 long    rem;     /* Remainder */
```

39334 The *lldiv()* function shall return a structure of type **lldiv_t**, comprising both the quotient and the
 39335 remainder. The structure shall include the following members, in any order:

```
39336 long long quot;    /* Quotient */
39337 long long rem;     /* Remainder */
```

39338 **ERRORS**

39339 No errors are defined.

39340 **EXAMPLES**

39341 None.

39342 **APPLICATION USAGE**

39343 None.

The *lldiv()* function is added for alignment with the ISO/IEC 9899:1999 standard.

39355 **NAME**
39356 lfind — find entry in a linear search table

39357 **SYNOPSIS**

```
39358 XSI #include <search.h>  
39359 void *lfind(const void *key, const void *base, size_t *nelp,  
39360           size_t width, int (*compar)(const void *, const void *));
```

39361 **DESCRIPTION**

39362 Refer to [lsearch\(\)](#).

39363 **NAME**
 39364 lgamma, lgammaf, lgammal — log gamma function

39365 **SYNOPSIS**
 39366 #include <math.h>
 39367 double lgamma(double x);
 39368 float lgammaf(float x);
 39369 long double lgammal(long double x);
 39370 XSI extern int signgam;

39371 DESCRIPTION

39372 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39373 conflict between the requirements described here and the ISO C standard is unintentional. This
 39374 volume of POSIX.1-200x defers to the ISO C standard.

39375 These functions shall compute $\log_e |\Gamma(x)|$ where $\Gamma(x)$ is defined as $\int_0^{\infty} e^{-t} t^{x-1} dt$. The argument x
 39376 need not be a non-positive integer ($\Gamma(x)$ is defined over the reals, except the non-positive
 39377 integers).

39378 XSI The sign of $\Gamma(x)$ is returned in the external integer *signgam*.

39379 CX These functions need not be thread-safe. A function that is not required to be thread-safe is not
 39380 required to be reentrant.

39381 An application wishing to check for error situations should set *errno* to zero and call
 39382 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 39383 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 39384 zero, an error has occurred.

39385 RETURN VALUE

39386 Upon successful completion, these functions shall return the logarithmic gamma of x .

39387 If x is a non-positive integer, a pole error shall occur and *lgamma()*, *lgammaf()*, and *lgammal()*
 39388 shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

39389 If the correct value would cause overflow, a range error shall occur and *lgamma()*, *lgammaf()*,
 39390 and *lgammal()* shall return \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL (having the same
 39391 sign as the correct value), respectively.

39392 MX If x is NaN, a NaN shall be returned.

39393 If x is 1 or 2, +0 shall be returned.

39394 If x is \pm Inf, +Inf shall be returned.

39395 ERRORS

39396 These functions shall fail if:

39397 Pole Error The x argument is a negative integer or zero.

39398 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39399 then *errno* shall be set to [ERANGE]. If the integer expression
 39400 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 39401 floating-point exception shall be raised.

39402 Range Error The result overflows.

39403 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

39404 then *errno* shall be set to [ERANGE]. If the integer expression

39405 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow

39406 floating-point exception shall be raised.

EXAMPLES

39407 None.

39408

APPLICATION USAGE

39409 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &

39410 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

39411

RATIONALE

39412 None.

39413

FUTURE DIRECTIONS

39414 None.

39415

39419

CHANGE HISTORY

39420 First released in Issue 3.

Issue 5

39421 The DESCRIPTION is updated to indicate how an application should check for an error. This

39422 text was previously published in the APPLICATION USAGE section.

39423

39424 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

39425 The *lgamma()* function is no longer marked as an extension.

39426

39427 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999

39428 standard.

39429 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are

39430 revised to align with the ISO/IEC 9899:1999 standard.

39431 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are

39432 marked.

39433 Functionality relating to the XSI option is marked.

39434 **NAME**

39435 link, linkat — link one file to another file relative to two directory file descriptors

39436 **SYNOPSIS**

```
39437 #include <unistd.h>
39438
39438 int link(const char *path1, const char *path2);
39439 int linkat(int fd1, const char *path1, int fd2, const char *path2,
39440 int flag);
```

39441 **DESCRIPTION**39442 The *link()* function shall create a new link (directory entry) for the existing file, *path1*.

39443 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to
 39444 a pathname naming the new directory entry to be created. The *link()* function shall atomically
 39445 create a new link for the existing file and the link count of the file shall be incremented by one.

39446 If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the
 39447 implementation supports using *link()* on directories.

39448 If *path1* names a symbolic link, it is implementation-defined whether *link()* follows the symbolic +
 39449 link, or creates a new link to the symbolic link itself. +

39450 Upon successful completion, *link()* shall mark for update the last file status change timestamp of |
 39451 the file. Also, the last data modification and last file status change timestamps of the directory |
 39452 that contains the new entry shall be marked for update.

39453 If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.

39454 The implementation may require that the calling process has permission to access the existing
 39455 file.

39456 The *linkat()* function shall be equivalent to the *link()* function except in the case where either
 39457 *path1* or *path2* or both are relative paths. In this case a relative path *path1* is interpreted relative to
 39458 the directory associated with the file descriptor *fd1* instead of the current working directory and
 39459 similarly for *path2* and the file descriptor *fd2*. It is unspecified whether directory searches are
 39460 permitted based on whether the file was opened with search permission or on the current
 39461 permissions of the directory underlying the file descriptor.

39462 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
 39463 in **<fcntl.h>**:

39464 AT_SYMLINK_FOLLOW

39465 If *path1* names a symbolic link, a new link for the target of the symbolic link is
 39466 created.

39467 If *linkat()* is passed the special value AT_FDCWD in the *fd1* or *fd2* parameter, the current
 39468 working directory is used for the respective *path* argument. If both *fd1* and *fd2* have value
 39469 AT_FDCWD, the behavior shall be identical to a call to *link()*.

39470 If the AT_SYMLINK_FOLLOW flag is clear in the *flag* argument and the *path1* argument names a |
 39471 symbolic link, a new link is created for the symbolic link *path1* and not its target, unless the |
 39472 implementation does not support making hard links to symbolic links in which case the *linkat()* |
 39473 call shall fail.

39474 **RETURN VALUE**

39475 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 39476 return `-1` and set `errno` to indicate the error.

39477 **ERRORS**

39478 These functions shall fail if:

39479 [EACCES] A component of either path prefix denies search permission, or the requested
 39480 link requires writing in a directory that denies write permission, or the calling
 39481 process does not have permission to access the existing file and this is required
 39482 by the implementation.

39483 [EEXIST] The `path2` argument resolves to an existing file or refers to a symbolic link.

39484 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path1` or
 39485 `path2` argument.

39486 [EMLINK] The number of links to the file named by `path1` would exceed `{LINK_MAX}`.

39487 [ENAMETOOLONG]

39488 The length of the `path1` or `path2` argument exceeds `{PATH_MAX}` or a
 39489 pathname component is longer than `{NAME_MAX}`.

39490 [ENOENT] A component of either path prefix does not exist; the file named by `path1` does
 39491 not exist; or `path1` or `path2` points to an empty string.

39492 [ENOSPC] The directory to contain the link cannot be extended.

39493 [ENOTDIR] A component of either path prefix is not a directory.

39494 [EPERM] The file named by `path1` is a directory and either the calling process does not
 39495 have appropriate privileges or the implementation prohibits using `link()` on
 39496 directories.

39497 [EROFS] The requested link requires writing in a directory on a read-only file system.

39498 [EXDEV] The link named by `path2` and the file named by `path1` are on different file
 39499 systems and the implementation does not support links between file systems.

39500 OB XSR [EXDEV] `path1` refers to a named STREAM.

39501 The `linkat()` function shall fail if:

39502 [EBADF] The `path1` or `path2` argument does not specify an absolute path and the `fd1` or
 39503 `fd2` argument, respectively, is neither `AT_FDCWD` nor a valid file descriptor
 39504 open for reading.

39505 [EOPNOTSUPP]

39506 The `AT_SYMLINK_FOLLOW` flag is clear in the `flag` argument, the `path1`
 39507 argument names a symbolic link, and the implementation does not support
 39508 making hard links to symbolic links.

39509 These functions may fail if:

39510 [ELOOP] More than `{SYMLOOP_MAX}` symbolic links were encountered during
 39511 resolution of the `path1` or `path2` argument.

39512 [ENAMETOOLONG]

39513 As a result of encountering a symbolic link in resolution of the `path1` or `path2`
 39514 argument, the length of the substituted pathname string exceeded
 39515 `{PATH_MAX}`.

39516 The `linkat()` function may fail if:

39517 [EINVAL] The value of the *flag* argument is not valid.

39518 [ENOTDIR] The *path1* or *path2* argument is not an absolute path and *fd1* or *fd2*,
39519 respectively, is neither AT_FDCWD nor a file descriptor associated with a
39520 directory.

EXAMPLES**Creating a Link to a File**

The following example shows how to create a link to a file named `/home/cnd/mod1` by creating a new directory entry named `/modules/pass1`.

```
39521 #include <unistd.h>
39522
39523 char *path1 = "/home/cnd/mod1";
39524 char *path2 = "/modules/pass1";
39525 int status;
39526 ...
39527 status = link (path1, path2);
```

Creating a Link to a File Within a Program

In the following program example, the `link()` function links the `/etc/passwd` file (defined as `PASSWDFILE`) to a file named `/etc/opasswd` (defined as `SAVEFILE`), which is used to save the current password file. Then, after removing the current password file (defined as `PASSWDFILE`), the new password file is saved as the current password file using the `link()` function again.

```
39531 #include <unistd.h>
39532 #define LOCKFILE "/etc/ptmp"
39533 #define PASSWDFILE "/etc/passwd"
39534 #define SAVEFILE "/etc/opasswd"
39535 ...
39536 /* Save current password file */
39537 link (PASSWDFILE, SAVEFILE);
39538
39539 /* Remove current password file. */
39540 unlink (PASSWDFILE);
39541
39542 /* Save new password file as current password file. */
39543 link (LOCKFILE, PASSWDFILE);
```

APPLICATION USAGE

Some implementations do allow links between file systems.

If *path1* refers to a symbolic link, application developers should use `linkat()` with appropriate + flags to select whether or not the symbolic link should be resolved.

RATIONALE

Linking to a directory is restricted to the superuser in most historical implementations because this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This volume of POSIX.1-200x continues that philosophy by prohibiting `link()` and `unlink()` from doing this. Other functions could do it if the implementor designed such an extension.

Some historical implementations allow linking of files on different file systems. Wording was added to explicitly allow this optional behavior.

The exception for cross-file system links is intended to apply only to links that are programmatically indistinguishable from "hard" links.

39561 The purpose of the *linkat()* function is to link files in directories other than the current working
 39562 directory without exposure to race conditions. Any part of the path of a file could be changed in
 39563 parallel to a call to *link()*, resulting in unspecified behavior. By opening a file descriptor for the
 39564 directory of both the existing file and the target location and using the *linkat()* function it can be
 39565 guaranteed that the both filenames are in the desired directories.

39566 The AT_SYMLINK_FOLLOW flag allows for implementing both common behaviors of the
 39567 *link()* function. The POSIX specification requires that if *path1* is a symbolic link, a new link for
 39568 the target of the symbolic link is created. Many systems by default or as an alternative provide a
 39569 mechanism to avoid the implicit symlink lookup and create a new link for the symbolic link
 39570 itself.

39571 Earlier versions of this standard specified only the *link()* function, and required it to behave like
 39572 *linkat()* with the AT_SYMLINK_FOLLOW flag. However, historical practice from SVR4 and
 39573 Linux kernels had *link()* behaving like *linkat()* with no flags, and many systems that attempted
 39574 to provide a conforming *link()* function did so in a way that was rarely used, and when it was
 39575 used did not conform to the standard (e.g., by not being atomic, or by dereferencing the
 39576 symbolic link incorrectly). Since applications could not rely on *link()* following links in practice,
 39577 the *linkat()* function was added taking a flag to specify the desired behavior for the application.

39578 FUTURE DIRECTIONS

39579 None.

39582 XBD `<fcntl.h>`, `<unistd.h>`

39583 CHANGE HISTORY

39584 First released in Issue 1. Derived from Issue 1 of the SVID.

39585 Issue 6

39586 The following new requirements on POSIX implementations derive from alignment with the
 39587 Single UNIX Specification:

- 39588 • The [ELOOP] mandatory error condition is added.
- 39589 • A second [ENAMETOOLONG] is added as an optional error condition.

39590 The following changes were made to align with the IEEE P1003.1a draft standard:

- 39591 • An explanation is added of the action when *path2* refers to a symbolic link.
- 39592 • The [ELOOP] optional error condition is added.

39593 Issue 7

39594 SD5-XSH-ERN-93 is applied, adding RATIONALE.

39595 The *linkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set
 39596 Part 2.

39597 Functionality relating to XSI STREAMS is marked obsolescent.

39598 Changes are made related to support for finegrained timestamps.

39599 **NAME**39600 `linkat` — link one file to another file relative to two directory file descriptors39601 **SYNOPSIS**39602 `#include <unistd.h>`39603 `int linkat(int fd1, const char *path1, int fd2, const char *path2,
39604 int flag);`39605 **DESCRIPTION**39606 Refer to [link](#).

39607 **NAME**

39608 lio_listio — list directed I/O

39609 **SYNOPSIS**

39610 #include <aio.h>

39611 int lio_listio(int mode, struct aiocb *restrict const list[restrict],
39612 int nent, struct sigevent *restrict sig);39613 **DESCRIPTION**39614 The *lio_listio()* function shall initiate a list of I/O requests with a single function call.39615 The *mode* argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in <aio.h> and
39616 determines whether the function returns when the I/O operations have been completed, or as
39617 soon as the operations have been queued. If the *mode* argument is LIO_WAIT, the function shall
39618 wait until all I/O is complete and the *sig* argument shall be ignored.39619 If the *mode* argument is LIO_NOWAIT, the function shall return immediately, and asynchronous
39620 notification shall occur, according to the *sig* argument, when all the I/O operations complete. If
39621 *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous
39622 notification occurs as specified in Section 2.4.1 (on page 463) when all the requests in *list* have
39623 completed.39624 The I/O requests enumerated by *list* are submitted in an unspecified order.39625 The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.
39626 The array may contain NULL elements, which shall be ignored.39627 If the buffer pointed to by *list* or the **aiocb** structures pointed to by the elements of the array *list*
39628 become illegal addresses before all asynchronous I/O completed and, if necessary, the
39629 notification is sent, then the behavior is undefined. If the buffers pointed to by the *aio_buf*
39630 member of the **aiocb** structure pointed to by the elements of the array *list* become illegal
39631 addresses prior to the asynchronous I/O associated with that **aiocb** structure being completed,
39632 the behavior is undefined.39633 The *aio_lio_opcode* field of each **aiocb** structure specifies the operation to be performed. The
39634 supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in
39635 <aio.h>. The LIO_NOP operation causes the list entry to be ignored. If the *aio_lio_opcode*
39636 element is equal to LIO_READ, then an I/O operation is submitted as if by a call to *aio_read()*
39637 with the *aio_cbp* equal to the address of the **aiocb** structure. If the *aio_lio_opcode* element is equal to
39638 LIO_WRITE, then an I/O operation is submitted as if by a call to *aio_write()* with the *aio_cbp*
39639 equal to the address of the **aiocb** structure.39640 The *aio_fildes* member specifies the file descriptor on which the operation is to be performed.39641 The *aio_buf* member specifies the address of the buffer to or from which the data is transferred.39642 The *aio_nbytes* member specifies the number of bytes of data to be transferred.39643 The members of the **aiocb** structure further describe the I/O operation to be performed, in a
39644 manner identical to that of the corresponding **aiocb** structure when used by the *aio_read()* and
39645 *aio_write()* functions.39646 The *nent* argument specifies how many elements are members of the list; that is, the length of the
39647 array.39648 The behavior of this function is altered according to the definitions of synchronized I/O data
39649 integrity completion and synchronized I/O file integrity completion if synchronized I/O is
39650 enabled on the file associated with *aio_fildes*.

39651 For regular files, no data transfer shall occur past the offset maximum established in the open
39652 file description associated with *aio*cbp->*aio_fildes*.

39653 If *sig*->*sigev_notify* is SIGEV_THREAD and *sig*->*sigev_notify_attributes* is a non-NULL pointer
39654 and the block pointed to by this pointer becomes an illegal address prior to all asynchronous
39655 I/O being completed, then the behavior is undefined.

RETURN VALUE

39656 If the *mode* argument has the value LIO_NOWAIT, the *lio_listio()* function shall return the value
39657 zero if the I/O operations are successfully queued; otherwise, the function shall return the value
39658 -1 and set *errno* to indicate the error.
39659

39660 If the *mode* argument has the value LIO_WAIT, the *lio_listio()* function shall return the value zero
39661 when all the indicated I/O has completed successfully. Otherwise, *lio_listio()* shall return a value
39662 of -1 and set *errno* to indicate the error.

39663 In either case, the return value only indicates the success or failure of the *lio_listio()* call itself,
39664 not the status of the individual I/O requests. In some cases one or more of the I/O requests
39665 contained in the list may fail. Failure of an individual request does not prevent completion of
39666 any other individual request. To determine the outcome of each I/O request, the application
39667 shall examine the error status associated with each **aio**cb control block. The error statuses so
39668 returned are identical to those returned as the result of an *aio_read()* or *aio_write()* function.

ERRORS

39669 The *lio_listio()* function shall fail if:
39670

39671 [EAGAIN] The resources necessary to queue all the I/O requests were not available. The
39672 application may check the error status for each **aio**cb to determine the
39673 individual request(s) that failed.

39674 [EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit
39675 {AIO_MAX} to be exceeded.

39676 [EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than
39677 {AIO_LISTIO_MAX}.

39678 [EINTR] A signal was delivered while waiting for all I/O requests to complete during
39679 an LIO_WAIT operation. Note that, since each I/O operation invoked by
39680 *lio_listio()* may possibly provoke a signal when it completes, this error return
39681 may be caused by the completion of one (or more) of the very I/O operations
39682 being awaited. Outstanding I/O requests are not canceled, and the application
39683 shall examine each list element to determine whether the request was
39684 initiated, canceled, or completed.

39685 [EIO] One or more of the individual I/O operations failed. The application may
39686 check the error status for each **aio**cb structure to determine the individual
39687 request(s) that failed.

39688 In addition to the errors returned by the *lio_listio()* function, if the *lio_listio()* function succeeds
39689 or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list
39690 may have been initiated. If the *lio_listio()* function fails with an error code other than [EAGAIN],
39691 [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation
39692 indicated by each list element can encounter errors specific to the individual read or write
39693 function being performed. In this event, the error status for each **aio**cb control block contains the
39694 associated error code. The error codes that can be set are the same as would be set by a *read()* or
39695 *write()* function, with the following additional error codes possible:

39696 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

- 39697 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
39698 *aio_cancel()* request.
- 39699 [EFBIG] The *aiocbp->aio_lio_opcode* is LIO_WRITE, the file is a regular file,
39700 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is greater than or
39701 equal to the offset maximum in the open file description associated with
39702 *aiocbp->aio_fildes*.
- 39703 [EINPROGRESS] The requested I/O is in progress.
- 39704 [EOVERFLOW] The *aiocbp->aio_lio_opcode* is LIO_READ, the file is a regular file,
39705 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is before the
39706 end-of-file and is greater than or equal to the offset maximum in the open file
39707 description associated with *aiocbp->aio_fildes*.

EXAMPLES

39708 None.
39709

APPLICATION USAGE

39710 None.
39711

RATIONALE

39712 Although it may appear that there are inconsistencies in the specified circumstances for error
39713 codes, the [EIO] error condition applies when any circumstance relating to an individual
39714 operation makes that operation fail. This might be due to a badly formulated request (for
39715 example, the *aio_lio_opcode* field is invalid, and *aio_error()* returns [EINVAL]) or might arise from
39716 application behavior (for example, the file descriptor is closed before the operation is initiated,
39717 and *aio_error()* returns [EBADF]).
39718

39719 The limitation on the set of error codes returned when operations from the list shall have been
39720 initiated enables applications to know when operations have been started and whether
39721 *aio_error()* is valid for a specific operation.

FUTURE DIRECTIONS

39722 None.

39728

CHANGE HISTORY

39729 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39730 Large File Summit extensions are added.
39731

Issue 6

39732 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39733 implementation does not support the Asynchronous Input and Output option.

39734 The *lio_listio()* function is marked as part of the Asynchronous Input and Output option.

39735 The following new requirements on POSIX implementations derive from alignment with the
39736 Single UNIX Specification:

- 39737 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs
39738 past the offset maximum established in the open file description associated with
39739 *aiocbp->aio_fildes*. This change is to support large files.
- 39740 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support
39741 large files.

39742 The normative text is updated to avoid use of the term “must” for application requirements.

39743 The **restrict** keyword is added to the *lio_listio()* prototype for alignment with the
39744 ISO/IEC 9899:1999 standard.

39745 **Issue 6**

39746 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/53 is applied, adding new text for
39747 symmetry with the *aio_read()* and *aio_write()* functions to the DESCRIPTION.

39748 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/54 is applied, adding text to the
39749 DESCRIPTION making it explicit that the user is required to keep the structure pointed to by
39750 *sig->sigev_notify_attributes* valid until the last asynchronous operation finished and the
39751 notification has been sent.

39752 **Issue 7**

39753 The *lio_listio()* function is moved from the Asynchronous Input and Output option to the Base.

39754 **NAME**

39755 listen — listen for socket connections and limit the queue of incoming connections

39756 **SYNOPSIS**

39757 #include <sys/socket.h>

39758 int listen(int *socket*, int *backlog*);39759 **DESCRIPTION**39760 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as
39761 accepting connections.39762 The *backlog* argument provides a hint to the implementation which the implementation shall use
39763 to limit the number of outstanding connections in the socket's listen queue. Implementations
39764 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*
39765 argument value shall result in a larger or equal length of the listen queue. Implementations shall
39766 support values of *backlog* up to SOMAXCONN, defined in <sys/socket.h>.39767 The implementation may include incomplete connections in its listen queue. The limits on the
39768 number of incomplete connections and completed connections queued may be different.39769 The implementation may have an upper limit on the length of the listen queue—either global or
39770 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.39771 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it
39772 had been called with a *backlog* argument value of 0.39773 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of
39774 the listen queue may be set to an implementation-defined minimum value.39775 The socket in use may require the process to have appropriate privileges to use the *listen()*
39776 function.39777 **RETURN VALUE**39778 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set
39779 to indicate the error.39780 **ERRORS**39781 The *listen()* function shall fail if:39782 [EBADF] The *socket* argument is not a valid file descriptor.

39783 [EDESTADDRREQ]

39784 The socket is not bound to a local address, and the protocol does not support
39785 listening on an unbound socket.39786 [EINVAL] The *socket* is already connected.39787 [ENOTSOCK] The *socket* argument does not refer to a socket.39788 [EOPNOTSUPP] The socket protocol does not support *listen()*.39789 The *listen()* function may fail if:

39790 [EACCES] The calling process does not have the appropriate privileges.

39791 [EINVAL] The *socket* has been shut down.

39792 [ENOBUFS] Insufficient resources are available in the system to complete the call.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog* argument.

39808 **NAME**
39809 llabs — return a long integer absolute value

39810 **SYNOPSIS**
39811 #include <stdlib.h>
39812 long long llabs(long long i);

39813 **DESCRIPTION**
39814 Refer to *labs()*.

39815 **NAME**
39816 `lldiv` — compute quotient and remainder of a long division

39817 **SYNOPSIS**
39818 `#include <stdlib.h>`
39819 `lldiv_t lldiv(long long numer, long long denom);`

39820 **DESCRIPTION**
39821 Refer to *ldiv()*.

39822 **NAME**

39823 llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

39824 **SYNOPSIS**

```
39825 #include <math.h>
39826
39826 long long llrint(double x);
39827 long long llrintf(float x);
39828 long long llrintl(long double x);
```

39829 **DESCRIPTION**

39830 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39831 conflict between the requirements described here and the ISO C standard is unintentional. This
 39832 volume of POSIX.1-200x defers to the ISO C standard.

39833 These functions shall round their argument to the nearest integer value, rounding according to
 39834 the current rounding direction.

39835 An application wishing to check for error situations should set *errno* to zero and call
 39836 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 39837 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 39838 zero, an error has occurred.

39839 **RETURN VALUE**

39840 Upon successful completion, these functions shall return the rounded integer value.

39841 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

39842 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

39843 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

39844 If the correct value is positive and too large to represent as a **long long**, an unspecified value
 39845 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 39846 shall occur;

39847 CX otherwise, a domain error may occur.

39848 If the correct value is negative and too large to represent as a **long long**, an unspecified value
 39849 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 39850 shall occur;

39851 CX otherwise, a domain error may occur.

39852 **ERRORS**

39853 These functions shall fail if:

39854 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an
 39855 integer.

39856 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39857 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 39858 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 39859 shall be raised.

39860 These functions may fail if:

39861 **Domain Error** The correct value is not representable as an integer.

39862 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39863 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 39864 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception

39865 shall be raised.

39866 **EXAMPLES**

39867 None.

39868 **APPLICATION USAGE**

39869 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
39870 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

39871 **RATIONALE**

39872 These functions provide floating-to-integer conversions. They round according to the current
39873 rounding direction. If the rounded value is outside the range of the return type, the numeric
39874 result is unspecified and the invalid floating-point exception is raised. When they raise no other
39875 floating-point exception and the result differs from the argument, they raise the inexact floating-
39876 point exception.

39877 **FUTURE DIRECTIONS**

39878 None.

39879 **SEE ALSO**

39880 *feclearexcept()*, *fetestexcept()*, *lrint()*

39881 XBD Section 4.19 (on page 104), <math.h>

39882 **CHANGE HISTORY**

39883 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

39884 **Issue 7**

39885 ISO C TC2 #53 is applied.

39886 **NAME**
 39887 llround, llroundf, llroundl — round to nearest integer value

39888 **SYNOPSIS**
 39889 #include <math.h>
 39890 long long llround(double x);
 39891 long long llroundf(float x);
 39892 long long llroundl(long double x);

39893 **DESCRIPTION**
 39894 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39895 conflict between the requirements described here and the ISO C standard is unintentional. This
 39896 volume of POSIX.1-200x defers to the ISO C standard.

39897 These functions shall round their argument to the nearest integer value, rounding halfway cases
 39898 away from zero, regardless of the current rounding direction.

39899 An application wishing to check for error situations should set *errno* to zero and call
 39900 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 39901 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 39902 zero, an error has occurred.

39903 **RETURN VALUE**
 39904 Upon successful completion, these functions shall return the rounded integer value.

39905 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.

39906 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

39907 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

39908 If the correct value is positive and too large to represent as a **long long**, an unspecified value
 39909 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 39910 shall occur;

39911 CX otherwise, a domain error may occur.

39912 If the correct value is negative and too large to represent as a **long long**, an unspecified value
 39913 MX shall be returned. On systems that support the IEC 60559 Floating-Point option, a domain error
 39914 shall occur;

39915 CX otherwise, a domain error may occur.

39916 **ERRORS**
 39917 These functions shall fail if:

39918 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an
 39919 integer.

39920 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39921 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 39922 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 39923 shall be raised.

39924 These functions may fail if:

39925 **Domain Error** The correct value is not representable as an integer.

39926 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 39927 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 39928 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception

shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions *(math_errhandling & MATH_ERRNO)* and *(math_errhandling & MATH_ERREXCEPT)* are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions differ from the *llrint()* functions in that the default rounding direction for the *llround()* functions round halfway cases away from zero and need not raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-75) is applied.

39948 **NAME**
 39949 localeconv — return locale-specific information

39950 **SYNOPSIS**
 39951 #include <locale.h>
 39952 struct lconv *localeconv(void);

39953 **DESCRIPTION**

39954 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 39955 conflict between the requirements described here and the ISO C standard is unintentional. This
 39956 volume of POSIX.1-200x defers to the ISO C standard.

39957 The *localeconv()* function shall set the components of an object with the type **struct lconv** with
 39958 the values appropriate for the formatting of numeric quantities (monetary and otherwise)
 39959 according to the rules of the current locale.

39960 The members of the structure with type **char *** are pointers to strings, any of which (except
 39961 **decimal_point**) can point to " ", to indicate that the value is not available in the current locale or
 39962 is of zero length. The members with type **char** are non-negative numbers, any of which can be
 39963 {CHAR_MAX} to indicate that the value is not available in the current locale.

39964 The members include the following:

39965 **char *decimal_point**
 39966 The radix character used to format non-monetary quantities.

39967 **char *thousands_sep**
 39968 The character used to separate groups of digits before the decimal-point character in
 39969 formatted non-monetary quantities.

39970 **char *grouping**
 39971 A string whose elements taken as one-byte integer values indicate the size of each group of
 39972 digits in formatted non-monetary quantities.

39973 **char *int_curr_symbol**
 39974 The international currency symbol applicable to the current locale. The first three characters
 39975 contain the alphabetic international currency symbol in accordance with those specified in
 39976 the ISO 4217:2001 standard. The fourth character (immediately preceding the null byte) is
 39977 the character used to separate the international currency symbol from the monetary
 39978 quantity.

39979 **char *currency_symbol**
 39980 The local currency symbol applicable to the current locale.

39981 **char *mon_decimal_point**
 39982 The radix character used to format monetary quantities.

39983 **char *mon_thousands_sep**
 39984 The separator for groups of digits before the decimal-point in formatted monetary
 39985 quantities.

39986 **char *mon_grouping**
 39987 A string whose elements taken as one-byte integer values indicate the size of each group of
 39988 digits in formatted monetary quantities.

39989 **char *positive_sign**
 39990 The string used to indicate a non-negative valued formatted monetary quantity.

- 39991 **char *negative_sign**
39992 The string used to indicate a negative valued formatted monetary quantity.
- 39993 **char int_frac_digits**
39994 The number of fractional digits (those after the decimal-point) to be displayed in an
39995 internationally formatted monetary quantity.
- 39996 **char frac_digits**
39997 The number of fractional digits (those after the decimal-point) to be displayed in a
39998 formatted monetary quantity.
- 39999 **char p_cs_precedes**
40000 Set to 1 if the **currency_symbol** precedes the value for a non-negative formatted monetary
40001 quantity. Set to 0 if the symbol succeeds the value.
- 40002 **char p_sep_by_space**
40003 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
40004 value for a non-negative formatted monetary quantity.
- 40005 **char n_cs_precedes**
40006 Set to 1 if the **currency_symbol** precedes the value for a negative formatted monetary
40007 quantity. Set to 0 if the symbol succeeds the value.
- 40008 **char n_sep_by_space**
40009 Set to a value indicating the separation of the **currency_symbol**, the sign string, and the
40010 value for a negative formatted monetary quantity.
- 40011 **char p_sign_posn**
40012 Set to a value indicating the positioning of the **positive_sign** for a non-negative formatted
40013 monetary quantity.
- 40014 **char n_sign_posn**
40015 Set to a value indicating the positioning of the **negative_sign** for a negative formatted
40016 monetary quantity.
- 40017 **char int_p_cs_precedes**
40018 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a non-
40019 negative internationally formatted monetary quantity.
- 40020 **char int_n_cs_precedes**
40021 Set to 1 or 0 if the **int_curr_symbol** respectively precedes or succeeds the value for a
40022 negative internationally formatted monetary quantity.
- 40023 **char int_p_sep_by_space**
40024 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
40025 value for a non-negative internationally formatted monetary quantity.
- 40026 **char int_n_sep_by_space**
40027 Set to a value indicating the separation of the **int_curr_symbol**, the sign string, and the
40028 value for a negative internationally formatted monetary quantity.
- 40029 **char int_p_sign_posn**
40030 Set to a value indicating the positioning of the **positive_sign** for a non-negative
40031 internationally formatted monetary quantity.
- 40032 **char int_n_sign_posn**
40033 Set to a value indicating the positioning of the **negative_sign** for a negative internationally
40034 formatted monetary quantity.
- 40035 The elements of **grouping** and **mon_grouping** are interpreted according to the following:

- 40036 {CHAR_MAX} No further grouping is to be performed.
- 40037 0 The previous element is to be repeatedly used for the remainder of the digits.
- 40038 *other* The integer value is the number of digits that comprise the current group. The
40039 next element is examined to determine the size of the next group of digits
40040 before the current group.

40041 The values of `p_sep_by_space`, `n_sep_by_space`, `int_p_sep_by_space`, and `int_n_sep_by_space`
40042 are interpreted according to the following:

- 40043 0 No space separates the currency symbol and value.
- 40044 1 If the currency symbol and sign string are adjacent, a space separates them from the value;
40045 otherwise, a space separates the currency symbol from the value.
- 40046 2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a
40047 space separates the sign string from the value.

40048 For `int_p_sep_by_space` and `int_n_sep_by_space`, the fourth character of `int_curr_symbol` is
40049 used instead of a space.

40050 The values of `p_sign_posn`, `n_sign_posn`, `int_p_sign_posn`, and `int_n_sign_posn` are
40051 interpreted according to the following:

- 40052 0 Parentheses surround the quantity and `currency_symbol` or `int_curr_symbol`.
- 40053 1 The sign string precedes the quantity and `currency_symbol` or `int_curr_symbol`.
- 40054 2 The sign string succeeds the quantity and `currency_symbol` or `int_curr_symbol`.
- 40055 3 The sign string immediately precedes the `currency_symbol` or `int_curr_symbol`.
- 40056 4 The sign string immediately succeeds the `currency_symbol` or `int_curr_symbol`.

40057 The implementation shall behave as if no function in this volume of POSIX.1-200x calls
40058 `localeconv()`.

40059 CX The `localeconv()` function need not be thread-safe. A function that is not required to be thread-
40060 safe is not required to be reentrant.

40061 RETURN VALUE

40062 The `localeconv()` function shall return a pointer to the filled-in object. The application shall not
40063 modify the structure pointed to by the return value which may be overwritten by a subsequent
40064 call to `localeconv()`. In addition, calls to `setlocale()` with the categories `LC_ALL`, `LC_MONETARY`,
40065 or `LC_NUMERIC` or calls to `uselocale()` which change the categories `LC_MONETARY` or
40066 `LC_NUMERIC` may overwrite the contents of the structure.

40067 ERRORS

40068 No errors are defined.

40069 EXAMPLES

40070 None.

40071 APPLICATION USAGE

40072 The following table illustrates the rules which may be used by four countries to format
40073 monetary quantities.

Country	Positive Format	Negative Format	International Format
Italy	L.1.230	-L.1.230	ITL.1.230
Netherlands	F 1.234,56	F -1.234,56	NLG 1.234,56
Norway	kr1.234,56	kr1.234,56-	NOK 1.234,56
Switzerland	SFrs.1,234.56	SFrs.1,234.56C	CHF 1,234.56

40079
40080

For these four countries, the respective values for the monetary members of the structure returned by *localeconv()* are:

40081
40082
40083
40084
40085
40086
40087
40088

40112**CHANGE HISTORY**

First released in Issue 4. Derived from the ANSI C standard.

40113
40114**Issue 6**

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

40115

The RETURN VALUE section is rewritten to avoid use of the term "must".

40116

This reference page is updated for alignment with the ISO/IEC 9899:1999 standard.

40117

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

40118

40119

40120

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to **int_curr_symbol** and updating the descriptions of **p_sep_by_space** and **n_sep_by_space**. These changes are for alignment with the ISO C standard.

40121

Issue 7

40122

The definitions of **int_curr_symbol** and **currency_symbol** are updated.

40123 **NAME**

40124 localtime, localtime_r — convert a time value to a broken-down local time

40125 **SYNOPSIS**

40126 #include <time.h>

40127 struct tm *localtime(const time_t *timer);

40128 CX struct tm *localtime_r(const time_t *restrict timer,
40129 struct tm *restrict result);40130 **DESCRIPTION**40131 CX For *localtime()*: The functionality described on this reference page is aligned with the ISO C
40132 standard. Any conflict between the requirements described here and the ISO C standard is
40133 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.40134 The *localtime()* function shall convert the time in seconds since the Epoch pointed to by *timer*
40135 into a broken-down time, expressed as a local time. The function corrects for the timezone and
40136 any seasonal time adjustments. Local timezone information is used as though *localtime()* calls
40137 *tzset()*.40138 The relationship between a time in seconds since the Epoch used as an argument to *localtime()*
40139 and the **tm** structure (defined in the **<time.h>** header) is that the result shall be as specified in
40140 the expression given in the definition of seconds since the Epoch (see XBD Section 4.15, on page
40141 100) corrected for timezone and any seasonal time adjustments, where the names in the structure
40142 and in the expression correspond.40143 The same relationship shall apply for *localtime_r()*.40144 The *localtime()* function need not be thread-safe. A function that is not required to be thread-safe
40145 is not required to be reentrant.40146 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
40147 objects: a broken-down time structure and an array of type **char**. Execution of any of the
40148 functions may overwrite the information returned in either of these objects by any of the other
40149 functions.40150 The *localtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
40151 into a broken-down time stored in the structure to which *result* points. The *localtime_r()* function
40152 shall also return a pointer to that same structure.40153 Unlike *localtime()*, the reentrant version is not required to set *tzname*.40154 If the reentrant version does not set *tzname*, it shall not set *daylight* and shall not set *timezone*.40155 **RETURN VALUE**40156 Upon successful completion, the *localtime()* function shall return a pointer to the broken-down
40157 CX time structure. If an error is detected, *localtime()* shall return a null pointer and set *errno* to
40158 indicate the error.40159 Upon successful completion, *localtime_r()* shall return a pointer to the structure pointed to by the
40160 argument *result*. If an error is detected, *localtime_r()* shall return a null pointer and set *errno* to
40161 indicate the error.40162 **ERRORS**40163 CX The *localtime()* and *localtime_r()* functions shall fail if:

40164 CX [Eoverflow] The result cannot be represented.

40165 EXAMPLES

40166 Getting the Local Date and Time

40167 The following example uses the *time()* function to calculate the time elapsed, in seconds, since
40168 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,
40169 and *asctime()* to convert the broken-down time values into a printable string.

```
40170 #include <stdio.h>
40171 #include <time.h>
40172 int main(void)
40173 {
40174     time_t result;
40175     result = time(NULL);
40176     printf("%s%ju secs since the Epoch\n",
40177           asctime(localtime(&result)),
40178           (uintmax_t)result);
40179     return(0);
40180 }
```

40181 This example writes the current time to *stdout* in a form like this:

```
40182 Wed Jun 26 10:32:15 1996
40183 835810335 secs since the Epoch
```

40184 Getting the Modification Time for a File

40185 The following example prints the last data modification timestamp in the local timezone for a
40186 given file.

```
40187 #include <stdio.h>
40188 #include <time.h>
40189 #include <sys/stat.h>
40190 int
40191 print_file_time(const char *filename)
40192 {
40193     struct stat statbuf;
40194     struct tm *tm;
40195     char timestr[BUFSIZ];
40196     if(stat(filename, &statbuf) == -1)
40197         return -1;
40198     if((tm = localtime(&statbuf.st_mtime)) == NULL)
40199         return -1;
40200     if(strftime(timestr, sizeof(timestr), "%Y-%m-%d %H:%M:%S", tm) == 0)
40201         return -1;
40202     printf("%s: %s.%09ld\n", filename, timestr, statbuf.st_mtim.tv_nsec);
40203     return 0;
40204 }
```

40205 **Timing an Event**

40206 The following example gets the current time, converts it to a string using *localtime()* and
 40207 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to
 40208 an event being timed.

```
40209 #include <time.h>
40210 #include <stdio.h>
40211 ...
40212 time_t now;
40213 int minutes_to_event;
40214 ...
40215 time(&now);
40216 printf("The time is ");
40217 fputs(asctime(localtime(&now)), stdout);
40218 printf("There are still %d minutes to the event.\n",
40219     minutes_to_event);
40220 ...
```

40221 **APPLICATION USAGE**

40222 The *localtime_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 40223 possibly using a static data area that may be overwritten by each call.

40224 **RATIONALE**

40225 None.

40226 **FUTURE DIRECTIONS**

40227 None.

40228 **SEE ALSO**

40229 *asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time*,
 40230 *tzset()*, *utime()*

40231 XBD Section 4.15 (on page 100), [<time.h>](#)

40232 **CHANGE HISTORY**

40233 First released in Issue 1. Derived from Issue 1 of the SVID.

40234 **Issue 5**

40235 A note indicating that the *localtime()* function need not be reentrant is added to the
 40236 DESCRIPTION.

40237 The *localtime_r()* function is included for alignment with the POSIX Threads Extension.

40238 **Issue 6**

40239 The *localtime_r()* function is marked as part of the Thread-Safe Functions option.

40240 Extensions beyond the ISO C standard are marked.

40241 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 40242 its avoidance of possibly using a static data area.

40243 The **restrict** keyword is added to the *localtime_r()* prototype for alignment with the
 40244 ISO/IEC 9899:1999 standard.

40245 Examples are added.

40246 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the
 40247 [EOverflow] error.

40248 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/55 is applied, updating the error handling
 40249 for *localtime_r()*.

localtime()

40250 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/56 is applied, adding a requirement that if
40251 *localtime_r()* does not set the *tzname* variable, it shall not set the *daylight* or *timezone* variables. On
40252 systems supporting XSI, the *daylight*, *timezone*, and *tzname* variables should all be set to provide
40253 information for the same timezone. This updates the description of *localtime_r()* to mention
40254 *daylight* and *timezone* as well as *tzname*. The SEE ALSO section is updated.

Issue 7

40255 The *localtime_r()* function is moved from the Thread-Safe Functions option to the Base.
40256 Changes are made to the EXAMPLES section related to support for finegrained timestamps. +
40257

40258 **NAME**
 40259 lockf — record locking on files

40260 **SYNOPSIS**

```
40261 XSI #include <unistd.h>
40262 int lockf(int fildes, int function, off_t size);
```

40263 **DESCRIPTION**

40264 The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from
 40265 threads in other processes which attempt to lock the locked file section shall either return an
 40266 error value or block until the section becomes unlocked. All the locks for a process are removed
 40267 when the process terminates. Record locking with *lockf()* shall be supported for regular files and
 40268 may be supported for other files.

40269 The *fildes* argument is an open file descriptor. To establish a lock with this function, the file
 40270 descriptor shall be opened with write-only permission (O_WRONLY) or with read/write
 40271 permission (O_RDWR).

40272 The *function* argument is a control value which specifies the action to be taken. The permissible
 40273 values for *function* are defined in **<unistd.h>** as follows:

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

40274
 40275
 40276
 40277
 40278
 40279 F_TEST shall detect if a lock by another process is present on the specified section.

40280 F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

40281 F_ULOCK shall remove locks from a section of the file.

40282 The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be
 40283 locked or unlocked starts at the current offset in the file and extends forward for a positive size
 40284 or backward for a negative size (the preceding bytes up to but not including the current offset).
 40285 If *size* is 0, the section from the current offset through the largest possible file offset shall be
 40286 locked (that is, from the current offset through the present or any future end-of-file). An area
 40287 need not be allocated to the file to be locked because locks may exist past the end-of-file.

40288 The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained
 40289 by a previously locked section for the same process. When this occurs, or if adjacent locked
 40290 sections would occur, the sections shall be combined into a single locked section. If the request
 40291 would cause the number of locks to exceed a system-imposed limit, the request shall fail.

40292 F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available.
 40293 F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the
 40294 function to fail if the section is already locked by another process.

40295 File locks shall be released on first close by the locking process of any file descriptor for the file.

40296 F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the
 40297 process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or
 40298 to the end-of-file if *size* is (off_t)0. When all of a locked section is not released (that is, when the
 40299 beginning or end of the area to be unlocked falls within a locked section), the remaining portions
 40300 of that section shall remain locked by the process. Releasing the center portion of a locked

lockf()

40301 section shall cause the remaining locked beginning and end portions to become two separate
 40302 locked sections. If the request would cause the number of locks in the system to exceed a system-
 40303 imposed limit, the request shall fail.

40304 A potential for deadlock occurs if the threads of a process controlling a locked section are
 40305 blocked by accessing a locked section of another process. If the system detects that deadlock
 40306 would occur, *lockf()* shall fail with an [EDEADLK] error.

40307 The interaction between *fcntl()* and *lockf()* locks is unspecified.

40308 Blocking on a section shall be interrupted by any signal.

40309 An F_ULOCK request in which *size* is non-zero and the offset of the last byte of the requested
 40310 section is the maximum value for an object of type **off_t**, when the process has an existing lock
 40311 in which *size* is 0 and which includes the last byte of the requested section, shall be treated as a
 40312 request to unlock from the start of the requested section with a size equal to 0. Otherwise, an
 40313 F_ULOCK request shall attempt to unlock only the requested section.

40314 Attempting to lock a section of a file that is associated with a buffered stream produces
 40315 unspecified results.

RETURN VALUE

40316 Upon successful completion, *lockf()* shall return 0. Otherwise, it shall return -1, set *errno* to
 40317 indicate an error, and existing locks shall not be changed.

ERRORS

40319 The *lockf()* function shall fail if:

40321 [EBADF] The *fildev* argument is not a valid open file descriptor; or *function* is F_LOCK
 40322 and F_TLOCK and *fildev* is not a valid file descriptor open for writing.

40323 [EACCES] or [EAGAIN]
 40324 The *function* argument is F_TLOCK or F_TEST and the section is already
 40325 locked by another process.

40326 [EDEADLK] The *function* argument is F_LOCK and a deadlock is detected.

40327 [EINTR] A signal was caught during execution of the function.

40328 [EINVAL] The *function* argument is not one of F_LOCK, F_TLOCK, F_TEST, or
 40329 F_ULOCK; or *size* plus the current file offset is less than 0.

40330 [EOVERFLOW] The offset of the first, or if *size* is not 0 then the last, byte in the requested
 40331 section cannot be represented correctly in an object of type **off_t**.

40332 The *lockf()* function may fail if:

40333 [EAGAIN] The *function* argument is F_LOCK or F_TLOCK and the file is mapped with
 40334 *mmap()*.

40335 [EDEADLK] or [ENOLCK]
 40336 The *function* argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request
 40337 would cause the number of locks to exceed a system-imposed limit.

40338 [EOPNOTSUPP] or [EINVAL]
 40339 The implementation does not support the locking of files of the type indicated
 40340 by the *fildev* argument.

EXAMPLES**Locking a Portion of a File**

In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that use locking are prevented from changing it during this process. Only the first 10 000 bytes are locked, and the lock call fails if another process has any part of this area locked already.

```
#include <fcntl.h>
#include <unistd.h>

int fildes;
int status;
...
fildes = open("/home/cnd/mod1", O_RDWR);
status = lockf(fildes, F_TLOCK, (off_t)10000);
```

APPLICATION USAGE

Record-locking should not be used in combination with the `fopen()`, `fread()`, `fwrite()`, and other `stdio` functions. Instead, the more primitive, non-buffered functions (such as `open()`) should be used. Unexpected results may occur in processes that do buffering in the user address space. The process may later read/write data which is/was locked. The `stdio` functions are the most common source of unexpected buffering.

The `alarm()` function may be used to provide a timeout facility in applications requiring it.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified and moved from optional to mandatory status.

A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a file that is associated with a buffered stream.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

Austin Group Interpretation 1003.1-2001 #054 is applied, updating the DESCRIPTION.

40379 **NAME**

40380 log, logf, logl — natural logarithm function

40381 **SYNOPSIS**

```
40382 #include <math.h>
40383
40383 double log(double x);
40384 float logf(float x);
40385 long double logl(long double x);
```

40386 **DESCRIPTION**

40387 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40388 conflict between the requirements described here and the ISO C standard is unintentional. This
 40389 volume of POSIX.1-200x defers to the ISO C standard.

40390 These functions shall compute the natural logarithm of their argument x , $\log_e(x)$.

40391 An application wishing to check for error situations should set *errno* to zero and call
 40392 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 40393 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 40394 zero, an error has occurred.

40395 **RETURN VALUE**

40396 Upon successful completion, these functions shall return the natural logarithm of x .

40397 If x is ± 0 , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return `-HUGE_VAL`,
 40398 `-HUGE_VALF`, and `-HUGE_VALL`, respectively.

40399 MX For finite values of x that are less than 0, or if x is `-Inf`, a domain error shall occur, and either a
 40400 NaN (if supported), or an implementation-defined value shall be returned.

40401 MX If x is NaN, a NaN shall be returned.

40402 If x is 1, `+0` shall be returned.

40403 If x is `+Inf`, x shall be returned.

40404 **ERRORS**

40405 These functions shall fail if:

40406 MX Domain Error The finite value of x is negative, or x is `-Inf`.

40407 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40408 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40409 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 40410 shall be raised.

40411 Pole Error The value of x is zero.

40412 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40413 then *errno* shall be set to [ERANGE]. If the integer expression
 40414 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 40415 floating-point exception shall be raised.

40502 **NAME**

40503 log1p, log1pf, log1pl — compute a natural logarithm

40504 **SYNOPSIS**

```
40505 #include <math.h>
40506
40506 double log1p(double x);
40507 float log1pf(float x);
40508 long double log1pl(long double x);
```

40509 **DESCRIPTION**

40510 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40511 conflict between the requirements described here and the ISO C standard is unintentional. This
 40512 volume of POSIX.1-200x defers to the ISO C standard.

40513 These functions shall compute $\log_e(1.0 + x)$.

40514 An application wishing to check for error situations should set *errno* to zero and call
 40515 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 40516 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 40517 zero, an error has occurred.

40518 **RETURN VALUE**40519 Upon successful completion, these functions shall return the natural logarithm of $1.0 + x$.

40520 If x is -1 , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return $-\text{HUGE_VAL}$,
 40521 $-\text{HUGE_VALF}$, and $-\text{HUGE_VALL}$, respectively.

40522 MX For finite values of x that are less than -1 , or if x is $-\text{Inf}$, a domain error shall occur, and either a
 40523 NaN (if supported), or an implementation-defined value shall be returned.

40524 MX If x is NaN, a NaN shall be returned.40525 If x is ± 0 , or $+\text{Inf}$, x shall be returned.40526 If x is subnormal, a range error may occur and x should be returned.40527 **ERRORS**

40528 These functions shall fail if:

40529 MX Domain Error The finite value of x is less than -1 , or x is $-\text{Inf}$.

40530 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40531 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40532 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 40533 shall be raised.

40534 Pole Error The value of x is -1 .

40535 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40536 then *errno* shall be set to [ERANGE]. If the integer expression
 40537 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 40538 floating-point exception shall be raised.

40539 These functions may fail if:

40540 MX Range Error The value of x is subnormal.

40541 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40542 then *errno* shall be set to [ERANGE]. If the integer expression

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

DRAFT

40621 **NAME**
 40622 `logb`, `logbf`, `logbl` — radix-independent exponent

40623 **SYNOPSIS**
 40624 `#include <math.h>`
 40625 `double logb(double x);`
 40626 `float logbf(float x);`
 40627 `long double logbl(long double x);`

40628 DESCRIPTION

40629 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40630 conflict between the requirements described here and the ISO C standard is unintentional. This
 40631 volume of POSIX.1-200x defers to the ISO C standard.

40632 These functions shall compute the exponent of x , which is the integral part of $\log_r |x|$, as a
 40633 signed floating-point value, for non-zero x , where r is the radix of the machine's floating-point
 40634 arithmetic, which is the value of `FLT_RADIX` defined in the `<float.h>` header.

40635 If x is subnormal it is treated as though it were normalized; thus for finite positive x :

40636
$$1 \leq x * FLT_RADIX^{-\logb(x)} < FLT_RADIX$$

40637 An application wishing to check for error situations should set `errno` to zero and call
 40638 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 40639 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 40640 zero, an error has occurred.

40641 RETURN VALUE

40642 Upon successful completion, these functions shall return the exponent of x .

40643 If x is ± 0 , `logb()`, `logbf()`, and `logbl()` shall return `-HUGE_VAL`, `-HUGE_VALF`, and
 40644 MX `-HUGE_VALL`, respectively. On systems that support the IEC 60559 Floating-Point option, a
 40645 pole error shall occur;
 40646 CX otherwise, a pole error may occur.

40647 MX If x is NaN, a NaN shall be returned.

40648 MX If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.

40649 ERRORS

40650 These functions shall fail if:

40651 MX **Pole Error** The value of x is ± 0 .
 40652 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 40653 then `errno` shall be set to `[ERANGE]`. If the integer expression
 40654 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero
 40655 floating-point exception shall be raised.

40656 These functions may fail if:

40657 **Pole Error** The value of x is 0.
 40658 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 40659 then `errno` shall be set to `[ERANGE]`. If the integer expression
 40660 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the divide-by-zero
 40661 floating-point exception shall be raised.

The *logb()* function is no longer marked as an extension.

The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #50 (SD5-XSH-ERN-76) is applied.

40687 **NAME**
40688 `logf, logl` — natural logarithm function

40689 **SYNOPSIS**
40690 `#include <math.h>`
40691 `float logf(float x);`
40692 `long double logl(long double x);`

40693 **DESCRIPTION**
40694 Refer to *log()*.

40695 **NAME**40696 `longjmp` — non-local goto40697 **SYNOPSIS**40698 `#include <setjmp.h>`40699 `void longjmp(jmp_buf env, int val);`40700 **DESCRIPTION**

40701 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40702 conflict between the requirements described here and the ISO C standard is unintentional. This
 40703 volume of POSIX.1-200x defers to the ISO C standard.

40704 The *longjmp()* function shall restore the environment saved by the most recent invocation of
 40705 *setjmp()* in the same thread, with the corresponding **jmp_buf** argument. If there is no such
 40706 invocation, or if the function containing the invocation of *setjmp()* has terminated execution in
 40707 the interim, or if the invocation of *setjmp()* was within the scope of an identifier with variably
 40708 CX modified type and execution has left that scope in the interim, the behavior is undefined. It is
 40709 unspecified whether *longjmp()* restores the signal mask, leaves the signal mask unchanged, or
 40710 restores it to its value at the time *setjmp()* was called.

40711 All accessible objects have values, and all other components of the abstract machine have state
 40712 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,
 40713 except that the values of objects of automatic storage duration are unspecified if they meet all
 40714 the following conditions:

- 40715 • They are local to the function containing the corresponding *setjmp()* invocation.
- 40716 • They do not have volatile-qualified type.
- 40717 • They are changed between the *setjmp()* invocation and *longjmp()* call.

40718 CX As it bypasses the usual function call and return mechanisms, *longjmp()* shall execute correctly
 40719 in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp()* is
 40720 invoked from a nested signal handler (that is, from a function invoked as a result of a signal
 40721 raised during the handling of another signal), the behavior is undefined.

40722 The effect of a call to *longjmp()* where initialization of the **jmp_buf** structure was not performed
 40723 in the calling thread is undefined.

40724 **RETURN VALUE**

40725 After *longjmp()* is completed, program execution continues as if the corresponding invocation of
 40726 *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause
 40727 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

40728 **ERRORS**

40729 No errors are defined.

40730 **EXAMPLES**

40731 None.

40732 **APPLICATION USAGE**

40733 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*
 40734 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the
 40735 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under
 40736 application control).

CHANGE HISTORY

40745

First released in Issue 1. Derived from Issue 1 of the SVID.

40746

Issue 5

40747

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

40748

Issue 6

40749

Extensions beyond the ISO C standard are marked.

40750

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

40751

- The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask unspecified.

40752

40753

40754

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

40755 **NAME**
40756 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

40757 **SYNOPSIS**

```
40758 XSI #include <stdlib.h>  
40759 long lrand48(void);
```

40760 **DESCRIPTION**

40761 Refer to *drand48()*.

40762 **NAME**40763 `lrint, lrintf, lrintl` — round to nearest integer value using current rounding direction40764 **SYNOPSIS**

```
40765 #include <math.h>
40766
40766 long lrint(double x);
40767 long lrintf(float x);
40768 long lrintl(long double x);
```

40769 **DESCRIPTION**

40770 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40771 conflict between the requirements described here and the ISO C standard is unintentional. This
 40772 volume of POSIX.1-200x defers to the ISO C standard.

40773 These functions shall round their argument to the nearest integer value, rounding according to
 40774 the current rounding direction.

40775 An application wishing to check for error situations should set *errno* to zero and call
 40776 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 40777 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 40778 zero, an error has occurred.

40779 **RETURN VALUE**

40780 Upon successful completion, these functions shall return the rounded integer value.

40781 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.40782 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.40783 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

40784 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be
 40785 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
 40786 occur;

40787 CX otherwise, a domain error may occur.

40788 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be
 40789 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain error shall
 40790 occur;

40791 CX otherwise, a domain error may occur.

40792 **ERRORS**

40793 These functions shall fail if:

40794 MX **Domain Error** The *x* argument is NaN or ±Inf, or the correct value is not representable as an
 40795 integer.

40796 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40797 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40798 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 40799 shall be raised.

40800 These functions may fail if:

40801 **Domain Error** The correct value is not representable as an integer.

40802 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40803 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40804 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception

40805 shall be raised.

40806 **EXAMPLES**

40807 None.

40808 **APPLICATION USAGE**

40809 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
40810 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40811 **RATIONALE**

40812 These functions provide floating-to-integer conversions. They round according to the current
40813 rounding direction. If the rounded value is outside the range of the return type, the numeric
40814 result is unspecified and the invalid floating-point exception is raised. When they raise no other
40815 floating-point exception and the result differs from the argument, they raise the inexact floating-
40816 point exception.

40817 **FUTURE DIRECTIONS**

40818 None.

40819 **SEE ALSO**

40820 *feclearexcept()*, *fetestexcept()*, *llrint()*

40822 **CHANGE HISTORY**

40823 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

40824 **Issue 7**

40825 ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #53 (SD5-XSH-ERN-77) is applied.

40826 **NAME**
 40827 `lround, lroundf, lroundl` — round to nearest integer value

40828 **SYNOPSIS**
 40829 `#include <math.h>`
 40830 `long lround(double x);`
 40831 `long lroundf(float x);`
 40832 `long lroundl(long double x);`

40833 **DESCRIPTION**
 40834 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40835 conflict between the requirements described here and the ISO C standard is unintentional. This
 40836 volume of POSIX.1-200x defers to the ISO C standard.

40837 These functions shall round their argument to the nearest integer value, rounding halfway cases
 40838 away from zero, regardless of the current rounding direction.

40839 An application wishing to check for error situations should set *errno* to zero and call
 40840 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 40841 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 40842 zero, an error has occurred.

40843 **RETURN VALUE**
 40844 Upon successful completion, these functions shall return the rounded integer value.

40845 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.

40846 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.

40847 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

40848 If the correct value is positive and too large to represent as a **long**, an unspecified value shall be
 40849 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;
 40850 CX otherwise, a **domain** error may occur.

40851 If the correct value is negative and too large to represent as a **long**, an unspecified value shall be
 40852 MX returned. On systems that support the IEC 60559 Floating-Point option, a domain shall occur;
 40853 CX otherwise, a **domain** error may occur.

40854 **ERRORS**
 40855 These functions shall fail if:

40856 MX **Domain Error** The *x* argument is NaN or \pm Inf, or the correct value is not representable as an
 40857 integer.

40858 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40859 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40860 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 40861 shall be raised.

40862 These functions may fail if:

40863 **Domain Error** The correct value is not representable as an integer.

40864 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 40865 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 40866 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 40867 shall be raised.

40868

EXAMPLES

40869

None.

40870

APPLICATION USAGE

40871

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

40872

40873

RATIONALE

40874

These functions differ from the *lrint()* functions in the default rounding direction, with the *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.

40875

40876

CHANGE HISTORY

40884

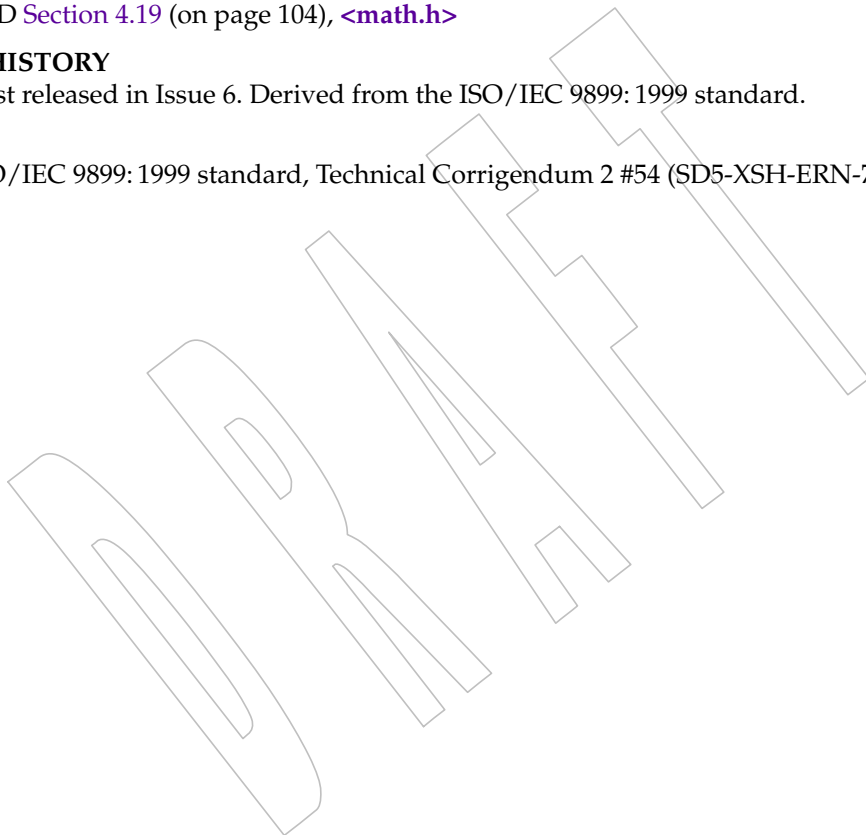

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

40885

Issue 7

40886

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #54 (SD5-XSH-ERN-78) is applied.

40887 **NAME**

40888 lsearch, lfind — linear search and update

40889 **SYNOPSIS**

```
40890 XSI #include <search.h>
40891 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
40892             int (*compar)(const void *, const void *));
40893 void *lfind(const void *key, const void *base, size_t *nel,
40894            size_t width, int (*compar)(const void *, const void *));
```

40895 **DESCRIPTION**

40896 The *lsearch()* function shall linearly search the table and return a pointer into the table for the
 40897 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*
 40898 argument points to the entry to be sought in the table. The *base* argument points to the first
 40899 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument
 40900 points to an integer containing the current number of elements in the table. The integer to which
 40901 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to
 40902 a comparison function which the application shall supply (for example, *strcmp()*). It is called
 40903 with two arguments that point to the elements being compared. The application shall ensure
 40904 that the function returns 0 if the elements are equal, and non-zero otherwise.

40905 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not
 40906 added to the table. Instead, a null pointer is returned.

40907 **RETURN VALUE**

40908 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it.
 40909 Otherwise, *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly
 40910 added element.

40911 Both functions shall return a null pointer in case of error.

40912 **ERRORS**

40913 No errors are defined.

40914 **EXAMPLES**40915 **Storing Strings in a Table**

40916 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to
 40917 ELSIZE and stores them in a table, eliminating duplicates.

```
40918 #include <stdio.h>
40919 #include <string.h>
40920 #include <search.h>
40921 #define TABSIZE 50
40922 #define ELSIZE 120
40923 ...
40924     char line[ELSIZE], tab[TABSIZE][ELSIZE];
40925     size_t nel = 0;
40926     ...
40927     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
40928         (void) lsearch(line, tab, &nel,
40929                      ELSIZE, (int (*)(const void *, const void *)) strcmp);
40930     ...
```

```

40931     Finding a Matching Entry
40932     The following example finds any line that reads "This is a test.".
40933     #include <search.h>
40934     #include <string.h>
40935     ...
40936     char line[ELSIZE], tab[TABSIZE][ELSIZE];
40937     size_t nel = 0;
40938     char *findline;
40939     void *entry;
40940
40941     findline = "This is a test.\n";
40942     entry = lfind(findline, tab, &nel, ELSIZE, (
40943         int (*)(const void *, const void *)) strcmp);

```

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

`lseek` — move the read/write file offset

SYNOPSIS

```
#include <unistd.h>

off_t lseek(int fildes, off_t offset, int whence);
```

DESCRIPTION

The `lseek()` function shall set the file offset for the open file description associated with the file descriptor `fildes`, as follows:

- If `whence` is `SEEK_SET`, the file offset shall be set to `offset` bytes.
- If `whence` is `SEEK_CUR`, the file offset shall be set to its current location plus `offset`.
- If `whence` is `SEEK_END`, the file offset shall be set to the size of the file plus `offset`.

The symbolic constants `SEEK_SET`, `SEEK_CUR`, and `SEEK_END` are defined in `<unistd.h>`.

The behavior of `lseek()` on devices which are incapable of seeking is implementation-defined. The value of the file offset associated with such a device is undefined.

The `lseek()` function shall allow the file offset to be set beyond the end of the existing data in the file. If data is later written at this point, subsequent reads of data in the gap shall return bytes with the value 0 until data is actually written into the gap.

The `lseek()` function shall not, by itself, extend the size of a file.

SHM If `fildes` refers to a shared memory object, the result of the `lseek()` function is unspecified.

TYM If `fildes` refers to a typed memory object, the result of the `lseek()` function is unspecified.

RETURN VALUE

Upon successful completion, the resulting offset, as measured in bytes from the beginning of the file, shall be returned. Otherwise, `(off_t)-1` shall be returned, `errno` shall be set to indicate the error, and the file offset shall remain unchanged.

ERRORS

The `lseek()` function shall fail if:

- | | |
|-------------|--|
| [EBADF] | The <code>fildes</code> argument is not an open file descriptor. |
| [EINVAL] | The <code>whence</code> argument is not a proper value, or the resulting file offset would be negative for a regular file, block special file, or directory. |
| [EOVERFLOW] | The resulting file offset would be a value which cannot be represented correctly in an object of type <code>off_t</code> . |
| [ESPIPE] | The <code>fildes</code> argument is associated with a pipe, FIFO, or socket. |

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The ISO C standard includes the functions `fgetpos()` and `fsetpos()`, which work on very large files by use of a special positioning type.

Although `lseek()` may position the file offset beyond the end of the file, this function does not itself extend the size of the file. While the only function in POSIX.1-200x that may directly

40999 extend the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally
 41000 derived from the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing
 41001 calls on *write()*).

41002 An invalid file offset that would cause [EINVAL] to be returned may be both implementation-
 41003 defined and device-dependent (for example, memory may have few invalid values). A negative
 41004 file offset may be valid for some devices in some implementations.

41005 The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset.
 41006 Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return
 41007 to determine whether a return value of (*off_t*)-1 is a negative offset or an indication of an error
 41008 condition. The standard developers did not wish to require this action on the part of a
 41009 conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting
 41010 file offset would be negative for a regular file, block special file, or directory.

41011 FUTURE DIRECTIONS

41012 None.

41013 SEE ALSO

41014 *open()*

41016 CHANGE HISTORY

41017 First released in Issue 1. Derived from Issue 1 of the SVID.

41018 Issue 5

41019 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

41020 Large File Summit extensions are added.

41021 Issue 6

41022 In the SYNOPSIS, the optional include of the <*sys/types.h*> header is removed.

41023 The following new requirements on POSIX implementations derive from alignment with the
 41024 Single UNIX Specification:

- 41025 • The requirement to include <*sys/types.h*> has been removed. Although <*sys/types.h*> was
 41026 required for conforming implementations of previous POSIX specifications, it was not
 41027 required for UNIX applications.
- 41028 • The [E_OVERFLOW] error condition is added. This change is to support large files.

41029 An additional [ESPIPE] error condition is added for sockets.

41030 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 41031 *lseek()* results are unspecified for typed memory objects.

lstat()41032 **NAME**41033 `lstat` — get file status41034 **SYNOPSIS**41035 `#include <sys/stat.h>`41036 `int lstat(const char *restrict path, struct stat *restrict buf);`41037 **DESCRIPTION**41038 Refer to *fstatat()*.

DRAFT

41039 **NAME**

41040 malloc — a memory allocator

41041 **SYNOPSIS**

41042 #include <stdlib.h>

41043 void *malloc(size_t size);

41044 **DESCRIPTION**

41045 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41046 conflict between the requirements described here and the ISO C standard is unintentional. This
 41047 volume of POSIX.1-200x defers to the ISO C standard.

41048 The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by
 41049 *size* and whose value is unspecified.

41050 The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The
 41051 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
 41052 a pointer to any type of object and then used to access such an object in the space allocated (until
 41053 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
 41054 disjoint from any other object. The pointer returned points to the start (lowest byte address) of
 41055 the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of
 41056 the space requested is 0, the behavior is implementation-defined: the value returned shall be
 41057 either a null pointer or a unique pointer.

41058 **RETURN VALUE**

41059 Upon successful completion with *size* not equal to 0, *malloc()* shall return a pointer to the
 41060 allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully
 41061 CX passed to *free()* shall be returned. Otherwise, it shall return a null pointer and set *errno* to
 41062 indicate the error.

41063 **ERRORS**41064 The *malloc()* function shall fail if:

41065 CX [ENOMEM] Insufficient storage space is available.

41066 **EXAMPLES**

41067 None.

41068 **APPLICATION USAGE**

41069 None.

41070 **RATIONALE**

41071 None.

41077 **CHANGE HISTORY**

41078 First released in Issue 1. Derived from Issue 1 of the SVID.

41079
41080
41081
41082
41083
41084**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
- The [ENOMEM] error condition is added.

41085 **NAME**
 41086 `mblen` — get number of bytes in a character

41087 **SYNOPSIS**
 41088 `#include <stdlib.h>`
 41089 `int mblen(const char *s, size_t n);`

41090 **DESCRIPTION**

41091 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41092 conflict between the requirements described here and the ISO C standard is unintentional. This
 41093 volume of POSIX.1-200x defers to the ISO C standard.

41094 If *s* is not a null pointer, *mblen()* shall determine the number of bytes constituting the character
 41095 pointed to by *s*. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

41096 `mbtowc((wchar_t *)0, s, n);`

41097 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 41098 *mblen()*.

41099 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 41100 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 41101 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 41102 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 41103 null pointer shall cause this function to return a non-zero value if encodings have state
 41104 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 41105 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 41106 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 41107 unspecified.

41108 **RETURN VALUE**

41109 If *s* is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,
 41110 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mblen()* shall
 41111 either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the
 41112 character (if the next *n* or fewer bytes form a valid character), or return -1 (if they do not form a
 41113 valid character) and may set *errno* to indicate the error. In no case shall the value returned be
 41114 greater than *n* or the value of the {MB_CUR_MAX} macro.

41115 **ERRORS**

41116 The *mblen()* function may fail if:

41117 XSI [EILSEQ] Invalid character sequence is detected.

41118 **EXAMPLES**

41119 None.

41120 **APPLICATION USAGE**

41121 None.

41122 **RATIONALE**

41123 None.

41124 **FUTURE DIRECTIONS**

41125 None.

CHANGE HISTORY

41130

First released in Issue 4. Aligned with the ISO C standard.

41131 **NAME**
 41132 `mbrlen` — get number of bytes in a character (restartable)

41133 **SYNOPSIS**
 41134 `#include <wchar.h>`
 41135 `size_t mbrlen(const char *restrict s, size_t n,`
 41136 `mbstate_t *restrict ps);`

41137 **DESCRIPTION**

41138 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41139 conflict between the requirements described here and the ISO C standard is unintentional. This
 41140 volume of POSIX.1-200x defers to the ISO C standard.

41141 If *s* is not a null pointer, `mbrlen()` shall determine the number of bytes constituting the character
 41142 pointed to by *s*. It shall be equivalent to:

41143 `mbstate_t internal;`
 41144 `mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);`

41145 If *ps* is a null pointer, the `mbrlen()` function shall use its own internal `mbstate_t` object, which is
 41146 initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object
 41147 pointed to by *ps* shall be used to completely describe the current conversion state of the
 41148 associated character sequence. The implementation shall behave as if no function defined in this
 41149 volume of POSIX.1-200x calls `mbrlen()`.

41150 The behavior of this function is affected by the `LC_CTYPE` category of the current locale.

41151 **RETURN VALUE**

41152 The `mbrlen()` function shall return the first of the following that applies:

41153 0 If the next *n* or fewer bytes complete the character that corresponds to the null
 41154 wide character.

41155 *positive* If the next *n* or fewer bytes complete a valid character; the value returned shall
 41156 be the number of bytes that complete the character.

41157 `(size_t)-2` If the next *n* bytes contribute to an incomplete but potentially valid character,
 41158 and all *n* bytes have been processed. When *n* has at least the value of the
 41159 `{MB_CUR_MAX}` macro, this case can only occur if *s* points at a sequence of
 41160 redundant shift sequences (for implementations with state-dependent
 41161 encodings).

41162 `(size_t)-1` If an encoding error occurs, in which case the next *n* or fewer bytes do not
 41163 contribute to a complete and valid character. In this case, `[EILSEQ]` shall be
 41164 stored in `errno` and the conversion state is undefined.

41165 **ERRORS**

41166 The `mbrlen()` function may fail if:

41167 `[EINVAL]` *ps* points to an object that contains an invalid conversion state.

41168 `[EILSEQ]` Invalid character sequence is detected.

41182	(E).
41183	Issue 6
41184	The <i>mbrlen()</i> prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41185 **NAME**41186 `mbrtowc` — convert a character to a wide-character code (restartable)41187 **SYNOPSIS**41188 `#include <wchar.h>`41189 `size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,`
41190 `size_t n, mbstate_t *restrict ps);`41191 **DESCRIPTION**41192 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
41193 conflict between the requirements described here and the ISO C standard is unintentional. This
41194 volume of POSIX.1-200x defers to the ISO C standard.41195 If *s* is a null pointer, the `mbrtowc()` function shall be equivalent to the call:41196 `mbrtowc(NULL, "", 1, ps)`41197 In this case, the values of the arguments *pwc* and *n* are ignored.41198 If *s* is not a null pointer, the `mbrtowc()` function shall inspect at most *n* bytes beginning at the
41199 byte pointed to by *s* to determine the number of bytes needed to complete the next character
41200 (including any shift sequences). If the function determines that the next character is completed,
41201 it shall determine the value of the corresponding wide character and then, if *pwc* is not a null
41202 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide
41203 character is the null wide character, the resulting state described shall be the initial conversion
41204 state.41205 If *ps* is a null pointer, the `mbrtowc()` function shall use its own internal `mbstate_t` object, which
41206 shall be initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t`
41207 object pointed to by *ps* shall be used to completely describe the current conversion state of the
41208 associated character sequence. The implementation shall behave as if no function defined in this
41209 volume of POSIX.1-200x calls `mbrtowc()`.41210 The behavior of this function is affected by the `LC_CTYPE` category of the current locale.41211 **RETURN VALUE**41212 The `mbrtowc()` function shall return the first of the following that applies:41213 **0** If the next *n* or fewer bytes complete the character that corresponds to the null
41214 wide character (which is the value stored).41215 between 1 and *n* inclusive41216 If the next *n* or fewer bytes complete a valid character (which is the value
41217 stored); the value returned shall be the number of bytes that complete the
41218 character.41219 **(size_t)−2** If the next *n* bytes contribute to an incomplete but potentially valid character,
41220 and all *n* bytes have been processed (no value is stored). When *n* has at least
41221 the value of the `{MB_CUR_MAX}` macro, this case can only occur if *s* points at
41222 a sequence of redundant shift sequences (for implementations with state-
41223 dependent encodings).41224 **(size_t)−1** If an encoding error occurs, in which case the next *n* or fewer bytes do not
41225 contribute to a complete and valid character (no value is stored). In this case,
41226 `[EILSEQ]` shall be stored in `errno` and the conversion state is undefined.

mbrtowc()

41227

ERRORS

CHANGE HISTORY

41243

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

41244

41245

Issue 6

41246

The *mbrtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41247

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

41248

- The **[EINVAL]** error condition is added.

41249

41250

ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

41251 **NAME**

41252 mbsinit — determine conversion object status

41253 **SYNOPSIS**

41254 #include <wchar.h>

41255 int mbsinit(const mbstate_t *ps);

41256 **DESCRIPTION**

41257 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41258 conflict between the requirements described here and the ISO C standard is unintentional. This
 41259 volume of POSIX.1-200x defers to the ISO C standard.

41260 If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by
 41261 *ps* describes an initial conversion state.

41262 **RETURN VALUE**

41263 The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object
 41264 describes an initial conversion state; otherwise, it shall return zero.

41265 If an **mbstate_t** object is altered by any of the functions described as “restartable”, and is then
 41266 used with a different character sequence, or in the other conversion direction, or with a different
 41267 *LC_CTYPE* category setting than on earlier function calls, the behavior is undefined.

41268 **ERRORS**

41269 No errors are defined.

41270 **EXAMPLES**

41271 None.

41272 **APPLICATION USAGE**

41273 The **mbstate_t** object is used to describe the current conversion state from a particular character
 41274 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the
 41275 *LC_CTYPE* category of the current locale.

41276 The initial conversion state corresponds, for a conversion in either direction, to the beginning of
 41277 a new character sequence in the initial shift state. A zero valued **mbstate_t** object is at least one
 41278 way to describe an initial conversion state. A zero valued **mbstate_t** object can be used to initiate
 41279 conversion involving any character sequence, in any *LC_CTYPE* category setting.

41280 **RATIONALE**

41281 None.

41282 **FUTURE DIRECTIONS**

41283 None.

```
41293 CX #include <wchar.h>  
41294 size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,  
41295 size_t nmc, size_t len, mbstate_t *restrict ps);
```

41296 **DESCRIPTION**41297 Refer to [mbsrtowcs\(\)](#).

41298 **NAME**41299 `mbsnrtowcs, mbsrtowcs` — convert a character string to a wide-character string (restartable)41300 **SYNOPSIS**41301 `#include <wchar.h>`

```
41302 CX size_t mbsnrtowcs(wchar_t *restrict dst, const char **restrict src,  

41303 size_t nmc, size_t len, mbstate_t *restrict ps);  

41304 size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,  

41305 size_t len, mbstate_t *restrict ps);
```

41306 **DESCRIPTION**

41307 CX For `mbsrtowcs()`: The functionality described on this reference page is aligned with the ISO C
41308 standard. Any conflict between the requirements described here and the ISO C standard is
41309 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

41310 The `mbsrtowcs()` function shall convert a sequence of characters, beginning in the conversion
41311 state described by the object pointed to by `ps`, from the array indirectly pointed to by `src` into a
41312 sequence of corresponding wide characters. If `dst` is not a null pointer, the converted characters
41313 shall be stored into the array pointed to by `dst`. Conversion continues up to and including a
41314 terminating null character, which shall also be stored. Conversion shall stop early in either of the
41315 following cases:

- 41316 • A sequence of bytes is encountered that does not form a valid character.
- 41317 • `len` codes have been stored into the array pointed to by `dst` (and `dst` is not a null pointer).

41318 Each conversion shall take place as if by a call to the `mbrtowc()` function.

41319 If `dst` is not a null pointer, the pointer object pointed to by `src` shall be assigned either a null
41320 pointer (if conversion stopped due to reaching a terminating null character) or the address just
41321 past the last character converted (if any). If conversion stopped due to reaching a terminating
41322 null character, and if `dst` is not a null pointer, the resulting state described shall be the initial
41323 conversion state.

41324 If `ps` is a null pointer, the `mbsrtowcs()` function shall use its own internal `mbstate_t` object, which
41325 is initialized at program start-up to the initial conversion state. Otherwise, the `mbstate_t` object
41326 pointed to by `ps` shall be used to completely describe the current conversion state of the
41327 associated character sequence.

41328 CX The `mbsnrtowcs()` function shall be equivalent to the `mbsrtowcs()` function, except that the
41329 conversion of characters pointed to by `src` is limited to at most `nmc` bytes (the size of the input
41330 buffer).

41331 The behavior of these functions shall be affected by the `LC_CTYPE` category of the current locale.

41332 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
41333 these functions.

41334 **RETURN VALUE**

41335 If the input conversion encounters a sequence of bytes that do not form a valid character, an
41336 encoding error occurs. In this case, these functions shall store the value of the macro `[EILSEQ]` in
41337 `errno` and shall return `(size_t)-1`; the conversion state is undefined. Otherwise, these functions
41338 shall return the number of characters successfully converted, not including the terminating null
41339 (if any).

mbsrtowcs()41340 **ERRORS**

41341 These functions may fail if:

41342 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

41343 [EILSEQ] Invalid character sequence is detected.

41344 **EXAMPLES**

41345 None.

41346 **APPLICATION USAGE**

41347 None.

41348 **RATIONALE**

41349 None.

41350 **FUTURE DIRECTIONS**

41351 None.

41352 **SEE ALSO**41353 *iconv*, *mbrtowc()*, *mbsinit()*41354 XBD <[wchar.h](#)>41355 **CHANGE HISTORY**41356 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
41357 (E).41358 **Issue 6**41359 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41360 The [EINVAL] error condition is marked CX.

41361 **Issue 7**41362 The *mbsnrtowcs()* function is added from The Open Group Technical Standard, 2006, Extended
41363 API Set Part 1.

41364 **NAME**
 41365 `mbstowcs` — convert a character string to a wide-character string

41366 **SYNOPSIS**
 41367 `#include <stdlib.h>`
 41368 `size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,`
 41369 `size_t n);`

41370 DESCRIPTION

41371 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41372 conflict between the requirements described here and the ISO C standard is unintentional. This
 41373 volume of POSIX.1-200x defers to the ISO C standard.

41374 The `mbstowcs()` function shall convert a sequence of characters that begins in the initial shift
 41375 state from the array pointed to by `s` into a sequence of corresponding wide-character codes and
 41376 shall store not more than `n` wide-character codes into the array pointed to by `pwcs`. No
 41377 characters that follow a null byte (which is converted into a wide-character code with value 0)
 41378 shall be examined or converted. Each character shall be converted as if by a call to `mbtowlc()`,
 41379 except that the shift state of `mbtowlc()` is not affected.

41380 No more than `n` elements shall be modified in the array pointed to by `pwcs`. If copying takes
 41381 place between objects that overlap, the behavior is undefined.

41382 XSI The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.
 41383 If `pwcs` is a null pointer, `mbstowcs()` shall return the length required to convert the entire array
 41384 regardless of the value of `n`, but no values are stored.

41385 RETURN VALUE

41386 CX If an invalid character is encountered, `mbstowcs()` shall return `(size_t)-1` and may set `errno` to
 41387 indicate the error.

41388 XSI Otherwise, `mbstowcs()` shall return the number of the array elements modified (or required if
 41389 `pwcs` is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if
 41390 the value returned is `n`.

41391 ERRORS

41392 The `mbstowcs()` function may fail if:

41393 XSI `[EILSEQ]` Invalid byte sequence is detected.

41394 EXAMPLES

41395 None.

41396 APPLICATION USAGE

41397 None.

41398 RATIONALE

CHANGE HISTORY

41406

First released in Issue 4. Aligned with the ISO C standard.

41407

Issue 6

41408

The *mbstowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41409

Extensions beyond the ISO C standard are marked.

41410 **NAME**
 41411 `mbtowc` — convert a character to a wide-character code

41412 **SYNOPSIS**

41413 `#include <stdlib.h>`
 41414 `int mbtowc(wchar_t *restrict pwc, const char *restrict s, size_t n);`

41415 **DESCRIPTION**

41416 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41417 conflict between the requirements described here and the ISO C standard is unintentional. This
 41418 volume of POSIX.1-200x defers to the ISO C standard.

41419 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the
 41420 character pointed to by *s*. It shall then determine the wide-character code for the value of type
 41421 `wchar_t` that corresponds to that character. (The value of the wide-character code corresponding
 41422 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store
 41423 the wide-character code in the object pointed to by *pwc*.

41424 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 41425 state-dependent encoding, this function is placed into its initial state by a call for which its
 41426 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 41427 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 41428 null pointer shall cause this function to return a non-zero value if encodings have state
 41429 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 41430 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 41431 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 41432 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

41433 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 41434 *mbtowc()*.

41435 **RETURN VALUE**

41436 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,
 41437 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*
 41438 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the
 41439 CX converted character (if the next *n* or fewer bytes form a valid character), or return -1 and may
 41440 set *errno* to indicate the error (if they do not form a valid character).

41441 In no case shall the value returned be greater than *n* or the value of the `{MB_CUR_MAX}` macro.

41442 **ERRORS**

41443 The *mbtowc()* function may fail if:

41444 XSI **[EILSEQ]** Invalid character sequence is detected.

41445 **EXAMPLES**

41446 None.

41447 **APPLICATION USAGE**

41448 None.

41449 **RATIONALE**

41450 None.

Issue 6

41459

The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41460

Extensions beyond the ISO C standard are marked.

41461 **NAME**

41462 memccpy — copy bytes in memory

41463 **SYNOPSIS**

```
41464 XSI #include <string.h>
41465 void *memccpy(void *restrict s1, const void *restrict s2,
41466 int c, size_t n);
```

41467 **DESCRIPTION**

41468 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first
 41469 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,
 41470 whichever comes first. If copying takes place between objects that overlap, the behavior is
 41471 undefined.

41472 **RETURN VALUE**

41473 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null
 41474 pointer if *c* was not found in the first *n* bytes of *s2*.

41475 **ERRORS**

41476 No errors are defined.

41477 **EXAMPLES**

41478 None.

41479 **APPLICATION USAGE**

41480 The *memccpy()* function does not check for the overflow of the receiving memory area.

41481 **RATIONALE**

41482 None.

41483 **FUTURE DIRECTIONS**

41484 None.

41485 **SEE ALSO**

41486 XBD [<string.h>](#)

41487 **CHANGE HISTORY**

41488 First released in Issue 1. Derived from Issue 1 of the SVID.

41489 **Issue 6**

41490 The **restrict** keyword is added to the *memccpy()* prototype for alignment with the
 41491 ISO/IEC 9899:1999 standard.

41492 **NAME**

41493 memchr — find byte in memory

41494 **SYNOPSIS**

41495 #include <string.h>

41496 void *memchr(const void *s, int c, size_t n);

41497 **DESCRIPTION**

41498 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41499 conflict between the requirements described here and the ISO C standard is unintentional. This
 41500 volume of POSIX.1-200x defers to the ISO C standard.

41501 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in
 41502 the initial *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s*.

41503 **RETURN VALUE**

41504 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte does
 41505 not occur in the object.

41506 **ERRORS**

41507 No errors are defined.

41508 **EXAMPLES**

41509 None.

41510 **APPLICATION USAGE**

41511 None.

41512 **RATIONALE**

41513 None.

41514 **FUTURE DIRECTIONS**

41515 None.

41516 **SEE ALSO**

41517 XBD <string.h>

41518 **CHANGE HISTORY**

41519 First released in Issue 1. Derived from Issue 1 of the SVID.

41520 **NAME**

41521 memcmp — compare bytes in memory

41522 **SYNOPSIS**

41523 #include <string.h>

41524 int memcmp(const void *s1, const void *s2, size_t n);

41525 **DESCRIPTION**

41526 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41527 conflict between the requirements described here and the ISO C standard is unintentional. This
 41528 volume of POSIX.1-200x defers to the ISO C standard.

41529 The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the
 41530 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

41531 The sign of a non-zero return value shall be determined by the sign of the difference between the
 41532 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects
 41533 being compared.

41534 **RETURN VALUE**

41535 The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object
 41536 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

41537 **ERRORS**

41538 No errors are defined.

41539 **EXAMPLES**

41540 None.

41541 **APPLICATION USAGE**

41542 None.

41543 **RATIONALE**

41544 None.

41545 **FUTURE DIRECTIONS**

41546 None.

41547 **SEE ALSO**

41548 XBD <string.h>

41549 **CHANGE HISTORY**

41550 First released in Issue 1. Derived from Issue 1 of the SVID.

41551 **NAME**41552 `memcpy` — copy bytes in memory41553 **SYNOPSIS**41554 `#include <string.h>`41555 `void *memcpy(void *restrict s1, const void *restrict s2, size_t n);`41556 **DESCRIPTION**

41557 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41558 conflict between the requirements described here and the ISO C standard is unintentional. This
 41559 volume of POSIX.1-200x defers to the ISO C standard.

41560 The `memcpy()` function shall copy *n* bytes from the object pointed to by *s2* into the object pointed
 41561 to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

41562 **RETURN VALUE**41563 The `memcpy()` function shall return *s1*; no return value is reserved to indicate an error.41564 **ERRORS**

41565 No errors are defined.

41566 **EXAMPLES**

41567 None.

41568 **APPLICATION USAGE**41569 The `memcpy()` function does not check for the overflow of the receiving memory area.41570 **RATIONALE**

41571 None.

41572 **FUTURE DIRECTIONS**

41573 None.

41574 **SEE ALSO**41575 XBD `<string.h>`41576 **CHANGE HISTORY**

41577 First released in Issue 1. Derived from Issue 1 of the SVID.

41578 **Issue 6**41579 The `memcpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

41580 **NAME**

41581 memmove — copy bytes in memory with overlapping areas

41582 **SYNOPSIS**

41583 #include <string.h>

41584 void *memmove(void *s1, const void *s2, size_t n);

41585 **DESCRIPTION**

41586 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41587 conflict between the requirements described here and the ISO C standard is unintentional. This
 41588 volume of POSIX.1-200x defers to the ISO C standard.

41589 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object
 41590 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first
 41591 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and
 41592 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

41593 **RETURN VALUE**41594 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.41595 **ERRORS**

41596 No errors are defined.

41597 **EXAMPLES**

41598 None.

41599 **APPLICATION USAGE**

41600 None.

41601 **RATIONALE**

41602 None.

41631 None.

41632 **SEE ALSO**41633 XBD [<string.h>](#)41634 **CHANGE HISTORY**

41635 First released in Issue 1. Derived from Issue 1 of the SVID.

41636 **NAME**

41637 mkdir, mkdirat — make a directory relative to directory file descriptor

41638 **SYNOPSIS**

41639 #include <sys/stat.h>

41640 int mkdir(const char *path, mode_t mode);

41641 int mkdirat(int fd, const char *path, mode_t mode);

41642 **DESCRIPTION**

41643 The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the
 41644 new directory shall be initialized from *mode*. These file permission bits of the *mode* argument
 41645 shall be modified by the process' file creation mask.

41646 When bits in *mode* other than the file permission bits are set, the meaning of these additional bits
 41647 is implementation-defined.

41648 The directory's user ID shall be set to the process' effective user ID. The directory's group ID
 41649 shall be set to the group ID of the parent directory or to the effective group ID of the process.
 41650 Implementations shall provide a way to initialize the directory's group ID to the group ID of the
 41651 parent directory. Implementations may, but need not, provide an implementation-defined way
 41652 to initialize the directory's group ID to the effective group ID of the calling process.

41653 The newly created directory shall be an empty directory.

41654 If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

41655 Upon successful completion, *mkdir()* shall mark for update the last data access, last data
 41656 modification, and last file status change timestamps of the directory. Also, the last data
 41657 modification and last file status change timestamps of the directory that contains the new entry
 41658 shall be marked for update.

41659 The *mkdirat()* function shall be equivalent to the *mkdir()* function except in the case where *path*
 41660 specifies a relative path. In this case the newly created directory is created relative to the
 41661 directory associated with the file descriptor *fd* instead of the current working directory. It is
 41662 unspecified whether directory searches are permitted based on whether the file was opened
 41663 with search permission or on the current permissions of the directory underlying the file
 41664 descriptor.

41665 If *mkdirat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
 41666 directory is used and the behavior shall be identical to a call to *mkdir()*.

41667 **RETURN VALUE**

41668 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 41669 return -1 and set *errno* to indicate the error. If -1 is returned, no directory shall be created.

41670 **ERRORS**

41671 These functions shall fail if:

41672 [EACCES] Search permission is denied on a component of the path prefix, or write
 41673 permission is denied on the parent directory of the directory to be created.

41674 [EEXIST] The named file exists.

41675 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 41676 argument.

41677 [EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

- 41678 [ENAMETOOLONG]
 41679 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 41680 component is longer than {NAME_MAX}.
- 41681 [ENOENT] A component of the path prefix specified by *path* does not name an existing
 41682 directory or *path* is an empty string.
- 41683 [ENOSPC] The file system does not contain enough space to hold the contents of the new
 41684 directory or to extend the parent directory of the new directory.
- 41685 [ENOTDIR] A component of the path prefix is not a directory.
- 41686 [EROFS] The parent directory resides on a read-only file system.
- 41687 In addition, the *mkdirat*() function shall fail if:
- 41688 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 41689 neither AT_FDCWD nor a valid file descriptor open for reading.

41690 These functions may fail if:

- 41691 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 41692 resolution of the *path* argument.
- 41693 [ENAMETOOLONG]
 41694 As a result of encountering a symbolic link in resolution of the *path* argument,
 41695 the length of the substituted pathname string exceeded {PATH_MAX}.
- 41696 The *mkdirat*() function may fail if:
- 41697 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
 41698 file descriptor associated with a directory.

41699 EXAMPLES

41700 Creating a Directory

41701 The following example shows how to create a directory named **/home/cnd/mod1**, with
 41702 read/write/search permissions for owner and group, and with read/search permissions for
 41703 others.

```
41704 #include <sys/types.h>
41705 #include <sys/stat.h>
41706
41707 int status;
41708 ...
41709 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

41709 APPLICATION USAGE

41710 None.

41711 RATIONALE

41712 The *mkdir*() function originated in 4.2 BSD and was added to System V in Release 3.0.

41713 4.3 BSD detects [ENAMETOOLONG].

41714 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the
 41715 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2
 41716 required that implementations provide a way to have the group ID be set to the group ID of the
 41717 containing directory, but did not prohibit implementations also supporting a way to set the
 41718 group ID to the effective group ID of the creating process. Conforming applications should not
 41719 assume which group ID will be used. If it matters, an application can use *chown*() to set the
 41720 group ID after the directory is created, or determine under what conditions the implementation
 41721 will set the desired group ID.

41722 The purpose of the *mkdirat()* function is to create a directory in directories other than the current
 41723 working directory without exposure to race conditions. Any part of the path of a file could be
 41724 changed in parallel to the call to *mkdir()*, resulting in unspecified behavior. By opening a file
 41725 descriptor for the target directory and using the *mkdirat()* function it can be guaranteed that the
 41726 newly created directory is located relative to the desired directory.

FUTURE DIRECTIONS

41727 None.
 41728

41731 XBD [<sys/stat.h>](#), [<sys/types.h>](#) |

CHANGE HISTORY

41732 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.
 41733

Issue 6

41734 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.
 41735

41736 The following new requirements on POSIX implementations derive from alignment with the
 41737 Single UNIX Specification:

- 41738 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
 41739 required for conforming implementations of previous POSIX specifications, it was not
 41740 required for UNIX applications.
- 41741 • The [ELOOP] mandatory error condition is added.
- 41742 • A second [ENAMETOOLONG] is added as an optional error condition.

41743 The following changes were made to align with the IEEE P1003.1a draft standard:

- 41744 • The [ELOOP] optional error condition is added.

Issue 7

41745 The *mkdirat()* function is added from The Open Group Technical Standard, 2006, Extended API
 41746 Set Part 2.

41747 Changes are made related to support for finegrained timestamps.
 41748 +

41749 **NAME**
41750 mkdirat — make a directory relative to directory file descriptor

41751 **SYNOPSIS**
41752 #include <sys/stat.h>
41753 int mkdirat(int *fd*, const char **path*, mode_t *mode*);

41754 **DESCRIPTION**
41755 Refer to *mkdir*.

41756 **NAME**
 41757 mkdtemp, mkstemp — create a unique directory or file

41758 **SYNOPSIS**

```
41759 CX #include <stdlib.h>
41760 char *mkdtemp(char *template);
41761 int mkstemp(char *template);
```

41762 **DESCRIPTION**

41763 The *mkdtemp()* function uses the contents of *template* to construct a unique directory name. The
 41764 string provided in *template* shall be a filename ending with six trailing 'X's. The *mkdtemp()*
 41765 function shall replace each 'X' with a character from the portable filename character set. The
 41766 characters are chosen such that the resulting name does not duplicate the name of an existing file
 41767 at the time of a call to *mkdtemp()*. The unique directory name is used to attempt to create the
 41768 directory using mode 0700 as modified by the file creation mask.

41769 The *mkstemp()* function shall replace the contents of the string pointed to by *template* by a unique
 41770 filename, and return a file descriptor for the file open for reading and writing. The *mkstemp()*
 41771 function shall create the file, and obtain a file descriptor for it, as if by a call to:

```
41772 open(filename, O_RDWR|O_CREAT|O_EXCL, S_IRUSR|S_IWUSR)
```

41773 The function thus prevents any possible race condition between testing whether the file exists
 41774 and opening it for use. The string in *template* should look like a filename with six trailing 'X's;
 41775 *mkstemp()* replaces each 'X' with a character from the portable filename character set. The
 41776 characters are chosen such that the resulting name does not duplicate the name of an existing file
 41777 at the time of a call to *mkstemp()*.

41778 **RETURN VALUE**

41779 Upon successful completion, the *mkdtemp()* function shall return a pointer to the string
 41780 containing the directory name if it was created. Otherwise, it shall return a null pointer and shall
 41781 set *errno* to indicate the error.

41782 Upon successful completion, the *mkstemp()* function shall return an open file descriptor. |
 41783 Otherwise, it shall return -1 if no suitable file could be created.

41784 **ERRORS**

41785 The *mkdtemp()* function shall fail if: |

41786 [EACCES] Search permission is denied on a component of the path prefix, or write
 41787 permission is denied on the parent directory of the directory to be created.

41788 [EINVAL] The string pointed to by *template* does not end in "XXXXXX".

41789 [ELOOP] A loop exists in symbolic links encountered during resolution of the path of
 41790 the directory to be created.

41791 [EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

41792 [ENAMETOOLONG]

41793 The length of the *template* argument exceeds {PATH_MAX} or a pathname
 41794 component is longer than {NAME_MAX}.

41795 [ENOENT] A component of the path prefix specified by the *template* argument does not
 41796 name an existing directory or path is an empty string.

- 41797 [ENOSPC] The file system does not contain enough space to hold the contents of the new
41798 directory or to extend the parent directory of the new directory.
- 41799 [ENOTDIR] A component of the path prefix is not a directory.
- 41800 [EROFS] The parent directory resides on a read-only file system.
- 41801 The *mkdtemp()* function may fail if:
- 41802 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
41803 resolution of the path of the directory to be created.
- 41804 [ENAMETOOLONG]
41805 As a result of encountering a symbolic link in resolution of the path of the
41806 directory to be created, the length of the substituted pathname string exceeded
41807 {PATH_MAX}.
- 41808 The error conditions for the *mkstemp()* function are defined in *open()*. +

EXAMPLES**Generating a Filename**

The following example creates a file with a 10-character name beginning with the characters "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file descriptor that identifies the file.

```
41814 #include <stdlib.h>
41815 ...
41816 char template[] = "/tmp/fileXXXXXX";
41817 int fd;
41818
41819 fd = mkstemp(template);
```

APPLICATION USAGE

It is possible to run out of letters.

The *mkdtemp()* and *mkstemp()* functions need not check to determine whether the filename part of *template* exceeds the maximum allowable filename length.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 7

The *mkstemp()* function is moved from the XSI option to the Base.

The *mkdtemp()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

SD5-XSH-ERN-168 is applied, clarifying file permissions upon creation.

41839 **NAME**

41840 mkfifo, mkfifoat — make a FIFO special file relative to directory file descriptor

41841 **SYNOPSIS**

41842 #include <sys/stat.h>

41843 int mkfifo(const char *path, mode_t mode);

41844 int mkfifoat(int fd, const char *path, mode_t mode);

41845 **DESCRIPTION**41846 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by
41847 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission
41848 bits of the *mode* argument shall be modified by the process' file creation mask.41849 When bits in *mode* other than the file permission bits are set, the effect is implementation-
41850 defined.41851 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].41852 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set
41853 to the group ID of the parent directory or to the effective group ID of the process.
41854 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the
41855 parent directory. Implementations may, but need not, provide an implementation-defined way
41856 to initialize the FIFO's group ID to the effective group ID of the calling process.41857 Upon successful completion, *mkfifo()* shall mark for update the last data access, last data |
41858 modification, and last file status change timestamps of the file. Also, the last data modification |
41859 and last file status change timestamps of the directory that contains the new entry shall be |
41860 marked for update.41861 The *mkfifoat()* function shall be equivalent to the *mkfifo()* function except in the case where *path*
41862 specifies a relative path. In this case the newly created FIFO is created relative to the directory
41863 associated with the file descriptor *fd* instead of the current working directory. It is unspecified
41864 whether directory searches are permitted based on whether the file was opened with search
41865 permission or on the current permissions of the directory underlying the file descriptor.41866 If *mkfifoat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
41867 directory is used and the behavior shall be identical to a call to *mkfifo()*.41868 **RETURN VALUE**41869 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
41870 return -1 and set *errno* to indicate the error. If -1 is returned, no FIFO shall be created.41871 **ERRORS**

41872 These functions shall fail if:

41873 [EACCES] A component of the path prefix denies search permission, or write permission
41874 is denied on the parent directory of the FIFO to be created.

41875 [EEXIST] The named file already exists.

41876 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
41877 argument.

41878 [ENAMETOOLONG]

41879 The length of the *path* argument exceeds {PATH_MAX} or a pathname
41880 component is longer than {NAME_MAX}.

- 41881 [ENOENT] A component of the path prefix specified by *path* does not name an existing
41882 directory or *path* is an empty string.
- 41883 [ENOSPC] The directory that would contain the new file cannot be extended or the file
41884 system is out of file-allocation resources.
- 41885 [ENOTDIR] A component of the path prefix is not a directory.
- 41886 [EROFS] The named file resides on a read-only file system.
- 41887 The *mkfifoat()* function shall fail if:
- 41888 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
41889 neither AT_FDCWD nor a valid file descriptor open for reading.
- 41890 These functions may fail if:
- 41891 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
41892 resolution of the *path* argument.
- 41893 [ENAMETOOLONG]
41894 As a result of encountering a symbolic link in resolution of the *path* argument,
41895 the length of the substituted pathname string exceeded {PATH_MAX}.
- 41896 The *mkfifoat()* function may fail if:
- 41897 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
41898 file descriptor associated with a directory.

EXAMPLES**Creating a FIFO File**

The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with read/write permissions for owner, and with read permissions for group and others.

```
41903 #include <sys/types.h>
41904 #include <sys/stat.h>
41905 int status;
41906 ...
41907 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
41908               S_IRGRP | S_IROTH);
```

APPLICATION USAGE

None.

RATIONALE

The syntax of this function is intended to maintain compatibility with historical implementations of *mknod()*. The latter function was included in the 1984 /usr/group standard but only for use in creating FIFO special files. The *mknod()* function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

41926 The purpose of the *mkfifoat()* function is to create a FIFO special file in directories other than the
 41927 current working directory without exposure to race conditions. Any part of the path of a file
 41928 could be changed in parallel to a call to *mkfifo()*, resulting in unspecified behavior. By opening a
 41929 file descriptor for the target directory and using the *mkfifoat()* function it can be guaranteed that
 41930 the newly created FIFO is located relative to the desired directory.

41931 FUTURE DIRECTIONS

41932 None.

41934 *chmod*, *mknod()*, *umask*

41935 XBD [<sys/stat.h>](#), [<sys/types.h>](#) |

41936 CHANGE HISTORY

41937 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41938 Issue 6

41939 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

41940 The following new requirements on POSIX implementations derive from alignment with the
 41941 Single UNIX Specification:

- 41942 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
 41943 required for conforming implementations of previous POSIX specifications, it was not
 41944 required for UNIX applications.
- 41945 • The [ELOOP] mandatory error condition is added.
- 41946 • A second [ENAMETOOLONG] is added as an optional error condition.

41947 The following changes were made to align with the IEEE P1003.1a draft standard:

- 41948 • The [ELOOP] optional error condition is added.

41949 Issue 7

41950 The *mkfifoat()* function is added from The Open Group Technical Standard, 2006, Extended API
 41951 Set Part 2.

41952 Changes are made related to support for finegrained timestamps. +

41953 **NAME**
41954 `mkfifoat` — make a FIFO special file relative to directory file descriptor

41955 **SYNOPSIS**
41956 `#include <sys/stat.h>`
41957 `int mkfifoat(int fd, const char *path, mode_t mode);`

41958 **DESCRIPTION**
41959 Refer to *mkfifo*.

41960 **NAME**

41961 mknod, mknodat — make directory, special file, or regular file

41962 **SYNOPSIS**

```
41963 XSI #include <sys/stat.h>
41964 int mknod(const char *path, mode_t mode, dev_t dev);
41965 int mknodat(int fd, const char *path, mode_t mode, dev_t dev);
```

41966 **DESCRIPTION**41967 The *mknod()* function shall create a new file named by the pathname to which the argument *path*
41968 points.41969 The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the
41970 following symbolic constants:

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

41977 The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S_IFIFO or *dev* is
41978 not 0, the behavior of *mknod()* is unspecified.41979 The permissions for the new file are OR'ed into the *mode* argument, and may be selected from
41980 any combination of the following symbolic constants:

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

41997 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of
41998 the file shall be initialized to either the effective group ID of the process or the group ID of the
41999 parent directory. Implementations shall provide a way to initialize the file's group ID to the
42000 group ID of the parent directory. Implementations may, but need not, provide an
42001 implementation-defined way to initialize the file's group ID to the effective group ID of the
42002 calling process. The owner, group, and other permission bits of *mode* shall be modified by the file
42003 mode creation mask of the process. The *mknod()* function shall clear each bit whose
42004 corresponding bit in the file mode creation mask of the process is set.

42005 If *path* names a symbolic link, *mknod()* shall fail and set *errno* to [EEXIST].

42006 Upon successful completion, *mknod()* shall mark for update the last data access, last data
42007 modification, and last file status change timestamps of the file. Also, the last data modification
42008 and last file status change timestamps of the directory that contains the new entry shall be
42009 marked for update.

42010 Only a process with appropriate privileges may invoke *mknod()* for file types other than FIFO-
42011 special.

42012 The *mknodat()* function shall be equivalent to the *mknod()* function except in the case where *path*
42013 specifies a relative path. In this case the newly created directory, special file, or regular file is
42014 located relative to the directory associated with the file descriptor *fd* instead of the current
42015 working directory. It is unspecified whether directory searches are permitted based on whether
42016 the file was opened with search permission or on the current permissions of the directory
42017 underlying the file descriptor.

42018 If *mknodat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
42019 directory is used and the behavior shall be identical to a call to *mknod()*.

RETURN VALUE

42020 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
42021 return -1 and set *errno* to indicate the error. If -1 is returned, the new file shall not be created.
42022

ERRORS

42023 These functions shall fail if:

42024 [EACCES] A component of the path prefix denies search permission, or write permission
42025 is denied on the parent directory.
42026

42027 [EEXIST] The named file exists.

42028 [EINVAL] An invalid argument exists.

42029 [EIO] An I/O error occurred while accessing the file system.

42030 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
42031 argument.

42032 [ENAMETOOLONG]

42033 The length of a pathname exceeds {PATH_MAX} or a pathname component is
42034 longer than {NAME_MAX}.

42035 [ENOENT] A component of the path prefix specified by *path* does not name an existing
42036 directory or *path* is an empty string.

42037 [ENOSPC] The directory that would contain the new file cannot be extended or the file
42038 system is out of file allocation resources.

42039 [ENOTDIR] A component of the path prefix is not a directory.

42040 [EPERM] The invoking process does not have appropriate privileges and the file type is
42041 not FIFO-special.

42042 [EROFS] The directory in which the file is to be created is located on a read-only file
42043 system.

42044 The *mknodat()* function shall fail if:

42045 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
42046 neither AT_FDCWD nor a valid file descriptor open for reading.

42047 These functions may fail if:

- 42048 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
42049 resolution of the *path* argument.
- 42050 [ENAMETOOLONG]
42051 Pathname resolution of a symbolic link produced an intermediate result
42052 whose length exceeds {PATH_MAX}.
- 42053 The *mknodat()* function may fail if:
- 42054 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
42055 file descriptor associated with a directory.

EXAMPLES**Creating a FIFO Special File**

The following example shows how to create a FIFO special file named */home/cnd/mod_done*, with read/write permissions for owner, and with read permissions for group and others.

```
42060 #include <sys/types.h>
42061 #include <sys/stat.h>
42062 dev_t dev;
42063 int status;
42064 ...
42065 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
42066 S_IRUSR | S_IRGRP | S_IROTH, dev);
```

APPLICATION USAGE

The *mkfifo()* function is preferred over this function for making FIFO special files.

RATIONALE

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use *chown()* to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

The purpose of the *mknodat()* function is to create directories, special files, or regular files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *mknod()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *mknodat()* function it can be guaranteed that the newly created directory, special file, or regular file is located relative to the desired directory.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

mknod()

42091	Issue 5	
42092		Moved from X/OPEN UNIX extension to BASE.
42093	Issue 6	
42094		The normative text is updated to avoid use of the term “must” for application requirements.
42095		The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.
42096		
42097	Issue 7	
42098		The <i>mknodat()</i> function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
42099		
42100		Changes are made related to support for finegrained timestamps. +

42101 **NAME**
42102 mknodat — make directory, special file, or regular file

42103 **SYNOPSIS**

42104 XSI `#include <sys/stat.h>`
42105 `int mknodat(int fd, const char *path, mode_t mode, dev_t dev);`

42106 **DESCRIPTION**

42107 Refer to *mknod()*.

mkstemp()

42108 **NAME**
42109 mkstemp — create a unique directory

SYNOPSIS

42111 CX `#include <stdlib.h>`
42112 `int mkstemp(char *template);`

DESCRIPTION

42113 Refer to *mkdtemp()*.
42114

42115 **NAME**

42116 mktime — convert broken-down time into time since the Epoch

42117 **SYNOPSIS**

42118 #include <time.h>

42119 time_t mktime(struct tm *timeptr);

42120 **DESCRIPTION**

42121 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42122 conflict between the requirements described here and the ISO C standard is unintentional. This
 42123 volume of POSIX.1-200x defers to the ISO C standard.

42124 The *mktime()* function shall convert the broken-down time, expressed as local time, in the
 42125 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that
 42126 of the values returned by *time()*. The original values of the *tm_wday* and *tm_yday* components of
 42127 the structure are ignored, and the original values of the other components are not restricted to
 42128 the ranges described in <time.h>.

42129 CX A positive or 0 value for *tm_isdst* shall cause *mktime()* to presume initially that Daylight Savings
 42130 Time, respectively, is or is not in effect for the specified time. A negative value for *tm_isdst* shall
 42131 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the
 42132 specified time.

42133 Local timezone information shall be set as though *mktime()* called *tzset()*.

42134 The relationship between the **tm** structure (defined in the <time.h> header) and the time in
 42135 seconds since the Epoch is that the result shall be as specified in the expression given in the
 42136 definition of seconds since the Epoch (see XBD Section 4.15, on page 100) corrected for timezone
 42137 and any seasonal time adjustments, where the names in the structure and in the expression
 42138 correspond.

42139 Upon successful completion, the values of the *tm_wday* and *tm_yday* components of the structure
 42140 shall be set appropriately, and the other components are set to represent the specified time since
 42141 the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final
 42142 value of *tm_mday* shall not be set until *tm_mon* and *tm_year* are determined.

42143 **RETURN VALUE**

42144 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type
 42145 **time_t**. If the time since the Epoch cannot be represented, the function shall return the value
 42146 CX **(time_t)-1** and may set *errno* to indicate the error.

42147 **ERRORS**42148 The *mktime()* function may fail if:

42149 CX [EOVERFLOW] The result cannot be represented.

42150 **EXAMPLES**

42151 What day of the week is July 4, 2001?

42152 #include <stdio.h>

42153 #include <time.h>

42154 struct tm time_str;

42155 char daybuf[20];

42156 int main(void)

42157 {

42158 time_str.tm_year = 2001 - 1900;

```

42159         time_str.tm_mon = 7 - 1;
42160         time_str.tm_mday = 4;
42161         time_str.tm_hour = 0;
42162         time_str.tm_min = 0;
42163         time_str.tm_sec = 1;
42164         time_str.tm_isdst = -1;
42165         if (mktime(&time_str) == -1)
42166             (void)puts("-unknown-");
42167         else {
42168             (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
42169             (void)puts(daybuf);
42170         }
42171         return 0;
42172     }

```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/58 is applied, updating the RETURN VALUE and ERRORS sections to add the optional [Eoverflow] error as a CX extension.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/59 is applied, adding the *tzset()* function to the SEE ALSO section.

42192 **NAME**42193 mlock, munlock — lock or unlock a range of process address space (**REALTIME**)42194 **SYNOPSIS**

```
42195 MLR #include <sys/mman.h>
42196 int mlock(const void *addr, size_t len);
42197 int munlock(const void *addr, size_t len);
```

42198 **DESCRIPTION**

42199 The *mlock()* function shall cause those whole pages containing any part of the address space of
 42200 the process starting at address *addr* and continuing for *len* bytes to be memory-resident until
 42201 unlocked or until the process exits or *execs* another process image. The implementation may
 42202 require that *addr* be a multiple of {PAGESIZE}.

42203 The *munlock()* function shall unlock those whole pages containing any part of the address space
 42204 of the process starting at address *addr* and continuing for *len* bytes, regardless of how many
 42205 times *mlock()* has been called by the process for any of the pages in the specified range. The
 42206 implementation may require that *addr* be a multiple of {PAGESIZE}.

42207 If any of the pages in the range specified to a call to *munlock()* are also mapped into the address
 42208 spaces of other processes, any locks established on those pages by another process are
 42209 unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a
 42210 call to *munlock()* are also mapped into other portions of the address space of the calling process
 42211 outside the range specified, any locks established on those pages via the other mappings are also
 42212 unaffected by this call.

42213 Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-
 42214 resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked
 42215 with respect to the address space of the process. Memory residency of unlocked pages is
 42216 unspecified.

42217 The appropriate privilege is required to lock process memory with *mlock()*.

42218 **RETURN VALUE**

42219 Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero.
 42220 Otherwise, no change is made to any locks in the address space of the process, and the function
 42221 shall return a value of -1 and set *errno* to indicate the error.

42222 **ERRORS**

42223 The *mlock()* and *munlock()* functions shall fail if:

42224 [ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does
 42225 not correspond to valid mapped pages in the address space of the process.

42226 The *mlock()* function shall fail if:

42227 [EAGAIN] Some or all of the memory identified by the operation could not be locked
 42228 when the call was made.

42229 The *mlock()* and *munlock()* functions may fail if:

42230 [EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

42231 The *mlock()* function may fail if:

42232 [ENOMEM] Locking the pages mapped by the specified range would exceed an
 42233 implementation-defined limit on the amount of memory that the process may
 42234 lock.

mlock()

42235 [EPERM] The calling process does not have the appropriate privilege to perform the
 42236 requested operation.

 42246

42247 XBD <[sys/mman.h](#)>

CHANGE HISTORY

42248 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
 42249

Issue 6

42250 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.
 42251

42252 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 42253 implementation does not support the Range Memory Locking option.

42254 **NAME**
 42255 `mlockall`, `munlockall` — lock/unlock the address space of a process (**REALTIME**)

42256 **SYNOPSIS**

```
42257 ML #include <sys/mman.h>
42258 int mlockall(int flags);
42259 int munlockall(void);
```

42260 **DESCRIPTION**

42261 The `mlockall()` function shall cause all of the pages mapped by the address space of a process to
 42262 be memory-resident until unlocked or until the process exits or *execs* another process image. The
 42263 *flags* argument determines whether the pages to be locked are those currently mapped by the
 42264 address space of the process, those that are mapped in the future, or both. The *flags* argument is
 42265 constructed from the bitwise-inclusive OR of one or more of the following symbolic constants,
 42266 defined in `<sys/mman.h>`:

42267 `MCL_CURRENT` Lock all of the pages currently mapped into the address space of the process.

42268 `MCL_FUTURE` Lock all of the pages that become mapped into the address space of the
 42269 process in the future, when those mappings are established.

42270 If `MCL_FUTURE` is specified, and the automatic locking of future mappings eventually causes
 42271 the amount of locked memory to exceed the amount of available physical memory or any other
 42272 implementation-defined limit, the behavior is implementation-defined. The manner in which the
 42273 implementation informs the application of these situations is also implementation-defined.

42274 The `munlockall()` function shall unlock all currently mapped pages of the address space of the
 42275 process. Any pages that become mapped into the address space of the process after a call to
 42276 `munlockall()` shall not be locked, unless there is an intervening call to `mlockall()` specifying
 42277 `MCL_FUTURE` or a subsequent call to `mlockall()` specifying `MCL_CURRENT`. If pages mapped
 42278 into the address space of the process are also mapped into the address spaces of other processes
 42279 and are locked by those processes, the locks established by the other processes shall be
 42280 unaffected by a call by this process to `munlockall()`.

42281 Upon successful return from the `mlockall()` function that specifies `MCL_CURRENT`, all currently
 42282 mapped pages of the address space of the process shall be memory-resident and locked. Upon
 42283 return from the `munlockall()` function, all currently mapped pages of the address space of the
 42284 process shall be unlocked with respect to the address space of the process. The memory
 42285 residency of unlocked pages is unspecified.

42286 The appropriate privilege is required to lock process memory with `mlockall()`.

42287 **RETURN VALUE**

42288 Upon successful completion, the `mlockall()` function shall return a value of zero. Otherwise, no
 42289 additional memory shall be locked, and the function shall return a value of `-1` and set *errno* to
 42290 indicate the error. The effect of failure of `mlockall()` on previously existing locks in the address
 42291 space is unspecified.

42292 If it is supported by the implementation, the `munlockall()` function shall always return a value of
 42293 zero. Otherwise, the function shall return a value of `-1` and set *errno* to indicate the error.

42294 **ERRORS**

42295 The `mlockall()` function shall fail if:

mlockall()

42296	[EAGAIN]	Some or all of the memory identified by the operation could not be locked
42297		when the call was made.
42298	[EINVAL]	The <i>flags</i> argument is zero, or includes unimplemented flags.
42299		The <i>mlockall()</i> function may fail if:
42300	[ENOMEM]	Locking all of the pages currently mapped into the address space of the
42301		process would exceed an implementation-defined limit on the amount of
42302		memory that the process may lock.
42303	[EPERM]	The calling process does not have the appropriate privilege to perform the
42304		requested operation.

SEE ALSO*exec*, *exit()*, *fork()*, *mlock()*, *munmap()*XBD <[sys/mman.h](#)>**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6The *mlockall()* and *munlockall()* functions are marked as part of the Process Memory Locking option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Memory Locking option.

42323 **NAME**

42324 mmap — map pages of memory

42325 **SYNOPSIS**

42326 #include <sys/mman.h>

42327 void *mmap(void *addr, size_t len, int prot, int flags,
42328 int fildes, off_t off);42329 **DESCRIPTION**42330 The *mmap()* function shall establish a mapping between an address space of a process and a
42331 memory object.42332 The *mmap()* function shall be supported for the following memory objects:

- 42333 • Regular files
- 42334 SHM • Shared memory objects
- 42335 TYM • Typed memory objects

42336 Support for any other type of file is unspecified.

42337 The format of the call is as follows:

42338 *pa*=mmap(*addr*, *len*, *prot*, *flags*, *fildes*, *off*);

42339 The *mmap()* function shall establish a mapping between the address space of the process at an
42340 address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off*
42341 for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and
42342 the values of *flags*, further described below. A successful *mmap()* call shall return *pa* as its result.
42343 The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible
42344 (not necessarily current) address space of the process. The range of bytes starting at *off* and
42345 continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the
42346 memory object represented by *fildes*.

42347 TYM If *fildes* represents a typed memory object opened with either the
42348 POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG
42349 flag, the memory object to be mapped shall be that portion of the typed memory object allocated
42350 by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap()*
42351 is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling
42352 process, *mmap()* shall fail.

42353 The mapping established by *mmap()* shall replace any previous mappings for those whole pages
42354 containing any part of the address space of the process starting at *pa* and continuing for *len*
42355 bytes.

42356 If the size of the mapped file changes after the call to *mmap()* as a result of some other operation
42357 on the mapped file, the effect of references to portions of the mapped region that correspond to
42358 added or removed portions of the file is unspecified.

42359 If *len* is zero, *mmap()* shall fail and no mapping shall be established.

42360 The parameter *prot* determines whether read, write, execute, or some combination of accesses
42361 are permitted to the data being mapped. The *prot* shall be either PROT_NONE or the bitwise-
42362 inclusive OR of one or more of the other flags in the following table, defined in the
42363 <sys/mman.h> header.

42364
42365
42366
42367
42368

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

42369
42370

If an implementation cannot support the combination of access types specified by *prot*, the call to *mmap()* shall fail.

42371
42372
42373
42374
42375
42376
42377
42378
42379

An implementation may permit accesses other than those specified by *prot*; however, the implementation shall not permit a write to succeed where PROT_WRITE has not been set and shall not permit any access where PROT_NONE alone has been set. The implementation shall support at least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. The file descriptor *fdes* shall have been opened with read permission, regardless of the protection options specified. If PROT_WRITE is specified, the application shall ensure that it has opened the file descriptor *fdes* with write permission unless MAP_PRIVATE is specified in the *flags* parameter as described below.

42380
42381

The parameter *flags* provides other information about the handling of the mapped data. The value of *flags* is the bitwise-inclusive OR of these options, defined in `<sys/mman.h>`:

42382
42383
42384
42385

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

42386
42387

XSI It is implementation-defined whether MAP_FIXED shall be supported. MAP_FIXED shall be supported on XSI-conformant systems.

42388
42389
42390
42391
42392
42393
42394

MAP_SHARED and MAP_PRIVATE describe the disposition of write references to the memory object. If MAP_SHARED is specified, write references shall change the underlying object. If MAP_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP_PRIVATE mapping is established are visible through the MAP_PRIVATE mapping. Either MAP_SHARED or MAP_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

42395
42396
42397

The state of synchronization objects such as mutexes, semaphores, barriers, and conditional variables placed in shared memory mapped with MAP_SHARED becomes undefined when the last region in any process containing the synchronization object is unmapped.

42398
42399
42400
42401
42402
42403
42404
42405
42406
42407
42408
42409
42410
42411
42412

TYM When *fdes* represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If *fdes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If *fdes* represents a typed memory object opened with the POSIX_TYPED_MEM_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If *fdes* represents a typed memory object opened with neither the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag nor the POSIX_TYPED_MEM_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two processes map an area of typed memory using the same *off* and *len* values and using file descriptors that refer to the same memory pool (either from the same port or from a different

- 42413 port), both processes shall map the same region of storage.
- 42414 When MAP_FIXED is set in the *flags* argument, the implementation is informed that the value of
42415 *pa* shall be *addr*, exactly. If MAP_FIXED is set, *mmap()* may return MAP_FAILED and set *errno* to
42416 [EINVAL]. If a MAP_FIXED request is successful, the mapping established by *mmap()* replaces
42417 any previous mappings for the pages in the range [*pa,pa+len*) of the process.
- 42418 When MAP_FIXED is not set, the implementation uses *addr* in an implementation-defined
42419 manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the
42420 implementation deems suitable for a mapping of *len* bytes to the file. All implementations
42421 interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*,
42422 subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a
42423 process address near which the mapping should be placed. When the implementation selects a
42424 value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.
- 42425 If MAP_FIXED is specified and *addr* is non-zero, it shall have the same remainder as the *off*
42426 parameter, modulo the page size as returned by *sysconf()* when passed _SC_PAGESIZE or
42427 _SC_PAGE_SIZE. The implementation may require that *off* is a multiple of the page size. If
42428 MAP_FIXED is specified, the implementation may require that *addr* is a multiple of the page
42429 size. The system performs mapping operations over whole pages. Thus, while the parameter *len*
42430 need not meet a size or alignment constraint, the system shall include, in any mapping
42431 operation, any partial page specified by the address range starting at *pa* and continuing for *len*
42432 bytes.
- 42433 The system shall always zero-fill any partial page at the end of an object. Further, the system
42434 shall never write out any modified portions of the last page of an object which are beyond its
42435 end. References within the address range starting at *pa* and continuing for *len* bytes to whole
42436 pages following the end of an object shall result in delivery of a SIGBUS signal.
- 42437 An implementation may generate SIGBUS signals when a reference would cause an error in the
42438 mapped object, such as out-of-space condition.
- 42439 The *mmap()* function shall add an extra reference to the file associated with the file descriptor
42440 *fildev* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be
42441 removed when there are no more mappings to the file.
- 42442 The last data access timestamp of the mapped file may be marked for update at any time |
42443 between the *mmap()* call and the corresponding *munmap()* call. The initial read or write |
42444 reference to a mapped region shall cause the file's last data access timestamp to be marked for |
42445 update if it has not already been marked for update.
- 42446 The last data modification and last file status change timestamps of a file that is mapped with |
42447 MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval |
42448 between a write reference to the mapped region and the next call to *msync()* with MS_ASYNC or |
42449 MS_SYNC for that portion of the file by any process. If there is no such call and if the |
42450 underlying file is modified as a result of a write reference, then these timestamps shall be |
42451 marked for update at some time after the write reference.
- 42452 There may be implementation-defined limits on the number of memory regions that can be
42453 mapped (per process or per system).
- 42454 XSI If such a limit is imposed, whether the number of memory regions that can be mapped by a
42455 process is decreased by the use of *shmat()* is implementation-defined.
- 42456 If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the
42457 mappings in the address range starting at *addr* and continuing for *len* bytes may have been
42458 unmapped.

mmap()

42459

RETURN VALUE

42460

Upon successful completion, the *mmap()* function shall return the address at which the mapping was placed (*pa*); otherwise, it shall return a value of `MAP_FAILED` and set *errno* to indicate the error. The symbol `MAP_FAILED` is defined in the `<sys/mman.h>` header. No successful return from *mmap()* shall return the value `MAP_FAILED`.

42461

42462

42463

42464

ERRORS

42465

The *mmap()* function shall fail if:

42466

[EACCES] The *fildev* argument is not open for read, regardless of the protection specified, or *fildev* is not open for write and `PROT_WRITE` was specified for a `MAP_SHARED` type mapping.

42467

42468

42469 ML

[EAGAIN] The mapping could not be locked in memory, if required by *mlockall()*, due to a lack of resources.

42470

42471

[EBADF] The *fildev* argument is not a valid open file descriptor.

42472

[EINVAL] The value of *len* is zero.

42473

42474

[EINVAL] The value of *flags* is invalid (neither `MAP_PRIVATE` nor `MAP_SHARED` is set).

42475

42476

[EMFILE] The number of mapped regions would exceed an implementation-defined limit (per process or per system).

42477

[ENODEV] The *fildev* argument refers to a file whose type is not supported by *mmap()*.

42478

42479

42480

[ENOMEM] `MAP_FIXED` was specified, and the range [*addr*,*addr+len*) exceeds that allowed for the address space of a process; or, if `MAP_FIXED` was not specified and there is insufficient room in the address space to effect the mapping.

42481 ML

[ENOMEM] The mapping could not be locked in memory, if required by *mlockall()*, because it would require more space than the system is able to supply.

42482

42483 TYM

[ENOMEM] Not enough unallocated memory resources remain in the typed memory object designated by *fildev* to allocate *len* bytes.

42484

42485

42486

[ENOTSUP] `MAP_FIXED` or `MAP_PRIVATE` was specified in the *flags* argument and the implementation does not support this functionality.

42487

42488

The implementation does not support the combination of accesses requested in the *prot* argument.

42489

[ENXIO] Addresses in the range [*off*,*off+len*) are invalid for the object specified by *fildev*.

42490

42491

[ENXIO] `MAP_FIXED` was specified in *flags* and the combination of *addr*, *len*, and *off* is invalid for the object specified by *fildev*.

42492 TYM

[ENXIO] The *fildev* argument refers to a typed memory object that is not accessible from the calling process.

42493

42494

42495

[EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset maximum established in the open file description associated with *fildev*.

42496

The *mmap()* function may fail if:

42497

42498

42499

[EINVAL] The *addr* argument (if `MAP_FIXED` was specified) or *off* is not a multiple of the page size as returned by *sysconf()*, or is considered invalid by the implementation.

EXAMPLES

None.

APPLICATION USAGE

Use of *mmap()* may reduce the amount of memory available to other memory allocation functions.

Use of *MAP_FIXED* may result in unspecified behavior in further use of *malloc()* and *shmat()*. The use of *MAP_FIXED* is discouraged, as it may prevent an implementation from making the most effective use of resources. Most implementations require that *off* and *addr* are multiples of the page size as returned by *sysconf()*.

The application must ensure correct synchronization when using *mmap()* in conjunction with any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

The *mmap()* function allows access to resources via address space manipulations, instead of *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the address to which the file was mapped. So, using pseudo-code to illustrate the way in which an existing program might be changed to use *mmap()*, the following:

```
fildes = open(...)
lseek(fildes, some_offset)
read(fildes, buf, len)
/* Use data in buf. */
```

becomes:

```
fildes = open(...)
address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
/* Use data at address. */
```

RATIONALE

After considering several other alternatives, it was decided to adopt the *mmap()* definition found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is minimal, in that it describes only what has been built, and what appears to be necessary for a general and portable mapping facility.

Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose mapping facility. It can be used to map any appropriate object, such as memory, files, devices, and so on, into the address space of a process.

When a mapping is established, it is possible that the implementation may need to map more than is requested into the address space of the process because of hardware requirements. An application, however, cannot count on this behavior. Implementations that do not use a paged architecture may simply allocate a common memory region and return the address of it; such implementations probably do not allocate any more than is necessary. References past the end of the requested area are unspecified.

If an application requests a mapping that would overlay existing mappings in the process, it might be desirable that an implementation detect this and inform the application. However, the default, portable (not *MAP_FIXED*) operation does not overlay existing mappings. On the other hand, if the program specifies a fixed address mapping (which requires some implementation knowledge to determine a suitable address, if the function is supported at all), then the program is presumed to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()* to the same address range. This volume of POSIX.1-200x specifies that the new mappings replace any existing mappings, following existing practice in this regard.

It is not expected that all hardware implementations are able to support all combinations of

42548 permissions at all addresses. Implementations are required to disallow write access to mappings
 42549 without write permission and to disallow access to mappings without any access permission.
 42550 Other than these restrictions, implementations may allow access types other than those
 42551 requested by the application. For example, if the application requests only PROT_WRITE, the
 42552 implementation may also allow read access. A call to *mmap()* fails if the implementation cannot
 42553 support allowing all the access requested by the application. For example, some
 42554 implementations cannot support a request for both write access and execute access
 42555 simultaneously. All implementations must support requests for no access, read access, write
 42556 access, and both read and write access. Strictly conforming code must only rely on the required
 42557 checks. These restrictions allow for portability across a wide range of hardware.

42558 The MAP_FIXED address treatment is likely to fail for non-page-aligned values and for certain
 42559 architecture-dependent address ranges. Conforming implementations cannot count on being
 42560 able to choose address values for MAP_FIXED without utilizing non-portable, implementation-
 42561 defined knowledge. Nonetheless, MAP_FIXED is provided as a standard interface conforming
 42562 to existing practice for utilizing such knowledge when it is available.

42563 Similarly, in order to allow implementations that do not support virtual addresses, support for
 42564 directly specifying any mapping addresses via MAP_FIXED is not required and thus a
 42565 conforming application may not count on it.

42566 The MAP_PRIVATE function can be implemented efficiently when memory protection hardware
 42567 is available. When such hardware is not available, implementations can implement such
 42568 “mappings” by simply making a real copy of the relevant data into process private memory,
 42569 though this tends to behave similarly to *read()*.

42570 The function has been defined to allow for many different models of using shared memory.
 42571 However, all uses are not equally portable across all machine architectures. In particular, the
 42572 *mmap()* function allows the system as well as the application to specify the address at which to
 42573 map a specific region of a memory object. The most portable way to use the function is always to
 42574 let the system choose the address, specifying NULL as the value for the argument *addr* and not
 42575 to specify MAP_FIXED.

42576 If it is intended that a particular region of a memory object be mapped at the same address in a
 42577 group of processes (on machines where this is even possible), then MAP_FIXED can be used to
 42578 pass in the desired mapping address. The system can still be used to choose the desired address
 42579 if the first such mapping is made without specifying MAP_FIXED, and then the resulting
 42580 mapping address can be passed to subsequent processes for them to pass in via MAP_FIXED.
 42581 The availability of a specific address range cannot be guaranteed, in general.

42582 The *mmap()* function can be used to map a region of memory that is larger than the current size
 42583 of the object. Memory access within the mapping but beyond the current end of the underlying
 42584 objects may result in SIGBUS signals being sent to the process. The reason for this is that the size
 42585 of the object can be manipulated by other processes and can change at any moment. The
 42586 implementation should tell the application that a memory reference is outside the object where
 42587 this can be detected; otherwise, written data may be lost and read data may not reflect actual
 42588 data in the object.

42589 Note that references beyond the end of the object do not extend the object as the new end cannot
 42590 be determined precisely by most virtual memory hardware. Instead, the size can be directly
 42591 manipulated by *ftruncate()*.

42592 Process memory locking does apply to shared memory regions, and the MEMLOCK_FUTURE
 42593 argument to *mlockall()* can be relied upon to cause new shared memory regions to be
 42594 automatically locked.

42595 Existing implementations of *mmap()* return the value `-1` when unsuccessful. Since the casting of
 42596 this value to type `void *` cannot be guaranteed by the ISO C standard to be distinct from a
 42597 successful value, this volume of POSIX.1-200x defines the symbol MAP_FAILED, which a

42598 conforming implementation does not return as the result of a successful call.

42599 **FUTURE DIRECTIONS**

42600 None.

42604 XBD <sys/mman.h>

42605 **CHANGE HISTORY**

42606 First released in Issue 4, Version 2.

42607 **Issue 5**

42608 Moved from X/OPEN UNIX extension to BASE.

42609 Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- 42610 • The DESCRIPTION is extensively reworded.
- 42611 • The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- 42612 • New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- 42613 • The value returned on failure is the value of the constant MAP_FAILED; this was
42614 previously defined as -1.

42615 Large File Summit extensions are added.

42616 **Issue 6**

42617 The *mmap()* function is marked as part of the Memory Mapped Files option.

42618 The Open Group Corrigendum U028/6 is applied, changing (void *)-1 to MAP_FAILED.

42619 The following new requirements on POSIX implementations derive from alignment with the
42620 Single UNIX Specification:

- 42621 • The DESCRIPTION is updated to describe the use of MAP_FIXED.
- 42622 • The DESCRIPTION is updated to describe the addition of an extra reference to the file
42623 associated with the file descriptor passed to *mmap()*.
- 42624 • The DESCRIPTION is updated to state that there may be implementation-defined limits on
42625 the number of memory regions that can be mapped.
- 42626 • The DESCRIPTION is updated to describe constraints on the alignment and size of the *off*
42627 argument.
- 42628 • The [EINVAL] and [EMFILE] error conditions are added.
- 42629 • The [EOVERFLOW] error condition is added. This change is to support large files.

42630 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 42631 • The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and
42632 MAP_FIXED need not be supported.

42633 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 42634 • Semantics for typed memory objects are added to the DESCRIPTION.
- 42635 • New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- 42636 • The *posix_typed_mem_open()* function is added to the SEE ALSO section.

42637 The normative text is updated to avoid use of the term “must” for application requirements.

mmap()

- 42638 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code
42639 in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).
- 42640 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/60 is applied, updating the
42641 DESCRIPTION and ERRORS sections to add the [EINVAL] error when *len* is zero.
- 42642 **Issue 7**
- 42643 Austin Group Interpretations 1003.1-2001 #078 and #079 are applied, clarifying page alignment
42644 requirements and adding a note about the state of synchronization objects becoming undefined
42645 when a shared region is unmapped.
- 42646 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to
42647 the Base.
- 42648 Changes are made related to support for finegrained timestamps. +

42649 **NAME**

42650 modf, modff, modfl — decompose a floating-point number

42651 **SYNOPSIS**

42652 #include <math.h>

42653 double modf(double *x*, double **iptr*);42654 float modff(float *value*, float **iptr*);42655 long double modfl(long double *value*, long double **iptr*);42656 **DESCRIPTION**42657 CX The functionality described on this reference page is aligned with the ISO C standard. Any
42658 conflict between the requirements described here and the ISO C standard is unintentional. This
42659 volume of POSIX.1-200x defers to the ISO C standard.42660 These functions shall break the argument *x* into integral and fractional parts, each of which has
42661 the same sign as the argument. It stores the integral part as a **double** (for the *modf()* function), a
42662 **float** (for the *modff()* function), or a **long double** (for the *modfl()* function), in the object pointed
42663 to by *iptr*.42664 **RETURN VALUE**42665 Upon successful completion, these functions shall return the signed fractional part of *x*.42666 MX If *x* is NaN, a NaN shall be returned, and **iptr* shall be set to a NaN.42667 If *x* is ±Inf, ±0 shall be returned, and **iptr* shall be set to ±Inf.42668 **ERRORS**

42669 No errors are defined.

42670 **EXAMPLES**

42671 None.

42672 **APPLICATION USAGE**42673 The *modf()* function computes the function result and **iptr* such that:

42674 a = modf(x, iptr) ;

42675 x == a+*iptr ;

42676 allowing for the usual floating-point inaccuracies.

42677 **RATIONALE**

42678 None.

42679 **FUTURE DIRECTIONS**

42680 None.

42684 **CHANGE HISTORY**

42685 First released in Issue 1. Derived from Issue 1 of the SVID.

42686 **Issue 5**42687 The DESCRIPTION is updated to indicate how an application should check for an error. This
42688 text was previously published in the APPLICATION USAGE section.

Issue 6

- 42689 The *modff()* and *modfl()* functions are added for alignment with the ISO/IEC 9899:1999
42690 standard.
42691
- 42692 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
42693 revised to align with the ISO/IEC 9899:1999 standard.
- 42694 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
42695 marked.
- 42696 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example
42697 in the APPLICATION USAGE section.

42698 **NAME**
 42699 `mprotect` — set protection of memory mapping

42700 **SYNOPSIS**
 42701 `#include <sys/mman.h>`

42702 `int mprotect(void *addr, size_t len, int prot);`

42703 **DESCRIPTION**

42704 The `mprotect()` function shall change the access protections to be that specified by `prot` for those
 42705 whole pages containing any part of the address space of the process starting at address `addr` and
 42706 continuing for `len` bytes. The parameter `prot` determines whether read, write, execute, or some
 42707 combination of accesses are permitted to the data being mapped. The `prot` argument should be
 42708 either `PROT_NONE` or the bitwise-inclusive OR of one or more of `PROT_READ`, `PROT_WRITE`,
 42709 and `PROT_EXEC`.

42710 If an implementation cannot support the combination of access types specified by `prot`, the call to
 42711 `mprotect()` shall fail.

42712 An implementation may permit accesses other than those specified by `prot`; however, no
 42713 implementation shall permit a write to succeed where `PROT_WRITE` has not been set or shall
 42714 permit any access where `PROT_NONE` alone has been set. Implementations shall support at
 42715 least the following values of `prot`: `PROT_NONE`, `PROT_READ`, `PROT_WRITE`, and the bitwise-
 42716 inclusive OR of `PROT_READ` and `PROT_WRITE`. If `PROT_WRITE` is specified, the application
 42717 shall ensure that it has opened the mapped objects in the specified address range with write
 42718 permission, unless `MAP_PRIVATE` was specified in the original mapping, regardless of whether
 42719 the file descriptors used to map the objects have since been closed.

42720 The implementation may require that `addr` be a multiple of the page size as returned by
 42721 `sysconf()`.

42722 The behavior of this function is unspecified if the mapping was not established by a call to
 42723 `mmap()`.

42724 When `mprotect()` fails for reasons other than `[EINVAL]`, the protections on some of the pages in
 42725 the range `[addr,addr+len)` may have been changed.

42726 **RETURN VALUE**

42727 Upon successful completion, `mprotect()` shall return 0; otherwise, it shall return `-1` and set `errno`
 42728 to indicate the error.

42729 **ERRORS**

42730 The `mprotect()` function shall fail if:

42731 `[EACCES]` The `prot` argument specifies a protection that violates the access permission the
 42732 process has to the underlying memory object.

42733 `[EAGAIN]` The `prot` argument specifies `PROT_WRITE` over a `MAP_PRIVATE` mapping
 42734 and there are insufficient memory resources to reserve for locking the private
 42735 page.

42736 `[ENOMEM]` Addresses in the range `[addr,addr+len)` are invalid for the address space of a
 42737 process, or specify one or more pages which are not mapped.

42738 `[ENOMEM]` The `prot` argument specifies `PROT_WRITE` on a `MAP_PRIVATE` mapping, and
 42739 it would require more space than the system is able to supply for locking the
 42740 private pages, if required.

mprotect()

42741 [ENOTSUP] The implementation does not support the combination of accesses requested
42742 in the *prot* argument.

42743 The *mprotect()* function may fail if:

42744 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

EXAMPLES

42745 None.
42746

APPLICATION USAGE

42747 Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.
42748

RATIONALE

42749 None.
42750

FUTURE DIRECTIONS

42751 None.
42752

CHANGE HISTORY

42756 First released in Issue 4, Version 2.
42757

Issue 5

42758 Moved from X/OPEN UNIX extension to BASE.
42759

42760 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 42761 • The DESCRIPTION is largely reworded.
- 42762 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 42763 • [EAGAIN] is moved from the optional to the mandatory error conditions.

Issue 6

42764 The *mprotect()* function is marked as part of the Memory Protection option.
42765

42766 The following new requirements on POSIX implementations derive from alignment with the
42767 Single UNIX Specification:

- 42768 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple
42769 of the page size as returned by *sysconf()*.
- 42770 • The [EINVAL] error condition is added.

42771 The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

42772 SD5-XSH-ERN-22 is applied, deleting erroneous APPLICATION USAGE.
42773

42774 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment
42775 requirements.

42776 The *mprotect()* function is moved from the Memory Protection option to the Base.

42777 **NAME**
 42778 `mq_close` — close a message queue (**REALTIME**)

42779 **SYNOPSIS**

42780 MSG `#include <mqqueue.h>`
 42781 `int mq_close(mqd_t mqdes);`

42782 **DESCRIPTION**

42783 The `mq_close()` function shall remove the association between the message queue descriptor,
 42784 `mqdes`, and its message queue. The results of using this message queue descriptor after successful
 42785 return from this `mq_close()`, and until the return of this message queue descriptor from a
 42786 subsequent `mq_open()`, are undefined.

42787 If the process has successfully attached a notification request to the message queue via this
 42788 `mqdes`, this attachment shall be removed, and the message queue is available for another process
 42789 to attach for notification.

42790 **RETURN VALUE**

42791 Upon successful completion, the `mq_close()` function shall return a value of zero; otherwise, the
 42792 function shall return a value of `-1` and set `errno` to indicate the error.

42793 **ERRORS**

42794 The `mq_close()` function shall fail if:

42795 [EBADF] The `mqdes` argument is not a valid message queue descriptor.

42796 **EXAMPLES**

42797 None.

42798 **APPLICATION USAGE**

42799 None.

42800 **RATIONALE**

42801 None.

42802 **FUTURE DIRECTIONS**

42803 None.

42807 **CHANGE HISTORY**

42808 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

42809 **Issue 6**

42810 The `mq_close()` function is marked as part of the Message Passing option.

42811 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 42812 implementation does not support the Message Passing option.

42813 **NAME**42814 `mq_getattr` — get message queue attributes (**REALTIME**)42815 **SYNOPSIS**

```
42816 MSG #include <mqueue.h>
42817 int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);
```

42818 **DESCRIPTION**42819 The `mq_getattr()` function shall obtain status information and attributes of the message queue
42820 and the open message queue description associated with the message queue descriptor.42821 The `mqdes` argument specifies a message queue descriptor.42822 The results shall be returned in the **mq_attr** structure referenced by the `mqstat` argument.42823 Upon return, the following members shall have the values associated with the open message
42824 queue description as set when the message queue was opened and as modified by subsequent
42825 `mq_setattr()` calls: `mq_flags`.42826 The following attributes of the message queue shall be returned as set at message queue
42827 creation: `mq_maxmsg`, `mq_msgsize`.42828 Upon return, the following members within the **mq_attr** structure referenced by the `mqstat`
42829 argument shall be set to the current state of the message queue:42830 `mq_curmsgs` The number of messages currently on the queue.42831 **RETURN VALUE**42832 Upon successful completion, the `mq_getattr()` function shall return zero. Otherwise, the function
42833 shall return `-1` and set `errno` to indicate the error.42834 **ERRORS**42835 The `mq_getattr()` function may fail if:42836 [EBADF] The `mqdes` argument is not a valid message queue descriptor.42837 **EXAMPLES**

42849 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

42850

Issue 6

42851

The `mq_getattr()` function is marked as part of the Message Passing option.

42852

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

42853

42854

The `mq_timedsend()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

42855

42856

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/61 is applied, updating the ERRORS section to change the [EBADF] error from mandatory to optional.

42857

42858 **NAME**42859 `mq_notify` — notify process that a message is available (**REALTIME**)42860 **SYNOPSIS**

```
42861 MSG #include <mqueue.h>
42862 int mq_notify(mqd_t mqdes, const struct sigevent *notification);
```

42863 **DESCRIPTION**

42864 If the argument *notification* is not NULL, this function shall register the calling process to be
 42865 notified of message arrival at an empty message queue associated with the specified message
 42866 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to
 42867 the process when the message queue transitions from empty to non-empty. At any time, only
 42868 one process may be registered for notification by a message queue. If the calling process or any
 42869 other process has already registered for notification of message arrival at the specified message
 42870 queue, subsequent attempts to register for that message queue shall fail.

42871 If *notification* is NULL and the process is currently registered for notification by the specified
 42872 message queue, the existing registration shall be removed.

42873 When the notification is sent to the registered process, its registration shall be removed. The
 42874 message queue shall then be available for registration.

42875 If a process has registered for notification of message arrival at a message queue and some
 42876 thread is blocked in *mq_receive()* or *mq_timedreceive()* waiting to receive a message when a
 42877 message arrives at the queue, the arriving message shall satisfy the appropriate *mq_receive()* or
 42878 *mq_timedreceive()*, respectively. The resulting behavior is as if the message queue remains empty,
 42879 and no notification shall be sent.

42880 **RETURN VALUE**

42881 Upon successful completion, the *mq_notify()* function shall return a value of zero; otherwise, the
 42882 function shall return a value of -1 and set *errno* to indicate the error.

42883 **ERRORS**

42884 The *mq_notify()* function shall fail if:

42885 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

42886 [EBUSY] A process is already registered for notification by the message queue.

42887 The *mq_notify()* function may fail if:

42888 [EINVAL] The *notification* argument is NULL and the process is currently not registered.

XBD <[mqqueue.h](#)>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *mq_notify()* function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

Issue 7

SD5-XSH-ERN-38 is applied, adding the *mq_timedreceive()* function to the DESCRIPTION.

Austin Group Interpretation 1003.1-2001 #032 is applied, adding the [EINVAL] error.

42911 **NAME**42912 mq_open — open a message queue (**REALTIME**)42913 **SYNOPSIS**

```
42914 MSG #include <mqueue.h>
42915 mqd_t mq_open(const char *name, int oflag, ...);
```

42916 **DESCRIPTION**

42917 The *mq_open()* function shall establish the connection between a process and a message queue
 42918 with a message queue descriptor. It shall create an open message queue description that refers to
 42919 the message queue, and a message queue descriptor that refers to that open message queue
 42920 description. The message queue descriptor is used by other functions to refer to that message
 42921 queue. The *name* argument points to a string naming a message queue. It is unspecified whether
 42922 the name appears in the file system and is visible to other functions that take pathnames as
 42923 arguments. The *name* argument conforms to the construction rules for a pathname, except that
 42924 the interpretation of slash characters other than the leading slash character in *name* is
 42925 implementation-defined, and that the length limits for the *name* argument are implementation-
 42926 defined and need not be the same as the pathname limits {PATH_MAX} and {NAME_MAX}. If
 42927 *name* begins with the slash character, then processes calling *mq_open()* with the same value of
 42928 *name* shall refer to the same message queue object, as long as that name has not been removed. If
 42929 *name* does not begin with the slash character, the effect is implementation-defined. If the *name*
 42930 argument is not the name of an existing message queue and creation is not requested, *mq_open()*
 42931 shall fail and return an error.

42932 A message queue descriptor may be implemented using a file descriptor, in which case
 42933 applications can open up to at least {OPEN_MAX} file and message queues.

42934 The *oflag* argument requests the desired receive and/or send access to the message queue. The
 42935 requested access permission to receive messages or send messages shall be granted if the calling
 42936 process would be granted read or write access, respectively, to an equivalently protected file.

42937 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications
 42938 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

42939 **O_RDONLY** Open the message queue for receiving messages. The process can use the
 42940 returned message queue descriptor with *mq_receive()*, but not *mq_send()*. A
 42941 message queue may be open multiple times in the same or different processes
 42942 for receiving messages.

42943 **O_WRONLY** Open the queue for sending messages. The process can use the returned
 42944 message queue descriptor with *mq_send()* but not *mq_receive()*. A message
 42945 queue may be open multiple times in the same or different processes for
 42946 sending messages.

42947 **O_RDWR** Open the queue for both receiving and sending messages. The process can use
 42948 any of the functions allowed for **O_RDONLY** and **O_WRONLY**. A message
 42949 queue may be open multiple times in the same or different processes for
 42950 sending messages.

42951 Any combination of the remaining flags may be specified in the value of *oflag*:

42952 **O_CREAT** Create a message queue. It requires two additional arguments: *mode*, which
 42953 shall be of type **mode_t**, and *attr*, which shall be a pointer to an **mq_attr**
 42954 structure. If the pathname *name* has already been used to create a message
 42955 queue that still exists, then this flag shall have no effect, except as noted under

42956 O_EXCL. Otherwise, a message queue shall be created without any messages
 42957 in it. The user ID of the message queue shall be set to the effective user ID of
 42958 the process. The group ID of the message queue shall be set to the effective
 42959 group ID of the process; however, if the *name* argument is visible in the file
 42960 system, the group ID may be set to the group ID of the containing directory.
 42961 When bits in *mode* other than the file permission bits are specified, the effect is
 42962 unspecified. If *attr* is NULL, the message queue shall be created with
 42963 implementation-defined default message queue attributes. If *attr* is non-NULL
 42964 and the calling process has the appropriate privilege on *name*, the message
 42965 queue *mq_maxmsg* and *mq_msgsize* attributes shall be set to the values of the
 42966 corresponding members in the **mq_attr** structure referred to by *attr*. If *attr* is
 42967 non-NULL, but the calling process does not have the appropriate privilege on
 42968 *name*, the *mq_open()* function shall fail and return an error without creating
 42969 the message queue.

42970 O_EXCL If O_EXCL and O_CREAT are set, *mq_open()* shall fail if the message queue
 42971 *name* exists. The check for the existence of the message queue and the creation
 42972 of the message queue if it does not exist shall be atomic with respect to other
 42973 threads executing *mq_open()* naming the same *name* with O_EXCL and
 42974 O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is
 42975 undefined.

42976 O_NONBLOCK Determines whether an *mq_send()* or *mq_receive()* waits for resources or
 42977 messages that are not currently available, or fails with *errno* set to [EAGAIN];
 42978 see *mq_send()* and *mq_receive()* for details.

42979 The *mq_open()* function does not add or remove messages from the queue.

42980 RETURN VALUE

42981 Upon successful completion, the function shall return a message queue descriptor; otherwise,
 42982 the function shall return (**mqd_t**)-1 and set *errno* to indicate the error.

42983 ERRORS

42984 The *mq_open()* function shall fail if:

42985 [EACCES] The message queue exists and the permissions specified by *oflag* are denied, or
 42986 the message queue does not exist and permission to create the message queue
 42987 is denied.

42988 [EEXIST] O_CREAT and O_EXCL are set and the named message queue already exists.

42989 [EINTR] The *mq_open()* function was interrupted by a signal.

42990 [EINVAL] The *mq_open()* function is not supported for the given name.

42991 [EINVAL] O_CREAT was specified in *oflag*, the value of *attr* is not NULL, and either
 42992 *mq_maxmsg* or *mq_msgsize* was less than or equal to zero.

42993 [EMFILE] Too many message queue descriptors or file descriptors are currently in use by
 42994 this process.

42995 [ENFILE] Too many message queues are currently open in the system.

42996 [ENOENT] O_CREAT is not set and the named message queue does not exist.

42997 [ENOSPC] There is insufficient space for the creation of the new message queue.

42998 If any of the following conditions occur, the *mq_open()* function may return (**mqd_t**)-1 and set
 42999 *errno* to the corresponding value.

mq_open()*System Interfaces*

43000 [ENAMETOOLONG]
 43001 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 43002 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 43003 systems, or has a pathname component that is longer than
 43004 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 43005 longer than {_XOPEN_NAME_MAX} on XSI systems.

XBD <[mqqueue.h](#)>**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6The *mq_open()* function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The *mq_timedreceive()* and *mq_timedsend()* functions are added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/62 is applied, updating the description of the permission bits in the DESCRIPTION. The change is made for consistency with the *shm_open()* and *sem_open()* functions.**Issue 7**Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the message queue.

43035 **NAME**43036 mq_receive, mq_timedreceive — receive a message from a message queue (**REALTIME**)43037 **SYNOPSIS**

```
43038 MSG #include <mqqueue.h>
43039
43039 ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
43040 unsigned *msg_prio);
43041
43041 #include <mqqueue.h>
43042 #include <time.h>
43043
43043 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
43044 size_t msg_len, unsigned *restrict msg_prio,
43045 const struct timespec *restrict abstime);
```

43046 **DESCRIPTION**

43047 The *mq_receive()* function shall receive the oldest of the highest priority message(s) from the
 43048 message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg_len*
 43049 argument, is less than the *mq_msgsize* attribute of the message queue, the function shall fail and
 43050 return an error. Otherwise, the selected message shall be removed from the queue and copied to
 43051 the buffer pointed to by the *msg_ptr* argument.

43052 If the value of *msg_len* is greater than {SSIZE_MAX}, the result is implementation-defined.

43053 If the argument *msg_prio* is not NULL, the priority of the selected message shall be stored in the
 43054 location referenced by *msg_prio*.

43055 If the specified message queue is empty and O_NONBLOCK is not set in the message queue
 43056 description associated with *mqdes*, *mq_receive()* shall block until a message is enqueued on the
 43057 message queue or until *mq_receive()* is interrupted by a signal. If more than one thread is waiting
 43058 to receive a message when a message arrives at an empty queue and the Priority Scheduling
 43059 option is supported, then the thread of highest priority that has been waiting the longest shall be
 43060 selected to receive the message. Otherwise, it is unspecified which waiting thread receives the
 43061 message. If the specified message queue is empty and O_NONBLOCK is set in the message
 43062 queue description associated with *mqdes*, no message shall be removed from the queue, and
 43063 *mq_receive()* shall return an error.

43064 The *mq_timedreceive()* function shall receive the oldest of the highest priority messages from the
 43065 message queue specified by *mqdes* as described for the *mq_receive()* function. However, if
 43066 O_NONBLOCK was not specified when the message queue was opened via the *mq_open()*
 43067 function, and no message exists on the queue to satisfy the receive, the wait for such a message
 43068 shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is
 43069 equivalent to *mq_receive()*.

43070 The timeout expires when the absolute time specified by *abstime* passes, as measured by the
 43071 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 43072 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
 43073 call.

43074 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
 43075 be the resolution of the clock on which it is based. The *timespec* argument is defined in the
 43076 **<time.h>** header.

43077 Under no circumstance shall the operation fail with a timeout if a message can be removed from
 43078 the message queue immediately. The validity of the *abstime* parameter need not be checked if a
 43079 message can be removed from the message queue immediately.

mq_receive()

System Interfaces

43080 **RETURN VALUE**

43081 Upon successful completion, the *mq_receive()* and *mq_timedreceive()* functions shall return the
 43082 length of the selected message in bytes and the message shall be removed from the queue.
 43083 Otherwise, no message shall be removed from the queue, the functions shall return a value of -1 ,
 43084 and set *errno* to indicate the error.

43085 **ERRORS**

43086 The *mq_receive()* and *mq_timedreceive()* functions shall fail if:

- 43087 [EAGAIN] O_NONBLOCK was set in the message description associated with *mqdes*, and
 43088 the specified message queue is empty.
- 43089 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.
- 43090 [EMSGSIZE] The specified message buffer size, *msg_len*, is less than the message size
 43091 attribute of the message queue.
- 43092 [EINTR] The *mq_receive()* or *mq_timedreceive()* operation was interrupted by a signal.
- 43093 [EINVAL] The process or thread would have blocked, and the *abstime* parameter
 43094 specified a nanoseconds field value less than zero or greater than or equal to
 43095 1 000 million.
- 43096 [ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened,
 43097 but no message arrived on the queue before the specified timeout expired.

43098 The *mq_receive()* and *mq_timedreceive()* functions may fail if:

- 43099 [EBADMSG] The implementation has detected a data corruption problem with the
 43100 message.

43112 **CHANGE HISTORY**

43113 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43114 **Issue 6**

43115 The *mq_receive()* function is marked as part of the Message Passing option.

43116 The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to
 43117 *msg_len* rather than *maxsize*.

43118 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 43119 implementation does not support the Message Passing option.

43120 The following new requirements on POSIX implementations derive from alignment with the
 43121 Single UNIX Specification:

- 43122
- 43123
- 43124
- In this function it is possible for the return value to exceed the range of the type `ssize_t` (since `size_t` has a larger range of positive values than `ssize_t`). A sentence restricting the size of the `size_t` object is added to the description to resolve this conflict.

43125 The `mq_timedreceive()` function is added for alignment with IEEE Std 1003.1d-1999.

43126 The `restrict` keyword is added to the `mq_timedreceive()` prototype for alignment with the
43127 ISO/IEC 9899:1999 standard.

43128 IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for `mq_timedreceive()`
43129 from `int` to `ssize_t`.

Issue 7

43130 The `mq_timedreceive()` function is moved from the Timeouts option to the Base.

43132 Functionality relating to the Timers option is moved to the Base.

43133 **NAME**43134 `mq_send`, `mq_timedsend` — send a message to a message queue (**REALTIME**)43135 **SYNOPSIS**

```

43136 MSG #include <mqqueue.h>
43137
43137 int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
43138             unsigned msg_prio);
43139
43139 #include <mqqueue.h>
43140 #include <time.h>
43141
43141 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
43142                 unsigned msg_prio, const struct timespec *abstime);

```

43143 **DESCRIPTION**

43144 The `mq_send()` function shall add the message pointed to by the argument `msg_ptr` to the
 43145 message queue specified by `mqdes`. The `msg_len` argument specifies the length of the message, in
 43146 bytes, pointed to by `msg_ptr`. The value of `msg_len` shall be less than or equal to the `mq_msgsize`
 43147 attribute of the message queue, or `mq_send()` shall fail.

43148 If the specified message queue is not full, `mq_send()` shall behave as if the message is inserted
 43149 into the message queue at the position indicated by the `msg_prio` argument. A message with a
 43150 larger numeric value of `msg_prio` shall be inserted before messages with lower values of
 43151 `msg_prio`. A message shall be inserted after other messages in the queue, if any, with equal
 43152 `msg_prio`. The value of `msg_prio` shall be less than {MQ_PRIO_MAX}.

43153 If the specified message queue is full and `O_NONBLOCK` is not set in the message queue
 43154 description associated with `mqdes`, `mq_send()` shall block until space becomes available to
 43155 enqueue the message, or until `mq_send()` is interrupted by a signal. If more than one thread is
 43156 waiting to send when space becomes available in the message queue and the Priority Scheduling
 43157 option is supported, then the thread of the highest priority that has been waiting the longest
 43158 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is
 43159 unblocked. If the specified message queue is full and `O_NONBLOCK` is set in the message
 43160 queue description associated with `mqdes`, the message shall not be queued and `mq_send()` shall
 43161 return an error.

43162 The `mq_timedsend()` function shall add a message to the message queue specified by `mqdes` in the
 43163 manner defined for the `mq_send()` function. However, if the specified message queue is full and
 43164 `O_NONBLOCK` is not set in the message queue description associated with `mqdes`, the wait for
 43165 sufficient room in the queue shall be terminated when the specified timeout expires. If
 43166 `O_NONBLOCK` is set in the message queue description, this function shall be equivalent to
 43167 `mq_send()`.

43168 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the
 43169 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 43170 `abstime`), or if the absolute time specified by `abstime` has already been passed at the time of the
 43171 call.

43172 The timeout shall be based on the `CLOCK_REALTIME` clock. The resolution of the timeout shall
 43173 be the resolution of the clock on which it is based. The `timespec` argument is defined in the
 43174 `<time.h>` header.

43175 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the
 43176 queue to add the message immediately. The validity of the `abstime` parameter need not be
 43177 checked when there is sufficient room in the queue.

43178 **RETURN VALUE**

43179 Upon successful completion, the `mq_send()` and `mq_timedsend()` functions shall return a value of
 43180 zero. Otherwise, no message shall be enqueued, the functions shall return `-1`, and `errno` shall be
 43181 set to indicate the error.

43182 **ERRORS**

43183 The `mq_send()` and `mq_timedsend()` functions shall fail if:

- 43184 [EAGAIN] The `O_NONBLOCK` flag is set in the message queue description associated
 43185 with `mqdes`, and the specified message queue is full.
- 43186 [EBADF] The `mqdes` argument is not a valid message queue descriptor open for writing.
- 43187 [EINTR] A signal interrupted the call to `mq_send()` or `mq_timedsend()`.
- 43188 [EINVAL] The value of `msg_prio` was outside the valid range.
- 43189 [EINVAL] The process or thread would have blocked, and the `abstime` parameter
 43190 specified a nanoseconds field value less than zero or greater than or equal to
 43191 1 000 million.
- 43192 [EMSGSIZE] The specified message length, `msg_len`, exceeds the message size attribute of
 43193 the message queue.
- 43194 [ETIMEDOUT] The `O_NONBLOCK` flag was not set when the message queue was opened,
 43195 but the timeout expired before the message could be added to the queue.

43196 **EXAMPLES**

43197 None.

43198 **APPLICATION USAGE**

43199 The value of the symbol `{MQ_PRIO_MAX}` limits the number of priority levels supported by the
 43200 application. Message priorities range from 0 to `{MQ_PRIO_MAX}-1`.

43201 **RATIONALE**

43202 None.

43203 **FUTURE DIRECTIONS**

43204 None.

43208 **CHANGE HISTORY**

43209 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43210 **Issue 6**

43211 The `mq_send()` function is marked as part of the Message Passing option.

43212 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an
 43213 implementation does not support the Message Passing option.

43214 The `mq_timedsend()` function is added for alignment with IEEE Std 1003.1d-1999.

43215 **Issue 7**

43216 The `mq_timedsend()` function is moved from the Timeouts option to the Base.

43217 Functionality relating to the Timers option is moved to the Base.

43218 **NAME**43219 `mq_setattr` — set message queue attributes (**REALTIME**)43220 **SYNOPSIS**

```
43221 MSG #include <mqqueue.h>
43222 int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
43223               struct mq_attr *restrict omqstat);
```

43224 **DESCRIPTION**43225 The `mq_setattr()` function shall set attributes associated with the open message queue
43226 description referenced by the message queue descriptor specified by `mqdes`.43227 The message queue attributes corresponding to the following members defined in the **mq_attr**
43228 structure shall be set to the specified values upon successful completion of `mq_setattr()`:43229 `mq_flags` The value of this member is the bitwise-logical OR of zero or more of
43230 `O_NONBLOCK` and any implementation-defined flags.43231 The values of the `mq_maxmsg`, `mq_msgsize`, and `mq_curmsgs` members of the **mq_attr** structure
43232 shall be ignored by `mq_setattr()`.43233 If `omqstat` is non-NULL, the `mq_setattr()` function shall store, in the location referenced by
43234 `omqstat`, the previous message queue attributes and the current queue status. These values shall
43235 be the same as would be returned by a call to `mq_getattr()` at that point.43236 **RETURN VALUE**43237 Upon successful completion, the function shall return a value of zero and the attributes of the
43238 message queue shall have been changed as specified.43239 Otherwise, the message queue attributes shall be unchanged, and the function shall return a
43240 value of `-1` and set `errno` to indicate the error.43241 **ERRORS**43242 The `mq_setattr()` function shall fail if:43243 [EBADF] The `mqdes` argument is not a valid message queue descriptor.43244 **EXAMPLES**

43256 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

43257

Issue 6

43258

The *mq_setattr()* function is marked as part of the Message Passing option.

43259

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

43260

43261

The *mq_timedsend()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

43262

43263

The **restrict** keyword is added to the *mq_setattr()* prototype for alignment with the ISO/IEC 9899:1999 standard.

43264

43265 **NAME**43266 mq_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)43267 **SYNOPSIS**

```
43268 MSG #include <mqueue.h>  
43269 #include <time.h>  
  
43270 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,  
43271 size_t msg_len, unsigned *restrict msg_prio,  
43272 const struct timespec *restrict abstime);
```

43273 **DESCRIPTION**43274 Refer to *mq_receive()*.

43275 **NAME**43276 mq_timedsend — send a message to a message queue (**ADVANCED REALTIME**)43277 **SYNOPSIS**

```
43278 MSG #include <mqueue.h>  
43279 #include <time.h>  
  
43280 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,  
43281 unsigned msg_prio, const struct timespec *abstime);
```

43282 **DESCRIPTION**43283 Refer to [mq_send\(\)](#).

43284 **NAME**
 43285 `mq_unlink` — remove a message queue (**REALTIME**)

43286 **SYNOPSIS**

43287 MSG `#include <mqeue.h>`
 43288 `int mq_unlink(const char *name);`

43289 **DESCRIPTION**

43290 The `mq_unlink()` function shall remove the message queue named by the pathname *name*. After
 43291 a successful call to `mq_unlink()` with *name*, a call to `mq_open()` with *name* shall fail if the flag
 43292 `O_CREAT` is not set in *flags*. If one or more processes have the message queue open when
 43293 `mq_unlink()` is called, destruction of the message queue shall be postponed until all references to
 43294 the message queue have been closed.

43295 Calls to `mq_open()` to recreate the message queue may fail until the message queue is actually
 43296 removed. However, the `mq_unlink()` call need not block until all references have been closed; it
 43297 may return immediately.

43298 **RETURN VALUE**

43299 Upon successful completion, the function shall return a value of zero. Otherwise, the named
 43300 message queue shall be unchanged by this function call, and the function shall return a value of
 43301 `-1` and set *errno* to indicate the error.

43302 **ERRORS**

43303 The `mq_unlink()` function shall fail if:

43304 `[EACCES]` Permission is denied to unlink the named message queue.

43305 `[ENOENT]` The named message queue does not exist.

43306 The `mq_unlink()` function may fail if:

43307 `[ENAMETOOLONG]`

43308 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems
 43309 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI
 43310 systems, or has a pathname component that is longer than
 43311 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or
 43312 longer than `{_XOPEN_NAME_MAX}` on XSI systems. A call to `mq_unlink()`
 43313 with a *name* argument that contains the same message queue name as was
 43314 previously used in a successful `mq_open()` call shall not give an
 43315 `[ENAMETOOLONG]` error.

43316 **EXAMPLES**

43317 None.

43318 **APPLICATION USAGE**

43319 None.

43320 **RATIONALE**

rand48()

43338 **NAME**
43339 `rand48` — generate uniformly distributed pseudo-random signed long integers

SYNOPSIS

43340 XSI `#include <stdlib.h>`
43341
43342 `long rand48(void);`

DESCRIPTION

43343 Refer to *drand48()*.
43344

43345 **NAME**
 43346 msgctl — XSI message control operations

43347 SYNOPSIS

```
43348 XSI #include <sys/msg.h>
43349 int msgctl(int msqid, int cmd, struct msqid_ds *buf);
```

43350 DESCRIPTION

43351 The *msgctl()* function operates on XSI message queues (see XBD [Section 3.223](#), on page 64). It is
 43352 unspecified whether this function interoperates with the realtime interprocess communication
 43353 facilities defined in [Section 2.8](#) (on page 476).

43354 The *msgctl()* function shall provide message control operations as specified by *cmd*. The
 43355 following values for *cmd*, and the message control operations they specify, are:

43356 **IPC_STAT** Place the current value of each member of the **msqid_ds** data structure
 43357 associated with *msqid* into the structure pointed to by *buf*. The contents of this
 43358 structure are defined in **<sys/msg.h>**.

43359 **IPC_SET** Set the value of the following members of the **msqid_ds** data structure
 43360 associated with *msqid* to the corresponding value found in the structure
 43361 pointed to by *buf*:

```
43362 msg_perm.uid
43363 msg_perm.gid
43364 msg_perm.mode
43365 msg_qbytes
```

43366 **IPC_SET** can only be executed by a process with appropriate privileges or that
 43367 has an effective user ID equal to the value of **msg_perm.cuid** or
 43368 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*. Only a
 43369 process with appropriate privileges can raise the value of **msg_qbytes**.

43370 **IPC_RMID** Remove the message queue identifier specified by *msqid* from the system and
 43371 destroy the message queue and **msqid_ds** data structure associated with it.
 43372 **IPC_RMID** can only be executed by a process with appropriate privileges or
 43373 one that has an effective user ID equal to the value of **msg_perm.cuid** or
 43374 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*.

43375 RETURN VALUE

43376 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to
 43377 indicate the error.

43378 ERRORS

43379 The *msgctl()* function shall fail if:

43380 **[EACCES]** The argument *cmd* is **IPC_STAT** and the calling process does not have read
 43381 permission; see [Section 2.7](#) (on page 474).

43382 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*
 43383 is not a valid command.

43384 **[EPERM]** The argument *cmd* is **IPC_RMID** or **IPC_SET** and the effective user ID of the
 43385 calling process is not equal to that of a process with appropriate privileges and
 43386 it is not equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the data
 43387 structure associated with *msqid*.

43388 [EPERM] The argument *cmd* is IPC_SET, an attempt is being made to increase to the
 43389 value of **msg_qbytes**, and the effective user ID of the calling process does not
 43390 have appropriate privileges.

43391 **EXAMPLES**

43392 None.

43393 **APPLICATION USAGE**

43394 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
 43395 (IPC). Application developers who need to use IPC should design their applications so that
 43396 modules using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to
 43397 use the alternative interfaces.

43398 **RATIONALE**

43399 None.

43400 **FUTURE DIRECTIONS**

43401 None.

43402 **SEE ALSO**

43403 [Section 2.7](#) (on page 474), [Section 2.8](#) (on page 476), [mq_close\(\)](#), [mq_getattr\(\)](#), [mq_notify\(\)](#),
 43404 [mq_open\(\)](#), [mq_receive\(\)](#), [mq_send\(\)](#), [mq_setattr\(\)](#), [mq_unlink\(\)](#), [msgget\(\)](#), [msgrcv\(\)](#), [msgsnd\(\)](#)

43405 XBD [Section 3.223](#) (on page 64), [<sys/msg.h>](#)

43406 **CHANGE HISTORY**

43407 First released in Issue 2. Derived from Issue 2 of the SVID.

43408 **Issue 5**

43409 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
 43410 DIRECTIONS to a new APPLICATION USAGE section.

43411 **NAME**

43412 msgget — get the XSI message queue identifier

43413 **SYNOPSIS**

```
43414 XSI #include <sys/msg.h>
43415 int msgget(key_t key, int msgflg);
```

43416 **DESCRIPTION**

43417 The `msgget()` function operates on XSI message queues (see XBD Section 3.223, on page 64). It is
 43418 unspecified whether this function interoperates with the realtime interprocess communication
 43419 facilities defined in Section 2.8 (on page 476).

43420 The `msgget()` function shall return the message queue identifier associated with the argument
 43421 `key`.

43422 A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`),
 43423 shall be created for the argument `key` if one of the following is true:

- 43424 • The argument `key` is equal to `IPC_PRIVATE`.
- 43425 • The argument `key` does not already have a message queue identifier associated with it, and
 43426 (`msgflg & IPC_CREAT`) is non-zero.

43427 Upon creation, the data structure associated with the new message queue identifier shall be
 43428 initialized as follows:

- 43429 • `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set equal to
 43430 the effective user ID and effective group ID, respectively, of the calling process.
- 43431 • The low-order 9 bits of `msg_perm.mode` shall be set equal to the low-order 9 bits of `msgflg`.
- 43432 • `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set equal to 0.
- 43433 • `msg_ctime` shall be set equal to the current time.
- 43434 • `msg_qbytes` shall be set equal to the system limit.

43435 **RETURN VALUE**

43436 Upon successful completion, `msgget()` shall return a non-negative integer, namely a message
 43437 queue identifier. Otherwise, it shall return `-1` and set `errno` to indicate the error.

43438 **ERRORS**

43439 The `msgget()` function shall fail if:

- | | | |
|-------|----------|---|
| 43440 | [EACCES] | A message queue identifier exists for the argument <code>key</code> , but operation permission as specified by the low-order 9 bits of <code>msgflg</code> would not be granted; see Section 2.7 (on page 474). |
| 43443 | [EEXIST] | A message queue identifier exists for the argument <code>key</code> but $((msgflg \& IPC_CREAT) \&\& (msgflg \& IPC_EXCL))$ is non-zero. |
| 43445 | [ENOENT] | A message queue identifier does not exist for the argument <code>key</code> and $(msgflg \& IPC_CREAT)$ is 0. |
| 43447 | [ENOSPC] | A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded. |

Issue 5

43468

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

43469

NAME

msgrcv — XSI message receive operation

SYNOPSIS

```
XSI #include <sys/msg.h>
    ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
        int msgflg);
```

DESCRIPTION

The *msgrcv()* function operates on XSI message queues (see XBD Section 3.223, on page 64). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 476).

The *msgrcv()* function shall read a message from the queue associated with the message queue identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

The application shall ensure that the argument *msgp* points to a user-defined buffer that contains first a field of type **long** specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long    mtype;    /* Message type. */
    char    mtext[1]; /* Message text. */
}
```

The structure member *mtype* is the received message's type as specified by the sending process.

The structure member *mtext* is the text of the message.

The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG_NOERROR) is non-zero. The truncated part of the message shall be lost and no indication of the truncation shall be given to the calling process.

If the value of *msgsz* is greater than {SSIZE_MAX}, the result is implementation-defined.

The argument *msgtyp* specifies the type of message requested as follows:

- If *msgtyp* is 0, the first message on the queue shall be received.
- If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the absolute value of *msgtyp* shall be received.

The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the queue. These are as follows:

- If (*msgflg* & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a return value of -1 and *errno* set to [ENOMSG].
- If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:

— A message of the desired type is placed on the queue.

- 43509 — The message queue identifier *msqid* is removed from the system; when this occurs,
43510 *errno* shall be set equal to [EIDRM] and -1 shall be returned.
- 43511 — The calling thread receives a signal that is to be caught; in this case a message is not
43512 received and the calling thread resumes execution in the manner prescribed in
43513 *sigaction()*.

43514 Upon successful completion, the following actions are taken with respect to the data structure
43515 associated with *msqid*:

- 43516 • **msg_qnum** shall be decremented by 1.
- 43517 • **msg_lrpid** shall be set equal to the process ID of the calling process.
- 43518 • **msg_rtime** shall be set equal to the current time.

43519 RETURN VALUE

43520 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually
43521 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return
43522 (**ssize_t**)-1, and *errno* shall be set to indicate the error.

43523 ERRORS

43524 The *msgrcv()* function shall fail if:

- | | | |
|-------|----------|--|
| 43525 | [E2BIG] | The value of <i>mtext</i> is greater than <i>msgsz</i> and (<i>msgflg</i> & MSG_NOERROR) is 0. |
| 43526 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page
43527 474). |
| 43528 | [EIDRM] | The message queue identifier <i>msqid</i> is removed from the system. |
| 43529 | [EINTR] | The <i>msgrcv()</i> function was interrupted by a signal. |
| 43530 | [EINVAL] | <i>msqid</i> is not a valid message queue identifier. |
| 43531 | [ENOMSG] | The queue does not contain a message of the desired type and (<i>msgflg</i> &
43532 IPC_NOWAIT) is non-zero. |

43533 EXAMPLES

43534 Receiving a Message

43535 The following example receives the first message on the queue (based on the value of the *msgtyp*
43536 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has
43537 previously been set). This call specifies that an error should be reported if no message is
43538 available, but not if the message is too large. The message size is calculated directly using the
43539 *sizeof* operator.

```
43540 #include <sys/msg.h>
43541 ...
43542 int result;
43543 int msqid;
43544 struct message {
43545     long type;
43546     char text[20];
43547 } msg;
43548 long msgtyp = 0;
43549 ...
43550 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
43551               msgtyp, MSG_NOERROR | IPC_NOWAIT);
```

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The type of the return value is changed from **int** to **ssize_t**, and a warning is added to the DESCRIPTION about values of *msgsz* larger than {SSIZE_MAX}.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

43575 **NAME**
 43576 msgsnd — XSI message send operation

43577 **SYNOPSIS**

```
43578 XSI #include <sys/msg.h>
43579 int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);
```

43580 **DESCRIPTION**

43581 The *msgsnd()* function operates on XSI message queues (see XBD Section 3.223, on page 64). It is
 43582 unspecified whether this function interoperates with the realtime interprocess communication
 43583 facilities defined in Section 2.8 (on page 476).

43584 The *msgsnd()* function shall send a message to the queue associated with the message queue
 43585 identifier specified by *msqid*.

43586 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains
 43587 first a field of type **long** specifying the type of the message, and then a data portion that holds
 43588 the data bytes of the message. The structure below is an example of what this user-defined
 43589 buffer might look like:

```
43590 struct mymsg {
43591     long   mtype;           /* Message type. */
43592     char   mtext[1];       /* Message text. */
43593 }
```

43594 The structure member *mtype* is a non-zero positive type **long** that can be used by the receiving
 43595 process for message selection.

43596 The structure member *mtext* is any text of length *msgsz* bytes. The argument *msgsz* can range
 43597 from 0 to a system-imposed maximum.

43598 The argument *msgflg* specifies the action to be taken if one or more of the following is true:

- 43599 • The number of bytes already on the queue is equal to **msg_qbytes**; see `<sys/msg.h>`.
- 43600 • The total number of messages on all queues system-wide is equal to the system-imposed
 43601 limit.

43602 These actions are as follows:

- 43603 • If (*msgflg* & IPC_NOWAIT) is non-zero, the message shall not be sent and the calling
 43604 thread shall return immediately.
- 43605 • If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the
 43606 following occurs:
 - 43607 — The condition responsible for the suspension no longer exists, in which case the
 43608 message is sent.
 - 43609 — The message queue identifier *msqid* is removed from the system; when this occurs,
 43610 *errno* shall be set equal to [EIDRM] and `-1` shall be returned.
 - 43611 — The calling thread receives a signal that is to be caught; in this case the message is not
 43612 sent and the calling thread resumes execution in the manner prescribed in *sigaction()*.

43613 Upon successful completion, the following actions are taken with respect to the data structure
43614 associated with *msqid*; see `<sys/msg.h>`:

- 43615 • `msg_qnum` shall be incremented by 1.
- 43616 • `msg_lspid` shall be set equal to the process ID of the calling process.
- 43617 • `msg_stime` shall be set equal to the current time.

43618 RETURN VALUE

43619 Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent,
43620 *msgsnd()* shall return `-1`, and *errno* shall be set to indicate the error.

43621 ERRORS

43622 The *msgsnd()* function shall fail if:

- | | | |
|-------|----------|---|
| 43623 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page 474). |
| 43625 | [EAGAIN] | The message cannot be sent for one of the reasons cited above and (<i>msgflg</i> & <code>IPC_NOWAIT</code>) is non-zero. |
| 43627 | [EIDRM] | The message queue identifier <i>msqid</i> is removed from the system. |
| 43628 | [EINTR] | The <i>msgsnd()</i> function was interrupted by a signal. |
| 43629 | [EINVAL] | The value of <i>msqid</i> is not a valid message queue identifier, or the value of <i>mtype</i> is less than 1; or the value of <i>msgsz</i> is less than 0 or greater than the system-imposed limit. |

43632 EXAMPLES

43633 Sending a Message

43634 The following example sends a message to the queue identified by the *msqid* argument
43635 (assuming that value has previously been set). This call specifies that an error should be
43636 reported if no message is available. The message size is calculated directly using the *sizeof*
43637 operator.

```
43638 #include <sys/msg.h>
43639 ...
43640 int result;
43641 int msqid;
43642 struct message {
43643     long type;
43644     char text[20];
43645 } msg;
43646
43647 msg.type = 1;
43648 strcpy(msg.text, "This is message 1");
43649 ...
43650 result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

43650 APPLICATION USAGE

43651 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
43652 (IPC). Application developers who need to use IPC should design their applications so that
43653 modules using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to
43654 use the alternative interfaces.

CHANGE HISTORY

43665

First released in Issue 2. Derived from Issue 2 of the SVID.

43666

Issue 5

43667

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

43668

43669

Issue 6

43670

The normative text is updated to avoid use of the term “must” for application requirements.

43671 **NAME**
 43672 `msync` — synchronize memory with physical storage

43673 **SYNOPSIS**

```
43674 XSI|SIO #include <sys/mman.h>
43675 int msync(void *addr, size_t len, int flags);
```

43676 **DESCRIPTION**

43677 The `msync()` function shall write all modified data to permanent storage locations, if any, in
 43678 those whole pages containing any part of the address space of the process starting at address
 43679 `addr` and continuing for `len` bytes. If no such storage exists, `msync()` need not have any effect. If
 43680 requested, the `msync()` function shall then invalidate cached copies of data.

43681 The implementation may require that `addr` be a multiple of the page size as returned by
 43682 `sysconf()`.

43683 For mappings to files, the `msync()` function shall ensure that all write operations are completed
 43684 as defined for synchronized I/O data integrity completion. It is unspecified whether the
 43685 implementation also writes out other file attributes. When the `msync()` function is called on
 43686 MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and
 43687 shall not cause such data to be made visible to other processes. It is unspecified whether data in
 43688 SHM|TYM MAP_PRIVATE mappings has any permanent storage locations. The effect of `msync()` on a
 43689 shared memory object or a typed memory object is unspecified. The behavior of this function is
 43690 unspecified if the mapping was not established by a call to `mmap()`.

43691 The `flags` argument is constructed from the bitwise-inclusive OR of one or more of the following
 43692 flags defined in the `<sys/mman.h>` header:

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

43697 When MS_ASYNC is specified, `msync()` shall return immediately once all the write operations
 43698 are initiated or queued for servicing; when MS_SYNC is specified, `msync()` shall not return until
 43699 all write operations are completed as defined for synchronized I/O data integrity completion.
 43700 Either MS_ASYNC or MS_SYNC shall be specified, but not both.

43701 When MS_INVALIDATE is specified, `msync()` shall invalidate all cached copies of mapped data
 43702 that are inconsistent with the permanent storage locations such that subsequent references shall
 43703 obtain data that was consistent with the permanent storage locations sometime between the call
 43704 to `msync()` and the first subsequent memory reference to the data.

43705 If `msync()` causes any write to a file, the file's last data modification and last file status change
 43706 timestamps shall be marked for update.

43707 **RETURN VALUE**

43708 Upon successful completion, `msync()` shall return 0; otherwise, it shall return -1 and set `errno` to
 43709 indicate the error.

43710 **ERRORS**

43711 The `msync()` function shall fail if:

43712 [EBUSY] Some or all of the addresses in the range starting at `addr` and continuing for `len`
 43713 bytes are locked, and MS_INVALIDATE is specified.

- 43714 [EINVAL] The value of *flags* is invalid.
- 43715 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are
- 43716 outside the range allowed for the address space of a process or specify one or
- 43717 more pages that are not mapped.

43718 The *msync()* function may fail if:

- 43719 [EINVAL] The value of *addr* is not a multiple of the page size as returned by *sysconf()*.

43720 EXAMPLES

43721 None.

43722 APPLICATION USAGE

43723 The *msync()* function is only supported if the Synchronized Input and Output option is

43724 supported, and thus need not be available on all implementations.

43725 The *msync()* function should be used by programs that require a memory object to be in a

43726 known state; for example, in building transaction facilities.

43727 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees

43728 that *msync()* is the only control over when pages are or are not written to disk.

43729 RATIONALE

43730 The *msync()* function writes out data in a mapped region to the permanent storage for the

43731 underlying object. The call to *msync()* ensures data integrity of the file.

43732 After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag

43733 was specified. This is useful on systems that do not support read/write consistency.

43734 FUTURE DIRECTIONS

43735 None.

43736 SEE ALSO

43737 [mmap\(\)](#), [sysconf\(\)](#)

43738 XBD [<sys/mman.h>](#)

43739 CHANGE HISTORY

43740 First released in Issue 4, Version 2.

43741 Issue 5

43742 Moved from X/OPEN UNIX extension to BASE.

43743 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 43744
- The DESCRIPTION is extensively reworded.
 - [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.
- 43745

43746 Issue 6

43747 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input

43748 and Output options.

43749 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 43750
- The [EBUSY] mandatory error condition is added.

43751 The following new requirements on POSIX implementations derive from alignment with the

43752 Single UNIX Specification:

- 43753
- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple
- 43754 of the page size.

43755 • The second [EINVAL] error condition is made mandatory.

43756 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to
43757 typed memory objects.

43758 **Issue 7**

43759 Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment -
43760 requirements.

43761 SD5-XSH-ERN-110 is applied. +

43762 The *msync()* function is marked as part of the Synchronized Input and Output option or XSI |
43763 option as the Memory Mapped Files is moved to the Base. |

43764 Changes are made related to support for finegrained timestamps.

munlock()

43765 **NAME**
43766 `munlock` — unlock a range of process address space

43767 **SYNOPSIS**

43768 MLR `#include <sys/mman.h>`
43769 `int munlock(const void *addr, size_t len);`

43770 **DESCRIPTION**

43771 Refer to *mlock()*.

43772 **NAME**
43773 `munlockall` — unlock the address space of a process

43774 **SYNOPSIS**

43775 ML `#include <sys/mman.h>`
43776 `int munlockall(void);`

43777 **DESCRIPTION**

43778 Refer to *mlockall()*.

43779 **NAME**43780 `munmap` — unmap pages of memory43781 **SYNOPSIS**43782 `#include <sys/mman.h>`43783 `int munmap(void *addr, size_t len);`43784 **DESCRIPTION**

43785 The `munmap()` function shall remove any mappings for those entire pages containing any part of
 43786 the address space of the process starting at `addr` and continuing for `len` bytes. Further references
 43787 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no
 43788 mappings in the specified address range, then `munmap()` has no effect.

43789 The implementation may require that `addr` be a multiple of the page size as returned by
 43790 `sysconf()`.

43791 If a mapping to be removed was private, any modifications made in this address range shall be
 43792 discarded.

43793 MLIMLR Any memory locks (see `mlock()` and `mlockall()`) associated with this address range shall be
 43794 removed, as if by an appropriate call to `munlock()`.

43795 TYM If a mapping removed from a typed memory object causes the corresponding address range of
 43796 the memory pool to be inaccessible by any process in the system except through allocatable
 43797 mappings (that is, mappings of typed memory objects opened with the
 43798 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall
 43799 become deallocated and may become available to satisfy future typed memory allocation
 43800 requests.

43801 A mapping removed from a typed memory object opened with the
 43802 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of
 43803 that typed memory for allocation.

43804 The behavior of this function is unspecified if the mapping was not established by a call to
 43805 `mmap()`.

43806 **RETURN VALUE**

43807 Upon successful completion, `munmap()` shall return 0; otherwise, it shall return -1 and set `errno`
 43808 to indicate the error.

43809 **ERRORS**

43810 The `munmap()` function shall fail if:

43811 [EINVAL] Addresses in the range [`addr,addr+len`) are outside the valid range for the
 43812 address space of a process.

43813 [EINVAL] The `len` argument is 0.

43814 The `munmap()` function may fail if:

43815 [EINVAL] The `addr` argument is not a multiple of the page size as returned by `sysconf()`.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary, causes those locks to be removed.

Most implementations require that *addr* is a multiple of the page size as returned by *sysconf()*.

FUTURE DIRECTIONS

None.

mlock(), *mlockall()*, *mmap()*, *posix_typed_mem_open()*, *sysconf()*

XBD <signal.h>, <sys/mman.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The SIGBUS error is no longer permitted to be generated.

Issue 6

The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory Objects option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- The [EINVAL] error conditions are added.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- The *posix_typed_mem_open()* function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).

Issue 7

Austin Group Interpretation 1003.1-2001 #078 is applied, clarifying page alignment requirements.

The *munmap()* function is moved from the Memory Mapped Files option to the Base.

43855 **NAME**

43856 nan, nanf, nanl — return quiet NaN

43857 **SYNOPSIS**

```
43858 #include <math.h>
43859 double nan(const char *tagp);
43860 float nanf(const char *tagp);
43861 long double nanl(const char *tagp);
```

43862 **DESCRIPTION**

43863 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43864 conflict between the requirements described here and the ISO C standard is unintentional. This
 43865 volume of POSIX.1-200x defers to the ISO C standard.

43866 The function call *nan("n-char-sequence")* shall be equivalent to:

```
43867 strtod("NAN(n-char-sequence)", (char **) NULL);
```

43868 The function call *nan("")* shall be equivalent to:

```
43869 strtod("NAN()", (char **) NULL)
```

43870 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be
 43871 equivalent to:

```
43872 strtod("NAN", (char **) NULL)
```

43873 Function calls to *nanf()* and *nanl()* are equivalent to the corresponding function calls to *strtof()*
 43874 and *strtold()*.

43875 **RETURN VALUE**

43876 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

43877 If the implementation does not support quiet NaNs, these functions shall return zero.

43878 **ERRORS**

43879 No errors are defined.

43880 **EXAMPLES**

43881 None.

43882 **APPLICATION USAGE**

43883 None.

43884 **RATIONALE**

43885 None.

43886 **FUTURE DIRECTIONS**

43887 None.

43888 **SEE ALSO**

43889 [strtod\(\)](#)

43890 XBD [<math.h>](#)

43891 **CHANGE HISTORY**

43892 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

43893 **NAME**

43894 nanosleep — high resolution sleep

43895 **SYNOPSIS**

```
43896 CX #include <time.h>
43897 int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);
```

43898 **DESCRIPTION**

43899 The *nanosleep()* function shall cause the current thread to be suspended from execution until
 43900 either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the
 43901 calling thread, and its action is to invoke a signal-catching function or to terminate the process.
 43902 The suspension time may be longer than requested because the argument value is rounded up to
 43903 an integer multiple of the sleep resolution or because of the scheduling of other activity by the
 43904 system. But, except for the case of being interrupted by a signal, the suspension time shall not be
 43905 less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

43906 The use of the *nanosleep()* function has no effect on the action or blockage of any signal.

43907 **RETURN VALUE**

43908 If the *nanosleep()* function returns because the requested time has elapsed, its return value shall
 43909 be zero.

43910 If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a
 43911 value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the
 43912 **timespec** structure referenced by it is updated to contain the amount of time remaining in the
 43913 interval (the requested time minus the time actually slept). The *rqtp* and *rmtp* arguments may
 43914 point to the same object. If the *rmtp* argument is NULL, the remaining time is not returned.

43915 If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.

43916 **ERRORS**

43917 The *nanosleep()* function shall fail if:

- | | | |
|-------|----------|--|
| 43918 | [EINTR] | The <i>nanosleep()</i> function was interrupted by a signal. |
| 43919 | [EINVAL] | The <i>rqtp</i> argument specified a nanosecond value less than zero or greater than
43920 or equal to 1 000 million. |

43921 **EXAMPLES**

43922 None.

43923 **APPLICATION USAGE**

43924 None.

43925 **RATIONALE**

43926 It is common to suspend execution of a thread for an interval in order to poll the status of a non-
 43927 interrupting function. A large number of actual needs can be met with a simple extension to
 43928 *sleep()* that provides finer resolution.

43929 In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the
 43930 frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD,
 43931 it is possible to write such a routine using no static storage and reserving no system facilities.
 43932 Although it is possible to write a function with similar functionality to *sleep()* using the
 43933 remainder of the *timer_**() functions, such a function requires the use of signals and the
 43934 reservation of some signal number. This volume of POSIX.1-200x requires that *nanosleep()* be
 43935 non-intrusive of the signals function.

43936 The *nanosleep()* function shall return a value of 0 on success and -1 on failure or if interrupted.
43937 This latter case is different from *sleep()*. This was done because the remaining time is returned
43938 via an argument structure pointer, *rmtpt*, instead of as the return value.

FUTURE DIRECTIONS

43939 None.
43940

43941 *clock_nanosleep()*, *sleep*
43942

43943 XBD <[time.h](#)>

CHANGE HISTORY

43944 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
43945

Issue 6

43946 The *nanosleep()* function is marked as part of the Timers option.
43947

43948 The [ENOSYS] error condition has been removed as stubs need not be provided if an
43949 implementation does not support the Timers option.

43950 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO
43951 section to include the *clock_nanosleep()* function.

43952 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/63 is applied, correcting text in the
43953 RATIONALE section.

Issue 7

43954 SD5-XBD-ERN-33 is applied.
43955

43956 The *nanosleep()* function is moved from the Timers option to the Base.

43957 **NAME**
 43958 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

43959 **SYNOPSIS**
 43960 #include <math.h>
 43961 double nearbyint(double x);
 43962 float nearbyintf(float x);
 43963 long double nearbyintl(long double x);

43964 **DESCRIPTION**
 43965 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43966 conflict between the requirements described here and the ISO C standard is unintentional. This
 43967 volume of POSIX.1-200x defers to the ISO C standard.

43968 These functions shall round their argument to an integer value in floating-point format, using
 43969 the current rounding direction and without raising the inexact floating-point exception.

43970 An application wishing to check for error situations should set *errno* to zero and call
 43971 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 43972 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 43973 zero, an error has occurred.

43974 **RETURN VALUE**
 43975 Upon successful completion, these functions shall return the rounded integer value.

43976 MX If *x* is NaN, a NaN shall be returned.

43977 If *x* is ± 0 , ± 0 shall be returned.

43978 If *x* is $\pm\text{Inf}$, *x* shall be returned.

43979 XSI If the correct value would cause overflow, a range error shall occur and *nearbyint*(), *nearbyintf*(),
 43980 and *nearbyintl*() shall return the value of the macro $\pm\text{HUGE_VAL}$, $\pm\text{HUGE_VALF}$, and
 43981 $\pm\text{HUGE_VALL}$ (with the same sign as *x*), respectively.

43982 **ERRORS**
 43983 These functions shall fail if:

43984 XSI **Range Error** The result would cause an overflow.

43985 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 43986 then *errno* shall be set to [ERANGE]. If the integer expression
 43987 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 43988 floating-point exception shall be raised.

43989 **EXAMPLES**
 43990 None.

43991 **APPLICATION USAGE**
 43992 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 43993 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

43994 **RATIONALE**
 43995 None.

- 44001 **CHANGE HISTORY**
- 44002 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

44003 **NAME**

44004 newlocale — create or modify a locale object

44005 **SYNOPSIS**

```
44006 CX #include <locale.h>
44007 locale_t newlocale(int category_mask, const char *locale,
44008 locale_t base);
```

44009 **DESCRIPTION**

44010 The *newlocale()* function shall create a new locale object or modify an existing one. If the *base*
 44011 argument is **(locale_t)0**, a new locale object shall be created. It is unspecified whether the locale
 44012 object pointed to by *base* shall be modified or freed and a new locale object created.

44013 The *category_mask* argument specifies the locale categories to be set or modified. Values for
 44014 *category_mask* shall be constructed by a bitwise-inclusive OR of the symbolic constants
 44015 *LC_CTYPE_MASK*, *LC_NUMERIC_MASK*, *LC_TIME_MASK*, *LC_COLLATE_MASK*,
 44016 *LC_MONETARY_MASK*, and *LC_MESSAGES_MASK*, or any of the other implementation-
 44017 defined *LC_*_MASK* values defined in **<locale.h>**.

44018 For each category with the corresponding bit set in *category_mask* the data from the locale named
 44019 by *locale* shall be used. In the case of modifying an existing locale object, the data from the locale
 44020 named by *locale* shall replace the existing data within the locale object. If a completely new locale
 44021 object is created, the data for all sections not requested by *category_mask* shall be taken from the
 44022 default locale.

44023 The following preset values of *locale* are defined for all settings of *category_mask*:

44024	"POSIX"	Specifies the minimal environment for C-language translation called the 44025 POSIX locale.
44026	"C"	Equivalent to "POSIX".
44027	""	Specifies an implementation-defined native environment. This corresponds to 44028 the value of the associated environment variables, <i>LC_*</i> and <i>LANG</i> ; see XBD 44029 Chapter 7 (on page 121) and Chapter 8 (on page 159).

44030 If the *base* argument is not **(locale_t)0** and the *newlocale()* function call succeeds, the contents of
 44031 *base* are unspecified. Applications shall ensure that they stop using *base* as a locale object before
 44032 calling *newlocale()*. If the function call fails and the *base* argument is not **(locale_t)0**, the contents
 44033 of *base* shall remain valid and unchanged.

44034 The results are undefined if the *base* argument is the special locale object *LC_GLOBAL_LOCALE*.

44035 **RETURN VALUE**

44036 Upon successful completion, the *newlocale()* function shall return a handle which the caller may
 44037 use on subsequent calls to *duplocale()*, *freelocale()*, and other functions taking a **locale_t**
 44038 argument.

44039 Upon failure, the *newlocale()* function shall return **(locale_t)0** and set *errno* to indicate the error.

44040 **ERRORS**

44041 The *newlocale()* function shall fail if:

44042	[ENOMEM]	There is not enough memory available to create the locale object or load the 44043 locale data.
-------	----------	--

- 44044 [EINVAL] The *category_mask* contains a bit that does not correspond to a valid category.
- 44045 [ENOENT] For any of the categories in *category_mask*, the locale data is not available.
- 44046 The *newlocale()* function may fail if:
- 44047 [EINVAL] The *locale* argument is not a valid string pointer.

EXAMPLES

Constructing a Locale Object from Different Locales

The following example shows the construction of a locale where the *LC_CTYPE* category data comes from a locale *loc1* and the *LC_TIME* category data from a locale *tok2*:

```
44052 #include <locale.h>
44053 ...
44054 locale_t loc, new_loc;
44055 /* Get the "loc1" data. */
44056 loc = newlocale (LC_CTYPE_MASK, "loc1", NULL);
44057 if (loc == (locale_t) 0)
44058     abort ();
44059 /* Get the "loc2" data. */
44060 new_loc = newlocale (LC_TIME_MASK, "loc2", loc);
44061 if (new_loc != (locale_t) 0)
44062     /* We don't abort if this fails. In this case this
44063     simply used to unchanged locale object. */
44064     loc = new_loc;
44065 ...
```

Freeing up a Locale Object

The following example shows a code fragment to free a locale object created by *newlocale()*:

```
44068 #include <locale.h>
44069 ...
44070 /* Every locale object allocated with newlocale() should be
44071 * freed using freelocale():
44072 */
44073 locale_t loc;
44074 /* Get the locale. */
44075 loc = newlocale (LC_CTYPE_MASK | LC_TIME_MASK, "locname", NULL);
44076 /* ... Use the locale object ... */
44077 ...
44078 /* Free the locale object resources. */
44079 freelocale (loc);
```

APPLICATION USAGE

Handles for locale objects created by the *newlocale()* function should be released by a corresponding call to *freelocale()*.

The special locale object *LC_GLOBAL_LOCALE* must not be passed for the *base* argument, even when returned by the *uselocale()* function.

44094 NAME

44095 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable
44096 floating-point number

44097 SYNOPSIS

```
44098 #include <math.h>

44099 double nextafter(double x, double y);
44100 float nextafterf(float x, float y);
44101 long double nextafterl(long double x, long double y);
44102 double nexttoward(double x, long double y);
44103 float nexttowardf(float x, long double y);
44104 long double nexttowardl(long double x, long double y);
```

44105 DESCRIPTION

44106 CX The functionality described on this reference page is aligned with the ISO C standard. Any
44107 conflict between the requirements described here and the ISO C standard is unintentional. This
44108 volume of POSIX.1-200x defers to the ISO C standard.

44109 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable
44110 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall
44111 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,
44112 and *nextafterl()* functions shall return *y* if *x* equals *y*.

44113 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the
44114 corresponding *nextafter()* functions, except that the second parameter shall have type **long**
44115 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

44116 An application wishing to check for error situations should set *errno* to zero and call
44117 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
44118 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
44119 zero, an error has occurred.

44120 RETURN VALUE

44121 Upon successful completion, these functions shall return the next representable floating-point
44122 value following *x* in the direction of *y*.

44123 If $x=y$, *y* (of the type *x*) shall be returned.

44124 If *x* is finite and the correct function value would overflow, a range error shall occur and
44125 \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL (with the same sign as *x*) shall be returned as
44126 appropriate for the return type of the function.

44127 MX If *x* or *y* is NaN, a NaN shall be returned.

44128 If $x \neq y$ and the correct function value is subnormal, zero, or underflows, a range error shall
44129 occur, and either the correct function value (if representable) or 0.0 shall be returned.

44130 ERRORS

44131 These functions shall fail if:

44132 Range Error The correct value overflows.

44133 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
44134 then *errno* shall be set to [ERANGE]. If the integer expression
44135 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
44136 floating-point exception shall be raised.

44137 MX **Range Error** The correct value is subnormal or underflows.
 44138 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 44139 then *errno* shall be set to [ERANGE]. If the integer expression
 44140 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 44141 floating-point exception shall be raised.

EXAMPLES

44142 None.
 44143

APPLICATION USAGE

44144 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 44145 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.
 44146

CHANGE HISTORY

44154 First released in Issue 4, Version 2.
 44155

Issue 5

44156 Moved from X/OPEN UNIX extension to BASE.
 44157

Issue 6

44158 The *nextafter()* function is no longer marked as an extension.
 44159

44160 The *nextafterf()*, *nextafterl()*, *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions are added
 44161 for alignment with the ISO/IEC 9899:1999 standard.

44162 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 44163 revised to align with the ISO/IEC 9899:1999 standard.

44164 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 44165 marked.

44166 **NAME**

44167 nftw — walk a file tree

44168 **SYNOPSIS**

```
44169 XSI #include <ftw.h>
44170 int nftw(const char *path, int (*fn)(const char *,
44171     const struct stat *, int, struct FTW *), int fd_limit, int flags);
```

44172 **DESCRIPTION**

44173 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()*
 44174 function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a
 44175 bitwise-inclusive OR of zero or more of the following flags:

44176 **FTW_CHDIR** If set, *nftw()* shall change the current working directory to each directory as it
 44177 reports files in that directory. If clear, *nftw()* shall not change the current
 44178 working directory.

44179 **FTW_DEPTH** If set, *nftw()* shall report all files in a directory before reporting the directory
 44180 itself. If clear, *nftw()* shall report any directory before reporting the files in that
 44181 directory.

44182 **FTW_MOUNT** If set, *nftw()* shall only report files in the same file system as *path*. If clear,
 44183 *nftw()* shall report all files encountered during the walk.

44184 **FTW_PHYS** If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

44185 If **FTW_PHYS** is clear and **FTW_DEPTH** is set, *nftw()* shall follow links instead of reporting
 44186 them, but shall not report any directory that would be a descendant of itself. If **FTW_PHYS** is
 44187 clear and **FTW_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not
 44188 report the contents of any directory that would be a descendant of itself.

44189 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 44190 • The first argument is the pathname of the object.
- 44191 • The second argument is a pointer to the **stat** buffer containing information on the object,
 44192 filled in as if *fstatat()*, *stat()*, or *lstat()* had been called to retrieve the information.
- 44193 • The third argument is an integer giving additional information. Its value is one of the
 44194 following:

44195 **FTW_F** The object is a file.

44196 **FTW_D** The object is a directory.

44197 **FTW_DP** The object is a directory and subdirectories have been visited. (This condition
 44198 shall only occur if the **FTW_DEPTH** flag is included in *flags*.)

44199 **FTW_SL** The object is a symbolic link. (This condition shall only occur if the
 44200 **FTW_PHYS** flag is included in *flags*.)

44201 **FTW_SLN** The object is a symbolic link that does not name an existing file. (This
 44202 condition shall only occur if the **FTW_PHYS** flag is not included in *flags*.)

44203 **FTW_DNR** The object is a directory that cannot be read. The *fn* function shall not be
 44204 called for any of its descendants.

44205 FTW_NS The *stat()* function failed on the object because of lack of appropriate
 44206 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any
 44207 other reason is considered an error and *nftw()* shall return -1 .

44208 • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the
 44209 object's filename in the pathname passed as the first argument to *fn*. The value of **level**
 44210 indicates depth relative to the root of the walk, where the root level is 0.

44211 The results are unspecified if the application-supplied *fn* function does not preserve the current
 44212 working directory.

44213 The argument *fd_limit* sets the maximum number of file descriptors that shall be used by *nftw()*
 44214 while traversing the file tree. At most one file descriptor shall be used for each directory level.

44215 The *nftw()* function need not be thread-safe. A function that is not required to be thread-safe is
 44216 not required to be reentrant.

44217 RETURN VALUE

44218 The *nftw()* function shall continue until the first of the following conditions occurs:

- 44219 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that
 44220 value.
- 44221 • The *nftw()* function detects an error other than [EACCES] (see FTW_DNR and FTW_NS
 44222 above), in which case *nftw()* shall return -1 and set *errno* to indicate the error.
- 44223 • The tree is exhausted, in which case *nftw()* shall return 0.

44224 ERRORS

44225 The *nftw()* function shall fail if:

44226 [EACCES] Search permission is denied for any component of *path* or read permission is
 44227 denied for *path*, or *fn* returns -1 and does not reset *errno*.

44228 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 44229 argument.

44230 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
 44231 component is longer than {NAME_MAX}.
 44232

44233 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

44234 [ENOTDIR] A component of *path* is not a directory.

44235 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
 44236 programming environment for one or more files found in the file hierarchy.

44237 The *nftw()* function may fail if:

44238 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 44239 resolution of the *path* argument.

44240 [EMFILE] All file descriptors available to the process are currently open.

44241 [ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
 44242 whose length exceeds {PATH_MAX}.
 44243

44244 [ENFILE] Too many files are currently open in the system.

44245 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

EXAMPLES

The following example walks the `/tmp` directory and its subdirectories, calling the `nftw()` function for every directory entry, using a maximum of 5 file descriptors.

```

44246 #include <ftw.h>
44247 ...
44248 int nftwfunc(const char *, const struct stat *, int, struct FTW *);
44249
44250 int nftwfunc(const char *filename, const struct stat *statptr,
44251             int fileflags, struct FTW *pftw)
44252 {
44253     return 0;
44254 }
44255 ...
44256 char *startpath = "/tmp";
44257 int fd_limit = 5;
44258 int flags = FTW_CHDIR | FTW_DEPTH | FTW_MOUNT;
44259 int ret;
44260
44261 ret = nftw(startpath, nftwfunc, fd_limit, flags);

```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

In the DESCRIPTION, the definition of the *depth* argument is clarified.

Issue 6

The Open Group Base Resolution bwg97-003 is applied.

The ERRORS section is updated as follows:

- The wording of the mandatory [ELOOP] error condition is updated.
- A second optional [ELOOP] error condition is added.
- The [EOVERFLOW] mandatory error condition is added.

Text is added to the DESCRIPTION to say that the `nftw()` function need not be reentrant and that the results are unspecified if the application-supplied *fn* function does not preserve the current working directory.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/64 is applied, changing the argument *depth* to *fd_limit* throughout and changing “to a maximum of 5 levels deep” to “using a maximum of 5 file descriptors” in the EXAMPLES section.

44289

Issue 7

44290

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

44291

SD5-XBD-ERN-61 is applied.

44292 **NAME**44293 `nice` — change the nice value of a process44294 **SYNOPSIS**44295 XSI

```
#include <unistd.h>
44296 int nice(int incr);
```

44297 **DESCRIPTION**44298 The `nice()` function shall add the value of `incr` to the nice value of the calling process. A nice
44299 value of a process is a non-negative number for which a more positive value shall result in less
44300 favorable scheduling.44301 A maximum nice value of $2*\{NZERO\}-1$ and a minimum nice value of 0 shall be imposed by the
44302 system. Requests for values above or below these limits shall result in the nice value being set to
44303 the corresponding limit. Only a process with appropriate privileges can lower the nice value.44304 PS|TPS Calling the `nice()` function has no effect on the priority of processes or threads with policy
44305 SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies
44306 is implementation-defined.44307 The nice value set with `nice()` shall be applied to the process. If the process is multi-threaded, the
44308 nice value shall affect all system scope threads in the process.44309 As -1 is a permissible return value in a successful situation, an application wishing to check for
44310 error situations should set `errno` to 0, then call `nice()`, and if it returns -1 , check to see whether
44311 `errno` is non-zero.44312 **RETURN VALUE**44313 Upon successful completion, `nice()` shall return the new nice value $-\{NZERO\}$. Otherwise, -1
44314 shall be returned, the nice value of the process shall not be changed, and `errno` shall be set to
44315 indicate the error.44316 **ERRORS**44317 The `nice()` function shall fail if:44318 [EPERM] The `incr` argument is negative and the calling process does not have
44319 appropriate privileges.44320 **EXAMPLES**44321 **Changing the Nice Value**44322 The following example adds the value of the `incr` argument, -20 , to the nice value of the calling
44323 process.44324

```
#include <unistd.h>
44325 ...
44326 int incr = -20;
44327 int ret;
44328 ret = nice(incr);
```

44329 **APPLICATION USAGE**

44330 None.

CHANGE HISTORY

44339

First released in Issue 1. Derived from Issue 1 of the SVID.

44340

Issue 5

44341

A statement is added to the description indicating the effects of this function on the different scheduling policies and multi-threaded processes.

44342

44343 **NAME**
 44344 nl_langinfo, nl_langinfo_l — language information

44345 **SYNOPSIS**
 44346 #include <langinfo.h>
 44347 char *nl_langinfo(nl_item item);
 44348 char *nl_langinfo_l(nl_item item, locale_t locale);

44349 **DESCRIPTION**
 44350 The *nl_langinfo()* and *nl_langinfo_l()* functions shall return a pointer to a string containing
 44351 information relevant to the particular language or cultural area defined in the locale of the
 44352 process, or in the locale represented by *locale*, respectively (see <langinfo.h>). The manifest
 44353 constant names and values of *item* are defined in <langinfo.h>. For example:

44354 nl_langinfo(ABDAY_1)
 44355 would return a pointer to the string "Dom" if the identified language was Portuguese, and
 44356 "Sun" if the identified language was English.

44357 nl_langinfo_l(ABDAY_1, loc)
 44358 would return a pointer to the string "Dom" if the identified language of the locale represented by
 44359 *loc* was Portuguese, and "Sun" if the identified language of the locale represented by *loc* was
 44360 English.

44361 Calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>), or to
 44362 the category *LC_ALL*, may overwrite the array pointed to by the return value. Calls to *uselocale()*
 44363 which change the category corresponding to the category of *item* may overwrite the array
 44364 pointed to by the return value.

44365 The *nl_langinfo()* function need not be thread-safe. A function that is not required to be thread-
 44366 safe is not required to be reentrant.

44367 **RETURN VALUE**
 44368 In a locale where *langinfo* data is not defined, these functions shall return a pointer to the
 44369 corresponding string in the POSIX locale. In all locales, these functions shall return a pointer to
 44370 an empty string if *item* contains an invalid setting.

44371 This pointer may point to static data that may be overwritten on the next call to either function.

44372 **ERRORS**
 44373 The *nl_langinfo_l()* function may fail if:
 44374 [EINVAL] *locale* is not a valid locale object handle.

44375 EXAMPLES

44376 Getting Date and Time Formatting Information

44377 The following example returns a pointer to a string containing date and time formatting
 44378 information, as defined in the *LC_TIME* category of the current locale.

```
44379 #include <time.h>
44380 #include <langinfo.h>
44381 ...
44382 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
44383 ...
```

44384
44385
44386
44387
44388
44389
44390
44391
44392
44393
44394
44395
44396
44397
44398
44399
44400
44401
44402

APPLICATION USAGE

The array pointed to by the return value should not be modified by the program, but may be modified by further calls to these functions.

CHANGE HISTORY

First released in Issue 2.

Issue 5

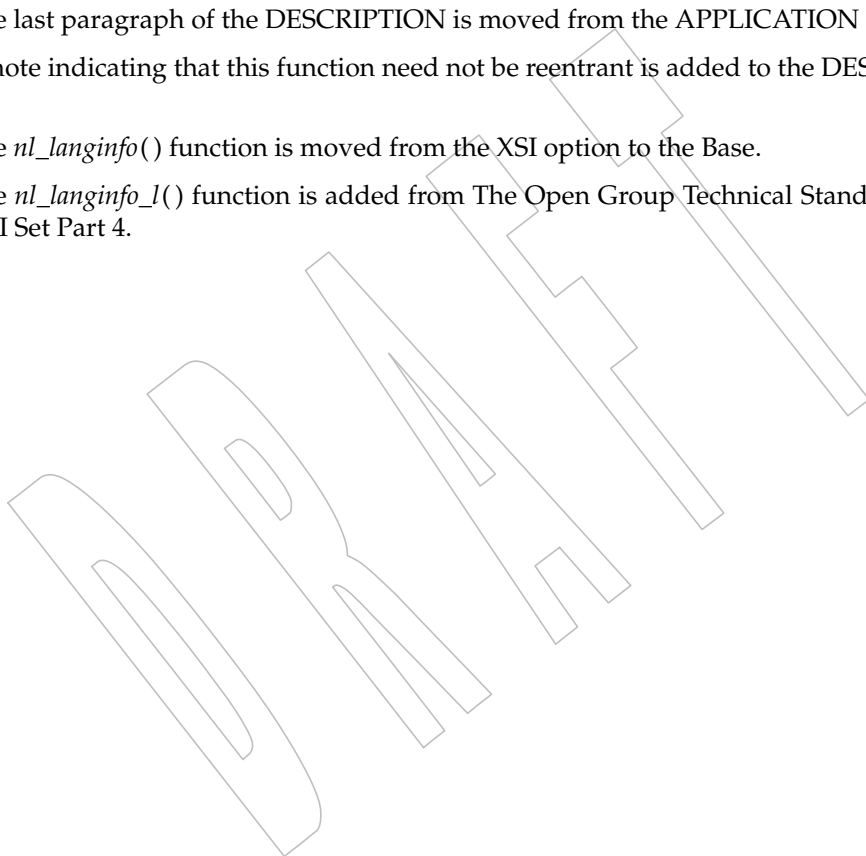

The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 7

The *nl_langinfo()* function is moved from the XSI option to the Base.

The *nl_langinfo_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

nrand48()*System Interfaces*

44403 **NAME**
44404 nrand48 — generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS

44405 XSI #include <stdlib.h>
44406
44407 long nrand48(unsigned short xsubi[3]);

DESCRIPTION

44408 Refer to *drand48()*.
44409

44410 **NAME**
44411 ntohl, ntohs — convert values between host and network byte order

44412 **SYNOPSIS**
44413 #include <arpa/inet.h>
44414 uint32_t ntohl(uint32_t *netlong*);
44415 uint16_t ntohs(uint16_t *netshort*);

44416 **DESCRIPTION**
44417 Refer to *htonl()*.

44418 **NAME**
 44419 open, openat — open file relative to directory file descriptor

44420 **SYNOPSIS**

```
44421 OH #include <sys/stat.h>
44422 #include <fcntl.h>

44423 int open(const char *path, int oflag, ...);
44424 int openat(int fd, const char *path, int oflag, ...);
```

44425 **DESCRIPTION**

44426 The *open()* function shall establish the connection between a file and a file descriptor. It shall
 44427 create an open file description that refers to a file and a file descriptor that refers to that open file
 44428 description. The file descriptor is used by other I/O functions to refer to that file. The *path*
 44429 argument points to a pathname naming the file.

44430 The *open()* function shall return a file descriptor for the named file that is the lowest file
 44431 descriptor not currently open for that process. The open file description is new, and therefore the
 44432 file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file
 44433 descriptor flag associated with the new file descriptor shall be cleared.

44434 The file offset used to mark the current position within the file shall be set to the beginning of
 44435 the file.

44436 The file status flags and file access modes of the open file description shall be set according to
 44437 the value of *oflag*.

44438 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
 44439 in **<fcntl.h>**. Applications shall specify exactly one of the first four values (file access modes)
 44440 below in the value of *oflag*:

44441 O_EXEC Open for execute only (non-directory files). Use of this flag on directories
 44442 is currently unspecified.

44443 O_RDONLY Open for reading only.

44444 O_WRONLY Open for writing only.

44445 O_RDWR Open for reading and writing. The result is undefined if this flag is
 44446 applied to a FIFO.

44447 Any combination of the following may be used:

44448 O_APPEND If set, the file offset shall be set to the end of the file prior to each write.

44449 O_CREAT If the file exists, this flag has no effect except as noted under O_EXCL
 44450 below. Otherwise, the file shall be created; the user ID of the file shall be
 44451 set to the effective user ID of the process; the group ID of the file shall be
 44452 set to the group ID of the file's parent directory or to the effective group
 44453 ID of the process; and the access permission bits (see **<sys/stat.h>**) of the
 44454 file mode shall be set to the value of the argument following the *oflag*
 44455 argument taken as type **mode_t** modified as follows: a bitwise AND is
 44456 performed on the file-mode bits and the corresponding bits in the
 44457 complement of the process' file mode creation mask. Thus, all bits in the
 44458 file mode whose corresponding bit in the file mode creation mask is set
 44459 are cleared. When bits other than the file permission bits are set, the effect
 44460 is unspecified. The argument following the *oflag* argument does not affect
 44461 whether the file is open for reading, writing, or for both. Implementations
 44462 shall provide a way to initialize the file's group ID to the group ID of the

44463			parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file's group ID to the effective group ID of the calling process.
44464			
44465			
44466		O_DIRECTORY	If <i>path</i> does not name a directory, fail and set <i>errno</i> to [ENOTDIR].
44467	SIO	O_DSYNC	Write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.
44468			
44469		O_EXCL	If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing <i>open()</i> naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.
44470			
44471			
44472			
44473			
44474			
44475			
44476			
44477		O_NOCTTY	If set and <i>path</i> identifies a terminal device, <i>open()</i> shall not cause the terminal device to become the controlling terminal for the process.
44478			
44479		O_NOFOLLOW	If <i>path</i> names a symbolic link, fail and set <i>errno</i> to [ELOOP]. When opening a FIFO with O_RDONLY or O_WRONLY set:
44480			
44481			• If O_NONBLOCK is set, an <i>open()</i> for reading-only shall return without delay. An <i>open()</i> for writing-only shall return an error if no process currently has the file open for reading.
44482			
44483			
44484			• If O_NONBLOCK is clear, an <i>open()</i> for reading-only shall block the calling thread until a thread opens the file for writing. An <i>open()</i> for writing-only shall block the calling thread until a thread opens the file for reading.
44485			
44486			
44487			
44488			When opening a block special or character special file that supports non-blocking opens:
44489			
44490			• If O_NONBLOCK is set, the <i>open()</i> function shall return without blocking for the device to be ready or available. Subsequent behavior of the device is device-specific.
44491			
44492			
44493			• If O_NONBLOCK is clear, the <i>open()</i> function shall block the calling thread until the device is ready or available before returning.
44494			
44495			Otherwise, the behavior of O_NONBLOCK is unspecified.
44496	SIO	O_RSYNC	Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in <i>oflag</i> , all I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
44497			
44498			
44499			
44500			
44501			
44502			
44503	XSI SIO	O_SYNC	Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
44504			
44505	XSI		The O_SYNC flag shall be supported for regular files, even if the Synchronized Input and Output option is not supported.
44506			
44507		O_TRUNC	If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files
44508			
44509			

open()

44510		or terminal device files. Its effect on other file types is implementation-
44511		defined. The result of using O_TRUNC without either O_RDWR or
44512		O_WRONLY is undefined.
44513		If O_CREAT is set and the file did not previously exist, upon successful completion, <i>open()</i> shall
44514		mark for update the last data access, last data modification, and last file status change
44515		timestamps of the file and the last data modification and last file status change timestamps of
44516		the parent directory.
44517		If O_TRUNC is set and the file did previously exist, upon successful completion, <i>open()</i> shall
44518		mark for update the last data modification and last file status change timestamps of the file.
44519	SIO	If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.
44520	OB XSR	If <i>path</i> refers to a STREAMS file, <i>oflag</i> may be constructed from O_NONBLOCK OR'ed with
44521		either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS
44522		devices and shall have no effect on them. The value O_NONBLOCK affects the operation of
44523		STREAMS drivers and certain functions applied to file descriptors associated with STREAMS
44524		files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.
44525	XSI	If <i>path</i> names the master side of a pseudo-terminal device, then it is unspecified whether <i>open()</i>
44526		locks the slave side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i>
44527		before opening the slave side.
44528		The largest value that can be represented correctly in an object of type off_t shall be established
44529		as the offset maximum in the open file description.
44530		The <i>openat()</i> function shall be equivalent to the <i>open()</i> function except in the case where <i>path</i>
44531		specifies a relative path. In this case the file to be opened is determined relative to the directory
44532		associated with the file descriptor <i>fd</i> instead of the current working directory. It is unspecified
44533		whether directory searches are permitted based on whether the file was opened with search
44534		permission or on the current permissions of the directory underlying the file descriptor.
44535		The <i>oflag</i> parameter and the optional fourth parameter correspond exactly to the parameters of
44536		<i>open()</i> .
44537		If <i>openat()</i> is passed the special value AT_FDCWD in the <i>fd</i> parameter, the current working
44538		directory is used and the behavior shall be identical to a call to <i>open()</i> .
44539		RETURN VALUE
44540		Upon successful completion, these functions shall open the file and return a non-negative
44541		integer representing the lowest numbered unused file descriptor. Otherwise, these functions
44542		shall return -1 and set <i>errno</i> to indicate the error. If $-$ is returned, no files shall be created or
44543		modified.
44544		ERRORS
44545		These functions shall fail if:
44546	[EACCES]	Search permission is denied on a component of the path prefix, or the file
44547		exists and the permissions specified by <i>oflag</i> are denied, or the file does not
44548		exist and write permission is denied for the parent directory of the file to be
44549		created, or O_TRUNC is specified and write permission is denied.
44550	[EEXIST]	O_CREAT and O_EXCL are set, and the named file exists.
44551	[EINTR]	A signal was caught during <i>open()</i> .
44552	SIO [EINVAL]	The implementation does not support synchronized I/O for this file.

44553	OB XSR	[EIO]	The <i>path</i> argument names a STREAMS file and a hangup or error occurred during the <i>open()</i> .
44554			
44555		[EISDIR]	The named file is a directory and <i>oflag</i> includes O_WRONLY or O_RDWR.
44556		[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument, or O_NOFOLLOW was specified and the <i>path</i> argument names a symbolic link.
44557			
44558			
44559		[EMFILE]	All file descriptors available to the process are currently open.
44560		[ENAMETOOLONG]	
44561			The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
44562			
44563		[ENFILE]	The maximum allowable number of files is currently open in the system.
44564		[ENOENT]	O_CREAT is not set and the named file does not exist; or O_CREAT is set and either the path prefix does not exist or the <i>path</i> argument points to an empty string.
44565			
44566			
44567	OB XSR	[ENOSR]	The <i>path</i> argument names a STREAMS-based file and the system is unable to allocate a STREAM.
44568			
44569		[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and O_CREAT is specified.
44570			
44571		[ENOTDIR]	A component of the path prefix is not a directory, or O_DIRECTORY was specified and the <i>path</i> argument does not name a directory.
44572			
44573		[ENXIO]	O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.
44574			
44575		[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
44576			
44577		[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type off_t .
44578			
44579		[EROFS]	The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the <i>oflag</i> argument.
44580			
44581			
44582			The <i>openat()</i> function shall fail if:
44583		[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading.
44584			
44585			These functions may fail if:
44586	XSI	[EAGAIN]	The <i>path</i> argument names the slave side of a pseudo-terminal device that is locked.
44587			
44588		[EINVAL]	The value of the <i>oflag</i> argument is not valid.
44589		[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
44590			
44591		[ENAMETOOLONG]	
44592			As a result of encountering a symbolic link in resolution of the <i>path</i> argument, the length of the substituted pathname string exceeded {PATH_MAX}.
44593			
44594	OB XSR	[ENOMEM]	The <i>path</i> argument names a STREAMS file and the system is unable to allocate resources.
44595			

44596 [ETXTBSY] The file is a pure procedure (shared text) file that is being executed and *oflag* is
 44597 O_WRONLY or O_RDWR.

44598 The *openat()* function may fail if:

44599 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
 44600 file descriptor associated with a directory.

44601 EXAMPLES

44602 Opening a File for Writing by the Owner

44603 The following example opens the file */tmp/file*, either by creating it (if it does not already exist),
 44604 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,
 44605 the access permission bits in the file mode of the file are set to permit reading and writing by the
 44606 owner, and to permit reading only by group members and others.

44607 If the call to *open()* is successful, the file is opened for writing.

```
44608 #include <fcntl.h>
44609 ...
44610 int fd;
44611 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
44612 char *filename = "/tmp/file";
44613 ...
44614 fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
44615 ...
```

44616 Opening a File Using an Existence Check

44617 The following example uses the *open()* function to try to create the **LOCKFILE** file and open it
 44618 for writing. Since the *open()* function specifies the O_EXCL flag, the call fails if the file already
 44619 exists. In that case, the program assumes that someone else is updating the password file and
 44620 exits.

```
44621 #include <fcntl.h>
44622 #include <stdio.h>
44623 #include <stdlib.h>
44624 #define LOCKFILE "/etc/ptmp"
44625 ...
44626 int pfd; /* Integer for file descriptor returned by open() call. */
44627 ...
44628 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
44629     S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
44630 {
44631     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
44632     exit(1);
44633 }
44634 ...
```

44635

Opening a File for Writing

44636

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

44637

44638

```
#include <fcntl.h>
```

44639

```
#include <stdio.h>
```

44640

```
#include <stdlib.h>
```

44641

```
#define LOCKFILE "/etc/ptmp"
```

44642

```
...
```

44643

```
int pfd;
```

44644

```
char filename[PATH_MAX+1];
```

44645

```
...
```

44646

```
if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
```

44647

```
 S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
```

44648

```
{
```

44649

```
    perror("Cannot open output file\n"); exit(1);
```

44650

```
}
```

44651

```
...
```

44652

APPLICATION USAGE

44653

None.

44654

RATIONALE

44655

Except as specified in this volume of POSIX.1-200x, the flags allowed in *oflag* are not mutually-exclusive and any number of them may be used simultaneously.

44656

44657

Some implementations permit opening FIFOs with `O_RDWR`. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

44658

44659

44660

See [getgroups\(\)](#) about the group of a newly created file.

44661

The use of `open()` to create a regular file is preferable to the use of `creat()`, because the latter is redundant and included only for historical reasons.

44662

44663

The use of the `O_TRUNC` flag on FIFOs and directories (pipes cannot be `open()`-ed) must be permissible without unexpected side effects (for example, `creat()` on a FIFO must not remove data). Since terminal special files might have type-ahead data stored in the buffer, `O_TRUNC` should not affect their content, particularly if a program that normally opens a regular file should open the current controlling terminal instead. Other file types, particularly implementation-defined ones, are left implementation-defined.

44664

44665

44666

44667

44668

44669

POSIX.1-200x permits [EACCES] to be returned for conditions other than those explicitly listed.

44670

The `O_NOCTTY` flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side effect of opening a terminal file. This volume of POSIX.1-200x does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on `open()` if the `O_NOCTTY` flag is not set and other conditions specified in XBD [Chapter 11](#) (on page 185) are met. The `O_NOCTTY` flag is an effective no-op if the file being opened is not a terminal device.

44671

44672

44673

44674

44675

44676

In historical implementations the value of `O_RDONLY` is zero. Because of that, it is not possible to detect the presence of `O_RDONLY` and another option. Future implementations should encode `O_RDONLY` and `O_WRONLY` as bit flags so that:

44677

44678

44679

```
O_RDONLY | O_WRONLY == O_RDWR
```

44680

`O_EXEC` is specified as one of the four file access modes. On implementations where none of `O_RDONLY`, `O_WRONLY`, or `O_RDWR` is zero, applications may open a directory with `O_EXEC`

44681

44682 OR'd in with one of the other three file access modes. On many historical implementations, this
44683 cannot be done since O_RDONLY has been defined to be zero.

44684 In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However,
44685 the *open()* function, when called with O_CREAT and O_EXCL, is required to fail with [EEXIST]
44686 if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This
44687 behavior is required so that privileged applications can create a new file in a known location
44688 without the possibility that a symbolic link might cause the file to be created in a different
44689 location.

44690 In addition, the *open()* function refuses to open non-directories if the O_DIRECTORY flag is set.
44691 This avoids race conditions whereby a user might compromise the system by substituting a hard
44692 link to a sensitive file (e.g., a device or a FIFO) while a privileged application is running, where
44693 opening a file even for read access might have undesirable side-effects.

44694 In addition, the *open()* function does not follow symbolic links if the O_NOFOLLOW flag is set.
44695 This avoids race conditions whereby a user might compromise the system by substituting a
44696 symbolic link to a sensitive file (e.g., a device) while a privileged application is running, where
44697 opening a file even for read access might have undesirable side-effects.

44698 For example, a privileged application that must create a file with a predictable name in a user-
44699 writable directory, such as the user's home directory, could be compromised if the user creates a
44700 symbolic link with that name that refers to a nonexistent file in a system directory. If the user can
44701 influence the contents of a file, the user could compromise the system by creating a new system
44702 configuration or spool file that would then be interpreted by the system. The test for a symbolic
44703 link which refers to a nonexistent file must be atomic with the creation of a new file.

44704 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group
44705 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required
44706 that implementations provide a way to have the group ID be set to the group ID of the
44707 containing directory, but did not prohibit implementations also supporting a way to set the
44708 group ID to the effective group ID of the creating process. Conforming applications should not
44709 assume which group ID will be used. If it matters, an application can use *chown()* to set the
44710 group ID after the file is created, or determine under what conditions the implementation will
44711 set the desired group ID.

44712 The purpose of the *openat()* function is to enable opening files in directories other than the
44713 current working directory without exposure to race conditions. Any part of the path of a file
44714 could be changed in parallel to a call to *open()*, resulting in unspecified behavior. By opening a
44715 file descriptor for the target directory and using the *openat()* function it can be guaranteed that
44716 the opened file is located relative to the desired directory. Some implementations use the
44717 *openat()* function for other purposes as well. In some cases, if the *oflag* parameter has the
44718 O_XATTR bit set, the returned file descriptor provides access to extended attributes. This
44719 functionality is not standardized here.

44720 FUTURE DIRECTIONS

44721 The meaning of the O_EXEC flag on directories may be specified in a future version.

44726 CHANGE HISTORY

44727 First released in Issue 1. Derived from Issue 1 of the SVID.

44728	Issue 5	The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.		
44729				
44730				
44731		Large File Summit extensions are added.		
44732	Issue 6	In the SYNOPSIS, the optional include of the <code><sys/types.h></code> header is removed.		
44733		The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:		
44734		<ul style="list-style-type: none"> • The requirement to include <code><sys/types.h></code> has been removed. Although <code><sys/types.h></code> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications. • In the DESCRIPTION, <code>O_CREAT</code> is amended to state that the group ID of the file is set to the group ID of the file's parent directory or to the effective group ID of the process. This is a FIPS requirement. • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files. • In the ERRORS section, the <code>[EOVERFLOW]</code> condition is added. This change is to support large files. • The <code>[ENXIO]</code> mandatory error condition is added. • The <code>[EINVAL]</code>, <code>[ENAMETOOLONG]</code>, and <code>[ETXTBSY]</code> optional error conditions are added. 		
44736				
44737				
44738				
44739				
44740				
44741				
44742				
44743				
44744				
44745				
44746				
44747				
44748		The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI STREAMS Option Group are marked.		
44749				
44750		The following changes were made to align with the IEEE P1003.1a draft standard:		
44751		<ul style="list-style-type: none"> • An explanation is added of the effect of the <code>O_CREAT</code> and <code>O_EXCL</code> flags when the path refers to a symbolic link. • The <code>[ELOOP]</code> optional error condition is added. 		
44752				
44753				
44754		The normative text is updated to avoid use of the term "must" for application requirements.		
44755		The DESCRIPTION of <code>O_EXCL</code> is updated in response to IEEE PASC Interpretation 1003.1c #48.		
44756	Issue 7	Austin Group Interpretation 1003.1-2001 #113 is applied.	+	
44757				
44758		SD5-XBD-ERN-4 is applied, changing the definition of the <code>[EMFILE]</code> error.		
44759		This page is revised and the <code>openat()</code> function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.		
44760				
44761		Functionality relating to the XSI STREAMS option is marked obsolescent.		
44762		Changes are made related to support for finegrained timestamps.		

44763 **NAME**

44764 open_memstream, open_wmemstream — open a dynamic memory buffer stream

44765 **SYNOPSIS**

```
44766 CX #include <stdio.h>
44767 FILE *open_memstream(char **bufp, size_t *sizep);
44768 #include <wchar.h>
44769 FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

44770 **DESCRIPTION**

44771 The *open_memstream()* and *open_wmemstream()* functions shall create an I/O stream associated
 44772 with a dynamically allocated memory buffer. The stream shall be opened for writing and shall
 44773 be seekable.

44774 The stream associated with a call to *open_memstream()* shall be byte-oriented.

44775 The stream associated with a call to *open_wmemstream()* shall be wide-oriented.

44776 The stream shall maintain a current position in the allocated buffer and a current buffer length.
 44777 The position shall be initially set to zero (the start of the buffer). Each write to the stream shall
 44778 start at the current position and move this position by the number of successfully written bytes
 44779 for *open_memstream()* or the number of successfully written wide characters for
 44780 *open_wmemstream()*. The length shall be initially set to zero. If a write moves the position to a
 44781 value larger than the current length, the current length shall be set to this position. In this case a
 44782 null character for *open_memstream()* or a null wide character for *open_wmemstream()* shall be
 44783 appended to the current buffer. For both functions the terminating null is not included in the
 44784 calculation of the buffer length.

44785 After a successful *fflush()* or *fclose()*, the pointer referenced by *bufp* shall contain the address of
 44786 the buffer, and the variable pointed to by *sizep* shall contain the number of bytes for
 44787 *open_memstream()* or the number of wide characters for *open_wmemstream()*, between the
 44788 beginning of the buffer and the current file position indicator. The buffer shall be terminated by
 44789 a null character for *open_memstream()* or a null wide character for *open_wmemstream()*, at the
 44790 current file position indicator.

44791 After a successful *fflush()* the pointer referenced by *bufp* and the variable referenced by *sizep*
 44792 remain valid only until the next write operation on the stream or a call to *fclose()*.

44793 **RETURN VALUE**

44794 Upon successful completion, these functions shall return a pointer to the object controlling the
 44795 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

44796 **ERRORS**

44797 These functions may fail if:

- 44798 [EINVAL] *bufp* or *sizep* are NULL.
- 44799 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.
- 44800 [ENOMEM] Memory for the stream or the buffer could not be allocated.

EXAMPLES

```

44801
44802     #include <stdio.h>
44803     #include <stdlib.h>
44804
44805     int
44806     main (void)
44807     {
44808         FILE *stream;
44809         char *buf;
44810         size_t len;
44811         off_t eob;
44812
44813         stream = open_memstream (&buf, &len);
44814         if (stream == NULL)
44815             /* handle error */ ;
44816         fprintf (stream, "hello my world");
44817         fflush (stream);
44818         printf ("buf=%s, len=%zu\n", buf, len);
44819         eob = ftello(stream);
44820         fseeko (stream, 0, SEEK_SET);
44821         fprintf (stream, "good-bye");
44822         fseeko (stream, eob, SEEK_SET);
44823         fclose (stream);
44824         printf ("buf=%s, len=%zu\n", buf, len);
44825         free (buf);
44826         return 0;
44827     }

```

This program produces the following output:

```

44827     buf=hello my world, len=14
44828     buf=good-bye world, len=14

```

APPLICATION USAGE

The buffer created by these functions should be freed by the application after closing the stream, by means of a call to *free()*.

RATIONALE

These functions are similar to *fnemopen()* except that the memory is always allocated dynamically by the function, and the stream is opened only for output.

FUTURE DIRECTIONS

None.

SEE ALSO

fclose(), *fdopen()*, *fflush()*, *fnemopen()*, *fopen()*, *free()*, *freopen()*

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 7.

44842 **NAME**
44843 open_wmemstream — open a dynamic memory buffer stream

44844 **SYNOPSIS**

```
44845 CX       #include <wchar.h>  
44846       FILE *open_wmemstream(wchar_t **bufp, size_t *sizep);
```

44847 **DESCRIPTION**

44848 Refer to *open_memstream()*.

44849 **NAME**
44850 `openat` — open file relative to directory file descriptor

44851 **SYNOPSIS**
44852 `#include <fcntl.h>`
44853 `int openat(int fd, const char *path, int oflag, ...);`

44854 **DESCRIPTION**
44855 Refer to `open()`.

44856 **NAME**
44857 opendir — open directory associated with file descriptor

44858 **SYNOPSIS**
44859 #include <dirent.h>
44860 DIR *opendir(const char *dirname);

44861 **DESCRIPTION**
44862 Refer to *fdopendir()*.

44863 **NAME**
44864 `openlog` — open a connection to the logging facility

44865 **SYNOPSIS**

44866 XSI `#include <syslog.h>`
44867 `void openlog(const char *ident, int logopt, int facility);`

44868 **DESCRIPTION**

44869 Refer to *closelog()*.

44870 **NAME**
44871 `optarg, opterr, optind, optopt` — options parsing variables

44872 **SYNOPSIS**
44873 `#include <unistd.h>`
44874 `extern char *optarg;`
44875 `extern int opterr, optind, optopt;`

44876 **DESCRIPTION**
44877 Refer to *getopt()*.

44878 **NAME**
44879 `pathconf` — get configurable pathname variables

44880 **SYNOPSIS**
44881 `#include <unistd.h>`
44882 `long pathconf(const char *path, int name);`

44883 **DESCRIPTION**
44884 Refer to *[fpathconf\(\)](#)*.

44885 **NAME**
 44886 `pause` — suspend the thread until a signal is received

44887 **SYNOPSIS**
 44888 `#include <unistd.h>`
 44889 `int pause(void);`

44890 **DESCRIPTION**
 44891 The `pause()` function shall suspend the calling thread until delivery of a signal whose action is
 44892 either to execute a signal-catching function or to terminate the process.

44893 If the action is to terminate the process, `pause()` shall not return.

44894 If the action is to execute a signal-catching function, `pause()` shall return after the signal-catching
 44895 function returns.

44896 **RETURN VALUE**
 44897 Since `pause()` suspends thread execution indefinitely unless interrupted by a signal, there is no
 44898 successful completion return value. A value of `-1` shall be returned and `errno` set to indicate the
 44899 error.

44900 **ERRORS**
 44901 The `pause()` function shall fail if:
 44902 [EINTR] A signal is caught by the calling process and control is returned from the
 44903 signal-catching function.

44904 **EXAMPLES**
 44905 None.

44906 **APPLICATION USAGE**
 44907 Many common uses of `pause()` have timing windows. The scenario involves checking a
 44908 condition related to a signal and, if the signal has not occurred, calling `pause()`. When the signal
 44909 occurs between the check and the call to `pause()`, the process often blocks indefinitely. The
 44910 `sigprocmask()` and `sigsuspend()` functions can be used to avoid this type of problem.

44911 **RATIONALE**
 44912 None.

44913 **FUTURE DIRECTIONS**
 44914 None.

44915 **SEE ALSO**
 44916 [sigsuspend\(\)](#)
 44917 XBD [<unistd.h>](#)

44918 **CHANGE HISTORY**
 44919 First released in Issue 1. Derived from Issue 1 of the SVID.

44920 **Issue 5**
 44921 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

44922 **Issue 6**
 44923 The APPLICATION USAGE section is added.

44924 **NAME**
 44925 `pclose` — close a pipe stream to or from a process

44926 **SYNOPSIS**

44927 CX

```
#include <stdio.h>
```

 44928

```
int pclose(FILE *stream);
```

44929 **DESCRIPTION**

44930 The `pclose()` function shall close a stream that was opened by `popen()`, wait for the command to
 44931 terminate, and return the termination status of the process that was running the command
 44932 language interpreter. However, if a call caused the termination status to be unavailable to
 44933 `pclose()`, then `pclose()` shall return `-1` with `errno` set to `[ECHILD]` to report this situation. This can
 44934 happen if the application calls one of the following functions:

- 44935 • `wait()`
- 44936 • `waitpid()` with a `pid` argument less than or equal to 0 or equal to the process ID of the
 44937 command line interpreter
- 44938 • Any other function not defined in this volume of POSIX.1-200x that could do one of the
 44939 above

44940 In any case, `pclose()` shall not return before the child process created by `popen()` has terminated.

44941 If the command language interpreter cannot be executed, the child termination status returned
 44942 by `pclose()` shall be as if the command language interpreter terminated using `exit(127)` or
 44943 `_exit(127)`.

44944 The `pclose()` function shall not affect the termination status of any child of the calling process
 44945 other than the one created by `popen()` for the associated stream.

44946 If the argument `stream` to `pclose()` is not a pointer to a stream created by `popen()`, the result of
 44947 `pclose()` is undefined.

44948 **RETURN VALUE**

44949 Upon successful return, `pclose()` shall return the termination status of the command language
 44950 interpreter. Otherwise, `pclose()` shall return `-1` and set `errno` to indicate the error.

44951 **ERRORS**

44952 The `pclose()` function shall fail if:

44953 `[ECHILD]` The status of the child process could not be obtained, as described above.

44954 **EXAMPLES**

44955 None.

44956 **APPLICATION USAGE**

44957 None.

44958 **RATIONALE**

44959 There is a requirement that `pclose()` not return before the child process terminates. This is
 44960 intended to disallow implementations that return `[EINTR]` if a signal is received while waiting.
 44961 If `pclose()` returned before the child terminated, there would be no way for the application to
 44962 discover which child used to be associated with the stream, and it could not do the cleanup
 44963 itself.

44964 If the stream pointed to by `stream` was not created by `popen()`, historical implementations of
 44965 `pclose()` return `-1` without setting `errno`. To avoid requiring `pclose()` to set `errno` in this case,

44966 POSIX.1-200x makes the behavior unspecified. An application should not use *pclose()* to close
44967 an stream that was not created by *popen()*.

44968 Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT,
44969 and SIGHUP while waiting for the child process to terminate. Since this behavior is not
44970 described for the *pclose()* function in POSIX.1-200x, such implementations are not conforming.
44971 Also, some historical implementations return [EINTR] if a signal is received, even though the
44972 child process has not terminated. Such implementations are also considered non-conforming.

44973 Consider, for example, an application that uses:

```
44974 popen("command", "r")
```

44975 to start *command*, which is part of the same application. The parent writes a prompt to its
44976 standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child
44977 reads the response from the user, does some transformation on the response (pathname
44978 expansion, perhaps) and writes the result to its standard output. The parent process reads the
44979 result from the pipe, does something with it, and prints another prompt. The cycle repeats.
44980 Assuming that both processes do appropriate buffer flushing, this would be expected to work.

44981 To conform to POSIX.1-200x, *pclose()* must use *waitpid()*, or some similar function, instead of
44982 *wait()*.

44983 The code sample below illustrates how the *pclose()* function might be implemented on a system
44984 conforming to POSIX.1-200x.

```
44985 int pclose(FILE *stream)
44986 {
44987     int stat;
44988     pid_t pid;
44989     pid = <pid for process created for stream by popen(>
44990         (void) fclose(stream);
44991     while (waitpid(pid, &stat, 0) == -1) {
44992         if (errno != EINTR){
44993             stat = -1;
44994             break;
44995         }
44996     }
44997     return(stat);
44998 }
```

44999 FUTURE DIRECTIONS

45000 None.

45003 XBD <stdio.h>

45004 CHANGE HISTORY

45005 First released in Issue 1. Derived from Issue 1 of the SVID.

45006 **NAME**
 45007 `perror` — write error messages to standard error

45008 **SYNOPSIS**
 45009 `#include <stdio.h>`

45010 `void perror(const char *s);`

45011 **DESCRIPTION**

45012 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 45013 conflict between the requirements described here and the ISO C standard is unintentional. This
 45014 volume of POSIX.1-200x defers to the ISO C standard.

45015 The `perror()` function shall map the error number accessed through the symbol `errno` to a
 45016 language-dependent error message, which shall be written to the standard error stream as
 45017 follows:

- 45018 • First (if `s` is not a null pointer and the character pointed to by `s` is not the null byte), the
 45019 string pointed to by `s` followed by a colon and a `<space>`.
- 45020 • Then an error message string followed by a `<newline>`.

45021 The contents of the error message strings shall be the same as those returned by `strerror()` with
 45022 argument `errno`.

45023 CX The `perror()` function shall mark the file associated with the standard error stream as having
 45024 been written (the last data modification and last file status change timestamps marked for
 45025 update) at some time between its successful completion and `exit()`, `abort()`, or the completion of
 45026 `fflush()` or `fclose()` on `stderr`.

45027 The `perror()` function shall not change the orientation of the standard error stream.

45028 **RETURN VALUE**

45029 The `perror()` function shall not return a value.

45030 **ERRORS**

45031 No errors are defined.

45032 **EXAMPLES**

45033 **Printing an Error Message for a Function**

45034 The following example replaces `bufptr` with a buffer that is the necessary size. If an error occurs,
 45035 the `perror()` function prints a message and the program exits.

```

45036 #include <stdio.h>
45037 #include <stdlib.h>
45038 ...
45039 char *bufptr;
45040 size_t szbuf;
45041 ...
45042 if ((bufptr = malloc(szbuf)) == NULL) {
45043     perror("malloc"); exit(2);
45044 }
45045 ...
  
```

perror()

45046 **APPLICATION USAGE**
 45047 None.

45048 **RATIONALE**
 45049 None.

45050 **FUTURE DIRECTIONS**
 45051 None.

45052 **SEE ALSO**
 45053 *psiginfo()*, *strerror()*
 45054 XBD <stdio.h>

45055 **CHANGE HISTORY**
 45056 First released in Issue 1. Derived from Issue 1 of the SVID.

45057 **Issue 5**
 45058 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the
 45059 orientation of the standard error stream.

45060 **Issue 6**
 45061 Extensions beyond the ISO C standard are marked.

45062 **Issue 7**
 45063 SD5-XSH-ERN-95 is applied.
 45064 Changes are made related to support for finegrained timestamps.

45065 **NAME**

45066 pipe — create an interprocess channel

45067 **SYNOPSIS**

45068 #include <unistd.h>

45069 int pipe(int *fildes*[2]);45070 **DESCRIPTION**

45071 The *pipe()* function shall create a pipe and place two file descriptors, one each into the
 45072 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write
 45073 ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe()*
 45074 call. The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The
 45075 *fcntl()* function can be used to set both these flags.)

45076 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A
 45077 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a
 45078 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether
 45079 *fildes*[1] is also open for reading.

45080 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open
 45081 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

45082 The pipe's user ID shall be set to the effective user ID of the calling process.

45083 The pipe's group ID shall be set to the effective group ID of the calling process.

45084 Upon successful completion, *pipe()* shall mark for update the last data access, last data
 45085 modification, and last file status change timestamps of the pipe.

45086 **RETURN VALUE**

45087 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 45088 indicate the error.

45089 **ERRORS**

45090 The *pipe()* function shall fail if:

45091 [EMFILE] All, or all but one, of the file descriptors available to the process are currently
 45092 open.

45093 [ENFILE] The number of simultaneously open files in the system would exceed a
 45094 system-imposed limit.

45095 **EXAMPLES**45096 **Using a Pipe to Pass Data Between a Parent Process and a Child Process**

45097 The following example demonstrates the use of a pipe to transfer data between a parent process
 45098 and a child process. Error handling is excluded, but otherwise this code demonstrates good
 45099 practice when using pipes: after the *fork()* the two processes close the unused ends of the pipe
 45100 before they commence transferring data.

```
45101 #include <stdlib.h>
45102 #include <unistd.h>
45103 ...
45104 int fildes[2];
45105 const int BSIZE = 100;
45106 char buf[BSIZE];
45107 ssize_t nbytes;
```

```

45108     int status;
45109
45109     status = pipe(fildes);
45110     if (status == -1 ) {
45111         /* an error occurred */
45112         ...
45113     }
45114
45114     switch (fork()) {
45115     case -1: /* Handle error */
45116         break;
45117
45117     case 0: /* Child - reads from pipe */
45118         close(fildes[1]); /* Write end is unused */
45119         nbytes = read(fildes[0], buf, BSIZE); /* Get data from pipe */
45120         /* At this point, a further read would see end of file ... */
45121         close(fildes[0]); /* Finished with pipe */
45122         exit(EXIT_SUCCESS);
45123
45123     default: /* Parent - writes to pipe */
45124         close(fildes[0]); /* Read end is unused */
45125         write(fildes[1], "Hello world\n", 12); /* Write data on pipe */
45126         close(fildes[1]); /* Child will see EOF */
45127         exit(EXIT_SUCCESS);
45128     }

```

APPLICATION USAGE

None.

RATIONALE

The wording carefully avoids using the verb “to open” in order to avoid any implication of use of *open()*; see also *write*.

FUTURE DIRECTIONS

None.

XBD [<fcntl.h>](#), [<unistd.h>](#)

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that certain dispositions of *fildes[0]* and *fildes[1]* are unspecified.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/65 is applied, adding the example to the EXAMPLES section.

Issue 7

SD5-XSH-ERN-156 is applied, updating the DESCRIPTION to state the setting of the pipe’s user ID and group ID.

Changes are made related to support for finegrained timestamps.

45152 **NAME**

45153 poll — input/output multiplexing

45154 **SYNOPSIS**

45155 #include <poll.h>

45156 int poll(struct pollfd *fds*[], nfds_t *nfds*, int *timeout*);45157 **DESCRIPTION**

45158 The *poll()* function provides applications with a mechanism for multiplexing input/output over
 45159 a set of file descriptors. For each member of the array pointed to by *fds*, *poll()* shall examine the
 45160 given file descriptor for the event(s) specified in *events*. The number of **pollfd** structures in the
 45161 *fds* array is specified by *nfds*. The *poll()* function shall identify those file descriptors on which an
 45162 application can read or write data, or on which certain events have occurred.

45163 The *fds* argument specifies the file descriptors to be examined and the events of interest for each
 45164 file descriptor. It is a pointer to an array with one member for each open file descriptor of
 45165 interest. The array's members are **pollfd** structures within which *fd* specifies an open file
 45166 descriptor and *events* and *revents* are bitmasks constructed by OR'ing a combination of the
 45167 following event flags:

45168	POLLIN	Data other than high-priority data may be read without blocking.
45169	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
45170		This flag shall be equivalent to POLLRDNORM POLLRDBAND.
45171	POLLRDNORM	Normal data may be read without blocking.
45172	OB XSR	For STREAMS, data on priority band 0 may be read without blocking. This
45173		flag is set in <i>revents</i> even if the message is of zero length.
45174	POLLRDBAND	Priority data may be read without blocking.
45175	OB XSR	For STREAMS, data on priority bands greater than 0 may be read without
45176		blocking. This flag is set in <i>revents</i> even if the message is of zero length.
45177	POLLPRI	High-priority data may be read without blocking.
45178	OB XSR	For STREAMS, this flag is set in <i>revents</i> even if the message is of zero length.
45179	POLLOUT	Normal data may be written without blocking.
45180	OB XSR	For STREAMS, data on priority band 0 may be written without blocking.
45181	POLLWRNORM	Equivalent to POLLOUT.
45182	POLLWRBAND	Priority data may be written.
45183	OB XSR	For STREAMS, data on priority bands greater than 0 may be written without
45184		blocking. If any priority band has been written to on this STREAM, this event
45185		only examines bands that have been written to at least once.
45186	POLLERR	An error has occurred on the device or stream. This flag is only valid in the
45187		<i>revents</i> bitmask; it shall be ignored in the <i>events</i> member.
45188	POLLHUP	The device has been disconnected. This event and POLLOUT are mutually-
45189		exclusive; a stream can never be writable if a hangup has occurred. However,
45190		this event and POLLIN, POLLRDNORM, POLLRDBAND, or POLLPRI are
45191		not mutually-exclusive. This flag is only valid in the <i>revents</i> bitmask; it shall be
45192		ignored in the <i>events</i> member.

poll()

- 45193 POLLNVAL The specified *fd* value is invalid. This flag is only valid in the *revents* member;
45194 it shall ignored in the *events* member.
- 45195 The significance and semantics of normal, priority, and high-priority data are file and device-
45196 specific.
- 45197 If the value of *fd* is less than 0, *events* shall be ignored, and *revents* shall be set to 0 in that entry on
45198 return from *poll()*.
- 45199 In each **pollfd** structure, *poll()* shall clear the *revents* member, except that where the application
45200 requested a report on a condition by setting one of the bits of *events* listed above, *poll()* shall set
45201 the corresponding bit in *revents* if the requested condition is true. In addition, *poll()* shall set the
45202 POLLHUP, POLLERR, and POLLNVAL flag in *revents* if the condition is true, even if the
45203 application did not set the corresponding bit in *events*.
- 45204 If none of the defined events have occurred on any selected file descriptor, *poll()* shall wait at
45205 least *timeout* milliseconds for an event to occur on any of the selected file descriptors. If the value
45206 of *timeout* is 0, *poll()* shall return immediately. If the value of *timeout* is -1, *poll()* shall block until
45207 a requested event occurs or until the call is interrupted.
- 45208 Implementations may place limitations on the granularity of timeout intervals. If the requested
45209 timeout interval requires a finer granularity than the implementation supports, the actual
45210 timeout interval shall be rounded up to the next supported value.
- 45211 The *poll()* function shall not be affected by the O_NONBLOCK flag.
- 45212 The *poll()* function shall support regular files, terminal and pseudo-terminal devices, FIFOs,
45213 OB XSR pipes, sockets and STREAMS-based files. The behavior of *poll()* on elements of *fds* that refer to
45214 other types of file is unspecified.
- 45215 Regular files shall always poll TRUE for reading and writing.
- 45216 A file descriptor for a socket that is listening for connections shall indicate that it is ready for
45217 reading, once connections are available. A file descriptor for a socket that is connecting
45218 asynchronously shall indicate that it is ready for writing, once a connection has been established.

RETURN VALUE

- 45219 Upon successful completion, *poll()* shall return a non-negative value. A positive value indicates
45220 the total number of file descriptors that have been selected (that is, file descriptors for which the
45221 *revents* member is non-zero). A value of 0 indicates that the call timed out and no file descriptors
45222 have been selected. Upon failure, *poll()* shall return -1 and set *errno* to indicate the error.

ERRORS

- 45224 The *poll()* function shall fail if:
- 45225 [EAGAIN] The allocation of internal data structures failed but a subsequent request may
45226 succeed.
- 45227 [EINTR] A signal was caught during *poll()*.
- 45228 [EINVAL] OB XSR The *nfds* argument is greater than {OPEN_MAX}, or one of the *fd* members
45229 refers to a STREAM or multiplexer that is linked (directly or indirectly)
45230 downstream from a multiplexer.
45231

EXAMPLES

Checking for Events on a Stream

The following example opens a pair of STREAMS devices and then waits for either one to become writable. This example proceeds as follows:

1. Sets the *timeout* parameter to 500 milliseconds.
2. Opens the STREAMS devices */dev/dev0* and */dev/dev1*, and then polls them, specifying POLLOUT and POLLWRBAND as the events of interest.

The STREAMS device names */dev/dev0* and */dev/dev1* are only examples of how STREAMS devices can be named; STREAMS naming conventions may vary among systems conforming to the POSIX.1-200x.

3. Uses the *ret* variable to determine whether an event has occurred on either of the two STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it has not occurred prior to the *poll()* call).
4. Checks the returned value of *ret*. If a positive value is returned, one of the following can be done:
 - a. Priority data can be written to the open STREAM on priority bands greater than 0, because the POLLWRBAND event occurred on the open STREAM (*fds[0]* or *fds[1]*).
 - b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT event occurred on the open STREAM (*fds[0]* or *fds[1]*).
5. If the returned value is not a positive value, permission to write data to the open STREAM (on any priority band) is denied.
6. If the POLLHUP event occurs on the open STREAM (*fds[0]* or *fds[1]*), the device on the open STREAM has disconnected.

```

45255 #include <stropts.h>
45256 #include <poll.h>
45257 ...
45258 struct pollfd fds[2];
45259 int timeout_msecs = 500;
45260 int ret;
45261 int i;

45262 /* Open STREAMS device. */
45263 fds[0].fd = open("/dev/dev0", ...);
45264 fds[1].fd = open("/dev/dev1", ...);
45265 fds[0].events = POLLOUT | POLLWRBAND;
45266 fds[1].events = POLLOUT | POLLWRBAND;

45267 ret = poll(fds, 2, timeout_msecs);

45268 if (ret > 0) {
45269     /* An event on one of the fds has occurred. */
45270     for (i=0; i<2; i++) {
45271         if (fds[i].revents & POLLWRBAND) {
45272             /* Priority data may be written on device number i. */
45273             ...
45274         }
45275         if (fds[i].revents & POLLOUT) {
45276             /* Data may be written on device number i. */
45277             ...

```

```

45278         }
45279         if (fds[i].revents & POLLHUP) {
45280             /* A hangup has occurred on device number i. */
45281             ...
45282         }
45283     }
45284 }

```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The description of POLLWRBAND is updated.

Issue 6

Text referring to sockets is added to the DESCRIPTION.

Functionality relating to the XSI STREAMS Option Group is marked.

The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of POLLWRBAND.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/66 is applied, correcting the spacing in the EXAMPLES section.

Issue 7

The *poll()* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

45309 **NAME**
 45310 popen — initiate pipe streams to or from a process

45311 **SYNOPSIS**

```
45312 CX #include <stdio.h>
45313 FILE *popen(const char *command, const char *mode);
```

45314 **DESCRIPTION**

45315 The *popen()* function shall execute the command specified by the string *command*. It shall create
 45316 a pipe between the calling program and the executed command, and shall return a pointer to a
 45317 stream that can be used to either read from or write to the pipe.

45318 The environment of the executed command shall be as if a child process were created within the
 45319 *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

```
45320 execl(shell_path, "sh", "-c", command, (char *)0);
```

45321 where *shell_path* is an unspecified pathname for the *sh* utility.

45322 The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open
 45323 in the parent process are closed in the new child process.

45324 The *mode* argument to *popen()* is a string that specifies I/O mode:

- 45325 1. If *mode* is *r*, when the child process is started, its file descriptor `STDOUT_FILENO` shall be
 45326 the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,
 45327 where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the
 45328 pipe.
- 45329 2. If *mode* is *w*, when the child process is started its file descriptor `STDIN_FILENO` shall be
 45330 the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,
 45331 where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the
 45332 pipe.
- 45333 3. If *mode* is any other value, the result is unspecified.

45334 After *popen()*, both the parent and the child process shall be capable of executing independently
 45335 before either terminates.

45336 Pipe streams are byte-oriented.

45337 **RETURN VALUE**

45338 Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to
 45339 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate
 45340 the error.

45341 **ERRORS**

45342 The *popen()* function shall fail if: +

45343 [EMFILE] {STREAM_MAX} streams are currently open in the calling process. +

45344 The *popen()* function may fail if:

45345 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process. -

45346 [EINVAL] The *mode* argument is invalid.

45347 The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

EXAMPLES

Using popen() to Obtain a List of Files from the ls Utility

The following example demonstrates the use of *popen()* and *pclose()* to execute the command *ls** in order to obtain a list of files in the current directory:

```

45352 #include <stdio.h>
45353 ...
45354 FILE *fp;
45355 int status;
45356 char path[PATH_MAX];
45357 fp = popen("ls *", "r");
45358 if (fp == NULL)
45359     /* Handle error */;
45360 while (fgets(path, PATH_MAX, fp) != NULL)
45361     printf("%s", path);
45362 status = pclose(fp);
45363 if (status == -1) {
45364     /* Error reported by pclose() */
45365     ...
45366 } else {
45367     /* Use macros described under wait() to inspect 'status' in order
45368        to determine success/failure of command executed by popen() */
45369     ...
45370 }

```

APPLICATION USAGE

Since open files are shared, a mode *r* command can be used as an input filter and a mode *w* command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with *fflush()*.

A stream opened by *popen()* should be closed by *pclose()*.

The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and *wb* might be supported by specific implementations, but these would not be portable features. Note that historical implementations of *popen()* only check to see if the first character of *mode* is *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be treated as *mode w*.

If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process started by *popen()*.

To determine whether or not the environment specified in the Shell and Utilities volume of POSIX.1-200x is present, use the function call:

```
sysconf(_SC_2_VERSION)
```

(See *sysconf()*).

45418

RATIONALE

The *popen()* function should not be used by programs that have set user (or group) ID privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

If the original and *popen()*ed processes both intend to read or write or read and write a common file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for sharing file handles must be observed (see [Section 2.5.1](#), on page 470).

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The optional [EMFILE] error condition is added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/67 is applied, adding the example to the EXAMPLES section.

Issue 7

Austin Group Interpretation 1003.1-2001 #029 is applied, clarifying the values for *mode* in the DESCRIPTION.

SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a "may fail" to a "shall fail".

45419 **NAME**45420 posix_fadvise — file advisory information (**ADVANCED REALTIME**)45421 **SYNOPSIS**

```
45422 ADV #include <fcntl.h>
45423 int posix_fadvise(int fd, off_t offset, off_t len, int advice);
```

45424 **DESCRIPTION**

45425 The *posix_fadvise()* function shall advise the implementation on the expected behavior of the
 45426 application with respect to the data in the file associated with the open file descriptor, *fd*, starting
 45427 at *offset* and continuing for *len* bytes. The specified range need not currently exist in the file. If *len*
 45428 is zero, all data following *offset* is specified. The implementation may use this information to
 45429 optimize handling of the specified data. The *posix_fadvise()* function shall have no effect on the
 45430 semantics of other operations on the specified data, although it may affect the performance of
 45431 other operations.

45432 The advice to be applied to the data is specified by the *advice* parameter and may be one of the
 45433 following values:

45434 **POSIX_FADV_NORMAL**

45435 Specifies that the application has no advice to give on its behavior with respect to the
 45436 specified data. It is the default characteristic if no advice is given for an open file.

45437 **POSIX_FADV_SEQUENTIAL**

45438 Specifies that the application expects to access the specified data sequentially from lower
 45439 offsets to higher offsets.

45440 **POSIX_FADV_RANDOM**

45441 Specifies that the application expects to access the specified data in a random order.

45442 **POSIX_FADV_WILLNEED**

45443 Specifies that the application expects to access the specified data in the near future.

45444 **POSIX_FADV_DONTNEED**

45445 Specifies that the application expects that it will not access the specified data in the near
 45446 future.

45447 **POSIX_FADV_NOREUSE**

45448 Specifies that the application expects to access the specified data once and then not reuse it
 45449 thereafter.

45450 These values are defined in **<fcntl.h>**.

45451 **RETURN VALUE**

45452 Upon successful completion, *posix_fadvise()* shall return zero; otherwise, an error number shall
 45453 be returned to indicate the error.

45454 **ERRORS**

45455 The *posix_fadvise()* function shall fail if:

- | | | |
|-------|----------|--|
| 45456 | [EBADF] | The <i>fd</i> argument is not a valid file descriptor. |
| 45457 | [EINVAL] | The value of <i>advice</i> is invalid, or the value of <i>len</i> is less than zero. |
| 45458 | [ESPIPE] | The <i>fd</i> argument is associated with a pipe or FIFO. |

45459 **EXAMPLES**

45460 None.

45461 **APPLICATION USAGE**45462 The *posix_fadvise()* function is part of the Advisory Information option and need not be
45463 provided on all implementations.45464 **RATIONALE**

45465 None.

45471 **CHANGE HISTORY**

45472 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

45473 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

45474 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/68 is applied, changing the function
45475 prototype in the SYNOPSIS section. The previous prototype was not large file-aware, and the
45476 standard developers felt it acceptable to make this change before implementations of this
45477 function become widespread.45478 **Issue 7**45479 Austin Group Interpretation 1003.1-2001 #024 is applied, changing the definition of the
45480 [EINVAL] error.

45481 **NAME**45482 posix_fallocate — file space control (**ADVANCED REALTIME**)45483 **SYNOPSIS**

45484 ADV #include <fcntl.h>

45485 int posix_fallocate(int *fd*, off_t *offset*, off_t *len*);45486 **DESCRIPTION**

45487 The *posix_fallocate()* function shall ensure that any required storage for regular file data starting
 45488 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If
 45489 *posix_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail due
 45490 to the lack of free space on the file system storage media.

45491 If the *offset+len* is beyond the current file size, then *posix_fallocate()* shall adjust the file size to
 45492 *offset+len*. Otherwise, the file size shall not be changed.

45493 It is implementation-defined whether a previous *posix_fadvise()* call influences allocation
 45494 strategy.

45495 Space allocated via *posix_fallocate()* shall be freed by a successful call to *creat()* or *open()* that
 45496 truncates the size of the file. Space allocated via *posix_fallocate()* may be freed by a successful call
 45497 to *truncate()* that reduces the file size to a size smaller than *offset+len*.

45498 **RETURN VALUE**

45499 Upon successful completion, *posix_fallocate()* shall return zero; otherwise, an error number shall
 45500 be returned to indicate the error.

45501 **ERRORS**45502 The *posix_fallocate()* function shall fail if:

- | | | |
|-------|----------|--|
| 45503 | [EBADF] | The <i>fd</i> argument is not a valid file descriptor. |
| 45504 | [EBADF] | The <i>fd</i> argument references a file that was opened without write permission. |
| 45505 | [EFBIG] | The value of <i>offset+len</i> is greater than the maximum file size. |
| 45506 | [EINTR] | A signal was caught during execution. |
| 45507 | [EINVAL] | The <i>len</i> argument is less than or equal to zero, or the <i>offset</i> argument is less than zero, or the underlying file system does not support this operation. |
| 45508 | | |
| 45509 | [EIO] | An I/O error occurred while reading from or writing to a file system. |
| 45510 | [ENODEV] | The <i>fd</i> argument does not refer to a regular file. |
| 45511 | [ENOSPC] | There is insufficient free space remaining on the file system storage media. |
| 45512 | [ESPIPE] | The <i>fd</i> argument is associated with a pipe or FIFO. |

45513 **EXAMPLES**

45514 None.

45515 **APPLICATION USAGE**

45516 The *posix_fallocate()* function is part of the Advisory Information option and need not be
 45517 provided on all implementations.

DRAFT

45535 **NAME**

45536 `posix_madvise` — memory advisory information and alignment control (**ADVANCED**
 45537 **REALTIME**)

45538 **SYNOPSIS**

```
45539 ADV #include <sys/mman.h>
45540 int posix_madvise(void *addr, size_t len, int advice);
```

45541 **DESCRIPTION**

45542 The `posix_madvise()` function shall advise the implementation on the expected behavior of the
 45543 application with respect to the data in the memory starting at address `addr`, and continuing for
 45544 `len` bytes. The implementation may use this information to optimize handling of the specified
 45545 data. The `posix_madvise()` function shall have no effect on the semantics of access to memory in
 45546 the specified range, although it may affect the performance of access.

45547 The implementation may require that `addr` be a multiple of the page size, which is the value
 45548 returned by `sysconf()` when the name value `_SC_PAGESIZE` is used.

45549 The advice to be applied to the memory range is specified by the `advice` parameter and may be
 45550 one of the following values:

45551 **POSIX_MADV_NORMAL**

45552 Specifies that the application has no advice to give on its behavior with respect to the
 45553 specified range. It is the default characteristic if no advice is given for a range of memory.

45554 **POSIX_MADV_SEQUENTIAL**

45555 Specifies that the application expects to access the specified range sequentially from lower
 45556 addresses to higher addresses.

45557 **POSIX_MADV_RANDOM**

45558 Specifies that the application expects to access the specified range in a random order.

45559 **POSIX_MADV_WILLNEED**

45560 Specifies that the application expects to access the specified range in the near future.

45561 **POSIX_MADV_DONTNEED**

45562 Specifies that the application expects that it will not access the specified range in the near
 45563 future.

45564 These values are defined in the `<sys/mman.h>` header.

45565 **RETURN VALUE**

45566 Upon successful completion, `posix_madvise()` shall return zero; otherwise, an error number shall
 45567 be returned to indicate the error.

45568 **ERRORS**

45569 The `posix_madvise()` function shall fail if:

45570 [EINVAL] The value of `advice` is invalid.

45571 [ENOMEM] Addresses in the range starting at `addr` and continuing for `len` bytes are partly
 45572 or completely outside the range allowed for the address space of the calling
 45573 process.

45574 The *posix_madvise()* function may fail if:

45575 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the
45576 name value *_SC_PAGESIZE* is used.

45577 [EINVAL] The value of *len* is zero.

EXAMPLES

45578 None.

CHANGE HISTORY

45590 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
45591

45592 IEEE PASC Interpretation 1003.1 #102 is applied.

45593 **NAME**

45594 **posix_mem_offset** — find offset and length of a mapped typed memory block (**ADVANCED**
 45595 **REALTIME**)

45596 **SYNOPSIS**

```
45597 TYM #include <sys/mman.h>
45598
45598 int posix_mem_offset(const void *restrict addr, size_t len,
45599 off_t *restrict off, size_t *restrict contig_len,
45600 int *restrict fildes);
```

45601 **DESCRIPTION**

45602 The *posix_mem_offset()* function shall return in the variable pointed to by *off* a value that
 45603 identifies the offset (or location), within a memory object, of the memory block currently
 45604 mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used
 45605 (via *mmap()*) to establish the mapping which contains *addr*. If that descriptor was closed since
 45606 the mapping was established, the returned value of *fildes* shall be -1 . The *len* argument specifies
 45607 the length of the block of the memory object the user wishes the offset for; upon return, the
 45608 value pointed to by *contig_len* shall equal either *len*, or the length of the largest contiguous block
 45609 of the memory object that is currently mapped to the calling process starting at *addr*, whichever
 45610 is smaller.

45611 If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig_len*
 45612 values obtained by calling *posix_mem_offset()* are used in a call to *mmap()* with a file descriptor
 45613 that refers to the same memory pool as *fildes* (either through the same port or through a different
 45614 port), and that was opened with neither the `POSIX_TYPED_MEM_ALLOCATE` nor the
 45615 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag, the typed memory area that is mapped shall
 45616 be exactly the same area that was mapped at *addr* in the address space of the process that called
 45617 *posix_mem_offset()*.

45618 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this
 45619 function is implementation-defined.

45620 **RETURN VALUE**

45621 Upon successful completion, the *posix_mem_offset()* function shall return zero; otherwise, the
 45622 corresponding error status value shall be returned.

45623 **ERRORS**

45624 The *posix_mem_offset()* function shall fail if:

45625 [EACCES] The process has not mapped a memory object supported by this function at
 45626 the given address *addr*.

45627 This function shall not return an error code of [EINTR].

45673 **CHANGE HISTORY**

45674 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

45675 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.

45676 **Issue 7**

45677 Austin Group Interpretation 1003.1-2001 #058 is applied, clarifying the value of the *alignment*
 45678 argument in the DESCRIPTION.

45679 **NAME**
 45680 posix_openpt — open a pseudo-terminal device

45681 **SYNOPSIS**

```
45682 XSI #include <stdlib.h>
45683 #include <fcntl.h>
45684 int posix_openpt(int oflag);
```

45685 **DESCRIPTION**

45686 The *posix_openpt()* function shall establish a connection between a master device for a pseudo-
 45687 terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that
 45688 pseudo-terminal.

45689 The file status flags and file access modes of the open file description shall be set according to
 45690 the value of *oflag*.

45691 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
 45692 in **<fcntl.h>**:

45693 O_RDWR Open for reading and writing.
 45694 O_NOCTTY If set *posix_openpt()* shall not cause the terminal device to become the
 45695 controlling terminal for the process.

45696 The behavior of other values for the *oflag* argument is unspecified.

45697 **RETURN VALUE**

45698 Upon successful completion, the *posix_openpt()* function shall open a master pseudo-terminal
 45699 device and return a non-negative integer representing the lowest numbered unused file
 45700 descriptor. Otherwise, -1 shall be returned and *errno* set to indicate the error.

45701 **ERRORS**

45702 The *posix_openpt()* function shall fail if:

45703 [EMFILE] All file descriptors available to the process are currently open.
 45704 [ENFILE] The maximum allowable number of files is currently open in the system.

45705 The *posix_openpt()* function may fail if:

45706 [EINVAL] The value of *oflag* is not valid.
 45707 [EAGAIN] Out of pseudo-terminal resources.

45708 OB XSR [ENOSR] Out of STREAMS resources.

45709 **EXAMPLES**

45710 **Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File**
 45711 **Descriptor**

```
45712 #include <fcntl.h>
45713 #include <stdio.h>
45714 int masterfd, slavefd;
45715 char *slavedevice;
45716 masterfd = posix_openpt(O_RDWR|O_NOCTTY);
45717 if (masterfd == -1
```

posix_openpt()

```

45718     || grantpt (masterfd) == -1
45719     || unlockpt (masterfd) == -1
45720     || (slavedevice = ptsname (masterfd)) == NULL)
45721     return -1;

45722     printf("slave device is: %s\n", slavedevice);

45723     slavefd = open(slavedevice, O_RDWR|O_NOCTTY);
45724     if (slavefd < 0)
45725         return -1;

```

APPLICATION USAGE

45726 This function is a method for portably obtaining a file descriptor of a master terminal device for
 45727 a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and
 45728 ownership permissions, and to obtain the name of the slave device, respectively.
 45729

RATIONALE

45730 The standard developers considered the matter of adding a special device for cloning master
 45731 pseudo-terminals: the */dev/ptmx* device. However, consensus could not be reached, and it was
 45732 felt that adding a new function would permit other implementations. The *posix_openpt()*
 45733 function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.
 45734

45735 On implementations supporting the */dev/ptmx* clone device, opening the master device of a
 45736 pseudo-terminal is simply:

```

45737     mfdp = open("/dev/ptmx", oflag );
45738     if (mfdp < 0)
45739         return -1;

```

FUTURE DIRECTIONS

45740 None.

NAME

posix_spawn, posix_spawnnp — spawn a process (**ADVANCED REALTIME**)

SYNOPSIS

```
SPN    #include <spawn.h>

45754    int posix_spawn(pid_t *restrict pid, const char *restrict path,
45755                const posix_spawn_file_actions_t *file_actions,
45756                const posix_spawnattr_t *restrict attrp,
45757                char *const argv[restrict], char *const envp[restrict]);
45758    int posix_spawnnp(pid_t *restrict pid, const char *restrict file,
45759                const posix_spawn_file_actions_t *file_actions,
45760                const posix_spawnattr_t *restrict attrp,
45761                char *const argv[restrict], char *const envp[restrict]);
```

DESCRIPTION

The *posix_spawn()* and *posix_spawnnp()* functions shall create a new process (child process) from the specified process image. The new process image shall be constructed from a regular executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language function call as follows:

```
int main(int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument *argv* is an array of character pointers to null-terminated strings. The last member of this array shall be a null pointer and is not counted in *argc*. These strings constitute the argument list available to the new process image. The value in *argv*[0] should point to a filename that is associated with the process image being started by the *posix_spawn()* or *posix_spawnnp()* function.

The argument *envp* is an array of character pointers to null-terminated strings. These strings constitute the environment for the new process image. The environment array is terminated by a null pointer.

The number of bytes available for the combined argument and environment lists of the child process is {ARG_MAX}. The implementation shall specify in the system documentation (see XBD Chapter 2, on page 15) whether any list overhead, such as length words, null terminators, pointers, or alignment bytes, is included in this total.

The *path* argument to *posix_spawn()* is a pathname that identifies the new process image file to execute.

The *file* parameter to *posix_spawnnp()* shall be used to construct a pathname that identifies the new process image file. If the *file* parameter contains a slash character, the *file* parameter shall be used as the pathname for the new process image file. Otherwise, the path prefix for this file shall be obtained by a search of the directories passed as the environment variable *PATH* (see XBD Chapter 8, on page 159). If this environment variable is not defined, the results of the search are implementation-defined.

If *file_actions* is a null pointer, then file descriptors open in the calling process shall remain open

45794 in the child process, except for those whose close-on-exec flag `FD_CLOEXEC` is set (see `fcntl()`).
 45795 For those file descriptors that remain open, all attributes of the corresponding open file
 45796 descriptions, including file locks (see `fcntl()`), shall remain unchanged.

45797 If `file_actions` is not `NULL`, then the file descriptors open in the child process shall be those open
 45798 in the calling process as modified by the spawn file actions object pointed to by `file_actions` and
 45799 the `FD_CLOEXEC` flag of each remaining open file descriptor after the spawn file actions have
 45800 been processed. The effective order of processing the spawn file actions shall be:

- 45801 1. The set of open file descriptors for the child process shall initially be the same set as is
 45802 open for the calling process. All attributes of the corresponding open file descriptions,
 45803 including file locks (see `fcntl()`), shall remain unchanged.
- 45804 2. The signal mask, signal default actions, and the effective user and group IDs for the child
 45805 process shall be changed as specified in the attributes object referenced by `attrp`.
- 45806 3. The file actions specified by the spawn file actions object shall be performed in the order
 45807 in which they were added to the spawn file actions object.
- 45808 4. Any file descriptor that has its `FD_CLOEXEC` flag set (see `fcntl()`) shall be closed.

45809 The `posix_spawnattr_t` spawn attributes object type is defined in `<spawn.h>`. It shall contain at
 45810 least the attributes defined below.

45811 If the `POSIX_SPAWN_SETPGROUP` flag is set in the `spawn_flags` attribute of the object referenced
 45812 by `attrp`, and the `spawn-pgroup` attribute of the same object is non-zero, then the child's process
 45813 group shall be as specified in the `spawn-pgroup` attribute of the object referenced by `attrp`.

45814 As a special case, if the `POSIX_SPAWN_SETPGROUP` flag is set in the `spawn_flags` attribute of
 45815 the object referenced by `attrp`, and the `spawn-pgroup` attribute of the same object is set to zero,
 45816 then the child shall be in a new process group with a process group ID equal to its process ID.

45817 If the `POSIX_SPAWN_SETPGROUP` flag is not set in the `spawn_flags` attribute of the object
 45818 referenced by `attrp`, the new child process shall inherit the parent's process group.

45819 PS If the `POSIX_SPAWN_SETSCHEDPARAM` flag is set in the `spawn_flags` attribute of the object
 45820 referenced by `attrp`, but `POSIX_SPAWN_SETSCHEDULER` is not set, the new process image
 45821 shall initially have the scheduling policy of the calling process with the scheduling parameters
 45822 specified in the `spawn-schedparam` attribute of the object referenced by `attrp`.

45823 If the `POSIX_SPAWN_SETSCHEDULER` flag is set in the `spawn_flags` attribute of the object
 45824 referenced by `attrp` (regardless of the setting of the `POSIX_SPAWN_SETSCHEDPARAM` flag),
 45825 the new process image shall initially have the scheduling policy specified in the `spawn-`
 45826 `schedpolicy` attribute of the object referenced by `attrp` and the scheduling parameters specified in
 45827 the `spawn-schedparam` attribute of the same object.

45828 The `POSIX_SPAWN_RESETPID` flag in the `spawn_flags` attribute of the object referenced by `attrp`
 45829 governs the effective user ID of the child process. If this flag is not set, the child process shall
 45830 inherit the effective user ID of the parent process. If this flag is set, the effective user ID of the
 45831 child process shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit
 45832 of the new process image file is set, the effective user ID of the child process shall become that
 45833 file's owner ID before the new process image begins execution.

45834 The `POSIX_SPAWN_RESETPID` flag in the `spawn_flags` attribute of the object referenced by `attrp`
 45835 also governs the effective group ID of the child process. If this flag is not set, the child process
 45836 shall inherit the effective group ID of the parent process. If this flag is set, the effective group ID
 45837 of the child process shall be reset to the parent's real group ID. In either case, if the set-group-ID
 45838 mode bit of the new process image file is set, the effective group ID of the child process shall
 45839 become that file's group ID before the new process image begins execution.

45840 If the `POSIX_SPAWN_SETSIGMASK` flag is set in the `spawn_flags` attribute of the object

45841 referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-*
 45842 *sigmask* attribute of the object referenced by *attrp*.

45843 If the POSIX_SPAWN_SETSIGDEF flag is set in the *spawn-flags* attribute of the object referenced
 45844 by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to
 45845 their default actions in the child process. Signals set to the default action in the parent process
 45846 shall be set to the default action in the child process.

45847 Signals set to be caught by the calling process shall be set to the default action in the child
 45848 process.

45849 Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be
 45850 ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag
 45851 being set in the *spawn-flags* attribute of the object referenced by *attrp* and the signals being
 45852 indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

45853 If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the
 45854 SIGCHLD signal is set to be ignored or to the default action in the child process, unless
 45855 otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn-flags*
 45856 attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the
 45857 *spawn-sigdefault* attribute of the object referenced by *attrp*.

45858 If the value of the *attrp* pointer is NULL, then the default values are used.

45859 All process attributes, other than those influenced by the attributes set in the object referenced
 45860 by *attrp* as specified above or by the file descriptor manipulations specified in *file_actions*, shall
 45861 appear in the new process image as though *fork()* had been called to create a child process and
 45862 then a member of the *exec* family of functions had been called by the child process to execute the
 45863 new process image.

45864 It is implementation-defined whether the fork handlers are run when *posix_spawn()* or
 45865 *posix_spawnnp()* is called.

45866 **RETURN VALUE**

45867 Upon successful completion, *posix_spawn()* and *posix_spawnnp()* shall return the process ID of the
 45868 child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and
 45869 shall return zero as the function return value. Otherwise, no child process shall be created, the
 45870 value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number
 45871 shall be returned as the function return value to indicate the error. If the *pid* argument is a null
 45872 pointer, the process ID of the child is not returned to the caller.

45873 **ERRORS**

45874 The *posix_spawn()* and *posix_spawnnp()* functions may fail if:

45875 [EINVAL] The value specified by *file_actions* or *attrp* is invalid.

45876 If this error occurs after the calling process successfully returns from the *posix_spawn()* or
 45877 *posix_spawnnp()* function, the child process may exit with exit status 127.

45878 If *posix_spawn()* or *posix_spawnnp()* fail for any of the reasons that would cause *fork()* or one of
 45879 the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and
 45880 *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child
 45881 process shall exit with exit status 127).

45882 If POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute of the object referenced by
 45883 *attrp*, and *posix_spawn()* or *posix_spawnnp()* fails while changing the child's process group, an
 45884 error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling
 45885 process successfully returns, the child process shall exit with exit status 127).

45886 PS If POSIX_SPAWN_SETSCHEDPARAM is set and POSIX_SPAWN_SETSCHEDULER is not set in
 45887 the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix_spawn()* or *posix_spawnnp()*

45888 fails for any of the reasons that would cause *sched_setparam()* to fail, an error value shall be
 45889 returned as described by *sched_setparam()* (or, if the error occurs after the calling process
 45890 successfully returns, the child process shall exit with exit status 127).

45891 If `POSIX_SPAWN_SETSCHEDULER` is set in the *spawn-flags* attribute of the object referenced by
 45892 *attrp*, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause
 45893 *sched_setscheduler()* to fail, an error value shall be returned as described by *sched_setscheduler()*
 45894 (or, if the error occurs after the calling process successfully returns, the child process shall exit
 45895 with exit status 127).

45896 If the *file_actions* argument is not `NULL`, and specifies any *close*, *dup2*, or *open* actions to be
 45897 performed, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause
 45898 *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*, *dup2()*,
 45899 and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the
 45900 child process shall exit with exit status 127). An open file action may, by itself, result in any of
 45901 the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

EXAMPLES

45902 None.
 45903

APPLICATION USAGE

45904 These functions are part of the Spawn option and need not be provided on all implementations.
 45905

RATIONALE

45906 The *posix_spawn()* function and its close relation *posix_spawnnp()* have been introduced to
 45907 overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or
 45908 impossible to implement without swapping or dynamic address translation.
 45909

- 45910 • Swapping is generally too slow for a realtime environment.
- 45911 • Dynamic address translation is not available everywhere that POSIX might be useful.
- 45912 • Processes are too useful to simply option out of POSIX whenever it must run without
 45913 address translation or other MMU services.

45914 Thus, POSIX needs process creation and file execution primitives that can be efficiently
 45915 implemented without address translation or other MMU services.

45916 The *posix_spawn()* function is implementable as a library routine, but both *posix_spawn()* and
 45917 *posix_spawnnp()* are designed as kernel operations. Also, although they may be an efficient
 45918 replacement for many *fork()/exec* pairs, their goal is to provide useful process creation
 45919 primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for
 45920 *fork()/exec*.

45921 This view of the role of *posix_spawn()* and *posix_spawnnp()* influenced the design of their API. It
 45922 does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified
 45923 operations of any sort are permitted between the creation of the child process and the execution
 45924 of the new process image; any attempt to reach that level would need to provide a programming
 45925 language as parameters. Instead, *posix_spawn()* and *posix_spawnnp()* are process creation
 45926 primitives like the *Start_Process* and *Start_Process_Search* Ada language bindings package
 45927 *POSIX_Process_Primitives* and also like those in many operating systems that are not UNIX
 45928 systems, but with some POSIX-specific additions.

45929 To achieve its coverage goals, *posix_spawn()* and *posix_spawnnp()* have control of six types of
 45930 inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and
 45931 whether each signal ignored in the parent will remain ignored in the child, or be reset to its
 45932 default action in the child.

45933 Control of file descriptors is required to allow an independently written child process image to
 45934 access data streams opened by and even generated or read by the parent process without being
 45935 specifically coded to know which parent files and file descriptors are to be used. Control of the

45936 process group ID is required to control how the job control of the child process relates to that of
45937 the parent.

45938 Control of the signal mask and signal defaulting is sufficient to support the implementation of
45939 *system()*. Although support for *system()* is not explicitly one of the goals for *posix_spawn()* and
45940 *posix_spawnnp()*, it is covered under the “at least 50%” coverage goal.

45941 The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of
45942 the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec*
45943 family of functions should fully specify open file inheritance. The implementation need make no
45944 decisions regarding the set of open file descriptors when the child process image begins
45945 execution, those decisions having already been made by the caller and expressed as the set of
45946 open file descriptors and their FD_CLOEXEC flags at the time of the call and the spawn file
45947 actions object specified in the call. We have been assured that in cases where the POSIX
45948 *Start_Process* Ada primitives have been implemented in a library, this method of controlling file
45949 descriptor inheritance may be implemented very easily.

45950 We can identify several problems with *posix_spawn()* and *posix_spawnnp()*, but there does not
45951 appear to be a solution that introduces fewer problems. Environment modification for child
45952 process attributes not specifiable via the *attrp* or *file_actions* arguments must be done in the
45953 parent process, and since the parent generally wants to save its context, it is more costly than
45954 similar functionality with *fork()/exec*. It is also complicated to modify the environment of a
45955 multi-threaded process temporarily, since all threads must agree when it is safe for the
45956 environment to be changed. However, this cost is only borne by those invocations of
45957 *posix_spawn()* and *posix_spawnnp()* that use the additional functionality. Since extensive
45958 modifications are not the usual case, and are particularly unlikely in time-critical code, keeping
45959 much of the environment control out of *posix_spawn()* and *posix_spawnnp()* is appropriate design.

45960 The *posix_spawn()* and *posix_spawnnp()* functions do not have all the power of *fork()/exec*. This is
45961 to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to
45962 duplicate its functionality in a simple, fast function with no special hardware requirements. It is
45963 worth noting that *posix_spawn()* and *posix_spawnnp()* are very similar to the process creation
45964 operations on many operating systems that are not UNIX systems.

45965 Requirements

45966 The requirements for *posix_spawn()* and *posix_spawnnp()* are:

- 45967 • They must be implementable without an MMU or unusual hardware.
- 45968 • They must be compatible with existing POSIX standards.

45969 Additional goals are:

- 45970 • They should be efficiently implementable.
- 45971 • They should be able to replace at least 50% of typical executions of *fork()*.
- 45972 • A system with *posix_spawn()* and *posix_spawnnp()* and without *fork()* should be useful, at
45973 least for realtime applications.
- 45974 • A system with *fork()* and the *exec* family should be able to implement *posix_spawn()* and
45975 *posix_spawnnp()* as library routines.

45976

Two-Syntax

45977

45978

45979

45980

POSIX *exec* has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the *posix_spawn**() functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the *posix_spawn**() functions.

45981

45982

The parameter list does not differ between *posix_spawn*() and *posix_spawnp*(); *posix_spawnp*() interprets the second parameter more elaborately than *posix_spawn*() .

45983

Compatibility with POSIX.5 (Ada)

45984

45985

45986

45987

45988

45989

45990

45991

45992

45993

45994

45995

45996

45997

45998

The *Start_Process* and *Start_Process_Search* procedures from the *POSIX_Process_Primitives* package from the Ada language binding to POSIX.1 encapsulate *fork*() and *exec* functionality in a manner similar to that of *posix_spawn*() and *posix_spawnp*() . Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of *posix_spawn*() and *posix_spawnp*() to a subset of the capabilities of *Start_Process* and *Start_Process_Search*; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that *posix_spawn*() and *posix_spawnp*() should be sufficiently powerful to implement *Start_Process* and *Start_Process_Search*. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by *posix_spawn*() and *posix_spawnp*() that are not provided by *Start_Process* and *Start_Process_Search* are optionally specifying the child's process group ID, the set of signals to be reset to default signal handling in the child process, and the child's scheduling policy and parameters.

45999

46000

46001

46002

46003

46004

For the Ada language binding for *Start_Process* to be implemented with *posix_spawn*() , that binding would need to explicitly pass an empty signal mask and the parent's environment to *posix_spawn*() whenever the caller of *Start_Process* allowed these arguments to default, since *posix_spawn*() does not provide such defaults. The ability of *Start_Process* to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to *posix_spawn*() .

46005

Process Group

46006

46007

46008

The process group inheritance field can be used to join the child process with an existing process group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by *attrp*, the *setpgid*() mechanism will place the child process in a new process group.

46009

Threads

46010

46011

46012

46013

46014

46015

46016

46017

46018

Without the *posix_spawn*() and *posix_spawnp*() functions, systems without address translation can still use threads to give an abstraction of concurrency. In many cases, thread creation suffices, but it is not always a good substitute. The *posix_spawn*() and *posix_spawnp*() functions are considerably "heavier" than thread creation. Processes have several important attributes that threads do not. Even without address translation, a process may have base-and-bound memory protection. Each process has a process environment including security attributes and file capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-uniform-memory-architecture multi-processors better than threads, and they are more convenient to use for activities that are not closely linked.

46019

46020

46021

46022

46023

The *posix_spawn*() and *posix_spawnp*() functions may not bring support for multiple processes to every configuration. Process creation is not the only piece of operating system support required to support multiple processes. The total cost of support for multiple processes may be quite high in some circumstances. Existing practice shows that support for multiple processes is uncommon and threads are common among "tiny kernels". There should, therefore, probably

46024 continue to be AEPs for operating systems with only one process.

46025 **Asynchronous Error Notification**

46026 A library implementation of *posix_spawn()* or *posix_spawnp()* may not be able to detect all
46027 possible errors before it forks the child process. POSIX.1-200x provides for an error indication
46028 returned from a child process which could not successfully complete the spawn operation via a
46029 special exit status which may be detected using the status value returned by *wait()*, *waitid()*, and
46030 *waitpid()*.

46031 The *stat_val* interface and the macros used to interpret it are not well suited to the purpose of
46032 returning API errors, but they are the only path available to a library implementation. Thus, an
46033 implementation may cause the child process to exit with exit status 127 for any error detected
46034 during the spawn process after the *posix_spawn()* or *posix_spawnp()* function has successfully
46035 returned.

46036 The standard developers had proposed using two additional macros to interpret *stat_val*. The
46037 first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because
46038 of an error detected during the *posix_spawn()* or *posix_spawnp()* operations rather than during
46039 actual execution of the child process image; the second, WSPAWNERRNO, would have
46040 extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group
46041 strongly opposed this because it would make a library implementation of *posix_spawn()* or
46042 *posix_spawnp()* dependent on kernel modifications to *waitpid()* to be able to embed special
46043 information in *stat_val* to indicate a spawn failure.

46044 The 8 bits of child process exit status that are guaranteed by POSIX.1-200x to be accessible to the
46045 waiting parent process are insufficient to disambiguate a spawn error from any other kind of
46046 error that may be returned by an arbitrary process image. No other bits of the exit status are
46047 required to be visible in *stat_val*, so these macros could not be strictly implemented at the library
46048 level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this
46049 value by *system()* and *popen()* to signal failures in these operations that occur after the function
46050 has returned but before a shell is able to execute. The exit status of 127 does not uniquely
46051 identify this class of error, nor does it provide any detailed information on the nature of the
46052 failure. Note that a kernel implementation of *posix_spawn()* or *posix_spawnp()* is permitted (and
46053 encouraged) to return any possible error as the function value, thus providing more detailed
46054 failure information to the parent process.

46055 Thus, no special macros are available to isolate asynchronous *posix_spawn()* or *posix_spawnp()*
46056 errors. Instead, errors detected by the *posix_spawn()* or *posix_spawnp()* operations in the context
46057 of the child process before the new process image executes are reported by setting the child's exit
46058 status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the
46059 *stat_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that
46060 other status values with which the child process image may exit (before the parent can
46061 conclusively determine that the child process image has begun execution) are distinct from exit
46062 status 127.

46078	Functionality relating to the Threads option is moved to the Base.

46079 **NAME**

46080 `posix_spawn_file_actions_addclose`, `posix_spawn_file_actions_addopen` — add close or open
 46081 action to spawn file actions object (**ADVANCED REALTIME**)

46082 **SYNOPSIS**

```
46083 SPN #include <spawn.h>
46084
46084 int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t
46085 *file_actions, int fildes);
46086 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t
46087 *restrict file_actions, int fildes,
46088 const char *restrict path, int oflag, mode_t mode);
```

46089 **DESCRIPTION**

46090 These functions shall add or delete a close or open action to a spawn file actions object.

46091 A spawn file actions object is of type **posix_spawn_file_actions_t** (defined in `<spawn.h>`) and is
 46092 used to specify a series of actions to be performed by a `posix_spawn()` or `posix_spawnwp()`
 46093 operation in order to arrive at the set of open file descriptors for the child process given the set
 46094 of open file descriptors of the parent. POSIX.1-200x does not define comparison or assignment
 46095 operators for the type **posix_spawn_file_actions_t**.

46096 A spawn file actions object, when passed to `posix_spawn()` or `posix_spawnwp()`, shall specify how
 46097 the set of open file descriptors in the calling process is transformed into a set of potentially open
 46098 file descriptors for the spawned process. This transformation shall be as if the specified sequence
 46099 of actions was performed exactly once, in the context of the spawned process (prior to execution
 46100 of the new process image), in the order in which the actions were added to the object;
 46101 additionally, when the new process image is executed, any file descriptor (from this new set)
 46102 which has its `FD_CLOEXEC` flag set shall be closed (see `posix_spawn()`).

46103 The `posix_spawn_file_actions_addclose()` function shall add a *close* action to the object referenced
 46104 by *file_actions* that shall cause the file descriptor *fildes* to be closed (as if `close(fildes)` had been
 46105 called) when a new process is spawned using this file actions object.

46106 The `posix_spawn_file_actions_addopen()` function shall add an *open* action to the object referenced
 46107 by *file_actions* that shall cause the file named by *path* to be opened (as if `open(path, oflag, mode)`
 46108 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a
 46109 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,
 46110 it shall be closed before the new file is opened.

46111 The string described by *path* shall be copied by the `posix_spawn_file_actions_addopen()` function.

46112 **RETURN VALUE**

46113 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 46114 be returned to indicate the error.

46115 **ERRORS**

46116 These functions shall fail if:

46117 [EBADF] The value specified by *fildes* is negative or greater than or equal to
 46118 {OPEN_MAX}.

46119 These functions may fail if:

46120 [EINVAL] The value specified by *file_actions* is invalid.

46121 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

46122 It shall not be considered an error for the *filides* argument passed to these functions to specify a
 46123 file descriptor for which the specified operation could not be performed at the time of the call.
 46124 Any such error will be detected when the associated file actions object is later used during a
 46125 *posix_spawn()* or *posix_spawnnp()* operation.

46126 EXAMPLES

46127 None.

46128 APPLICATION USAGE

46129 These functions are part of the Spawn option and need not be provided on all implementations.

46130 RATIONALE

46131 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,
 46132 and *open()* operations to be used by *posix_spawn()* or *posix_spawnnp()* to arrive at the set of open
 46133 file descriptors inherited by the spawned process from the set of open file descriptors in the
 46134 parent at the time of the *posix_spawn()* or *posix_spawnnp()* call. It had been suggested that the
 46135 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files
 46136 which need to be opened for use by the spawned process can be handled either by having the
 46137 calling process open them before the *posix_spawn()* or *posix_spawnnp()* call (and close them after),
 46138 or by passing filenames to the spawned process (in *argv*) so that it may open them itself. The
 46139 standard developers recommend that applications use one of these two methods when practical,
 46140 since detailed error status on a failed open operation is always available to the application this
 46141 way. However, the standard developers feel that allowing a spawn file actions object to specify
 46142 open operations is still appropriate because:

- 46143 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 46144 2. It supports the I/O redirection paradigm commonly employed by POSIX programs
 46145 designed to be invoked from a shell. When such a program is the child process, it may not
 46146 be designed to open files on its own.
- 46147 3. It allows file opens that might otherwise fail or violate file ownership/access rights if
 46148 executed by the parent process.

46149 Regarding 2. above, note that the spawn open file action provides to *posix_spawn()* and
 46150 *posix_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only
 46151 without the intervening execution of a shell; for example:

```
46152 system ("myprog <file1 3<file2");
```

46153 Regarding 3. above, note that if the calling process needs to open one or more files for access by
 46154 the spawned process, but has insufficient spare file descriptors, then the open action is necessary
 46155 to allow the *open()* to occur in the context of the child process after other file descriptors have
 46156 been closed (that must remain open in the parent).

46157 Additionally, if a parent is executed from a file having a "set-user-id" mode bit set and the
 46158 POSIX_SPAWN_RESETEUIDS flag is set in the spawn attributes, a file created within the parent
 46159 process will (possibly incorrectly) have the parent's effective user ID as its owner, whereas a file
 46160 created via an *open()* action during *posix_spawn()* or *posix_spawnnp()* will have the parent's real
 46161 ID as its owner; and an open by the parent process may successfully open a file to which the real
 46162 user should not have access or fail to open a file to which the real user should have access.

46163

File Descriptor Mapping46164
46165
46166
46167
46168
46169
46170

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix_spawn()* or *posix_spawnp()* without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

46171
46172
46173
46174
46175
46176
46177

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language *Start_Process* family of POSIX process primitives use a caller-specified set of file actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

46178

46184

CHANGE HISTORY

46185

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46186

46187

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by *path* is copied by the *posix_spawn_file_actions_addopen()* function.

46188 **NAME**

46189 `posix_spawn_file_actions_adddup2` — add `dup2` action to spawn file actions object
 46190 (**ADVANCED REALTIME**)

46191 **SYNOPSIS**

```
46192 SPN #include <spawn.h>
46193
46193 int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t
46194     *file_actions, int fildes, int newfildes);
```

46195 **DESCRIPTION**

46196 The `posix_spawn_file_actions_adddup2()` function shall add a `dup2()` action to the object
 46197 referenced by `file_actions` that shall cause the file descriptor `fildes` to be duplicated as `newfildes` (as
 46198 if `dup2(fildes, newfildes)` had been called) when a new process is spawned using this file actions
 46199 object.

46200 A spawn file actions object is as defined in [`posix_spawn_file_actions_addclose\(\)`](#).

46201 **RETURN VALUE**

46202 Upon successful completion, the `posix_spawn_file_actions_adddup2()` function shall return zero;
 46203 otherwise, an error number shall be returned to indicate the error.

46204 **ERRORS**

46205 The `posix_spawn_file_actions_adddup2()` function shall fail if:

46206 [EBADF] The value specified by `fildes` or `newfildes` is negative or greater than or equal to
 46207 {OPEN_MAX}.

46208 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

46209 The `posix_spawn_file_actions_adddup2()` function may fail if:

46210 [EINVAL] The value specified by `file_actions` is invalid.

46211 It shall not be considered an error for the `fildes` argument passed to the
 46212 `posix_spawn_file_actions_adddup2()` function to specify a file descriptor for which the specified
 46213 operation could not be performed at the time of the call. Any such error will be detected when
 46214 the associated file actions object is later used during a `posix_spawn()` or `posix_spawnnp()`
 46215 operation.

46216 **EXAMPLES**

46217 None.

46218 **APPLICATION USAGE**

46219 The `posix_spawn_file_actions_adddup2()` function is part of the Spawn option and need not be
 46220 provided on all implementations.

46221 **RATIONALE**

46222 Refer to the RATIONALE in [`posix_spawn_file_actions_addclose\(\)`](#).

CHANGE HISTORY

46229

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46230

IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the *newfildes* argument in addition to *fildes*.

46231

46232 **NAME**

46233 `posix_spawn_file_actions_addopen` — add open action to spawn file actions object
46234 (ADVANCED REALTIME)

46235 **SYNOPSIS**

```
46236 SPN #include <spawn.h>  
46237 int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t  
46238 *restrict file_actions, int fildes,  
46239 const char *restrict path, int oflag, mode_t mode);
```

46240 **DESCRIPTION**

46241 Refer to [*posix_spawn_file_actions_addclose\(\)*](#).

46242 **NAME**

46243 `posix_spawn_file_actions_destroy`, `posix_spawn_file_actions_init` — destroy and initialize
 46244 spawn file actions object (**ADVANCED REALTIME**)

46245 **SYNOPSIS**

```
46246 SPN #include <spawn.h>
46247
46247 int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t
46248 *file_actions);
46249 int posix_spawn_file_actions_init(posix_spawn_file_actions_t
46250 *file_actions);
```

46251 **DESCRIPTION**

46252 The `posix_spawn_file_actions_destroy()` function shall destroy the object referenced by `file_actions`;
 46253 the object becomes, in effect, uninitialized. An implementation may cause
 46254 `posix_spawn_file_actions_destroy()` to set the object referenced by `file_actions` to an invalid value. A
 46255 destroyed spawn file actions object can be reinitialized using `posix_spawn_file_actions_init()`; the
 46256 results of otherwise referencing the object after it has been destroyed are undefined.

46257 The `posix_spawn_file_actions_init()` function shall initialize the object referenced by `file_actions` to
 46258 contain no file actions for `posix_spawn()` or `posix_spawnnp()` to perform.

46259 A spawn file actions object is as defined in [`posix_spawn_file_actions_addclose\(\)`](#).

46260 The effect of initializing an already initialized spawn file actions object is undefined.

46261 **RETURN VALUE**

46262 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 46263 be returned to indicate the error.

46264 **ERRORS**

46265 The `posix_spawn_file_actions_init()` function shall fail if:

46266 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

46267 The `posix_spawn_file_actions_destroy()` function may fail if:

46268 [EINVAL] The value specified by `file_actions` is invalid.

46269 **EXAMPLES**

46270 None.

46271 **APPLICATION USAGE**

46272 These functions are part of the Spawn option and need not be provided on all implementations.

46273 **RATIONALE**

46274 Refer to the RATIONALE in [`posix_spawn_file_actions_addclose\(\)`](#).

46275 **FUTURE DIRECTIONS**

46276 None.

46277 **SEE ALSO**

46278 [`posix_spawn\(\)`](#)

46279 XBD [<spawn.h>](#)

46280	CHANGE HISTORY
46281	First released in Issue 6. Derived from IEEE Std 1003.1d-1999.
46282	In the SYNOPSIS, the inclusion of <code><sys/types.h></code> is no longer required.

46283 **NAME**

46284 `posix_spawnattr_destroy`, `posix_spawnattr_init` — destroy and initialize spawn attributes object
 46285 (**ADVANCED REALTIME**)

46286 **SYNOPSIS**

```
46287 SPN #include <spawn.h>
46288
46288 int posix_spawnattr_destroy(posix_spawnattr_t *attr);
46289 int posix_spawnattr_init(posix_spawnattr_t *attr);
```

46290 **DESCRIPTION**

46291 The `posix_spawnattr_destroy()` function shall destroy a spawn attributes object. A destroyed `attr`
 46292 attributes object can be reinitialized using `posix_spawnattr_init()`; the results of otherwise
 46293 referencing the object after it has been destroyed are undefined. An implementation may cause
 46294 `posix_spawnattr_destroy()` to set the object referenced by `attr` to an invalid value.

46295 The `posix_spawnattr_init()` function shall initialize a spawn attributes object `attr` with the default
 46296 value for all of the individual attributes used by the implementation. Results are undefined if
 46297 `posix_spawnattr_init()` is called specifying an already initialized `attr` attributes object.

46298 A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to
 46299 specify the inheritance of process attributes across a spawn operation. POSIX.1-200x does not
 46300 define comparison or assignment operators for the type **posix_spawnattr_t**.

46301 Each implementation shall document the individual attributes it uses and their default values
 46302 unless these values are defined by POSIX.1-200x. Attributes not defined by POSIX.1-200x, their
 46303 default values, and the names of the associated functions to get and set those attribute values are
 46304 implementation-defined.

46305 The resulting spawn attributes object (possibly modified by setting individual attribute values),
 46306 is used to modify the behavior of `posix_spawn()` or `posix_spawnnp()`. After a spawn attributes
 46307 object has been used to spawn a process by a call to a `posix_spawn()` or `posix_spawnnp()`, any
 46308 function affecting the attributes object (including destruction) shall not affect any process that
 46309 has been spawned in this way.

46310 **RETURN VALUE**

46311 Upon successful completion, `posix_spawnattr_destroy()` and `posix_spawnattr_init()` shall return
 46312 zero; otherwise, an error number shall be returned to indicate the error.

46313 **ERRORS**

46314 The `posix_spawnattr_init()` function shall fail if:

46315 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

46316 The `posix_spawnattr_destroy()` function may fail if:

46317 [EINVAL] The value specified by `attr` is invalid.

46318 **EXAMPLES**

46319 None.

46320 **APPLICATION USAGE**

46321 These functions are part of the Spawn option and need not be provided on all implementations.

46322 **RATIONALE**

46323 The original spawn interface proposed in POSIX.1-200x defined the attributes that specify the
 46324 inheritance of process attributes across a spawn operation as a structure. In order to be able to
 46325 separate optional individual attributes under their appropriate options (that is, the *spawn-*
 46326 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and
 46327 also for extensibility and consistency with the newer POSIX interfaces, the attributes interface
 46328 has been changed to an opaque data type. This interface now consists of the type
 46329 **posix_spawnattr_t**, representing a spawn attributes object, together with associated functions to
 46330 initialize or destroy the attributes object, and to set or get each individual attribute. Although the
 46331 new object-oriented interface is more verbose than the original structure, it is simple to use,
 46332 more extensible, and easy to implement.

46333 **FUTURE DIRECTIONS**

46334 None.

46335 **SEE ALSO**

46336 *posix_spawn()*, *posix_spawnattr_getsigdefault()*, *posix_spawnattr_getflags()*,
 46337 *posix_spawnattr_getpgroup()*, *posix_spawnattr_getschedparam()*, *posix_spawnattr_getschedpolicy()*,

46339 XBD <spawn.h>

46340 **CHANGE HISTORY**

46341 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46342 IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already
 46343 initialized spawn attributes option is undefined.

46344

NAME

46345

posix_spawnattr_getflags, posix_spawnattr_setflags — get and set the spawn-flags attribute of a spawn attributes object (**ADVANCED REALTIME**)

46346

46347

SYNOPSIS

46348

```
SPN #include <spawn.h>
```

46349

```
int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
    short *restrict flags);
```

46350

46351

```
int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

46352

DESCRIPTION

46353

The *posix_spawnattr_getflags()* function shall obtain the value of the *spawn-flags* attribute from the attributes object referenced by *attr*.

46354

46355

The *posix_spawnattr_setflags()* function shall set the *spawn-flags* attribute in an initialized attributes object referenced by *attr*.

46356

46357

The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the new process image when invoking *posix_spawn()* or *posix_spawnnp()*. It is the bitwise-inclusive OR of zero or more of the following flags:

46358

46359

46360

```
POSIX_SPAWN_RESETIDS
```

46361

```
POSIX_SPAWN_SETPGROUP
```

46362

```
POSIX_SPAWN_SETSIGDEF
```

46363

```
POSIX_SPAWN_SETSIGMASK
```

46364

PS

```
POSIX_SPAWN_SETSCHEDPARAM
```

46365

```
POSIX_SPAWN_SETSCHEDULER
```

46366

These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags were set.

46367

46368

RETURN VALUE

46369

Upon successful completion, *posix_spawnattr_getflags()* shall return zero and store the value of the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an error number shall be returned to indicate the error.

46370

46371

46372

Upon successful completion, *posix_spawnattr_setflags()* shall return zero; otherwise, an error number shall be returned to indicate the error.

46373

46374

ERRORS

46375

These functions may fail if:

46376

[EINVAL] The value specified by *attr* is invalid.

46377

The *posix_spawnattr_setflags()* function may fail if:

46378

[EINVAL] The value of the attribute being set is not valid.

46379

EXAMPLES

46380

None.

46381

APPLICATION USAGE

46382

These functions are part of the Spawn option and need not be provided on all implementations.

46383

CHANGE HISTORY

46393

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

DRAFT

46394 **NAME**

46395 `posix_spawnattr_getpgroup`, `posix_spawnattr_setpgroup` — get and set the spawn-pgroup
 46396 attribute of a spawn attributes object (**ADVANCED REALTIME**)

46397 **SYNOPSIS**

```
46398 SPN #include <spawn.h>
46399
46399 int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
46400 pid_t *restrict pgroup);
46401 int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
```

46402 **DESCRIPTION**

46403 The `posix_spawnattr_getpgroup()` function shall obtain the value of the `spawn-pgroup` attribute
 46404 from the attributes object referenced by `attr`.

46405 The `posix_spawnattr_setpgroup()` function shall set the `spawn-pgroup` attribute in an initialized
 46406 attributes object referenced by `attr`.

46407 The `spawn-pgroup` attribute represents the process group to be joined by the new process image
 46408 in a spawn operation (if `POSIX_SPAWN_SETPGROUP` is set in the `spawn-flags` attribute). The
 46409 default value of this attribute shall be zero.

46410 **RETURN VALUE**

46411 Upon successful completion, `posix_spawnattr_getpgroup()` shall return zero and store the value of
 46412 the `spawn-pgroup` attribute of `attr` into the object referenced by the `pgroup` parameter; otherwise,
 46413 an error number shall be returned to indicate the error.

46414 Upon successful completion, `posix_spawnattr_setpgroup()` shall return zero; otherwise, an error
 46415 number shall be returned to indicate the error.

46416 **ERRORS**

46417 These functions may fail if:

46418 [EINVAL] The value specified by `attr` is invalid.

46419 The `posix_spawnattr_setpgroup()` function may fail if:

46420 [EINVAL] The value of the attribute being set is not valid.

46421 **EXAMPLES**

46422 None.

46423 **APPLICATION USAGE**

46424 These functions are part of the Spawn option and need not be provided on all implementations.

46425 **RATIONALE**

46426 None.

46427 **FUTURE DIRECTIONS**

46428 None.

46429 **SEE ALSO**

46435

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46436 **NAME**

46437 `posix_spawnattr_getschedparam`, `posix_spawnattr_setschedparam` — get and set the spawn-
 46438 `schedparam` attribute of a spawn attributes object (**ADVANCED REALTIME**)

46439 **SYNOPSIS**

```
46440 SPN PS #include <spawn.h>
46441 #include <sched.h>
46442
46442 int posix_spawnattr_getschedparam(const posix_spawnattr_t
46443     *restrict attr, struct sched_param *restrict schedparam);
46444 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
46445     const struct sched_param *restrict schedparam);
```

46446 **DESCRIPTION**

46447 The `posix_spawnattr_getschedparam()` function shall obtain the value of the `spawn-schedparam`
 46448 attribute from the attributes object referenced by `attr`.

46449 The `posix_spawnattr_setschedparam()` function shall set the `spawn-schedparam` attribute in an
 46450 initialized attributes object referenced by `attr`.

46451 The `spawn-schedparam` attribute represents the scheduling parameters to be assigned to the new
 46452 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` or
 46453 `POSIX_SPAWN_SETSCHEDPARAM` is set in the `spawn-flags` attribute). The default value of this
 46454 attribute is unspecified.

46455 **RETURN VALUE**

46456 Upon successful completion, `posix_spawnattr_getschedparam()` shall return zero and store the
 46457 value of the `spawn-schedparam` attribute of `attr` into the object referenced by the `schedparam`
 46458 parameter; otherwise, an error number shall be returned to indicate the error.

46459 Upon successful completion, `posix_spawnattr_setschedparam()` shall return zero; otherwise, an
 46460 error number shall be returned to indicate the error.

46461 **ERRORS**

46462 These functions may fail if:

46463 [EINVAL] The value specified by `attr` is invalid.

46464 The `posix_spawnattr_setschedparam()` function may fail if:

46465 [EINVAL] The value of the attribute being set is not valid.

46466 **EXAMPLES**

46467 None.

46468 **APPLICATION USAGE**

46469 These functions are part of the Spawn and Process Scheduling options and need not be provided
 46470 on all implementations.

46471 **RATIONALE**

46472 None.

46473 **FUTURE DIRECTIONS**

46474 None.

posix_spawnattr_getschedparam()*System Interfaces*46475 **SEE ALSO**

46480 **CHANGE HISTORY**

46481 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46482 **NAME**

46483 `posix_spawnattr_getschedpolicy`, `posix_spawnattr_setschedpolicy` — get and set the spawn-
 46484 `schedpolicy` attribute of a spawn attributes object (**ADVANCED REALTIME**)

46485 **SYNOPSIS**

```
46486 SPN PS #include <spawn.h>
46487 #include <sched.h>
46488
46488 int posix_spawnattr_getschedpolicy(const posix_spawnattr_t
46489 *restrict attr, int *restrict schedpolicy);
46490
46490 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
46491 int schedpolicy);
```

46492 **DESCRIPTION**

46493 The `posix_spawnattr_getschedpolicy()` function shall obtain the value of the `spawn-schedpolicy`
 46494 attribute from the attributes object referenced by `attr`.

46495 The `posix_spawnattr_setschedpolicy()` function shall set the `spawn-schedpolicy` attribute in an
 46496 initialized attributes object referenced by `attr`.

46497 The `spawn-schedpolicy` attribute represents the scheduling policy to be assigned to the new
 46498 process image in a spawn operation (if `POSIX_SPAWN_SETSCHEDULER` is set in the `spawn-`
 46499 `flags` attribute). The default value of this attribute is unspecified.

46500 **RETURN VALUE**

46501 Upon successful completion, `posix_spawnattr_getschedpolicy()` shall return zero and store the
 46502 value of the `spawn-schedpolicy` attribute of `attr` into the object referenced by the `schedpolicy`
 46503 parameter; otherwise, an error number shall be returned to indicate the error.

46504 Upon successful completion, `posix_spawnattr_setschedpolicy()` shall return zero; otherwise, an
 46505 error number shall be returned to indicate the error.

46506 **ERRORS**

46507 These functions may fail if:

46508 [EINVAL] The value specified by `attr` is invalid.

46509 The `posix_spawnattr_setschedpolicy()` function may fail if:

46510 [EINVAL] The value of the attribute being set is not valid.

46511 **EXAMPLES**

46512 None.

46513 **APPLICATION USAGE**

46514 These functions are part of the Spawn and Process Scheduling options and need not be provided
 46515 on all implementations.

46516 **RATIONALE**

46517 None.

46518 **FUTURE DIRECTIONS**

46519 None.

46525

CHANGE HISTORY

46526

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46527 **NAME**

46528 `posix_spawnattr_getsigdefault`, `posix_spawnattr_setsigdefault` — get and set the spawn-
 46529 sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

46530 **SYNOPSIS**

```
46531 SPN #include <signal.h>
46532 #include <spawn.h>
46533
46533 int posix_spawnattr_getsigdefault(const posix_spawnattr_t
46534 *restrict attr, sigset_t *restrict sigdefault);
46535 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
46536 const sigset_t *restrict sigdefault);
```

46537 **DESCRIPTION**

46538 The `posix_spawnattr_getsigdefault()` function shall obtain the value of the `spawn-sigdefault`
 46539 attribute from the attributes object referenced by `attr`.

46540 The `posix_spawnattr_setsigdefault()` function shall set the `spawn-sigdefault` attribute in an
 46541 initialized attributes object referenced by `attr`.

46542 The `spawn-sigdefault` attribute represents the set of signals to be forced to default signal handling
 46543 in the new process image (if `POSIX_SPAWN_SETSIGDEF` is set in the `spawn-flags` attribute) by a
 46544 spawn operation. The default value of this attribute shall be an empty signal set.

46545 **RETURN VALUE**

46546 Upon successful completion, `posix_spawnattr_getsigdefault()` shall return zero and store the value
 46547 of the `spawn-sigdefault` attribute of `attr` into the object referenced by the `sigdefault` parameter;
 46548 otherwise, an error number shall be returned to indicate the error.

46549 Upon successful completion, `posix_spawnattr_setsigdefault()` shall return zero; otherwise, an error
 46550 number shall be returned to indicate the error.

46551 **ERRORS**

46552 These functions may fail if:

46553 [EINVAL] The value specified by `attr` is invalid.

46554 The `posix_spawnattr_setsigdefault()` function may fail if:

46555 [EINVAL] The value of the attribute being set is not valid.

46556 **EXAMPLES**

46557 None.

46558 **APPLICATION USAGE**

46559 These functions are part of the Spawn option and need not be provided on all implementations.

46560 **RATIONALE**

46561 None.

46562 **FUTURE DIRECTIONS**

46563 None.

46564 **SEE ALSO**

46568

46569

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46570 **NAME**

46571 `posix_spawnattr_getsigmask`, `posix_spawnattr_setsigmask` — get and set the spawn-sigmask
 46572 attribute of a spawn attributes object (**ADVANCED REALTIME**)

46573 **SYNOPSIS**

```
46574 SPN #include <signal.h>
46575 #include <spawn.h>
46576
46576 int posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict attr,
46577 sigset_t *restrict sigmask);
46578 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,
46579 const sigset_t *restrict sigmask);
```

46580 **DESCRIPTION**

46581 The `posix_spawnattr_getsigmask()` function shall obtain the value of the `spawn-sigmask` attribute
 46582 from the attributes object referenced by `attr`.

46583 The `posix_spawnattr_setsigmask()` function shall set the `spawn-sigmask` attribute in an initialized
 46584 attributes object referenced by `attr`.

46585 The `spawn-sigmask` attribute represents the signal mask in effect in the new process image of a
 46586 spawn operation (if `POSIX_SPAWN_SETSIGMASK` is set in the `spawn-flags` attribute). The
 46587 default value of this attribute is unspecified.

46588 **RETURN VALUE**

46589 Upon successful completion, `posix_spawnattr_getsigmask()` shall return zero and store the value
 46590 of the `spawn-sigmask` attribute of `attr` into the object referenced by the `sigmask` parameter;
 46591 otherwise, an error number shall be returned to indicate the error.

46592 Upon successful completion, `posix_spawnattr_setsigmask()` shall return zero; otherwise, an error
 46593 number shall be returned to indicate the error.

46594 **ERRORS**

46595 These functions may fail if:

46596 [EINVAL] The value specified by `attr` is invalid.

46597 The `posix_spawnattr_setsigmask()` function may fail if:

46598 [EINVAL] The value of the attribute being set is not valid.

46599 **EXAMPLES**

46600 None.

46601 **APPLICATION USAGE**

46602 These functions are part of the Spawn option and need not be provided on all implementations.

46603 **RATIONALE**

46613

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

46614 **NAME**46615 posix_spawnattr_init — initialize the spawn attributes object (**ADVANCED REALTIME**)46616 **SYNOPSIS**46617 SPN

```
#include <spawn.h>
```

46618

```
int posix_spawnattr_init(posix_spawnattr_t *attr);
```

46619 **DESCRIPTION**46620 Refer to [posix_spawnattr_destroy\(\)](#).

46621 **NAME**

46622 `posix_spawnattr_setflags` — set the spawn-flags attribute of a spawn attributes object
46623 (**ADVANCED REALTIME**)

46624 **SYNOPSIS**

```
46625 SPN #include <spawn.h>  
46626 int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
```

46627 **DESCRIPTION**

46628 Refer to [posix_spawnattr_getflags\(\)](#).

46629 **NAME**

46630 `posix_spawnattr_setpgroup` — set the spawn-pgroup attribute of a spawn attributes object

46631 (**ADVANCED REALTIME**)

46632 **SYNOPSIS**

46633 SPN `#include <spawn.h>`

46634 `int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);`

46635 **DESCRIPTION**

46636 Refer to *posix_spawnattr_getpgroup()*.

46637 **NAME**

46638 `posix_spawnattr_setschedparam` — set the spawn-schedparam attribute of a spawn attributes
46639 object (**ADVANCED REALTIME**)

46640 **SYNOPSIS**

```
46641 SPN PS #include <sched.h>  
46642 #include <spawn.h>  
46643 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
46644     const struct sched_param *restrict schedparam);
```

46645 **DESCRIPTION**

46646 Refer to [posix_spawnattr_getschedparam\(\)](#).

46647 **NAME**

46648 `posix_spawnattr_setschedpolicy` — set the spawn-schedpolicy attribute of a spawn attributes
46649 object (**ADVANCED REALTIME**)

46650 **SYNOPSIS**

```
46651 SPN PS #include <sched.h>  
46652 #include <spawn.h>  
46653 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
46654 int schedpolicy);
```

46655 **DESCRIPTION**

46656 Refer to [posix_spawnattr_getschedpolicy\(\)](#).

46657 **NAME**

46658 `posix_spawnattr_setsigdefault` — set the spawn-sigdefault attribute of a spawn attributes object
46659 (**ADVANCED REALTIME**)

46660 **SYNOPSIS**

```
46661 SPN #include <signal.h>  
46662 #include <spawn.h>  
  
46663 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,  
46664     const sigset_t *restrict sigdefault);
```

46665 **DESCRIPTION**

46666 Refer to [posix_spawnattr_getsigdefault\(\)](#).

46667 **NAME**

46668 `posix_spawnattr_setsigmask` — set the spawn-sigmask attribute of a spawn attributes object
46669 (**ADVANCED REALTIME**)

46670 **SYNOPSIS**

```
46671 SPN #include <signal.h>  
46672 #include <spawn.h>  
  
46673 int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
46674     const sigset_t *restrict sigmask);
```

46675 **DESCRIPTION**

46676 Refer to [posix_spawnattr_getsigmask\(\)](#).

46677 **NAME**46678 posix_spawn — spawn a process (**ADVANCED REALTIME**)46679 **SYNOPSIS**

```
46680 SPN #include <spawn.h>
46681 int posix_spawn(pid_t *restrict pid, const char *restrict file,
46682 const posix_spawn_file_actions_t *file_actions,
46683 const posix_spawnattr_t *restrict attrp,
46684 char *const argv[restrict], char *const envp[restrict]);
```

46685 **DESCRIPTION**46686 Refer to *posix_spawn()*.

46687 **NAME**

46688 `posix_trace_attr_destroy`, `posix_trace_attr_init` — destroy and initialize the trace stream
 46689 attributes object (**TRACING**)

46690 **SYNOPSIS**

```
46691 OB TRC #include <trace.h>
46692
46692 int posix_trace_attr_destroy(trace_attr_t *attr);
46693 int posix_trace_attr_init(trace_attr_t *attr);
```

46694 **DESCRIPTION**

46695 The `posix_trace_attr_destroy()` function shall destroy an initialized trace attributes object. A
 46696 destroyed `attr` attributes object can be reinitialized using `posix_trace_attr_init()`; the results of
 46697 otherwise referencing the object after it has been destroyed are undefined.

46698 The `posix_trace_attr_init()` function shall initialize a trace attributes object `attr` with the default
 46699 value for all of the individual attributes used by a given implementation. The read-only
 46700 *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object
 46701 shall be set to their appropriate values (see [Section 2.11.1.2](#), on page 513).

46702 Results are undefined if `posix_trace_attr_init()` is called specifying an already initialized `attr`
 46703 attributes object.

46704 Implementations may add extensions to the trace attributes object structure as permitted in XBD
 46705 [Chapter 2](#) (on page 15).

46706 The resulting attributes object (possibly modified by setting individual attributes values), when
 46707 used by `posix_trace_create()`, defines the attributes of the trace stream created. A single attributes
 46708 object can be used in multiple calls to `posix_trace_create()`. After one or more trace streams have
 46709 been created using an attributes object, any function affecting that attributes object, including
 46710 destruction, shall not affect any trace stream previously created. An initialized attributes object
 46711 also serves to receive the attributes of an existing trace stream or trace log when calling the
 46712 `posix_trace_get_attr()` function.

46713 **RETURN VALUE**

46714 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 46715 return the corresponding error number.

46716 **ERRORS**

46717 The `posix_trace_attr_destroy()` function may fail if:

46718 [EINVAL] The value of `attr` is invalid.

46719 The `posix_trace_attr_init()` function shall fail if:

46720 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

46721 **EXAMPLES**

46722 None.

46723 **APPLICATION USAGE**

46724 None.

46725 **RATIONALE**

46726 None.

CHANGE HISTORY

46734

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

46735

IEEE PASC Interpretation 1003.1 #123 is applied.

46736

Issue 7

46737

The *posix_trace_attr_destroy()* and *posix_trace_attr_init()* functions are marked obsolescent.

46738 **NAME**

46739 `posix_trace_attr_getclockres`, `posix_trace_attr_getcreatetime`, `posix_trace_attr_getgenversion`,
 46740 `posix_trace_attr_getname`, `posix_trace_attr_setname` — retrieve and set information about a
 46741 trace stream (**TRACING**)

46742 **SYNOPSIS**

```
46743 OB TRC #include <time.h>
46744 #include <trace.h>
46745
46746 int posix_trace_attr_getclockres(const trace_attr_t *attr,
46747 struct timespec *resolution);
46748
46749 int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
46750 struct timespec *createtime);
46751
46752 #include <trace.h>
46753
46754 int posix_trace_attr_getgenversion(const trace_attr_t *attr,
46755 char *genversion);
46756
46757 int posix_trace_attr_getname(const trace_attr_t *attr,
46758 char *tracename);
46759
46760 int posix_trace_attr_setname(trace_attr_t *attr,
46761 const char *tracename);
```

46762 **DESCRIPTION**

46763 The `posix_trace_attr_getclockres()` function shall copy the clock resolution of the clock used to
 46764 generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the
 46765 *attr* argument into the structure pointed to by the *resolution* argument.

46766 The `posix_trace_attr_getcreatetime()` function shall copy the trace stream creation time from the
 46767 *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure
 46768 pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of
 46769 creation of the trace stream.

46770 The `posix_trace_attr_getgenversion()` function shall copy the string containing version information
 46771 from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into
 46772 the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of
 46773 a character array which can store at least {TRACE_NAME_MAX} characters.

46774 The `posix_trace_attr_getname()` function shall copy the string containing the trace name from the
 46775 *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string
 46776 pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character
 46777 array which can store at least {TRACE_NAME_MAX} characters.

46778 The `posix_trace_attr_setname()` function shall set the name in the *trace-name* attribute of the
 46779 attributes object pointed to by the *attr* argument, using the trace name string supplied by the
 46780 *tracename* argument. If the supplied string contains more than {TRACE_NAME_MAX}
 46781 characters, the name copied into the *trace-name* attribute may be truncated to one less than the
 46782 length of {TRACE_NAME_MAX} characters. The default value is a null string.

46783 **RETURN VALUE**

46784 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 46785 return the corresponding error number.

46786 If successful, the `posix_trace_attr_getclockres()` function stores the *clock-resolution* attribute value in
 46787 the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

46788 If successful, the `posix_trace_attr_getcreatetime()` function stores the trace stream creation time in

posix_trace_attr_getclockres()

46783 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

46784 If successful, the *posix_trace_attr_getgenversion()* function stores the trace version information in
46785 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

46786 If successful, the *posix_trace_attr_getname()* function stores the trace name in the string pointed
46787 to by *tracename*. Otherwise, the content of this string is unspecified.

ERRORS

46788 The *posix_trace_attr_getclockres()*, *posix_trace_attr_getcreatetime()*, *posix_trace_attr_getgenversion()*,
46789 and *posix_trace_attr_getname()* functions may fail if:

46791 [EINVAL] The value specified by one of the arguments is invalid.

46810 **NAME**

46811 posix_trace_attr_getinherited, posix_trace_attr_getlogfullpolicy,
 46812 posix_trace_attr_getstreamfullpolicy, posix_trace_attr_setinherited,
 46813 posix_trace_attr_setlogfullpolicy, posix_trace_attr_setstreamfullpolicy — retrieve and set the
 46814 behavior of a trace stream (**TRACING**)

46815 **SYNOPSIS**

```
46816 OB TRC #include <trace.h>
46817 TRI int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
46818 int *restrict inheritancepolicy);
46819 TRI int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
46820 int *restrict logpolicy);
46821 int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *restrict
46822 attr, int *restrict streampolicy);
46823 TRI int posix_trace_attr_setinherited(trace_attr_t *attr,
46824 int inheritancepolicy);
46825 TRI int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
46826 int logpolicy);
46827 int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
46828 int streampolicy);
```

46829 **DESCRIPTION**

46830 TRI The *posix_trace_attr_getinherited()* and *posix_trace_attr_setinherited()* functions, respectively, shall
 46831 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across the
 46832 *fork()* and *spawn()* operations. The *inheritance* attribute of the attributes object pointed to by the
 46833 *attr* argument shall be set to one of the following values defined by manifest constants in the
 46834 **<trace.h>** header:

46835 **POSIX_TRACE_CLOSE_FOR_CHILD**

46836 After a *fork()* or *spawn()* operation, the child shall not be traced, and tracing of the parent
 46837 shall continue.

46838 **POSIX_TRACE_INHERITED**

46839 After a *fork()* or *spawn()* operation, if the parent is being traced, its child shall be
 46840 concurrently traced using the same trace stream.

46841 The default value for the *inheritance* attribute is **POSIX_TRACE_CLOSE_FOR_CHILD**.

46842 TRI The *posix_trace_attr_getlogfullpolicy()* and *posix_trace_attr_setlogfullpolicy()* functions,
 46843 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the
 46844 attributes object pointed to by the *attr* argument.

46845 The *log-full-policy* attribute shall be set to one of the following values defined by manifest
 46846 constants in the **<trace.h>** header:

46847 **POSIX_TRACE_LOOP**

46848 The trace log shall loop until the associated trace stream is stopped. This policy means that
 46849 when the trace log gets full, the file system shall reuse the resources allocated to the oldest
 46850 trace events that were recorded. In this way, the trace log will always contain the most
 46851 recent trace events flushed.

46852 **POSIX_TRACE_UNTIL_FULL**

46853 The trace stream shall be flushed to the trace log until the trace log is full. This condition can
 46854 be deduced from the *posix_log_full_status* member status (see the **posix_trace_status_info**
 46855 structure defined in **<trace.h>**). The last recorded trace event shall be the
 46856 **POSIX_TRACE_STOP** trace event.

- 46857 POSIX_TRACE_APPEND
 46858 The associated trace stream shall be flushed to the trace log without log size limitation. If
 46859 the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the *log-*
 46860 *max-size* attribute.
- 46861 The default value for the *log-full-policy* attribute is POSIX_TRACE_LOOP.
- 46862 The *posix_trace_attr_getstreamfullpolicy()* and *posix_trace_attr_setstreamfullpolicy()* functions,
 46863 respectively, shall get and set the trace stream full policy stored in the *stream-full-policy* attribute
 46864 of the attributes object pointed to by the *attr* argument.
- 46865 The *stream-full-policy* attribute shall be set to one of the following values defined by manifest
 46866 constants in the **<trace.h>** header:
- 46867 POSIX_TRACE_LOOP
 46868 The trace stream shall loop until explicitly stopped by the *posix_trace_stop()* function. This
 46869 policy means that when the trace stream is full, the trace system shall reuse the resources
 46870 allocated to the oldest trace events recorded. In this way, the trace stream will always
 46871 contain the most recent trace events recorded.
- 46872 POSIX_TRACE_UNTIL_FULL
 46873 The trace stream will run until the trace stream resources are exhausted. Then the trace
 46874 stream will stop. This condition can be deduced from *posix_stream_status* and
 46875 *posix_stream_full_status* (see the **posix_trace_status_info** structure defined in **<trace.h>**).
 46876 When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after
 46877 reporting the last recorded trace event. The trace system shall reuse the resources allocated
 46878 to any trace events already reported—see the *posix_trace_getnext_event()*,
 46879 *posix_trace_trygetnext_event()*, and *posix_trace_timedgetnext_event()* functions—or already
 46880 flushed for an active trace stream with log if the Trace Log option is supported; see the
 46881 *posix_trace_flush()* function. The trace system shall restart the trace stream when it is empty
 46882 and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before
 46883 reporting the next recorded trace event.
- 46884 TRL POSIX_TRACE_FLUSH
 46885 If the Trace Log option is supported, this policy is identical to the
 46886 POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be
 46887 flushed regularly as if *posix_trace_flush()* had been explicitly called. Defining this policy for
 46888 an active trace stream without log shall be invalid.
- 46889 The default value for the *stream-full-policy* attribute shall be POSIX_TRACE_LOOP for an active
 46890 trace stream without log.
- 46891 TRL If the Trace Log option is supported, the default value for the *stream-full-policy* attribute shall be
 46892 POSIX_TRACE_FLUSH for an active trace stream with log.
- 46893 **RETURN VALUE**
 46894 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 46895 return the corresponding error number.
- 46896 TRI If successful, the *posix_trace_attr_getinherited()* function shall store the *inheritance* attribute value
 46897 in the object pointed to by *inheritancepolicy*. Otherwise, the content of this object is undefined.
- 46898 TRL If successful, the *posix_trace_attr_getlogfullpolicy()* function shall store the *log-full-policy* attribute
 46899 value in the object pointed to by *logpolicy*. Otherwise, the content of this object is undefined.
- 46900 If successful, the *posix_trace_attr_getstreamfullpolicy()* function shall store the *stream-full-policy*
 46901 attribute value in the object pointed to by *streampolicy*. Otherwise, the content of this object is
 46902 undefined.

46903 ERRORS

46904 These functions may fail if:

46905 [EINVAL] The value specified by at least one of the arguments is invalid.

46925 CHANGE HISTORY

46926 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

46927 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC
 46928 margin codes to the `posix_trace_attr_setlogfullpolicy()` function.

46929 Issue 7

46930 SD5-XSH-ERN-116 is applied, adding the missing **restrict** keyword to the
 46931 `posix_trace_attr_getstreamfullpolicy()` function declaration.

46932 These functions are marked obsolescent.

46933 NAME

46934 posix_trace_attr_getlogsize, posix_trace_attr_getmaxdatasize,

 46936 posix_trace_attr_getstreamsize, posix_trace_attr_setlogsize, posix_trace_attr_setmaxdatasize,
 46937 posix_trace_attr_setstreamsize — retrieve and set trace stream size attributes (TRACING)

46938 SYNOPSIS

```
46939 OB TRC #include <sys/types.h>
46940 #include <trace.h>

46941 TRL int posix_trace_attr_getlogsize(const trace_attr_t *restrict attr,
46942 size_t *restrict logsize);
46943 int posix_trace_attr_getmaxdatasize(const trace_attr_t *restrict attr,
46944 size_t *restrict maxdatasize);
46945 int posix_trace_attr_getmaxsystemeventsize(
46946 const trace_attr_t *restrict attr,
46947 size_t *restrict eventsize);
46948 int posix_trace_attr_getmaxusereventsize(
46949 const trace_attr_t *restrict attr,
46950 size_t data_len, size_t *restrict eventsize);
46951 int posix_trace_attr_getstreamsize(const trace_attr_t *restrict attr,
46952 size_t *restrict streamsize);
46953 TRL int posix_trace_attr_setlogsize(trace_attr_t *attr,
46954 size_t logsize);
46955 int posix_trace_attr_setmaxdatasize(trace_attr_t *attr,
46956 size_t maxdatasize);
46957 int posix_trace_attr_setstreamsize(trace_attr_t *attr,
46958 size_t streamsize);
```

46959 DESCRIPTION

46960 TRL The *posix_trace_attr_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size*
 46961 attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by
 46962 the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for
 46963 system and user trace events in the trace log. The default value for the *log-max-size* attribute is
 46964 implementation-defined.

46965 The *posix_trace_attr_setlogsize()* function shall set the maximum allowed size, in bytes, in the *log-*
 46966 *max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value
 46967 supplied by the *logsize* argument.

46968 The trace log size shall be used if the *log-full-policy* attribute is set to `POSIX_TRACE_LOOP` or
 46969 `POSIX_TRACE_UNTIL_FULL`. If the *log-full-policy* attribute is set to `POSIX_TRACE_APPEND`,
 46970 the implementation shall ignore the *log-max-size* attribute.

46971 The *posix_trace_attr_getmaxdatasize()* function shall copy the maximum user trace event data
 46972 size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr*
 46973 argument into the variable pointed to by the *maxdatasize* argument. The default value for the
 46974 *max-data-size* attribute is implementation-defined.

46975 The *posix_trace_attr_getmaxsystemeventsize()* function shall calculate the maximum memory size,
 46976 in bytes, required to store a single system trace event. This value is calculated for the trace
 46977 stream attributes object pointed to by the *attr* argument and is returned in the variable pointed
 46978 to by the *eventsize* argument.

46979 The values returned as the maximum memory sizes of the user and system trace events shall be
 46980 such that if the sum of the maximum memory sizes of a set of the trace events that may be

46981 recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace
 46982 stream, the system provides the necessary resources for recording all those trace events, without
 46983 loss.

46984 The *posix_trace_attr_getmaxusereventsize()* function shall calculate the maximum memory size, in
 46985 bytes, required to store a single user trace event generated by a call to *posix_trace_event()* with a
 46986 *data_len* parameter equal to the *data_len* value specified in this call. This value is calculated for
 46987 the trace stream attributes object pointed to by the *attr* argument and is returned in the variable
 46988 pointed to by the *eventsize* argument.

46989 The *posix_trace_attr_getstreamsize()* function shall copy the stream size, in bytes, from the *stream-*
 46990 *min-size* attribute of the attributes object pointed to by the *attr* argument into the variable
 46991 pointed to by the *streamsize* argument.

46992 This stream size is the current total memory size reserved for system and user trace events in the
 46993 trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The
 46994 stream size refers to memory used to store trace event records. Other stream data (for example,
 46995 trace attribute values) shall not be included in this size.

46996 The *posix_trace_attr_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in
 46997 the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size
 46998 value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size
 46999 for the user data argument which may be passed to *posix_trace_event()*. The implementation
 47000 shall be allowed to truncate data passed to *trace_user_event* which is longer than *maxdatasize*.

47001 The *posix_trace_attr_setstreamsize()* function shall set the minimum allowed size, in bytes, in the
 47002 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size
 47003 value supplied by the *streamsize* argument.

47004 RETURN VALUE

47005 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47006 return the corresponding error number.

47007 TRL The *posix_trace_attr_getlogsize()* function stores the maximum trace log allowed size in the object
 47008 pointed to by *logsize*, if successful.

47009 The *posix_trace_attr_getmaxdatasize()* function stores the maximum trace event record memory
 47010 size in the object pointed to by *maxdatasize*, if successful.

47011 The *posix_trace_attr_getmaxsystemeventsize()* function stores the maximum memory size to store a
 47012 single system trace event in the object pointed to by *eventsize*, if successful.

47013 The *posix_trace_attr_getmaxusereventsize()* function stores the maximum memory size to store a
 47014 single user trace event in the object pointed to by *eventsize*, if successful.

47015 The *posix_trace_attr_getstreamsize()* function stores the maximum trace stream allowed size in the
 47016 object pointed to by *streamsize*, if successful.

47017 ERRORS

47018 These functions may fail if:

47019 [EINVAL] The value specified by one of the arguments is invalid.

```

47124 **DESCRIPTION**47125 Refer to *posix_trace_attr_getlogsize()*.

47126 **NAME**47127 `posix_trace_clear` — clear trace stream and trace log (**TRACING**)47128 **SYNOPSIS**

```
47129 OB TRC #include <sys/types.h>
47130 #include <trace.h>
47131 int posix_trace_clear(trace_id_t trid);
```

47132 **DESCRIPTION**

47133 The `posix_trace_clear()` function shall reinitialize the trace stream identified by the argument *trid*
 47134 as if it were returning from the `posix_trace_create()` function, except that the same allocated
 47135 resources shall be reused, the mapping of trace event type identifiers to trace event names shall
 47136 be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it
 47137 remains running and if it was suspended, it remains suspended).

47138 All trace events in the trace stream recorded before the call to `posix_trace_clear()` shall be lost. The
 47139 `posix_stream_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee
 47140 that all trace events that occurred during the `posix_trace_clear()` call are recorded; the behavior
 47141 with respect to trace points that may occur during this call is unspecified.

47142 OB TRL If the Trace Log option is supported and the trace stream has been created with a log, the
 47143 `posix_trace_clear()` function shall reinitialize the trace stream with the same behavior as if the
 47144 trace stream was created without the log, plus it shall reinitialize the trace log associated with
 47145 the trace stream identified by the argument *trid* as if it were returning from the
 47146 `posix_trace_create_withlog()` function, except that the same allocated resources, for the trace log,
 47147 may be reused and the associated trace stream status remains unchanged. The first trace event
 47148 recorded in the trace log after the call to `posix_trace_clear()` shall be the same as the first trace
 47149 event recorded in the active trace stream after the call to `posix_trace_clear()`. The
 47150 `posix_log_full_status` status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that
 47151 all trace events that occurred during the `posix_trace_clear()` call are recorded in the trace log; the
 47152 behavior with respect to trace points that may occur during this call is unspecified. If the log full
 47153 policy is `POSIX_TRACE_APPEND`, the effect of a call to this function is unspecified for the trace
 47154 log associated with the trace stream identified by the *trid* argument.

47155 **RETURN VALUE**

47156 Upon successful completion, the `posix_trace_clear()` function shall return a value of zero.
 47157 Otherwise, it shall return the corresponding error number.

47158 **ERRORS**

47159 The `posix_trace_clear()` function shall fail if:

47160 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream.

47161 **EXAMPLES**

47162 None.

47163 **APPLICATION USAGE**

47164 None.

47165 **RATIONALE**

47166 None.

- 47167 **FUTURE DIRECTIONS**
- 47168 The *posix_trace_clear()* function may be removed in a future version. |
- 47169 **SEE ALSO**
- 47170 *posix_trace_attr_destroy()*, *posix_trace_create()*, *posix_trace_get_attr()*

- 47175 **Issue 7**
- 47176 The *posix_trace_clear()* function is marked obsolescent.

47177 **NAME**47178 `posix_trace_close`, `posix_trace_open`, `posix_trace_rewind` — trace log management (**TRACING**)47179 **SYNOPSIS**47180 OB TRC `#include <trace.h>`47181 TRL `int posix_trace_close(trace_id_t trid);`47182 `int posix_trace_open(int file_desc, trace_id_t *trid);`47183 `int posix_trace_rewind(trace_id_t trid);`47184 **DESCRIPTION**47185 The `posix_trace_close()` function shall deallocate the trace log identifier indicated by *trid*, and all
47186 of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall
47187 fail.47188 The `posix_trace_open()` function shall allocate the necessary resources and establish the
47189 connection between a trace log identified by the *file_desc* argument and a trace stream identifier
47190 identified by the object pointed to by the *trid* argument. The *file_desc* argument should be a valid
47191 open file descriptor that corresponds to a trace log. The *file_desc* argument shall be open for
47192 reading. The current trace event timestamp, which specifies the timestamp of the trace event that
47193 will be read by the next call to `posix_trace_getnext_event()`, shall be set to the timestamp of the
47194 oldest trace event recorded in the trace log identified by *trid*.47195 The `posix_trace_open()` function shall return a trace stream identifier in the variable pointed to by
47196 the *trid* argument, that may only be used by the following functions:47197 `posix_trace_close()` `posix_trace_get_attr()`
47198 `posix_trace_eventid_equal()` `posix_trace_get_status()`
47199 `posix_trace_eventid_get_name()` `posix_trace_getnext_event()`
47200 `posix_trace_eventtypelist_getnext_id()` `posix_trace_rewind()`
47201 `posix_trace_eventtypelist_rewind()`47202 In particular, notice that the operations normally used by a trace controller process, such as
47203 `posix_trace_start()`, `posix_trace_stop()`, or `posix_trace_shutdown()`, cannot be invoked using the
47204 trace stream identifier returned by the `posix_trace_open()` function.47205 The `posix_trace_rewind()` function shall reset the current trace event timestamp, which specifies
47206 the timestamp of the trace event that will be read by the next call to `posix_trace_getnext_event()`,
47207 to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.47208 **RETURN VALUE**47209 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
47210 return the corresponding error number.47211 If successful, the `posix_trace_open()` function stores the trace stream identifier value in the object
47212 pointed to by *trid*.47213 **ERRORS**47214 The `posix_trace_open()` function shall fail if:

47215 [EINTR] The operation was interrupted by a signal and thus no trace log was opened.

47216 [EINVAL] The object pointed to by *file_desc* does not correspond to a valid trace log.47217 The `posix_trace_close()` and `posix_trace_rewind()` functions may fail if:

47218 [EINVAL] The object pointed to by *trid* does not correspond to a valid trace log.

Issue 7

47235 The *posix_trace_close()*, *posix_trace_open()*, and *posix_trace_rewind()* functions are marked
47236 obsolescent.

47237 **NAME**

47238 `posix_trace_create`, `posix_trace_create_withlog`, `posix_trace_flush`, `posix_trace_shutdown` —
 47239 trace stream initialization, flush, and shutdown from a process (**TRACING**)

47240 **SYNOPSIS**

```
47241 OB TRC #include <sys/types.h>
47242 #include <trace.h>
47243
47243 int posix_trace_create(pid_t pid,
47244     const trace_attr_t *restrict attr,
47245     trace_id_t *restrict trid);
47246 TRL int posix_trace_create_withlog(pid_t pid,
47247     const trace_attr_t *restrict attr, int file_desc,
47248     trace_id_t *restrict trid);
47249 int posix_trace_flush(trace_id_t trid);
47250 int posix_trace_shutdown(trace_id_t trid);
```

47251 **DESCRIPTION**

47252 The `posix_trace_create()` function shall create an active trace stream. It allocates all the resources
 47253 needed by the trace stream being created for tracing the process specified by `pid` in accordance
 47254 with the `attr` argument. The `attr` argument represents the initial attributes of the trace stream and
 47255 shall have been initialized by the function `posix_trace_attr_init()` prior to the `posix_trace_create()`
 47256 call. If the argument `attr` is `NULL`, the default attributes shall be used. The `attr` attributes object
 47257 shall be manipulated through a set of functions described in the `posix_trace_attr` family of
 47258 functions. If the attributes of the object pointed to by `attr` are modified later, the attributes of the
 47259 trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream
 47260 shall be set to the value of the system clock, if the Timers option is not supported, or to the value
 47261 of the `CLOCK_REALTIME` clock, if the Timers option is supported.

47262 The `pid` argument represents the target process to be traced. If the process executing this function
 47263 does not have appropriate privileges to trace the process identified by `pid`, an error shall be
 47264 returned. If the `pid` argument is zero, the calling process shall be traced.

47265 The `posix_trace_create()` function shall store the trace stream identifier of the new trace stream in
 47266 the object pointed to by the `trid` argument. This trace stream identifier shall be used in
 47267 subsequent calls to control tracing. The `trid` argument may only be used by the following
 47268 functions:

47269	<code>posix_trace_clear()</code>	<code>posix_trace_getnext_event()</code>
47270	<code>posix_trace_eventid_equal()</code>	<code>posix_trace_shutdown()</code>
47271	<code>posix_trace_eventid_get_name()</code>	<code>posix_trace_start()</code>
47272	<code>posix_trace_eventtypelist_getnext_id()</code>	<code>posix_trace_stop()</code>
47273	<code>posix_trace_eventtypelist_rewind()</code>	<code>posix_trace_timedgetnext_event()</code>
47274	<code>posix_trace_get_attr()</code>	<code>posix_trace_trid_eventid_open()</code>
47275	<code>posix_trace_get_status()</code>	<code>posix_trace_trygetnext_event()</code>

47276 TEF If the Trace Event Filter option is supported, the following additional functions may use the `trid`
 47277 argument:

```
47278 posix_trace_get_filter()  posix_trace_set_filter()
```

47279 In particular, notice that the operations normally used by a trace analyzer process, such as
 47280 `posix_trace_rewind()` or `posix_trace_close()`, cannot be invoked using the trace stream identifier
 47281 returned by the `posix_trace_create()` function.

- 47282 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is
47283 supported, its trace event type filter shall be empty.
- 47284 The *posix_trace_create()* function may be called multiple times from the same or different
47285 processes, with the system-wide limit indicated by the runtime invariant value
47286 {TRACE_SYS_MAX}, which has the minimum value {_POSIX_TRACE_SYS_MAX}.
- 47287 The trace stream identifier returned by the *posix_trace_create()* function in the argument pointed
47288 to by *trid* is valid only in the process that made the function call. If it is used from another
47289 process, that is a child process, in functions defined in POSIX.1-200x, these functions shall return
47290 with the error [EINVAL].
- 47291 TRL The *posix_trace_create_withlog()* function shall be equivalent to *posix_trace_create()*, except that it
47292 associates a trace log with this stream. The *file_desc* argument shall be the file descriptor
47293 designating the trace log destination. The function shall fail if this file descriptor refers to a file
47294 with a file type that is not compatible with the log policy associated with the trace log. The list of
47295 the appropriate file types that are compatible with each log policy is implementation-defined.
- 47296 The *posix_trace_create_withlog()* function shall return in the parameter pointed to by *trid* the trace
47297 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in
47298 subsequent calls to control tracing. The *trid* argument may only be used by the following
47299 functions:
- | | | |
|-------|---|---|
| 47300 | <i>posix_trace_clear()</i> | <i>posix_trace_get_status()</i> |
| 47301 | <i>posix_trace_eventid_equal()</i> | <i>posix_trace_getnext_event()</i> |
| 47302 | <i>posix_trace_eventid_get_name()</i> | <i>posix_trace_shutdown()</i> |
| 47303 | <i>posix_trace_eventtypelist_getnext_id()</i> | <i>posix_trace_start()</i> |
| 47304 | <i>posix_trace_eventtypelist_rewind()</i> | <i>posix_trace_stop()</i> |
| 47305 | <i>posix_trace_flush()</i> | <i>posix_trace_timedgetnext_event()</i> |
| 47306 | <i>posix_trace_get_attr()</i> | <i>posix_trace_trid_eventid_open()</i> |
- 47307 TEF TRL If the Trace Event Filter option is supported, the following additional functions may use the *trid*
47308 argument:
- 47309 *posix_trace_get_filter()* *posix_trace_set_filter()*
- 47310 TRL In particular, notice that the operations normally used by a trace analyzer process, such as
47311 *posix_trace_rewind()* or *posix_trace_close()*, cannot be invoked using the trace stream identifier
47312 returned by the *posix_trace_create_withlog()* function.
- 47313 The *posix_trace_flush()* function shall initiate a flush operation which copies the contents of the
47314 trace stream identified by the argument *trid* into the trace log associated with the trace stream at
47315 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this
47316 function shall return an error. The termination of the flush operation can be polled by the
47317 *posix_trace_get_status()* function. During the flush operation, it shall be possible to trace new
47318 trace events up to the point when the trace stream becomes full. After flushing is completed, the
47319 space used by the flushed trace events shall be available for tracing new trace events.
- 47320 If flushing the trace stream causes the resulting trace log to become full, the trace log full policy
47321 shall be applied. If the trace *log-full-policy* attribute is set, the following occurs:
- 47322 POSIX_TRACE_UNTIL_FULL
47323 The trace events that have not yet been flushed shall be discarded.
- 47324 POSIX_TRACE_LOOP
47325 The trace events that have not yet been flushed shall be written to the beginning of the trace
47326 log, overwriting previous trace events stored there.

47327

POSIX_TRACE_APPEND

47328

The trace events that have not yet been flushed shall be appended to the trace log.

47329

The *posix_trace_shutdown()* function shall stop the tracing of trace events in the trace stream identified by *trid*, as if *posix_trace_stop()* had been invoked. The *posix_trace_shutdown()* function shall free all the resources associated with the trace stream.

47330

47331

47332

The *posix_trace_shutdown()* function shall not return until all the resources associated with the trace stream have been freed. When the *posix_trace_shutdown()* function returns, the *trid* argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the *trace_getnext_event()* functions (which specified this *trid*) before this call is unblocked with the error [EINVAL].

47333

47334

47335

47336

47337

47338

If the process exits, invokes a member of the *exec* family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the *posix_trace_shutdown()* function.

47339

47340

47341 TRL

For an active trace stream with log, when the *posix_trace_shutdown()* function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the *posix_trace_flush()* function, and the trace log shall be closed.

47342

47343

47344

When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.

47345

47346

47347

47348

In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the *posix_trace_open()* operation.

47349

47350

The *posix_trace_shutdown()* function shall not return until all trace events have been flushed.

RETURN VALUE

47351

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

47352

47353

47354 TRL

The *posix_trace_create()* and *posix_trace_create_withlog()* functions store the trace stream identifier value in the object pointed to by *trid*, if successful.

47355

ERRORS

47356

47357 TRL

The *posix_trace_create()* and *posix_trace_create_withlog()* functions shall fail if:

47358

[EAGAIN] No more trace streams can be started now. {TRACE_SYS_MAX} has been exceeded.

47359

47360

[EINTR] The operation was interrupted by a signal. No trace stream was created.

47361

[EINVAL] One or more of the trace parameters specified by the *attr* parameter is invalid.

47362

[ENOMEM] The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.

47363

47364

[EPERM] The caller does not have appropriate privilege to trace the process specified by *pid*.

47365

47366

[ESRCH] The *pid* argument does not refer to an existing process.

47367 TRL

The *posix_trace_create_withlog()* function shall fail if:

47368

[EBADF] The *file_desc* argument is not a valid file descriptor open for writing.

47369	[EINVAL]	The <i>file_desc</i> argument refers to a file with a file type that does not support the log policy associated with the trace log.
47370		
47371	[ENOSPC]	No space left on device. The device corresponding to the argument <i>file_desc</i> does not contain the space required to create this trace log.
47372		

47373 TRL The *posix_trace_flush()* and *posix_trace_shutdown()* functions shall fail if:

47374	[EINVAL]	The value of the <i>trid</i> argument does not correspond to an active trace stream with log.
47375		
47376	[EFBIG]	The trace log file has attempted to exceed an implementation-defined maximum file size.
47377		
47378	[ENOSPC]	No space left on device.

EXAMPLES

47379 None.

APPLICATION USAGE

47380 None.

RATIONALE

47381 None.

FUTURE DIRECTIONS

47382 The *posix_trace_create()*, *posix_trace_create_withlog()*, *posix_trace_flush()*, and *posix_trace_shutdown()* functions may be removed in a future version.

CHANGE HISTORY

47387 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

Issue 7

47388 These functions are marked obsolescent.

47389 SD5-XSH-ERN-154 is applied, updating the DESCRIPTION to remove the
 47390 *posix_trace_trygetnext_event()* function from the list of functions that use the *trid* argument.

47399 **NAME**

47400 `posix_trace_event`, `posix_trace_eventid_open` — trace functions for instrumenting application
 47401 code (**TRACING**)

47402 **SYNOPSIS**

```
47403 OB TRC #include <sys/types.h>
47404 #include <trace.h>
47405
47406 void posix_trace_event(trace_event_id_t event_id,
47407                       const void *restrictdata_ptr, size_t data_len);
47407 int posix_trace_eventid_open(const char *restrict event_name,
47408                             trace_event_id_t *restrict event_id);
```

47409 **DESCRIPTION**

47410 The `posix_trace_event()` function shall record the `event_id` and the user data pointed to by `data_ptr`
 47411 in the trace stream into which the calling process is being traced and in which `event_id` is not
 47412 filtered out. If the total size of the user trace event data represented by `data_len` is not greater
 47413 than the declared maximum size for user trace event data, then the `truncation-status` attribute of
 47414 the trace event recorded is `POSIX_TRACE_NOT_TRUNCATED`. Otherwise, the user trace event
 47415 data is truncated to this declared maximum size and the `truncation-status` attribute of the trace
 47416 event recorded is `POSIX_TRACE_TRUNCATED_RECORD`.

47417 If there is no trace stream created for the process or if the created trace stream is not running, or
 47418 if the trace event specified by `event_id` is filtered out in the trace stream, the `posix_trace_event()`
 47419 function shall have no effect.

47420 The `posix_trace_eventid_open()` function shall associate a user trace event name with a trace event
 47421 type identifier for the calling process. The trace event name is the string pointed to by the
 47422 argument `event_name`. It shall have a maximum of `{TRACE_EVENT_NAME_MAX}` characters
 47423 (which has the minimum value `{_POSIX_TRACE_EVENT_NAME_MAX}`). The number of user
 47424 trace event type identifiers that can be defined for any given process is limited by the maximum
 47425 value `{TRACE_USER_EVENT_MAX}`, which has the minimum value
 47426 `{POSIX_TRACE_USER_EVENT_MAX}`.

47427 If the Trace Inherit option is not supported, the `posix_trace_eventid_open()` function shall associate
 47428 the user trace event name pointed to by the `event_name` argument with a trace event type
 47429 identifier that is unique for the traced process, and is returned in the variable pointed to by the
 47430 `event_id` argument. If the user trace event name has already been mapped for the traced process,
 47431 then the previously assigned trace event type identifier shall be returned. If the per-process user
 47432 trace event name limit represented by `{TRACE_USER_EVENT_MAX}` has been reached, the pre-
 47433 defined `POSIX_TRACE_UNNAMED_USEREVENT` (see [Table 2-7](#), on page 517) user trace event
 47434 shall be returned.

47435 TRI If the Trace Inherit option is supported, the `posix_trace_eventid_open()` function shall associate the
 47436 user trace event name pointed to by the `event_name` argument with a trace event type identifier
 47437 that is unique for all the processes being traced in this same trace stream, and is returned in the
 47438 variable pointed to by the `event_id` argument. If the user trace event name has already been
 47439 mapped for the traced processes, then the previously assigned trace event type identifier shall be
 47440 returned. If the per-process user trace event name limit represented by
 47441 `{TRACE_USER_EVENT_MAX}` has been reached, the pre-defined
 47442 `POSIX_TRACE_UNNAMED_USEREVENT` ([Table 2-7](#), on page 517) user trace event shall be
 47443 returned.

Note: The above procedure, together with the fact that multiple processes can only be traced into the same trace stream by inheritance, ensure that all the processes that are traced into a trace stream have the same mapping of trace event names to trace event type identifiers.

47444
4744547446
47447

If there is no trace stream created, the *posix_trace_eventid_open()* function shall store this information for future trace streams created for this process.

47448
47449**RETURN VALUE**

No return value is defined for the *posix_trace_event()* function.

47450
47451
47452
47453

Upon successful completion, the *posix_trace_eventid_open()* function shall return a value of zero. Otherwise, it shall return the corresponding error number. The *posix_trace_eventid_open()* function stores the trace event type identifier value in the object pointed to by *event_id*, if successful.

47454
47455**ERRORS**

The *posix_trace_eventid_open()* function shall fail if:

47456
47457
47458

[ENAMETOOLONG]

The size of the name pointed to by the *event_name* argument was longer than the implementation-defined value {TRACE_EVENT_NAME_MAX}.

47477**Issue 7**

The *posix_trace_event()* and *posix_trace_eventid_open()* functions are marked obsolescent.

posix_trace_eventid_equal()

System Interfaces

47478 **NAME**

47479 `posix_trace_eventid_equal`, `posix_trace_eventid_get_name`, `posix_trace_trid_eventid_open` —
 47480 manipulate the trace event type identifier (**TRACING**)

47481 **SYNOPSIS**

```
47482 OB TRC #include <trace.h>
47483
47483 int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
47484 trace_event_id_t event2);
47485 int posix_trace_eventid_get_name(trace_id_t trid,
47486 trace_event_id_t event, char *event_name);
47487 TEF int posix_trace_trid_eventid_open(trace_id_t trid,
47488 const char *restrict event_name,
47489 trace_event_id_t *restrict event);
```

47490 **DESCRIPTION**

47491 The `posix_trace_eventid_equal()` function shall compare the trace event type identifiers `event1` and
 47492 `event2` from the same trace stream or the same trace log identified by the `trid` argument. If the
 47493 trace event type identifiers `event1` and `event2` are from different trace streams, the return value
 47494 shall be unspecified.

47495 The `posix_trace_eventid_get_name()` function shall return, in the argument pointed to by
 47496 `event_name`, the trace event name associated with the trace event type identifier identified by the
 47497 argument `event`, for the trace stream or for the trace log identified by the `trid` argument. The
 47498 name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
 47499 (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to
 47500 this function with the same trace event type identifier and the same trace stream identifier shall
 47501 return the same event name.

47502 TEF The `posix_trace_trid_eventid_open()` function shall associate a user trace event name with a trace
 47503 event type identifier for a given trace stream. The trace stream is identified by the `trid` argument,
 47504 and it shall be an active trace stream. The trace event name is the string pointed to by the
 47505 argument `event_name`. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
 47506 (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user
 47507 trace event type identifiers that can be defined for any given process is limited by the maximum
 47508 value {TRACE_USER_EVENT_MAX}, which has the minimum value
 47509 {_POSIX_TRACE_USER_EVENT_MAX}.

47510 If the Trace Inherit option is not supported, the `posix_trace_trid_eventid_open()` function shall
 47511 associate the user trace event name pointed to by the `event_name` argument with a trace event
 47512 type identifier that is unique for the process being traced in the trace stream identified by the `trid`
 47513 argument, and is returned in the variable pointed to by the `event` argument. If the user trace
 47514 event name has already been mapped for the traced process, then the previously assigned trace
 47515 event type identifier shall be returned. If the per-process user trace event name limit represented
 47516 by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
 47517 POSIX_TRACE_UNNAMED_USEREVENT (see [Table 2-7](#), on page 517) user trace event shall be
 47518 returned.

47519 TEF TRI If the Trace Inherit option is supported, the `posix_trace_trid_eventid_open()` function shall
 47520 associate the user trace event name pointed to by the `event_name` argument with a trace event
 47521 type identifier that is unique for all the processes being traced in the trace stream identified by
 47522 the `trid` argument, and is returned in the variable pointed to by the `event` argument. If the user
 47523 trace event name has already been mapped for the traced processes, then the previously
 47524 assigned trace event type identifier shall be returned. If the per-process user trace event name

47525 limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
 47526 POSIX_TRACE_UNNAMED_USEREVENT (see [Table 2-7](#), on page 517) user trace event shall be
 47527 returned.

47528 RETURN VALUE

47529 TEF Upon successful completion, the `posix_trace_eventid_get_name()` and
 47530 `posix_trace_trid_eventid_open()` functions shall return a value of zero. Otherwise, they shall return
 47531 the corresponding error number.

47532 The `posix_trace_eventid_equal()` function shall return a non-zero value if *event1* and *event2* are
 47533 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or
 47534 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*
 47535 is invalid, the behavior shall be unspecified.

47536 The `posix_trace_eventid_get_name()` function stores the trace event name value in the object
 47537 pointed to by *event_name*, if successful.

47538 TEF The `posix_trace_trid_eventid_open()` function stores the trace event type identifier value in the
 47539 object pointed to by *event*, if successful.

47540 ERRORS

47541 TEF The `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall fail if:
 47542 [EINVAL] The *trid* argument was not a valid trace stream identifier.

47543 TEF The `posix_trace_trid_eventid_open()` function shall fail if:

47544 TEF [ENAMETOOLONG]

47545 The size of the name pointed to by the *event_name* argument was longer than
 47546 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

47547 The `posix_trace_eventid_get_name()` function shall fail if:

47548 [EINVAL] The trace event type identifier *event* was not associated with any name.

47549 EXAMPLES

47550 None.

47551 APPLICATION USAGE

47552 None.

47553 RATIONALE

47554 None.

47555 FUTURE DIRECTIONS

47556 The `posix_trace_eventid_equal()`, `posix_trace_eventid_get_name()`, and
 47557 `posix_trace_trid_eventid_open()` functions may be removed in a future version. |

47565 These functions are marked obsolescent.

posix_trace_eventid_open()*System Interfaces*47566 **NAME**47567 posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)47568 **SYNOPSIS**

```
47569 OB TRC #include <sys/types.h>  
47570 #include <trace.h>  
  
47571 int posix_trace_eventid_open(const char *restrict event_name,  
47572 trace_event_id_t *restrict event_id);
```

47573 **DESCRIPTION**47574 Refer to [posix_trace_event\(\)](#).

47575 **NAME**

47576 `posix_trace_eventset_add`, `posix_trace_eventset_del`, `posix_trace_eventset_empty`,
 47577 `posix_trace_eventset_fill`, `posix_trace_eventset_ismember` — manipulate trace event type sets
 47578 (**TRACING**)

47579 **SYNOPSIS**

```
47580 OB TRC #include <trace.h>
47581 TEF int posix_trace_eventset_add(trace_event_id_t event_id,
47582     trace_event_set_t *set);
47583 int posix_trace_eventset_del(trace_event_id_t event_id,
47584     trace_event_set_t *set);
47585 int posix_trace_eventset_empty(trace_event_set_t *set);
47586 int posix_trace_eventset_fill(trace_event_set_t *set, int what);
47587 int posix_trace_eventset_ismember(trace_event_id_t event_id,
47588     const trace_event_set_t *restrict set, int *restrict ismember);
```

47589 **DESCRIPTION**

47590 These primitives manipulate sets of trace event types. They operate on data objects addressable
 47591 by the application, not on the current trace event filter of any trace stream.

47592 The `posix_trace_eventset_add()` and `posix_trace_eventset_del()` functions, respectively, shall add or
 47593 delete the individual trace event type specified by the value of the argument `event_id` to or from
 47594 the trace event type set pointed to by the argument `set`. Adding a trace event type already in the
 47595 set or deleting a trace event type not in the set shall not be considered an error.

47596 The `posix_trace_eventset_empty()` function shall initialize the trace event type set pointed to by
 47597 the `set` argument such that all trace event types defined, both system and user, shall be excluded
 47598 from the set.

47599 The `posix_trace_eventset_fill()` function shall initialize the trace event type set pointed to by the
 47600 argument `set`, such that the set of trace event types defined by the argument `what` shall be
 47601 included in the set. The value of the argument `what` shall consist of one of the following values,
 47602 as defined in the `<trace.h>` header:

47603 **POSIX_TRACE_WOPID_EVENTS**

47604 All the process-independent implementation-defined system trace event types are included
 47605 in the set.

47606 **POSIX_TRACE_SYSTEM_EVENTS**

47607 All the implementation-defined system trace event types are included in the set, as are those
 47608 defined in POSIX.1-200x.

47609 **POSIX_TRACE_ALL_EVENTS**

47610 All trace event types defined, both system and user, are included in the set.

47611 Applications shall call either `posix_trace_eventset_empty()` or `posix_trace_eventset_fill()` at least
 47612 once for each object of type `trace_event_set_t` prior to any other use of that object. If such an
 47613 object is not initialized in this way, but is nonetheless supplied as an argument to any of the
 47614 `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, or `posix_trace_eventset_ismember()` functions,
 47615 the results are undefined.

47616 The `posix_trace_eventset_ismember()` function shall test whether the trace event type specified by
 47617 the value of the argument `event_id` is a member of the set pointed to by the argument `set`. The
 47618 value returned in the object pointed to by `ismember` argument is zero if the trace event type
 47619 identifier is not a member of the set and a value different from zero if it is a member of the set.

posix_trace_eventset_add()*System Interfaces*47620 **RETURN VALUE**

47621 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
47622 return the corresponding error number.

47623 **ERRORS**

47624 These functions may fail if:

47625 [EINVAL] The value of one of the arguments is invalid.

47626 **EXAMPLES**

47627 None.

47628 **APPLICATION USAGE**

47629 None.

47630 **RATIONALE**

47631 None.

47632 **FUTURE DIRECTIONS**

47633 The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,
47634 `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions may be removed in a
47635 future version.

47636 **SEE ALSO**

47638 XBD [**<trace.h>**](#)

47639 **CHANGE HISTORY**

47640 First released in Issue 6. Derived from IEEE Std. 1003.1q-2000.

47641 **Issue 7**

47642 The `posix_trace_eventset_add()`, `posix_trace_eventset_del()`, `posix_trace_eventset_empty()`,
47643 `posix_trace_eventset_fill()`, and `posix_trace_eventset_ismember()` functions are marked obsolescent.

47644 **NAME**

47645 `posix_trace_eventtypelist_getnext_id`, `posix_trace_eventtypelist_rewind` — iterate over a
 47646 mapping of trace event types (**TRACING**)

47647 **SYNOPSIS**

```
47648 OB TRC #include <trace.h>
47649
47649 int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
47650     trace_event_id_t *restrict event, int *restrict unavailable);
47651 int posix_trace_eventtypelist_rewind(trace_id_t trid);
```

47652 **DESCRIPTION**

47653 The first time `posix_trace_eventtypelist_getnext_id()` is called, the function shall return in the
 47654 variable pointed to by `event` the first trace event type identifier of the list of trace events of the
 47655 trace stream identified by the `trid` argument. Successive calls to
 47656 `posix_trace_eventtypelist_getnext_id()` return in the variable pointed to by `event` the next trace
 47657 event type identifier in that same list. Each time a trace event type identifier is successfully
 47658 written into the variable pointed to by the `event` argument, the variable pointed to by the
 47659 `unavailable` argument shall be set to zero. When no more trace event type identifiers are available,
 47660 and so none is returned, the variable pointed to by the `unavailable` argument shall be set to a
 47661 value different from zero.

47662 The `posix_trace_eventtypelist_rewind()` function shall reset the next trace event type identifier to
 47663 be read to the first trace event type identifier from the list of trace events used in the trace stream
 47664 identified by `trid`.

47665 **RETURN VALUE**

47666 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47667 return the corresponding error number.

47668 The `posix_trace_eventtypelist_getnext_id()` function stores the trace event type identifier value in
 47669 the object pointed to by `event`, if successful.

47670 **ERRORS**

47671 These functions shall fail if:

47672 [EINVAL] The `trid` argument was not a valid trace stream identifier.

47673 **EXAMPLES**

47674 None.

47675 **APPLICATION USAGE**

47676 None.

47677 **RATIONALE**

47678 None.

47679 **FUTURE DIRECTIONS**

47680 The `posix_trace_eventtypelist_getnext_id()` and `posix_trace_eventtypelist_rewind()` functions may be
 47681 removed in a future version.

47689
47690**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

IEEE PASC Interpretations 1003.1 #123 and #129 are applied.

Issue 7

The *posix_trace_eventtypelist_getnext_id()* and *posix_trace_eventtypelist_rewind()* functions are marked obsolescent.

47691 **NAME**
47692 `posix_trace_flush` — trace stream flush from a process (**TRACING**)

47693 **SYNOPSIS**

```
47694 OB TRC #include <sys/types.h>  
47695 #include <trace.h>  
47696 TRL int posix_trace_flush(trace_id_t trid);
```

47697 **DESCRIPTION**

47698 Refer to [posix_trace_create\(\)](#).

47699 **NAME**

47700 posix_trace_get_attr, posix_trace_get_status — retrieve the trace attributes or trace status
 47701 (TRACING)

47702 **SYNOPSIS**

```
47703 OB TRC #include <trace.h>
47704
47704 int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
47705 int posix_trace_get_status(trace_id_t trid,
47706 struct posix_trace_status_info *statusinfo);
```

47707 **DESCRIPTION**

47708 The *posix_trace_get_attr()* function shall copy the attributes of the active trace stream identified
 47709 TRL by *trid* into the object pointed to by the *attr* argument. If the Trace Log option is supported, *trid*
 47710 may represent a pre-recorded trace log.

47711 The *posix_trace_get_status()* function shall return, in the structure pointed to by the *statusinfo*
 47712 argument, the current trace status for the trace stream identified by the *trid* argument. These
 47713 status values returned in the structure pointed to by *statusinfo* shall have been appropriately
 47714 TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and
 47715 the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the
 47716 completed trace stream.

47717 Each time the *posix_trace_get_status()* function is used, the overrun status of the trace stream
 47718 TRL shall be reset to POSIX_TRACE_NO_OVERRUN immediately after the call completes. If the
 47719 Trace Log option is supported, the *posix_trace_get_status()* function shall behave the same as
 47720 when the option is not supported except for the following differences:

- 47721 • If the *trid* argument refers to a trace stream with log, each time the *posix_trace_get_status()*
 47722 function is used, the log overrun status of the trace stream shall be reset to
 47723 POSIX_TRACE_NO_OVERRUN and the *flush_error* status shall be reset to zero
 47724 immediately after the call completes.
- 47725 • If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the
 47726 status of the completed trace stream and the status values of the trace stream shall not be
 47727 reset.

47728 **RETURN VALUE**

47729 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47730 return the corresponding error number.

47731 The *posix_trace_get_attr()* function stores the trace attributes in the object pointed to by *attr*, if
 47732 successful.

47733 The *posix_trace_get_status()* function stores the trace status in the object pointed to by *statusinfo*,
 47734 if successful.

47735 **ERRORS**

47736 These functions shall fail if:

- 47737 [EINVAL] The trace stream argument *trid* does not correspond to a valid active trace
 47738 stream or a valid trace log.

DRAFT

47756 **NAME**

47757 `posix_trace_get_filter`, `posix_trace_set_filter` — retrieve and set the filter of an initialized trace
 47758 stream (**TRACING**)

47759 **SYNOPSIS**

```
47760 OB TRC #include <trace.h>
47761 TEF int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
47762 int posix_trace_set_filter(trace_id_t trid,
47763 const trace_event_set_t *set, int how);
```

47764 **DESCRIPTION**

47765 The `posix_trace_get_filter()` function shall retrieve, into the argument pointed to by *set*, the actual
 47766 trace event filter from the trace stream specified by *trid*.

47767 The `posix_trace_set_filter()` function shall change the set of filtered trace event types after a trace
 47768 stream identified by the *trid* argument is created. This function may be called prior to starting
 47769 the trace stream, or while the trace stream is active. By default, if no call is made to
 47770 `posix_trace_set_filter()`, all trace events shall be recorded (that is, none of the trace event types are
 47771 filtered out).

47772 If this function is called while the trace is in progress, a special system trace event,
 47773 `POSIX_TRACE_FILTER`, shall be recorded in the trace indicating both the old and the new sets
 47774 of filtered trace event types (see [Table 2-4](#) (on page 515) and [Table 2-6](#), on page 516).

47775 If the `posix_trace_set_filter()` function is interrupted by a signal, an error shall be returned and the
 47776 filter shall not be changed. In this case, the state of the trace stream shall not be changed.

47777 The value of the argument *how* indicates the manner in which the set is to be changed and shall
 47778 have one of the following values, as defined in the `<trace.h>` header:

47779 `POSIX_TRACE_SET_EVENTSET`

47780 The resulting set of trace event types to be filtered shall be the trace event type set pointed
 47781 to by the argument *set*.

47782 `POSIX_TRACE_ADD_EVENTSET`

47783 The resulting set of trace event types to be filtered shall be the union of the current set and
 47784 the trace event type set pointed to by the argument *set*.

47785 `POSIX_TRACE_SUB_EVENTSET`

47786 The resulting set of trace event types to be filtered shall be all trace event types in the
 47787 current set that are not in the set pointed to by the argument *set*; that is, remove each
 47788 element of the specified set from the current filter.

47789 **RETURN VALUE**

47790 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47791 return the corresponding error number.

47792 The `posix_trace_get_filter()` function stores the set of filtered trace event types in *set*, if successful.

47793 **ERRORS**

47794 These functions shall fail if:

47795 `[EINVAL]` The value of the *trid* argument does not correspond to an active trace stream
 47796 or the value of the argument pointed to by *set* is invalid.

47797 [EINTR] The operation was interrupted by a signal.

Issue 7

47813 The *posix_trace_get_filter()* and *posix_trace_set_filter()* functions are marked obsolescent.
47814

DRAFT

posix_trace_get_status()47815 **NAME**47816 `posix_trace_get_status` — retrieve the trace status (**TRACING**)47817 **SYNOPSIS**47818 OB TRC `#include <trace.h>`47819 `int posix_trace_get_status(trace_id_t trid,`
47820 `struct posix_trace_status_info *statusinfo);`47821 **DESCRIPTION**47822 Refer to [*posix_trace_get_attr\(\)*](#).

47823 **NAME**

47824 `posix_trace_getnext_event`, `posix_trace_timedgetnext_event`, `posix_trace_trygetnext_event` —
 47825 retrieve a trace event (**TRACING**)

47826 **SYNOPSIS**

```
47827 OB TRC #include <sys/types.h>
47828 #include <trace.h>

47829 int posix_trace_getnext_event(trace_id_t trid,
47830     struct posix_trace_event_info *restrict event,
47831     void *restrict data, size_t num_bytes,
47832     size_t *restrict data_len, int *restrict unavailable);
47833 int posix_trace_timedgetnext_event(trace_id_t trid,
47834     struct posix_trace_event_info *restrict event,
47835     void *restrict data, size_t num_bytes,
47836     size_t *restrict data_len, int *restrict unavailable,
47837     const struct timespec *restrict abstime);
47838 int posix_trace_trygetnext_event(trace_id_t trid,
47839     struct posix_trace_event_info *restrict event,
47840     void *restrict data, size_t num_bytes,
47841     size_t *restrict data_len, int *restrict unavailable);
```

47842 **DESCRIPTION**

47843 The `posix_trace_getnext_event()` function shall report a recorded trace event either from an active
 47844 TRL trace stream without log or a pre-recorded trace stream identified by the `trid` argument. The
 47845 `posix_trace_trygetnext_event()` function shall report a recorded trace event from an active trace
 47846 stream without log identified by the `trid` argument.

47847 The trace event information associated with the recorded trace event shall be copied by the
 47848 function into the structure pointed to by the argument `event` and the data associated with the
 47849 trace event shall be copied into the buffer pointed to by the `data` argument.

47850 The `posix_trace_getnext_event()` function shall block if the `trid` argument identifies an active trace
 47851 stream and there is currently no trace event ready to be retrieved. When returning, if a recorded
 47852 trace event was reported, the variable pointed to by the `unavailable` argument shall be set to zero.
 47853 Otherwise, the variable pointed to by the `unavailable` argument shall be set to a value different
 47854 from zero.

47855 The `posix_trace_timedgetnext_event()` function shall attempt to get another trace event from an
 47856 active trace stream without log, as in the `posix_trace_getnext_event()` function. However, if no
 47857 trace event is available from the trace stream, the implied wait shall be terminated when the
 47858 timeout specified by the argument `abstime` expires, and the function shall return the error
 47859 [ETIMEDOUT].

47860 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the
 47861 clock upon which timeouts are based (that is, when the value of that clock equals or exceeds
 47862 `abstime`), or if the absolute time specified by `abstime` has already passed at the time of the call.

47863 The timeout shall be based on the `CLOCK_REALTIME` clock. The resolution of the timeout shall
 47864 be the resolution of the clock on which it is based. The `timespec` data type is defined in the
 47865 `<time.h>` header.

47866 Under no circumstance shall the function fail with a timeout if a trace event is immediately
 47867 available from the trace stream. The validity of the `abstime` argument need not be checked if a
 47868 trace event is immediately available from the trace stream.

47869 The behavior of this function for a pre-recorded trace stream is unspecified.

47870 TRL The *posix_trace_trygetnext_event()* function shall not block. This function shall return an error if
 47871 the *trid* argument identifies a pre-recorded trace stream. If a recorded trace event was reported,
 47872 the variable pointed to by the *unavailable* argument shall be set to zero. Otherwise, if no trace
 47873 event was reported, the variable pointed to by the *unavailable* argument shall be set to a value
 47874 different from zero.

47875 The argument *num_bytes* shall be the size of the buffer pointed to by the *data* argument. The
 47876 argument *data_len* reports to the application the length in bytes of the data record just
 47877 transferred. If *num_bytes* is greater than or equal to the size of the data associated with the trace
 47878 event pointed to by the *event* argument, all the recorded data shall be transferred. In this case,
 47879 the *truncation-status* member of the trace event structure shall be either
 47880 POSIX_TRACE_NOT_TRUNCATED, if the trace event data was recorded without truncation
 47881 while tracing, or POSIX_TRACE_TRUNCATED_RECORD, if the trace event data was truncated
 47882 when it was recorded. If the *num_bytes* argument is less than the length of recorded trace event
 47883 data, the data transferred shall be truncated to a length of *num_bytes*, the value stored in the
 47884 variable pointed to by *data_len* shall be equal to *num_bytes*, and the *truncation-status* member of
 47885 the *event* structure argument shall be set to POSIX_TRACE_TRUNCATED_READ (see the
 47886 **posix_trace_event_info** structure defined in <trace.h>).

47887 The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace
 47888 events shall be reported in the order in which they were generated, up to an implementation-
 47889 defined time resolution that causes the ordering of trace events occurring very close to each
 47890 other to be unknown. Once reported, a trace event cannot be reported again from an active trace
 47891 stream. Once a trace event is reported from an active trace stream without log, the trace stream
 47892 shall make the resources associated with that trace event available to record future generated
 47893 trace events.

47894 RETURN VALUE

47895 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47896 return the corresponding error number.

47897 If successful, these functions store:

- 47898 • The recorded trace event in the object pointed to by *event*
- 47899 • The trace event information associated with the recorded trace event in the object pointed
 47900 to by *data*
- 47901 • The length of this trace event information in the object pointed to by *data_len*
- 47902 • The value of zero in the object pointed to by *unavailable*

47903 ERRORS

47904 These functions shall fail if:

47905 [EINVAL] The trace stream identifier argument *trid* is invalid.

47906 The *posix_trace_getnext_event()* and *posix_trace_timedgetnext_event()* functions shall fail if:

47907 [EINTR] The operation was interrupted by a signal, and so the call had no effect.

47908 The *posix_trace_trygetnext_event()* function shall fail if:

47909 [EINVAL] The trace stream identifier argument *trid* does not correspond to an active
 47910 trace stream.

47911 The *posix_trace_timedgetnext_event()* function shall fail if:

47912 [EINVAL] There is no trace event immediately available from the trace stream, and the
 47913 *timeout* argument is invalid.

47914 [ETIMEDOUT] No trace event was available from the trace stream before the specified
47915 timeout *timeout* expired.

47931 The `posix_trace_getnext_event()`, `posix_trace_timedgetnext_event()`, and
47932 `posix_trace_trygetnext_event()` functions are marked obsolescent.
47933

47934 Functionality relating to the Timers option is moved to the Base.

47935 **NAME**47936 posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)47937 **SYNOPSIS**47938 OB TRC `#include <trace.h>`47939 TRL `int posix_trace_open(int file_desc, trace_id_t *trid);`47940 `int posix_trace_rewind(trace_id_t trid);`47941 **DESCRIPTION**47942 Refer to [posix_trace_close\(\)](#).

47943 **NAME**47944 `posix_trace_set_filter` — set filter of an initialized trace stream (**TRACING**)47945 **SYNOPSIS**47946 OB TRC `#include <trace.h>`47947 TEF `int posix_trace_set_filter(trace_id_t trid,`
47948 `const trace_event_set_t *set, int how);`47949 **DESCRIPTION**47950 Refer to [posix_trace_get_filter\(\)](#).

posix_trace_shutdown()*System Interfaces*

47951 **NAME**
47952 `posix_trace_shutdown` — trace stream shutdown from a process (**TRACING**)

SYNOPSIS

```
47954 OB TRC #include <sys/types.h>  
47955 #include <trace.h>  
47956 int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

47957 Refer to [posix_trace_create\(\)](#).
47958

47959 **NAME**47960 `posix_trace_start`, `posix_trace_stop` — trace start and stop (**TRACING**)47961 **SYNOPSIS**

```
47962 OB TRC #include <trace.h>
47963
47963 int posix_trace_start(trace_id_t trid);
47964 int posix_trace_stop (trace_id_t trid);
```

47965 **DESCRIPTION**

47966 The `posix_trace_start()` and `posix_trace_stop()` functions, respectively, shall start and stop the trace
 47967 stream identified by the argument *trid*.

47968 The effect of calling the `posix_trace_start()` function shall be recorded in the trace stream as the
 47969 POSIX_TRACE_START system trace event and the status of the trace stream shall become
 47970 POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the
 47971 POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall
 47972 continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall
 47973 not be recorded and the status of the trace stream shall not be changed.

47974 The effect of calling the `posix_trace_stop()` function shall be recorded in the trace stream as the
 47975 POSIX_TRACE_STOP system trace event and the status of the trace stream shall become
 47976 POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the
 47977 POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain
 47978 suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be
 47979 recorded and the status of the trace stream shall not be changed.

47980 **RETURN VALUE**

47981 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 47982 return the corresponding error number.

47983 **ERRORS**

47984 These functions shall fail if:

47985 [EINVAL] The value of the argument *trid* does not correspond to an active trace stream
 47986 and thus no trace stream was started or stopped.

47987 [EINTR] The operation was interrupted by a signal and thus the trace stream was not
 47988 necessarily started or stopped.

47989 **EXAMPLES**

47990 None.

47991 **APPLICATION USAGE**

47992 None.

47993 **RATIONALE**

47994 None.

47995 **FUTURE DIRECTIONS**47996 The `posix_trace_start()` and `posix_trace_stop()` functions may be removed in a future version.47997 **SEE ALSO**47998 [*posix_trace_create\(\)*](#)47999 XBD [**<trace.h>**](#)

The *posix_trace_start()* and *posix_trace_stop()* functions are marked obsolescent.

48005 **NAME**
48006 `posix_trace_timedgetnext_event` — retrieve a trace event (**TRACING**)

48007 **SYNOPSIS**

```
48008 OB TRC #include <sys/types.h>  
48009 #include <trace.h>  
  
48010 int posix_trace_timedgetnext_event(trace_id_t trid,  
48011 struct posix_trace_event_info *restrict event,  
48012 void *restrict data, size_t num_bytes,  
48013 size_t *restrict data_len, int *restrict unavailable,  
48014 const struct timespec *restrict abstime);
```

48015 **DESCRIPTION**

48016 Refer to [posix_trace_getnext_event\(\)](#).

48017 **NAME**48018 posix_trace_trid_eventid_open — open a trace event type identifier (**TRACING**)48019 **SYNOPSIS**

48020 OB TRC #include <trace.h>

48021 TEF int posix_trace_trid_eventid_open(trace_id_t trid,
48022 const char *restrict event_name,
48023 trace_event_id_t *restrict event);48024 **DESCRIPTION**48025 Refer to [posix_trace_eventid_equal\(\)](#).

48026 **NAME**
48027 `posix_trace_trygetnext_event` — retrieve a trace event (**TRACING**)

48028 **SYNOPSIS**

```
48029 OB TRC #include <sys/types.h>  
48030 #include <trace.h>  
  
48031 int posix_trace_trygetnext_event(trace_id_t trid,  
48032     struct posix_trace_event_info *restrict event,  
48033     void *restrict data, size_t num_bytes,  
48034     size_t *restrict data_len, int *restrict unavailable);
```

48035 **DESCRIPTION**

48036 Refer to [posix_trace_getnext_event\(\)](#).

48037 **NAME**48038 `posix_typed_mem_get_info` — query typed memory information (**ADVANCED REALTIME**)48039 **SYNOPSIS**

```
48040 TYM #include <sys/mman.h>
48041
48041 int posix_typed_mem_get_info(int fildev,
48042 struct posix_typed_mem_info *info);
```

48043 **DESCRIPTION**

48044 The `posix_typed_mem_get_info()` function shall return, in the `posix_tmi_length` field of the **posix_typed_mem_info** structure pointed to by `info`, the maximum length which may be successfully allocated by the typed memory object designated by `fildev`. This maximum length shall take into account the flag `POSIX_TYPED_MEM_ALLOCATE` or `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified when the typed memory object represented by `fildev` was opened. The maximum length is dynamic; therefore, the value returned is valid only while the current mapping of the corresponding typed memory pool remains unchanged.

48052 If `fildev` represents a typed memory object opened with neither the `POSIX_TYPED_MEM_ALLOCATE` flag nor the `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag specified, the returned value of `info->posix_tmi_length` is unspecified.

48055 The `posix_typed_mem_get_info()` function may return additional implementation-defined information in other fields of the **posix_typed_mem_info** structure pointed to by `info`.

48057 If the memory object specified by `fildev` is not a typed memory object, then the behavior of this function is undefined.

48059 **RETURN VALUE**

48060 Upon successful completion, the `posix_typed_mem_get_info()` function shall return zero; otherwise, the corresponding error status value shall be returned.

48062 **ERRORS**

48063 The `posix_typed_mem_get_info()` function shall fail if:

- | | | |
|-------|----------|--|
| 48064 | [EBADF] | The <code>fildev</code> argument is not a valid open file descriptor. |
| 48065 | [ENODEV] | The <code>fildev</code> argument is not connected to a memory object supported by this function. |

48067 This function shall not return an error code of [EINTR].

48068 **EXAMPLES**

48069 None.

48070 **APPLICATION USAGE**

48071 None.

48072 **RATIONALE**

48073 An application that needs to allocate a block of typed memory with length dependent upon the amount of memory currently available must either query the typed memory object to obtain the amount available, or repeatedly invoke `mmap()` attempting to guess an appropriate length. While the latter method is existing practice with `malloc()`, it is awkward and imprecise. The `posix_typed_mem_get_info()` function allows an application to immediately determine available memory. This is particularly important for typed memory objects that may in some cases be scarce resources. Note that when a typed memory pool is a shared resource, some form of mutual-exclusion or synchronization may be required while typed memory is being queried and

48081 allocated to prevent race conditions.

48082 The existing *fstat()* function is not suitable for this purpose. We realize that implementations
48083 may wish to provide other attributes of typed memory objects (for example, alignment
48084 requirements, page size, and so on). The *fstat()* function returns a structure which is not
48085 extensible and, furthermore, contains substantial information that is inappropriate for typed
48086 memory objects.

48087 FUTURE DIRECTIONS

48088 None.

48089 SEE ALSO

48090 *fstat()*, *mmap()*, *posix_typed_mem_open()*

48091 XBD <[sys/mman.h](#)>

48092 CHANGE HISTORY

48093 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

48094 **NAME**48095 posix_typed_mem_open — open a typed memory object (**ADVANCED REALTIME**)48096 **SYNOPSIS**

```
48097 TYM #include <sys/mman.h>
48098 int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

48099 **DESCRIPTION**

48100 The *posix_typed_mem_open()* function shall establish a connection between the typed memory
 48101 object specified by the string pointed to by *name* and a file descriptor. It shall create an open file
 48102 description that refers to the typed memory object and a file descriptor that refers to that open
 48103 file description. The file descriptor is used by other functions to refer to that typed memory
 48104 object. It is unspecified whether the name appears in the file system and is visible to other
 48105 functions that take pathnames as arguments. The *name* argument shall conform to the
 48106 construction rules for a pathname. If *name* begins with the slash character, then processes calling
 48107 *posix_typed_mem_open()* with the same value of *name* shall refer to the same typed memory
 48108 object. If *name* does not begin with the slash character, the effect is implementation-defined. The
 48109 interpretation of slash characters other than the leading slash character in *name* is
 48110 implementation-defined.

48111 Each typed memory object supported in a system shall be identified by a name which specifies
 48112 not only its associated typed memory pool, but also the path or port by which it is accessed. That
 48113 is, the same typed memory pool accessed via several different ports shall have several different
 48114 corresponding names. The binding between names and typed memory objects is established in
 48115 an implementation-defined manner. Unlike shared memory objects, there is no way within
 48116 POSIX.1-200x for a program to create a typed memory object.

48117 The value of *tflag* shall determine how the typed memory object behaves when subsequently
 48118 mapped by calls to *mmap()*. At most, one of the following flags defined in **<sys/mman.h>** may
 48119 be specified:

48120 POSIX_TYPED_MEM_ALLOCATE
 48121 Allocate on *mmap()*.

48122 POSIX_TYPED_MEM_ALLOCATE_CONTIG
 48123 Allocate contiguously on *mmap()*.

48124 POSIX_TYPED_MEM_MAP_ALLOCATABLE
 48125 Map on *mmap()*, without affecting allocatability.

48126 If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE specified, any subsequent call to *mmap()*
 48127 using the returned file descriptor shall result in allocation and mapping of typed memory from
 48128 the specified typed memory pool. The allocated memory may be a contiguous previously
 48129 unallocated area of the typed memory pool or several non-contiguous previously unallocated
 48130 areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag
 48131 POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the
 48132 returned file descriptor shall result in allocation and mapping of a single contiguous previously
 48133 unallocated area of the typed memory pool (also mapped to a contiguous portion of the process
 48134 address space). If *tflag* has none of the flags POSIX_TYPED_MEM_ALLOCATE or
 48135 POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the
 48136 returned file descriptor shall map an application-chosen area from the specified typed memory
 48137 pool such that this mapped area becomes unavailable for allocation until unmapped by all
 48138 processes. If *tflag* has the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE specified, any
 48139 subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen

48140 area from the specified typed memory pool without an effect on the availability of that area for
 48141 allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it
 48142 was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. The
 48143 appropriate privilege to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag is
 48144 implementation-defined.

48145 If successful, *posix_typed_mem_open()* shall return a file descriptor for the typed memory object
 48146 that is the lowest numbered file descriptor not currently open for that process. The open file
 48147 description is new, and therefore the file descriptor shall not share it with any other processes. It
 48148 is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated
 48149 with the new file descriptor shall be cleared.

48150 The behavior of *msync()*, *ftruncate()*, and all file operations other than *mmap()*,
 48151 *posix_mem_offset()*, *posix_typed_mem_get_info()*, *fstat()*, *dup()*, *dup2()*, and *close()*, is unspecified
 48152 when passed a file descriptor connected to a typed memory object by this function.

48153 The file status flags of the open file description shall be set according to the value of *oflag*.
 48154 Applications shall specify exactly one of the three access mode values described below and
 48155 defined in the `<fcntl.h>` header, as the value of *oflag*.

48156 O_RDONLY Open for read access only.
 48157 O_WRONLY Open for write access only.
 48158 O_RDWR Open for read or write access.

48159 RETURN VALUE

48160 Upon successful completion, the *posix_typed_mem_open()* function shall return a non-negative
 48161 integer representing the lowest numbered unused file descriptor. Otherwise, it shall return `-1`
 48162 and set *errno* to indicate the error.

48163 ERRORS

48164 The *posix_typed_mem_open()* function shall fail if:

48165 [EACCES] The typed memory object exists and the permissions specified by *oflag* are
 48166 denied.

48167 [EINTR] The *posix_typed_mem_open()* operation was interrupted by a signal.

48168 [EINVAL] The flags specified in *tflag* are invalid (more than one of
 48169 POSIX_TYPED_MEM_ALLOCATE,
 48170 POSIX_TYPED_MEM_ALLOCATE_CONTIG, or
 48171 POSIX_TYPED_MEM_MAP_ALLOCATABLE is specified).

48172 [EMFILE] All file descriptors available to the process are currently open.

48173 [ENAMETOOLONG] The length of the *name* argument exceeds `{PATH_MAX}` or a pathname
 48174 component is longer than `{NAME_MAX}`.
 48175

48176 [ENFILE] Too many file descriptors are currently open in the system.

48177 [ENOENT] The named typed memory object does not exist.

48178 [EPERM] The caller lacks the appropriate privilege to specify the flag
 48179 POSIX_TYPED_MEM_MAP_ALLOCATABLE in argument *tflag*.

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

DRAFT

48194 **NAME**

48195 pow, powf, powl — power function

48196 **SYNOPSIS**

48197 #include <math.h>

48198 double pow(double x, double y);

48199 float powf(float x, float y);

48200 long double powl(long double x, long double y);

48201 **DESCRIPTION**

48202 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 48203 conflict between the requirements described here and the ISO C standard is unintentional. This
 48204 volume of POSIX.1-200x defers to the ISO C standard.

48205 These functions shall compute the value of x raised to the power y , x^y . If x is negative, the
 48206 application shall ensure that y is an integer value.

48207 An application wishing to check for error situations should set *errno* to zero and call
 48208 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 48209 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 48210 zero, an error has occurred.

48211 **RETURN VALUE**48212 Upon successful completion, these functions shall return the value of x raised to the power y .

48213 MX For finite values of $x < 0$, and finite non-integer values of y , a domain error shall occur and
 48214 either a NaN (if representable), or an implementation-defined value shall be returned.

48215 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and
 48216 *powl()* shall return \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL, respectively, with the
 48217 same sign as the correct value of the function.

48218 If the correct value would cause underflow, and is not representable, a range error may occur,
 48219 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

48220 CX For $y < 0$, if x is zero, a pole error may occur and *pow()*, *powf()*, and *powl()* shall return
 48221 MX \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL, respectively. On systems that support the
 48222 IEC 60559 Floating-Point option, a pole error shall occur and *pow()*, *powf()*, and *powl()* shall
 48223 return \pm HUGE_VAL, \pm HUGE_VALF, and \pm HUGE_VALL, respectively if y is an odd integer, or
 48224 HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively if y is not an odd integer.

48225 MX If x or y is a NaN, a NaN shall be returned (unless specified elsewhere in this description).48226 For any value of y (including NaN), if x is +1, 1.0 shall be returned.48227 For any value of x (including NaN), if y is ± 0 , 1.0 shall be returned.48228 For any odd integer value of $y > 0$, if x is ± 0 , ± 0 shall be returned.48229 For $y > 0$ and not an odd integer, if x is ± 0 , +0 shall be returned.48230 If x is -1 , and y is \pm Inf, 1.0 shall be returned.48231 For $|x| < 1$, if y is $-\text{Inf}$, $+\text{Inf}$ shall be returned.48232 For $|x| > 1$, if y is $-\text{Inf}$, +0 shall be returned.48233 For $|x| < 1$, if y is $+\text{Inf}$, +0 shall be returned.48234 For $|x| > 1$, if y is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

pow()

48235 For y an odd integer < 0 , if x is $-\text{Inf}$, -0 shall be returned.

48236 For $y < 0$ and not an odd integer, if x is $-\text{Inf}$, $+0$ shall be returned.

48237 For y an odd integer > 0 , if x is $-\text{Inf}$, $-\text{Inf}$ shall be returned.

48238 For $y > 0$ and not an odd integer, if x is $-\text{Inf}$, $+\text{Inf}$ shall be returned.

48239 For $y < 0$, if x is $+\text{Inf}$, $+0$ shall be returned.

48240 For $y > 0$, if x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

48241 If the correct value would cause underflow, and is representable, a range error may occur and

48242 the correct value shall be returned.

ERRORS

48243 These functions shall fail if:

48245 Domain Error The value of x is negative and y is a finite non-integer.

48246 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

48247 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*

48248 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception

48249 shall be raised.

48250 MX Pole Error The value of x is zero and y is negative.

48251 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

48252 then *errno* shall be set to [ERANGE]. If the integer expression

48253 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero

48254 floating-point exception shall be raised.

48255 Range Error The result overflows.

48256 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

48257 then *errno* shall be set to [ERANGE]. If the integer expression

48258 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow

48259 floating-point exception shall be raised.

48260 These functions may fail if:

48261 Pole Error The value of x is zero and y is negative.

48262 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

48263 then *errno* shall be set to [ERANGE]. If the integer expression

48264 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero

48265 floating-point exception shall be raised.

48266 Range Error The result underflows.

48267 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,

48268 then *errno* shall be set to [ERANGE]. If the integer expression

48269 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow

48270 floating-point exception shall be raised.

XBD Section 4.19 (on page 104), `<math.h>`

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

The *powf()* and *powl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third paragraph in the RETURN VALUE section.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #51 (SD5-XSH-ERN-81) is applied.

48312 Refer to *fprintf()*.

48313 NAME

48314 pselect, select — synchronous I/O multiplexing

48315 SYNOPSIS

```

48316 #include <sys/select.h>
48317
48317 int pselect(int nfds, fd_set *restrict readfds,
48318            fd_set *restrict writefds, fd_set *restrict errorfds,
48319            const struct timespec *restrict timeout,
48320            const sigset_t *restrict sigmask);
48321 int select(int nfds, fd_set *restrict readfds,
48322           fd_set *restrict writefds, fd_set *restrict errorfds,
48323           struct timeval *restrict timeout);
48324 void FD_CLR(int fd, fd_set *fdset);
48325 int FD_ISSET(int fd, fd_set *fdset);
48326 void FD_SET(int fd, fd_set *fdset);
48327 void FD_ZERO(fd_set *fdset);

```

48328 DESCRIPTION

48329 The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for reading, are ready for writing, or have an exceptional condition pending, respectively.

48332 The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- 48333 • For the *select()* function, the timeout period is given in seconds and microseconds in an argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is given in seconds and nanoseconds in an argument of type **struct timespec**.
- 48334 • The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when *sigmask* is a null pointer.
- 48336 • Upon successful completion, the *select()* function may modify the object pointed to by the *timeout* argument.

48340 The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal devices, **STREAMS-based files**, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()* on file descriptors that refer to other types of file is unspecified.

48343 The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall be checked in each set; that is, the descriptors from zero through *nfds*-1 in the descriptor sets shall be examined.

48346 If the *readfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to read, and on output indicates which file descriptors are ready to read.

48349 If the *writefds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for being ready to write, and on output indicates which file descriptors are ready to write.

48352 If the *errorfds* argument is not a null pointer, it points to an object of type **fd_set** that on input specifies the file descriptors to be checked for error conditions pending, and on output indicates which file descriptors have error conditions pending.

48355 Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for reading, ready for writing, or have an error condition pending, respectively, and shall return the

48358 total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the
 48359 corresponding bit shall be set on successful completion if it was set on input and the associated
 48360 condition is true for that file descriptor.

48361 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*
 48362 function shall block until at least one of the requested operations becomes ready, until the
 48363 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the
 48364 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null
 48365 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified
 48366 time interval expires without any requested operation becoming ready, the function shall return.
 48367 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block
 48368 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*
 48369 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

48370 The use of a timeout does not affect any pending timers set up by *alarm()* or *setitimer()*.

48371 Implementations may place limitations on the maximum timeout interval supported. All
 48372 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*
 48373 argument specifies a timeout interval greater than the implementation-defined maximum value,
 48374 the maximum value shall be used as the actual timeout value. Implementations may also place
 48375 limitations on the granularity of timeout intervals. If the requested timeout interval requires a
 48376 finer granularity than the implementation supports, the actual timeout interval shall be rounded
 48377 up to the next supported value.

48378 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the
 48379 caller by the set of signals pointed to by *sigmask* before examining the descriptors, and shall
 48380 restore the signal mask of the calling thread before returning.

48381 A descriptor shall be considered ready for reading when a call to an input function with
 48382 O_NONBLOCK clear would not block, whether or not the function would transfer data
 48383 successfully. (The function might return data, an end-of-file indication, or an error other than
 48384 one indicating that it is blocked, and in each of these cases the descriptor shall be considered
 48385 ready for reading.)

48386 A descriptor shall be considered ready for writing when a call to an output function with
 48387 O_NONBLOCK clear would not block, whether or not the function would transfer data
 48388 successfully.

48389 If a socket has a pending error, it shall be considered to have an exceptional condition pending.
 48390 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for
 48391 use with a socket, it is protocol-specific except as noted below. For other file types it is
 48392 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or
 48393 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate
 48394 that the descriptor has no exceptional condition pending.

48395 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with
 48396 parameters requesting normal and ancillary data, such that the presence of either type shall
 48397 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if
 48398 the socket option SO_OOINLINE has been enabled, as out-of-band data is enqueued with
 48399 normal data. If the socket is currently listening, then it shall be marked as readable if an
 48400 incoming connection request has been received, and a call to the *accept()* function shall complete
 48401 without blocking.

48402 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying
 48403 an amount of normal data equal to the current value of the SO_SNDLOWAT option for the
 48404 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the
 48405 connection attempt has either succeeded or failed leaving a pending error, the socket shall be
 48406 marked as writable.

48407 A socket shall be considered to have an exceptional condition pending if a receive operation
 48408 with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would
 48409 return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag
 48410 would be used to read out-of-band data.) A socket shall also be considered to have an
 48411 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other
 48412 circumstances under which a socket may be considered to have an exceptional condition
 48413 pending are protocol-specific and implementation-defined.

48414 If the `readfds`, `writfds`, and `errorfds` arguments are all null pointers and the `timeout` argument is
 48415 not a null pointer, the `pselect()` or `select()` function shall block for the time specified, or until
 48416 interrupted by a signal. If the `readfds`, `writfds`, and `errorfds` arguments are all null pointers and
 48417 the `timeout` argument is a null pointer, the `pselect()` or `select()` function shall block until
 48418 interrupted by a signal.

48419 File descriptors associated with regular files shall always select true for ready to read, ready to
 48420 write, and error conditions.

48421 On failure, the objects pointed to by the `readfds`, `writfds`, and `errorfds` arguments shall not be
 48422 modified. If the timeout interval expires without the specified condition being true for any of the
 48423 specified file descriptors, the objects pointed to by the `readfds`, `writfds`, and `errorfds` arguments
 48424 shall have all bits set to 0.

48425 File descriptor masks of type `fd_set` can be initialized and tested with `FD_CLR()`, `FD_ISSET()`,
 48426 `FD_SET()`, and `FD_ZERO()`. It is unspecified whether each of these is a macro or a function. If a
 48427 macro definition is suppressed in order to access an actual function, or a program defines an
 48428 external identifier with any of these names, the behavior is undefined.

48429 `FD_CLR(fd, fdsetp)` shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not
 48430 a member of this set, there shall be no effect on the set, nor will an error be returned.

48431 `FD_ISSET(fd, fdsetp)` shall evaluate to non-zero if the file descriptor *fd* is a member of the set
 48432 pointed to by *fdsetp*, and shall evaluate to zero otherwise.

48433 `FD_SET(fd, fdsetp)` shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file
 48434 descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be
 48435 returned.

48436 `FD_ZERO(fdsetp)` shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is
 48437 returned if the set is not empty at the time `FD_ZERO()` is invoked.

48438 The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or
 48439 equal to `FD_SETSIZE`, or if *fd* is not a valid file descriptor, or if any of the arguments are
 48440 expressions with side effects.

48441 If a thread gets canceled during a `pselect()` call, the signal mask in effect when executing the
 48442 registered cleanup functions is either the original signal mask or the signal mask installed as part
 48443 of the `pselect()` call.

48444 RETURN VALUE

48445 Upon successful completion, the `pselect()` and `select()` functions shall return the total number of
 48446 bits set in the bit masks. Otherwise, `-1` shall be returned, and `errno` shall be set to indicate the
 48447 error.

48448 `FD_CLR()`, `FD_SET()`, and `FD_ZERO()` do not return a value. `FD_ISSET()` shall return a non-
 48449 zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and
 48450 0 otherwise.

48451 **ERRORS**48452 Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:48453 [EBADF] One or more of the file descriptor sets specified a file descriptor that is not a
48454 valid open file descriptor.48455 [EINTR] The function was interrupted before any of the selected events occurred and
48456 before the timeout interval expired.48457 XSI If SA_RESTART has been set for the interrupting signal, it is implementation-
48458 defined whether the function restarts or returns with [EINTR].

48459 [EINVAL] An invalid timeout interval was specified.

48460 [EINVAL] The *nfds* argument is less than 0 or greater than FD_SETSIZE.48461 OB XSR [EINVAL] One of the specified file descriptors refers to a STREAM or multiplexer that is
48462 linked (directly or indirectly) downstream from a multiplexer.48463 **EXAMPLES**

48464 None.

48465 **APPLICATION USAGE**

48466 None.

48467 **RATIONALE**48468 In earlier versions of the Single UNIX Specification, the *select()* function was defined in the
48469 `<sys/time.h>` header. This is now changed to `<sys/select.h>`. The rationale for this change was
48470 as follows: the introduction of the *pselect()* function included the `<sys/select.h>` header and the
48471 `<sys/select.h>` header defines all the related definitions for the *pselect()* and *select()* functions.
48472 Backwards-compatibility to existing XSI implementations is handled by allowing `<sys/time.h>`
48473 to include `<sys/select.h>`.48474 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers
48475 can install an additional cancellation handler which resets the signal mask to the expected value.48476

```
void cleanup(void *arg)
48477 {
48478     sigset_t *ss = (sigset_t *) arg;
48479     pthread_sigmask(SIG_SETMASK, ss, NULL);
48480 }
48481 int call_pselect(int nfds, fd_set *readfds, fd_set *writefds,
48482 fd_set errorfds, const struct timespec *timeout,
48483 const sigset_t *sigmask)
48484 {
48485     sigset_t oldmask;
48486     int result;
48487     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
48488     pthread_cleanup_push(cleanup, &oldmask);
48489     result = pselect(nfds, readfds, writefds, errorfds, timeout, sigmask);
48490     pthread_cleanup_pop(0);
48491     return result;
48492 }
```

48493 **FUTURE DIRECTIONS**

48494 None.

48495 **SEE ALSO**48496 *accept(), alarm(), connect(), fcntl(), getitimer(), poll(), read, recvmsg(), sendmsg(), write*48497 XBD **<sys/select.h>**, **<sys/time.h>**48498 **CHANGE HISTORY**

48499 First released in Issue 4, Version 2.

48500 **Issue 5**

48501 Moved from X/OPEN UNIX extension to BASE.

48502 In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when
48503 *nfds* is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or
48504 equal to FD_SETSIZE.48505 Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.48506 **Issue 6**48507 The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs*
48508 in the *select()* DESCRIPTION to be *readfds* and *writefds*.

48509 Text referring to sockets is added to the DESCRIPTION.

48510 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
48511 marked as part of the XSI STREAMS Option Group.48512 The following new requirements on POSIX implementations derive from alignment with the
48513 Single UNIX Specification:

- 48514
- These functions are now mandatory.

48515 The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail
48516 related to sockets semantics is added to the DESCRIPTION.48517 The *select()* function now requires inclusion of **<sys/select.h>**.48518 The **restrict** keyword is added to the *select()* prototype for alignment with the
48519 ISO/IEC 9899:1999 standard.48520 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/70 is applied, updating the
48521 DESCRIPTION to reference the signal mask in terms of the calling thread rather than the
48522 process.48523 **Issue 7**48524 SD5-XSH-ERN-122 is applied, adding text to the DESCRIPTION for when a thread is canceled
48525 during a call to *pselect()*, and adding example code to the RATIONALE.

48526 Functionality relating to the XSI STREAMS option is marked obsolescent.

48527 Functionality relating to the Threads option is moved to the Base.

48528 **NAME**
 48529 `psiginfo, psignal` — print signal information to standard error

48530 **SYNOPSIS**

```
48531 CX #include <signal.h>
48532 void psiginfo(siginfo_t *pinfo, const char *message);
48533 void psignal(int signum, const char *message);
```

48534 **DESCRIPTION**

48535 The `psiginfo()` and `psignal()` functions shall print a message out on `stderr` associated with a signal
 48536 number. If `message` is not null and is not the empty string, then the string pointed to by the
 48537 `message` argument shall be printed first, followed by a colon, a space, and the signal description
 48538 string indicated by `signum`, or by the signal associated with `pinfo`. If the `message` argument is null
 48539 or points to an empty string, then only the signal description shall be printed. For `psiginfo()`, the
 48540 argument `pinfo` references a valid **`siginfo_t`** structure. For `psignal()`, if `signum` is not a valid signal
 48541 number, the behavior is implementation-defined.

48542 **RETURN VALUE**

48543 These functions shall not return a value.

48544 **ERRORS**

48545 No errors are defined.

48546 **EXAMPLES**

48547 None.

48548 **APPLICATION USAGE**

48549 None.

48550 **RATIONALE**

48551 System V historically has `psignal()` and `psiginfo()` in `<siginfo.h>`. However, the `<siginfo.h>`
 48552 header is not specified in the Base Definitions volume of POSIX.1-200x, and the type **`siginfo_t`** is
 48553 defined in `<signal.h>`.

48554 **FUTURE DIRECTIONS**

48555 None.

48557 [*`perror\(\)`*](#), [*`strsignal\(\)`*](#)

48558 XBD `<signal.h>`

48559 **CHANGE HISTORY**

48560 First released in Issue 7.

psignal()

48561 **NAME**
48562 psignal — print signal information to standard error

48563 **SYNOPSIS**

```
48564 CX       #include <signal.h>  
48565       void psignal(int signum, const char *message);
```

48566 **DESCRIPTION**

48567 Refer to *psiginfo()*.

48568 **NAME**

48569 pthread_atfork — register fork handlers

48570 **SYNOPSIS**

48571 #include <pthread.h>

48572 int pthread_atfork(void (*prepare)(void), void (*parent)(void),
48573 void (*child)(void));48574 **DESCRIPTION**

48575 The *pthread_atfork()* function shall declare fork handlers to be called before and after *fork()*, in
48576 the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()*
48577 processing commences. The *parent* fork handle shall be called after *fork()* processing completes
48578 in the parent process. The *child* fork handler shall be called after *fork()* processing completes
48579 in the child process. If no handling is desired at one or more of these three points, the
48580 corresponding fork handler address(es) may be set to NULL.

48581 The order of calls to *pthread_atfork()* is significant. The *parent* and *child* fork handlers shall be
48582 called in the order in which they were established by calls to *pthread_atfork()*. The *prepare* fork
48583 handlers shall be called in the opposite order.

48584 **RETURN VALUE**

48585 Upon successful completion, *pthread_atfork()* shall return a value of zero; otherwise, an error
48586 number shall be returned to indicate the error.

48587 **ERRORS**48588 The *pthread_atfork()* function shall fail if:

48589 [ENOMEM] Insufficient table space exists to record the fork handler addresses.

48590 The *pthread_atfork()* function shall not return an error code of [EINTR].48591 **EXAMPLES**

48592 None.

48593 **APPLICATION USAGE**

48594 None.

48595 **RATIONALE**

48596 There are at least two serious problems with the semantics of *fork()* in a multi-threaded
48597 program. One problem has to do with state (for example, memory) covered by mutexes.
48598 Consider the case where one thread has a mutex locked and the state covered by that mutex is
48599 inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state
48600 (locked by a nonexistent thread and thus can never be unlocked). Having the child simply
48601 reinitialize the mutex is unsatisfactory since this approach does not resolve the question about
48602 how to correct or otherwise deal with the inconsistent state in the child.

48603 It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the
48604 child process, thus resetting all states. In the meantime, only a short list of async-signal-safe
48605 library routines are promised to be available.

48606 Unfortunately, this solution does not address the needs of multi-threaded libraries. Application
48607 programs may not be aware that a multi-threaded library is in use, and they feel free to call any
48608 number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed,
48609 they may be extant single-threaded programs and cannot, therefore, be expected to obey new
48610 restrictions imposed by the threads library.

48611 On the other hand, the multi-threaded library needs a way to protect its internal state during
48612 *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-

48613 threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to
 48614 effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may
 48615 entail simply resetting the state in the child after the *fork()* processing completes.

48616 The *pthread_atfork()* function provides multi-threaded libraries with a means to protect
 48617 themselves from innocent application programs that call *fork()*, and it provides multi-threaded
 48618 application programs with a standard mechanism for protecting themselves from *fork()* calls in a
 48619 library routine or the application itself.

48620 The expected usage is that the *prepare* handler acquires all mutex locks and the other two fork
 48621 handlers release them.

48622 For example, an application can supply a *prepare* routine that acquires the necessary mutexes the
 48623 library maintains and supply *child* and *parent* routines that release those mutexes, thus ensuring
 48624 that the child gets a consistent snapshot of the state of the library (and that no mutexes are left
 48625 stranded). Alternatively, some libraries might be able to supply just a *child* routine that
 48626 reinitializes the mutexes in the library and all associated states to some known value (for
 48627 example, what it was when the image was originally executed).

48628 When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization
 48629 variables remain in the same state in the child as they were in the parent at the time *fork()* was
 48630 called. Thus, for example, mutex locks may be held by threads that no longer exist in the child
 48631 process, and any associated states may be inconsistent. The parent process may avoid this by
 48632 explicit code that acquires and releases locks critical to the child via *pthread_atfork()*. In addition,
 48633 any critical threads need to be recreated and reinitialized to the proper state in the child (also via
 48634 *pthread_atfork()*).

48635 A higher-level package may acquire locks on its own data structures before invoking lower-level
 48636 packages. Under this scenario, the order specified for fork handler calls allows a simple rule of
 48637 initialization for avoiding package deadlock: a package initializes all packages on which it
 48638 depends before it calls the *pthread_atfork()* function for itself.

48639 FUTURE DIRECTIONS

48640 None.

48644 CHANGE HISTORY

48645 First released in Issue 5. Derived from the POSIX Threads Extension.

48646 IEEE PASC Interpretation 1003.1c #4 is applied.

48647 Issue 6

48648 The *pthread_atfork()* function is marked as part of the Threads option.

48649 The [<pthread.h>](#) header is added to the SYNOPSIS.

48650 Issue 7

48651 The *pthread_atfork()* function is moved from the Threads option to the Base.

48652 **NAME**

48653 pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

48654 **SYNOPSIS**

48655 #include <pthread.h>

48656 int pthread_attr_destroy(pthread_attr_t *attr);

48657 int pthread_attr_init(pthread_attr_t *attr);

48658 **DESCRIPTION**

48659 The *pthread_attr_destroy()* function shall destroy a thread attributes object. An implementation
 48660 may cause *pthread_attr_destroy()* to set *attr* to an implementation-defined invalid value. A
 48661 destroyed *attr* attributes object can be reinitialized using *pthread_attr_init()*; the results of
 48662 otherwise referencing the object after it has been destroyed are undefined.

48663 The *pthread_attr_init()* function shall initialize a thread attributes object *attr* with the default
 48664 value for all of the individual attributes used by a given implementation.

48665 The resulting attributes object (possibly modified by setting individual attribute values) when
 48666 used by *pthread_create()* defines the attributes of the thread created. A single attributes object can
 48667 be used in multiple simultaneous calls to *pthread_create()*. Results are undefined if
 48668 *pthread_attr_init()* is called specifying an already initialized *attr* attributes object.

48669 **RETURN VALUE**

48670 Upon successful completion, *pthread_attr_destroy()* and *pthread_attr_init()* shall return a value of
 48671 0; otherwise, an error number shall be returned to indicate the error.

48672 **ERRORS**48673 The *pthread_attr_init()* function shall fail if:

48674 [ENOMEM] Insufficient memory exists to initialize the thread attributes object.

48675 The *pthread_attr_destroy()* function may fail if:48676 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
48677 object.48678 The *pthread_attr_init()* function may fail if:48679 [EBUSY] The implementation has detected an attempt to reinitialize the thread attribute
48680 referenced by *attr*, a previously initialized, but not yet destroyed, thread
48681 attribute.

48682 These functions shall not return an error code of [EINTR].

48683 **EXAMPLES**

48684 None.

48685 **APPLICATION USAGE**

48686 None.

48687 **RATIONALE**

48688 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to
 48689 support probable future standardization in these areas without requiring that the function itself
 48690 be changed.

48691 Attributes objects provide clean isolation of the configurable aspects of threads. For example,
 48692 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When
 48693 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects
 48694 can help by allowing the changes to be isolated in a single place, rather than being spread across

48695 every instance of thread creation.

48696 Attributes objects can be used to set up “classes’ of threads with similar attributes; for example,
48697 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes
48698 can be defined in a single place and then referenced wherever threads need to be created.
48699 Changes to “class” decisions become straightforward, and detailed analysis of each
48700 *pthread_create()* call is not required.

48701 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had
48702 been specified as structures, adding new attributes would force recompilation of all multi-
48703 threaded programs when the attributes objects are extended; this might not be possible if
48704 different program components were supplied by different vendors.

48705 Additionally, opaque attributes objects present opportunities for improving performance.
48706 Argument validity can be checked once when attributes are set, rather than each time a thread is
48707 created. Implementations often need to cache kernel objects that are expensive to create.
48708 Opaque attributes objects provide an efficient mechanism to detect when cached objects become
48709 invalid due to attribute changes.

48710 Since assignment is not necessarily defined on a given opaque type, implementation-defined
48711 default values cannot be defined in a portable way. The solution to this problem is to allow
48712 attributes objects to be initialized dynamically by attributes object initialization functions, so that
48713 default values can be supplied automatically by the implementation.

48714 The following proposal was provided as a suggested alternative to the supplied attributes:

- 48715 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to
48716 the initialization routines (*pthread_create()*, *pthread_mutex_init()*, *pthread_cond_init()*). The
48717 parameter containing the flags should be an opaque type for extensibility. If no flags are
48718 set in the parameter, then the objects are created with default characteristics. An
48719 implementation may specify implementation-defined flag values and associated
48720 behavior.
- 48721 2. If further specialization of mutexes and condition variables is necessary, implementations
48722 may specify additional procedures that operate on the **pthread_mutex_t** and
48723 **pthread_cond_t** objects (instead of on attributes objects).

48724 The difficulties with this solution are:

- 48725 1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using
48726 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,
48727 application programmers need to know the location of each bit. If bits are set or read by
48728 encapsulation (that is, get and set functions), then the bitmask is merely an
48729 implementation of attributes objects as currently defined and should not be exposed to
48730 the programmer.
- 48731 2. Many attributes are not Boolean or very small integral values. For example, scheduling
48732 policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking
48733 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,
48734 the bitmask can only reasonably control whether particular attributes are set or not, and it
48735 cannot serve as the repository of the value itself. The value needs to be specified as a
48736 function parameter (which is non-extensible), or by setting a structure field (which is non-
48737 opaque), or by get and set functions (making the bitmask a redundant addition to the
48738 attributes objects).

48739 Stack size is defined as an optional attribute because the very notion of a stack is inherently
48740 machine-dependent. Some implementations may not be able to change the size of the stack, for
48741 example, and others may not need to because stack pages may be discontinuous and can be
48742 allocated and released on demand.

48743 The attribute mechanism has been designed in large measure for extensibility. Future extensions
 48744 to the attribute mechanism or to any attributes object defined in this volume of POSIX.1-200x
 48745 has to be done with care so as not to affect binary-compatibility.

48746 Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*,
 48747 may have their size fixed at compile time. This means, for example, a *pthread_create()* in an
 48748 implementation with extensions to **pthread_attr_t** cannot look beyond the area that the binary
 48749 application assumes is valid. This suggests that implementations should maintain a size field in
 48750 the attributes object, as well as possibly version information, if extensions in different directions
 48751 (possibly by different vendors) are to be accommodated.

FUTURE DIRECTIONS

48752 None.

CHANGE HISTORY

48757 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
 48758

Issue 6

48759 The *pthread_attr_destroy()* and *pthread_attr_init()* functions are marked as part of the Threads
 48760 option.
 48761

48762 IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already
 48763 initialized thread attributes object is undefined.

48764 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/71 is applied, updating the ERRORS
 48765 section to add the optional [EINVAL] error for the *pthread_attr_destroy()* function, and the
 48766 optional [EBUSY] error for the *pthread_attr_init()* function.

Issue 7

48767 The *pthread_attr_destroy()* and *pthread_attr_init()* functions are moved from the Threads option
 48768 to the Base.
 48769

48770 **NAME**

48771 pthread_attr_getdetachstate, pthread_attr_setdetachstate — get and set the detachstate attribute

48772 **SYNOPSIS**

```
48773 #include <pthread.h>
48774
48775 int pthread_attr_getdetachstate(const pthread_attr_t *attr,
48776                               int *detachstate);
48777
48778 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

48777 **DESCRIPTION**

48778 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread
 48779 is created detached, then use of the ID of the newly created thread by the *pthread_detach()* or
 48780 *pthread_join()* function is an error.

48781 The *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* functions, respectively, shall get
 48782 and set the *detachstate* attribute in the *attr* object.

48783 For *pthread_attr_getdetachstate()*, *detachstate* shall be set to either
 48784 PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

48785 For *pthread_attr_setdetachstate()*, the application shall set *detachstate* to either
 48786 PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

48787 A value of PTHREAD_CREATE_DETACHED shall cause all threads created with *attr* to be in
 48788 the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all
 48789 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute
 48790 shall be PTHREAD_CREATE_JOINABLE.

48791 **RETURN VALUE**

48792 Upon successful completion, *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* shall
 48793 return a value of 0; otherwise, an error number shall be returned to indicate the error.

48794 The *pthread_attr_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*
 48795 if successful.

48796 **ERRORS**

48797 The *pthread_attr_setdetachstate()* function shall fail if:

48798 [EINVAL] The value of *detachstate* was not valid

48799 These functions may fail if:

48800 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 48801 object.

48802 These functions shall not return an error code of [EINTR].

48803 **EXAMPLES**48804 **Retrieving the detachstate Attribute**

48805 This example shows how to obtain the *detachstate* attribute of a thread attribute object.

```
48806 #include <pthread.h>
48807
48808 pthread_attr_t thread_attr;
48809 int detachstate;
48810 int rc;
48811
48812 /* code initializing thread_attr */
```

```

48811     ...
48812     rc = pthread_attr_getdetachstate (&thread_attr, &detachstate);
48813     if (rc!=0) {
48814         /* handle error */
48815         ...
48816     }
48817     else {
48818         /* legal values for detachstate are:
48819          * PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE
48820          */
48821         ...
48822     }

```

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The [pthread_attr_setdetachstate\(\)](#) and [pthread_attr_getdetachstate\(\)](#) functions are marked as part of the Threads option.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/72 is applied, adding the example to the EXAMPLES section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/73 is applied, updating the ERRORS section to include the optional [EINVAL] error.

Issue 7

The [pthread_attr_setdetachstate\(\)](#) and [pthread_attr_getdetachstate\(\)](#) functions are moved from the Threads option to the Base.

48845 **NAME**

48846 pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize
 48847 attribute

48848 **SYNOPSIS**

```
48849 #include <pthread.h>

48850 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
48851 size_t *restrict guardsize);
48852 int pthread_attr_setguardsize(pthread_attr_t *attr,
48853 size_t guardsize);
```

48854 **DESCRIPTION**

48855 The *pthread_attr_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This
 48856 attribute shall be returned in the *guardsize* parameter.

48857 The *pthread_attr_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new
 48858 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard
 48859 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard
 48860 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

48861 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The
 48862 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is
 48863 created with guard protection, the implementation allocates extra memory at the overflow end
 48864 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows
 48865 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

48866 A conforming implementation may round up the value contained in *guardsize* to a multiple of
 48867 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation
 48868 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread_attr_getguardsize()*
 48869 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous
 48870 *pthread_attr_setguardsize()* function call.

48871 The default value of the *guardsize* attribute is implementation-defined.

48872 If the *stackaddr* attribute has been set (that is, the caller is allocating and managing its own thread
 48873 stacks), the *guardsize* attribute shall be ignored and no protection shall be provided by the
 48874 implementation. It is the responsibility of the application to manage stack overflow along with
 48875 stack allocation and management in this case.

48876 **RETURN VALUE**

48877 If successful, the *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions shall return
 48878 zero; otherwise, an error number shall be returned to indicate the error.

48879 **ERRORS**

48880 These functions shall fail if:

48881 [EINVAL] The parameter *guardsize* is invalid.

48882 These functions may fail if:

48883 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 48884 object.

48885 These functions shall not return an error code of [EINTR].

EXAMPLES**Retrieving the guardsize Attribute**

This example shows how to obtain the *guardsize* attribute of a thread attribute object.

```

48886 #include <pthread.h>
48887
48888 pthread_attr_t thread_attr;
48889 size_t guardsize;
48890 int rc;
48891
48892 /* code initializing thread_attr */
48893 ...
48894
48895 rc = pthread_attr_getguardsize (&thread_attr, &guardsize);
48896 if (rc != 0) {
48897     /* handle error */
48898     ...
48899 }
48900 else {
48901     if (guardsize > 0) {
48902         /* a guard area of at least guardsize bytes is provided */
48903         ...
48904     }
48905     else {
48906         /* no guard area provided */
48907         ...
48908     }
48909 }

```

APPLICATION USAGE

None.

RATIONALE

The *guardsize* attribute is provided to the application for two reasons:

1. Overflow protection can potentially result in wasted system resources. An application that creates a large number of threads, and which knows its threads never overflow their stack, can save system resources by turning off guard areas.
2. When threads allocate large data structures on the stack, large guard areas may be needed to detect stack overflow.

The default size of the guard area is left implementation-defined since on systems supporting very large page sizes, the overhead might be substantial if at least one guard page is required by default.

FUTURE DIRECTIONS

None.

48933

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/74 is applied, updating the ERRORS section to remove the [EINVAL] error ("The attribute *attr* is invalid."), and replacing it with the optional [EINVAL] error.

48934

48935

48936

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/76 is applied, adding the example to the EXAMPLES section.

48937

48938

Issue 7

48939

SD5-XSH-ERN-111 is applied, removing the reference to the *stack* attribute in the DESCRIPTION.

48940

SD5-XSH-ERN-175 is applied, updating the DESCRIPTION to note that the default size of the guard area is implementation-defined. +

48941

48942

The *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions are moved from the XSI option to the Base. +

48943

48944 **NAME**

48945 pthread_attr_getinheritsched, pthread_attr_setinheritsched — get and set the inheritsched
 48946 attribute (**REALTIME THREADS**)

48947 **SYNOPSIS**

```
48948 TPS #include <pthread.h>
48949
48949 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
48950 int *restrict inheritsched);
48951 int pthread_attr_setinheritsched(pthread_attr_t *attr,
48952 int inheritsched);
```

48953 **DESCRIPTION**

48954 The *pthread_attr_getinheritsched()*, and *pthread_attr_setinheritsched()* functions, respectively, shall
 48955 get and set the *inheritsched* attribute in the *attr* argument.

48956 When the attributes objects are used by *pthread_create()*, the *inheritsched* attribute determines
 48957 how the other scheduling attributes of the created thread shall be set.

48958 The supported values of *inheritsched* shall be:

48959 **PTHREAD_INHERIT_SCHED**

48960 Specifies that the thread scheduling attributes shall be inherited from the creating thread,
 48961 and the scheduling attributes in this *attr* argument shall be ignored.

48962 **PTHREAD_EXPLICIT_SCHED**

48963 Specifies that the thread scheduling attributes shall be set to the corresponding values from
 48964 this attributes object.

48965 The symbols **PTHREAD_INHERIT_SCHED** and **PTHREAD_EXPLICIT_SCHED** are defined in
 48966 the **<pthread.h>** header.

48967 The following thread scheduling attributes defined by POSIX.1-200x are affected by the
 48968 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and
 48969 scheduling contention scope (*contentionscope*).

48970 **RETURN VALUE**

48971 If successful, the *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions shall
 48972 return zero; otherwise, an error number shall be returned to indicate the error.

48973 **ERRORS**

48974 The *pthread_attr_getinheritsched()* function may fail if:

48975 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 48976 object.

48977 The *pthread_attr_setinheritsched()* function may fail if:

48978 [EINVAL] The value of *inheritsched* is not valid.

48979 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 48980 object.

48981 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

48982 These functions shall not return an error code of [EINTR].

pthread_attr_getinheritsched()

System Interfaces

48983 **EXAMPLES**

48984 None.

48985 **APPLICATION USAGE**48986 After these attributes have been set, a thread can be created with the specified attributes using
48987 *pthread_create()*. Using these routines does not affect the current running thread.48988 See [Section 2.9.4](#) (on page 488) for further details on thread scheduling attributes and their
48989 default settings.48990 **RATIONALE**

48991 None.

48992 **FUTURE DIRECTIONS**

48993 None.

48999 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49000 Marked as part of the Realtime Threads Feature Group.

49001 **Issue 6**49002 The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions are marked as part
49003 of the Threads and Thread Execution Scheduling options.49004 The [ENOSYS] error condition has been removed as stubs need not be provided if an
49005 implementation does not support the Thread Execution Scheduling option.49006 The **restrict** keyword is added to the *pthread_attr_getinheritsched()* prototype for alignment with
49007 the ISO/IEC 9899:1999 standard.49008 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/75 is applied, clarifying the values of
49009 *inheritsched* in the DESCRIPTION and adding two optional [EINVAL] errors to the ERRORS
49010 section for checking when *attr* refers to an uninitialized thread attribute object.49011 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/77 is applied, adding a reference to
49012 [Section 2.9.4](#) (on page 488) in the APPLICATION USAGE section.49013 **Issue 7**49014 The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions are moved from the
49015 Threads option.

49016 **NAME**

49017 pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam
49018 attribute

49019 **SYNOPSIS**

```
49020 #include <pthread.h>

49021 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
49022 struct sched_param *restrict param);
49023 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
49024 const struct sched_param *restrict param);
```

49025 **DESCRIPTION**

49026 The *pthread_attr_getschedparam()*, and *pthread_attr_setschedparam()* functions, respectively, shall
49027 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*
49028 structure are defined in the **<sched.h>** header. For the SCHED_FIFO and SCHED_RR policies,
49029 the only required member of *param* is *sched_priority*.

49030 TSP For the SCHED_SPORADIC policy, the required members of the *param* structure are
49031 *sched_priority*, *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and
49032 *sched_ss_max_repl*. The specified *sched_ss_repl_period* must be greater than or equal to the
49033 specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.
49034 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
49035 function to succeed; if not, the function shall fail. It is unspecified whether the
49036 *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are
49037 rounded to align with the resolution of the clock being used. +

49038 **RETURN VALUE**

49039 If successful, the *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions shall
49040 return zero; otherwise, an error number shall be returned to indicate the error.

49041 **ERRORS**

49042 The *pthread_attr_getschedparam()* function may fail if:

49043 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
49044 object.

49045 The *pthread_attr_setschedparam()* function may fail if:

49046 [EINVAL] The value of *param* is not valid, or the value specified by *attr* does not refer to
49047 an initialized thread attribute object.

49048 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49049 These functions shall not return an error code of [EINTR].

49050 **EXAMPLES**

49051 None.

49052 **APPLICATION USAGE**

49053 After these attributes have been set, a thread can be created with the specified attributes using
49054 *pthread_create()*. Using these routines does not affect the current running thread.

49062 XBD <pthread.h>, <sched.h> +

49063 **CHANGE HISTORY**

49064 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49065 **Issue 6**49066 The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions are marked as part
49067 of the Threads option.

49068 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

49069 The **restrict** keyword is added to the *pthread_attr_getschedparam()* and
49070 *pthread_attr_setschedparam()* prototypes for alignment with the ISO/IEC 9899:1999 standard.49071 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/78 is applied, updating the ERRORS
49072 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute
49073 object.49074 **Issue 7**49075 The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions are moved from the
49076 Threads option to the Base.

49077 Austin Group Interpretation 1003.1-2001 #119 is applied. +

49078 **NAME**

49079 pthread_attr_getschedpolicy, pthread_attr_setschedpolicy — get and set the schedpolicy
 49080 attribute (**REALTIME THREADS**)

49081 **SYNOPSIS**

```
49082 TPS #include <pthread.h>
49083
49083 int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
49084 int *restrict policy);
49085 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
```

49086 **DESCRIPTION**

49087 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions, respectively, shall
 49088 get and set the *schedpolicy* attribute in the *attr* argument.

49089 The supported values of *policy* shall include SCHED_FIFO, SCHED_RR, and SCHED_OTHER,
 49090 which are defined in the **<sched.h>** header. When threads executing with the scheduling policy
 49091 TSP SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on a mutex, they shall acquire
 49092 the mutex in priority order when the mutex is unlocked.

49093 **RETURN VALUE**

49094 If successful, the *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions shall
 49095 return zero; otherwise, an error number shall be returned to indicate the error.

49096 **ERRORS**

49097 The *pthread_attr_getschedpolicy()* function may fail if:

49098 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 49099 object.

49100 The *pthread_attr_setschedpolicy()* function may fail if:

49101 [EINVAL] The value of *policy* is not valid, or the value specified by *attr* does not refer to
 49102 an initialized thread attribute object.

49103 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49104 These functions shall not return an error code of [EINTR].

49105 **EXAMPLES**

49106 None.

49107 **APPLICATION USAGE**

49108 After these attributes have been set, a thread can be created with the specified attributes using
 49109 *pthread_create()*. Using these routines does not affect the current running thread.

49110 See [Section 2.9.4](#) (on page 488) for further details on thread scheduling attributes and their
 49111 default settings.

49120 **CHANGE HISTORY**

49121 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49122 Marked as part of the Realtime Threads Feature Group.

49123 **Issue 6**

49124 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions are marked as part of
 49125 the Threads and Thread Execution Scheduling options.

49126 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 49127 implementation does not support the Thread Execution Scheduling option.

49128 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

49129 The **restrict** keyword is added to the *pthread_attr_getschedpolicy()* prototype for alignment with
 49130 the ISO/IEC 9899:1999 standard.

49131 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/79 is applied, adding a reference to
 49132 [Section 2.9.4](#) (on page 488) in the APPLICATION USAGE section.

49133 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/80 is applied, updating the ERRORS
 49134 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute
 49135 object.

49136 **Issue 7**

49137 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions are moved from the
 49138 Threads option.

49139 **NAME**

49140 pthread_attr_getscope, pthread_attr_setscope — get and set the contentionscope attribute
 49141 (**REALTIME THREADS**)

49142 **SYNOPSIS**

```
49143 TPS #include <pthread.h>
49144
49144 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
49145 int *restrict contentionscope);
49146 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
```

49147 **DESCRIPTION**

49148 The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions, respectively, shall get and set
 49149 the *contentionscope* attribute in the *attr* object.

49150 The *contentionscope* attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying
 49151 system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process
 49152 scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and
 49153 PTHREAD_SCOPE_PROCESS are defined in the **<pthread.h>** header.

49154 **RETURN VALUE**

49155 If successful, the *pthread_attr_getscope()* and *pthread_attr_setscope()* functions shall return zero;
 49156 otherwise, an error number shall be returned to indicate the error.

49157 **ERRORS**

49158 The *pthread_attr_getscope()* function may fail if:

49159 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 49160 object.

49161 The *pthread_attr_setscope()* function may fail if:

49162 [EINVAL] The value of *contentionscope* is not valid, or the value specified by *attr* does not
 49163 refer to an initialized thread attribute object.

49164 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

49165 These functions shall not return an error code of [EINTR].

49166 **EXAMPLES**

49167 None.

49168 **APPLICATION USAGE**

49169 After these attributes have been set, a thread can be created with the specified attributes using
 49170 *pthread_create()*. Using these routines does not affect the current running thread.

49181 **CHANGE HISTORY**

49182 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49183 Marked as part of the Realtime Threads Feature Group.

49184 **Issue 6**

49185 The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions are marked as part of the
 49186 Threads and Thread Execution Scheduling options.

49187 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 49188 implementation does not support the Thread Execution Scheduling option.

49189 The **restrict** keyword is added to the *pthread_attr_getscope()* prototype for alignment with the
 49190 ISO/IEC 9899:1999 standard.

49191 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/81 is applied, adding a reference to
 49192 [Section 2.9.4](#) (on page 488) in the APPLICATION USAGE section.

49193 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/82 is applied, updating the ERRORS
 49194 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute
 49195 object.

49196 **Issue 7**

49197 The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions are moved from the Threads
 49198 option.

49199 **NAME**

49200 pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

49201 **SYNOPSIS**

```

49202 TSA TSS #include <pthread.h>
49203
49204 int pthread_attr_getstack(const pthread_attr_t *restrict attr,
49205 void **restrict stackaddr, size_t *restrict stacksize);
49206 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
49207 size_t stacksize);

```

49207 **DESCRIPTION**

49208 The *pthread_attr_getstack()* and *pthread_attr_setstack()* functions, respectively, shall get and set the
 49209 thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

49210 The stack attributes specify the area of storage to be used for the created thread's stack. The base
 49211 (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be
 49212 *stacksize* bytes. The *stacksize* shall be at least {PTHREAD_STACK_MIN}. The
 49213 *pthread_attr_setstack()* function may fail with [EINVAL] if *stackaddr* does not meet
 49214 implementation-defined alignment requirements. All pages within the stack described by
 49215 *stackaddr* and *stacksize* shall be both readable and writable by the thread.

49216 If the *pthread_attr_getstack()* function is called before the *stackaddr* attribute has been set, the
 49217 behavior is unspecified.

49218 **RETURN VALUE**

49219 Upon successful completion, these functions shall return a value of 0; otherwise, an error
 49220 number shall be returned to indicate the error.

49221 The *pthread_attr_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize*
 49222 if successful.

49223 **ERRORS**

49224 The *pthread_attr_setstack()* function shall fail if:

49225 [EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds an
 49226 implementation-defined limit.

49227 The *pthread_attr_getstack()* function may fail if:

49228 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
 49229 object.

49230 The *pthread_attr_setstack()* function may fail if:

49231 [EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or
 49232 ((**char** *)*stackaddr* + *stacksize*) lacks proper alignment, or the value specified by
 49233 *attr* does not refer to an initialized thread attribute object.

49234 [EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable
 49235 and writable by the thread.

49236 These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected page outside the specified stack region, this cannot be done portably. Implementations are free to place the thread's initial stack pointer anywhere within the specified region to accommodate the machine's stack pointer behavior and allocation requirements. Furthermore, on some architectures, such as the IA-64, "overflow" might mean that two separate stack pointers allocated within the region will overlap somewhere in the middle of the region.

After a successful call to *pthread_attr_setstack()*, the storage area specified by the *stackaddr* parameter is under the control of the implementation, as described in [Section 2.9.8](#) (on page 495).

The specification of the *stackaddr* attribute presents several ambiguities that make portable use of these functions impossible. For example, the standard allows implementations to impose arbitrary alignment requirements on *stackaddr*. Applications cannot assume that a buffer obtained from *malloc()* is suitably aligned. Note that although the *stacksize* value passed to *pthread_attr_setstack()* must satisfy alignment requirements, the same is not true for *pthread_attr_setstacksize()* where the implementation must increase the specified size if necessary to achieve the proper alignment.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Developed as part of the XSI option and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/83 is applied, updating the APPLICATION USAGE section to refer to [Section 2.9.8](#) (on page 495).

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC/D6/84 is applied, updating the ERRORS section to include optional errors for the case when *attr* refers to an uninitialized thread attribute object.

Issue 7

SD5-XSH-ERN-66 is applied, correcting the use of *attr* in the [EINVAL] error condition.

Austin Group Interpretation 1003.1-2001 #057 is applied, clarifying the behavior if the function is called before the *stackaddr* attribute is set.

SD5-XSH-ERN-157 is applied, updating the APPLICATION USAGE section.

The description of the *stackaddr* attribute is updated in the DESCRIPTION and APPLICATION USAGE sections.

49279 **NAME**

49280 pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stacksize attribute

49281 **SYNOPSIS**

```
49282 TSS      #include <pthread.h>
49283
49283      int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
49284                                  size_t *restrict stacksize);
49285      int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

49286 **DESCRIPTION**49287 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions, respectively, shall get and
49288 set the thread creation *stacksize* attribute in the *attr* object.49289 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created
49290 threads stack.49291 **RETURN VALUE**49292 Upon successful completion, *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* shall
49293 return a value of 0; otherwise, an error number shall be returned to indicate the error.49294 The *pthread_attr_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if
49295 successful.49296 **ERRORS**49297 The *pthread_attr_setstacksize()* function shall fail if:49298 [EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds a
49299 system-imposed limit.

49300 These functions may fail if:

49301 [EINVAL] The value specified by *attr* does not refer to an initialized thread attribute
49302 object.

49303 These functions shall not return an error code of [EINTR].

49315 **CHANGE HISTORY**

49316 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

49317 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions are marked as part of the
49318 Threads and Thread Stack Size Attribute options.
49319

49320 The **restrict** keyword is added to the *pthread_attr_getstacksize()* prototype for alignment with the
49321 ISO/IEC 9899:1999 standard.

49322 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/43 is applied, correcting the margin code
49323 in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack
49324 Address Attribute” option to “Thread Stack Size Attribute” option.

49325 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/87 is applied, updating the ERRORS
49326 section to include optional errors for the case when *attr* refers to an uninitialized thread attribute
49327 object.

Issue 7

49328 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions are moved from the
49329 Threads option.
49330

49331 **NAME**
49332 pthread_attr_init — initialize the thread attributes object

49333 **SYNOPSIS**
49334 #include <pthread.h>
49335 int pthread_attr_init(pthread_attr_t *attr);

49336 **DESCRIPTION**
49337 Refer to *pthread_attr_destroy()*.

pthread_attr_setdetachstate()

49338

NAME

49339

pthread_attr_setdetachstate — set the detachstate attribute

49340

SYNOPSIS

49341

#include <pthread.h>

49342

int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);

49343

DESCRIPTION

49344

Refer to *pthread_attr_getdetachstate()*.

49345 **NAME**
49346 pthread_attr_setguardsize — set the thread guardsize attribute

49347 **SYNOPSIS**
49348 #include <pthread.h>
49349 int pthread_attr_setguardsize(pthread_attr_t *attr,
49350 size_t guardsize);

49351 **DESCRIPTION**
49352 Refer to *pthread_attr_getguardsize()*.

pthread_attr_setinheritsched()*System Interfaces*49353 **NAME**49354 pthread_attr_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)49355 **SYNOPSIS**

49356 TPS #include <pthread.h>

49357 int pthread_attr_setinheritsched(pthread_attr_t *attr,
49358 int inheritsched);49359 **DESCRIPTION**49360 Refer to *pthread_attr_getinheritsched()*.

49361 **NAME**
49362 pthread_attr_setschedparam — set the schedparam attribute

49363 **SYNOPSIS**
49364 #include <pthread.h>
49365 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
49366 const struct sched_param *restrict param);

49367 **DESCRIPTION**
49368 Refer to *pthread_attr_getschedparam()*.

pthread_attr_setschedpolicy()*System Interfaces*49369 **NAME**49370 pthread_attr_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)49371 **SYNOPSIS**49372 TPS #include <pthread.h>
49373 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);49374 **DESCRIPTION**49375 Refer to *pthread_attr_getschedpolicy()*.

49376 **NAME**
49377 pthread_attr_setscope — set the contentionscope attribute (**REALTIME THREADS**)

49378 **SYNOPSIS**

49379 TPS #include <pthread.h>
49380 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);

49381 **DESCRIPTION**

49382 Refer to [pthread_attr_getscope\(\)](#).

pthread_attr_setstack()*System Interfaces*49383 **NAME**

49384 pthread_attr_setstack — set the stack attribute

49385 **SYNOPSIS**

49386 TSA TSS #include <pthread.h>

49387 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
49388 size_t stacksize);49389 **DESCRIPTION**49390 Refer to *pthread_attr_getstack()*.

49391 **NAME**
49392 pthread_attr_setstacksize — set the stacksize attribute

49393 **SYNOPSIS**

49394 TSS #include <pthread.h>
49395 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);

49396 **DESCRIPTION**

49397 Refer to [pthread_attr_getstacksize\(\)](#).

49398 **NAME**

49399 pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object

49400 **SYNOPSIS**

```
49401 #include <pthread.h>
49402
49402 int pthread_barrier_destroy(pthread_barrier_t *barrier);
49403 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
49404     const pthread_barrierattr_t *restrict attr, unsigned count);
```

49405 **DESCRIPTION**

49406 The *pthread_barrier_destroy()* function shall destroy the barrier referenced by *barrier* and release
 49407 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until
 49408 the barrier is reinitialized by another call to *pthread_barrier_init()*. An implementation may use
 49409 this function to set *barrier* to an invalid value. The results are undefined if
 49410 *pthread_barrier_destroy()* is called when any thread is blocked on the barrier, or if this function is
 49411 called with an uninitialized barrier.

49412 The *pthread_barrier_init()* function shall allocate any resources required to use the barrier
 49413 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is
 49414 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of
 49415 a default barrier attributes object. The results are undefined if *pthread_barrier_init()* is called
 49416 when any thread is blocked on the barrier (that is, has not returned from the
 49417 *pthread_barrier_wait()* call). The results are undefined if a barrier is used without first being
 49418 initialized. The results are undefined if *pthread_barrier_init()* is called specifying an already
 49419 initialized barrier.

49420 The *count* argument specifies the number of threads that must call *pthread_barrier_wait()* before
 49421 any of them successfully return from the call. The value specified by *count* must be greater than
 49422 zero.

49423 If the *pthread_barrier_init()* function fails, the barrier shall not be initialized and the contents of
 49424 *barrier* are undefined.

49425 Only the object referenced by *barrier* may be used for performing synchronization. The result of
 49426 referring to copies of that object in calls to *pthread_barrier_destroy()* or *pthread_barrier_wait()* is
 49427 undefined.

49428 **RETURN VALUE**

49429 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 49430 be returned to indicate the error.

49431 **ERRORS**

49432 The *pthread_barrier_destroy()* function may fail if:

49433 [EBUSY] The implementation has detected an attempt to destroy a barrier while it is in
 49434 use (for example, while being used in a *pthread_barrier_wait()* call) by another
 49435 thread.

49436 [EINVAL] The value specified by *barrier* is invalid.

49437 The *pthread_barrier_init()* function shall fail if:

49438 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

49439 [EINVAL] The value specified by *count* is equal to zero.

49440 [ENOMEM] Insufficient memory exists to initialize the barrier.

49441 The *pthread_barrier_init()* function may fail if:

49442 [EBUSY] The implementation has detected an attempt to reinitialize a barrier while it is
49443 in use (for example, while being used in a *pthread_barrier_wait()* call) by
49444 another thread.

49445 [EINVAL] The value specified by *attr* is invalid.

49446 These functions shall not return an error code of [EINTR].

49447 **EXAMPLES**

49448 None.

49449 **APPLICATION USAGE**

49450 None.

49451 **RATIONALE**

49452 None.

49453 **FUTURE DIRECTIONS**

49454 None.

49455 **SEE ALSO**

49456 *pthread_barrier_wait()*

49457 XBD <pthread.h>

49458 **CHANGE HISTORY**

49459 First released in Issue 6. Derived from IEEE Std. 1003.1j-2000.

49460 **Issue 7**

49461 The *pthread_barrier_destroy()* and *pthread_barrier_init()* functions are moved from the Barriers
49462 option to the Base.

49463 **NAME**

49464 pthread_barrier_wait — synchronize at a barrier

49465 **SYNOPSIS**

49466 #include <pthread.h>

49467 int pthread_barrier_wait(pthread_barrier_t *barrier);

49468 **DESCRIPTION**

49469 The *pthread_barrier_wait()* function shall synchronize participating threads at the barrier
 49470 referenced by *barrier*. The calling thread shall block until the required number of threads have
 49471 called *pthread_barrier_wait()* specifying the barrier.

49472 When the required number of threads have called *pthread_barrier_wait()* specifying the barrier,
 49473 the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified
 49474 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall
 49475 be reset to the state it had as a result of the most recent *pthread_barrier_init()* function that
 49476 referenced it.

49477 The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in <pthread.h> and its value
 49478 shall be distinct from any other value returned by *pthread_barrier_wait()*.

49479 The results are undefined if this function is called with an uninitialized barrier.

49480 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the
 49481 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the
 49482 required number of threads have not arrived at the barrier during the execution of the signal
 49483 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until
 49484 the thread in the signal handler returns from it, it is unspecified whether other threads may
 49485 proceed past the barrier once they have all reached it.

49486 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to
 49487 use the same processing resources from eventually making forward progress in its execution.
 49488 Eligibility for processing resources shall be determined by the scheduling policy.

49489 **RETURN VALUE**

49490 Upon successful completion, the *pthread_barrier_wait()* function shall return
 49491 PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the
 49492 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to
 49493 indicate the error.

49494 **ERRORS**

49495 The *pthread_barrier_wait()* function may fail if:

49496 [EINVAL] The value specified by *barrier* does not refer to an initialized barrier object.

49497 This function shall not return an error code of [EINTR].

49498 **EXAMPLES**

49499 None.

49500 **APPLICATION USAGE**

49501 Applications using this function may be subject to priority inversion, as discussed in XBD |
 49502 [Section 3.284](#) (on page 72).

SEE ALSO*pthread_barrier_destroy()*XBD [Section 3.284](#) (on page 72), [Section 4.11](#) (on page 98), [<pthread.h>](#)**CHANGE HISTORY**

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.**Issue 7**The *pthread_barrier_wait()* function is moved from the Barriers option to the Base.

49515 **NAME**

49516 pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier
 49517 attributes object

49518 **SYNOPSIS**

49519 #include <pthread.h>

49520 int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);

49521 int pthread_barrierattr_init(pthread_barrierattr_t *attr);

49522 **DESCRIPTION**

49523 The *pthread_barrierattr_destroy()* function shall destroy a barrier attributes object. A destroyed
 49524 *attr* attributes object can be reinitialized using *pthread_barrierattr_init()*; the results of otherwise
 49525 referencing the object after it has been destroyed are undefined. An implementation may cause
 49526 *pthread_barrierattr_destroy()* to set the object referenced by *attr* to an invalid value.

49527 The *pthread_barrierattr_init()* function shall initialize a barrier attributes object *attr* with the
 49528 default value for all of the attributes defined by the implementation.

49529 Results are undefined if *pthread_barrierattr_init()* is called specifying an already initialized *attr*
 49530 attributes object.

49531 After a barrier attributes object has been used to initialize one or more barriers, any function
 49532 affecting the attributes object (including destruction) shall not affect any previously initialized
 49533 barrier.

49534 **RETURN VALUE**

49535 If successful, the *pthread_barrierattr_destroy()* and *pthread_barrierattr_init()* functions shall return
 49536 zero; otherwise, an error number shall be returned to indicate the error.

49537 **ERRORS**

49538 The *pthread_barrierattr_destroy()* function may fail if:

49539 [EINVAL] The value specified by *attr* is invalid.

49540 The *pthread_barrierattr_init()* function shall fail if:

49541 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

49542 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

49555

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

49556

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

49557

Issue 7

49558

The `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions are moved from the Barriers option to the Base.

49559

49560 **NAME**

49561 pthread_barrierattr_getpshared, pthread_barrierattr_setpshared — get and set the process-
 49562 shared attribute of the barrier attributes object

49563 **SYNOPSIS**

```
49564 TSH #include <pthread.h>
49565
49565 int pthread_barrierattr_getpshared(const pthread_barrierattr_t
49566     *restrict attr, int *restrict pshared);
49567 int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
49568     int pshared);
```

49569 **DESCRIPTION**

49570 The *pthread_barrierattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 49571 from the attributes object referenced by *attr*. The *pthread_barrierattr_setpshared()* function shall
 49572 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

49573 The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a barrier to be
 49574 operated upon by any thread that has access to the memory where the barrier is allocated. If the
 49575 *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the barrier shall only be operated
 49576 upon by threads created within the same process as the thread that initialized the barrier; if
 49577 threads of different processes attempt to operate on such a barrier, the behavior is undefined.
 49578 The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE. Both constants
 49579 PTHREAD_PROCESS_SHARED and PTHREAD_PROCESS_PRIVATE are defined in
 49580 **<pthread.h>**.

49581 Additional attributes, their default values, and the names of the associated functions to get and
 49582 set those attribute values are implementation-defined.

49583 **RETURN VALUE**

49584 If successful, the *pthread_barrierattr_getpshared()* function shall return zero and store the value of
 49585 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,
 49586 an error number shall be returned to indicate the error.

49587 If successful, the *pthread_barrierattr_setpshared()* function shall return zero; otherwise, an error
 49588 number shall be returned to indicate the error.

49589 **ERRORS**

49590 These functions may fail if:

49591 [EINVAL] The value specified by *attr* is invalid.

49592 The *pthread_barrierattr_setpshared()* function may fail if:

49593 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal
 49594 values PTHREAD_PROCESS_SHARED or PTHREAD_PROCESS_PRIVATE.

49595 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000

Issue 7

The *pthread_barrierattr_getpshared()* and *pthread_barrierattr_setpshared()* functions are moved from the Barriers option.

DRAFT

49614 **NAME**
49615 pthread_barrierattr_init — initialize the barrier attributes object

49616 **SYNOPSIS**
49617 #include <pthread.h>
49618 int pthread_barrierattr_init(pthread_barrierattr_t *attr);

49619 **DESCRIPTION**
49620 Refer to *pthread_barrierattr_destroy()*.

49621 **NAME**
49622 `pthread_barrierattr_setpshared` — set the process-shared attribute of the barrier attributes object

49623 **SYNOPSIS**

```
49624 TSH #include <pthread.h>  
49625 int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,  
49626 int pshared);
```

49627 **DESCRIPTION**

49628 Refer to [pthread_barrierattr_getpshared\(\)](#).

49629 **NAME**

49630 pthread_cancel — cancel execution of a thread

49631 **SYNOPSIS**

49632 #include <pthread.h>

49633 int pthread_cancel(pthread_t thread);

49634 **DESCRIPTION**

49635 The *pthread_cancel()* function shall request that *thread* be canceled. The target thread's
 49636 cancelability state and type determines when the cancellation takes effect. When the cancellation
 49637 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last
 49638 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called
 49639 for *thread*. When the last destructor function returns, *thread* shall be terminated.

49640 The cancellation processing in the target thread shall run asynchronously with respect to the
 49641 calling thread returning from *pthread_cancel()*.

49642 **RETURN VALUE**

49643 If successful, the *pthread_cancel()* function shall return zero; otherwise, an error number shall be
 49644 returned to indicate the error.

49645 **ERRORS**49646 The *pthread_cancel()* function may fail if:

49647 [ESRCH] No thread could be found corresponding to that specified by the given thread
 49648 ID.

49649 The *pthread_cancel()* function shall not return an error code of [EINTR].49650 **EXAMPLES**

49651 None.

49652 **APPLICATION USAGE**

49653 None.

49654 **RATIONALE**

49655 Two alternative functions were considered for sending the cancellation notification to a thread.
 49656 One would be to define a new SIGCANCEL signal that had the cancellation semantics when
 49657 delivered; the other was to define the new *pthread_cancel()* function, which would trigger the
 49658 cancellation semantics.

49659 The advantage of a new signal was that so much of the delivery criteria were identical to that
 49660 used when trying to deliver a signal that making cancellation notification a signal was seen as
 49661 consistent. Indeed, many implementations implement cancellation using a special signal. On the
 49662 other hand, there would be no signal functions that could be used with this signal except
 49663 *pthread_kill()*, and the behavior of the delivered cancellation signal would be unlike any
 49664 previously existing defined signal.

49665 The benefits of a special function include the recognition that this signal would be defined
 49666 because of the similar delivery criteria and that this is the only common behavior between a
 49667 cancellation request and a signal. In addition, the cancellation delivery mechanism does not
 49668 have to be implemented as a signal. There are also strong, if not stronger, parallels with
 49669 language exception mechanisms than with signals that are potentially obscured if the delivery
 49670 mechanism is visibly closer to signals.

49671 In the end, it was considered that as there were so many exceptions to the use of the new signal
 49672 with existing signals functions it would be misleading. A special function has resolved this
 49673 problem. This function was carefully defined so that an implementation wishing to provide the

49674 cancellation functions on top of signals could do so. The special function also means that
49675 implementations are not obliged to implement cancellation with signals.

FUTURE DIRECTIONS

49676 None.
49677

CHANGE HISTORY

49681 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
49682

Issue 6

49683 The *pthread_cancel()* function is marked as part of the Threads option.
49684

Issue 7

49685 The *pthread_cancel()* function is moved from the Threads option to the Base.
49686

49687 **NAME**

49688 pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers

49689 **SYNOPSIS**

49690 #include <pthread.h>

49691 void pthread_cleanup_pop(int *execute*);49692 void pthread_cleanup_push(void (**routine*)(void*), void **arg*);49693 **DESCRIPTION**49694 The *pthread_cleanup_pop()* function shall remove the routine at the top of the calling thread's
49695 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero).49696 The *pthread_cleanup_push()* function shall push the specified cancellation cleanup handler *routine*
49697 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be
49698 popped from the cancellation cleanup stack and invoked with the argument *arg* when:

- 49699
- The thread exits (that is, calls *pthread_exit()*).
 - The thread acts upon a cancellation request.
 - The thread calls *pthread_cleanup_pop()* with a non-zero *execute* argument.

49702 These functions may be implemented as macros. The application shall ensure that they appear
49703 as statements, and in pairs within the same lexical scope (that is, the *pthread_cleanup_push()*
49704 macro may be thought to expand to a token list whose first token is '{' with
49705 *pthread_cleanup_pop()* expanding to a token list whose last token is the corresponding '}').49706 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to
49707 *pthread_cleanup_push()* or *pthread_cleanup_pop()* made without the matching call since the jump
49708 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation
49709 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation
49710 cleanup handler.49711 The effect of the use of **return**, **break**, **continue**, and **goto** to prematurely leave a code block
49712 described by a pair of *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions calls is
49713 undefined.49714 **RETURN VALUE**49715 The *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions shall not return a value.49716 **ERRORS**

49717 No errors are defined.

49718 These functions shall not return an error code of [EINTR].

49719 **EXAMPLES**49720 The following is an example using thread primitives to implement a cancelable, writers-priority
49721 read-write lock:49722 typedef struct {
49723 pthread_mutex_t lock;
49724 pthread_cond_t rcond,
49725 wcond;
49726 int lock_count; /* < 0 .. Held by writer. */
49727 /* > 0 .. Held by lock_count readers. */
49728 /* = 0 .. Held by nobody. */
49729 int waiting_writers; /* Count of waiting writers. */
49730 } rwlock;

```

49731     void

49830     pthread_cleanup_pop(1);
49831 }

```

APPLICATION USAGE

The two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push()* and *pthread_cleanup_pop()*, can be thought of as left and right parentheses. They always need to be matched.

RATIONALE

The restriction that the two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push()* and *pthread_cleanup_pop()*, have to appear in the same lexical scope allows for efficient macro or compiler implementations and efficient storage management. A sample implementation of these routines as macros might look like this:

```

49838 #define pthread_cleanup_push(rtn,arg) { \
49839     struct _pthread_handler_rec __cleanup_handler, **__head; \
49840     __cleanup_handler.rtn = rtn; \
49841     __cleanup_handler.arg = arg; \
49842     (void) pthread_getspecific(_pthread_handler_key, &__head); \
49843     __cleanup_handler.next = *__head; \
49844     *__head = &__cleanup_handler;
49845
49846 #define pthread_cleanup_pop(ex) \
49847     *__head = __cleanup_handler.next; \
49848     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
49849 }

```

A more ambitious implementation of these routines might do even better by allowing the compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

This volume of POSIX.1-200x currently leaves unspecified the effect of calling *longjmp()* from a signal handler executing in a POSIX System Interfaces function. If an implementation wants to allow this and give the programmer reasonable behavior, the *longjmp()* function has to call all cancellation cleanup handlers that have been pushed but not popped since the time *setjmp()* was called.

Consider a multi-threaded function called by a thread that uses signals. If a signal were delivered to a signal handler during the operation of *qsort()* and that handler were to call *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers), the helper threads created by the *qsort()* function would not be canceled. Instead, they would continue to execute and write into the argument array even though the array might have been popped off the stack.

Note that the specified cleanup handling mechanism is especially tied to the C language and, while the requirement for a uniform mechanism for expressing cleanup is language-independent, the mechanism used in other languages may be quite different. In addition, this mechanism is really only necessary due to the lack of a real exception mechanism in the C language, which would be the ideal solution.

There is no notion of a cancellation cleanup-safe function. If an application has no cancellation points in its signal handlers, blocks any signal whose handler may have cancellation points while calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all functions may be safely called from cancellation cleanup routines.

FUTURE DIRECTIONS

None.

49887**Issue 6**

The *pthread_cleanup_pop()* and *pthread_cleanup_push()* functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

The normative text is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/88 is applied, updating the DESCRIPTION to describe the consequences of prematurely leaving a code block defined by the *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions.

Issue 7

The *pthread_cleanup_pop()* and *pthread_cleanup_push()* functions are moved from the Threads option to the Base.

49888 **NAME**

49889 pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

49890 **SYNOPSIS**

49891 #include <pthread.h>

49892 int pthread_cond_broadcast(pthread_cond_t *cond);

49893 int pthread_cond_signal(pthread_cond_t *cond);

49894 **DESCRIPTION**

49895 These functions shall unblock threads blocked on a condition variable.

49896 The *pthread_cond_broadcast()* function shall unblock all threads currently blocked on the
49897 specified condition variable *cond*.49898 The *pthread_cond_signal()* function shall unblock at least one of the threads that are blocked on
49899 the specified condition variable *cond* (if any threads are blocked on *cond*).49900 If more than one thread is blocked on a condition variable, the scheduling policy shall determine
49901 the order in which threads are unblocked. When each thread unblocked as a result of a
49902 *pthread_cond_broadcast()* or *pthread_cond_signal()* returns from its call to *pthread_cond_wait()* or
49903 *pthread_cond_timedwait()*, the thread shall own the mutex with which it called
49904 *pthread_cond_wait()* or *pthread_cond_timedwait()*. The thread(s) that are unblocked shall contend
49905 for the mutex according to the scheduling policy (if applicable), and as if each had called
49906 *pthread_mutex_lock()*.49907 The *pthread_cond_broadcast()* or *pthread_cond_signal()* functions may be called by a thread
49908 whether or not it currently owns the mutex that threads calling *pthread_cond_wait()* or
49909 *pthread_cond_timedwait()* have associated with the condition variable during their waits;
49910 however, if predictable scheduling behavior is required, then that mutex shall be locked by the
49911 thread calling *pthread_cond_broadcast()* or *pthread_cond_signal()*.49912 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall have no effect if there are
49913 no threads currently blocked on *cond*.49914 **RETURN VALUE**49915 If successful, the *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall return zero;
49916 otherwise, an error number shall be returned to indicate the error.49917 **ERRORS**49918 The *pthread_cond_broadcast()* and *pthread_cond_signal()* function may fail if:49919 [EINVAL] The value *cond* does not refer to an initialized condition variable.

49920 These functions shall not return an error code of [EINTR].

49921 **EXAMPLES**

49922 None.

49923 **APPLICATION USAGE**49924 The *pthread_cond_broadcast()* function is used whenever the shared-variable state has been
49925 changed in a way that more than one thread can proceed with its task. Consider a single
49926 producer/multiple consumer problem, where the producer can insert multiple items on a list
49927 that is accessed one item at a time by the consumers. By calling the *pthread_cond_broadcast()*
49928 function, the producer would notify all consumers that might be waiting, and thereby the
49929 application would receive more throughput on a multi-processor. In addition,
49930 *pthread_cond_broadcast()* makes it easier to implement a read-write lock. The
49931 *pthread_cond_broadcast()* function is needed in order to wake up all waiting readers when a
49932 writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function

49933 to notify all clients of an impending transaction commit.

49934 It is not safe to use the *pthread_cond_signal()* function in a signal handler that is invoked
49935 asynchronously. Even if it were safe, there would still be a race between the test of the Boolean
49936 *pthread_cond_wait()* that could not be efficiently eliminated.

49937 Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling
49938 from code running in a signal handler.

49939 RATIONALE

49940 Multiple Awakenings by Condition Signal

49941 On a multi-processor, it may be impossible for an implementation of *pthread_cond_signal()* to
49942 avoid the unblocking of more than one thread blocked on a condition variable. For example,
49943 consider the following partial implementation of *pthread_cond_wait()* and *pthread_cond_signal()*,
49944 executed by two threads in the order given. One thread is trying to wait on the condition
49945 variable, another is concurrently executing *pthread_cond_signal()*, while a third thread is already
49946 waiting.

```

49947 pthread_cond_wait(mutex, cond):
49948     value = cond->value; /* 1 */
49949     pthread_mutex_unlock(mutex); /* 2 */
49950     pthread_mutex_lock(cond->mutex); /* 10 */
49951     if (value == cond->value) { /* 11 */
49952         me->next_cond = cond->waiter;
49953         cond->waiter = me;
49954         pthread_mutex_unlock(cond->mutex);
49955         unable_to_run(me);
49956     } else
49957         pthread_mutex_unlock(cond->mutex); /* 12 */
49958     pthread_mutex_lock(mutex); /* 13 */

49959 pthread_cond_signal(cond):
49960     pthread_mutex_lock(cond->mutex); /* 3 */
49961     cond->value++; /* 4 */
49962     if (cond->waiter) { /* 5 */
49963         sleeper = cond->waiter; /* 6 */
49964         cond->waiter = sleeper->next_cond; /* 7 */
49965         able_to_run(sleeper); /* 8 */
49966     }
49967     pthread_mutex_unlock(cond->mutex); /* 9 */

```

49968 The effect is that more than one thread can return from its call to *pthread_cond_wait()* or
49969 *pthread_cond_timedwait()* as a result of one call to *pthread_cond_signal()*. This effect is called
49970 “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that
49971 are so awakened is finite; for example, the next thread to call *pthread_cond_wait()* after the
49972 sequence of events above blocks.

49973 While this problem could be resolved, the loss of efficiency for a fringe condition that occurs
49974 only rarely is unacceptable, especially given that one has to check the predicate associated with a
49975 condition variable anyway. Correcting this problem would unnecessarily reduce the degree of
49976 concurrency in this basic building block for all higher-level synchronization operations.

49977 An added benefit of allowing spurious wakeups is that applications are forced to code a
49978 predicate-testing-loop around the condition wait. This also makes the application tolerate
49979 superfluous condition broadcasts or signals on the same condition variable that may be coded in
49980 some other part of the application. The resulting applications are thus more robust. Therefore,
49981 POSIX.1-200x explicitly documents that spurious wakeups may occur.

49982 **FUTURE DIRECTIONS**

49983 None.

49984 **SEE ALSO**49985 *pthread_cond_destroy()*, *pthread_cond_timedwait()*49986 XBD Section 4.11 (on page 98), **<pthread.h>**49987 **CHANGE HISTORY**

49988 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

49989 **Issue 6**49990 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions are marked as part of the
49991 Threads option.

49992 The APPLICATION USAGE section is added.

49993 **Issue 7**49994 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions are moved from the Threads
49995 option to the Base.

49996 **NAME**

49997 pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

49998 **SYNOPSIS**

```
49999 #include <pthread.h>
50000
50000 int pthread_cond_destroy(pthread_cond_t *cond);
50001 int pthread_cond_init(pthread_cond_t *restrict cond,
50002     const pthread_condattr_t *restrict attr);
50003 pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
```

50004 **DESCRIPTION**

50005 The *pthread_cond_destroy()* function shall destroy the given condition variable specified by *cond*;
 50006 the object becomes, in effect, uninitialized. An implementation may cause *pthread_cond_destroy()*
 50007 to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can
 50008 be reinitialized using *pthread_cond_init()*; the results of otherwise referencing the object after it
 50009 has been destroyed are undefined.

50010 It shall be safe to destroy an initialized condition variable upon which no threads are currently
 50011 blocked. Attempting to destroy a condition variable upon which other threads are currently
 50012 blocked results in undefined behavior.

50013 The *pthread_cond_init()* function shall initialize the condition variable referenced by *cond* with
 50014 attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be
 50015 used; the effect is the same as passing the address of a default condition variable attributes
 50016 object. Upon successful initialization, the state of the condition variable shall become initialized.

50017 Only *cond* itself may be used for performing synchronization. The result of referring to copies of
 50018 *cond* in calls to *pthread_cond_wait()*, *pthread_cond_timedwait()*, *pthread_cond_signal()*,
 50019 *pthread_cond_broadcast()*, and *pthread_cond_destroy()* is undefined.

50020 Attempting to initialize an already initialized condition variable results in undefined behavior.

50021 In cases where default condition variable attributes are appropriate, the macro
 50022 PTHREAD_COND_INITIALIZER can be used to initialize condition variables that are statically
 50023 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_cond_init()*
 50024 with parameter *attr* specified as NULL, except that no error checks are performed.

50025 **RETURN VALUE**

50026 If successful, the *pthread_cond_destroy()* and *pthread_cond_init()* functions shall return zero;
 50027 otherwise, an error number shall be returned to indicate the error.

50028 The [EBUSY] and [EINVAL] error checks, if implemented, shall act as if they were performed
 50029 immediately at the beginning of processing for the function and caused an error return prior to
 50030 modifying the state of the condition variable specified by *cond*.

50031 **ERRORS**

50032 The *pthread_cond_destroy()* function may fail if:

50033 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 50034 by *cond* while it is referenced (for example, while being used in a
 50035 *pthread_cond_wait()* or *pthread_cond_timedwait()*) by another thread.

50036 [EINVAL] The value specified by *cond* is invalid.

50037 The *pthread_cond_init()* function shall fail if:

- 50038 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
50039 another condition variable.
- 50040 [ENOMEM] Insufficient memory exists to initialize the condition variable.
- 50041 The *pthread_cond_init()* function may fail if:
- 50042 [EBUSY] The implementation has detected an attempt to reinitialize the object
50043 referenced by *cond*, a previously initialized, but not yet destroyed, condition
50044 variable.
- 50045 [EINVAL] The value specified by *attr* is invalid.
- 50046 These functions shall not return an error code of [EINTR].

EXAMPLES

50047 A condition variable can be destroyed immediately after all the threads that are blocked on it are
50048 awakened. For example, consider the following code:

```

50050 struct list {
50051     pthread_mutex_t lm;
50052     ...
50053 }
50054 struct elt {
50055     key k;
50056     int busy;
50057     pthread_cond_t notbusy;
50058     ...
50059 }
50060 /* Find a list element and reserve it. */
50061 struct elt *
50062 list_find(struct list *lp, key k)
50063 {
50064     struct elt *ep;
50065     pthread_mutex_lock(&lp->lm);
50066     while ((ep = find_elt(l, k) != NULL) && ep->busy)
50067         pthread_cond_wait(&ep->notbusy, &lp->lm);
50068     if (ep != NULL)
50069         ep->busy = 1;
50070     pthread_mutex_unlock(&lp->lm);
50071     return(ep);
50072 }
50073 delete_elt(struct list *lp, struct elt *ep)
50074 {
50075     pthread_mutex_lock(&lp->lm);
50076     assert(ep->busy);
50077     ... remove ep from list ...
50078     ep->busy = 0; /* Paranoid. */
50079     (A) pthread_cond_broadcast(&ep->notbusy);
50080     pthread_mutex_unlock(&lp->lm);
50081     (B) pthread_cond_destroy(&rp->notbusy);
50082     free(ep);
50083 }

```

50084 In this example, the condition variable and its list element may be freed (line B) immediately
50085 after all threads waiting for it are awakened (line A), since the mutex and the code ensure that

50086 no other thread can touch the element to be deleted.

50087 **APPLICATION USAGE**

50088 None.

50089 **RATIONALE**

50090 See *pthread_mutex_destroy()*; a similar rationale applies to condition variables.

50121 int pthread_cond_wait(pthread_cond_t *restrict cond,
50122 pthread_mutex_t *restrict mutex);

```

50123 **DESCRIPTION**

50124 The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions shall block on a condition
50125 variable. They shall be called with *mutex* locked by the calling thread or undefined behavior
50126 results.

50127 These functions atomically release *mutex* and cause the calling thread to block on the condition
50128 variable *cond*; atomically here means “atomically with respect to access by another thread to the
50129 mutex and then the condition variable”. That is, if another thread is able to acquire the mutex
50130 after the about-to-block thread has released it, then a subsequent call to *pthread_cond_broadcast()*
50131 or *pthread_cond_signal()* in that thread shall behave as if it were issued after the about-to-block
50132 thread has blocked.

50133 Upon successful return, the mutex shall have been locked and shall be owned by the calling
50134 thread. If *mutex* is a robust mutex where an owner terminated while holding the lock and the
50135 state is recoverable, the mutex shall be acquired even though the function returns an error code.

50136 When using condition variables there is always a Boolean predicate involving shared variables
50137 associated with each condition wait that is true if the thread should proceed. Spurious wakeups
50138 from the *pthread_cond_timedwait()* or *pthread_cond_wait()* functions may occur. Since the return
50139 from *pthread_cond_timedwait()* or *pthread_cond_wait()* does not imply anything about the value of
50140 this predicate, the predicate should be re-evaluated upon such return.

50141 When a thread waits on a condition variable, having specified a particular mutex to either the
50142 *pthread_cond_timedwait()* or the *pthread_cond_wait()* operation, a dynamic binding is formed
50143 between that mutex and condition variable that remains in effect as long as at least one thread is
50144 blocked on the condition variable. During this time, the effect of an attempt by any thread to
50145 wait on that condition variable using a different mutex is undefined. Once all waiting threads
50146 have been unblocked (as by the *pthread_cond_broadcast()* operation), the next wait operation on
50147 that condition variable shall form a new dynamic binding with the mutex specified by that wait
50148 operation. Even though the dynamic binding between condition variable and mutex may be
50149 removed or replaced between the time a thread is unblocked from a wait on the condition
50150 variable and the time that it returns to the caller or begins cancellation cleanup, the unblocked
50151 thread shall always re-acquire the mutex specified in the condition wait operation call from
50152 which it is returning.

50153 A condition wait (whether timed or not) is a cancellation point. When the cancelability type of a
50154 thread is set to *PTHREAD_CANCEL_DEFERRED*, a side effect of acting upon a cancellation
50155 request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first
50156 cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up
50157 to the point of returning from the call to *pthread_cond_timedwait()* or *pthread_cond_wait()*, but at
50158 that point notices the cancellation request and instead of returning to the caller of
50159 *pthread_cond_timedwait()* or *pthread_cond_wait()*, starts the thread cancellation activities, which
50160 includes calling cancellation cleanup handlers.

50161 A thread that has been unblocked because it has been canceled while blocked in a call to
 50162 *pthread_cond_timedwait()* or *pthread_cond_wait()* shall not consume any condition signal that may
 50163 be directed concurrently at the condition variable if there are other threads blocked on the
 50164 condition variable.

50165 The *pthread_cond_timedwait()* function shall be equivalent to *pthread_cond_wait()*, except that an
 50166 error is returned if the absolute time specified by *abstime* passes (that is, system time equals or
 50167 exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time
 50168 specified by *abstime* has already been passed at the time of the call.

50169 The condition variable shall have a clock attribute which specifies the clock that shall be used to
 50170 measure the time specified by the *abstime* argument. When such timeouts occur,
 50171 *pthread_cond_timedwait()* shall nonetheless release and re-acquire the mutex referenced by *mutex*.
 50172 The *pthread_cond_timedwait()* function is also a cancellation point.

50173 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal
 50174 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it
 50175 shall return zero due to spurious wakeup.

50176 RETURN VALUE

50177 Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed
 50178 immediately at the beginning of processing for the function and shall cause an error return, in
 50179 effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable
 50180 specified by *cond*.

50181 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall
 50182 be returned to indicate the error.

50183 ERRORS

50184 The *pthread_cond_timedwait()* function shall fail if:

50185 [ETIMEDOUT] The time specified by *abstime* to *pthread_cond_timedwait()* has passed.

50186 [EINVAL] The *abstime* argument specified a nanosecond value less than zero or greater
 50187 than or equal to 1000 million.

50188 [ENOTRECOVERABLE]
 50189 The state protected by the mutex is not recoverable. The mutex is not locked.

50190 [EOWNERDEAD]
 50191 The mutex is a robust mutex and the process containing the previous owner
 50192 thread terminated while holding the mutex lock. The mutex lock has been
 50193 acquired and it is up to the new owner to make the state consistent.

50194 These functions may fail if:

50195 [EINVAL] The value specified by *cond* or *mutex* is invalid.

50196 [EOWNERDEAD]
 50197 The mutex is a robust mutex and the previous owning thread terminated
 50198 while holding the mutex lock. The mutex lock has been acquired and it is up
 50199 to the new owner to make the state consistent.

50200 [EPERM] The mutex was not owned by the current thread at the time of the call.

50201 These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

RATIONALE**Condition Wait Semantics**

It is important to note that when *pthread_cond_wait()* and *pthread_cond_timedwait()* return without error, the associated predicate may still be false. Similarly, when *pthread_cond_timedwait()* returns with the timeout error, the associated predicate may be true due to an unavoidable race between the expiration of the timeout and the predicate state change.

The application needs to recheck the predicate on any return because it cannot be sure there is another thread waiting on the thread to handle the signal, and if there is not then the signal is lost. The burden is on the application to check the predicate.

Some implementations, particularly on a multi-processor, may sometimes cause multiple threads to wake up when the condition variable is signaled simultaneously on different processors.

In general, whenever a condition wait returns, the thread has to re-evaluate the predicate associated with the condition wait to determine whether it can safely proceed, should wait again, or should declare a timeout. A return from the wait does not imply that the associated predicate is either true or false.

It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop” that checks the predicate.

Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that *clock_gettime()* returns the current time and *cond_relative_timed_wait()* uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time -now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

50245

Cancellation and Condition Wait50246
50247
50248
50249
50250
50251
50252

A condition wait, whether timed or not, is a cancellation point. That is, the functions `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

50253
50254
50255
50256
50257
50258
50259
50260
50261
50262

A side effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

50263
50264
50265

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

50266
50267
50268
50269
50270
50271

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

50272

Performance of Mutexes and Condition Variables50273
50274
50275

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

50276
50277
50278
50279
50280
50281
50282
50283

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

50284
50285
50286
50287

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

50288

Features of Mutexes and Condition Variables50289
50290
50291
50292
50293
50294
50295
50296

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

50297

Scheduling Behavior of Mutexes and Condition Variables50298
50299
50300
50301
50302

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

50303

Timed Condition Wait50304
50305

The `pthread_cond_timedwait()` function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

50306
50307
50308
50309
50310
50311
50312
50313
50314
50315

```
(void) pthread_mutex_lock(&t.mn);
    t.waiters++;
    clock_gettime(CLOCK_REALTIME, &ts);
    ts.tv_sec += 5;
    rc = 0;
    while (! mypredicate(&t) && rc == 0)
        rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
    t.waiters--;
    if (rc == 0) setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```

50316
50317
50318
50319
50320

By making the timeout parameter absolute, it does not need to be recomputed each time the program checks its blocking predicate. If the timeout was relative, it would have to be recomputed before each call. This would be especially difficult since such code would need to take into account the possibility of extra wakeups that result from extra broadcasts or signals on the condition variable that occur before either the predicate is true or the timeout is due.

50321

FUTURE DIRECTIONS

50322

None.

CHANGE HISTORY

50327

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50328

Issue 650329
50330

The `pthread_cond_timedwait()` and `pthread_cond_wait()` functions are marked as part of the Threads option.

50331
50332

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the `pthread_cond_wait()` function.

50333

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics

- 50334 for the Clock Selection option.
- 50335 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC
50336 Interpretation 1003.1c #28.
- 50337 The **restrict** keyword is added to the *pthread_cond_timedwait()* and *pthread_cond_wait()*
50338 prototypes for alignment with the ISO/IEC 9899:1999 standard.
- 50339 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/89 is applied, updating the
50340 DESCRIPTION for consistency with the *pthread_cond_destroy()* function that states it is safe to
50341 destroy an initialized condition variable upon which no threads are currently blocked.
- 50342 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/90 is applied, updating words in the
50343 DESCRIPTION from “the cancelability enable state” to “the cancelability type”.
- 50344 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/91 is applied, updating the ERRORS
50345 section to remove the error case related to *abstime* from the *pthread_cond_wait()* function, and to
50346 make the error case related to *abstime* mandatory for *pthread_cond_timedwait()* for consistency
50347 with other functions.
- 50348 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/92 is applied, adding a new paragraph to
50349 the RATIONALE section stating that an application should check the predicate on any return
50350 from this function.
- 50351 **Issue 7**
- 50352 SD5-XSH-ERN-44 is applied, changing the definition of the “shall fail” case of the [EINVAL]
50353 error.
- 50354 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.
- 50355 The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions are moved from the Threads
50356 option to the Base.

50357 **NAME**

50358 pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable
 50359 attributes object

50360 **SYNOPSIS**

50361 #include <pthread.h>

50362 int pthread_condattr_destroy(pthread_condattr_t *attr);
 50363 int pthread_condattr_init(pthread_condattr_t *attr);

50364 **DESCRIPTION**

50365 The *pthread_condattr_destroy()* function shall destroy a condition variable attributes object; the
 50366 object becomes, in effect, uninitialized. An implementation may cause *pthread_condattr_destroy()*
 50367 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be
 50368 reinitialized using *pthread_condattr_init()*; the results of otherwise referencing the object after it
 50369 has been destroyed are undefined.

50370 The *pthread_condattr_init()* function shall initialize a condition variable attributes object *attr* with
 50371 the default value for all of the attributes defined by the implementation.

50372 Results are undefined if *pthread_condattr_init()* is called specifying an already initialized *attr*
 50373 attributes object.

50374 After a condition variable attributes object has been used to initialize one or more condition
 50375 variables, any function affecting the attributes object (including destruction) shall not affect any
 50376 previously initialized condition variables.

50377 This volume of POSIX.1-200x requires two attributes, the *clock* attribute and the *process-shared*
 50378 attribute.

50379 Additional attributes, their default values, and the names of the associated functions to get and
 50380 set those attribute values are implementation-defined.

50381 **RETURN VALUE**

50382 If successful, the *pthread_condattr_destroy()* and *pthread_condattr_init()* functions shall return
 50383 zero; otherwise, an error number shall be returned to indicate the error.

50384 **ERRORS**

50385 The *pthread_condattr_destroy()* function may fail if:

50386 [EINVAL] The value specified by *attr* is invalid.

50387 The *pthread_condattr_init()* function shall fail if:

50388 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

50389 These functions shall not return an error code of [EINTR].

50390 **EXAMPLES**

50391 None.

50392 **APPLICATION USAGE**

50393 None.

50394 **RATIONALE**

50395 See *pthread_attr_destroy()* and *pthread_mutex_destroy()*.

50396 A *process-shared* attribute has been defined for condition variables for the same reason it has been
 50397 defined for mutexes.

50398 **FUTURE DIRECTIONS**

50399 None.

50400 **SEE ALSO**50401 *pthread_attr_destroy()*, *pthread_cond_destroy()*, *pthread_condattr_getpshared()*, *pthread_create()*,
50402 *pthread_mutex_destroy()*

50403 XBD <pthread.h>

50404 **CHANGE HISTORY**

50405 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50406 **Issue 6**50407 The *pthread_condattr_destroy()* and *pthread_condattr_init()* functions are marked as part of the
50408 Threads option.50409 **Issue 7**50410 The *pthread_condattr_destroy()* and *pthread_condattr_init()* functions are moved from the Threads
50411 option to the Base.

50412 **NAME**

50413 pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection
 50414 condition variable attribute

50415 **SYNOPSIS**

```
50416 #include <pthread.h>

50417 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
50418 clockid_t *restrict clock_id);
50419 int pthread_condattr_setclock(pthread_condattr_t *attr,
50420 clockid_t clock_id);
```

50421 **DESCRIPTION**

50422 The *pthread_condattr_getclock()* function shall obtain the value of the *clock* attribute from the
 50423 attributes object referenced by *attr*. The *pthread_condattr_setclock()* function shall set the *clock*
 50424 attribute in an initialized attributes object referenced by *attr*. If *pthread_condattr_setclock()* is
 50425 called with a *clock_id* argument that refers to a CPU-time clock, the call shall fail.

50426 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of
 50427 *pthread_cond_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

50428 **RETURN VALUE**

50429 If successful, the *pthread_condattr_getclock()* function shall return zero and store the value of the
 50430 clock attribute of *attr* into the object referenced by the *clock_id* argument. Otherwise, an error
 50431 number shall be returned to indicate the error.

50432 If successful, the *pthread_condattr_setclock()* function shall return zero; otherwise, an error
 50433 number shall be returned to indicate the error.

50434 **ERRORS**

50435 These functions may fail if:

50436 [EINVAL] The value specified by *attr* is invalid.

50437 The *pthread_condattr_setclock()* function may fail if:

50438 [EINVAL] The value specified by *clock_id* does not refer to a known clock, or is a CPU-
 50439 time clock.

50440 These functions shall not return an error code of [EINTR].

50441 **EXAMPLES**

50442 None.

50453

CHANGE HISTORY

50454

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

50455

Issue 7

50456

The *pthread_condattr_getclock()* and *pthread_condattr_setclock()* functions are moved from the Clock Selection option to the Base.

50457

50458 **NAME**

50459 pthread_condattr_getpshared, pthread_condattr_setpshared — get and set the process-shared
 50460 condition variable attributes

50461 **SYNOPSIS**

```
50462 TSH #include <pthread.h>
50463
50463 int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
50464 int *restrict pshared);
50465 int pthread_condattr_setpshared(pthread_condattr_t *attr,
50466 int pshared);
```

50467 **DESCRIPTION**

50468 The *pthread_condattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 50469 from the attributes object referenced by *attr*. The *pthread_condattr_setpshared()* function shall set
 50470 the *process-shared* attribute in an initialized attributes object referenced by *attr*.

50471 The *process-shared* attribute is set to `PTHREAD_PROCESS_SHARED` to permit a condition
 50472 variable to be operated upon by any thread that has access to the memory where the condition
 50473 variable is allocated, even if the condition variable is allocated in memory that is shared by
 50474 multiple processes. If the *process-shared* attribute is `PTHREAD_PROCESS_PRIVATE`, the
 50475 condition variable shall only be operated upon by threads created within the same process as the
 50476 thread that initialized the condition variable; if threads of differing processes attempt to operate
 50477 on such a condition variable, the behavior is undefined. The default value of the attribute is
 50478 `PTHREAD_PROCESS_PRIVATE`.

50479 **RETURN VALUE**

50480 If successful, the *pthread_condattr_setpshared()* function shall return zero; otherwise, an error
 50481 number shall be returned to indicate the error.

50482 If successful, the *pthread_condattr_getpshared()* function shall return zero and store the value of
 50483 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,
 50484 an error number shall be returned to indicate the error.

50485 **ERRORS**

50486 The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions may fail if:

50487 [EINVAL] The value specified by *attr* is invalid.

50488 The *pthread_condattr_setpshared()* function may fail if:

50489 [EINVAL] The new value specified for the attribute is outside the range of legal values
 50490 for that attribute.

50491 These functions shall not return an error code of [EINTR].

50492 **EXAMPLES**

50493 None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the *pthread_condattr_getpshared()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions are moved from the Threads option.

DRAFT

50513 **NAME**
50514 pthread_condattr_init — initialize the condition variable attributes object

50515 **SYNOPSIS**
50516 #include <pthread.h>
50517 int pthread_condattr_init(pthread_condattr_t *attr);

50518 **DESCRIPTION**
50519 Refer to *pthread_condattr_destroy()*.

50520 **NAME**
50521 pthread_condattr_setclock — set the clock selection condition variable attribute

50522 **SYNOPSIS**
50523 #include <pthread.h>

50524 int pthread_condattr_setclock(pthread_condattr_t *attr,
50525 clockid_t clock_id);

50526 **DESCRIPTION**
50527 Refer to *pthread_condattr_getclock()*.

50528 **NAME**

50529 pthread_condattr_setpshared — set the process-shared condition variable attribute

50530 **SYNOPSIS**50531 TSH

```
#include <pthread.h>
```

```
int pthread_condattr_setpshared(pthread_condattr_t *attr,
```

```
int pshared);
```

50534 **DESCRIPTION**50535 Refer to *pthread_condattr_getpshared()*.

50536 **NAME**

50537 pthread_create — thread creation

50538 **SYNOPSIS**

50539 #include <pthread.h>

```
50540 int pthread_create(pthread_t *restrict thread,
50541                  const pthread_attr_t *restrict attr,
50542                  void *(*start_routine)(void*), void *restrict arg);
```

50543 **DESCRIPTION**

50544 The *pthread_create()* function shall create a new thread, with attributes specified by *attr*, within a
 50545 process. If *attr* is *NULL*, the default attributes shall be used. If the attributes specified by *attr* are
 50546 modified later, the thread's attributes shall not be affected. Upon successful completion,
 50547 *pthread_create()* shall store the ID of the created thread in the location referenced by *thread*.

50548 The thread is created executing *start_routine* with *arg* as its sole argument. If the *start_routine*
 50549 returns, the effect shall be as if there was an implicit call to *pthread_exit()* using the return value
 50550 of *start_routine* as the exit status. Note that the thread in which *main()* was originally invoked
 50551 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call to
 50552 *exit()* using the return value of *main()* as the exit status.

50553 The signal state of the new thread shall be initialized as follows:

- 50554 • The signal mask shall be inherited from the creating thread.
- 50555 • The set of signals pending for the new thread shall be empty.

50556 XSI The alternate stack shall not be inherited.

50557 The floating-point environment shall be inherited from the creating thread.

50558 If *pthread_create()* fails, no new thread is created and the contents of the location referenced by
 50559 *thread* are undefined.

50560 TCT If *_POSIX_THREAD_CPUTIME* is defined, the new thread shall have a CPU-time clock
 50561 accessible, and the initial value of this clock shall be set to zero.

50562 **RETURN VALUE**

50563 If successful, the *pthread_create()* function shall return zero; otherwise, an error number shall be
 50564 returned to indicate the error.

50565 **ERRORS**

50566 The *pthread_create()* function shall fail if:

50567 [EAGAIN] The system lacked the necessary resources to create another thread, or the
 50568 system-imposed limit on the total number of threads in a process
 50569 {*PTHREAD_THREADS_MAX*} would be exceeded.

50570 [EPERM] The caller does not have appropriate permission to set the required scheduling
 50571 parameters or scheduling policy.

50572 The *pthread_create()* function may fail if:

50573 [EINVAL] The attributes specified by *attr* are invalid.

50574 The *pthread_create()* function shall not return an error code of [EINTR].

EXAMPLES

50575
50576 None.

APPLICATION USAGE

50577
50578 There is no requirement on the implementation that the ID of the created thread be available
50579 before the newly created thread starts executing. The calling thread can obtain the ID of the
50580 created thread through the return value of the *pthread_create()* function, and the newly created
50581 thread can obtain its ID by a call to *pthread_self()*.

RATIONALE

50582
50583 A suggested alternative to *pthread_create()* would be to define two separate operations: create
50584 and start. Some applications would find such behavior more natural. Ada, in particular,
50585 separates the “creation” of a task from its “activation”.

50586 Splitting the operation was rejected by the standard developers for many reasons:

- 50587 • The number of calls required to start a thread would increase from one to two and thus
50588 place an additional burden on applications that do not require the additional
50589 synchronization. The second call, however, could be avoided by the additional
50590 complication of a start-up state attribute.
- 50591 • An extra state would be introduced: “created but not started”. This would require the
50592 standard to specify the behavior of the thread operations when the target has not yet
50593 started executing.
- 50594 • For those applications that require such behavior, it is possible to simulate the two separate
50595 steps with the facilities that are currently provided. The *start_routine()* can synchronize by
50596 waiting on a condition variable that is signaled by the start operation.

50597 An Ada implementor can choose to create the thread at either of two points in the Ada program:
50598 when the task object is created, or when the task is activated (generally at a “begin”). If the first
50599 approach is adopted, the *start_routine()* needs to wait on a condition variable to receive the order
50600 to begin “activation”. The second approach requires no such condition variable or extra
50601 synchronization. In either approach, a separate Ada task control block would need to be created
50602 when the task object is created to hold rendezvous queues, and so on.

50603 An extension of the preceding model would be to allow the state of the thread to be modified
50604 between the create and start. This would allow the thread attributes object to be eliminated. This
50605 has been rejected because:

- 50606 • All state in the thread attributes object has to be able to be set for the thread. This would
50607 require the definition of functions to modify thread attributes. There would be no
50608 reduction in the number of function calls required to set up the thread. In fact, for an
50609 application that creates all threads using identical attributes, the number of function calls
50610 required to set up the threads would be dramatically increased. Use of a thread attributes
50611 object permits the application to make one set of attribute setting function calls.
50612 Otherwise, the set of attribute setting function calls needs to be made for each thread
50613 creation.
- 50614 • Depending on the implementation architecture, functions to set thread state would require
50615 kernel calls, or for other implementation reasons would not be able to be implemented as
50616 macros, thereby increasing the cost of thread creation.
- 50617 • The ability for applications to segregate threads by class would be lost.

50618 Another suggested alternative uses a model similar to that for process creation, such as “thread
50619 fork”. The fork semantics would provide more flexibility and the “create” function can be
50620 implemented simply by doing a thread fork followed immediately by a call to the desired “start
50621 routine” for the thread. This alternative has these problems:

- 50622 • For many implementations, the entire stack of the calling thread would need to be
- 50623 duplicated, since in many architectures there is no way to determine the size of the calling
- 50624 frame.
- 50625 • Efficiency is reduced since at least some part of the stack has to be copied, even though in
- 50626 most cases the thread never needs the copied context, since it merely calls the desired start
- 50627 routine.

FUTURE DIRECTIONS

50628 None.

CHANGE HISTORY

50633 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

50635 The *pthread_create()* function is marked as part of the Threads option.

50637 The following new requirements on POSIX implementations derive from alignment with the

50638 Single UNIX Specification:

- 50639 • The [EPERM] mandatory error condition is added.

50640 The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

50641 The **restrict** keyword is added to the *pthread_create()* prototype for alignment with the

50642 ISO/IEC 9899:1999 standard.

50643 The DESCRIPTION is updated to make it explicit that the floating-point environment is

50644 inherited from the creating thread.

50645 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the

50646 alternate stack is not inherited.

50647 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/93 is applied, updating the ERRORS

50648 section to remove the mandatory [EINVAL] error (“The value specified by *attr* is invalid”), and

50649 adding the optional [EINVAL] error (“The attributes specified by *attr* are invalid”).

50650 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/94 is applied, adding the APPLICATION

50651 USAGE section.

Issue 7

50652 The *pthread_create()* function is moved from the Threads option to the Base.

50653

50654 **NAME**

50655 pthread_detach — detach a thread

50656 **SYNOPSIS**

50657 #include <pthread.h>

50658 int pthread_detach(pthread_t thread);

50659 **DESCRIPTION**

50660 The *pthread_detach()* function shall indicate to the implementation that storage for the thread
 50661 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,
 50662 *pthread_detach()* shall not cause it to terminate. The effect of multiple *pthread_detach()* calls on the
 50663 same target thread is unspecified.

50664 **RETURN VALUE**

50665 If the call succeeds, *pthread_detach()* shall return 0; otherwise, an error number shall be returned
 50666 to indicate the error.

50667 **ERRORS**50668 The *pthread_detach()* function may fail if:

- 50669 [EINVAL] The implementation has detected that the value specified by *thread* does not
 50670 refer to a joinable thread.
- 50671 [ESRCH] No thread could be found corresponding to that specified by the given thread
 50672 ID.

50673 The *pthread_detach()* function shall not return an error code of [EINTR].50674 **EXAMPLES**

50675 None.

50676 **APPLICATION USAGE**

50677 None.

50678 **RATIONALE**

50679 The *pthread_join()* or *pthread_detach()* functions should eventually be called for every thread that
 50680 is created so that storage associated with the thread may be reclaimed.

50681 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation
 50682 attribute is sufficient, since a thread need never be dynamically detached. However, need arises
 50683 in at least two cases:

- 50684 1. In a cancellation handler for a *pthread_join()* it is nearly essential to have a
 50685 *pthread_detach()* function in order to detach the thread on which *pthread_join()* was
 50686 waiting. Without it, it would be necessary to have the handler do another *pthread_join()*
 50687 to attempt to detach the thread, which would both delay the cancellation processing for an
 50688 unbounded period and introduce a new call to *pthread_join()*, which might itself need a
 50689 cancellation handler. A dynamic detach is nearly essential in this case.
- 50690 2. In order to detach the “initial thread” (as may be desirable in processes that set up server
 50691 threads).

50692 **FUTURE DIRECTIONS**

50693 None.

50703

Issue 7

50704

The *pthread_detach()* function is moved from the Threads option to the Base.

50705 **NAME**

50706 pthread_equal — compare thread IDs

50707 **SYNOPSIS**

50708 #include <pthread.h>

50709 int pthread_equal(pthread_t t1, pthread_t t2);

50710 **DESCRIPTION**50711 This function shall compare the thread IDs *t1* and *t2*.50712 **RETURN VALUE**50713 The *pthread_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero
50714 shall be returned.50715 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.50716 **ERRORS**

50717 No errors are defined.

50718 The *pthread_equal()* function shall not return an error code of [EINTR].50719 **EXAMPLES**

50720 None.

50721 **APPLICATION USAGE**

50722 None.

50723 **RATIONALE**50724 Implementations may choose to define a thread ID as a structure. This allows additional
50725 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence
50726 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).
50727 Since the C language does not support comparison on structure types, the *pthread_equal()*
50728 function is provided to compare thread IDs.50729 **FUTURE DIRECTIONS**

50730 None.

50731 **SEE ALSO**50732 *pthread_create()*, *pthread_self()*

50734 **CHANGE HISTORY**

50735 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50736 **Issue 6**50737 The *pthread_equal()* function is marked as part of the Threads option.50738 **Issue 7**50739 The *pthread_equal()* function is moved from the Threads option to the Base.

50740 **NAME**

50741 pthread_exit — thread termination

50742 **SYNOPSIS**

50743 #include <pthread.h>

50744 void pthread_exit(void *value_ptr);

50745 **DESCRIPTION**

50746 The *pthread_exit()* function shall terminate the calling thread and make the value *value_ptr*
 50747 available to any successful join with the terminating thread. Any cancellation cleanup handlers
 50748 that have been pushed and not yet popped shall be popped in the reverse order that they were
 50749 pushed and then executed. After all cancellation cleanup handlers have been executed, if the
 50750 thread has any thread-specific data, appropriate destructor functions shall be called in an
 50751 unspecified order. Thread termination does not release any application visible process resources,
 50752 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level
 50753 cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

50754 An implicit call to *pthread_exit()* is made when a thread other than the thread in which *main()*
 50755 was first invoked returns from the start routine that was used to create it. The function's return
 50756 value shall serve as the thread's exit status.

50757 The behavior of *pthread_exit()* is undefined if called from a cancellation cleanup handler or
 50758 destructor function that was invoked as a result of either an implicit or explicit call to
 50759 *pthread_exit()*.

50760 After a thread has terminated, the result of access to local (auto) variables of the thread is
 50761 undefined. Thus, references to local variables of the exiting thread should not be used for the
 50762 *pthread_exit()* *value_ptr* parameter value.

50763 The process shall exit with an exit status of 0 after the last thread has been terminated. The
 50764 behavior shall be as if the implementation called *exit()* with a zero argument at thread
 50765 termination time.

50766 **RETURN VALUE**50767 The *pthread_exit()* function cannot return to its caller.50768 **ERRORS**

50769 No errors are defined.

50770 **EXAMPLES**

50771 None.

50772 **APPLICATION USAGE**

50773 None.

50774 **RATIONALE**

50775 The normal mechanism by which a thread terminates is to return from the routine that was
 50776 specified in the *pthread_create()* call that started it. The *pthread_exit()* function provides the
 50777 capability for a thread to terminate without requiring a return from the start routine of that
 50778 thread, thereby providing a function analogous to *exit()*.

50779 Regardless of the method of thread termination, any cancellation cleanup handlers that have
 50780 been pushed and not yet popped are executed, and the destructors for any existing thread-
 50781 specific data are executed. This volume of POSIX.1-200x requires that cancellation cleanup
 50782 handlers be popped and called in order. After all cancellation cleanup handlers have been
 50783 executed, thread-specific data destructors are called, in an unspecified order, for each item of
 50784 thread-specific data that exists in the thread. This ordering is necessary because cancellation

50785 cleanup handlers may rely on thread-specific data.

50786 As the meaning of the status is determined by the application (except when the thread has been
50787 canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an
50788 illegal status value is, which is why no address error checking is done.

FUTURE DIRECTIONS

50789 None.

DRAFT

50800 **NAME**

50801 pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

50802 **SYNOPSIS**

```
50803 OB XSI #include <pthread.h>
50804 int pthread_getconcurrency(void);
50805 int pthread_setconcurrency(int new_level);
```

50806 **DESCRIPTION**

50807 Unbound threads in a process may or may not be required to be simultaneously active. By
 50808 default, the threads implementation ensures that a sufficient number of threads are active so that
 50809 the process can continue to make progress. While this conserves system resources, it may not
 50810 produce the most effective level of concurrency.

50811 The *pthread_setconcurrency()* function allows an application to inform the threads
 50812 implementation of its desired concurrency level, *new_level*. The actual level of concurrency
 50813 provided by the implementation as a result of this function call is unspecified.

50814 If *new_level* is zero, it causes the implementation to maintain the concurrency level at its
 50815 discretion as if *pthread_setconcurrency()* had never been called.

50816 The *pthread_getconcurrency()* function shall return the value set by a previous call to the
 50817 *pthread_setconcurrency()* function. If the *pthread_setconcurrency()* function was not previously
 50818 called, this function shall return zero to indicate that the implementation is maintaining the
 50819 concurrency level.

50820 A call to *pthread_setconcurrency()* shall inform the implementation of its desired concurrency
 50821 level. The implementation shall use this as a hint, not a requirement.

50822 If an implementation does not support multiplexing of user threads on top of several kernel-
 50823 scheduled entities, the *pthread_setconcurrency()* and *pthread_getconcurrency()* functions are
 50824 provided for source code compatibility but they shall have no effect when called. To maintain
 50825 the function semantics, the *new_level* parameter is saved when *pthread_setconcurrency()* is called
 50826 so that a subsequent call to *pthread_getconcurrency()* shall return the same value.

50827 **RETURN VALUE**

50828 If successful, the *pthread_setconcurrency()* function shall return zero; otherwise, an error number
 50829 shall be returned to indicate the error.

50830 The *pthread_getconcurrency()* function shall always return the concurrency level set by a previous
 50831 call to *pthread_setconcurrency()*. If the *pthread_setconcurrency()* function has never been called,
 50832 *pthread_getconcurrency()* shall return zero.

50833 **ERRORS**

50834 The *pthread_setconcurrency()* function shall fail if:

- | | | |
|-------|----------|---|
| 50835 | [EINVAL] | The value specified by <i>new_level</i> is negative. |
| 50836 | [EAGAIN] | The value specified by <i>new_level</i> would cause a system resource to be exceeded. |

50838 The *pthread_setconcurrency()* function shall not return an error code of [EINTR].

pthread_getschedparam()

System Interfaces

50889 NAME

50890 pthread_getschedparam, pthread_setschedparam — dynamic thread scheduling parameters
 50891 access (**REALTIME THREADS**)

50892 SYNOPSIS

```
50893 TPS #include <pthread.h>
50894
50894 int pthread_getschedparam(pthread_t thread, int *restrict policy,
50895 struct sched_param *restrict param);
50896 int pthread_setschedparam(pthread_t thread, int policy,
50897 const struct sched_param *param);
```

50898 DESCRIPTION

50899 The *pthread_getschedparam()* and *pthread_setschedparam()* functions shall, respectively, get and set
 50900 the scheduling policy and parameters of individual threads within a multi-threaded process to
 50901 be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the
 50902 **sched_param** structure is the priority *sched_priority*. For SCHED_OTHER, the affected
 50903 scheduling parameters are implementation-defined.

50904 The *pthread_getschedparam()* function shall retrieve the scheduling policy and scheduling
 50905 parameters for the thread whose thread ID is given by *thread* and shall store those values in
 50906 *policy* and *param*, respectively. The priority value returned from *pthread_getschedparam()* shall be
 50907 the value specified by the most recent *pthread_setschedparam()*, *pthread_setschedprio()*, or
 50908 *pthread_create()* call affecting the target thread. It shall not reflect any temporary adjustments to
 50909 its priority as a result of any priority inheritance or ceiling functions. The *pthread_setschedparam()*
 50910 function shall set the scheduling policy and associated scheduling parameters for the thread
 50911 whose thread ID is given by *thread* to the policy and associated parameters provided in *policy*
 50912 and *param*, respectively.

50913 The *policy* parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The
 50914 scheduling parameters for the SCHED_OTHER policy are implementation-defined. The
 50915 SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, *priority*.

50916 TSP If **_POSIX_THREAD_SPORADIC_SERVER** is defined, then the *policy* argument may have the
 50917 value SCHED_SPORADIC, with the exception for the *pthread_setschedparam()* function that if the
 50918 scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-
 50919 defined whether the function is supported; in other words, the implementation need not allow
 50920 the application to dynamically change the scheduling policy to SCHED_SPORADIC. The
 50921 sporadic server scheduling policy has the associated parameters *sched_ss_low_priority*,
 50922 *sched_ss_repl_period*, *sched_ss_init_budget*, *sched_priority*, and *sched_ss_max_repl*. The specified
 50923 *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the
 50924 function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall
 50925 be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function
 50926 shall fail. It is unspecified whether the *sched_ss_repl_period* and *sched_ss_init_budget* values are
 50927 stored as provided by this function or are rounded to align with the resolution of the clock being
 50928 used. +

50929 If the *pthread_setschedparam()* function fails, the scheduling parameters shall not be changed for
 50930 the target thread.

50931 RETURN VALUE

50932 If successful, the *pthread_getschedparam()* and *pthread_setschedparam()* functions shall return zero;
 50933 otherwise, an error number shall be returned to indicate the error.

ERRORS

- 50934
- 50935 The *pthread_getschedparam()* function may fail if:
- 50936 [ESRCH] The value specified by *thread* does not refer to an existing thread.
- 50937 The *pthread_setschedparam()* function may fail if:
- 50938 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated with the scheduling policy *policy* is invalid.
- 50939
- 50940 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an unsupported value.
- 50941
- 50942 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to SCHED_SPORADIC, and the implementation does not support this change.
- 50943
- 50944 [EPERM] The caller does not have the appropriate permission to set either the scheduling parameters or the scheduling policy of the specified thread.
- 50945
- 50946 [EPERM] The implementation does not allow the application to modify one of the parameters to the value specified.
- 50947
- 50948 [ESRCH] The value specified by *thread* does not refer to a existing thread.
- 50949 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

50961 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

50962

Issue 6

50963 The *pthread_getschedparam()* and *pthread_setschedparam()* functions are marked as part of the Threads and Thread Execution Scheduling options.

50964

50965

50966 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

50967

50968 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the *pthread_setschedparam()* function so that its second argument is of type **int**.

50969

50970 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

50971 The **restrict** keyword is added to the *pthread_getschedparam()* prototype for alignment with the ISO/IEC 9899:1999 standard.

50972

50973 The Open Group Corrigendum U047/1 is applied.

50974 IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the *pthread_setschedprio()* function.

50975

pthread_getschedparam()

50976

Issue 7

50977

The *pthread_getschedparam()* and *pthread_setschedparam()* functions are moved from the Threads option.

50978

50979

Austin Group Interpretation 1003.1-2001 #119 is applied.

+

50980 **NAME**

50981 pthread_getspecific, pthread_setspecific — thread-specific data management

50982 **SYNOPSIS**

50983 #include <pthread.h>

50984 void *pthread_getspecific(pthread_key_t key);

50985 int pthread_setspecific(pthread_key_t key, const void *value);

50986 **DESCRIPTION**50987 The *pthread_getspecific()* function shall return the value currently bound to the specified *key* on
50988 behalf of the calling thread.50989 The *pthread_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a
50990 previous call to *pthread_key_create()*. Different threads may bind different values to the same
50991 key. These values are typically pointers to blocks of dynamically allocated memory that have
50992 been reserved for use by the calling thread.50993 The effect of calling *pthread_getspecific()* or *pthread_setspecific()* with a *key* value not obtained
50994 from *pthread_key_create()* or after *key* has been deleted with *pthread_key_delete()* is undefined.50995 Both *pthread_getspecific()* and *pthread_setspecific()* may be called from a thread-specific data
50996 destructor function. A call to *pthread_getspecific()* for the thread-specific data key being
50997 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)
50998 by a call to *pthread_setspecific()*. Calling *pthread_setspecific()* from a thread-specific data
50999 destructor routine may result either in lost storage (after at least
51000 PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

51001 Both functions may be implemented as macros.

51002 **RETURN VALUE**51003 The *pthread_getspecific()* function shall return the thread-specific data value associated with the
51004 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be
51005 returned.51006 If successful, the *pthread_setspecific()* function shall return zero; otherwise, an error number shall
51007 be returned to indicate the error.51008 **ERRORS**51009 No errors are returned from *pthread_getspecific()*.51010 The *pthread_setspecific()* function shall fail if:

51011 [ENOMEM] Insufficient memory exists to associate the non-NULL value with the key.

51012 The *pthread_setspecific()* function may fail if:

51013 [EINVAL] The key value is invalid.

51014 The *pthread_setspecific()* function shall not return an error code of [EINTR].

EXAMPLES

51015
51016 None.

APPLICATION USAGE

51017
51018 None.

RATIONALE

51019
51020 Performance and ease-of-use of *pthread_getspecific()* are critical for functions that rely on
51021 maintaining state in thread-specific data. Since no errors are required to be detected by it, and
51022 since the only error that could be detected is the use of an invalid key, the function to
51023 *pthread_getspecific()* has been designed to favor speed and simplicity over error reporting.

FUTURE DIRECTIONS

51024
51025 None.

Issue 6

51031
51032 The *pthread_getspecific()* and *pthread_setspecific()* functions are marked as part of the Threads
51033 option.

51034 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

51035 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/96 is applied, updating the ERRORS
51036 section so that the [ENOMEM] error case is changed from “to associate the value with the key”
51037 to “to associate the non-NULL value with the key”.

Issue 7

51038
51039 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the ERRORS section.

51040 The *pthread_getspecific()* and *pthread_setspecific()* functions are moved from the Threads option to
51041 the Base.

51042 **NAME**

51043 pthread_join — wait for thread termination

51044 **SYNOPSIS**

51045 #include <pthread.h>

51046 int pthread_join(pthread_t thread, void **value_ptr);

51047 **DESCRIPTION**

51048 The *pthread_join()* function shall suspend execution of the calling thread until the target *thread*
 51049 terminates, unless the target *thread* has already terminated. On return from a successful
 51050 *pthread_join()* call with a non-NULL *value_ptr* argument, the value passed to *pthread_exit()* by
 51051 the terminating thread shall be made available in the location referenced by *value_ptr*. When a
 51052 *pthread_join()* returns successfully, the target thread has been terminated. The results of multiple
 51053 simultaneous calls to *pthread_join()* specifying the same target thread are undefined. If the
 51054 thread calling *pthread_join()* is canceled, then the target thread shall not be detached.

51055 It is unspecified whether a thread that has exited but remains unjoined counts against
 51056 {PTHREAD_THREADS_MAX}.

51057 **RETURN VALUE**

51058 If successful, the *pthread_join()* function shall return zero; otherwise, an error number shall be
 51059 returned to indicate the error.

51060 **ERRORS**51061 The *pthread_join()* function shall fail if:

51062 [ESRCH] No thread could be found corresponding to that specified by the given thread
 51063 ID.

51064 The *pthread_join()* function may fail if:

51065 [EDEADLK] A deadlock was detected or the value of *thread* specifies the calling thread.

51066 [EINVAL] The value specified by *thread* does not refer to a joinable thread.

51067 The *pthread_join()* function shall not return an error code of [EINTR].

51068 **EXAMPLES**

51069 An example of thread creation and deletion follows:

```

51070 typedef struct {
51071     int *ar;
51072     long n;
51073 } subarray;

51074 void *
51075 incer(void *arg)
51076 {
51077     long i;

51078     for (i = 0; i < ((subarray *)arg)->n; i++)
51079         ((subarray *)arg)->ar[i]++;
51080 }

51081 int main(void)
51082 {
51083     int ar[1000000];
51084     pthread_t th1, th2;
51085     subarray sb1, sb2;

```

pthread_join()

```

51086         sb1.ar = &ar[0];
51087         sb1.n  = 500000;
51088         (void) pthread_create(&th1, NULL, incer, &sb1);
51089
51090         sb2.ar = &ar[500000];
51091         sb2.n  = 500000;
51092         (void) pthread_create(&th2, NULL, incer, &sb2);
51093
51094         (void) pthread_join(th1, NULL);
51095         (void) pthread_join(th2, NULL);
51096         return 0;
51097     }

```

APPLICATION USAGE

None.

RATIONALE

The *pthread_join()* function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the *start_routine()*. The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the *pthread_join()* function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including *pthread_join()* in this volume of POSIX.1-200x was considered valuable.

The *pthread_join()* function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after *pthread_join()* returns, any application-provided stack storage could be reclaimed.

The *pthread_join()* or *pthread_detach()* function should eventually be called for every thread that is created with the *detachstate* attribute set to `PTHREAD_CREATE_JOINABLE` so that storage associated with the thread may be reclaimed.

The interaction between *pthread_join()* and cancellation is well-defined for the following reasons:

- The *pthread_join()* function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.
- Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the *pthread_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or *pthread_join()* returns. There are no race conditions since *pthread_join()* was called in the deferred cancelability state.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

51130

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51131

Issue 6

51132

The *pthread_join()* function is marked as part of the Threads option.

51133

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/97 is applied, updating the ERRORS section so that the [EINVAL] error is made optional and the words “the implementation has detected” are removed from it.

51134

51135

51136

Issue 7

51137

The *pthread_join()* function is moved from the Threads option to the Base.

51138 **NAME**

51139 pthread_key_create — thread-specific data key creation

51140 **SYNOPSIS**

51141 #include <pthread.h>

51142 int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));

51143 **DESCRIPTION**

51144 The *pthread_key_create()* function shall create a thread-specific data key visible to all threads in
 51145 the process. Key values provided by *pthread_key_create()* are opaque objects used to locate
 51146 thread-specific data. Although the same key value may be used by different threads, the values
 51147 bound to the key by *pthread_setspecific()* are maintained on a per-thread basis and persist for the
 51148 life of the calling thread.

51149 Upon key creation, the value NULL shall be associated with the new key in all active threads.
 51150 Upon thread creation, the value NULL shall be associated with all defined keys in the new
 51151 thread.

51152 An optional destructor function may be associated with each key value. At thread exit, if a key
 51153 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with
 51154 that key, the value of the key is set to NULL, and then the function pointed to is called with the
 51155 previously associated value as its sole argument. The order of destructor calls is unspecified if
 51156 more than one destructor exists for a thread when it exits.

51157 If, after all the destructors have been called for all non-NULL values with associated destructors,
 51158 there are still some non-NULL values with associated destructors, then the process is repeated.
 51159 If, after at least {PTHREAD_DESTRUCTOR_ITERATIONS} iterations of destructor calls for
 51160 outstanding non-NULL values, there are still some non-NULL values with associated
 51161 destructors, implementations may stop calling destructors, or they may continue calling
 51162 destructors until no non-NULL values with associated destructors exist, even though this might
 51163 result in an infinite loop.

51164 **RETURN VALUE**

51165 If successful, the *pthread_key_create()* function shall store the newly created key value at **key* and
 51166 shall return zero. Otherwise, an error number shall be returned to indicate the error.

51167 **ERRORS**51168 The *pthread_key_create()* function shall fail if:

51169 [EAGAIN] The system lacked the necessary resources to create another thread-specific
 51170 data key, or the system-imposed limit on the total number of keys per process
 51171 {PTHREAD_KEYS_MAX} has been exceeded.

51172 [ENOMEM] Insufficient memory exists to create the key.

51173 The *pthread_key_create()* function shall not return an error code of [EINTR].

51174 **EXAMPLES**

51175 The following example demonstrates a function that initializes a thread-specific data key when it
 51176 is first called, and associates a thread-specific object with each calling thread, initializing this
 51177 object when necessary.

```
51178 static pthread_key_t key;
51179 static pthread_once_t key_once = PTHREAD_ONCE_INIT;

51180 static void
51181 make_key()
51182 {
```

```

51183         (void) pthread_key_create(&key, NULL);
51184     }
51185     func()
51186     {
51187         void *ptr;
51188
51189         (void) pthread_once(&key_once, make_key);
51190         if ((ptr = pthread_getspecific(key)) == NULL) {
51191             ptr = malloc(OBJECT_SIZE);
51192             ...
51193             (void) pthread_setspecific(key, ptr);
51194         }
51195     }

```

Note that the key has to be initialized before *pthread_getspecific()* or *pthread_setspecific()* can be used. The *pthread_key_create()* call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```

51200     static pthread_key_t key;
51201     func()
51202     {
51203         void *ptr;
51204
51205         /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
51206         if ((ptr = pthread_getspecific(key)) == NULL &&
51207             pthread_setspecific(key, NULL) != 0) {
51208             pthread_key_create(&key, NULL);
51209             ...
51210         }
51211     }

```

APPLICATION USAGE

None.

RATIONALE

Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with *pthread_key_create()* are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the *pthread_setspecific()* function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```

51225     pthread_getspecific(key, &old);
51226     new = allocate();
51227     destructor(old);
51228     pthread_setspecific(key, new);

```

Note: The above example could leak storage if run with asynchronous cancellation enabled. No such problems occur in the default cancellation state if no cancellation points occur between the get and set.

There is no notion of a destructor-safe function. If an application does not call *pthread_exit()* from a signal handler, or if it blocks any signal whose handler may call *pthread_exit()* while calling async-unsafe functions, all functions may be safely called from destructors.

Non-Idempotent Data Key Creation

There were requests to make *pthread_key_create()* idempotent with respect to a given *key* address parameter. This would allow applications to call *pthread_key_create()* multiple times for a given *key* address and be guaranteed that only one key would be created. Doing so would require the key value to be previously initialized (possibly at compile time) to a known null value and would require that implicit mutual-exclusion be performed based on the address and contents of the *key* parameter in order to guarantee that exactly one key would be created.

Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread_key_create()*. On many implementations, implicit mutual-exclusion would also have to be performed by *pthread_getspecific()* and *pthread_setspecific()* in order to guard against using incompletely stored or not-yet-visible key values. This could significantly increase the cost of important operations, particularly *pthread_getspecific()*.

Thus, this proposal was rejected. The *pthread_key_create()* function performs no implicit synchronization. It is the responsibility of the programmer to ensure that it is called exactly once per key before use of the key. Several straightforward mechanisms can already be used to accomplish this, including calling explicit module initialization functions, using mutexes, and using *pthread_once()*. This places no significant burden on the programmer, introduces no possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows commonly used thread-specific data operations to be more efficient.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_key_create()* function is marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

Issue 7

The *pthread_key_create()* function is moved from the Threads option to the Base.

51265 **NAME**

51266 pthread_key_delete — thread-specific data key deletion

51267 **SYNOPSIS**

51268 #include <pthread.h>

51269 int pthread_key_delete(pthread_key_t key);

51270 **DESCRIPTION**

51271 The *pthread_key_delete()* function shall delete a thread-specific data key previously returned by
 51272 *pthread_key_create()*. The thread-specific data values associated with *key* need not be NULL at
 51273 the time *pthread_key_delete()* is called. It is the responsibility of the application to free any
 51274 application storage or perform any cleanup actions for data structures related to the deleted key
 51275 or associated thread-specific data in any threads; this cleanup can be done either before or after
 51276 *pthread_key_delete()* is called. Any attempt to use *key* following the call to *pthread_key_delete()*
 51277 results in undefined behavior.

51278 The *pthread_key_delete()* function shall be callable from within destructor functions. No
 51279 destructor functions shall be invoked by *pthread_key_delete()*. Any destructor function that may
 51280 have been associated with *key* shall no longer be called upon thread exit.

51281 **RETURN VALUE**

51282 If successful, the *pthread_key_delete()* function shall return zero; otherwise, an error number shall
 51283 be returned to indicate the error.

51284 **ERRORS**

51285 The *pthread_key_delete()* function may fail if:

51286 [EINVAL] The *key* value is invalid.

51287 The *pthread_key_delete()* function shall not return an error code of [EINTR].

51288 **EXAMPLES**

51289 None.

51290 **APPLICATION USAGE**

51291 None.

51292 **RATIONALE**

51293 A thread-specific data key deletion function has been included in order to allow the resources
 51294 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys
 51295 can arise, among other scenarios, when a dynamically loaded module that allocated a key is
 51296 unloaded.

51297 Conforming applications are responsible for performing any cleanup actions needed for data
 51298 structures associated with the key to be deleted, including data referenced by thread-specific
 51299 data values. No such cleanup is done by *pthread_key_delete()*. In particular, destructor functions
 51300 are not called. There are several reasons for this division of responsibility:

- 51301 1. The associated destructor functions used to free thread-specific data at thread exit time
 51302 are only guaranteed to work correctly when called in the thread that allocated the thread-
 51303 specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot
 51304 be used to free thread-specific data in other threads at key deletion time. Attempting to
 51305 have them called by other threads at key deletion time would require other threads to be
 51306 asynchronously interrupted. But since interrupted threads could be in an arbitrary state,
 51307 including holding locks necessary for the destructor to run, this approach would fail. In
 51308 general, there is no safe mechanism whereby an implementation could free thread-
 51309 specific data at key deletion time.

51310 2. Even if there were a means of safely freeing thread-specific data associated with keys to
 51311 be deleted, doing so would require that implementations be able to enumerate the
 51312 threads with non-NULL data and potentially keep them from creating more thread-
 51313 specific data while the key deletion is occurring. This special case could cause extra
 51314 synchronization in the normal case, which would otherwise be unnecessary.

51315 For an application to know that it is safe to delete a key, it has to know that all the threads that
 51316 might potentially ever use the key do not attempt to use it again. For example, it could know
 51317 this if all the client threads have called a cleanup procedure declaring that they are through with
 51318 the module that is being shut down, perhaps by setting a reference count to zero.

51330 **NAME**

51331 pthread_kill — send a signal to a thread

51332 **SYNOPSIS**

51333 CX #include <signal.h>

51334 int pthread_kill(pthread_t thread, int sig);

51335 **DESCRIPTION**51336 The *pthread_kill()* function shall request that a signal be delivered to the specified thread.51337 As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.51338 **RETURN VALUE**51339 Upon successful completion, the function shall return a value of zero. Otherwise, the function
51340 shall return an error number. If the *pthread_kill()* function fails, no signal shall be sent.51341 **ERRORS**51342 The *pthread_kill()* function shall fail if:51343 [ESRCH] No thread could be found corresponding to that specified by the given thread
51344 ID.51345 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.51346 The *pthread_kill()* function shall not return an error code of [EINTR].51347 **EXAMPLES**

51348 None.

51349 **APPLICATION USAGE**51350 The *pthread_kill()* function provides a mechanism for asynchronously directing a signal at a
51351 thread in the calling process. This could be used, for example, by one thread to affect broadcast
51352 delivery of a signal to a set of threads.51353 Note that *pthread_kill()* only causes the signal to be handled in the context of the given thread;
51354 the signal action (termination or stopping) affects the process as a whole.51355 **RATIONALE**

51356 None.

Issue 7

51368

The *pthread_kill()* function is moved from the Threads option to the Base.

51369 **NAME**

51370 pthread_mutex_consistent — mark state protected by robust mutex as consistent

51371 **SYNOPSIS**

51372 #include <pthread.h>

51373 int pthread_mutex_consistent(pthread_mutex_t *mutex);

51374 **DESCRIPTION**51375 If *mutex* is a robust mutex in an inconsistent state, the *pthread_mutex_consistent()* function can be
51376 used to mark the state protected by the mutex referenced by *mutex* as consistent again.51377 If an owner of a robust mutex terminates while holding the mutex, the mutex becomes
51378 inconsistent and the next thread that acquires the mutex lock shall be notified of the state by the
51379 return value [EOWNERDEAD]. In this case, the mutex does not become normally usable again
51380 until the state is marked consistent.51381 If the thread which acquired the mutex lock with the return value [EOWNERDEAD] terminates
51382 before calling either *pthread_mutex_consistent()* or *pthread_mutex_unlock()*, the next thread that
51383 acquires the mutex lock shall be notified about the state of the mutex by the return value
51384 [EOWNERDEAD].51385 **RETURN VALUE**51386 Upon successful completion, the *pthread_mutex_consistent()* function shall return zero.
51387 Otherwise, an error value shall be returned to indicate the error.51388 **ERRORS**51389 The *pthread_mutex_consistent()* function shall fail if:51390 [EINVAL] The mutex object referenced by *mutex* is not robust or does not protect an
51391 inconsistent state.51392 The *pthread_mutex_consistent()* function may fail if:51393 [EINVAL] The value *mutex* is invalid.

51394 These functions shall not return an error code of [EINTR].

51395 **EXAMPLES**

51396 None.

51397 **APPLICATION USAGE**51398 The *pthread_mutex_consistent()* function is only responsible for notifying the implementation that
51399 the state protected by the mutex has been recovered and that normal operations with the mutex
51400 can be resumed. It is the responsibility of the application to recover the state so it can be reused.
51401 If the application is not able to perform the recovery, it can notify the implementation that the
51402 situation is unrecoverable by a call to *pthread_mutex_unlock()* without a prior call to
51403 *pthread_mutex_consistent()*, in which case subsequent threads that attempt to lock the mutex will
51404 fail to acquire the lock and be returned [ENOTRECOVERABLE].51405 **RATIONALE**

51406 None.

51407 **FUTURE DIRECTIONS**

51408 None.

CHANGE HISTORY

51413

First released in Issue 7.

51414

The *pthread_mutex_consistent()* function is moved from the Threads option to the Base.

51415 **NAME**

51416 pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

51417 **SYNOPSIS**

51418 #include <pthread.h>

51419 int pthread_mutex_destroy(pthread_mutex_t *mutex);

51420 int pthread_mutex_init(pthread_mutex_t *restrict mutex,

51421 const pthread_mutexattr_t *restrict attr);

51422 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;

51423 **DESCRIPTION**

51424 The *pthread_mutex_destroy()* function shall destroy the mutex object referenced by *mutex*; the
 51425 mutex object becomes, in effect, uninitialized. An implementation may cause
 51426 *pthread_mutex_destroy()* to set the object referenced by *mutex* to an invalid value. A destroyed
 51427 mutex object can be reinitialized using *pthread_mutex_init()*; the results of otherwise referencing
 51428 the object after it has been destroyed are undefined.

51429 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked
 51430 mutex results in undefined behavior.

51431 The *pthread_mutex_init()* function shall initialize the mutex referenced by *mutex* with attributes
 51432 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the
 51433 same as passing the address of a default mutex attributes object. Upon successful initialization,
 51434 the state of the mutex becomes initialized and unlocked.

51435 Only *mutex* itself may be used for performing synchronization. The result of referring to copies
 51436 of *mutex* in calls to *pthread_mutex_lock()*, *pthread_mutex_trylock()*, *pthread_mutex_unlock()*, and
 51437 *pthread_mutex_destroy()* is undefined.

51438 Attempting to initialize an already initialized mutex results in undefined behavior.

51439 In cases where default mutex attributes are appropriate, the macro
 51440 PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes that are statically allocated.
 51441 The effect shall be equivalent to dynamic initialization by a call to *pthread_mutex_init()* with
 51442 parameter *attr* specified as NULL, except that no error checks are performed.

51443 **RETURN VALUE**

51444 If successful, the *pthread_mutex_destroy()* and *pthread_mutex_init()* functions shall return zero;
 51445 otherwise, an error number shall be returned to indicate the error.

51446 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed
 51447 immediately at the beginning of processing for the function and shall cause an error return prior
 51448 to modifying the state of the mutex specified by *mutex*.

51449 **ERRORS**

51450 The *pthread_mutex_destroy()* function may fail if:

51451 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 51452 by *mutex* while it is locked or referenced (for example, while being used in a
 51453 *pthread_cond_timedwait()* or *pthread_cond_wait()*) by another thread.

51454 [EINVAL] The value specified by *mutex* is invalid.

51455 The *pthread_mutex_init()* function shall fail if:

51456 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
 51457 another mutex.

- 51458 [ENOMEM] Insufficient memory exists to initialize the mutex.
- 51459 [EPERM] The caller does not have the privilege to perform the operation.
- 51460 The *pthread_mutex_init()* function may fail if:
- 51461 [EBUSY] The implementation has detected an attempt to reinitialize the object
51462 referenced by *mutex*, a previously initialized, but not yet destroyed, mutex.
- 51463 [EINVAL] The value specified by *attr* is invalid.
- 51464 [EINVAL] The attributes object referenced by *attr* has the robust mutex attribute set
51465 without the process-shared attribute being set.
- 51466 These functions shall not return an error code of [EINTR].

51468

APPLICATION USAGE

51469 None.
51470

RATIONALE**Alternate Implementations Possible**

51472 This volume of POSIX.1-200x supports several alternative implementations of mutexes. An
51473 implementation may store the lock directly in the object of type **pthread_mutex_t**. Alternatively,
51474 an implementation may store the lock in the heap and merely store a pointer, handle, or unique
51475 ID in the mutex object. Either implementation has advantages or may be required on certain
51476 hardware configurations. So that portable code can be written that is invariant to this choice, this
51477 volume of POSIX.1-200x does not define assignment or equality for this type, and it uses the
51478 term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the
51479 mutex object itself.
51480

51481 Note that this precludes an over-specification of the type of the mutex or condition variable and
51482 motivates the opaqueness of the type.

51483 An implementation is permitted, but not required, to have *pthread_mutex_destroy()* store an
51484 illegal value into the mutex. This may help detect erroneous programs that try to lock (or
51485 otherwise reference) a mutex that has already been destroyed.

Tradeoff Between Error Checks and Performance Supported

51486 Many of the error checks were made optional in order to let implementations trade off
51487 performance *versus* degree of error checking according to the needs of their specific applications
51488 and execution environment. As a general rule, errors or conditions caused by the system (such
51489 as insufficient memory) always need to be reported, but errors due to an erroneously coded
51490 application (such as failing to provide adequate synchronization to prevent a mutex from being
51491 deleted while in use) are made optional.
51492

51493 A wide range of implementations is thus made possible. For example, an implementation
51494 intended for application debugging may implement all of the error checks, but an
51495 implementation running a single, provably correct application under very tight performance
51496 constraints in an embedded computer might implement minimal checks. An implementation
51497 might even be provided in two versions, similar to the options that compilers provide: a full-
51498 checking, but slower version; and a limited-checking, but faster version. To forbid this
51499 optionality would be a disservice to users.

51500 By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly
51501 coded) application might do, and by defining that resource-not-available errors are mandatory,
51502 this volume of POSIX.1-200x ensures that a fully-conforming application is portable across the

51503 full range of implementations, while not forcing all implementations to add overhead to check
51504 for numerous things that a correct program never does.

51505 **Why No Limits are Defined**

51506 Defining symbols for the maximum number of mutexes and condition variables was considered
51507 but rejected because the number of these objects may change dynamically. Furthermore, many
51508 implementations place these objects into application memory; thus, there is no explicit
51509 maximum.

51510 **Static Initializers for Mutexes and Condition Variables**

51511 Providing for static initialization of statically allocated synchronization objects allows modules
51512 with private static synchronization variables to avoid runtime initialization tests and overhead.
51513 Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in
51514 C libraries, where for various reasons the design calls for self-initialization instead of requiring
51515 an explicit module initialization function to be called. An example use of static initialization
51516 follows.

51517 Without static initialization, a self-initializing routine *foo()* might look as follows:

```
51518 static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
51519 static pthread_mutex_t foo_mutex;

51520 void foo_init()
51521 {
51522     pthread_mutex_init(&foo_mutex, NULL);
51523 }

51524 void foo()
51525 {
51526     pthread_once(&foo_once, foo_init);
51527     pthread_mutex_lock(&foo_mutex);
51528     /* Do work. */
51529     pthread_mutex_unlock(&foo_mutex);
51530 }
```

51531 With static initialization, the same routine could be coded as follows:

```
51532 static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;

51533 void foo()
51534 {
51535     pthread_mutex_lock(&foo_mutex);
51536     /* Do work. */
51537     pthread_mutex_unlock(&foo_mutex);
51538 }
```

51539 Note that the static initialization both eliminates the need for the initialization test inside
51540 *pthread_once()* and the fetch of *&foo_mutex* to learn the address to be passed to
51541 *pthread_mutex_lock()* or *pthread_mutex_unlock()*.

51542 Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a
51543 large class of systems; those where the (entire) synchronization object can be stored in
51544 application memory.

51545 Yet the locking performance question is likely to be raised for machines that require mutexes to
51546 be allocated out of special memory. Such machines actually have to have mutexes and possibly
51547 condition variables contain pointers to the actual hardware locks. For static initialization to work
51548 on such machines, *pthread_mutex_lock()* also has to test whether or not the pointer to the actual

51549 lock has been allocated. If it has not, *pthread_mutex_lock()* has to initialize it before use. The
 51550 reservation of such resources can be made when the program is loaded, and hence return codes
 51551 have not been added to mutex locking and condition variable waiting to indicate failure to
 51552 complete initialization.

51553 This runtime test in *pthread_mutex_lock()* would at first seem to be extra work; an extra test is
 51554 required to see whether the pointer has been initialized. On most machines this would actually
 51555 be implemented as a fetch of the pointer, testing the pointer against zero, and then using the
 51556 pointer if it has already been initialized. While the test might seem to add extra work, the extra
 51557 effort of testing a register is usually negligible since no extra memory references are actually
 51558 done. As more and more machines provide caches, the real expenses are memory references, not
 51559 instructions executed.

51560 Alternatively, depending on the machine architecture, there are often ways to eliminate *all*
 51561 overhead in the most important case: on the lock operations that occur *after* the lock has been
 51562 initialized. This can be done by shifting more overhead to the less frequent operation:
 51563 initialization. Since out-of-line mutex allocation also means that an address has to be
 51564 dereferenced to find the actual lock, one technique that is widely applicable is to have static
 51565 initialization store a bogus value for that address; in particular, an address that causes a machine
 51566 fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity
 51567 checks can be done, and then the correct address for the actual lock can be filled in. Subsequent
 51568 lock operations incur no extra overhead since they do not “fault”. This is merely one technique
 51569 that can be used to support static initialization, while not adversely affecting the performance of
 51570 lock acquisition. No doubt there are other techniques that are highly machine-dependent.

51571 The locking overhead for machines doing out-of-line mutex allocation is thus similar for
 51572 modules being implicitly initialized, where it is improved for those doing mutex allocation
 51573 entirely inline. The inline case is thus made much faster, and the out-of-line case is not
 51574 significantly worse.

51575 Besides the issue of locking performance for such machines, a concern is raised that it is possible
 51576 that threads would serialize contending for initialization locks when attempting to finish
 51577 initializing statically allocated mutexes. (Such finishing would typically involve taking an
 51578 internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing
 51579 the internal lock.) First, many implementations would reduce such serialization by hashing on
 51580 the mutex address. Second, such serialization can only occur a bounded number of times. In
 51581 particular, it can happen at most as many times as there are statically allocated synchronization
 51582 objects. Dynamically allocated objects would still be initialized via *pthread_mutex_init()* or
 51583 *pthread_cond_init()*.

51584 Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient
 51585 performance for an application on some implementation, the application can avoid static
 51586 initialization altogether by explicitly initializing all synchronization objects with the
 51587 corresponding *pthread_*_init()* functions, which are supported by all implementations. An
 51588 implementation can also document the tradeoffs and advise which initialization technique is
 51589 more efficient for that particular implementation.

51590 **Destroying Mutexes**

51591 A mutex can be destroyed immediately after it is unlocked. For example, consider the following
 51592 code:

```
51593 struct obj {
51594     pthread_mutex_t om;
51595     int refcnt;
51596     ...
51597 };
```

```

51598     obj_done(struct obj *op)
51599     {
51600         pthread_mutex_lock(&op->om);
51601         if (--op->refcnt == 0) {
51602             pthread_mutex_unlock(&op->om);
51603             (A)     pthread_mutex_destroy(&op->om);
51604             (B)     free(op);
51605         } else
51606             (C)     pthread_mutex_unlock(&op->om);
51607     }

```

51608 In this case *obj* is reference counted and *obj_done()* is called whenever a reference to the object is
51609 dropped. Implementations are required to allow an object to be destroyed and freed and
51610 potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line
51611 C).

51612 **Robust Mutexes**

51613 Implementations are required to provide robust mutexes for mutexes with the process-shared
51614 attribute set to PTHREAD_PROCESS_SHARED. Implementations are allowed, but not required,
51615 to provide robust mutexes when the process-shared attribute is set to
51616 PTHREAD_PROCESS_PRIVATE.

51623 **CHANGE HISTORY**

51624 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

51625 **Issue 6**

51626 The *pthread_mutex_destroy()* and *pthread_mutex_init()* functions are marked as part of the
51627 Threads option.

51628 The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with
51629 IEEE Std 1003.1d-1999.

51630 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

51631 The **restrict** keyword is added to the *pthread_mutex_init()* prototype for alignment with the
51632 ISO/IEC 9899:1999 standard.

51633 **Issue 7**

51634 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

51635 The *pthread_mutex_destroy()* and *pthread_mutex_init()* functions are moved from the Threads
51636 option to the Base.

51637 **NAME**

51638 pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling
 51639 of a mutex (**REALTIME THREADS**)

51640 **SYNOPSIS**

```
51641 RPP|TPP #include <pthread.h>
51642
51642 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
51643 int *restrict prioceiling);
51644 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
51645 int prioceiling, int *restrict old_ceiling);
```

51646 **DESCRIPTION**

51647 The *pthread_mutex_getprioceiling()* function shall return the current priority ceiling of the mutex.

51648 The *pthread_mutex_setprioceiling()* function shall either lock the mutex if it is unlocked, or block
 51649 until it can successfully lock the mutex, then it shall change the mutex's priority ceiling and
 51650 release the mutex. When the change is successful, the previous value of the priority ceiling shall
 51651 be returned in *old_ceiling*. The process of locking the mutex need not adhere to the priority
 51652 protect protocol.

51653 If *pthread_mutex_setprioceiling()* is called while holding the mutex, the result is undefined unless
 51654 the mutex is of type PTHREAD_MUTEX_RECURSIVE.

51655 If the *pthread_mutex_setprioceiling()* function fails, the mutex priority ceiling shall not be
 51656 changed.

51657 **RETURN VALUE**

51658 If successful, the *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions shall
 51659 return zero; otherwise, an error number shall be returned to indicate the error.

51660 **ERRORS**

51661 These functions shall fail if:

51662 [EINVAL] The protocol attribute of *mutex* is PTHREAD_PRIO_NONE.

51663 These functions may fail if:

51664 [EDEADLK] The current thread already owns the mutex.

51665 [EINVAL] The priority requested by *prioceiling* is out of range.

51666 [EINVAL] The value specified by *mutex* does not refer to a currently existing mutex.

51667 [EPERM] The caller does not have the privilege to perform the operation.

51668 These functions shall not return an error code of [EINTR].

51682 Marked as part of the Realtime Threads Feature Group.

51683 **Issue 6**51684 The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions are marked as
51685 part of the Threads and Thread Priority Protection options.

51686 The [ENOSYS] error conditions have been removed.

51687 The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with
51688 IEEE Std 1003.1d-1999.51689 The **restrict** keyword is added to the *pthread_mutex_getprioceiling()* and
51690 *pthread_mutex_setprioceiling()* prototypes for alignment with the ISO/IEC 9899:1999 standard.51691 **Issue 7**

51692 SD5-XSH-ERN-39 is applied.

51693 Austin Group Interpretation 1003.1-2001 #052 is applied, adding [EDEADLK] as a “may fail”
51694 error.51695 SD5-XSH-ERN-158 is applied, updating the ERRORS section to include a “shall fail” error case
51696 for when the protocol attribute of *mutex* is PTHREAD_PRIO_NONE.51697 The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions are moved from
51698 the Threads option to require support of either the Robust Mutex Priority Protection option or
51699 the Non-Robust Mutex Priority Protection option.

51700 **NAME**
51701 pthread_mutex_init — destroy and initialize a mutex

51702 **SYNOPSIS**
51703 #include <pthread.h>
51704 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
51705 const pthread_mutexattr_t *restrict attr);
51706 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;

51707 **DESCRIPTION**
51708 Refer to *pthread_mutex_destroy()*.

51709 **NAME**

51710 pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a
51711 mutex

51712 **SYNOPSIS**

51713 #include <pthread.h>

51714 int pthread_mutex_lock(pthread_mutex_t *mutex);
51715 int pthread_mutex_trylock(pthread_mutex_t *mutex);
51716 int pthread_mutex_unlock(pthread_mutex_t *mutex);

51717 **DESCRIPTION**

51718 The mutex object referenced by *mutex* shall be locked by calling *pthread_mutex_lock()*. If the
51719 mutex is already locked, the calling thread shall block until the mutex becomes available. This
51720 operation shall return with the mutex object referenced by *mutex* in the locked state with the
51721 calling thread as its owner.

51722 If the mutex type is PTHREAD_MUTEX_NORMAL, deadlock detection shall not be provided.
51723 Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it
51724 has not locked or a mutex which is unlocked, undefined behavior results.

51725 If the mutex type is PTHREAD_MUTEX_ERRORCHECK, then error checking shall be provided.
51726 If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a
51727 thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error
51728 shall be returned.

51729 If the mutex type is PTHREAD_MUTEX_RECURSIVE, then the mutex shall maintain the
51730 concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock
51731 count shall be set to one. Every time a thread relocks this mutex, the lock count shall be
51732 incremented by one. Each time the thread unlocks the mutex, the lock count shall be
51733 decremented by one. When the lock count reaches zero, the mutex shall become available for
51734 other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex
51735 which is unlocked, an error shall be returned.

51736 If the mutex type is PTHREAD_MUTEX_DEFAULT, attempting to recursively lock the mutex
51737 results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling
51738 thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in
51739 undefined behavior.

51740 The *pthread_mutex_trylock()* function shall be equivalent to *pthread_mutex_lock()*, except that if
51741 the mutex object referenced by *mutex* is currently locked (by any thread, including the current
51742 thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE
51743 and the mutex is currently owned by the calling thread, the mutex lock count shall be
51744 incremented by one and the *pthread_mutex_trylock()* function shall immediately return success.

51745 The *pthread_mutex_unlock()* function shall release the mutex object referenced by *mutex*. The
51746 manner in which a mutex is released is dependent upon the mutex's type attribute. If there are
51747 threads blocked on the mutex object referenced by *mutex* when *pthread_mutex_unlock()* is called,
51748 resulting in the mutex becoming available, the scheduling policy shall determine which thread
51749 shall acquire the mutex.

51750 (In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available
51751 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

51752 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the
51753 thread shall resume waiting for the mutex as if it was not interrupted.

51754 If *mutex* is a robust mutex and the process containing the owning thread terminated while

pthread_mutex_lock()

51755 holding the mutex lock, a call to *pthread_mutex_lock()* shall return the error value
 51756 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding
 51757 the mutex lock, a call to *pthread_mutex_lock()* may return the error value [EOWNERDEAD] even
 51758 if the process in which the owning thread resides has not terminated. In these cases, the mutex is
 51759 locked by the thread but the state it protects is marked as inconsistent. The application should
 51760 ensure that the state is made consistent for reuse and when that is complete call
 51761 *pthread_mutex_consistent()*. If the application is unable to recover the state, it should unlock the
 51762 mutex without a prior call to *pthread_mutex_consistent()*, after which the mutex is marked
 51763 permanently unusable.

RETURN VALUE

51764 If successful, the *pthread_mutex_lock()* and *pthread_mutex_unlock()* functions shall return zero;
 51765 otherwise, an error number shall be returned to indicate the error.

51767 The *pthread_mutex_trylock()* function shall return zero if a lock on the mutex object referenced by
 51768 *mutex* is acquired. Otherwise, an error number is returned to indicate the error.

ERRORS

51769 The *pthread_mutex_lock()* and *pthread_mutex_trylock()* functions shall fail if:

51771 RPP|TPP [EINVAL] The *mutex* was created with the protocol attribute having the value
 51772 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
 51773 the mutex's current priority ceiling.

51774 [ENOTRECOVERABLE]

51775 The state protected by the mutex is not recoverable. The mutex is not locked.

51776 [EOWNERDEAD]

51777 The mutex is a robust mutex and the process containing the previous owning
 51778 thread terminated while holding the mutex lock. The mutex lock has been
 51779 acquired and it is up to the new owner to make the state consistent.

51780 The *pthread_mutex_trylock()* function shall fail if:

51781 [EBUSY] The *mutex* could not be acquired because it was already locked.

51782 The *pthread_mutex_unlock()* function shall fail if:

51783 [EPERM] The current thread does not own the mutex and the mutex is a robust mutex.

51784 The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions may fail
 51785 if:

51786 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.

51787 [EAGAIN] The mutex could not be acquired because the maximum number of recursive
 51788 locks for *mutex* has been exceeded.

51789 The *pthread_mutex_lock()* and *pthread_mutex_trylock()* functions may fail if:

51790 [EOWNERDEAD]

51791 The mutex is a robust mutex and the previous owning thread terminated
 51792 while holding the mutex lock. The mutex lock has been acquired and it is up
 51793 to the new owner to make the state consistent.

51794 The *pthread_mutex_lock()* function may fail if:

51795 [EDEADLK] A deadlock condition was detected or the current thread already owns the
 51796 mutex.

51797 The *pthread_mutex_unlock()* function may fail if:

51798 [EPERM] The current thread does not own the mutex.

51799 These functions shall not return an error code of [EINTR].

EXAMPLES

51800 None.

APPLICATION USAGE

51803 Applications that have assumed that non-zero return values are errors will need updating for
 51804 use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting
 51805 a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error
 51806 returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If
 51807 an application is supposed to work with normal and robust mutexes it should check all return
 51808 values for error conditions and if necessary take appropriate action.

RATIONALE

51809 Mutex objects are intended to serve as a low-level primitive from which other thread
 51810 synchronization functions can be built. As such, the implementation of mutexes should be as
 51811 efficient as possible, and this has ramifications on the features available at the interface.
 51812

51813 The mutex functions and the particular default settings of the mutex attributes have been
 51814 motivated by the desire to not preclude fast, inlined implementations of mutex locking and
 51815 unlocking.

51816 Since most attributes only need to be checked when a thread is going to be blocked, the use of
 51817 attributes does not slow the (common) mutex-locking case.

51818 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it
 51819 would require storing the current thread ID when each mutex is locked, and this could incur
 51820 unacceptable levels of overhead. Similar arguments apply to a *mutex_tryunlock* operation.

51821 For further rationale on the extended mutex types, see the Rationale (Informative) volume of
 51822 POSIX.1-200x.

FUTURE DIRECTIONS

51823 None.

51828 XBD Section 4.11 (on page 98), [<pthread.h>](#)

CHANGE HISTORY

51829 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

51831 The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions are
 51832 marked as part of the Threads option.
 51833

51834 The following new requirements on POSIX implementations derive from alignment with the
 51835 Single UNIX Specification:

- 51836 • The behavior when attempting to relock a mutex is defined.

51837 The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with
 51838 IEEE Std 1003.1d-1999.

51839 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/98 is applied, updating the ERRORS
 51840 section so that the [EDEADLK] error includes detection of a deadlock condition. The
 51841 RATIONALE section is also reworded to take into account non-XSI-conformant systems.

pthread_mutex_lock()51842 **Issue 7**

51843 SD5-XSH-ERN-43 is applied, marking the “shall fail” case of the [EINVAL] error as dependent
51844 on the Thread Priority Protection option.

51845 Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

51846 The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions are
51847 moved from the Threads option to the Base.

51848 The PTHREAD_MUTEX_NORMAL, PTHREAD_MUTEX_ERRORCHECK,
51849 PTHREAD_MUTEX_RECURSIVE, and PTHREAD_MUTEX_DEFAULT extended mutex types
51850 are moved from the XSI option to the Base.

51851 **NAME**

51852 pthread_mutex_setprioceiling — change the priority ceiling of a mutex (**REALTIME**
51853 **THREADS**)

51854 **SYNOPSIS**

```
51855 RPP|TPP #include <pthread.h>  
51856 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,  
51857 int prioceiling, int *restrict old_ceiling);
```

51858 **DESCRIPTION**

51859 Refer to [pthread_mutex_getprioceiling\(\)](#).

51860 **NAME**

51861 pthread_mutex_timedlock — lock a mutex

51862 **SYNOPSIS**

51863 #include <pthread.h>

51864 #include <time.h>

51865 int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
51866 const struct timespec *restrict abstime);51867 **DESCRIPTION**51868 The *pthread_mutex_timedlock()* function shall lock the mutex object referenced by *mutex*. If the
51869 mutex is already locked, the calling thread shall block until the mutex becomes available as in
51870 the *pthread_mutex_lock()* function. If the mutex cannot be locked without waiting for another
51871 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.51872 The timeout shall expire when the absolute time specified by *abstime* passes, as measured by the
51873 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
51874 *abstime*), or if the absolute time specified by *abstime* has already been passed at the time of the
51875 call.51876 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
51877 be the resolution of the clock on which it is based. The **timespec** data type is defined in the
51878 <**time.h**> header.51879 Under no circumstance shall the function fail with a timeout if the mutex can be locked
51880 immediately. The validity of the *abstime* parameter need not be checked if the mutex can be
51881 locked immediately.51882 RPI | TPI As a consequence of the priority inheritance rules (for mutexes initialized with the
51883 PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the
51884 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this
51885 thread is no longer among the threads waiting for the mutex.51886 If *mutex* is a robust mutex and the process containing the owning thread terminated while
51887 holding the mutex lock, a call to *pthread_mutex_timedlock()* shall return the error value
51888 [EOWNERDEAD]. If *mutex* is a robust mutex and the owning thread terminated while holding
51889 the mutex lock, a call to *pthread_mutex_timedlock()* may return the error value [EOWNERDEAD]
51890 even if the process in which the owning thread resides has not terminated. In these cases, the
51891 mutex is locked by the thread but the state it protects is marked as inconsistent. The application
51892 should ensure that the state is made consistent for reuse and when that is complete call
51893 *pthread_mutex_consistent()*. If the application is unable to recover the state, it should unlock the
51894 mutex without a prior call to *pthread_mutex_consistent()*, after which the mutex is marked
51895 permanently unusable.51896 **RETURN VALUE**51897 If successful, the *pthread_mutex_timedlock()* function shall return zero; otherwise, an error
51898 number shall be returned to indicate the error.51899 **ERRORS**51900 The *pthread_mutex_timedlock()* function shall fail if:51901 [EINVAL] The mutex was created with the protocol attribute having the value
51902 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
51903 the mutex' current priority ceiling.

- 51904 [EINVAL] The process or thread would have blocked, and the *abstime* parameter
51905 specified a nanoseconds field value less than zero or greater than or equal to
51906 1 000 million.
- 51907 [ENOTRECOVERABLE]
51908 The state protected by the mutex is not recoverable. The mutex is not locked.
- 51909 [EOWNERDEAD]
51910 The mutex is a robust mutex and the process containing the previous owning
51911 thread terminated while holding the mutex lock. The mutex lock has been
51912 acquired and it is up to the new owner to make the state consistent.
- 51913 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.
- 51914 The *pthread_mutex_timedlock()* function may fail if:
- 51915 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.
- 51916 [EAGAIN] The mutex could not be acquired because the maximum number of recursive
51917 locks for *mutex* has been exceeded.
- 51918 [EDEADLK] A deadlock condition was detected or the current thread already owns the
51919 mutex.
- 51920 [EOWNERDEAD]
51921 The mutex is a robust mutex and the previous owning thread terminated
51922 while holding the mutex lock. The mutex lock has been acquired and it is up
51923 to the new owner to make the state consistent.
- 51924 This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications that have assumed that non-zero return values are errors will need updating for use with robust mutexes, since a valid return for a thread acquiring a mutex which is protecting a currently inconsistent state is [EOWNERDEAD]. Applications that do not check the error returns, due to ruling out the possibility of such errors arising, should not use robust mutexes. If an application is supposed to work with normal and robust mutexes, it should check all return values for error conditions and if necessary take appropriate action.

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/99 is applied, marking the last paragraph in the DESCRIPTION as part of the Thread Priority Inheritance option.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/100 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

pthread_mutex_timedlock()

51947

Issue 7

51948

Changes are made from The Open Group Technical Standard, 2006, Extended API Set Part 3.

51949

The *pthread_mutex_timedlock()* function is moved from the Timeouts option to the Base.

51950

Functionality relating to the Timers option is moved to the Base.

51951 **NAME**
51952 pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

51953 **SYNOPSIS**
51954 #include <pthread.h>

51955 int pthread_mutex_trylock(pthread_mutex_t *mutex);
51956 int pthread_mutex_unlock(pthread_mutex_t *mutex);

51957 **DESCRIPTION**
51958 Refer to *pthread_mutex_lock()*.

51959 **NAME**

51960 pthread_mutexattr_destroy, pthread_mutexattr_init — destroy and initialize the mutex
 51961 attributes object

51962 **SYNOPSIS**

51963 #include <pthread.h>

51964 int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
 51965 int pthread_mutexattr_init(pthread_mutexattr_t *attr);

51966 **DESCRIPTION**

51967 The *pthread_mutexattr_destroy()* function shall destroy a mutex attributes object; the object
 51968 becomes, in effect, uninitialized. An implementation may cause *pthread_mutexattr_destroy()* to
 51969 set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be
 51970 reinitialized using *pthread_mutexattr_init()*; the results of otherwise referencing the object after it
 51971 has been destroyed are undefined.

51972 The *pthread_mutexattr_init()* function shall initialize a mutex attributes object *attr* with the
 51973 default value for all of the attributes defined by the implementation.

51974 Results are undefined if *pthread_mutexattr_init()* is called specifying an already initialized *attr*
 51975 attributes object.

51976 After a mutex attributes object has been used to initialize one or more mutexes, any function
 51977 affecting the attributes object (including destruction) shall not affect any previously initialized
 51978 mutexes.

51979 **RETURN VALUE**

51980 Upon successful completion, *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* shall
 51981 return zero; otherwise, an error number shall be returned to indicate the error.

51982 **ERRORS**

51983 The *pthread_mutexattr_destroy()* function may fail if:

51984 [EINVAL] The value specified by *attr* is invalid.

51985 The *pthread_mutexattr_init()* function shall fail if:

51986 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

51987 These functions shall not return an error code of [EINTR].

51988 **EXAMPLES**

51989 None.

51990 **APPLICATION USAGE**

51991 None.

51992 **RATIONALE**

51993 See *pthread_attr_destroy()* for a general explanation of attributes. Attributes objects allow
 51994 implementations to experiment with useful extensions and permit extension of this volume of
 51995 POSIX.1-200x without changing the existing functions. Thus, they provide for future
 51996 extensibility of this volume of POSIX.1-200x and reduce the temptation to standardize
 51997 prematurely on semantics that are not yet widely implemented or understood.

51998 Examples of possible additional mutex attributes that have been discussed are *spin_only*,
 51999 *limited_spin*, *no_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:
 52000 recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes
 52001 would transparently keep records of queue length, wait time, and so on.) Since there is not yet
 52002 wide agreement on the usefulness of these resulting from shared implementation and usage

52003 experience, they are not yet specified in this volume of POSIX.1-200x. Mutex attributes objects,
52004 however, make it possible to test out these concepts for possible standardization at a later time.

52005 **Mutex Attributes and Performance**

52006 Care has been taken to ensure that the default values of the mutex attributes have been defined
52007 such that mutexes initialized with the defaults have simple enough semantics so that the locking
52008 and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few
52009 other basic instructions).

52010 There is at least one implementation method that can be used to reduce the cost of testing at
52011 lock-time if a mutex has non-default attributes. One such method that an implementation can
52012 employ (and this can be made fully transparent to fully conforming POSIX applications) is to
52013 secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to
52014 lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were
52015 unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-
52016 default mutex. The underlying unlock operation is more complicated since the implementation
52017 never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending
52018 on the hardware, there may be certain optimizations that can be used so that whatever mutex
52019 attributes are considered “most frequently used” can be processed most efficiently.

52020 **Process Shared Memory and Synchronization**

52021 The existence of memory mapping functions in this volume of POSIX.1-200x leads to the
52022 possibility that an application may allocate the synchronization objects from this section in
52023 memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

52024 In order to permit such usage, while at the same time keeping the usual case (that is, usage
52025 within a single process) efficient, a *process-shared* option has been defined.

52026 If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the
52027 *process-shared* attribute can be used to indicate that mutexes or condition variables may be
52028 accessed by threads of multiple processes.

52029 The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared*
52030 attribute so that the most efficient forms of these synchronization objects are created by default.

52031 Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-*
52032 *shared* attribute may only be operated on by threads in the process that initialized them.
52033 Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-*
52034 *shared* attribute may be operated on by any thread in any process that has access to it. In
52035 particular, these processes may exist beyond the lifetime of the initializing process. For example,
52036 the following code implements a simple counting semaphore in a mapped file that may be used
52037 by many processes.

```
52038 /* sem.h */
52039 struct semaphore {
52040     pthread_mutex_t lock;
52041     pthread_cond_t nonzero;
52042     unsigned count;
52043 };
52044 typedef struct semaphore semaphore_t;

52045 semaphore_t *semaphore_create(char *semaphore_name);
52046 semaphore_t *semaphore_open(char *semaphore_name);
52047 void semaphore_post(semaphore_t *semap);
52048 void semaphore_wait(semaphore_t *semap);
52049 void semaphore_close(semaphore_t *semap);
```

pthread_mutexattr_destroy()

```

52050     /* sem.c */
52051     #include <sys/types.h>
52052     #include <sys/stat.h>
52053     #include <sys/mman.h>
52054     #include <fcntl.h>
52055     #include <pthread.h>
52056     #include "sem.h"

52057     semaphore_t *
52058     semaphore_create(char *semaphore_name)
52059     {
52060     int fd;
52061         semaphore_t *semap;
52062         pthread_mutexattr_t psharedm;
52063         pthread_condattr_t psharedc;

52064         fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
52065         if (fd < 0)
52066             return (NULL);
52067         (void) ftruncate(fd, sizeof(semaphore_t));
52068         (void) pthread_mutexattr_init(&psharedm);

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The [*pthread_mutexattr_destroy\(\)*](#) and [*pthread_mutexattr_init\(\)*](#) functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

Issue 7

The [*pthread_mutexattr_destroy\(\)*](#) and [*pthread_mutexattr_init\(\)*](#) functions are moved from the Threads option to the Base.

52179 **NAME**

52180 pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling — get and set the
 52181 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

52182 **SYNOPSIS**

```
52183 RPP|TPP #include <pthread.h>
52184
52184 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t
52185 *restrict attr, int *restrict prioceiling);
52186 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
52187 int prioceiling);
```

52188 **DESCRIPTION**

52189 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions,
 52190 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to
 52191 by *attr* which was previously created by the function *pthread_mutexattr_init()*.

52192 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of
 52193 *prioceiling* are within the maximum range of priorities defined by SCHED_FIFO.

52194 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum
 52195 priority level at which the critical section guarded by the mutex is executed. In order to avoid
 52196 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal
 52197 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are
 52198 within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

52199 **RETURN VALUE**

52200 Upon successful completion, the *pthread_mutexattr_getprioceiling()* and
 52201 *pthread_mutexattr_setprioceiling()* functions shall return zero; otherwise, an error number shall be
 52202 returned to indicate the error.

52203 **ERRORS**

52204 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions may fail if:

52205 [EINVAL] The value specified by *attr* or *prioceiling* is invalid.

52206 [EPERM] The caller does not have the privilege to perform the operation.

52207 These functions shall not return an error code of [EINTR].

52219 **CHANGE HISTORY**

52220 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52221 Marked as part of the Realtime Threads Feature Group.

52222 **Issue 6**52223 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions are marked
52224 as part of the Threads and Thread Priority Protection options.52225 The [ENOSYS] error condition has been removed as stubs need not be provided if an
52226 implementation does not support the Thread Priority Protection option.52227 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol*
52228 argument.52229 The **restrict** keyword is added to the *pthread_mutexattr_getprioceiling()* prototype for alignment
52230 with the ISO/IEC 9899:1999 standard.52231 **Issue 7**52232 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions are moved
52233 from the Threads option to require support of either the Robust Mutex Priority Protection option
52234 or the Non-Robust Mutex Priority Protection option.

52235 **NAME**

52236 pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol — get and set the protocol
 52237 attribute of the mutex attributes object (**REALTIME THREADS**)

52238 **SYNOPSIS**

```
52239 MC1 #include <pthread.h>
52240
52241 int pthread_mutexattr_getprotocol(const pthread_mutexattr_t
52242 *restrict attr, int *restrict protocol);
52243 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
52244 int protocol);
```

52244 **DESCRIPTION**

52245 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions, respectively,
 52246 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was
 52247 previously created by the function *pthread_mutexattr_init()*.

52248 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of
 52249 *protocol* may be one of:

```
52250 RPI | TPI PTHREAD_PRIO_INHERIT
52251 MC1 PTHREAD_PRIO_NONE
52252 RPP | TPP PTHREAD_PRIO_PROTECT
```

52253 which are defined in the **<pthread.h>** header. The default value of the attribute shall be
 52254 PTHREAD_PRIO_NONE.

52255 When a thread owns a mutex with the PTHREAD_PRIO_NONE *protocol* attribute, its priority
 52256 and scheduling shall not be affected by its mutex ownership.

52257 RPI When a thread is blocking higher priority threads because of owning one or more robust
 52258 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
 52259 its priority or the priority of the highest priority thread waiting on any of the robust mutexes
 52260 owned by this thread and initialized with this protocol.

52261 TPI When a thread is blocking higher priority threads because of owning one or more non-robust
 52262 mutexes with the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of
 52263 its priority or the priority of the highest priority thread waiting on any of the non-robust
 52264 mutexes owned by this thread and initialized with this protocol.

52265 RPP When a thread owns one or more robust mutexes initialized with the
 52266 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
 52267 of the priority ceilings of all the robust mutexes owned by this thread and initialized with this
 52268 attribute, regardless of whether other threads are blocked on any of these robust mutexes or not.

52269 TPP When a thread owns one or more non-robust mutexes initialized with the
 52270 PTHREAD_PRIO_PROTECT protocol, it shall execute at the higher of its priority or the highest
 52271 of the priority ceilings of all the non-robust mutexes owned by this thread and initialized with
 52272 this attribute, regardless of whether other threads are blocked on any of these non-robust
 52273 mutexes or not.

52274 While a thread is holding a mutex which has been initialized with the
 52275 PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be
 52276 subject to being moved to the tail of the scheduling queue at its priority in the event that its
 52277 original priority is changed, such as by a call to *sched_setparam()*. Likewise, when a thread

pthread_mutexattr_getprotocol()

System Interfaces

52278 unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or
 52279 PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail
 52280 of the scheduling queue at its priority in the event that its original priority is changed.

52281 If a thread simultaneously owns several mutexes initialized with different protocols, it shall
 52282 execute at the highest of the priorities that it would have obtained by each of these protocols.

52283 RPI | TPI When a thread makes a call to *pthread_mutex_lock()*, the mutex was initialized with the protocol
 52284 attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked
 52285 because the mutex is owned by another thread, that owner thread shall inherit the priority level
 52286 of the calling thread as long as it continues to own the mutex. The implementation shall update
 52287 its execution priority to the maximum of its assigned priority and all its inherited priorities.
 52288 Furthermore, if this owner thread itself becomes blocked on another mutex with the *protocol*
 52289 attribute having the value PTHREAD_PRIO_INHERIT, the same priority inheritance effect shall
 52290 be propagated to this other owner thread, in a recursive manner.

RETURN VALUE

52291 Upon successful completion, the *pthread_mutexattr_getprotocol()* and
 52292 *pthread_mutexattr_setprotocol()* functions shall return zero; otherwise, an error number shall be
 52293 returned to indicate the error.
 52294

ERRORS

52295 The *pthread_mutexattr_setprotocol()* function shall fail if:

52296 [ENOTSUP] The value specified by *protocol* is an unsupported value.

52297 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions may fail if:

52298 [EINVAL] The value specified by *attr* or *protocol* is invalid.

52299 [EPERM] The caller does not have the privilege to perform the operation.

52300 These functions shall not return an error code of [EINTR].

52333 **NAME**

52334 pthread_mutexattr_getpshared, pthread_mutexattr_setpshared — get and set the process-shared
 52335 attribute

52336 **SYNOPSIS**

```
52337 TSH #include <pthread.h>
52338
52338 int pthread_mutexattr_getpshared(const pthread_mutexattr_t
52339 *restrict attr, int *restrict pshared);
52340 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
52341 int pshared);
```

52342 **DESCRIPTION**

52343 The *pthread_mutexattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 52344 from the attributes object referenced by *attr*. The *pthread_mutexattr_setpshared()* function shall
 52345 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

52346 The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a mutex to be
 52347 operated upon by any thread that has access to the memory where the mutex is allocated, even if
 52348 the mutex is allocated in memory that is shared by multiple processes. If the *process-shared*
 52349 attribute is PTHREAD_PROCESS_PRIVATE, the mutex shall only be operated upon by threads
 52350 created within the same process as the thread that initialized the mutex; if threads of differing
 52351 processes attempt to operate on such a mutex, the behavior is undefined. The default value of
 52352 the attribute shall be PTHREAD_PROCESS_PRIVATE.

52353 **RETURN VALUE**

52354 Upon successful completion, *pthread_mutexattr_setpshared()* shall return zero; otherwise, an error
 52355 number shall be returned to indicate the error.

52356 Upon successful completion, *pthread_mutexattr_getpshared()* shall return zero and store the value
 52357 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.
 52358 Otherwise, an error number shall be returned to indicate the error.

52359 **ERRORS**

52360 The *pthread_mutexattr_getpshared()* and *pthread_mutexattr_setpshared()* functions may fail if:

52361 [EINVAL] The value specified by *attr* is invalid.

52362 The *pthread_mutexattr_setpshared()* function may fail if:

52363 [EINVAL] The new value specified for the attribute is outside the range of legal values
 52364 for that attribute.

52365 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The [pthread_mutexattr_getpshared\(\)](#) and [pthread_mutexattr_setpshared\(\)](#) functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The **restrict** keyword is added to the [pthread_mutexattr_getpshared\(\)](#) prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The [pthread_mutexattr_getpshared\(\)](#) and [pthread_mutexattr_setpshared\(\)](#) functions are moved from the Threads option.

52387 **NAME**

52388 pthread_mutexattr_getrobust, pthread_mutexattr_setrobust — get and set the mutex robust
 52389 attribute

52390 **SYNOPSIS**

```
52391 #include <pthread.h>

52392 int pthread_mutexattr_getrobust(const pthread_mutexattr_t *restrict
52393     attr, int *restrict robust);
52394 int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
52395     int robust);
```

52396 **DESCRIPTION**

52397 The *pthread_mutexattr_getrobust()* and *pthread_mutexattr_setrobust()* functions, respectively, shall
 52398 get and set the mutex *robust* attribute. This attribute is set in the *robust* parameter. Valid values
 52399 for *robust* include:

52400 **PTHREAD_MUTEX_STALLED**

52401 No special actions are taken if the owner of the mutex is terminated while holding the
 52402 mutex lock. This can lead to deadlocks if no other thread can unlock the mutex.
 52403 This is the default value.

52404 **PTHREAD_MUTEX_ROBUST**

52405 If the process containing the owning thread of a robust mutex terminates while holding the
 52406 mutex lock, the next thread that acquires the mutex shall be notified about the termination
 52407 by the return value [EOWNERDEAD] from the locking function. If the owning thread of a
 52408 robust mutex terminates while holding the mutex lock, the next thread that acquires the
 52409 mutex may be notified about the termination by the return value [EOWNERDEAD]. The
 52410 notified thread can then attempt to mark the state protected by the mutex as consistent
 52411 again by a call to *pthread_mutex_consistent()*. After a subsequent successful call to
 52412 *pthread_mutex_unlock()*, the mutex lock shall be released and can be used normally by other
 52413 threads. If the mutex is unlocked without a call to *pthread_mutex_consistent()*, it shall be in a
 52414 permanently unusable state and all attempts to lock the mutex shall fail with the error
 52415 [ENOTRECOVERABLE]. The only permissible operation on such a mutex is
 52416 *pthread_mutex_destroy()*.

52417 **RETURN VALUE**

52418 Upon successful completion, the *pthread_mutexattr_getrobust()* function shall return zero and
 52419 store the value of the *robust* attribute of *attr* into the object referenced by the *robust* parameter.
 52420 Otherwise, an error value shall be returned to indicate the error. If successful, the
 52421 *pthread_mutexattr_setrobust()* function shall return zero; otherwise, an error number shall be
 52422 returned to indicate the error.

52423 **ERRORS**

52424 The *pthread_mutexattr_setrobust()* function shall fail if:

52425 [EINVAL] The value of *robust* is invalid.

52426 The *pthread_mutexattr_getrobust()* and *pthread_mutexattr_setrobust()* functions may fail if:

52427 [EINVAL] The value specified by *attr* is invalid.

52428 These functions shall not return an error code of [EINTR].

52429

EXAMPLES

52430

None.

52431

APPLICATION USAGE

52432

The actions required to make the state protected by the mutex consistent again are solely dependent on the application. If it is not possible to make the state of a mutex consistent, robust mutexes can be used to notify this situation by calling *pthread_mutex_unlock()* without a prior call to *pthread_mutex_consistent()*.

52433

52434

52435

52436

If the state is declared inconsistent by calling *pthread_mutex_unlock()* without a prior call to *pthread_mutex_consistent()*, a possible approach could be to destroy the mutex and then reinitialize it. However, it should be noted that this is possible only in certain situations where the state protected by the mutex has to be reinitialized and coordination achieved with other threads blocked on the mutex, because otherwise a call to a locking function with a reference to a mutex object invalidated by a call to *pthread_mutex_destroy()* results in undefined behavior.

First released in Issue 7.

52451

The *pthread_mutexattr_getrobust()* and *pthread_mutexattr_setrobust()* functions are moved from the Threads option to the Base.

52452

52453 **NAME**

52454 pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

52455 **SYNOPSIS**

52456 #include <pthread.h>

```
52457 int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
52458 int *restrict type);
52459 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

52460 **DESCRIPTION**

52461 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions, respectively, shall get
 52462 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The
 52463 default value of the *type* attribute is PTHREAD_MUTEX_DEFAULT.

52464 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types
 52465 include:

52466 **PTHREAD_MUTEX_NORMAL**

52467 This type of mutex does not detect deadlock. A thread attempting to relock this mutex
 52468 without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a
 52469 different thread results in undefined behavior. Attempting to unlock an unlocked mutex
 52470 results in undefined behavior.

52471 **PTHREAD_MUTEX_ERRORCHECK**

52472 This type of mutex provides error checking. A thread attempting to relock this mutex
 52473 without first unlocking it shall return with an error. A thread attempting to unlock a mutex
 52474 which another thread has locked shall return with an error. A thread attempting to unlock
 52475 an unlocked mutex shall return with an error.

52476 **PTHREAD_MUTEX_RECURSIVE**

52477 A thread attempting to relock this mutex without first unlocking it shall succeed in locking
 52478 the mutex. The relocking deadlock which can occur with mutexes of type
 52479 PTHREAD_MUTEX_NORMAL cannot occur with this type of mutex. Multiple locks of this
 52480 mutex shall require the same number of unlocks to release the mutex before another thread
 52481 can acquire the mutex. A thread attempting to unlock a mutex which another thread has
 52482 locked shall return with an error. A thread attempting to unlock an unlocked mutex shall
 52483 return with an error.

52484 **PTHREAD_MUTEX_DEFAULT**

52485 Attempting to recursively lock a mutex of this type results in undefined behavior.
 52486 Attempting to unlock a mutex of this type which was not locked by the calling thread
 52487 results in undefined behavior. Attempting to unlock a mutex of this type which is not
 52488 locked results in undefined behavior. An implementation may map this mutex to one of the
 52489 other mutex types.

52490 **RETURN VALUE**

52491 Upon successful completion, the *pthread_mutexattr_gettype()* function shall return zero and store
 52492 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,
 52493 an error shall be returned to indicate the error.

52494 If successful, the *pthread_mutexattr_settype()* function shall return zero; otherwise, an error
 52495 number shall be returned to indicate the error.

52496 ERRORS

52497 The *pthread_mutexattr_settype()* function shall fail if:

52498 [EINVAL] The value *type* is invalid.

52499 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions may fail if:

52500 [EINVAL] The value specified by *attr* is invalid.

52501 These functions shall not return an error code of [EINTR].

52502 EXAMPLES

52503 None.

52504 APPLICATION USAGE

52505 It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with
 52506 condition variables because the implicit unlock performed for a *pthread_cond_timedwait()* or
 52507 *pthread_cond_wait()* may not actually release the mutex (if it had been locked multiple times). If
 52508 this happens, no other thread can satisfy the condition of the predicate.

52509 RATIONALE

52510 None.

52511 FUTURE DIRECTIONS

52512 None.

52516 CHANGE HISTORY

52517 First released in Issue 5.

52518 Issue 6

52519 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for
 52520 *pthread_mutexattr_gettype()* is updated so that the first argument is of type **const**
 52521 **pthread_mutexattr_t***.

52522 The **restrict** keyword is added to the *pthread_mutexattr_gettype()* prototype for alignment with
 52523 the ISO/IEC 9899:1999 standard.

52524 Issue 7

52525 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions are moved from the
 52526 XSI option to the Base.

52527 **NAME**
52528 pthread_mutexattr_init — initialize the mutex attributes object

52529 **SYNOPSIS**
52530 #include <pthread.h>
52531 int pthread_mutexattr_init(pthread_mutexattr_t *attr);

52532 **DESCRIPTION**
52533 Refer to *pthread_mutexattr_destroy()*.

52534

NAME

52535

pthread_mutexattr_setprioceiling — set the prioceiling attribute of the mutex attributes object
(**REALTIME THREADS**)

52536

52537

SYNOPSIS

52538

```
RPP|TPP #include <pthread.h>
```

52539

```
int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,  
int prioceiling);
```

52540

52541

DESCRIPTION

52542

Refer to [pthread_mutexattr_getprioceiling\(\)](#).

pthread_mutexattr_setprotocol()*System Interfaces*52543 **NAME**

52544 pthread_mutexattr_setprotocol — set the protocol attribute of the mutex attributes object
52545 (**REALTIME THREADS**)

52546 **SYNOPSIS**

```
52547 MC1 #include <pthread.h>  
52548 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,  
52549 int protocol);
```

52550 **DESCRIPTION**

52551 Refer to [pthread_mutexattr_getprotocol\(\)](#).

52552 **NAME**

52553 pthread_mutexattr_setpshared — set the process-shared attribute

52554 **SYNOPSIS**

```
52555 TSH #include <pthread.h>
52556 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
52557 int pshared);
```

52558 **DESCRIPTION**52559 Refer to *pthread_mutexattr_getpshared()*.

pthread_mutexattr_setrobust()

52560 **NAME**
52561 pthread_mutexattr_setrobust — get and set the mutex robust attribute

52562 **SYNOPSIS**
52563 #include <pthread.h>
52564 int pthread_mutexattr_setrobust(pthread_mutexattr_t *attr,
52565 int robust);

52566 **DESCRIPTION**
52567 Refer to [pthread_mutexattr_getrobust\(\)](#).

52568 **NAME**
52569 pthread_mutexattr_settype — set the mutex type attribute

52570 **SYNOPSIS**
52571 #include <pthread.h>
52572 int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type); |

52573 **DESCRIPTION**
52574 Refer to *pthread_mutexattr_gettype()*.

52575 **NAME**
 52576 pthread_once — dynamic package initialization

52577 **SYNOPSIS**
 52578 #include <pthread.h>
 52579 int pthread_once(pthread_once_t *once_control,
 52580 void (*init_routine)(void));
 52581 pthread_once_t once_control = PTHREAD_ONCE_INIT;

52582 **DESCRIPTION**
 52583 The first call to *pthread_once()* by any thread in a process, with a given *once_control*, shall call the
 52584 *init_routine* with no arguments. Subsequent calls of *pthread_once()* with the same *once_control*
 52585 shall not call the *init_routine*. On return from *pthread_once()*, *init_routine* shall have completed.
 52586 The *once_control* parameter shall determine whether the associated initialization routine has been
 52587 called.

52588 The *pthread_once()* function is not a cancellation point. However, if *init_routine* is a cancellation
 52589 point and is canceled, the effect on *once_control* shall be as if *pthread_once()* was never called.

52590 The constant PTHREAD_ONCE_INIT is defined in the <pthread.h> header.

52591 The behavior of *pthread_once()* is undefined if *once_control* has automatic storage duration or is
 52592 not initialized by PTHREAD_ONCE_INIT.

52593 **RETURN VALUE**
 52594 Upon successful completion, *pthread_once()* shall return zero; otherwise, an error number shall
 52595 be returned to indicate the error.

52596 **ERRORS**
 52597 The *pthread_once()* function may fail if:
 52598 [EINVAL] If either *once_control* or *init_routine* is invalid.
 52599 The *pthread_once()* function shall not return an error code of [EINTR].

52600 **EXAMPLES**
 52601 None.

52602 **APPLICATION USAGE**
 52603 None.

52604 **RATIONALE**
 52605 Some C libraries are designed for dynamic initialization. That is, the global initialization for the
 52606 library is performed when the first procedure in the library is called. In a single-threaded
 52607 program, this is normally implemented using a static variable whose value is checked on entry
 52608 to a routine, as follows:

```
52609 static int random_is_initialized = 0;
52610 extern int initialize_random();

52611 int random_function()
52612 {
52613     if (random_is_initialized == 0) {
52614         initialize_random();
52615         random_is_initialized = 1;
52616     }
52617     ... /* Operations performed after initialization. */
52618 }
```

52619 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,
 52620 library initialization has to be accomplished by an explicit call to a library-exported initialization
 52621 function prior to any use of the library.

52622 For dynamic library initialization in a multi-threaded process, a simple initialization flag is not
 52623 sufficient; the flag needs to be protected against modification by multiple threads
 52624 simultaneously calling into the library. Protecting the flag requires the use of a mutex; however,
 52625 mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized
 52626 once requires a recursive solution to this problem.

52627 The use of *pthread_once()* not only supplies an implementation-guaranteed means of dynamic
 52628 initialization, it provides an aid to the reliable construction of multi-threaded and realtime
 52629 systems. The preceding example then becomes:

```
52630 #include <pthread.h>
52631 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
52632 extern int initialize_random();

52633 int random_function()
52634 {
52635     (void) pthread_once(&random_is_initialized, initialize_random);
52636     ... /* Operations performed after initialization. */
52637 }
```

52638 Note that a **pthread_once_t** cannot be an array because some compilers do not accept the
 52639 construct **&<array_name>**.

52640 FUTURE DIRECTIONS

52641 None.

52642 SEE ALSO

52643 XBD [<pthread.h>](#)

52644 CHANGE HISTORY

52645 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

52646 Issue 6

52647 The *pthread_once()* function is marked as part of the Threads option.

52648 The [EINVAL] error is added as a “may fail” case for if either argument is invalid.

52649 Issue 7

52650 The *pthread_once()* function is moved from the Threads option to the Base.

52651 **NAME**

52652 pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

52653 **SYNOPSIS**

52654 #include <pthread.h>

```
52655 int pthread_rwlock_destroy(pthread_rwlock_t *rwlck,
52656 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlck,
52657 const pthread_rwlockattr_t *restrict attr);
```

52658 XSI pthread_rwlock_t rwlck = PTHREAD_RWLOCK_INITIALIZER;

52659 **DESCRIPTION**

52660 The *pthread_rwlock_destroy()* function shall destroy the read-write lock object referenced by
 52661 *rwlck* and release any resources used by the lock. The effect of subsequent use of the lock is
 52662 undefined until the lock is reinitialized by another call to *pthread_rwlock_init()*. An
 52663 implementation may cause *pthread_rwlock_destroy()* to set the object referenced by *rwlck* to an
 52664 invalid value. Results are undefined if *pthread_rwlock_destroy()* is called when any thread holds
 52665 *rwlck*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

52666 The *pthread_rwlock_init()* function shall allocate any resources required to use the read-write lock
 52667 referenced by *rwlck* and initializes the lock to an unlocked state with attributes referenced by
 52668 *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same as
 52669 passing the address of a default read-write lock attributes object. Once initialized, the lock can be
 52670 used any number of times without being reinitialized. Results are undefined if
 52671 *pthread_rwlock_init()* is called specifying an already initialized read-write lock. Results are
 52672 undefined if a read-write lock is used without first being initialized.

52673 If the *pthread_rwlock_init()* function fails, *rwlck* shall not be initialized and the contents of *rwlck*
 52674 are undefined.

52675 Only the object referenced by *rwlck* may be used for performing synchronization. The result of
 52676 referring to copies of that object in calls to *pthread_rwlock_destroy()*, *pthread_rwlock_rdlock()*,
 52677 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_rwlock_tryrdlock()*,
 52678 *pthread_rwlock_trywrlock()*, *pthread_rwlock_unlock()*, or *pthread_rwlock_wrlock()* is undefined.

52679 XSI In cases where default read-write lock attributes are appropriate, the macro
 52680 PTHREAD_RWLOCK_INITIALIZER can be used to initialize read-write locks that are statically
 52681 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_rwlock_init()*
 52682 with the *attr* parameter specified as NULL, except that no error checks are performed.

52683 **RETURN VALUE**

52684 If successful, the *pthread_rwlock_destroy()* and *pthread_rwlock_init()* functions shall return zero;
 52685 otherwise, an error number shall be returned to indicate the error.

52686 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed
 52687 immediately at the beginning of processing for the function and caused an error return prior to
 52688 modifying the state of the read-write lock specified by *rwlck*.

52689 **ERRORS**

52690 The *pthread_rwlock_destroy()* function may fail if:

52691 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 52692 by *rwlck* while it is locked.

52693 [EINVAL] The value specified by *rwlck* is invalid.

52694 The *pthread_rwlock_init()* function shall fail if:

- 52695 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
52696 another read-write lock.
- 52697 [ENOMEM] Insufficient memory exists to initialize the read-write lock.
- 52698 [EPERM] The caller does not have the privilege to perform the operation.
- 52699 The *pthread_rwlock_init()* function may fail if:
- 52700 [EBUSY] The implementation has detected an attempt to reinitialize the object
52701 referenced by *rwlock*, a previously initialized but not yet destroyed read-write
52702 lock.
- 52703 [EINVAL] The value specified by *attr* is invalid.
- 52704 These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in XBD [Section 3.284](#) (on page 72).

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.
- The DESCRIPTION is updated as follows:
 - It explicitly notes allocation of resources upon initialization of a read-write lock object.
 - A paragraph is added specifying that copies of read-write lock objects may not be used.
- An [EINVAL] error is added to the ERRORS section for *pthread_rwlock_init()*, indicating that the *rwlock* value is invalid.
- The SEE ALSO section is updated.

The **restrict** keyword is added to the *pthread_rwlock_init()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION USAGE relating to priority inversion.

pthread_rwlock_destroy()*System Interfaces*

52738

Issue 7

52739

Austin Group Interpretation 1003.1-2001 #048 is applied, adding the PTHREAD_RWLOCK_INITIALIZER macro.

52740

52741

The *pthread_rwlock_destroy()* and *pthread_rwlock_init()* functions are moved from the Threads option to the Base.

52742

52743 **NAME**
 52744 `pthread_rwlock_rdlock, pthread_rwlock_tryrdlock` — lock a read-write lock object for reading

52745 **SYNOPSIS**

52746 `#include <pthread.h>`

52747 `int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);`
 52748 `int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);`

52749 **DESCRIPTION**

52750 The `pthread_rwlock_rdlock()` function shall apply a read lock to the read-write lock referenced by
 52751 `rwlock`. The calling thread acquires the read lock if a writer does not hold the lock and there are
 52752 no writers blocked on the lock.

52753 TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are
 52754 executing with the scheduling policies `SCHED_FIFO` or `SCHED_RR`, the calling thread shall not
 52755 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on
 52756 the lock; otherwise, the calling thread shall acquire the lock.

52757 TPS TSP If the Thread Execution Scheduling option is supported, and the threads involved in the lock are
 52758 executing with the `SCHED_SPORADIC` scheduling policy, the calling thread shall not acquire
 52759 the lock if a writer holds the lock or if writers of higher or equal priority are blocked on the lock;
 52760 otherwise, the calling thread shall acquire the lock.

52761 If the Thread Execution Scheduling option is not supported, it is implementation-defined
 52762 whether the calling thread acquires the lock when a writer does not hold the lock and there are
 52763 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the
 52764 read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the
 52765 lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

52766 A thread may hold multiple concurrent read locks on `rwlock` (that is, successfully call the
 52767 `pthread_rwlock_rdlock()` function n times). If so, the application shall ensure that the thread
 52768 performs matching unlocks (that is, it calls the `pthread_rwlock_unlock()` function n times).

52769 The maximum number of simultaneous read locks that an implementation guarantees can be
 52770 applied to a read-write lock shall be implementation-defined. The `pthread_rwlock_rdlock()`
 52771 function may fail if this maximum would be exceeded.

52772 The `pthread_rwlock_tryrdlock()` function shall apply a read lock as in the `pthread_rwlock_rdlock()`
 52773 function, with the exception that the function shall fail if the equivalent `pthread_rwlock_rdlock()`
 52774 call would have blocked the calling thread. In no case shall the `pthread_rwlock_tryrdlock()`
 52775 function ever block; it always either acquires the lock or fails and returns immediately.

52776 Results are undefined if any of these functions are called with an uninitialized read-write lock.

52777 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the
 52778 signal handler the thread resumes waiting for the read-write lock for reading as if it was not
 52779 interrupted.

52780 **RETURN VALUE**

52781 If successful, the `pthread_rwlock_rdlock()` function shall return zero; otherwise, an error number
 52782 shall be returned to indicate the error.

52783 The `pthread_rwlock_tryrdlock()` function shall return zero if the lock for reading on the read-write
 52784 lock object referenced by `rwlock` is acquired. Otherwise, an error number shall be returned to
 52785 indicate the error.

ERRORS

52786

52787

The *pthread_rwlock_tryrdlock()* function shall fail if:

52788

52789

[EBUSY] The read-write lock could not be acquired for reading because a writer holds the lock or a writer with the appropriate priority was blocked on it.

52790

The *pthread_rwlock_rdlock()* and *pthread_rwlock_tryrdlock()* functions may fail if:

52791

52792

[EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock object.

52793

52794

[EAGAIN] The read lock could not be acquired because the maximum number of read locks for *rwlock* has been exceeded.

52795

The *pthread_rwlock_rdlock()* function may fail if:

52796

52797

[EDEADLK] A deadlock condition was detected or the current thread already owns the read-write lock for writing.

52798

These functions shall not return an error code of [EINTR].

EXAMPLES

52799

52800

None.

APPLICATION USAGE

52801

52802

52803

Applications using these functions may be subject to priority inversion, as discussed in XBD Section 3.284 (on page 72).

CHANGE HISTORY

52812

52813

First released in Issue 5.

Issue 6

52814

52815

The following changes are made for alignment with IEEE Std 1003.1j-2000:

52816

52817

52818

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).

52819

- The DESCRIPTION is updated as follows:

52820

52821

52822

- Conditions under which writers have precedence over readers are specified.

- Failure of *pthread_rwlock_tryrdlock()* is clarified.

- A paragraph on the maximum number of read locks is added.

52823

52824

- In the ERRORS sections, [EBUSY] is modified to take into account write priority, and [EDEADLK] is deleted as a *pthread_rwlock_tryrdlock()* error.

52825

- The SEE ALSO section is updated.

52826

52827

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/101 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

52828

Issue 7

52829

52830

The *pthread_rwlock_rdlock()* and *pthread_rwlock_tryrdlock()* functions are moved from the Threads option to the Base.

52831 **NAME**

52832 pthread_rwlock_timedrdlock — lock a read-write lock for reading

52833 **SYNOPSIS**

52834 #include <pthread.h>

52835 #include <time.h>

52836 int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict *rwlock*,
52837 const struct timespec *restrict *abstime*);52838 **DESCRIPTION**52839 The *pthread_rwlock_timedrdlock()* function shall apply a read lock to the read-write lock
52840 referenced by *rwlock* as in the *pthread_rwlock_rdlock()* function. However, if the lock cannot be
52841 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
52842 when the specified timeout expires. The timeout shall expire when the absolute time specified
52843 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value
52844 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already
52845 been passed at the time of the call.52846 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
52847 be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the
52848 <**time.h**> header. Under no circumstances shall the function fail with a timeout if the lock can be
52849 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can
52850 be immediately acquired.52851 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
52852 write lock via a call to *pthread_rwlock_timedrdlock()*, upon return from the signal handler the
52853 thread shall resume waiting for the lock as if it was not interrupted.52854 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.
52855 The results are undefined if this function is called with an uninitialized read-write lock.52856 **RETURN VALUE**52857 The *pthread_rwlock_timedrdlock()* function shall return zero if the lock for reading on the read-
52858 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
52859 to indicate the error.52860 **ERRORS**52861 The *pthread_rwlock_timedrdlock()* function shall fail if:

52862 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

52863 The *pthread_rwlock_timedrdlock()* function may fail if:52864 [EAGAIN] The read lock could not be acquired because the maximum number of read
52865 locks for lock would be exceeded.52866 [EDEADLK] A deadlock condition was detected or the calling thread already holds a write
52867 lock on *rwlock*.52868 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
52869 object, or the *abstime* nanosecond value is less than zero or greater than or
52870 equal to 1 000 million.

52871 This function shall not return an error code of [EINTR].

52890

The *pthread_rwlock_timedrdlock()* function is moved from the Timeouts option to the Base.

DRAFT

52891 **NAME**

52892 pthread_rwlock_timedwrlock — lock a read-write lock for writing

52893 **SYNOPSIS**

52894 #include <pthread.h>

52895 #include <time.h>

52896 int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict *rwlock*,
52897 const struct timespec *restrict *abstime*);52898 **DESCRIPTION**52899 The *pthread_rwlock_timedwrlock()* function shall apply a write lock to the read-write lock
52900 referenced by *rwlock* as in the *pthread_rwlock_wrlock()* function. However, if the lock cannot be
52901 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
52902 when the specified timeout expires. The timeout shall expire when the absolute time specified
52903 by *abstime* passes, as measured by the clock on which timeouts are based (that is, when the value
52904 of that clock equals or exceeds *abstime*), or if the absolute time specified by *abstime* has already
52905 been passed at the time of the call.52906 The timeout shall be based on the CLOCK_REALTIME clock. The resolution of the timeout shall
52907 be the resolution of the CLOCK_REALTIME clock. The **timespec** data type is defined in the
52908 <**time.h**> header. Under no circumstances shall the function fail with a timeout if the lock can be
52909 acquired immediately. The validity of the *abstime* parameter need not be checked if the lock can
52910 be immediately acquired.52911 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
52912 write lock via a call to *pthread_rwlock_timedwrlock()*, upon return from the signal handler the
52913 thread shall resume waiting for the lock as if it was not interrupted.52914 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The
52915 results are undefined if this function is called with an uninitialized read-write lock.52916 **RETURN VALUE**52917 The *pthread_rwlock_timedwrlock()* function shall return zero if the lock for writing on the read-
52918 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
52919 to indicate the error.52920 **ERRORS**52921 The *pthread_rwlock_timedwrlock()* function shall fail if:

52922 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

52923 The *pthread_rwlock_timedwrlock()* function may fail if:52924 [EDEADLK] A deadlock condition was detected or the calling thread already holds the
52925 *rwlock*.52926 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
52927 object, or the *abstime* nanosecond value is less than zero or greater than or
52928 equal to 1 000 million.

52929 This function shall not return an error code of [EINTR].

52947

Issue 7

52948

The *pthread_rwlock_timedwrlock()* function is moved from the Timeouts option to the Base.

DRAFT

52949 **NAME**

52950 pthread_rwlock_tryrdlock — lock a read-write lock object for reading

52951 **SYNOPSIS**

52952 #include <pthread.h>

52953 int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);

52954 **DESCRIPTION**52955 Refer to *pthread_rwlock_rdlock()*.

52956 **NAME**

52957 pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

52958 **SYNOPSIS**

52959 #include <pthread.h>

52960 int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlck);

52961 int pthread_rwlock_wrlock(pthread_rwlock_t *rwlck);

52962 **DESCRIPTION**

52963 The *pthread_rwlock_trywrlock()* function shall apply a write lock like the *pthread_rwlock_wrlock()*
 52964 function, with the exception that the function shall fail if any thread currently holds *rwlck* (for
 52965 reading or writing).

52966 The *pthread_rwlock_wrlock()* function shall apply a write lock to the read-write lock referenced by
 52967 *rwlck*. The calling thread acquires the write lock if no other thread (reader or writer) holds the
 52968 read-write lock *rwlck*. Otherwise, the thread shall block until it can acquire the lock. The calling
 52969 thread may deadlock if at the time the call is made it holds the read-write lock (whether a read
 52970 or write lock).

52971 Implementations may favor writers over readers to avoid writer starvation.

52972 Results are undefined if any of these functions are called with an uninitialized read-write lock.

52973 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the
 52974 signal handler the thread resumes waiting for the read-write lock for writing as if it was not
 52975 interrupted.

52976 **RETURN VALUE**

52977 The *pthread_rwlock_trywrlock()* function shall return zero if the lock for writing on the read-write
 52978 lock object referenced by *rwlck* is acquired. Otherwise, an error number shall be returned to
 52979 indicate the error.

52980 If successful, the *pthread_rwlock_wrlock()* function shall return zero; otherwise, an error number
 52981 shall be returned to indicate the error.

52982 **ERRORS**52983 The *pthread_rwlock_trywrlock()* function shall fail if:

52984 [EBUSY] The read-write lock could not be acquired for writing because it was already
 52985 locked for reading or writing.

52986 The *pthread_rwlock_trywrlock()* and *pthread_rwlock_wrlock()* functions may fail if:

52987 [EINVAL] The value specified by *rwlck* does not refer to an initialized read-write lock
 52988 object.

52989 The *pthread_rwlock_wrlock()* function may fail if:

52990 [EDEADLK] A deadlock condition was detected or the current thread already owns the
 52991 read-write lock for writing or reading.

52992 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The [EDEADLK] error is deleted as a *pthread_rwlock_trywrlock()* error.
- The SEE ALSO section is updated.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/104 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The *pthread_rwlock_trywrlock()* and *pthread_rwlock_wrlock()* functions are moved from the Threads option to the Base.

53020 **NAME**
 53021 pthread_rwlock_unlock — unlock a read-write lock object

53022 **SYNOPSIS**
 53023 #include <pthread.h>

53024 int pthread_rwlock_unlock(pthread_rwlock_t *rwlck);

53025 **DESCRIPTION**

53026 The *pthread_rwlock_unlock()* function shall release a lock held on the read-write lock object
 53027 referenced by *rwlck*. Results are undefined if the read-write lock *rwlck* is not held by the
 53028 calling thread.

53029 If this function is called to release a read lock from the read-write lock object and there are other
 53030 read locks currently held on this read-write lock object, the read-write lock object remains in the
 53031 read locked state. If this function releases the last read lock for this read-write lock object, the
 53032 read-write lock object shall be put in the unlocked state with no owners.

53033 If this function is called to release a write lock for this read-write lock object, the read-write lock
 53034 object shall be put in the unlocked state.

53035 If there are threads blocked on the lock when it becomes available, the scheduling policy shall
 53036 determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is
 53037 supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or
 53038 SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when
 53039 the lock becomes available. For equal priority threads, write locks shall take precedence over
 53040 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-
 53041 defined whether write locks take precedence over read locks.

53042 Results are undefined if this function is called with an uninitialized read-write lock.

53043 **RETURN VALUE**

53044 If successful, the *pthread_rwlock_unlock()* function shall return zero; otherwise, an error number
 53045 shall be returned to indicate the error.

53046 **ERRORS**

53047 The *pthread_rwlock_unlock()* function may fail if:

53048 [EINVAL] The value specified by *rwlck* does not refer to an initialized read-write lock
 53049 object.

53050 [EPERM] The current thread does not hold a lock on the read-write lock.

53051 The *pthread_rwlock_unlock()* function shall not return an error code of [EINTR].

53052 **EXAMPLES**

53053 None.

53054 **APPLICATION USAGE**

53055 None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

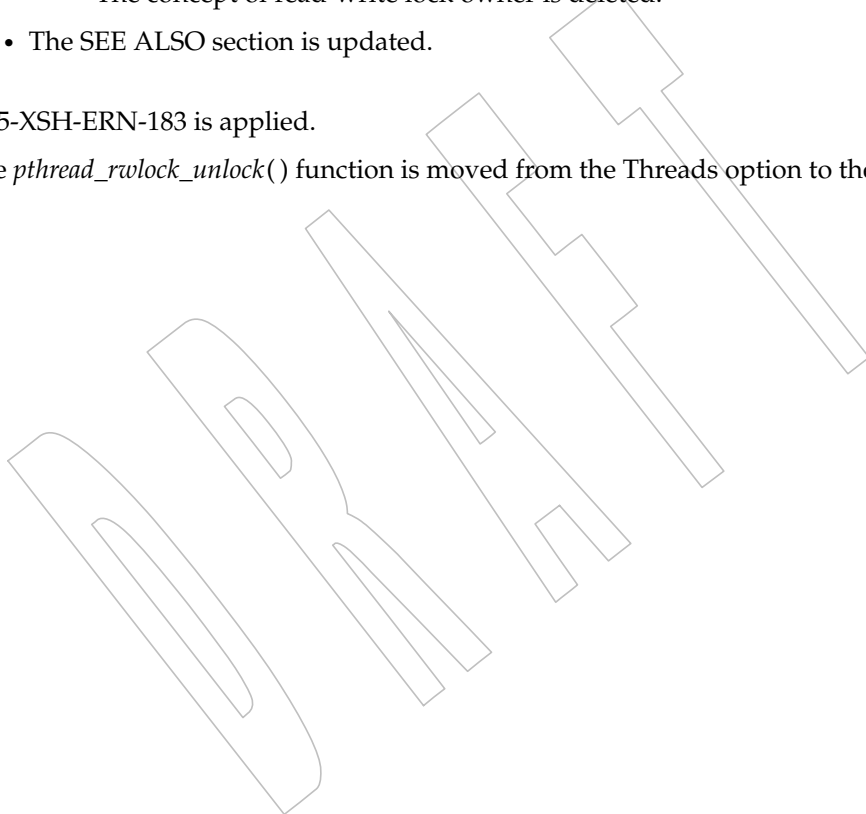

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
 - The conditions under which writers have precedence over readers are specified.
 - The concept of read-write lock owner is deleted.
- The SEE ALSO section is updated.

Issue 7

SD5-XSH-ERN-183 is applied.

+

The *pthread_rwlock_unlock()* function is moved from the Threads option to the Base.

53078 **NAME**
53079 pthread_rwlock_wrlock — lock a read-write lock object for writing

53080 **SYNOPSIS**
53081 #include <pthread.h>
53082 int pthread_rwlock_wrlock(pthread_rwlock_t *rlock);

53083 **DESCRIPTION**
53084 Refer to *pthread_rwlock_trywrlock()*.

53085 **NAME**

53086 pthread_rwlockattr_destroy, pthread_rwlockattr_init — destroy and initialize the read-write
 53087 lock attributes object

53088 **SYNOPSIS**

53089 #include <pthread.h>

53090 int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);

53091 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

53092 **DESCRIPTION**

53093 The *pthread_rwlockattr_destroy()* function shall destroy a read-write lock attributes object. A
 53094 destroyed *attr* attributes object can be reinitialized using *pthread_rwlockattr_init()*; the results of
 53095 otherwise referencing the object after it has been destroyed are undefined. An implementation
 53096 may cause *pthread_rwlockattr_destroy()* to set the object referenced by *attr* to an invalid value.

53097 The *pthread_rwlockattr_init()* function shall initialize a read-write lock attributes object *attr* with
 53098 the default value for all of the attributes defined by the implementation.

53099 Results are undefined if *pthread_rwlockattr_init()* is called specifying an already initialized *attr*
 53100 attributes object.

53101 After a read-write lock attributes object has been used to initialize one or more read-write locks,
 53102 any function affecting the attributes object (including destruction) shall not affect any previously
 53103 initialized read-write locks.

53104 **RETURN VALUE**

53105 If successful, the *pthread_rwlockattr_destroy()* and *pthread_rwlockattr_init()* functions shall return
 53106 zero; otherwise, an error number shall be returned to indicate the error.

53107 **ERRORS**

53108 The *pthread_rwlockattr_destroy()* function may fail if:

53109 [EINVAL] The value specified by *attr* is invalid.

53110 The *pthread_rwlockattr_init()* function shall fail if:

53111 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

53112 These functions shall not return an error code of [EINTR].

53113 **EXAMPLES**

53114 None.

53115 **APPLICATION USAGE**

53116 None.

53117 **RATIONALE**

53118 None.

53119 **FUTURE DIRECTIONS**

53120 None.

53123 XBD <pthread.h>

53124

CHANGE HISTORY

53125

First released in Issue 5.

53126

Issue 6

53127

The following changes are made for alignment with IEEE Std 1003.1j-2000:

53128

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).

53129

53130

53131

- The SEE ALSO section is updated.

53132

Issue 7

53133

The *pthread_rwlockattr_destroy()* and *pthread_rwlockattr_init()* functions are moved from the Threads option to the Base.

53134

53135 **NAME**

53136 pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared — get and set the process-
 53137 shared attribute of the read-write lock attributes object

53138 **SYNOPSIS**

```
53139 TSH #include <pthread.h>
53140
53141 int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t
53142     *restrict attr, int *restrict pshared);
53143 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
53144     int pshared);
```

53144 **DESCRIPTION**

53145 The *pthread_rwlockattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 53146 from the initialized attributes object referenced by *attr*. The *pthread_rwlockattr_setpshared()*
 53147 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

53148 The *process-shared* attribute shall be set to PTHREAD_PROCESS_SHARED to permit a read-write
 53149 lock to be operated upon by any thread that has access to the memory where the read-write lock
 53150 is allocated, even if the read-write lock is allocated in memory that is shared by multiple
 53151 processes. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the read-write lock
 53152 shall only be operated upon by threads created within the same process as the thread that
 53153 initialized the read-write lock; if threads of differing processes attempt to operate on such a
 53154 read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall
 53155 be PTHREAD_PROCESS_PRIVATE.

53156 Additional attributes, their default values, and the names of the associated functions to get and
 53157 set those attribute values are implementation-defined.

53158 **RETURN VALUE**

53159 Upon successful completion, the *pthread_rwlockattr_getpshared()* function shall return zero and
 53160 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*
 53161 parameter. Otherwise, an error number shall be returned to indicate the error.

53162 If successful, the *pthread_rwlockattr_setpshared()* function shall return zero; otherwise, an error
 53163 number shall be returned to indicate the error.

53164 **ERRORS**

53165 The *pthread_rwlockattr_getpshared()* and *pthread_rwlockattr_setpshared()* functions may fail if:

53166 [EINVAL] The value specified by *attr* is invalid.

53167 The *pthread_rwlockattr_setpshared()* function may fail if:

53168 [EINVAL] The new value specified for the attribute is outside the range of legal values
 53169 for that attribute.

53170 These functions shall not return an error code of [EINTR].

53171 **EXAMPLES**
 53172 None.

53173 **APPLICATION USAGE**
 53174 None.

53175 **RATIONALE**
 53176 None.

53177 **FUTURE DIRECTIONS**
 53178 None.

53179 **SEE ALSO**
 53180 *pthread_rwlock_destroy()*, *pthread_rwlockattr_destroy()*

53181 XBD <pthread.h>

53182 **CHANGE HISTORY**
 53183 First released in Issue 5.

53184 **Issue 6**
 53185 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 53186 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the
- 53187 functionality is now part of the Threads option (previously it was part of the Read-Write
- 53188 Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 53189 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 53190 • The SEE ALSO section is updated.

53191 The **restrict** keyword is added to the *pthread_rwlockattr_getpshared()* prototype for alignment
 53192 with the ISO/IEC 9899:1999 standard.

53193 **Issue 7**
 53194 The *pthread_rwlockattr_getpshared()* and *pthread_rwlockattr_setpshared()* functions are moved from
 53195 the Threads option.

53196 **NAME**
53197 pthread_rwlockattr_init — initialize the read-write lock attributes object

53198 **SYNOPSIS**
53199 #include <pthread.h>
53200 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

53201 **DESCRIPTION**
53202 Refer to *pthread_rwlockattr_destroy()*.

53203 **NAME**

53204 pthread_rwlockattr_setpshared — set the process-shared attribute of the read-write lock
53205 attributes object

53206 **SYNOPSIS**

```
53207 TSH #include <pthread.h>  
53208 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,  
53209 int pshared);
```

53210 **DESCRIPTION**

53211 Refer to [pthread_rwlockattr_getpshared\(\)](#).

53212 **NAME**

53213 pthread_self — get the calling thread ID

53214 **SYNOPSIS**

53215 #include <pthread.h>

53216 pthread_t pthread_self(void);

53217 **DESCRIPTION**53218 The *pthread_self()* function shall return the thread ID of the calling thread.53219 **RETURN VALUE**53220 The *pthread_self()* function shall always be successful and no return value is reserved to indicate
53221 an error.53222 **ERRORS**

53223 No errors are defined.

53224 **EXAMPLES**

53225 None.

53226 **APPLICATION USAGE**

53227 None.

53228 **RATIONALE**53229 The *pthread_self()* function provides a capability similar to the *getpid()* function for processes
53230 and the rationale is the same: the creation call does not provide the thread ID to the created
53231 thread.53232 **FUTURE DIRECTIONS**

53233 None.

53236 XBD <pthread.h>

53237 **CHANGE HISTORY**

53238 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

53239 **Issue 6**53240 The *pthread_self()* function is marked as part of the Threads option.53241 **Issue 7**

53242 Austin Group Interpretation 1003.1-2001 #063 is applied, updating the RETURN VALUE section.

53243 The *pthread_self()* function is moved from the Threads option to the Base.

53244 **NAME**
 53245 pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

53246 **SYNOPSIS**
 53247 #include <pthread.h>
 53248 int pthread_setcancelstate(int state, int *oldstate);
 53249 int pthread_setcanceltype(int type, int *oldtype);
 53250 void pthread_testcancel(void);

53251 **DESCRIPTION**
 53252 The *pthread_setcancelstate()* function shall atomically both set the calling thread's cancelability
 53253 state to the indicated *state* and return the previous cancelability state at the location referenced
 53254 by *oldstate*. Legal values for *state* are PTHREAD_CANCEL_ENABLE and
 53255 PTHREAD_CANCEL_DISABLE.

53256 The *pthread_setcanceltype()* function shall atomically both set the calling thread's cancelability
 53257 type to the indicated *type* and return the previous cancelability type at the location referenced by
 53258 *oldtype*. Legal values for *type* are PTHREAD_CANCEL_DEFERRED and
 53259 PTHREAD_CANCEL_ASYNCCHRONOUS.

53260 The cancelability state and type of any newly created threads, including the thread in which
 53261 *main()* was first invoked, shall be PTHREAD_CANCEL_ENABLE and
 53262 PTHREAD_CANCEL_DEFERRED respectively.

53263 The *pthread_testcancel()* function shall create a cancellation point in the calling thread. The
 53264 *pthread_testcancel()* function shall have no effect if cancelability is disabled.

53265 **RETURN VALUE**
 53266 If successful, the *pthread_setcancelstate()* and *pthread_setcanceltype()* functions shall return zero;
 53267 otherwise, an error number shall be returned to indicate the error.

53268 **ERRORS**
 53269 The *pthread_setcancelstate()* function may fail if:
 53270 [EINVAL] The specified state is not PTHREAD_CANCEL_ENABLE or
 53271 PTHREAD_CANCEL_DISABLE.

53272 The *pthread_setcanceltype()* function may fail if:
 53273 [EINVAL] The specified type is not PTHREAD_CANCEL_DEFERRED or
 53274 PTHREAD_CANCEL_ASYNCCHRONOUS.

53275 These functions shall not return an error code of [EINTR].

53276 **EXAMPLES**
 53277 None.

53278 **APPLICATION USAGE**
 53279 None.

53280 **RATIONALE**
 53281 The *pthread_setcancelstate()* and *pthread_setcanceltype()* functions control the points at which a
 53282 thread may be asynchronously canceled. For cancellation control to be usable in modular
 53283 fashion, some rules need to be followed.

53284 An object can be considered to be a generalization of a procedure. It is a set of procedures and
 53285 global variables written as a unit and called by clients not known by the object. Objects may
 53286 depend on other objects.

pthread_setcancelstate()*System Interfaces*

53287 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On
 53288 exit from an object, the cancelability state should always be restored to its value on entry to the
 53289 object.

53290 This follows from a modularity argument: if the client of an object (or the client of an object that
 53291 uses that object) has disabled cancelability, it is because the client does not want to be concerned
 53292 about cleaning up if the thread is canceled while executing some sequence of actions. If an object
 53293 is called in such a state and it enables cancelability and a cancellation request is pending for that
 53294 thread, then the thread is canceled, contrary to the wish of the client that disabled.

53295 Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry
 53296 to an object. But as with the cancelability state, on exit from an object the cancelability type
 53297 should always be restored to its value on entry to the object.

53298 Finally, only functions that are cancel-safe may be called from a thread that is asynchronously
 53299 cancelable.

FUTURE DIRECTIONS

53300 None.

53313 **NAME**
53314 pthread_setconcurrency — set the level of concurrency

53315 **SYNOPSIS**

53316 OB XSI #include <pthread.h>
53317 int pthread_setconcurrency(int new_level);

53318 **DESCRIPTION**

53319 Refer to [pthread_getconcurrency\(\)](#).

pthread_setschedparam()*System Interfaces*53320 **NAME**

53321 pthread_setschedparam — dynamic thread scheduling parameters access (**REALTIME**
53322 **THREADS**)

53323 **SYNOPSIS**

```
53324 TPS #include <pthread.h>  
  
53325 int pthread_setschedparam(pthread_t thread, int policy,  
53326 const struct sched_param *param);
```

53327 **DESCRIPTION**

53328 Refer to *pthread_getschedparam()*.

53329 **NAME**

53330 pthread_setschedprio — dynamic thread scheduling parameters access (**REALTIME**
53331 **THREADS**)

53332 **SYNOPSIS**

```
53333 TPS #include <pthread.h>
53334 int pthread_setschedprio(pthread_t thread, int prio);
```

53335 **DESCRIPTION**

53336 The *pthread_setschedprio()* function shall set the scheduling priority for the thread whose thread
53337 ID is given by *thread* to the value given by *prio*. See [Scheduling Policies](#) (on page 479) for a
53338 description on how this function call affects the ordering of the thread in the thread list for its
53339 new priority.

53340 If the *pthread_setschedprio()* function fails, the scheduling priority of the target thread shall not be
53341 changed.

53342 **RETURN VALUE**

53343 If successful, the *pthread_setschedprio()* function shall return zero; otherwise, an error number
53344 shall be returned to indicate the error.

53345 **ERRORS**

53346 The *pthread_setschedprio()* function may fail if:

- 53347 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.
- 53348 [ENOTSUP] An attempt was made to set the priority to an unsupported value.
- 53349 [EPERM] The caller does not have the appropriate permission to set the scheduling
53350 priority of the specified thread.
- 53351 [ESRCH] The value specified by *thread* does not refer to an existing thread.

53352 The *pthread_setschedprio()* function shall not return an error code of [EINTR].

53353 **EXAMPLES**

53354 None.

53355 **APPLICATION USAGE**

53356 None.

53357 **RATIONALE**

53358 The *pthread_setschedprio()* function provides a way for an application to temporarily raise its
53359 priority and then lower it again, without having the undesired side effect of yielding to other
53360 threads of the same priority. This is necessary if the application is to implement its own
53361 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This
53362 capability is especially important if the implementation does not support the Thread Priority
53363 Protection or Thread Priority Inheritance options, but even if those options are supported it is
53364 needed if the application is to bound priority inheritance for other resources, such as
53365 semaphores.

53366 The standard developers considered that while it might be preferable conceptually to solve this
53367 problem by modifying the specification of *pthread_setschedparam()*, it was too late to make such a
53368 change, as there may be implementations that would need to be changed. Therefore, this new
53369 function was introduced.

pthread_setschedprio()*System Interfaces*53370 **FUTURE DIRECTIONS**

53371 None.

53372 **SEE ALSO**53373 [Scheduling Policies](#) (on page 479), [pthread_getschedparam\(\)](#)53374 XBD [<pthread.h>](#)53375 **CHANGE HISTORY**

53376 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

53377 **Issue 7**

53378 Austin Group Interpretation 1003.1-2001 #069 is applied, updating the [EPERM] error.

53379 The `pthread_setschedprio()` function is moved from the Threads option.

53380 **NAME**
53381 pthread_setspecific — thread-specific data management

53382 **SYNOPSIS**
53383 #include <pthread.h>
53384 int pthread_setspecific(pthread_key_t key, const void *value);

53385 **DESCRIPTION**
53386 Refer to *pthread_getspecific()*.

53387 **NAME**

53388 pthread_sigmask, sigprocmask — examine and change blocked signals

53389 **SYNOPSIS**

```
53390 CX #include <signal.h>
53391 int pthread_sigmask(int how, const sigset_t *restrict set,
53392 sigset_t *restrict oset);
53393 int sigprocmask(int how, const sigset_t *restrict set,
53394 sigset_t *restrict oset);
```

53395 **DESCRIPTION**

53396 The *pthread_sigmask()* function shall examine or change (or both) the calling thread's signal
 53397 mask, regardless of the number of threads in the process. The function shall be equivalent to
 53398 *sigprocmask()*, without the restriction that the call be made in a single-threaded process.

53399 In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the
 53400 signal mask of the calling thread.

53401 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the
 53402 currently blocked set.

53403 The argument *how* indicates the way in which the set is changed, and the application shall
 53404 ensure it consists of one of the following values:

53405 SIG_BLOCK The resulting set shall be the union of the current set and the signal set
 53406 pointed to by *set*.

53407 SIG_SETMASK The resulting set shall be the signal set pointed to by *set*.

53408 SIG_UNBLOCK The resulting set shall be the intersection of the current set and the
 53409 complement of the signal set pointed to by *set*.

53410 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location
 53411 pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the
 53412 thread's signal mask shall be unchanged; thus the call can be used to enquire about currently
 53413 blocked signals.

53414 If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those
 53415 signals shall be delivered before the call to *sigprocmask()* returns.

53416 It is not possible to block those signals which cannot be ignored. This shall be enforced by the
 53417 system without causing an error to be indicated.

53418 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked,
 53419 the result is undefined, unless the signal was generated by the *kill()* function, the *sigqueue()*
 53420 function, or the *raise()* function.

53421 If *sigprocmask()* fails, the thread's signal mask shall not be changed.

53422 The use of the *sigprocmask()* function is unspecified in a multi-threaded process.

53423 **RETURN VALUE**

53424 Upon successful completion *pthread_sigmask()* shall return 0; otherwise, it shall return the
 53425 corresponding error number.

53426 Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno*
 53427 shall be set to indicate the error, and the signal mask of the process shall be unchanged.

53428 **ERRORS**53429 The *pthread_sigmask()* and *sigprocmask()* functions shall fail if:53430 [EINVAL] The value of the *how* argument is not equal to one of the defined values.53431 The *pthread_sigmask()* function shall not return an error code of [EINTR].53432 **EXAMPLES**53433 **Signalling in a Multi-Threaded Process**53434 This example shows the use of *pthread_sigmask()* in order to deal with signals in a multi-
53435 threaded process. It provides a fairly general framework that could be easily adapted/extended.

```

53436 #include <stdio.h>
53437 #include <stdlib.h>
53438 #include <pthread.h>
53439 #include <signal.h>
53440 #include <string.h>
53441 #include <errno.h>
53442 ...
53443 static sigset_t  signal_mask; /* signals to block          */
53444 int main (int argc, char *argv[])
53445 {
53446     pthread_t  sig_thr_id; /* signal handler thread ID */
53447     int        rc;        /* return code              */
53448     sigemptyset (&signal_mask);
53449     sigaddset (&signal_mask, SIGINT);
53450     sigaddset (&signal_mask, SIGTERM);
53451     rc = pthread_sigmask (SIG_BLOCK, &signal_mask, NULL);
53452     if (rc != 0) {
53453         /* handle error */
53454         ...
53455     }
53456     /* any newly created threads inherit the signal mask */
53457     rc = pthread_create (&sig_thr_id, NULL, signal_thread, NULL);
53458     if (rc != 0) {
53459         /* handle error */
53460         ...
53461     }
53462     /* APPLICATION CODE */
53463     ...
53464 }
53465 void *signal_thread (void *arg)
53466 {
53467     int        sig_caught; /* signal caught          */
53468     int        rc;        /* returned code          */
53469     rc = sigwait (&signal_mask, &sig_caught);
53470     if (rc != 0) {
53471         /* handle error */
53472     }
53473     switch (sig_caught)
53474     {

```

```

53475         case SIGINT:      /* process SIGINT */
53476             ...
53477             break;
53478         case SIGTERM:    /* process SIGTERM */
53479             ...
53480             break;
53481         default:        /* should normally not happen */
53482             fprintf (stderr, "\nUnexpected signal %d\n", sig_caught);
53483             break;
53484     }
53485 }

```

APPLICATION USAGE

None.

RATIONALE

When a thread's signal mask is changed in a signal-catching function that is installed by *sigaction()*, the restoration of the signal mask on return from the signal-catching function overrides that change (see *sigaction()*). If the signal-catching function was installed with *signal()*, it is unspecified whether this occurs.

See *kill* for a discussion of the requirement on delivery of signals.

FUTURE DIRECTIONS

None.

XBD **<signal.h>**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *pthread_sigmask()* function is added for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_sigmask()* function is marked as part of the Threads option.

The SYNOPSIS for *sigprocmask()* is marked as a CX extension to note that the presence of this function in the **<signal.h>** header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *pthread_sigmask()* and *sigprocmask()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/105 is applied, updating “process’ signal mask” to “thread’s signal mask” in the DESCRIPTION and RATIONALE sections.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/106 is applied, adding the example to the EXAMPLES section.

53519

Issue 7

53520

The *pthread_sigmask()* function is moved from the Threads option to the Base.

53521 **NAME**

53522 pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object

53523 **SYNOPSIS**

53524 #include <pthread.h>

53525 int pthread_spin_destroy(pthread_spinlock_t *lock);

53526 int pthread_spin_init(pthread_spinlock_t *lock, int pshared);

53527 **DESCRIPTION**

53528 The *pthread_spin_destroy()* function shall destroy the spin lock referenced by *lock* and release any
 53529 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is
 53530 reinitialized by another call to *pthread_spin_init()*. The results are undefined if
 53531 *pthread_spin_destroy()* is called when a thread holds the lock, or if this function is called with an
 53532 uninitialized thread spin lock.

53533 The *pthread_spin_init()* function shall allocate any resources required to use the spin lock
 53534 referenced by *lock* and initialize the lock to an unlocked state.

53535 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is
 53536 PTHREAD_PROCESS_SHARED, the implementation shall permit the spin lock to be operated
 53537 upon by any thread that has access to the memory where the spin lock is allocated, even if it is
 53538 allocated in memory that is shared by multiple processes.

53539 If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is
 53540 PTHREAD_PROCESS_PRIVATE, or if the option is not supported, the spin lock shall only be
 53541 operated upon by threads created within the same process as the thread that initialized the spin
 53542 lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is
 53543 undefined.

53544 The results are undefined if *pthread_spin_init()* is called specifying an already initialized spin
 53545 lock. The results are undefined if a spin lock is used without first being initialized.

53546 If the *pthread_spin_init()* function fails, the lock is not initialized and the contents of *lock* are
 53547 undefined.

53548 Only the object referenced by *lock* may be used for performing synchronization.

53549 The result of referring to copies of that object in calls to *pthread_spin_destroy()*,
 53550 *pthread_spin_lock()*, *pthread_spin_trylock()*, or *pthread_spin_unlock()* is undefined.

53551 **RETURN VALUE**

53552 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 53553 be returned to indicate the error.

53554 **ERRORS**

53555 These functions may fail if:

53556 [EBUSY] The implementation has detected an attempt to initialize or destroy a spin lock
 53557 while it is in use (for example, while being used in a *pthread_spin_lock()* call)
 53558 by another thread.

53559 [EINVAL] The value specified by *lock* is invalid.

53560 The *pthread_spin_init()* function shall fail if:

53561 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

53562 [ENOMEM] Insufficient memory exists to initialize the lock.

53563 These functions shall not return an error code of [EINTR].

53564 **EXAMPLES**

53565 None.

53566 **APPLICATION USAGE**

53567 None.

53568 **RATIONALE**

53569 None.

53570 **FUTURE DIRECTIONS**

53571 None.

53572 **SEE ALSO**

53573 *pthread_spin_lock()*, *pthread_spin_unlock()*

53574 XBD **<pthread.h>**

53575 **CHANGE HISTORY**

53576 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

53577 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

53578 **Issue 7**

53579 The *pthread_spin_destroy()* and *pthread_spin_init()* functions are moved from the Spin Locks
53580 option to the Base.

53581 **NAME**
 53582 pthread_spin_lock, pthread_spin_trylock — lock a spin lock object

53583 **SYNOPSIS**
 53584 #include <pthread.h>
 53585 int pthread_spin_lock(pthread_spinlock_t *lock);
 53586 int pthread_spin_trylock(pthread_spinlock_t *lock);

53587 **DESCRIPTION**
 53588 The *pthread_spin_lock()* function shall lock the spin lock referenced by *lock*. The calling thread
 53589 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,
 53590 shall not return from the *pthread_spin_lock()* call) until the lock becomes available. The results are
 53591 undefined if the calling thread holds the lock at the time the call is made. The
 53592 *pthread_spin_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any
 53593 thread. Otherwise, the function shall fail.

53594 The results are undefined if any of these functions is called with an uninitialized spin lock.

53595 **RETURN VALUE**
 53596 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 53597 be returned to indicate the error.

53598 **ERRORS**
 53599 These functions may fail if:
 53600 [EINVAL] The value specified by *lock* does not refer to an initialized spin lock object.
 53601 The *pthread_spin_lock()* function may fail if:
 53602 [EDEADLK] A deadlock condition was detected or the calling thread already holds the
 53603 lock.
 53604 The *pthread_spin_trylock()* function shall fail if:
 53605 [EBUSY] A thread currently holds the lock.
 53606 These functions shall not return an error code of [EINTR].

53607 **EXAMPLES**
 53608 None.

53609 **APPLICATION USAGE**
 53610 Applications using this function may be subject to priority inversion, as discussed in XBD
 53611 [Section 3.284](#) (on page 72).

53612 **RATIONALE**
 53613 None.

53614 **FUTURE DIRECTIONS**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/107 is applied, updating the ERRORS section so that the [EDEADLK] error includes detection of a deadlock condition.

Issue 7

The `pthread_spin_lock()` and `pthread_spin_trylock()` functions are moved from the Spin Locks option to the Base.

53627 **NAME**

53628 pthread_spin_unlock — unlock a spin lock object

53629 **SYNOPSIS**

53630 #include <pthread.h>

53631 int pthread_spin_unlock(pthread_spinlock_t *lock);

53632 **DESCRIPTION**

53633 The *pthread_spin_unlock()* function shall release the spin lock referenced by *lock* which was
 53634 locked via the *pthread_spin_lock()* or *pthread_spin_trylock()* functions. The results are undefined if
 53635 the lock is not held by the calling thread. If there are threads spinning on the lock when
 53636 *pthread_spin_unlock()* is called, the lock becomes available and an unspecified spinning thread
 53637 shall acquire the lock.

53638 The results are undefined if this function is called with an uninitialized thread spin lock.

53639 **RETURN VALUE**

53640 Upon successful completion, the *pthread_spin_unlock()* function shall return zero; otherwise, an
 53641 error number shall be returned to indicate the error.

53642 **ERRORS**53643 The *pthread_spin_unlock()* function may fail if:

53644 [EINVAL] An invalid argument was specified.

53645 [EPERM] The calling thread does not hold the lock.

53646 This function shall not return an error code of [EINTR].

53647 **EXAMPLES**

53648 None.

53649 **APPLICATION USAGE**

53650 None.

53651 **RATIONALE**

53652 None.

53653 **FUTURE DIRECTIONS**

53654 None.

53655 **SEE ALSO**53656 [pthread_spin_destroy\(\)](#), [pthread_spin_lock\(\)](#)53657 XBD Section 4.11 (on page 98), [<pthread.h>](#)53658 **CHANGE HISTORY**

53659 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

53660 In the SYNOPSIS, the inclusion of [<sys/types.h>](#) is no longer required.53661 **Issue 7**53662 The *pthread_spin_unlock()* function is moved from the Spin Locks option to the Base.

53663 **NAME**
53664 pthread_testcancel — set cancelability state

53665 **SYNOPSIS**
53666 #include <pthread.h>
53667 void pthread_testcancel(void);

53668 **DESCRIPTION**
53669 Refer to *pthread_setcancelstate()*.

53670 **NAME**

53671 ptsname — get name of the slave pseudo-terminal device

53672 **SYNOPSIS**

```
53673 XSI #include <stdlib.h>
53674 char *ptsname(int fildes);
```

53675 **DESCRIPTION**

53676 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated
 53677 with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the
 53678 master device. The *ptsname()* function shall return a pointer to a string containing the pathname
 53679 of the corresponding slave device.

53680 The *ptsname()* function need not be thread-safe. A function that is not required to be thread-safe
 53681 is not required to be reentrant.

53682 **RETURN VALUE**

53683 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the
 53684 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer. This could
 53685 occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file
 53686 system.

53687 **ERRORS**

53688 No errors are defined.

53689 **EXAMPLES**

53690 None.

53691 **APPLICATION USAGE**53692 The value returned may point to a static data area that is overwritten by each call to *ptsname()*.53693 **RATIONALE**

53694 None.

53695 **FUTURE DIRECTIONS**

53696 None.

53697 **SEE ALSO**53698 *grantpt()*, *open()*, *ttyname()*, *unlockpt()*

53701 First released in Issue 4, Version 2.

53702 **Issue 5**

53703 Moved from X/OPEN UNIX extension to BASE.

53704 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

53705 **NAME**

53706 putc — put a byte on a stream

53707 **SYNOPSIS**

53708 #include <stdio.h>

53709 int putc(int *c*, FILE **stream*);53710 **DESCRIPTION**53711 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
53712 conflict between the requirements described here and the ISO C standard is unintentional. This
53713 volume of POSIX.1-200x defers to the ISO C standard.53714 The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it
53715 may evaluate *stream* more than once, so the argument should never be an expression with side
53716 effects.53717 **RETURN VALUE**53718 Refer to *fputc()*.53719 **ERRORS**53720 Refer to *fputc()*.53721 **EXAMPLES**

53722 None.

53723 **APPLICATION USAGE**53724 Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side effects
53725 incorrectly. In particular, *putc(c,*f++)* does not necessarily work correctly. Therefore, use of this
53726 function is not recommended in such situations; *fputc()* should be used instead.53727 **RATIONALE**

53728 None.

53729 **FUTURE DIRECTIONS**

53730 None.

NAME

putchar — put a byte on a stdout stream

SYNOPSIS

```
#include <stdio.h>

int putchar(int c);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.

RETURN VALUE

Refer to *fputc()*.

ERRORS

Refer to *fputc()*.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

putchar_unlocked()*System Interfaces*

53770 **NAME**
53771 putchar_unlocked — stdio with explicit client locking

SYNOPSIS

53772 CX `#include <stdio.h>`
53773 `int putchar_unlocked(int c);`

DESCRIPTION

53775 Refer to [getc_unlocked\(\)](#).
53776

53777 **NAME**
 53778 putenv — change or add a value to an environment

53779 SYNOPSIS

```
53780 XSI #include <stdlib.h>
53781 int putenv(char *string);
```

53782 DESCRIPTION

53783 The *putenv()* function shall use the *string* argument to set environment variable values. The
 53784 *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall
 53785 make the value of the environment variable *name* equal to *value* by altering an existing variable
 53786 or creating a new one. In either case, the string pointed to by *string* shall become part of the
 53787 environment, so altering the string shall change the environment. The space used by *string* is no
 53788 longer used once a new string which defines *name* is passed to *putenv()*.

53789 The *putenv()* function need not be thread-safe. A function that is not required to be thread-safe is
 53790 not required to be reentrant.

53791 RETURN VALUE

53792 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value
 53793 and set *errno* to indicate the error.

53794 ERRORS

53795 The *putenv()* function may fail if:
 53796 [ENOMEM] Insufficient memory was available.

53797 EXAMPLES

53798 Changing the Value of an Environment Variable

53799 The following example changes the value of the *HOME* environment variable to the value
 53800 */usr/home*.

```
53801 #include <stdlib.h>
53802 ...
53803 static char *var = "HOME=/usr/home";
53804 int ret;
53805 ret = putenv(var);
```

53806 APPLICATION USAGE

53807 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in
 53808 conjunction with *getenv()*.

53809 See *exec*, for restrictions on changing the environment in multi-threaded applications.

53810 This routine may use *malloc()* to enlarge the environment.

53811 A potential error is to call *putenv()* with an automatic variable as the argument, then return from
 53812 the calling function while *string* is still part of the environment.

53813 The *setenv()* function is preferred over this function.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The type of the argument to this function is changed from **const char *** to **char ***. This was indicated as a FUTURE DIRECTION in previous issues.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to *exec*.

53832 **NAME**53833 putmsg, putpmsg — send a message on a STREAM (**STREAMS**)53834 **SYNOPSIS**

```
53835 OB XSR #include <stropts.h>
53836
53836 int putmsg(int fildev, const struct strbuf *ctlptr,
53837           const struct strbuf *dataptr, int flags);
53838 int putpmsg(int fildev, const struct strbuf *ctlptr,
53839           const struct strbuf *dataptr, int band, int flags);
```

53840 **DESCRIPTION**

53841 The *putmsg()* function shall create a message from a process buffer(s) and send the message to a
 53842 STREAMS file. The message may contain either a data part, a control part, or both. The data and
 53843 control parts are distinguished by placement in separate buffers, as described below. The
 53844 semantics of each part are defined by the STREAMS module that receives the message.

53845 The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in
 53846 different priority bands. Except where noted, all requirements on *putmsg()* also pertain to
 53847 *putpmsg()*.

53848 The *fildev* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and
 53849 *dataptr* arguments each point to a **strbuf** structure.

53850 The *ctlptr* argument points to the structure describing the control part, if any, to be included in
 53851 the message. The *buf* member in the **strbuf** structure points to the buffer where the control
 53852 information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen*
 53853 member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if
 53854 any, to be included in the message. The *flags* argument indicates what type of message should be
 53855 sent and is described further below.

53856 To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer
 53857 and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the
 53858 application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part
 53859 shall be sent if either *dataptr(ctlptr)* is a null pointer or the *len* member of *dataptr(ctlptr)* is set to
 53860 -1.

53861 For *putmsg()*, if a control part is specified and *flags* is set to RS_HIPRI, a high priority message
 53862 shall be sent. If no control part is specified, and *flags* is set to RS_HIPRI, *putmsg()* shall fail and
 53863 set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be
 53864 sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be
 53865 sent and 0 shall be returned.

53866 For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following
 53867 mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If *flags* is set to 0, *putpmsg()*
 53868 shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG_HIPRI
 53869 and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG_HIPRI and either
 53870 no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to
 53871 [EINVAL]. If *flags* is set to MSG_BAND, then a message shall be sent in the priority band
 53872 specified by *band*. If a control part and data part are not specified and *flags* is set to MSG_BAND,
 53873 no message shall be sent and 0 shall be returned.

53874 The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control
 53875 conditions, with the following exceptions:

putmsg()

- 53876 • For high-priority messages, *putmsg()* shall not block on this condition and continues
53877 processing the message.
- 53878 • For other messages, *putmsg()* shall not block but shall fail when the write queue is full and
53879 O_NONBLOCK is set.

53880 The *putmsg()* function shall also block, unless prevented by lack of internal resources, while
53881 waiting for the availability of message blocks in the STREAM, regardless of priority or whether
53882 O_NONBLOCK has been specified. No partial message shall be sent.

RETURN VALUE

53883 Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return
53884 -1 and set *errno* to indicate the error.
53885

ERRORS

53886 The *putmsg()* and *putpmsg()* functions shall fail if:
53887

53888 [EAGAIN] A non-priority message was specified, the O_NONBLOCK flag is set, and the
53889 STREAM write queue is full due to internal flow control conditions; or buffers
53890 could not be allocated for the message that was to be created.

53891 [EBADF] *fildev* is not a valid file descriptor open for writing.

53892 [EINTR] A signal was caught during *putmsg()*.

53893 [EINVAL] An undefined value is specified in *flags*, or *flags* is set to RS_HIPRI or
53894 MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer
53895 referenced by *fildev* is linked (directly or indirectly) downstream from a
53896 multiplexer, or *flags* is set to MSG_HIPRI and *band* is non-zero (for *putpmsg()*
53897 only).

53898 [ENOSR] Buffers could not be allocated for the message that was to be created due to
53899 insufficient STREAMS memory resources.

53900 [ENOSTR] A STREAM is not associated with *fildev*.

53901 [ENXIO] A hangup condition was generated downstream for the specified STREAM.

53902 [EPIPE] or [EIO] The *fildev* argument refers to a STREAMS-based pipe and the other end of the
53903 pipe is closed. A SIGPIPE signal is generated for the calling thread.

53904 [ERANGE] The size of the data part of the message does not fall within the range
53905 specified by the maximum and minimum packet sizes of the topmost
53906 STREAM module. This value is also returned if the control part of the message
53907 is larger than the maximum configured size of the control part of a message,
53908 or if the data part of a message is larger than the maximum configured size of
53909 the data part of a message.

53910 In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an
53911 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
53912 *putmsg()* or *putpmsg()*, but reflects the prior error.

53913 **EXAMPLES**53914 **Sending a High-Priority Message**

53915 The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the
 53916 following:

- 53917 1. Creates a high-priority message with a control part and a data part, using the buffers
 53918 pointed to by *ctrlbuf* and *databuf*, respectively.
- 53919 2. Sends the message to the STREAMS file identified by *fd*.

```

53920 #include <stropts.h>
53921 #include <string.h>
53922 ...
53923 int fd;
53924 char *ctrlbuf = "This is the control part";
53925 char *databuf = "This is the data part";
53926 struct strbuf ctrl;
53927 struct strbuf data;
53928 int ret;

53929 ctrl.buf = ctrlbuf;
53930 ctrl.len = strlen(ctrlbuf);

53931 data.buf = databuf;
53932 data.len = strlen(databuf);

53933 ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);

```

53934 **Using putpmsg()**

53935 This example has the same effect as the previous example. In this example, however, the
 53936 *putpmsg()* function creates and sends the message to the STREAMS file.

```

53937 #include <stropts.h>
53938 #include <string.h>
53939 ...
53940 int fd;
53941 char *ctrlbuf = "This is the control part";
53942 char *databuf = "This is the data part";
53943 struct strbuf ctrl;
53944 struct strbuf data;
53945 int ret;

53946 ctrl.buf = ctrlbuf;
53947 ctrl.len = strlen(ctrlbuf);

53948 data.buf = databuf;
53949 data.len = strlen(databuf);

53950 ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);

```

53951 **APPLICATION USAGE**

53952 None.

53953 **RATIONALE**

53954 None.

53955

FUTURE DIRECTIONS

53956

The *putmsg()* and *putpmsg()* functions may be removed in a future version.

CHANGE HISTORY

53961

First released in Issue 4, Version 2.

53962

Issue 5

53963

Moved from X/OPEN UNIX extension to BASE.

53964

53965

The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the control part of a message generated by *putmsg()* is at least 64 bytes in length”.

53966

Issue 6

53967

This function is marked as part of the XSI STREAMS Option Group.

53968

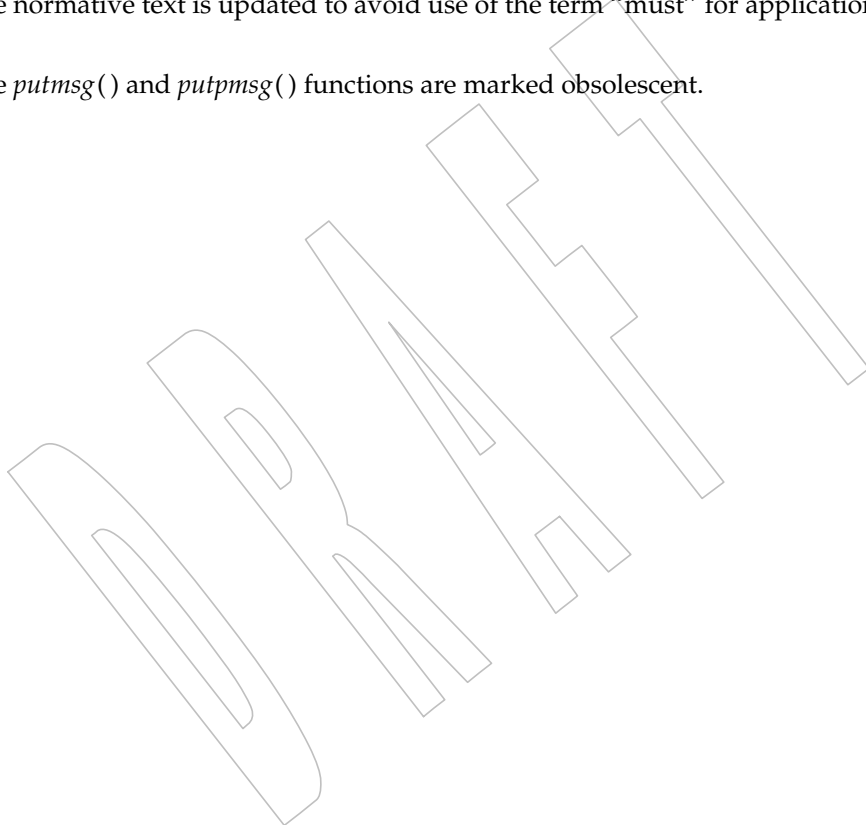

The normative text is updated to avoid use of the term “must” for application requirements.

53969

Issue 7

53970

The *putmsg()* and *putpmsg()* functions are marked obsolescent.

53971 **NAME**
 53972 puts — put a string on standard output

53973 **SYNOPSIS**
 53974 #include <stdio.h>

53975 int puts(const char *s);

53976 DESCRIPTION

53977 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 53978 conflict between the requirements described here and the ISO C standard is unintentional. This
 53979 volume of POSIX.1-200x defers to the ISO C standard.

53980 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the
 53981 standard output stream *stdout*. The terminating null byte shall not be written.

53982 CX The last data modification and last file status change timestamps of the file shall be marked for
 53983 update between the successful execution of *puts()* and the next successful completion of a call to
 53984 *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

53985 RETURN VALUE

53986 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall
 53987 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

53988 ERRORS

53989 Refer to *fputc()*.

53990 EXAMPLES

53991 Printing to Standard Output

53992 The following example gets the current time, converts it to a string using *localtime()* and
 53993 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to
 53994 an event for which it is waiting.

```
53995 #include <time.h>
53996 #include <stdio.h>
53997 ...
53998 time_t now;
53999 int minutes_to_event;
54000 ...
54001 time(&now);
54002 printf("The time is ");
54003 puts(asctime(localtime(&now)));
54004 printf("There are %d minutes to the event.\n",
54005        minutes_to_event);
54006 ...
```

54007 APPLICATION USAGE

54008 The *puts()* function appends a <newline>, while *fputs()* does not.

54009 RATIONALE

54010 None.

54026 `struct utmpx *pututxline(const struct utmpx *utmpx);`

54027 **DESCRIPTION**

54028 Refer to *endutxent()*.

54029 **NAME**

54030 putwc — put a wide character on a stream

54031 **SYNOPSIS**

54032 #include <stdio.h>

54033 #include <wchar.h>

54034 wint_t putwc(wchar_t *wc*, FILE **stream*);54035 **DESCRIPTION**

54036 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 54037 conflict between the requirements described here and the ISO C standard is unintentional. This
 54038 volume of POSIX.1-200x defers to the ISO C standard.

54039 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro
 54040 it may evaluate *stream* more than once, so the argument should never be an expression with side
 54041 effects.

54042 **RETURN VALUE**54043 Refer to *fputwc()*.54044 **ERRORS**54045 Refer to *fputwc()*.54046 **EXAMPLES**

54047 None.

54048 **APPLICATION USAGE**

54049 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side effects
 54050 incorrectly. In particular, *putwc(wc,*f++)* need not work correctly. Therefore, use of this function
 54051 is not recommended; *fputwc()* should be used instead.

54052 **RATIONALE**

54053 None.

54054 **FUTURE DIRECTIONS**

54055 None.

54056 **SEE ALSO**54057 *fputwc()*

54058 XBD <stdio.h>, <wchar.h>

54059 **CHANGE HISTORY**

54060 First released as a World-wide Portability Interface in Issue 4.

54061 **Issue 5**

54062 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
 54063 is changed from **wint_t** to **wchar_t**.

54064 The Optional Header (OH) marking is removed from <stdio.h>.

54065 **NAME**
 54066 putwchar — put a wide character on a stdout stream

54067 **SYNOPSIS**
 54068 #include <wchar.h>

54069 wint_t putwchar(wchar_t wc);

54070 **DESCRIPTION**

54071 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 54072 conflict between the requirements described here and the ISO C standard is unintentional. This
 54073 volume of POSIX.1-200x defers to the ISO C standard.

54074 The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.

54075 **RETURN VALUE**

54076 Refer to *fputwc()*.

54077 **ERRORS**

54078 Refer to *fputwc()*.

54079 **EXAMPLES**

54080 None.

54081 **APPLICATION USAGE**

54082 None.

54083 **RATIONALE**

54084 None.

54085 **FUTURE DIRECTIONS**

54086 None.

54087 **SEE ALSO**

54088 *fputwc()*, *putwc()*

54089 XBD <wchar.h>

54090 **CHANGE HISTORY**

54091 First released in Issue 4.

54092 **Issue 5**

54093 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
 54094 is changed from **wint_t** to **wchar_t**.

54095 **NAME**
54096 pwrite — write on a file

54097 **SYNOPSIS**
54098 #include <unistd.h>

54099 ssize_t pwrite(int *fildes*, const void **buf*, size_t *nbyte*,
54100 off_t *offset*);

54101 **DESCRIPTION**
54102 Refer to *write*.

54103 **NAME**

54104 qsort — sort a table of data

54105 **SYNOPSIS**

54106 #include <stdlib.h>

54107 void qsort(void *base, size_t nel, size_t width,
54108 int (*compar)(const void *, const void *));54109 **DESCRIPTION**54110 CX The functionality described on this reference page is aligned with the ISO C standard. Any
54111 conflict between the requirements described here and the ISO C standard is unintentional. This
54112 volume of POSIX.1-200x defers to the ISO C standard.54113 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by
54114 *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has
54115 the value zero, the comparison function pointed to by *compar* shall not be called and no
54116 rearrangement shall take place.54117 The application shall ensure that the comparison function pointed to by *compar* does not alter the
54118 contents of the array. The implementation may reorder elements of the array between calls to the
54119 comparison function, but shall not alter the contents of any individual element.54120 When the same objects (consisting of *width* bytes, irrespective of their current positions in the
54121 array) are passed more than once to the comparison function, the results shall be consistent with
54122 one another. That is, they shall define a total ordering on the array.54123 The contents of the array shall be sorted in ascending order according to a comparison function.
54124 The *compar* argument is a pointer to the comparison function, which is called with two
54125 arguments that point to the elements being compared. The application shall ensure that the
54126 function returns an integer less than, equal to, or greater than 0, if the first argument is
54127 considered respectively less than, equal to, or greater than the second. If two members compare
54128 as equal, their order in the sorted array is unspecified.54129 **RETURN VALUE**54130 The *qsort()* function shall not return a value.54131 **ERRORS**

54132 No errors are defined.

54133 **EXAMPLES**

54134 None.

54135 **APPLICATION USAGE**54136 The comparison function need not compare every byte, so arbitrary data may be contained in
54137 the elements in addition to the values being compared.54138 **RATIONALE**54139 The requirement that each argument (hereafter referred to as *p*) to the comparison function is a
54140 pointer to elements of the array implies that for every call, for each argument separately, all of
54141 the following expressions are non-zero:54142 ((char *)p - (char *)base) % width == 0
54143 (char *)p >= (char *)base
54144 (char *)p < (char *)base + nel * width

54145 **FUTURE DIRECTIONS**

54146 None.

54147 **SEE ALSO**54148 *alphasort()*

54149 XBD <stdlib.h>

54150 **CHANGE HISTORY**

54151 First released in Issue 1. Derived from Issue 1 of the SVID.

54152 **Issue 6**

54153 The normative text is updated to avoid use of the term “must” for application requirements.

54154 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to
54155 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The
54156 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

54157 **NAME**

54158 raise — send a signal to the executing process

54159 **SYNOPSIS**

54160 #include <signal.h>

54161 int raise(int sig);

54162 **DESCRIPTION**54163 CX The functionality described on this reference page is aligned with the ISO C standard. Any
54164 conflict between the requirements described here and the ISO C standard is unintentional. This
54165 volume of POSIX.1-200x defers to the ISO C standard.54166 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal
54167 handler is called, the *raise()* function shall not return until after the signal handler does.54168 CX The effect of the *raise()* function shall be equivalent to calling:

54169 pthread_kill(pthread_self(), sig);

54170 **RETURN VALUE**54171 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned
54172 and *errno* shall be set to indicate the error.54173 **ERRORS**54174 The *raise()* function shall fail if:54175 CX [EINVAL] The value of the *sig* argument is an invalid signal number.54176 **EXAMPLES**

54177 None.

54178 **APPLICATION USAGE**

54179 None.

54180 **RATIONALE**

54181 The term “thread” is an extension to the ISO C standard.

54182 **FUTURE DIRECTIONS**

54183 None.

54184 **SEE ALSO**54185 *kill*, *sigaction()*

54186 XBD <signal.h>, <sys/types.h>

54187 **CHANGE HISTORY**

54188 First released in Issue 4. Derived from the ANSI C standard.

54189 **Issue 5**

54190 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

54191 **Issue 6**

54192 Extensions beyond the ISO C standard are marked.

54193 The following new requirements on POSIX implementations derive from alignment with the
54194 Single UNIX Specification:

raise()

54195

- In the RETURN VALUE section, the requirement to set *errno* on error is added.

54196

- The [EINVAL] error condition is added.

54197

Issue 7

54198

Functionality relating to the Threads option is moved to the Base.

54199 **NAME**
 54200 rand, rand_r, srand — pseudo-random number generator

54201 **SYNOPSIS**

54202 #include <stdlib.h>
 54203 int rand(void);
 54204 OB CX int rand_r(unsigned *seed);
 54205 void srand(unsigned seed);

54206 **DESCRIPTION**

54207 CX For *rand()* and *srand()*: The functionality described on this reference page is aligned with the
 54208 ISO C standard. Any conflict between the requirements described here and the ISO C standard is
 54209 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

54210 The *rand()* function shall compute a sequence of pseudo-random integers in the range
 54211 XSI [0,{RAND_MAX}] with a period of at least 2^{32} .

54212 CX The *rand()* function need not be thread-safe. A function that is not required to be thread-safe is
 54213 not required to be reentrant.

54214 OB CX The *rand_r()* function shall compute a sequence of pseudo-random integers in the range
 54215 [0,{RAND_MAX}]. (The value of the {RAND_MAX} macro shall be at least 32767.)

54216 If *rand_r()* is called with the same initial value for the object pointed to by *seed* and that object is
 54217 not modified between successive returns and calls to *rand_r()*, the same sequence shall be
 54218 generated.

54219 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random
 54220 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same
 54221 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before
 54222 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first
 54223 called with a seed value of 1.

54224 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 54225 *rand()* or *srand()*.

54226 **RETURN VALUE**

54227 The *rand()* function shall return the next pseudo-random number in the sequence.

54228 OB CX The *rand_r()* function shall return a pseudo-random integer.

54229 The *srand()* function shall not return a value.

54230 **ERRORS**

54231 No errors are defined.

54232 **EXAMPLES**

54233 **Generating a Pseudo-Random Number Sequence**

54234 The following example demonstrates how to generate a sequence of pseudo-random numbers.

```
54235 #include <stdio.h>
54236 #include <stdlib.h>
54237 ...
54238     long count, i;
54239     char *keystri;
54240     int elementlen, len;
54241     char c;
```

```

54242     ...
54243     /* Initial random number generator. */
54244         srand(1);

54245         /* Create keys using only lowercase characters */
54246         len = 0;
54247         for (i=0; i<count; i++) {
54248             while (len < elementlen) {
54249                 c = (char) (rand() % 128);
54250                 if (islower(c))
54251                     keystr[len++] = c;
54252             }

54253             keystr[len] = '\0';
54254             printf("%s Element%0*ld\n", keystr, elementlen, i);
54255             len = 0;
54256         }

```

54257 **Generating the Same Sequence on Different Machines**

54258 The following code defines a pair of functions that could be incorporated into applications
54259 wishing to ensure that the same sequence of numbers is generated across different machines.

```

54260     static unsigned long next = 1;
54261     int myrand(void) /* RAND_MAX assumed to be 32767. */
54262     {
54263         next = next * 1103515245 + 12345;
54264         return((unsigned)(next/65536) % 32768);
54265     }

54266     void myrand(unsigned seed)
54267     {
54268         next = seed;
54269     }

```

54270 **APPLICATION USAGE**

54271 The *drand48()* function provides a much more elaborate random number generator.

54272 The limitations on the amount of state that can be carried between one function call and another
54273 mean the *rand_r()* function can never be implemented in a way which satisfies all of the
54274 requirements on a pseudo-random number generator. Therefore this function should be avoided
54275 whenever non-trivial requirements (including safety) have to be fulfilled.

54276 **RATIONALE**

54277 The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams
54278 shared by all threads. Those two functions need not change, but there has to be mutual-
54279 exclusion that prevents interference between two threads concurrently accessing the random
54280 number generator.

54281 With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded
54282 program:

- 54283 1. A single per-process sequence of pseudo-random numbers that is shared by all threads
54284 that call *rand()*
- 54285 2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

54286 This is provided by the modified thread-safe function based on whether the seed value is global
54287 to the entire process or local to each thread.

54288 This does not address the known deficiencies of the *rand()* function implementations, which
 54289 have been approached by maintaining more state. In effect, this specifies new thread-safe forms
 54290 of a deficient function.

54291 FUTURE DIRECTIONS

54292 The *rand_r()* function may be removed in a future version. |

54293 SEE ALSO

54295 XBD <stdlib.h> |

54296 CHANGE HISTORY

54297 First released in Issue 1. Derived from Issue 1 of the SVID.

54298 Issue 5

54299 The *rand_r()* function is included for alignment with the POSIX Threads Extension.

54300 A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.

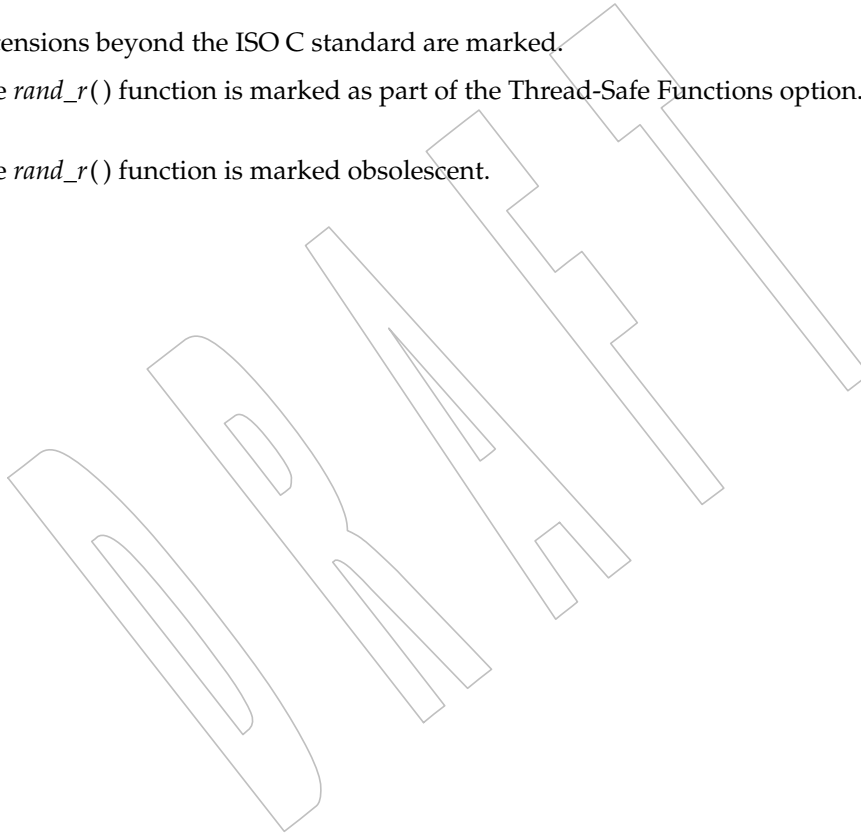

54301 Issue 6

54302 Extensions beyond the ISO C standard are marked.

54303 The *rand_r()* function is marked as part of the Thread-Safe Functions option.

54304 Issue 7

54305 The *rand_r()* function is marked obsolescent. |

random()

54306

NAME

54307

random — generate pseudo-random number

54308

SYNOPSIS

54309

XSI `#include <stdlib.h>`

54310

`long random(void);`

54311

DESCRIPTION

54312

Refer to *initstate()*.

54313 **NAME**54314 `pread, read` — read from a file54315 **SYNOPSIS**54316 `#include <unistd.h>`54317 `ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);`54318 `ssize_t read(int fildes, void *buf, size_t nbyte);`54319 **DESCRIPTION**54320 The `read()` function shall attempt to read *nbyte* bytes from the file associated with the open file
54321 descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on
54322 the same pipe, FIFO, or terminal device is unspecified.54323 Before any action described below is taken, and if *nbyte* is zero, the `read()` function may detect
54324 and return errors as described below. In the absence of errors, or if error detection is not
54325 performed, the `read()` function shall return zero and have no other results.54326 On files that support seeking (for example, a regular file), the `read()` shall start at a position in
54327 the file given by the file offset associated with *fildes*. The file offset shall be incremented by the
54328 number of bytes actually read.54329 Files that do not support seeking—for example, terminals—always read from the current
54330 position. The value of a file offset associated with such a file is undefined.54331 No data transfer shall occur past the current end-of-file. If the starting position is at or after the
54332 end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent
54333 `read()` requests is implementation-defined.54334 If the value of *nbyte* is greater than `{SSIZE_MAX}`, the result is implementation-defined.

54335 When attempting to read from an empty pipe or FIFO:

- 54336
- If no process has the pipe open for writing, `read()` shall return 0 to indicate end-of-file.
 - 54337 • If some process has the pipe open for writing and `O_NONBLOCK` is set, `read()` shall return
54338 `-1` and set *errno* to `[EAGAIN]`.
 - 54339 • If some process has the pipe open for writing and `O_NONBLOCK` is clear, `read()` shall
54340 block the calling thread until some data is written or the pipe is closed by all processes that
54341 had the pipe open for writing.

54342 When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and
54343 has no data currently available:

- 54344
- If `O_NONBLOCK` is set, `read()` shall return `-1` and set *errno* to `[EAGAIN]`.
 - 54345 • If `O_NONBLOCK` is clear, `read()` shall block the calling thread until some data becomes
54346 available.
 - 54347 • The use of the `O_NONBLOCK` flag has no effect if there is some data available.

54348 The `read()` function reads data previously written to a file. If any portion of a regular file prior to
54349 the end-of-file has not been written, `read()` shall return bytes with value 0. For example, `lseek()`
54350 allows the file offset to be set beyond the end of existing data in the file. If data is later written at
54351 this point, subsequent reads in the gap between the previous end of data and the newly written
54352 data shall return bytes with value 0 until data is written into the gap.54353 Upon successful completion, where *nbyte* is greater than 0, `read()` shall mark for update the last
54354 data access timestamp of the file, and shall return the number of bytes read. This number shall
54355 never be greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes

read()

54356		left in the file is less than <i>nbyte</i> , if the <i>read()</i> request was interrupted by a signal, or if the file is a pipe or FIFO or special file and has fewer than <i>nbyte</i> bytes immediately available for reading. For example, a <i>read()</i> from a file associated with a terminal may return one typed line of data.
54357		
54358		
54359		If a <i>read()</i> is interrupted by a signal before it reads any data, it shall return -1 with <i>errno</i> set to [EINTR].
54360		
54361		If a <i>read()</i> is interrupted by a signal after it has successfully read some data, it shall return the number of bytes read.
54362		
54363		For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with <i>filides</i> .
54364		
54365		If <i>filides</i> refers to a socket, <i>read()</i> shall be equivalent to <i>recv()</i> with no flags set.
54366	SIO	If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
54367		
54368		
54369		
54370	SHM	If <i>filides</i> refers to a shared memory object, the result of the <i>read()</i> function is unspecified.
54371	TYM	If <i>filides</i> refers to a typed memory object, the result of the <i>read()</i> function is unspecified.
54372	OB XSR	A <i>read()</i> from a STREAMS file can read data in three different modes: <i>byte-stream</i> mode, <i>message-nondiscard</i> mode, and <i>message-discard</i> mode. The default shall be byte-stream mode. This can be changed using the I_SRDOPT <i>ioctl()</i> request, and can be tested with I_GRDOPT <i>ioctl()</i> . In byte-stream mode, <i>read()</i> shall retrieve data from the STREAM until as many bytes as were requested are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores message boundaries.
54373		
54374		
54375		
54376		
54377		
54378		In STREAMS message-nondiscard mode, <i>read()</i> shall retrieve data until as many bytes as were requested are transferred, or until a message boundary is reached. If <i>read()</i> does not retrieve all the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by the next <i>read()</i> call. Message-discard mode also retrieves data until as many bytes as were requested are transferred, or a message boundary is reached. However, unread data remaining in a message after the <i>read()</i> returns shall be discarded, and shall not be available for a subsequent <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> call.
54379		
54380		
54381		
54382		
54383		
54384		
54385		How <i>read()</i> handles zero-byte STREAMS messages is determined by the current read mode setting. In byte-stream mode, <i>read()</i> shall accept data until it has read <i>nbyte</i> bytes, or until there is no more data to read, or until a zero-byte message block is encountered. The <i>read()</i> function shall then return the number of bytes read, and place the zero-byte message back on the STREAM to be retrieved by the next <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> . In message-nondiscard mode or message-discard mode, a zero-byte message shall return 0 and the message shall be removed from the STREAM. When a zero-byte message is read as the first message on a STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless of the read mode.
54386		
54387		
54388		
54389		
54390		
54391		
54392		
54393		
54394		A <i>read()</i> from a STREAMS file shall return the data in the message at the front of the STREAM head read queue, regardless of the priority band of the message.
54395		
54396		By default, STREAMS are in control-normal mode, in which a <i>read()</i> from a STREAMS file can only process messages that contain a data part but do not contain a control part. The <i>read()</i> shall fail if a message containing a control part is encountered at the STREAM head. This default action can be changed by placing the STREAM in either control-data mode or control-discard mode with the I_SRDOPT <i>ioctl()</i> command. In control-data mode, <i>read()</i> shall convert any control part to data and pass it to the application before passing any data part originally present in the same message. In control-discard mode, <i>read()</i> shall discard message control parts but return to the process any data part in the message.
54397		
54398		
54399		
54400		
54401		
54402		
54403		

54404 In addition, `read()` shall fail if the STREAM head had processed an asynchronous error before
 54405 the call. In this case, the value of `errno` shall not reflect the result of `read()`, but reflect the prior
 54406 error. If a hangup occurs on the STREAM being read, `read()` shall continue to operate normally
 54407 until the STREAM head read queue is empty. Thereafter, it shall return 0.

54408 The `pread()` function shall be equivalent to `read()`, except that it shall read from a given position
 54409 in the file without changing the file pointer. The first three arguments to `pread()` are the same as
 54410 `read()` with the addition of a fourth argument `offset` for the desired position inside the file. An
 54411 attempt to perform a `pread()` on a file that is incapable of seeking shall result in an error.

RETURN VALUE

54412 Upon successful completion, these functions shall return a non-negative integer indicating the
 54413 number of bytes actually read. Otherwise, the functions shall return `-1` and set `errno` to indicate
 54414 the error.
 54415

ERRORS

54416 These functions shall fail if:

54417 [EAGAIN] The `O_NONBLOCK` flag is set for the file descriptor and the thread would be
 54418 delayed.
 54419

54420 [EBADF] The `fildev` argument is not a valid file descriptor open for reading.

54421 OB XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message
 54422 waiting to be read includes a control part.

54423 [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 54424 was transferred.

54425 OB XSR [EINVAL] The STREAM or multiplexer referenced by `fildev` is linked (directly or
 54426 indirectly) downstream from a multiplexer.

54427 [EIO] The process is a member of a background process attempting to read from its
 54428 controlling terminal, the process is ignoring or blocking the SIGTTIN signal,
 54429 or the process group is orphaned. This error may also be generated for
 54430 implementation-defined reasons.

54431 XSI [EISDIR] The `fildev` argument refers to a directory and the implementation does not
 54432 allow the directory to be read using `read()` or `pread()`. The `readdir()` function
 54433 should be used instead.

54434 [EOVERFLOW] The file is a regular file, `nbyte` is greater than 0, the starting position is before
 54435 the end-of-file, and the starting position is greater than or equal to the offset
 54436 maximum established in the open file description associated with `fildev`.

54437 The `read()` function shall fail if:

54438 [EAGAIN] or [EWOULDBLOCK]

54439 The file descriptor is for a socket, is marked `O_NONBLOCK`, and no data is
 54440 waiting to be received.

54441 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by
 54442 its peer.

54443 [ENOTCONN] A read was attempted on a socket that is not connected.

54444 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

54445 These functions may fail if:

54446 [EIO] A physical I/O error has occurred.

54447	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
54448	[ENOMEM]	Insufficient memory was available to fulfill the request.
54449	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
54450		
54451		The <i>pread()</i> function shall fail, and the file pointer shall remain unchanged, if:
54452	[EINVAL]	The <i>offset</i> argument is invalid. The value is negative.
54453	[EOVERFLOW]	The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the file.
54454		
54455	[ENXIO]	A request was outside the capabilities of the device.
54456	[ESPIPE]	<i>fildev</i> is associated with a pipe or FIFO.

EXAMPLES**Reading Data into a Buffer**

The following example reads data from the file associated with the file descriptor *fd* into the buffer pointed to by *buf*.

```

54461 #include <sys/types.h>
54462 #include <unistd.h>
54463 ...
54464 char buf[20];
54465 size_t nbytes;
54466 ssize_t bytes_read;
54467 int fd;
54468 ...
54469 nbytes = sizeof(buf);
54470 bytes_read = read(fd, buf, nbytes);
54471 ...

```

APPLICATION USAGE

None.

RATIONALE

This volume of POSIX.1-200x does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as [EBADF], the concept is meaningless since no file is involved. For errors that are detected immediately, such as [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

Note that a *read()* of zero bytes does not modify the last data access timestamp. A *read()* that requests more than zero bytes, but returns zero, is required to modify the last data access timestamp.

Implementations are allowed, but not required, to perform error checking for *read()* requests of zero bytes.

54485

Input and Output54486
54487
54488
54489
54490
54491
54492
54493
54494

The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size_t** also limit portable I/O requests to the same range. This volume of POSIX.1-200x also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

54495
54496
54497

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE_BUF} or any other size that would be an aid to applications portability.

54498
54499
54500
54501
54502

This volume of POSIX.1-200x requires that no action be taken for *read()* or *write()* when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of POSIX.1-200x, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

54503
54504
54505
54506
54507
54508

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

54509
54510
54511
54512
54513
54514

There were recommendations to add format parameters to *read()* and *write()* in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of POSIX.1-200x. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

54515
54516
54517
54518
54519
54520

In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select()*, whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select()* to be used before *read()* in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

54521
54522

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

54523
54524
54525

There are no references to actions taken following an “unrecoverable error”. It is considered beyond the scope of this volume of POSIX.1-200x to describe what happens in the case of hardware errors.

54526
54527
54528
54529
54530
54531
54532
54533
54534

Earlier versions of this standard allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that POSIX.1-200x should support only one of these behaviors. Historical practice on AT&T-derived systems was to have *read()* and *write()* return -1 and set *errno* to [EINTR] when interrupted after some, but not all, of the data requested had been transferred. However, the U.S. Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in which *read()* and *write()* return the number of bytes actually transferred before the interrupt. If -1 is returned when any data is transferred, it is difficult to recover from the error on a seekable device and impossible on a non-seekable device. Most new implementations support this behavior. The

54535 behavior required by POSIX.1-200x is to return the number of bytes transferred.

54536 POSIX.1-200x does not specify when an implementation that buffers *read()*s actually moves the
54537 data into the user-supplied buffer, so an implementation may choose to do this at the latest
54538 possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a
54539 partial byte count, but rather to return -1 and set *errno* to [EINTR].

54540 Consideration was also given to combining the two previous options, and setting *errno* to
54541 [EINTR] while returning a short count. However, not only is there no existing practice that
54542 implements this, it is also contradictory to the idea that when *errno* is set, the function
54543 responsible shall return -1 .

54544 FUTURE DIRECTIONS

54545 None.

54549 CHANGE HISTORY

54550 First released in Issue 1. Derived from Issue 1 of the SVID.

54551 Issue 5

54552 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
54553 Threads Extension.

54554 Large File Summit extensions are added.

54555 The *pread()* function is added.

54556 Issue 6

54557 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
54558 marked as part of the XSI STREAMS Option Group.

54559 The following new requirements on POSIX implementations derive from alignment with the
54560 Single UNIX Specification:

- 54561 • The DESCRIPTION now states that if *read()* is interrupted by a signal after it has
54562 successfully read some data, it returns the number of bytes read. In Issue 3, it was optional
54563 whether *read()* returned the number of bytes read, or whether it returned -1 with *errno* set
54564 to [EINTR]. This is a FIPS requirement.
- 54565 • In the DESCRIPTION, text is added to indicate that for regular files, no data transfer
54566 occurs past the offset maximum established in the open file description associated with
54567 *files*. This change is to support large files.
- 54568 • The [Eoverflow] mandatory error condition is added.
- 54569 • The [ENxio] optional error condition is added.

54570 Text referring to sockets is added to the DESCRIPTION.

54571 The following changes were made to align with the IEEE P1003.1a draft standard:

- 54572 • The effect of reading zero bytes is clarified.

54573 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
54574 *read()* results are unspecified for typed memory objects.

54575 New RATIONALE is added to explain the atomicity requirements for input and output
54576 operations.

54577 The following error conditions are added for operations on sockets: [EAGAIN],
54578 [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

54579

The [EIO] error is made optional.

54580

54581

The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].

54582

The *readv()* function is split out into a separate reference page.

54583

54584

54585

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/108 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

54586

54587

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/109 is applied, making an editorial correction in the RATIONALE section.

54588

Issue 7

54589

The *pread()* function is moved from the XSI option to the Base.

54590

Functionality relating to the XSI STREAMS option is marked obsolescent.

54591

Changes are made related to support for finegrained timestamps.

+

54592 NAME

54593 readdir, readdir_r — read a directory

54594 SYNOPSIS

54595 #include <dirent.h>

54596 struct dirent *readdir(DIR *dirp);

54597 int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,

54598 struct dirent **restrict result);

54599 DESCRIPTION

54600 The type **DIR**, which is defined in the **<dirent.h>** header, represents a *directory stream*, which is
 54601 an ordered sequence of all the directory entries in a particular directory. Directory entries
 54602 represent files; files may be removed from a directory or added to a directory asynchronously to
 54603 the operation of *readdir()*.

54604 The *readdir()* function shall return a pointer to a structure representing the directory entry at the
 54605 current position in the directory stream specified by the argument *dirp*, and position the
 54606 directory stream at the next entry. It shall return a null pointer upon reaching the end of the
 54607 directory stream. The structure **dirent** defined in the **<dirent.h>** header describes a directory
 54608 entry.

54609 The *readdir()* function shall not return directory entries containing empty names. If entries for
 54610 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-
 54611 dot; otherwise, they shall not be returned.

54612 The pointer returned by *readdir()* points to data which may be overwritten by another call to
 54613 *readdir()* on the same directory stream. This data is not overwritten by another call to *readdir()*
 54614 on a different directory stream.

54615 If a file is removed from or added to the directory after the most recent call to *opendir()* or
 54616 *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

54617 The *readdir()* function may buffer several directory entries per actual read operation; *readdir()* |
 54618 shall mark for update the last data access timestamp of the directory each time the directory is |
 54619 actually read.

54620 After a call to *fork()*, either the parent or child (but not both) may continue processing the
 54621 directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes
 54622 use these functions, the result is undefined.

54623 If the entry names a symbolic link, the value of the *d_ino* member is unspecified.

54624 The *readdir()* function need not be thread-safe. A function that is not required to be thread-safe is
 54625 not required to be reentrant.

54626 The *readdir_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the
 54627 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer
 54628 to this structure at the location referenced by *result*, and position the directory stream at the next
 54629 entry.

54630 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d_name*
 54631 members containing at least {NAME_MAX}+1 elements.

54632 Upon successful return, the pointer returned at **result* shall have the same value as the argument
 54633 *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

54634 The *readdir_r()* function shall not return directory entries containing empty names.

54635 If a file is removed from or added to the directory after the most recent call to *opendir()* or

54636 *rewinddir()*, whether a subsequent call to *readdir_r()* returns an entry for that file is unspecified.

54637 The *readdir_r()* function may buffer several directory entries per actual read operation; |
 54638 *readdir_r()* shall mark for update the last data access timestamp of the directory each time the |
 54639 directory is actually read.

54640 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If
 54641 *errno* is set to non-zero on return, an error occurred.

54642 RETURN VALUE

54643 Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**.
 54644 When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate
 54645 the error. When the end of the directory is encountered, a null pointer shall be returned and
 54646 *errno* is not changed.

54647 If successful, the *readdir_r()* function shall return zero; otherwise, an error number shall be
 54648 returned to indicate the error.

54649 ERRORS

54650 The *readdir()* and *readdir_r()* functions shall fail if:

54651 [EOVERFLOW] One of the values in the structure to be returned cannot be represented
 54652 correctly.

54653 The *readdir()* and *readdir_r()* functions may fail if:

54654 [EBADF] The *dirp* argument does not refer to an open directory stream.

54655 [ENOENT] The current position of the directory stream is invalid.

54656 EXAMPLES

54657 The following sample program searches the current directory for each of the arguments supplied
 54658 on the command line.

```
54659 #include <dirent.h>
54660 #include <errno.h>
54661 #include <stdio.h>
54662 #include <string.h>
54663 static void lookup(const char *arg)
54664 {
54665     DIR *dirp;
54666     struct dirent *dp;
54667     if ((dirp = opendir(".")) == NULL) {
54668         perror("couldn't open '.'");
54669         return;
54670     }
54671     do {
54672         errno = 0;
54673         if ((dp = readdir(dirp)) != NULL) {
54674             if (strcmp(dp->d_name, arg) != 0)
54675                 continue;
54676             (void) printf("found %s\n", arg);
54677             (void) closedir(dirp);
54678             return;
54679         }
54680     } while (dp != NULL);
54681     if (errno != 0)
```

```

54682         perror("error reading directory");
54683     else
54684         (void) printf("failed to find %s\n", arg);
54685     (void) closedir(dirp);
54686     return;
54687 }
54688 int main(int argc, char *argv[])
54689 {
54690     int i;
54691     for (i = 1; i < argc; i++)
54692         lookup(argv[i]);
54693     return (0);
54694 }

```

APPLICATION USAGE

The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to examine the contents of the directory.

The *readdir_r()* function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be inferred.

Historical implementations of *readdir()* obtain multiple directory entries on a single read operation, which permits subsequent *readdir()* operations to operate from the buffered information. Any wording that required each successful *readdir()* operation to mark the directory last data access timestamp for update would disallow such historical performance-oriented implementations.

Since *readdir()* returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set *errno* to zero before the call and check it if NULL is returned. Since the function must not change *errno* in the second case and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```

54714 int derror (dirp)
54715 DIR *dirp;
54716
54717 void clearerr (dirp)
54718 DIR *dirp;

```

The first would indicate whether an error had occurred, and the second would clear the error indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()* not change *errno* when end-of-directory is encountered.

An error or signal indicating that a directory has changed while open was considered but rejected.

The thread-safe version of the directory reading function returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. Either the {NAME_MAX} compile-time constant or the corresponding *pathconf()* option can be used to determine the maximum sizes of returned pathnames.

54727 **FUTURE DIRECTIONS**

54728 None.

54729 **SEE ALSO**54730 *closedir()*, *dirfd()*, *exec*, *fdopendir()*, *fstatat()*, *rewinddir()*, *symlink()*54731 XBD **<dirent.h>**, **<sys/types.h>**54732 **CHANGE HISTORY**

54733 First released in Issue 2.

54734 **Issue 5**

54735 Large File Summit extensions are added.

54736 The *readdir_r()* function is included for alignment with the POSIX Threads Extension.54737 A note indicating that the *readdir()* function need not be reentrant is added to the
54738 DESCRIPTION.54739 **Issue 6**54740 The *readdir_r()* function is marked as part of the Thread-Safe Functions option.54741 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r()*.54742 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful
54743 return for the *readdir_r()* function.54744 The following new requirements on POSIX implementations derive from alignment with the
54745 Single UNIX Specification:

- 54746 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
54747 required for conforming implementations of previous POSIX specifications, it was not
54748 required for UNIX applications.
- 54749 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in
54750 **struct dirent** when an entry refers to a symbolic link.
- 54751 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
54752 files.
- 54753 • The [ENOENT] optional error condition is added.

54754 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
54755 its avoidance of possibly using a static data area.54756 The **restrict** keyword is added to the *readdir_r()* prototype for alignment with the
54757 ISO/IEC 9899:1999 standard.54758 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES
54759 section with a new example.54760 **Issue 7**

54761 Austin Group Interpretation 1003.1-2001 #059 is applied, updating the ERRORS section.

54762 The *readdir_r()* function is moved from the Thread-Safe Functions option to the Base.

54763 Changes are made related to support for finegrained timestamps.

54764 **NAME**

54765 readlink, readlinkat — read the contents of a symbolic link relative to a directory file descriptor

54766 **SYNOPSIS**

54767 #include <unistd.h>

54768 ssize_t readlink(const char *restrict path, char *restrict buf,
54769 size_t bufsize);54770 ssize_t readlinkat(int fd, const char *restrict path,
54771 char *restrict buf, size_t bufsize);54772 **DESCRIPTION**54773 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the
54774 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,
54775 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to
54776 contain the link content, the first *bufsize* bytes shall be placed in *buf*.54777 If the value of *bufsize* is greater than {SSIZE_MAX}, the result is implementation-defined.54778 The *readlinkat()* function shall be equivalent to the *readlink()* function except in the case where
54779 *path* specifies a relative path. In this case the symbolic link whose content is read is relative to the
54780 directory associated with the file descriptor *fd* instead of the current working directory. It is
54781 unspecified whether directory searches are permitted based on whether the file was opened
54782 with search permission or on the current permissions of the directory underlying the file
54783 descriptor.54784 If *readlinkat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
54785 directory is used and the behavior shall be identical to a call to *readlink()*.54786 **RETURN VALUE**54787 Upon successful completion, *readlink()* shall return the count of bytes placed in the buffer.
54788 Otherwise, it shall return a value of -1 , leave the buffer unchanged, and set *errno* to indicate the
54789 error.54790 Upon successful completion, the *readlinkat()* function shall return 0. Otherwise, it shall return -1
54791 and set *errno* to indicate the error.54792 **ERRORS**

54793 These functions shall fail if:

54794 [EACCES] Search permission is denied for a component of the path prefix of *path*.54795 [EINVAL] The *path* argument names a file that is not a symbolic link.

54796 [EIO] An I/O error occurred while reading from the file system.

54797 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
54798 argument.

54799 [ENAMETOOLONG]

54800 The length of the *path* argument exceeds {PATH_MAX} or a pathname
54801 component is longer than {NAME_MAX}.54802 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

54803 [ENOTDIR] A component of the path prefix is not a directory.

54804 The *readlinkat()* function shall fail if:

54805 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 54806 neither AT_FDCWD nor a valid file descriptor open for reading.

54807 These functions may fail if:

54808 [EACCES] Read permission is denied for the symbolic link referred to by *path*.

54809 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 54810 resolution of the *path* argument.

54811 [ENAMETOOLONG]

54812 As a result of encountering a symbolic link in resolution of the *path* argument,
 54813 the length of the substituted pathname string exceeded {PATH_MAX}.

54814 The *readlinkat*() function may fail if:

54815 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
 54816 file descriptor associated with a directory.

54817 EXAMPLES

54818 Reading the Name of a Symbolic Link

54819 The following example shows how to read the name of a symbolic link named `/modules/pass1`.

```
54820 #include <unistd.h>
54821 char buf[1024];
54822 ssize_t len;
54823 ...
54824 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
54825     buf[len] = '\0';
```

54826 APPLICATION USAGE

54827 Conforming applications should not assume that the returned contents of the symbolic link are
 54828 null-terminated.

54829 RATIONALE

54830 Since POSIX.1-200x does not require any association of file times with symbolic links, there is no
 54831 requirement that file times be updated by *readlink*(). The type associated with *bufsiz* is a `size_t`
 54832 in order to be consistent with both the ISO C standard and the definition of *read*(). The behavior
 54833 specified for *readlink*() when *bufsiz* is zero represents historical practice. For this case, the
 54834 standard developers considered a change whereby *readlink*() would return the number of non-
 54835 null bytes contained in the symbolic link with the buffer *buf* remaining unchanged; however,
 54836 since the `stat` structure member *st_size* value can be used to determine the size of buffer
 54837 necessary to contain the contents of the symbolic link as returned by *readlink*(), this proposal
 54838 was rejected, and the historical practice retained.

54839 The purpose of the *readlinkat*() function is to read the content of symbolic links in directories
 54840 other than the current working directory without exposure to race conditions. Any part of the
 54841 path of a file could be changed in parallel to a call to *readlink*(), resulting in unspecified behavior.
 54842 By opening a file descriptor for the target directory and using the *readlinkat*() function it can be
 54843 guaranteed that the symbolic link read is located relative to the desired directory.

54844 FUTURE DIRECTIONS

54845 None.

54870**CHANGE HISTORY**

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The return type is changed to **ssize_t**, to align with the IEEE P1003.1a draft standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- This function is made mandatory.
- In this function it is possible for the return value to exceed the range of the type **ssize_t** (since **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of the **size_t** object is added to the description to resolve this conflict.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The FUTURE DIRECTIONS section is changed to None.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The **restrict** keyword is added to the *readlink()* prototype for alignment with the ISO/IEC 9899: 1999 standard.

Issue 7

SD5-XSH-ERN-189 is applied, updating the ERRORS section. +

The *readlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

54871 **NAME**

54872 readv — read a vector

54873 **SYNOPSIS**

```
54874 XSI #include <sys/uio.h>
54875 ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);
```

54876 **DESCRIPTION**

54877 The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()*
 54878 function shall place the input data into the *iovcnt* buffers specified by the members of the *iov*
 54879 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*-1]. The *iovcnt* argument is valid if greater than 0 and less than
 54880 or equal to {IOV_MAX}.

54881 Each *iovec* entry specifies the base address and length of an area in memory where data should
 54882 be placed. The *readv()* function shall always fill an area completely before proceeding to the
 54883 next.

54884 Upon successful completion, *readv()* shall mark for update the last data access timestamp of the
 54885 file.

54886 **RETURN VALUE**54887 Refer to *read*.54888 **ERRORS**54889 Refer to *read*.54890 In addition, the *readv()* function shall fail if:54891 [EINVAL] The sum of the *iov_len* values in the *iov* array overflowed an **ssize_t**.54892 The *readv()* function may fail if:54893 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.54894 **EXAMPLES**54895 **Reading Data into an Array**

54896 The following example reads data from the file associated with the file descriptor *fd* into the
 54897 buffers specified by members of the *iov* array.

```
54898 #include <sys/types.h>
54899 #include <sys/uio.h>
54900 #include <unistd.h>
54901 ...
54902 ssize_t bytes_read;
54903 int fd;
54904 char buf0[20];
54905 char buf1[30];
54906 char buf2[40];
54907 int iovcnt;
54908 struct iovec iov[3];

54909 iov[0].iov_base = buf0;
54910 iov[0].iov_len = sizeof(buf0);
54911 iov[1].iov_base = buf1;
54912 iov[1].iov_len = sizeof(buf1);
```

readv()

```

54913         iov[2].iov_base = buf2;
54914         iov[2].iov_len = sizeof(buf2);
54915         ...
54916         iovcnt = sizeof(iov) / sizeof(struct iovec);
54917         bytes_read = readv(fd, iov, iovcnt);
54918         ...

```

APPLICATION USAGE

None.

RATIONALE

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

Split out from the *read()* reference page.

Issue 7

Changes are made related to support for finegrained timestamps.

54934 **NAME**
 54935 realloc — memory reallocator

54936 **SYNOPSIS**
 54937 #include <stdlib.h>
 54938 void *realloc(void *ptr, size_t size);

54939 DESCRIPTION

54940 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 54941 conflict between the requirements described here and the ISO C standard is unintentional. This
 54942 volume of POSIX.1-200x defers to the ISO C standard.

54943 The *realloc()* function shall change the size of the memory object pointed to by *ptr* to the size
 54944 specified by *size*. The contents of the object shall remain unchanged up to the lesser of the new
 54945 and old sizes. If the new size of the memory object would require movement of the object, the
 54946 space for the previous instantiation of the object is freed. If the new size is larger, the contents of
 54947 the newly allocated portion of the object are unspecified. If *size* is 0 and *ptr* is not a null pointer,
 54948 the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

54949 If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

54950 If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has
 54951 previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

54952 The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The
 54953 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
 54954 a pointer to any type of object and then used to access such an object in the space allocated (until
 54955 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
 54956 disjoint from any other object. The pointer returned shall point to the start (lowest byte address)
 54957 of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

54958 RETURN VALUE

54959 Upon successful completion with a size not equal to 0, *realloc()* shall return a pointer to the
 54960 (possibly moved) allocated space. If *size* is 0, either a null pointer or a unique pointer that can be
 54961 successfully passed to *free()* shall be returned. If there is not enough available memory, *realloc()*
 54962 shall return a null pointer and set *errno* to [ENOMEM].

54963 ERRORS

54964 The *realloc()* function shall fail if:

54965 CX [ENOMEM] Insufficient memory is available.

54966 EXAMPLES

54967 None.

54968 APPLICATION USAGE

54969 None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, if there is not enough available memory, the setting of *errno* to [ENOMEM] is added.
- The [ENOMEM] error condition is added.

54986 **NAME**
 54987 `realpath` — resolve a pathname

54988 **SYNOPSIS**

```
54989 XSI #include <stdlib.h>
54990
54990 char *realpath(const char *restrict file_name,
54991               char *restrict resolved_name);
```

54992 **DESCRIPTION**

54993 The `realpath()` function shall derive, from the pathname pointed to by `file_name`, an absolute
 54994 pathname that names the same file, whose resolution does not involve '.', '..', or symbolic |
 54995 links. If `resolved_name` is a null pointer, the generated pathname shall be stored as a null- |
 54996 terminated string in a buffer allocated by `realpath()`. Otherwise, if {PATH_MAX} is defined as a |
 54997 constant in the <limits.h> header, then the generated pathname shall be stored as a null- |
 54998 terminated string, up to a maximum of {PATH_MAX} bytes, in the buffer pointed to by |
 54999 `resolved_name`.

55000 If `resolved_name` is not a null pointer and {PATH_MAX} is not defined as a constant in the |
 55001 <limits.h> header, the behavior is implementation-defined.

55002 **RETURN VALUE**

55003 Upon successful completion, `realpath()` shall return a pointer to the buffer containing the |
 55004 resolved name. Otherwise, `realpath()` shall return a null pointer and set `errno` to indicate the |
 55005 error.

55006 If the `resolved_name` argument is a null pointer, the pointer returned by `realpath()` can be passed |
 55007 to `free()`.

55008 If the `resolved_name` argument is not a null pointer and the `realpath()` function fails, the contents |
 55009 of the buffer pointed to by `resolved_name` are undefined.

55010 **ERRORS**

55011 The `realpath()` function shall fail if:

55012 [EACCES] Read or search permission was denied for a component of `file_name`.

55013 [EINVAL] The `file_name` argument is a null pointer.

55014 [EIO] An error occurred while reading from the file system.

55015 [ELOOP] A loop exists in symbolic links encountered during resolution of the `file_name` |
 55016 argument.

55017 [ENAMETOOLONG]

55018 The length of the `file_name` argument exceeds {PATH_MAX} or a pathname |
 55019 component is longer than {NAME_MAX}.

55020 [ENOENT] A component of `file_name` does not name an existing file or `file_name` points to |
 55021 an empty string.

55022 [ENOTDIR] A component of the path prefix is not a directory.

55023 The `realpath()` function may fail if:

55024 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during |
 55025 resolution of the `file_name` argument.

- 55026 [ENAMETOOLONG]
 55027 Pathname resolution of a symbolic link produced an intermediate result
 55028 whose length exceeds {PATH_MAX}.
 55029 [ENOMEM] Insufficient storage space is available.

EXAMPLES**Generating an Absolute Pathname**

The following example generates an absolute pathname for the file identified by the *symlinkpath* argument. The generated pathname is stored in the buffer pointed to by *actualpath*.

```
55034 #include <stdlib.h>
55035 ...
55036 char *symlinkpath = "/tmp/symlink/file";
55037 char *actualpath;

55038 actualpath = realpath(symlinkpath, NULL);
55039 if (actualpath != NULL)
55040 {
55041     ... use actualpath ...
55042     free(actualpath);
55043 }
55044 else
55045 {
55046     ... handle error ...
55047 }
```

APPLICATION USAGE

None.

RATIONALE

Since *realpath()* has no *length* argument, if {PATH_MAX} is not defined as a constant in <limits.h>, applications have no way of determining how large a buffer they need to allocate for it to be safe to pass to *realpath()*. A {PATH_MAX} value obtained from a prior *pathconf()* call is out-of-date by the time *realpath()* is called. Hence the only reliable way to use *realpath()* when {PATH_MAX} is not defined in <limits.h> is to pass a null pointer for *resolved_name* so that *realpath()* will allocate a buffer of the necessary size.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The **restrict** keyword is added to the *realpath()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

- 55071 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the
55072 DESCRIPTION for the case when *resolved_name* is a null pointer, changing the [EINVAL] error
55073 text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.
- 55074 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/110 is applied, updating the ERRORS
55075 section to refer to the *file_name* argument, rather than a non-existent *path* argument.
- 55076 **Issue 7**
- 55077 This function is updated for passing a null pointer to *realpath()* for the *resolved_name* argument. +

55078 **NAME**

55079 recv — receive a message from a connected socket

55080 **SYNOPSIS**

55081 #include <sys/socket.h>

55082 ssize_t recv(int socket, void *buffer, size_t length, int flags);

55083 **DESCRIPTION**55084 The *recv()* function shall receive a message from a connection-mode or connectionless-mode
55085 socket. It is normally used with connected sockets because it does not permit the application to
55086 retrieve the source address of received data.55087 The *recv()* function takes the following arguments:55088 *socket* Specifies the socket file descriptor.55089 *buffer* Points to a buffer where the message should be stored.55090 *length* Specifies the length in bytes of the buffer pointed to by the *buffer* argument.55091 *flags* Specifies the type of message reception. Values of this argument are formed by
55092 logically OR'ing zero or more of the following values:55093 MSG_PEEK Peeks at an incoming message. The data is treated as unread and
55094 the next *recv()* or similar function shall still return this data.55095 MSG_OOB Requests out-of-band data. The significance and semantics of
55096 out-of-band data are protocol-specific.55097 MSG_WAITALL On SOCK_STREAM sockets this requests that the function block
55098 until the full amount of data can be returned. The function may
55099 return the smaller amount of data if the socket is a message-
55100 based socket, if a signal is caught, if the connection is terminated,
55101 if MSG_PEEK was specified, or if an error is pending for the
55102 socket.55103 The *recv()* function shall return the length of the message written to the buffer pointed to by the
55104 *buffer* argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET,
55105 the entire message shall be read in a single operation. If a message is too long to fit in the
55106 supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be
55107 discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be
55108 ignored. In this case, data shall be returned to the user as soon as it becomes available, and no
55109 data shall be discarded.55110 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
55111 message.55112 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
55113 descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket
55114 and O_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to
55115 [EAGAIN] or [EWOULDBLOCK].55116 **RETURN VALUE**55117 Upon successful completion, *recv()* shall return the length of the message in bytes. If no
55118 messages are available to be received and the peer has performed an orderly shutdown, *recv()*
55119 shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

55120 ERRORS

- 55121 The *recv()* function shall fail if:
- 55122 [EAGAIN] or [EWOULDBLOCK] The socket's file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket's file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.
- 55127 [EBADF] The *socket* argument is not a valid file descriptor.
- 55128 [ECONNRESET] A connection was forcibly closed by a peer.
- 55129 [EINTR] The *recv()* function was interrupted by a signal that was caught, before any data was available.
- 55130
- 55131 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.
- 55132 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.
- 55133 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 55134 [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.
- 55135 [ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.
- 55136
- 55137 The *recv()* function may fail if:
- 55138 [EIO] An I/O error occurred while reading from or writing to the file system.
- 55139 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 55140 [ENOMEM] Insufficient memory was available to fulfill the request.

55141 EXAMPLES

55142 None.

55143 APPLICATION USAGE

55144 The *recv()* function is equivalent to *recvfrom()* with a zero *address_len* argument, and to *read()* if no flags are used.

55146 The *select()* and *poll()* functions can be used to determine when data is available to be received.

55147 RATIONALE

55148 None.

55153 XBD <sys/socket.h> |

55154 CHANGE HISTORY

55155 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

55156 **NAME**

55157 recvfrom — receive a message from a socket

55158 **SYNOPSIS**

```
55159 #include <sys/socket.h>
55160
55160 ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
55161                 int flags, struct sockaddr *restrict address,
55162                 socklen_t *restrict address_len);
```

55163 **DESCRIPTION**

55164 The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode
 55165 socket. It is normally used with connectionless-mode sockets because it permits the application
 55166 to retrieve the source address of received data.

55167 The *recvfrom()* function takes the following arguments:

55168	<i>socket</i>	Specifies the socket file descriptor.
55169	<i>buffer</i>	Points to the buffer where the message should be stored.
55170	<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
55171	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by 55172 logically OR'ing zero or more of the following values:
55173	MSG_PEEK	Peeks at an incoming message. The data is treated as unread 55174 and the next <i>recvfrom()</i> or similar function shall still return 55175 this data.
55176	MSG_OOB	Requests out-of-band data. The significance and semantics 55177 of out-of-band data are protocol-specific.
55178	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function 55179 block until the full amount of data can be returned. The 55180 function may return the smaller amount of data if the socket 55181 is a message-based socket, if a signal is caught, if the 55182 connection is terminated, if MSG_PEEK was specified, or if 55183 an error is pending for the socket.
55184	<i>address</i>	A null pointer, or points to a sockaddr structure in which the sending address 55185 is to be stored. The length and format of the address depend on the address 55186 family of the socket.
55187	<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> 55188 argument.

55189 The *recvfrom()* function shall return the length of the message written to the buffer pointed to by
 55190 RS the *buffer* argument. For message-based sockets, such as **SOCK_RAW**, **SOCK_DGRAM**, and
 55191 **SOCK_SEQPACKET**, the entire message shall be read in a single operation. If a message is too
 55192 long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess
 55193 bytes shall be discarded. For stream-based sockets, such as **SOCK_STREAM**, message
 55194 boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes
 55195 available, and no data shall be discarded.

55196 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 55197 message.

55198 Not all protocols provide the source address for messages. If the *address* argument is not a null
 55199 pointer and the protocol provides the source address of messages, the source address of the

55200 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,
 55201 and the length of this address shall be stored in the object pointed to by the *address_len*
 55202 argument.

55203 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 55204 the stored address shall be truncated.

55205 If the *address* argument is not a null pointer and the protocol does not provide the source address
 55206 of messages, the value stored in the object pointed to by *address* is unspecified.

55207 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 55208 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the
 55209 socket and O_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*
 55210 to [EAGAIN] or [EWOULDBLOCK].

55211 RETURN VALUE

55212 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no
 55213 messages are available to be received and the peer has performed an orderly shutdown,
 55214 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the
 55215 error.

55216 ERRORS

55217 The *recvfrom()* function shall fail if:

55218 [EAGAIN] or [EWOULDBLOCK]

55219 The socket's file descriptor is marked O_NONBLOCK and no data is waiting
 55220 to be received; or MSG_OOB is set and no out-of-band data is available and
 55221 either the socket's file descriptor is marked O_NONBLOCK or the socket does
 55222 not support blocking to await out-of-band data.

55223 [EBADF] The *socket* argument is not a valid file descriptor.

55224 [ECONNRESET] A connection was forcibly closed by a peer.

55225 [EINTR] A signal interrupted *recvfrom()* before any data was available.

55226 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

55227 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

55228 [ENOTSOCK] The *socket* argument does not refer to a socket.

55229 [EOPNOTSUPP] The specified flags are not supported for this socket type.

55230 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
 55231 transmission timeout on active connection.

55232 The *recvfrom()* function may fail if:

55233 [EIO] An I/O error occurred while reading from or writing to the file system.

55234 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

55235 [ENOMEM] Insufficient memory was available to fulfill the request.

recvfrom()

55247

CHANGE HISTORY

55248

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

55249 **NAME**55250 `recvmsg` — receive a message from a socket55251 **SYNOPSIS**55252 `#include <sys/socket.h>`55253 `ssize_t recvmsg(int socket, struct msghdr *message, int flags);`55254 **DESCRIPTION**

55255 The `recvmsg()` function shall receive a message from a connection-mode or connectionless-mode
 55256 socket. It is normally used with connectionless-mode sockets because it permits the application
 55257 to retrieve the source address of received data.

55258 The `recvmsg()` function takes the following arguments:

55259	<i>socket</i>	Specifies the socket file descriptor.
55260	<i>message</i>	Points to a msghdr structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.
55261		
55262		
55263		
55264	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
55265		
55266	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
55267		
55268	MSG_PEEK	Peeks at the incoming message.
55269	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.
55270		
55271		
55272		
55273		
55274		

55275 The `recvmsg()` function shall receive messages from unconnected or connected sockets and shall
 55276 return the length of the message.

55277 The `recvmsg()` function shall return the total length of the message. For message-based sockets,
 55278 such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single
 55279 operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the
 55280 *flags* argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the
 55281 *msg_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK_STREAM,
 55282 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it
 55283 becomes available, and no data shall be discarded.

55284 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 55285 message.

55286 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 55287 descriptor, `recvmsg()` shall block until a message arrives. If no messages are available at the
 55288 socket and O_NONBLOCK is set on the socket's file descriptor, the `recvmsg()` function shall fail
 55289 and set *errno* to [EAGAIN] or [EWOULDBLOCK].

55290 In the **msghdr** structure, the *msg_name* and *msg_namelen* members specify the source address if
 55291 the socket is unconnected. If the socket is connected, the *msg_name* and *msg_namelen* members
 55292 shall be ignored. The *msg_name* member may be a null pointer if no names are desired or

55293 required. The *msg_iov* and *msg_iovlen* fields are used to specify where the received data shall be
 55294 stored. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of
 55295 this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field
 55296 gives its size in bytes. Each storage area indicated by *msg_iov* is filled with received data in turn
 55297 until all of the received data is stored or all of the areas have been filled.

55298 Upon successful completion, the *msg_flags* member of the message header shall be the bitwise-
 55299 inclusive OR of all of the following flags that indicate conditions detected for the received
 55300 message:

55301 **MSG_EOR** End-of-record was received (if supported by the protocol).
 55302 **MSG_OOB** Out-of-band data was received.
 55303 **MSG_TRUNC** Normal data was truncated.
 55304 **MSG_CTRUNC** Control data was truncated.

55305 RETURN VALUE

55306 Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no
 55307 messages are available to be received and the peer has performed an orderly shutdown,
 55308 *recvmsg()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

55309 ERRORS

55310 The *recvmsg()* function shall fail if:

55311 [EAGAIN] or [EWOULDBLOCK]
 55312 The socket's file descriptor is marked **O_NONBLOCK** and no data is waiting
 55313 to be received; or **MSG_OOB** is set and no out-of-band data is available and
 55314 either the socket's file descriptor is marked **O_NONBLOCK** or the socket does
 55315 not support blocking to await out-of-band data.

55316 [EBADF] The *socket* argument is not a valid open file descriptor.

55317 [ECONNRESET] A connection was forcibly closed by a peer.

55318 [EINTR] This function was interrupted by a signal before any data was available.

55319 [EINVAL] The sum of the *iov_len* values overflows a **ssize_t**, or the **MSG_OOB** flag is set
 55320 and no out-of-band data is available.

55321 [EMSGSIZE] The *msg_iovlen* member of the **msghdr** structure pointed to by *message* is less
 55322 than or equal to 0, or is greater than **{IOV_MAX}**.

55323 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

55324 [ENOTSOCK] The *socket* argument does not refer to a socket.

55325 [EOPNOTSUPP] The specified flags are not supported for this socket type.

55326 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
 55327 transmission timeout on active connection.

55328 The *recvmsg()* function may fail if:

55329 [EIO] An I/O error occurred while reading from or writing to the file system.
 55330 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
 55331 [ENOMEM] Insufficient memory was available to fulfill the request.

55332

EXAMPLES

55333

None.

CHANGE HISTORY

55344

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

55345 **NAME**

55346 regcomp, regerror, regex, regfree — regular expression matching

55347 **SYNOPSIS**

```
55348 #include <regex.h>
55349
55349 int regcomp(regex_t *restrict preg, const char *restrict pattern,
55350             int cflags);
55351 size_t regerror(int errcode, const regex_t *restrict preg,
55352               char *restrict errbuf, size_t errbuf_size);
55353 int regex(const regex_t *restrict preg, const char *restrict string,
55354           size_t nmatch, regmatch_t pmatch[restrict], int eflags);
55355 void regfree(regex_t *preg);
```

55356 **DESCRIPTION**55357 These functions interpret *basic* and *extended* regular expressions as described in XBD [Chapter 9](#) |
55358 (on page 167).55359 The `regex_t` structure is defined in `<regex.h>` and contains at least the following member:

Member Type	Member Name	Description
size_t	re_nsub	Number of parenthesized subexpressions.

55362 The `regmatch_t` structure is defined in `<regex.h>` and contains at least the following members:

Member Type	Member Name	Description
<code>regoff_t</code>	<code>rm_so</code>	Byte offset from start of <i>string</i> to start of substring.
<code>regoff_t</code>	<code>rm_eo</code>	Byte offset from start of <i>string</i> of the first character after the end of substring.

55367 The `regcomp()` function shall compile the regular expression contained in the string pointed to by
55368 the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags*
55369 argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in
55370 the `<regex.h>` header:

55371 REG_EXTENDED Use Extended Regular Expressions.
55372 REG_ICASE Ignore case in match (see XBD [Chapter 9](#), on page 167). |
55373 REG_NOSUB Report only success/fail in `regex()`.
55374 REG_NEWLINE Change the handling of <newline>s, as described in the text.

55375 The default regular expression type for *pattern* is a Basic Regular Expression. The application can
55376 specify Extended Regular Expressions using the REG_EXTENDED *cflags* flag.

55377 If the REG_NOSUB flag was not set in *cflags*, then `regcomp()` shall set `re_nsub` to the number of
55378 parenthesized subexpressions (delimited by "`\\(\\)`" in basic regular expressions or "`()`" in
55379 extended regular expressions) found in *pattern*.

55380 The `regex()` function compares the null-terminated string specified by *string* with the compiled
55381 regular expression *preg* initialized by a previous call to `regcomp()`. If it finds a match, `regex()`
55382 shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The
55383 *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are
55384 defined in the `<regex.h>` header:

55385 REG_NOTBOL The first character of the string pointed to by *string* is not the beginning of the
 55386 line. Therefore, the circumflex character ('^'), when taken as a special
 55387 character, shall not match the beginning of *string*.

55388 REG_NOTEOL The last character of the string pointed to by *string* is not the end of the line.
 55389 Therefore, the dollar sign ('\$'), when taken as a special character, shall not
 55390 match the end of *string*.

55391 If *nmatch* is 0 or REG_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexec()* shall
 55392 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument
 55393 points to an array with at least *nmatch* elements, and *regexec()* shall fill in the elements of that
 55394 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions
 55395 of *pattern*: *pmatch[i].rm_so* shall be the byte offset of the beginning and *pmatch[i].rm_eo* shall be
 55396 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th
 55397 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that
 55398 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*
 55399 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself
 55400 counts as a subexpression), then *regexec()* shall still do the match, but shall record only the first
 55401 *nmatch* substrings.

55402 When matching a basic or extended regular expression, any given parenthesized subexpression
 55403 of *pattern* might participate in the match of several different substrings of *string*, or it might not
 55404 match any substring even though the pattern as a whole did match. The following rules shall be
 55405 used to determine which substrings to report in *pmatch* when matching regular expressions:

55406 1. If subexpression *i* in a regular expression is not contained within another subexpression,
 55407 and it participated in the match several times, then the byte offsets in *pmatch[i]* shall
 55408 delimit the last such match.

55409 2. If subexpression *i* is not contained within another subexpression, and it did not
 55410 participate in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A
 55411 subexpression does not participate in the match when:

55412 ' * ' or " \{ \} " appears immediately after the subexpression in a basic regular
 55413 expression, or ' * ', ' ? ', or " { } " appears immediately after the subexpression in
 55414 an extended regular expression, and the subexpression did not match (matched 0
 55415 times)

55416 or:

55417 ' | ' is used in an extended regular expression to select this subexpression or
 55418 another, and the other subexpression matched.

55419 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained
 55420 within any other subexpression that is contained within *j*, and a match of subexpression *j*
 55421 is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in
 55422 *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in
 55423 *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start
 55424 of *string*.

55425 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are -1,
 55426 then the pointers in *pmatch[i]* shall also be -1.

55427 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be
 55428 the byte offset of the character or null terminator immediately following the zero-length
 55429 string.

55430 If, when *regexec()* is called, the locale is different from when the regular expression was
 55431 compiled, the result is undefined.

55432 If REG_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an
 55433 ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary
 55434 character except as follows:

- 55435 1. A <newline> in *string* shall not be matched by a period outside a bracket expression or by
 55436 any form of a non-matching list (see XBD Chapter 9, on page 167).
- 55437 2. A circumflex ('^') in *pattern*, when used to specify expression anchoring (see XBD
 55438 Section 9.3.8, on page 173), shall match the zero-length string immediately after a
 55439 <newline> in *string*, regardless of the setting of REG_NOTBOL.
- 55440 3. A dollar sign ('\$') in *pattern*, when used to specify expression anchoring, shall match the
 55441 zero-length string immediately before a <newline> in *string*, regardless of the setting of
 55442 REG_NOTEOL.

55443 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

55444 The following constants are defined as error return values:

55445	REG_NOMATCH	<i>regexec()</i> failed to match.
55446	REG_BADPAT	Invalid regular expression.
55447	REG_ECOLLATE	Invalid collating element referenced.
55448	REG_ECTYPE	Invalid character class type referenced.
55449	REG_EESCAPE	Trailing '\\' in pattern.
55450	REG_ESUBREG	Number in "\digit" invalid or in error.
55451	REG_EBRACK	"[]" imbalance.
55452	REG_EPAREN	"\(\)" or "()" imbalance.
55453	REG_EBRACE	"\{\}" imbalance.
55454	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than 55455 two numbers, first larger than second.
55456	REG_ERANGE	Invalid endpoint in range expression.
55457	REG_ESPACE	Out of memory.
55458	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.

55459 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and
 55460 *regexec()* to unspecified printable strings. It generates a string corresponding to the value of the
 55461 *errcode* argument, which the application shall ensure is the last non-zero value returned by
 55462 *regcomp()* or *regexec()* with the given value of *preg*. If *errcode* is not such a value, the content of
 55463 the generated string is unspecified.

55464 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec()* or *regcomp()*,
 55465 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not
 55466 be as detailed under some implementations.

55467 If the *errbuf_size* argument is not 0, *regerror()* shall place the generated string into the buffer of
 55468 size *errbuf_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit
 55469 in the buffer, *regerror()* shall truncate the string and null-terminate the result.

55470 If *errbuf_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer
 55471 needed to hold the generated string.

55472 If the *preg* argument to *regexec()* or *regfree()* is not a compiled regular expression returned by
 55473 *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression
 55474 after it is given to *regfree()*.

55475 **RETURN VALUE**

55476 Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an
 55477 integer value indicating an error as described in <regex.h>, and the content of *preg* is undefined.
 55478 If a code is returned, the interpretation shall be as given in <regex.h>.

55479 If *regcomp()* detects an invalid RE, it may return REG_BADPAT, or it may return one of the error
 55480 codes that more precisely describes the error.

55481 Upon successful completion, the *regexec()* function shall return 0. Otherwise, it shall return
 55482 REG_NOMATCH to indicate no match.

55483 Upon successful completion, the *regerror()* function shall return the number of bytes needed to
 55484 hold the entire generated string, including the null termination. If the return value is greater
 55485 than *errbuf_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

55486 The *regfree()* function shall not return a value.

55487 **ERRORS**

55488 No errors are defined.

55489 **EXAMPLES**

```

55490 #include <regex.h>
55491 /*
55492  * Match string against the extended regular expression in
55493  * pattern, treating errors as no match.
55494  *
55495  * Return 1 for match, 0 for no match.
55496  */
55497 int
55498 match(const char *string, char *pattern)
55499 {
55500     int     status;
55501     regex_t re;
55502     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
55503         return(0); /* Report error. */
55504     }
55505     status = regexec(&re, string, (size_t) 0, NULL, 0);
55506     regfree(&re);
55507     if (status != 0) {
55508         return(0); /* Report error. */
55509     }
55510     return(1);
55511 }

```

55512 The following demonstrates how the REG_NOTBOL flag could be used with *regexec()* to find all
 55513 substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very
 55514 little error checking is done.)

```

55515 (void) regcomp (&re, pattern, 0);
55516 /* This call to regexec() finds the first match on the line. */
55517 error = regexec (&re, &buffer[0], 1, &pm, 0);
55518 while (error == 0) { /* While matches found. */
55519     /* Substring found between pm.rm_so and pm.rm_eo. */
55520     /* This call to regexec() finds the next match. */
55521     error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
55522 }

```

APPLICATION USAGE

An application could use:

```
regerror(code, preg, (char *)NULL, (size_t)0)
```

to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed, static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger buffer if it finds that this is too small.

To match a pattern as described in XCU Section 2.13 (on page 2278), use the *fnmatch()* function.

RATIONALE

The *regexexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are supplied by the application, even if some elements of *pmatch* do not correspond to subexpressions in *pattern*. The application developer should note that there is probably no reason for using a value of *nmatch* that is larger than *preg->re_nsub*+1.

The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like text editors. In such applications, the user supplies an RE asking the application to find a line that matches the given expression. An anchor in such an RE anchors at the beginning or end of any line. Such an application can pass a sequence of <newline>-separated lines to *regexexec()* as a single long string and specify REG_NEWLINE to *regcomp()* to get the desired behavior. The application must ensure that there are no explicit <newline>s in *pattern* if it wants to ensure that any match occurs entirely within a single line.

The REG_NEWLINE flag affects the behavior of *regexexec()*, but it is in the *cflags* parameter to *regcomp()* to allow flexibility of implementation. Some implementations will want to generate the same compiled RE in *regcomp()* regardless of the setting of REG_NEWLINE and have *regexexec()* handle anchors differently based on the setting of the flag. Other implementations will generate different compiled REs based on the REG_NEWLINE.

The REG_ICASE flag supports the operations taken by the *grep -i* option and the historical implementations of *ex* and *vi*. Including this flag will make it easier for application code to be written that does the same thing as these utilities.

The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather than pointers. This allows type-safe access to both constant and non-constant strings.

The type **regoff_t** is used for the elements of *pmatch[]* to ensure that the application can represent large arrays in memory (important for an application conforming to the Shell and Utilities volume of POSIX.1-200x).

The 1992 edition of this standard required **regoff_t** to be at least as wide as **off_t**, to facilitate future extensions in which the string to be searched is taken from a file. However, these future extensions have not appeared. The requirement rules out popular implementations with 32-bit **regoff_t** and 64-bit **off_t**, so it has been removed.

The standard developers rejected the inclusion of a *regsub()* function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by *regexexec()*, is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The *errno* variable has not been used for error returns to avoid filling the *errno* name space for this feature.

The interface is defined so that the matched substrings *rm_sp* and *rm_ep* are in a separate

55571 **regmatch_t** structure instead of in **regex_t**. This allows a single compiled RE to be used
 55572 simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple
 55573 threads of lightweight processes. (The *preg* argument to *regexec()* is declared with type **const**, so
 55574 the implementation is not permitted to use the structure to store intermediate results.) It also
 55575 allows an application to request an arbitrary number of substrings from an RE. The number of
 55576 subexpressions in the RE is reported in *re_nsub* in *preg*. With this change to *regexec()*,
 55577 consideration was given to dropping the REG_NOSUB flag since the user can now specify this
 55578 with a zero *nmatch* argument to *regexec()*. However, keeping REG_NOSUB allows an
 55579 implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()* that
 55580 no subexpressions need be reported. The implementation is only required to fill in *pmatch* if
 55581 *nmatch* is not zero and if REG_NOSUB is not specified. Note that the **size_t** type, as defined in
 55582 the ISO C standard, is unsigned, so the description of *regexec()* does not need to address
 55583 negative values of *nmatch*.

55584 REG_NOTBOL was added to allow an application to do repeated searches for the same pattern
 55585 in a line. If the pattern contains a circumflex character that should match the beginning of a line,
 55586 then the pattern should only match when matched against the beginning of the line. Without
 55587 the REG_NOTBOL flag, the application could rewrite the expression for subsequent matches,
 55588 but in the general case this would require parsing the expression. The need for REG_NOTEOL is
 55589 not as clear; it was added for symmetry.

55590 The addition of the *regerror()* function addresses the historical need for conforming application
 55591 programs to have access to error information more than “Function failed to compile/match your
 55592 RE for unknown reasons”.

55593 This interface provides for two different methods of dealing with error conditions. The specific
 55594 error codes (REG_EBRACE, for example), defined in **<regex.h>**, allow an application to recover
 55595 from an error if it is so able. Many applications, especially those that use patterns supplied by a
 55596 user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-
 55597 readable error message to present to the user.

55598 The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating
 55599 memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was
 55600 considered unacceptable since it creates difficulties for multi-threaded applications.

55601 The *preg* argument is provided to *regerror()* to allow an implementation to generate a more
 55602 descriptive message than would be possible with *errcode* alone. An implementation might, for
 55603 example, save the character offset of the offending character of the pattern in a field of *preg*, and
 55604 then include that in the generated message string. The implementation may also ignore *preg*.

55605 A REG_FILENAME flag was considered, but omitted. This flag caused *regexec()* to match |
 55606 patterns as described in XCU [Section 2.13](#) (on page 2278) instead of REs. This service is now |
 55607 provided by the *fnmatch()* function.

55608 Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and
 55609 POSIX.1-200x in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says
 55610 that many bad constructs “produce undefined results”, or that “the interpretation is undefined”.
 55611 POSIX.1-200x, however, says that the interpretation of such REs is unspecified. The term
 55612 “undefined” means that the action by the application is an error, of similar severity to passing a
 55613 bad pointer to a function.

55614 The *regcomp()* and *regexec()* functions are required to accept any null-terminated string as the
 55615 *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is
 55616 “unspecified”. POSIX.1-200x does not specify how the functions will interpret the pattern; they
 55617 might return error codes, or they might do pattern matching in some completely unexpected
 55618 way, but they should not do something like abort the process.

XCU Section 2.13 (on page 2278)

CHANGE HISTORY

First released in Issue 4. Derived from the ISO POSIX-2 standard.

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The normative text is updated to avoid use of the term “must” for application requirements.

The REG_ENOSYS constant is removed.

The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexec()* prototypes for alignment with the ISO/IEC 9899:1999 standard.**Issue 7**

SD5-XBD-ERN-60 is applied.

55642 **NAME**
 55643 remainder, remainderf, remainderl — remainder function

55644 **SYNOPSIS**
 55645 #include <math.h>
 55646 double remainder(double x, double y);
 55647 float remainderf(float x, float y);
 55648 long double remainderl(long double x, long double y);

55649 **DESCRIPTION**

55650 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 55651 conflict between the requirements described here and the ISO C standard is unintentional. This
 55652 volume of POSIX.1-200x defers to the ISO C standard.

55653 These functions shall return the floating-point remainder $r=x-ny$ when y is non-zero. The value
 55654 n is the integral value nearest the exact value x/y . When $|n-x/y|=\frac{1}{2}$, the value n is chosen to
 55655 be even.

55656 The behavior of *remainder()* shall be independent of the rounding mode.

55657 **RETURN VALUE**

55658 Upon successful completion, these functions shall return the floating-point remainder $r=x-ny$
 55659 when y is non-zero.

55660 On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is
 55661 implementation-defined whether a domain error occurs or zero is returned.

55662 MX If x or y is NaN, a NaN shall be returned.

55663 If x is infinite or y is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if
 55664 supported), or an implementation-defined value shall be returned.

55665 **ERRORS**

55666 These functions shall fail if:

55667 MX **Domain Error** The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-
 55668 NaN.

55669 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 55670 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 55671 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 55672 shall be raised.

55673 These functions may fail if:

55674 **Domain Error** The y argument is zero.

55675 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 55676 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 55677 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 55678 shall be raised.

remainder()

55679

EXAMPLES

55680

None.

55681

APPLICATION USAGE

55682

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

55683

55684

55691

CHANGE HISTORY

55692

First released in Issue 4, Version 2.

55693

Issue 5

55694

Moved from X/OPEN UNIX extension to BASE.

55695

Issue 6

55696

The *remainder()* function is no longer marked as an extension.

55697

The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

55698

55699

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

55700

55701

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

55702

55703

Issue 7

55704

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #55 (SD5-XSH-ERN-82) is applied.

55705 **NAME**

55706 remove — remove a file

55707 **SYNOPSIS**

55708 #include <stdio.h>

55709 int remove(const char *path);

55710 **DESCRIPTION**

55711 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 55712 conflict between the requirements described here and the ISO C standard is unintentional. This
 55713 volume of POSIX.1-200x defers to the ISO C standard.

55714 The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no
 55715 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,
 55716 unless it is created anew.

55717 CX If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

55718 If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

55719 **RETURN VALUE**55720 CX Refer to *rmdir* or *unlink*.55721 **ERRORS**55722 CX Refer to *rmdir* or *unlink*.55723 **EXAMPLES**55724 **Removing Access to a File**55725 The following example shows how to remove access to a file named */home/cnd/old_mods*.

```
55726 #include <stdio.h>
55727 int status;
55728 ...
55729 status = remove("/home/cnd/old_mods");
```

55730 **APPLICATION USAGE**

55731 None.

55732 **RATIONALE**

55733 None.

55734 **FUTURE DIRECTIONS**

55735 None.

55736 **SEE ALSO**55737 *rmdir*, *unlink*

55738 XBD <stdio.h>

55739 **CHANGE HISTORY**

55740 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C
 55741 standard.

55742

Issue 6

55743

Extensions beyond the ISO C standard are marked.

55744

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

55745

55746

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

55747

55748

55749 **NAME**
55750 `remque` — remove an element from a queue

55751 **SYNOPSIS**

55752 XSI `#include <search.h>`
55753 `void remque(void *element);`

55754 **DESCRIPTION**

55755 Refer to *insque()*.

55756 **NAME**
 55757 remquo, remquof, remquol — remainder functions

55758 **SYNOPSIS**
 55759 #include <math.h>
 55760 double remquo(double x, double y, int *quo);
 55761 float remquof(float x, float y, int *quo);
 55762 long double remquol(long double x, long double y, int *quo);

55763 **DESCRIPTION**
 55764 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 55765 conflict between the requirements described here and the ISO C standard is unintentional. This
 55766 volume of POSIX.1-200x defers to the ISO C standard.

55767 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the
 55768 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by *quo*,
 55769 they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo 2^n
 55770 to the magnitude of the integral quotient of x/y , where n is an implementation-defined integer
 55771 greater than or equal to 3. If y is zero, the value stored in the object pointed to by *quo* is
 55772 unspecified.

55773 An application wishing to check for error situations should set *errno* to zero and call
 55774 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 55775 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 55776 zero, an error has occurred.

55777 **RETURN VALUE**
 55778 These functions shall return $x \text{ REM } y$.
 55779 On systems that do not support the IEC 60559 Floating-Point option, if y is zero, it is
 55780 implementation-defined whether a domain error occurs or zero is returned.

55781 MX If x or y is NaN, a NaN shall be returned.
 55782 If x is $\pm\text{Inf}$ or y is zero and the other argument is non-NaN, a domain error shall occur, and either
 55783 a NaN (if supported), or an implementation-defined value shall be returned.

55784 **ERRORS**
 55785 These functions shall fail if:
 55786 MX **Domain Error** The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-
 55787 NaN.
 55788 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 55789 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 55790 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 55791 shall be raised.

55792 These functions may fail if:
 55793 **Domain Error** The y argument is zero.
 55794 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 55795 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 55796 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 55797 shall be raised.

55798

EXAMPLES

55799

None.

55800

APPLICATION USAGE

55801

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

55802

55803

RATIONALE

55804

These functions are intended for implementing argument reductions which can exploit a few low-order bits of the quotient. Note that x may be so large in magnitude relative to y that an exact representation of the quotient is not practical.

55805

55806

55807

FUTURE DIRECTIONS

55808

None.

DRAFT

55816 **NAME**

55817 rename, renameat — rename file relative to directory file descriptor

55818 **SYNOPSIS**

55819 #include <stdio.h>

55820 int rename(const char *old, const char *new);

55821 CX int renameat(int oldfd, const char *old, int newfd,
55822 const char *new);55823 **DESCRIPTION**55824 CX For *rename()*: The functionality described on this reference page is aligned with the ISO C
55825 standard. Any conflict between the requirements described here and the ISO C standard is
55826 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.55827 The *rename()* function shall change the name of a file. The *old* argument points to the pathname
55828 of the file to be renamed. The *new* argument points to the new pathname of the file.55829 CX If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic
55830 link itself, and shall not resolve the last component of the argument. If the *old* argument and the
55831 *new* argument resolve to the same existing file, *rename()* shall return successfully and perform no
55832 other action.55833 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall
55834 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be
55835 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other
55836 processes throughout the renaming operation and refer either to the file referred to by *new* or *old*
55837 before the operation began. Write access permission is required for both the directory containing
55838 *old* and the directory containing *new*.55839 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the
55840 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it
55841 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout
55842 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the
55843 operation began. If *new* names an existing directory, it shall be required to be an empty directory.55844 If either *pathname* argument refers to a path whose final component is either dot or dot-dot,
55845 *rename()* shall fail.55846 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.
55847 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.55848 The *new* pathname shall not contain a path prefix that names *old*. Write access permission is
55849 required for the directory containing *old* and the directory containing *new*. If the *old* argument
55850 points to the pathname of a directory, write access permission may be required for the directory
55851 named by *old*, and, if it exists, the directory named by *new*.55852 If the link named by the *new* argument exists and the file's link count becomes 0 when it is
55853 removed and no process has the file open, the space occupied by the file shall be freed and the
55854 file shall no longer be accessible. If one or more processes have the file open when the last link is
55855 removed, the link shall be removed before *rename()* returns, but the removal of the file contents
55856 shall be postponed until all references to the file are closed.55857 Upon successful completion, *rename()* shall mark for update the last data modification and last
55858 file status change timestamps of the parent directory of each file.55859 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be

55860

unaffected.

55861

55862

55863

55864

55865

55866

55867

The *renameat()* function shall be equivalent to the *rename()* function except in the case where either *old* or *new* specifies a relative path. If *old* is a relative path, the file to be renamed is located relative to the directory associated with the file descriptor *oldfd* instead of the current working directory. If *new* is a relative path, the same happens only relative to the directory associated with *newfd*. It is unspecified whether directory searches are permitted based on whether the file was opened with search permission or on the current permissions of the directory underlying the file descriptor.

55868

55869

If *renameat()* is passed the special value *AT_FDCWD* in the *oldfd* or *newfd* parameter, the current working directory shall be used in the determination of the file for the respective *path* parameter.

55870

RETURN VALUE

55871

CX Upon successful completion, the *rename()* function shall return 0. Otherwise, it shall return *-1*, *errno* shall be set to indicate the error, and neither the file named by *old* nor the file named by *new* shall be changed or created.

55874

55875

CX Upon successful completion, the *renameat()* function shall return 0. Otherwise, it shall return *-1* and set *errno* to indicate the error.

55876

ERRORS

55877

CX The *rename()* and *renameat()* functions shall fail if:

55878

55879

55880

55881

CX **[EACCES]** A component of either path prefix denies search permission; or one of the directories containing *old* or *new* denies write permissions; or, write permission is required and is denied for a directory pointed to by the *old* or *new* arguments.

55882

55883

CX **[EBUSY]** The directory named by *old* or *new* is currently in use by the system or another process, and the implementation considers this an error.

55884

55885

CX **[EEXIST] or [ENOTEMPTY]** The link named by *new* is a directory that is not an empty directory.

55886

55887

55888

CX **[EINVAL]** The *new* directory pathname contains a path prefix that names the *old* directory, or either *pathname* argument contains a final component that is dot or dot-dot.

55889

CX **[EIO]** A physical I/O error has occurred.

55890

55891

CX **[EISDIR]** The *new* argument points to a directory and the *old* argument points to a file that is not a directory.

55892

55893

CX **[ELOOP]** A loop exists in symbolic links encountered during resolution of the *path* argument.

55894

55895

CX **[EMLINK]** The file named by *old* is a directory, and the link count of the parent directory of *new* would exceed *{LINK_MAX}*.

55896

55897

55898

CX **[ENAMETOOLONG]** The length of the *old* or *new* argument exceeds *{PATH_MAX}* or a pathname component is longer than *{NAME_MAX}*.

55899

55900

CX **[ENOENT]** The link named by *old* does not name an existing file, or either *old* or *new* points to an empty string.

55901

CX **[ENOSPC]** The directory that would contain *new* cannot be extended.

55902

55903

CX **[ENOTDIR]** A component of either path prefix is not a directory; or the *old* argument names a directory and *new* argument names a non-directory file.

rename()

System Interfaces

55904	XSI	[EPERM] or [EACCES]	
55905			The S_ISVTX flag is set on the directory containing the file referred to by <i>old</i>
55906			and the caller is not the file owner, nor is the caller the directory owner, nor
55907			does the caller have appropriate privileges; or <i>new</i> refers to an existing file, the
55908			S_ISVTX flag is set on the directory containing this file, and the caller is not
55909			the file owner, nor is the caller the directory owner, nor does the caller have
55910			appropriate privileges.
55911	CX	[EROFS]	The requested operation requires writing in a directory on a read-only file
55912			system.
55913	CX	[EXDEV]	The links named by <i>new</i> and <i>old</i> are on different file systems and the
55914			implementation does not support links between file systems.
55915	CX		In addition, the <i>renameat()</i> function shall fail if:
55916		[EBADF]	The <i>old</i> argument does not specify an absolute path and the <i>oldfd</i> argument is
55917			neither AT_FDCWD nor a valid file descriptor open for reading, or the <i>new</i>
55918			argument does not specify an absolute path and the <i>newfd</i> argument is neither
55919			AT_FDCWD nor a valid file descriptor open for reading.
55920	CX		The <i>rename()</i> and <i>renameat()</i> functions may fail if:
55921	OB XSR	[EBUSY]	The file named by the <i>old</i> or <i>new</i> arguments is a named STREAM.
55922	CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
55923			resolution of the <i>path</i> argument.
55924	CX	[ENAMETOOLONG]	
55925			As a result of encountering a symbolic link in resolution of the <i>path</i> argument,
55926			the length of the substituted pathname string exceeded {PATH_MAX}.
55927	CX	[ETXTBSY]	The file to be renamed is a pure procedure (shared text) file that is being
55928			executed.
55929	CX		The <i>renameat()</i> function may fail if:
55930		[ENOTDIR]	The <i>old</i> argument is not an absolute path and <i>oldfd</i> is neither AT_FDCWD nor
55931			a file descriptor associated with a directory, or the <i>new</i> argument is not an
55932			absolute path and <i>newfd</i> is neither AT_FDCWD nor a file descriptor associated
55933			with a directory.

EXAMPLES**Renaming a File**

The following example shows how to rename a file named `/home/cnd/mod1` to `/home/cnd/mod2`.

```
#include <stdio.h>

int status;
...
status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

APPLICATION USAGE

Some implementations mark for update the last file status change timestamp of renamed files and some do not. Applications which make use of the last file status change timestamp may behave differently with respect to renamed files unless they are designed to allow for either behavior.

RATIONALE

This *rename()* function is equivalent for regular files to that defined by the ISO C standard. Its inclusion here expands that definition to include actions on directories and specifies behavior when the *new* parameter names a file that already exists. That specification requires that the action of the function be atomic.

One of the reasons for introducing this function was to have a means of renaming directories while permitting implementations to prohibit the use of *link()* and *unlink()* with directories, thus constraining links to directories to those made by *mkdir()*.

The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
rename("x", "x");
```

does not remove the file.

Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir* and [EBUSY] in *unlink*. For a discussion of [EXDEV], see *link*.

The purpose of the *renameat()* function is to rename files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *rename()*, resulting in unspecified behavior. By opening file descriptors for the source and target directories and using the *renameat()* function it can be guaranteed that that renamed file is located correctly and the resulting file is in the desired directory.

FUTURE DIRECTIONS

None.

XBD <stdio.h>

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The [EBUSY] error is added to the optional part of the ERRORS section.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The normative text is updated to avoid use of the term “must” for application requirements.

rename()

55988	Issue 7	
55989		Austin Group Interpretation 1003.1-2001 #076 is applied, clarifying the behavior if the final component of a path is either dot or dot-dot, and adding the associated [EINVAL] error case.
55990		
55991		The <i>renameat()</i> function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.
55992		
55993		Changes are made related to support for finegrained timestamps.
55994		

55995 **NAME**
 55996 `rewind` — reset the file position indicator in a stream

55997 **SYNOPSIS**
 55998 `#include <stdio.h>`

55999 `void rewind(FILE *stream);`

56000 **DESCRIPTION**

56001 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56002 conflict between the requirements described here and the ISO C standard is unintentional. This
 56003 volume of POSIX.1-200x defers to the ISO C standard.

56004 The call:

56005 `rewind(stream)`

56006 shall be equivalent to:

56007 `(void) fseek(stream, 0L, SEEK_SET)`

56008 except that `rewind()` shall also clear the error indicator.

56009 CX Since `rewind()` does not return a value, an application wishing to detect errors should clear `errno`,
 56010 then call `rewind()`, and if `errno` is non-zero, assume an error has occurred.

56011 **RETURN VALUE**

56012 The `rewind()` function shall not return a value.

56013 **ERRORS**

56014 CX Refer to `fseek()` with the exception of [EINVAL] which does not apply.

56015 **EXAMPLES**

56016 None.

56017 **APPLICATION USAGE**

56018 None.

56019 **RATIONALE**

56020 None.

56021 **FUTURE DIRECTIONS**

56022 None.

56023 **SEE ALSO**

56024 `fseek()`

56025 XBD `<stdio.h>`

56026 **CHANGE HISTORY**

56027 First released in Issue 1. Derived from Issue 1 of the SVID.

56028 **Issue 6**

56029 Extensions beyond the ISO C standard are marked.

56030 **NAME**56031 `rewinddir` — reset the position of a directory stream to the beginning of a directory56032 **SYNOPSIS**56033 `#include <dirent.h>`56034 `void rewinddir(DIR *dirp);`56035 **DESCRIPTION**

56036 The `rewinddir()` function shall reset the position of the directory stream to which `dirp` refers to the
 56037 beginning of the directory. It shall also cause the directory stream to refer to the current state of
 56038 the corresponding directory, as a call to `opendir()` would have done. If `dirp` does not refer to a
 56039 directory stream, the effect is undefined.

56040 After a call to the `fork()` function, either the parent or child (but not both) may continue
 56041 processing the directory stream using `readdir()`, `rewinddir()`, or `seekdir()`. If both the parent and
 56042 child processes use these functions, the result is undefined.

56043 **RETURN VALUE**56044 The `rewinddir()` function shall not return a value.56045 **ERRORS**

56046 No errors are defined.

56047 **EXAMPLES**

56048 None.

56049 **APPLICATION USAGE**

56050 The `rewinddir()` function should be used in conjunction with `opendir()`, `readdir()`, and `closedir()` to
 56051 examine the contents of the directory. This method is recommended for portability.

56052 **RATIONALE**

56053 None.

56054 **FUTURE DIRECTIONS**

56055 None.

56056 **SEE ALSO**56057 `closedir()`, `fdopendir()`, `readdir()`56058 XBD `<dirent.h>`, `<sys/types.h>`56059 **CHANGE HISTORY**

56060 First released in Issue 2.

56061 **Issue 6**56062 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

56063 The following new requirements on POSIX implementations derive from alignment with the
 56064 Single UNIX Specification:

- 56065 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
 56066 required for conforming implementations of previous POSIX specifications, it was not
 56067 required for UNIX applications.

56068 **NAME**
 56069 rint, rintf, rintl — round-to-nearest integral value

56070 **SYNOPSIS**
 56071 #include <math.h>
 56072 double rint(double x);
 56073 float rintf(float x);
 56074 long double rintl(long double x);

56075 DESCRIPTION

56076 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56077 conflict between the requirements described here and the ISO C standard is unintentional. This
 56078 volume of POSIX.1-200x defers to the ISO C standard.

56079 These functions shall return the integral value (represented as a **double**) nearest x in the
 56080 direction of the current rounding mode. The current rounding mode is implementation-defined.

56081 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to
 56082 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be
 56083 equivalent to *ceil()*.

56084 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that
 56085 they may raise the inexact floating-point exception if the result differs in value from the
 56086 argument.

56087 An application wishing to check for error situations should set *errno* to zero and call
 56088 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 56089 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 56090 zero, an error has occurred.

56091 RETURN VALUE

56092 Upon successful completion, these functions shall return the integer (represented as a double
 56093 precision number) nearest x in the direction of the current rounding mode.

56094 MX If x is NaN, a NaN shall be returned.

56095 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

56096 XSI If the correct value would cause overflow, a range error shall occur and *rint()*, *rintf()*, and *rintl()*
 56097 shall return the value of the macro $\pm \text{HUGE_VAL}$, $\pm \text{HUGE_VALF}$, and $\pm \text{HUGE_VALL}$ (with the
 56098 same sign as x), respectively.

56099 ERRORS

56100 These functions shall fail if:

56101 XSI **Range Error** The result would cause an overflow.

56102 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 56103 then *errno* shall be set to [ERANGE]. If the integer expression
 56104 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 56105 floating-point exception shall be raised.

XBD Section 4.19 (on page 104), **<math.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *rintf()* and *rintl()* functions are added.
- The *rint()* function is no longer marked as an extension.
- The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

56130 **NAME**56131 `rmdir` — remove a directory56132 **SYNOPSIS**56133 `#include <unistd.h>`56134 `int rmdir(const char *path);`56135 **DESCRIPTION**56136 The `rmdir()` function shall remove a directory whose name is given by *path*. The directory shall
56137 be removed only if it is an empty directory.56138 If the directory is the root directory or the current working directory of any process, it is
56139 unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].56140 If *path* names a symbolic link, then `rmdir()` shall fail and set *errno* to [ENOTDIR].56141 If the *path* argument refers to a path whose final component is either dot or dot-dot, `rmdir()` shall
56142 fail.56143 If the directory's link count becomes 0 and no process has the directory open, the space occupied
56144 by the directory shall be freed and the directory shall no longer be accessible. If one or more
56145 processes have the directory open when the last link is removed, the dot and dot-dot entries, if
56146 present, shall be removed before `rmdir()` returns and no new entries may be created in the
56147 directory, but the directory shall not be removed until all references to the directory are closed.56148 If the directory is not an empty directory, `rmdir()` shall fail and set *errno* to [EEXIST] or
56149 [ENOTEMPTY].56150 Upon successful completion, `rmdir()` shall mark for update the last data modification and last
56151 file status change timestamps of the parent directory.56152 **RETURN VALUE**56153 Upon successful completion, the function `rmdir()` shall return 0. Otherwise, -1 shall be returned,
56154 and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.56155 **ERRORS**56156 The `rmdir()` function shall fail if:56157 [EACCES] Search permission is denied on a component of the path prefix, or write
56158 permission is denied on the parent directory of the directory to be removed.56159 [EBUSY] The directory to be removed is currently in use by the system or some process
56160 and the implementation considers this to be an error.56161 [EEXIST] or [ENOTEMPTY] The *path* argument names a directory that is not an empty directory, or there
56162 are hard links to the directory other than dot or a single entry in dot-dot.
5616356164 [EINVAL] The *path* argument contains a last component that is dot.

56165 [EIO] A physical I/O error has occurred.

56166 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
56167 argument.56168 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
56169 component is longer than {NAME_MAX}.
56170

56171	[ENOENT]	A component of <i>path</i> does not name an existing file, or the <i>path</i> argument names a nonexistent directory or points to an empty string.
56172		
56173	[ENOTDIR]	A component of <i>path</i> is not a directory.
56174	XSI [EPERM] or [EACCES]	The S_ISVTX flag is set on the parent directory of the directory to be removed and the caller is not the owner of the directory to be removed, nor is the caller the owner of the parent directory, nor does the caller have the appropriate privileges.
56175		
56176		
56177		
56178		
56179	[EROFS]	The directory entry to be removed resides on a read-only file system.
56180		The <i>rmdir()</i> function may fail if:
56181	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
56182		
56183	[ENAMETOOLONG]	As a result of encountering a symbolic link in resolution of the <i>path</i> argument, the length of the substituted pathname string exceeded {PATH_MAX}.
56184		
56185		

EXAMPLES**Removing a Directory**

The following example shows how to remove a directory named **/home/cnd/mod1**.

```
#include <unistd.h>

int status;
...
status = rmdir("/home/cnd/mod1");
```

APPLICATION USAGE

None.

RATIONALE

The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the condition when the directory to be removed does not exist or *new* already exists. When the 1984 /usr/group standard was published, it contained [EEXIST] instead. When these functions were adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore, several existing applications and implementations support/use both forms, and no agreement could be reached on either value. All implementations are required to supply both [EEXIST] and [ENOTEMPTY] in **<errno.h>** with distinct values, so that applications can use both values in C-language **case** statements.

The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the parent directory to be removed is not clear, particularly in the presence of multiple links to a directory.

The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or [ENOTEMPTY] clarifies the behavior in this case.

If the current working directory of the process is being removed, that should be an allowed error.

Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in [Section 2.3](#) (on page 456) about returning any one of the possible errors permits that behavior to continue. The [ELOOP] error may be returned if more than {SYMLOOP_MAX} symbolic links are encountered during resolution of the *path* argument.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

Changes are made related to support for finegrained timestamps.

DRAFT

56234 **NAME**

56235 round, roundf, roundl — round to the nearest integer value in a floating-point format

56236 **SYNOPSIS**

```
56237 #include <math.h>
56238
56238 double round(double x);
56239 float roundf(float x);
56240 long double roundl(long double x);
```

56241 **DESCRIPTION**

56242 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56243 conflict between the requirements described here and the ISO C standard is unintentional. This
 56244 volume of POSIX.1-200x defers to the ISO C standard.

56245 These functions shall round their argument to the nearest integer value in floating-point format,
 56246 rounding halfway cases away from zero, regardless of the current rounding direction.

56247 An application wishing to check for error situations should set *errno* to zero and call
 56248 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 56249 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 56250 zero, an error has occurred.

56251 **RETURN VALUE**

56252 Upon successful completion, these functions shall return the rounded integer value.

56253 MX If *x* is NaN, a NaN shall be returned.56254 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.

56255 XSI If the correct value would cause overflow, a range error shall occur and *round()*, *roundf()*, and
 56256 *roundl()* shall return the value of the macro $\pm \text{HUGE_VAL}$, $\pm \text{HUGE_VALF}$, and $\pm \text{HUGE_VALL}$
 56257 (with the same sign as *x*), respectively.

56258 **ERRORS**

56259 These functions may fail if:

56260 XSI **Range Error** The result overflows.

56261 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 56262 then *errno* shall be set to [ERANGE]. If the integer expression
 56263 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 56264 floating-point exception shall be raised.

56265 **EXAMPLES**

56266 None.

56267 **APPLICATION USAGE**

56268 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 56269 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

56270 **RATIONALE**

56271 None.

56272 **FUTURE DIRECTIONS**

56273 None.

CHANGE HISTORY

56278

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

DRAFT

56279 **NAME**

56280 scalbn, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX

56281 **SYNOPSIS**

```
56282 #include <math.h>
56283
56283 double scalbn(double x, long n);
56284 float scalblnf(float x, long n);
56285 long double scalblnl(long double x, long n);
56286 double scalbn(double x, int n);
56287 float scalbnf(float x, int n);
56288 long double scalbnl(long double x, int n);
```

56289 **DESCRIPTION**

56290 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 56291 conflict between the requirements described here and the ISO C standard is unintentional. This
 56292 volume of POSIX.1-200x defers to the ISO C standard.

56293 These functions shall compute $x * FLT_RADIX^n$ efficiently, not normally by computing
 56294 FLT_RADIX^n explicitly.

56295 An application wishing to check for error situations should set *errno* to zero and call
 56296 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 56297 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 56298 zero, an error has occurred.

56299 **RETURN VALUE**56300 Upon successful completion, these functions shall return $x * FLT_RADIX^n$.

56301 If the result would cause overflow, a range error shall occur and these functions shall return
 56302 $\pm HUGE_VAL$, $\pm HUGE_VALF$, and $\pm HUGE_VALL$ (according to the sign of x) as appropriate for
 56303 the return type of the function.

56304 If the correct value would cause underflow, and is not representable, a range error may occur,
 56305 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

56306 MX If x is NaN, a NaN shall be returned.

56307 If x is ± 0 or $\pm Inf$, x shall be returned.

56308 If n is 0, x shall be returned.

56309 If the correct value would cause underflow, and is representable, a range error may occur and
 56310 the correct value shall be returned.

56311 **ERRORS**

56312 These functions shall fail if:

56313 Range Error The result overflows.

56314 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 56315 then *errno* shall be set to [ERANGE]. If the integer expression
 56316 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 56317 floating-point exception shall be raised.

56318 These functions may fail if:

56319 Range Error The result underflows.

56320 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 56321 then *errno* shall be set to [ERANGE]. If the integer expression

(*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

These functions are named so as to avoid conflicting with the historical definition of the *scalb()* function from the Single UNIX Specification. The difference is that the *scalb()* function has a second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard. The three functions whose second type is **long** are provided because the factor required to scale from the smallest positive floating-point value to the largest finite one, on many implementations, is too large to represent in the minimum-width **int** format.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

56343 **NAME**
56344 `scandir` — scan a directory

56345 **SYNOPSIS**
56346 `#include <dirent.h>`
56347 `int scandir(const char *dir, struct dirent ***namelist,`
56348 `int (*sel)(const struct dirent *),`
56349 `int (*compar)(const struct dirent **, const struct dirent **));`

56350 **DESCRIPTION**
56351 Refer to *alphasort()*.

56352

NAME

56353

scanf — convert formatted input

56354

SYNOPSIS

56355

#include <stdio.h>

56356

int scanf(const char *restrict *format*, ...);

56357

DESCRIPTION

56358

Refer to *fscanf()*.

56359 **NAME**56360 sched_get_priority_max, sched_get_priority_min — get priority limits (**REALTIME**)56361 **SYNOPSIS**

```
56362 PS|TPS #include <sched.h>
56363 int sched_get_priority_max(int policy);
56364 int sched_get_priority_min(int policy);
```

56365 **DESCRIPTION**56366 The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the appropriate
56367 maximum or minimum, respectively, for the scheduling policy specified by *policy*.56368 The value of *policy* shall be one of the scheduling policy values defined in **<sched.h>**.56369 **RETURN VALUE**56370 If successful, the *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the
56371 appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a
56372 value of -1 and set *errno* to indicate the error.56373 **ERRORS**56374 The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall fail if:56375 [EINVAL] The value of the *policy* parameter does not represent a defined scheduling
56376 policy.56377 **EXAMPLES**

56378 None.

56379 **APPLICATION USAGE**

56380 None.

56381 **RATIONALE**

56382 None.

56383 **FUTURE DIRECTIONS**

56384 None.

56385 **SEE ALSO**56386 *sched_getparam()*, *sched_setparam()*, *sched_getscheduler()*, *sched_rr_get_interval()*,
56387 *sched_setscheduler()*56388 XBD **<sched.h>** +56389 **CHANGE HISTORY**

56390 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56391 **Issue 6**

56392 These functions are marked as part of the Process Scheduling option.

56393 The [ENOSYS] error condition has been removed as stubs need not be provided if an
56394 implementation does not support the Process Scheduling option.56395 The [ESRCH] error condition has been removed since these functions do not take a *pid*
56396 argument.56397 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin
56398 code in the SYNOPSIS to PS|TPS.

56399 **NAME**56400 sched_getparam — get scheduling parameters (**REALTIME**)56401 **SYNOPSIS**

```
56402 PS #include <sched.h>
56403 int sched_getparam(pid_t pid, struct sched_param *param);
```

56404 **DESCRIPTION**

56405 The *sched_getparam()* function shall return the scheduling parameters of a process specified by
56406 *pid* in the **sched_param** structure pointed to by *param*.

56407 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
56408 parameters for the process whose process ID is equal to *pid* shall be returned.

56409 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of
56410 the *sched_getparam()* function is unspecified if the value of *pid* is negative.

56411 **RETURN VALUE**

56412 Upon successful completion, the *sched_getparam()* function shall return zero. If the call to
56413 *sched_getparam()* is unsuccessful, the function shall return a value of -1 and set *errno* to indicate
56414 the error.

56415 **ERRORS**

56416 The *sched_getparam()* function shall fail if:

56417 [EPERM] The requesting process does not have permission to obtain the scheduling
56418 parameters of the specified process.

56419 [ESRCH] No process can be found corresponding to that specified by *pid*.

56420 **EXAMPLES**

56421 None.

56422 **APPLICATION USAGE**

56423 None.

56424 **RATIONALE**

56425 None.

56426 **FUTURE DIRECTIONS**

56427 None.

56428 **SEE ALSO**

56431 **CHANGE HISTORY**

56432 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56433 **Issue 6**

56434 The *sched_getparam()* function is marked as part of the Process Scheduling option.

56435 The [ENOSYS] error condition has been removed as stubs need not be provided if an
56436 implementation does not support the Process Scheduling option.

56437 **NAME**56438 sched_getscheduler — get scheduling policy (**REALTIME**)56439 **SYNOPSIS**

```
56440 PS #include <sched.h>
56441 int sched_getscheduler(pid_t pid);
```

56442 **DESCRIPTION**

56443 The *sched_getscheduler()* function shall return the scheduling policy of the process specified by
 56444 *pid*. If the value of *pid* is negative, the behavior of the *sched_getscheduler()* function is
 56445 unspecified.

56446 The values that can be returned by *sched_getscheduler()* are defined in the **<sched.h>** header.

56447 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
 56448 policy shall be returned for the process whose process ID is equal to *pid*.

56449 If *pid* is zero, the scheduling policy shall be returned for the calling process.

56450 **RETURN VALUE**

56451 Upon successful completion, the *sched_getscheduler()* function shall return the scheduling policy
 56452 of the specified process. If unsuccessful, the function shall return -1 and set *errno* to indicate the
 56453 error.

56454 **ERRORS**

56455 The *sched_getscheduler()* function shall fail if:

56456 [EPERM] The requesting process does not have permission to determine the scheduling
 56457 policy of the specified process.

56458 [ESRCH] No process can be found corresponding to that specified by *pid*.

56459 **EXAMPLES**

56460 None.

56461 **APPLICATION USAGE**

56470 **CHANGE HISTORY**

56471 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56472 **Issue 6**

56473 The *sched_getscheduler()* function is marked as part of the Process Scheduling option.

56474 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56475 implementation does not support the Process Scheduling option.

56476 **NAME**56477 sched_rr_get_interval — get execution time limits (**REALTIME**)56478 **SYNOPSIS**

56479 PS|TPS #include <sched.h>

56480 int sched_rr_get_interval(pid_t pid, struct timespec *interval);

56481 **DESCRIPTION**

56482 The *sched_rr_get_interval()* function shall update the **timespec** structure referenced by the
 56483 *interval* argument to contain the current execution time limit (that is, time quantum) for the
 56484 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process
 56485 shall be returned.

56486 **RETURN VALUE**

56487 If successful, the *sched_rr_get_interval()* function shall return zero. Otherwise, it shall return a
 56488 value of -1 and set *errno* to indicate the error.

56489 **ERRORS**56490 The *sched_rr_get_interval()* function shall fail if:56491 [ESRCH] No process can be found corresponding to that specified by *pid*.56492 **EXAMPLES**

56493 None.

56494 **APPLICATION USAGE**

56495 None.

56496 **RATIONALE**

56500 **SEE ALSO**

56501 *sched_getparam()*, *sched_get_priority_max()*, *sched_getscheduler()*, *sched_setparam()*,
 56502 *sched_setscheduler()*

56503 XBD <[sched.h](#)>56504 **CHANGE HISTORY**

56505 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56506 **Issue 6**56507 The *sched_rr_get_interval()* function is marked as part of the Process Scheduling option.

56508 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56509 implementation does not support the Process Scheduling option.

56510 IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in
 56511 the SYNOPSIS to PS|TPS.

56512 **NAME**56513 sched_setparam — set scheduling parameters (**REALTIME**)56514 **SYNOPSIS**

```
56515 PS #include <sched.h>
56516 int sched_setparam(pid_t pid, const struct sched_param *param);
```

56517 **DESCRIPTION**

56518 The *sched_setparam()* function shall set the scheduling parameters of the process specified by *pid*
 56519 to the values specified by the **sched_param** structure pointed to by *param*. The value of the
 56520 *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive
 56521 priority range for the current scheduling policy of the process specified by *pid*. Higher
 56522 numerical values for the priority represent higher priorities. If the value of *pid* is negative, the
 56523 behavior of the *sched_setparam()* function is unspecified.

56524 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
 56525 parameters shall be set for the process whose process ID is equal to *pid*.

56526 If *pid* is zero, the scheduling parameters shall be set for the calling process.

56527 The conditions under which one process has permission to change the scheduling parameters of
 56528 another process are implementation-defined.

56529 Implementations may require the requesting process to have the appropriate privilege to set its
 56530 own scheduling parameters or those of another process.

56531 See [Scheduling Policies](#) (on page 479) for a description on how this function affects the
 56532 scheduling of the threads within the target process.

56533 SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or
 56534 SCHED_SPORADIC, the result is implementation-defined; this case includes the
 56535 SCHED_OTHER policy.

56536 SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified
 56537 *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

56538 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
 56539 function to succeed; if not, the function shall fail. It is unspecified whether the
 56540 *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are
 56541 rounded to align with the resolution of the clock being used.

56542 This function is not atomic with respect to other threads in the process. Threads may continue to
 56543 execute while this function call is in the process of changing the scheduling policy for the
 56544 underlying kernel-scheduled entities used by the process contention scope threads.

56545 **RETURN VALUE**

56546 If successful, the *sched_setparam()* function shall return zero.

56547 If the call to *sched_setparam()* is unsuccessful, the priority shall remain unchanged, and the
 56548 function shall return a value of -1 and set *errno* to indicate the error.

56549 **ERRORS**

56550 The *sched_setparam()* function shall fail if:

56551 [EINVAL] One or more of the requested scheduling parameters is outside the range
 56552 defined for the scheduling policy of the specified *pid*.

56553 [EPERM] The requesting process does not have permission to set the scheduling
 56554 parameters for the specified process, or does not have the appropriate
 56555 privilege to invoke *sched_setparam()*.

56556 [ESRCH] No process can be found corresponding to that specified by *pid*.

CHANGE HISTORY

56568 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
 56569

Issue 6

56570 The *sched_setparam()* function is marked as part of the Process Scheduling option.
 56571

56572 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56573 implementation does not support the Process Scheduling option.

56574 The following new requirements on POSIX implementations derive from alignment with the
 56575 Single UNIX Specification:

- 56576 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is
 56577 added.
- 56578 • Sections describing two-level scheduling and atomicity of the function are added.

56579 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

56580 IEEE PASC Interpretation 1003.1 #100 is applied.

Issue 7

56581 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.
 56582

56583 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements +
 56584 for the *sched_ss_repl_period* and *sched_ss_init_budget* values.

56585 **NAME**56586 sched_setscheduler — set scheduling policy and parameters (**REALTIME**)56587 **SYNOPSIS**

```
56588 PS #include <sched.h>
56589
56589 int sched_setscheduler(pid_t pid, int policy,
56590 const struct sched_param *param);
```

56591 **DESCRIPTION**

56592 The *sched_setscheduler()* function shall set the scheduling policy and scheduling parameters of
 56593 the process specified by *pid* to *policy* and the parameters specified in the **sched_param** structure
 56594 pointed to by *param*, respectively. The value of the *sched_priority* member in the **sched_param**
 56595 structure shall be any integer within the inclusive priority range for the scheduling policy
 56596 specified by *policy*. If the value of *pid* is negative, the behavior of the *sched_setscheduler()*
 56597 function is unspecified.

56598 The possible values for the *policy* parameter are defined in the **<sched.h>** header.

56599 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
 56600 policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

56601 If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling
 56602 process.

56603 The conditions under which one process has the appropriate privilege to change the scheduling
 56604 parameters of another process are implementation-defined.

56605 Implementations may require that the requesting process have permission to set its own
 56606 scheduling parameters or those of another process. Additionally, implementation-defined
 56607 restrictions may apply as to the appropriate privileges required to set the scheduling policy of
 56608 the process, or the scheduling policy of another process, to a particular value.

56609 The *sched_setscheduler()* function shall be considered successful if it succeeds in setting the
 56610 scheduling policy and scheduling parameters of the process specified by *pid* to the values
 56611 specified by *policy* and the structure pointed to by *param*, respectively.

56612 See [Scheduling Policies](#) (on page 479) for a description on how this function affects the
 56613 scheduling of the threads within the target process.

56614 SS If the current scheduling policy for the target process is not SCHED_FIFO, SCHED_RR, or
 56615 SCHED_SPORADIC, the result is implementation-defined; this case includes the
 56616 SCHED_OTHER policy.

56617 SS The specified *sched_ss_repl_period* shall be greater than or equal to the specified
 56618 *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

56619 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
 56620 function to succeed; if not, the function shall fail. It is unspecified whether the
 56621 *sched_ss_repl_period* and *sched_ss_init_budget* values are stored as provided by this function or are
 56622 rounded to align with the resolution of the clock being used.

56623 This function is not atomic with respect to other threads in the process. Threads may continue to
 56624 execute while this function call is in the process of changing the scheduling policy and
 56625 associated scheduling parameters for the underlying kernel-scheduled entities used by the
 56626 process contention scope threads.

56627 **RETURN VALUE**

56628 Upon successful completion, the function shall return the former scheduling policy of the
 56629 specified process. If the `sched_setscheduler()` function fails to complete successfully, the policy
 56630 and scheduling parameters shall remain unchanged, and the function shall return a value of `-1`
 56631 and set `errno` to indicate the error.

56632 **ERRORS**

56633 The `sched_setscheduler()` function shall fail if:

- 56634 [EINVAL] The value of the `policy` parameter is invalid, or one or more of the parameters
 56635 contained in `param` is outside the valid range for the specified scheduling
 56636 policy.
- 56637 [EPERM] The requesting process does not have permission to set either or both of the
 56638 scheduling parameters or the scheduling policy of the specified process.
- 56639 [ESRCH] No process can be found corresponding to that specified by `pid`.

56640 **EXAMPLES**

56641 None.

56642 **APPLICATION USAGE**

56643 None.

56644 **RATIONALE**

56645 None.

56646 **FUTURE DIRECTIONS**

56647 None.

56648 **SEE ALSO**

56650 XBD [<sched.h>](#)

56651 **CHANGE HISTORY**

56652 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56653 **Issue 6**

56654 The `sched_setscheduler()` function is marked as part of the Process Scheduling option.

56655 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56656 implementation does not support the Process Scheduling option.

56657 The following new requirements on POSIX implementations derive from alignment with the
 56658 Single UNIX Specification:

- 56659 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is
 56660 added.
- 56661 • Sections describing two-level scheduling and atomicity of the function are added.

56662 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

56663 **Issue 7**

56664 Austin Group Interpretation 1003.1-2001 #061 is applied, updating the DESCRIPTION.

56665 Austin Group Interpretation 1003.1-2001 #119 is applied, clarifying the accuracy requirements +
 56666 for the `sched_ss_repl_period` and `sched_ss_init_budget` values.

56667 **NAME**

56668 sched_yield — yield the processor

56669 **SYNOPSIS**

56670 #include <sched.h>

56671 int sched_yield(void);

56672 **DESCRIPTION**56673 The *sched_yield()* function shall force the running thread to relinquish the processor until it again
56674 becomes the head of its thread list. It takes no arguments.56675 **RETURN VALUE**56676 The *sched_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a
56677 value of -1 and set *errno* to indicate the error.56678 **ERRORS**

56679 No errors are defined.

56680 **EXAMPLES**

56681 None.

56682 **APPLICATION USAGE**56683 The conceptual model for scheduling semantics in POSIX.1-200x defines a set of thread lists. |
56684 This set of thread lists is always present regardless of the scheduling options supported by the
56685 system. On a system where the Process Scheduling option is not supported, portable
56686 applications should not make any assumptions regarding whether threads from other processes
56687 will be on the same thread list.56688 **RATIONALE**

56689 None.

56690 **FUTURE DIRECTIONS**

56691 None.

56692 **SEE ALSO**56693 XBD [<sched.h>](#) |56694 **CHANGE HISTORY**56695 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
56696 POSIX Threads Extension.56697 **Issue 6**56698 The *sched_yield()* function is now marked as part of the Process Scheduling and Threads options.56699 **Issue 7**

56700 SD5-XSH-ERN-120 is applied, adding APPLICATION USAGE.

56701 The *sched_yield()* function is moved to the Base.

56702 **NAME**
56703 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

56704 **SYNOPSIS**

56705 XSI #include <stdlib.h>
56706 unsigned short *seed48(unsigned short seed16v[3]);

56707 **DESCRIPTION**

56708 Refer to *drand48()*.

56709 **NAME**
 56710 seekdir — set the position of a directory stream

56711 **SYNOPSIS**

```
56712 XSI #include <dirent.h>
56713 void seekdir(DIR *dirp, long loc);
```

56714 **DESCRIPTION**

56715 The *seekdir()* function shall set the position of the next *readdir()* operation on the directory
 56716 stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been
 56717 returned from an earlier call to *telldir()* using the same directory stream. The new position
 56718 reverts to the one associated with the directory stream when *telldir()* was performed.

56719 If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()*
 56720 occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to
 56721 *readdir()* are unspecified.

56722 **RETURN VALUE**

56723 The *seekdir()* function shall not return a value.

56724 **ERRORS**

56725 No errors are defined.

56726 **EXAMPLES**

56727 None.

56728 **APPLICATION USAGE**

56729 None.

56730 **RATIONALE**

56731 The original standard developers perceived that there were restrictions on the use of the
 56732 *seekdir()* and *telldir()* functions related to implementation details, and for that reason these
 56733 functions need not be supported on all POSIX-conforming systems. They are required on
 56734 implementations supporting the XSI option.

56735 One of the perceived problems of implementation is that returning to a given point in a directory
 56736 is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-
 56737 trees, hashing functions, or other similar mechanisms to order their directories are considered.
 56738 The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a
 56739 given directory entry will be seen at all, or more than once.

56740 On systems not supporting these functions, their capability can sometimes be accomplished by
 56741 saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to
 56742 relocate the position from which the filename was saved.

56743 **FUTURE DIRECTIONS**

56744 None.

56745 **SEE ALSO**

56746 *fdopendir()*, *readdir()*, *telldir()*

56748

CHANGE HISTORY

56749

First released in Issue 2.

56750

Issue 6

56751

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

56752

Issue 7

56753

SD5-XSH-ERN-200 is applied, updating the DESCRIPTION to note that the value of *loc* should have been returned from an earlier call to `telldir()` using the same directory stream. +

56754

56755 **NAME**
56756 `select` — synchronous I/O multiplexing

56757 **SYNOPSIS**
56758 `#include <sys/select.h>`
56759 `int select(int nfds, fd_set *restrict readfds,`
56760 `fd_set *restrict writefds, fd_set *restrict errorfds,`
56761 `struct timeval *restrict timeout);`

56762 **DESCRIPTION**
56763 Refer to [pselect\(\)](#).

56764 **NAME**
 56765 sem_close — close a named semaphore

56766 **SYNOPSIS**
 56767 #include <semaphore.h>
 56768 int sem_close(sem_t *sem);

56769 **DESCRIPTION**
 56770 The *sem_close()* function shall indicate that the calling process is finished using the named
 56771 semaphore indicated by *sem*. The effects of calling *sem_close()* for an unnamed semaphore (one
 56772 created by *sem_init()*) are undefined. The *sem_close()* function shall deallocate (that is, make
 56773 available for reuse by a subsequent *sem_open()* by this process) any system resources allocated
 56774 by the system for use by this process for this semaphore. The effect of subsequent use of the
 56775 semaphore indicated by *sem* by this process is undefined. If the semaphore has not been
 56776 removed with a successful call to *sem_unlink()*, then *sem_close()* has no effect on the state of the
 56777 semaphore. If the *sem_unlink()* function has been successfully invoked for *name* after the most
 56778 recent call to *sem_open()* with O_CREAT for this semaphore, then when all processes that have
 56779 opened the semaphore close it, the semaphore is no longer accessible.

56780 **RETURN VALUE**
 56781 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be
 56782 returned and *errno* set to indicate the error.

56783 **ERRORS**
 56784 The *sem_close()* function may fail if:
 56785 [EINVAL] The *sem* argument is not a valid semaphore descriptor.

56786 **EXAMPLES**
 56787 None.

56788 **APPLICATION USAGE**
 56789 The *sem_close()* function is part of the Semaphores option and need not be available on all
 56790 implementations.

56791 **RATIONALE**
 56792 None.

56793 **FUTURE DIRECTIONS**
 56794 None.

56795 **SEE ALSO**
 56796 *semctl()*, *semget()*, *semop()*, *sem_init()*, *sem_open()*, *sem_unlink()*
 56797 XBD <semaphore.h>

56798 **CHANGE HISTORY**
 56799 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56800 **Issue 6**
 56801 The *sem_close()* function is marked as part of the Semaphores option.
 56802 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56803 implementation does not support the Semaphores option.
 56804 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/113 is applied, updating the ERRORS
 56805 section so that the [EINVAL] error becomes optional.

56806

Issue 7

56807

The *sem_close()* function is moved from the Semaphores option to the Base.

56808 **NAME**
 56809 `sem_destroy` — destroy an unnamed semaphore

56810 **SYNOPSIS**
 56811 `#include <semaphore.h>`
 56812 `int sem_destroy(sem_t *sem);`

56813 **DESCRIPTION**
 56814 The `sem_destroy()` function shall destroy the unnamed semaphore indicated by `sem`. Only a
 56815 semaphore that was created using `sem_init()` may be destroyed using `sem_destroy()`; the effect of
 56816 calling `sem_destroy()` with a named semaphore is undefined. The effect of subsequent use of the
 56817 semaphore `sem` is undefined until `sem` is reinitialized by another call to `sem_init()`.

56818 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The
 56819 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

56820 **RETURN VALUE**
 56821 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be
 56822 returned and `errno` set to indicate the error.

56823 **ERRORS**
 56824 The `sem_destroy()` function may fail if:
 56825 [EINVAL] The `sem` argument is not a valid semaphore.
 56826 [EBUSY] There are currently processes blocked on the semaphore.

56827 **EXAMPLES**
 56828 None.

56829 **APPLICATION USAGE**
 56830 The `sem_destroy()` function is part of the Semaphores option and need not be available on all
 56831 implementations.

56832 **RATIONALE**
 56833 None.

56834 **FUTURE DIRECTIONS**
 56835 None.

56847

Issue 7

56848

The *sem_destroy()* function is moved from the Semaphores option to the Base.

56849 **NAME**56850 `sem_getvalue` — get the value of a semaphore56851 **SYNOPSIS**56852 `#include <semaphore.h>`56853 `int sem_getvalue(sem_t *restrict sem, int *restrict sval);`56854 **DESCRIPTION**

56855 The `sem_getvalue()` function shall update the location referenced by the `sval` argument to have
 56856 the value of the semaphore referenced by `sem` without affecting the state of the semaphore. The
 56857 updated value represents an actual semaphore value that occurred at some unspecified time
 56858 during the call, but it need not be the actual value of the semaphore when it is returned to the
 56859 calling process.

56860 If `sem` is locked, then the object to which `sval` points shall either be set to zero or to a negative
 56861 number whose absolute value represents the number of processes waiting for the semaphore at
 56862 some unspecified time during the call.

56863 **RETURN VALUE**

56864 Upon successful completion, the `sem_getvalue()` function shall return a value of zero. Otherwise,
 56865 it shall return a value of `-1` and set `errno` to indicate the error.

56866 **ERRORS**56867 The `sem_getvalue()` function may fail if:56868 [EINVAL] The `sem` argument does not refer to a valid semaphore.56869 **EXAMPLES**

56870 None.

56871 **APPLICATION USAGE**

56872 The `sem_getvalue()` function is part of the Semaphores option and need not be available on all
 56873 implementations.

56874 **RATIONALE**

56875 None.

56876 **FUTURE DIRECTIONS**

56877 None.

56878 **SEE ALSO**56879 [`semctl\(\)`](#), [`semget\(\)`](#), [`semop\(\)`](#), [`sem_post\(\)`](#), [`sem_timedwait\(\)`](#), [`sem_trywait\(\)`](#)56880 XBD [`<semaphore.h>`](#)56881 **CHANGE HISTORY**

56882 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

56883 **Issue 6**56884 The `sem_getvalue()` function is marked as part of the Semaphores option.

56885 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 56886 implementation does not support the Semaphores option.

56887 The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std
 56888 1003.1d-1999.

56889 The **restrict** keyword is added to the `sem_getvalue()` prototype for alignment with the
 56890 ISO/IEC 9899:1999 standard.

sem_getvalue()

56891 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/54 is applied.

56892 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/115 is applied, updating the ERRORS
56893 section so that the [EINVAL] error becomes optional.

Issue 7

56894 The *sem_getvalue()* function is moved from the Semaphores option to the Base.
56895

56896 **NAME**

56897 sem_init — initialize an unnamed semaphore

56898 **SYNOPSIS**

56899 #include <semaphore.h>

56900 int sem_init(sem_t *sem, int pshared, unsigned value);

56901 **DESCRIPTION**

56902 The *sem_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of
 56903 the initialized semaphore shall be *value*. Following a successful call to *sem_init()*, the semaphore
 56904 may be used in subsequent calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and
 56905 *sem_destroy()*. This semaphore shall remain usable until the semaphore is destroyed.

56906 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;
 56907 in this case, any process that can access the semaphore *sem* can use *sem* for performing
 56908 *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* operations.

56909 Only *sem* itself may be used for performing synchronization. The result of referring to copies of
 56910 *sem* in calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* is
 56911 undefined.

56912 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any
 56913 thread in this process can use *sem* for performing *sem_wait()*, *sem_timedwait()*, *sem_trywait()*,
 56914 *sem_post()*, and *sem_destroy()* operations. The use of the semaphore by threads other than those
 56915 created in the same process is undefined.

56916 Attempting to initialize an already initialized semaphore results in undefined behavior.

56917 **RETURN VALUE**

56918 Upon successful completion, the *sem_init()* function shall initialize the semaphore in *sem* and
 56919 return 0. Otherwise, it shall return -1 and set *errno* to indicate the error.

56920 **ERRORS**

56921 The *sem_init()* function shall fail if:

56922 [EINVAL] The *value* argument exceeds {SEM_VALUE_MAX}.

56923 [ENOSPC] A resource required to initialize the semaphore has been exhausted, or the
 56924 limit on semaphores ({SEM_NSEMS_MAX}) has been reached.

56925 [EPERM] The process lacks the appropriate privileges to initialize the semaphore.

56926 **EXAMPLES**

56927 None.

56928 **APPLICATION USAGE**

56929 The *sem_init()* function is part of the Semaphores option and need not be available on all
 56930 implementations.

56931 **RATIONALE**

56932 None.

56933 **FUTURE DIRECTIONS**

56934 None.

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6The *sem_init()* function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/116 is applied, updating the DESCRIPTION to add the *sem_timedwait()* function for alignment with IEEE Std 1003.1d-1999.**Issue 7**

SD5-XSH-ERN-176 is applied.

The *sem_init()* function is moved from the Semaphores option to the Base.

56951 NAME

56952 sem_open — initialize and open a named semaphore

56953 SYNOPSIS

56954 #include <semaphore.h>

56955 sem_t *sem_open(const char *name, int oflag, ...);

56956 DESCRIPTION

56957 The *sem_open()* function shall establish a connection between a named semaphore and a process.
 56958 Following a call to *sem_open()* with semaphore name *name*, the process may reference the
 56959 semaphore associated with *name* using the address returned from the call. This semaphore may
 56960 be used in subsequent calls to *sem_wait()*, *sem_timedwait()*, *sem_trywait()*, *sem_post()*, and
 56961 *sem_close()*. The semaphore remains usable by this process until the semaphore is closed by a
 56962 successful call to *sem_close()*, *_exit()*, or one of the *exec* functions.

56963 The *oflag* argument controls whether the semaphore is created or merely accessed by the call to
 56964 *sem_open()*. The following flag bits may be set in *oflag*:

56965 **O_CREAT** This flag is used to create a semaphore if it does not already exist. If **O_CREAT** is
 56966 set and the semaphore already exists, then **O_CREAT** has no effect, except as noted
 56967 under **O_EXCL**. Otherwise, *sem_open()* creates a named semaphore. The **O_CREAT**
 56968 flag requires a third and a fourth argument: *mode*, which is of type **mode_t**, and
 56969 *value*, which is of type **unsigned**. The semaphore is created with an initial value of
 56970 *value*. Valid initial values for semaphores are less than or equal to
 56971 {SEM_VALUE_MAX}.

56972 The user ID of the semaphore shall be set to the effective user ID of the process. |
 56973 The group ID of the semaphore shall be set to the effective group ID of the process; |
 56974 however, if the *name* argument is visible in the file system, the group ID may be set |
 56975 to the group ID of the containing directory. The permission bits of the semaphore |
 56976 are set to the value of the *mode* argument except those set in the file mode creation |
 56977 mask of the process. When bits in *mode* other than the file permission bits are |
 56978 specified, the effect is unspecified.

56979 After the semaphore named *name* has been created by *sem_open()* with the
 56980 **O_CREAT** flag, other processes can connect to the semaphore by calling
 56981 *sem_open()* with the same value of *name*.

56982 **O_EXCL** If **O_EXCL** and **O_CREAT** are set, *sem_open()* fails if the semaphore *name* exists.
 56983 The check for the existence of the semaphore and the creation of the semaphore if it
 56984 does not exist are atomic with respect to other processes executing *sem_open()* with
 56985 **O_EXCL** and **O_CREAT** set. If **O_EXCL** is set and **O_CREAT** is not set, the effect is
 56986 undefined.

56987 If flags other than **O_CREAT** and **O_EXCL** are specified in the *oflag* parameter, the
 56988 effect is unspecified.

56989 The *name* argument points to a string naming a semaphore object. It is unspecified whether the
 56990 name appears in the file system and is visible to functions that take pathnames as arguments.
 56991 The *name* argument conforms to the construction rules for a pathname, except that the
 56992 interpretation of slash characters other than the leading slash character in *name* is
 56993 implementation-defined, and that the length limits for the *name* argument are implementation-
 56994 defined and need not be the same as the path name limits {PATH_MAX} and {NAME_MAX}. If
 56995 *name* begins with the slash character, then processes calling *sem_open()* with the same value of
 56996 *name* shall refer to the same semaphore object, as long as that name has not been removed. If
 56997 *name* does not begin with the slash character, the effect is implementation-defined.

sem_open()

56998 If a process makes multiple successful calls to *sem_open()* with the same value for *name*, the same
 56999 semaphore address shall be returned for each such successful call, provided that there have been
 57000 no calls to *sem_unlink()* for this semaphore, and at least one previous successful *sem_open()* call
 57001 for this semaphore has not been matched with a *sem_close()* call.

57002 References to copies of the semaphore produce undefined results.

RETURN VALUE

57003 Upon successful completion, the *sem_open()* function shall return the address of the semaphore.
 57004 Otherwise, it shall return a value of SEM_FAILED and set *errno* to indicate the error. The symbol
 57005 SEM_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem_open()*
 57006 shall return the value SEM_FAILED.
 57007

ERRORS

57008 If any of the following conditions occur, the *sem_open()* function shall return SEM_FAILED and
 57009 set *errno* to the corresponding value:
 57010

57011 [EACCES] The named semaphore exists and the permissions specified by *oflag* are
 57012 denied, or the named semaphore does not exist and permission to create the
 57013 named semaphore is denied.

57014 [EEXIST] O_CREAT and O_EXCL are set and the named semaphore already exists.

57015 [EINTR] The *sem_open()* operation was interrupted by a signal.

57016 [EINVAL] The *sem_open()* operation is not supported for the given name, or O_CREAT
 57017 was specified in *oflag* and *value* was greater than {SEM_VALUE_MAX}.

57018 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this
 57019 process.

57020 [ENFILE] Too many semaphores are currently open in the system.

57021 [ENOENT] O_CREAT is not set and the named semaphore does not exist.

57022 [ENOMEM] There is insufficient memory for the creation of the new named semaphore.

57023 [ENOSPC] There is insufficient space on a storage device for the creation of the new
 57024 named semaphore.

57025 If any of the following conditions occur, the *sem_open()* function may return SEM_FAILED and
 57026 set *errno* to the corresponding value:

57027 [ENAMETOOLONG]
 57028 The length of the *name* argument exceeds {_POSIX_PATH_MAX} on systems
 57029 XSI that do not support the XSI option or exceeds {_XOPEN_PATH_MAX} on XSI
 57030 systems, or has a pathname component that is longer than
 57031 XSI {_POSIX_NAME_MAX} on systems that do not support the XSI option or
 57032 longer than {_XOPEN_NAME_MAX} on XSI systems.

EXAMPLES

57033 None.
 57034

APPLICATION USAGE

57035 The *sem_open()* function is part of the Semaphores option and need not be available on all
 57036 implementations.
 57037

RATIONALE

57038 Early drafts required an error return value of -1 with the type **sem_t *** for the *sem_open()*
 57039 function, which is not guaranteed to be portable across implementations. The revised text
 57040 provides the symbolic error code SEM_FAILED to eliminate the type conflict.
 57041

57056 DESCRIPTION to add the *sem_timedwait()* function for alignment with IEEE Std 1003.1d-1999.57057 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/118 is applied, updating the
57058 DESCRIPTION to describe the conditions to return the same semaphore address on a call to
57059 *sem_open()*. The words “and at least one previous successful *sem_open()* call for this semaphore
57060 has not been matched with a *sem_close()* call” are added.57061 **Issue 7**57062 Austin Group Interpretation 1003.1-2001 #066 is applied, updating the [ENOSPC] error case and
57063 adding the [ENOMEM] error case.57064 Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and
57065 adding [ENAMETOOLONG] as a “may fail” error.57066 SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the +
57067 user ID and group ID of the semaphore. +57068 The *sem_open()* function is moved from the Semaphores option to the Base.

57069 **NAME**57070 `sem_post` — unlock a semaphore57071 **SYNOPSIS**57072 `#include <semaphore.h>`57073 `int sem_post(sem_t *sem);`57074 **DESCRIPTION**57075 The `sem_post()` function shall unlock the semaphore referenced by `sem` by performing a
57076 semaphore unlock operation on that semaphore.57077 If the semaphore value resulting from this operation is positive, then no threads were blocked
57078 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.57079 If the value of the semaphore resulting from this operation is zero, then one of the threads
57080 blocked waiting for the semaphore shall be allowed to return successfully from its call to
57081 PS `sem_wait()`. If the Process Scheduling option is supported, the thread to be unblocked shall be
57082 chosen in a manner appropriate to the scheduling policies and parameters in effect for the
57083 blocked threads. In the case of the schedulers `SCHED_FIFO` and `SCHED_RR`, the highest
57084 priority waiting thread shall be unblocked, and if there is more than one highest priority thread
57085 blocked waiting for the semaphore, then the highest priority thread that has been waiting the
57086 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread
57087 to unblock is unspecified.57088 SS If the Process Sporadic Server option is supported, and the scheduling policy is
57089 `SCHED_SPORADIC`, the semantics are as per `SCHED_FIFO` above.57090 The `sem_post()` function shall be reentrant with respect to signals and may be invoked from a
57091 signal-catching function.57092 **RETURN VALUE**57093 If successful, the `sem_post()` function shall return zero; otherwise, the function shall return `-1`
57094 and set `errno` to indicate the error.57095 **ERRORS**57096 The `sem_post()` function may fail if:57097 [EINVAL] The `sem` argument does not refer to a valid semaphore.57098 **EXAMPLES**

57099 None.

57100 **APPLICATION USAGE**57101 The `sem_post()` function is part of the Semaphores option and need not be available on all
57102 implementations.57103 **RATIONALE**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *sem_post()* function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The *sem_timedwait()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be unblocked is specified for alignment with IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/119 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_post()* function is moved from the Semaphores option to the Base.

57124 **NAME**
 57125 `sem_timedwait` — lock a semaphore

57126 **SYNOPSIS**
 57127 `#include <semaphore.h>`
 57128 `#include <time.h>`
 57129 `int sem_timedwait(sem_t *restrict sem,`
 57130 `const struct timespec *restrict abstime);`

57131 **DESCRIPTION**
 57132 The `sem_timedwait()` function shall lock the semaphore referenced by `sem` as in the `sem_wait()`
 57133 function. However, if the semaphore cannot be locked without waiting for another process or
 57134 thread to unlock the semaphore by performing a `sem_post()` function, this wait shall be
 57135 terminated when the specified timeout expires.

57136 The timeout shall expire when the absolute time specified by `abstime` passes, as measured by the
 57137 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 57138 `abstime`), or if the absolute time specified by `abstime` has already been passed at the time of the
 57139 call.

57140 The timeout shall be based on the `CLOCK_REALTIME` clock. The resolution of the timeout shall
 57141 be the resolution of the clock on which it is based. The `timespec` data type is defined as a
 57142 structure in the `<time.h>` header.

57143 Under no circumstance shall the function fail with a timeout if the semaphore can be locked
 57144 immediately. The validity of the `abstime` need not be checked if the semaphore can be locked
 57145 immediately.

57146 **RETURN VALUE**
 57147 The `sem_timedwait()` function shall return zero if the calling process successfully performed the
 57148 semaphore lock operation on the semaphore designated by `sem`. If the call was unsuccessful, the
 57149 state of the semaphore shall be unchanged, and the function shall return a value of `-1` and set
 57150 `errno` to indicate the error.

57151 **ERRORS**
 57152 The `sem_timedwait()` function shall fail if:
 57153 [EINVAL] The process or thread would have blocked, and the `abstime` parameter
 57154 specified a nanoseconds field value less than zero or greater than or equal to
 57155 1 000 million.

57156 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

57157 The `sem_timedwait()` function may fail if:

57158 [EDEADLK] A deadlock condition was detected.

57159 [EINTR] A signal interrupted this function.

57160 [EINVAL] The `sem` argument does not refer to a valid semaphore.

XBD Section 3.284 (on page 72), **<semaphore.h>**, **<time.h>**

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/120 is applied, updating the ERRORS section so that the [EINVAL] error becomes optional.

Issue 7

The *sem_timedwait()* function is moved from the Semaphores option to the Base.

Functionality relating to the Timers option is moved to the Base.

57180 **NAME**
 57181 `sem_trywait`, `sem_wait` — lock a semaphore

57182 **SYNOPSIS**
 57183 `#include <semaphore.h>`
 57184 `int sem_trywait(sem_t *sem);`
 57185 `int sem_wait(sem_t *sem);`

57186 **DESCRIPTION**
 57187 The `sem_trywait()` function shall lock the semaphore referenced by `sem` only if the semaphore is
 57188 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not
 57189 lock the semaphore.

57190 The `sem_wait()` function shall lock the semaphore referenced by `sem` by performing a semaphore
 57191 lock operation on that semaphore. If the semaphore value is currently zero, then the calling
 57192 thread shall not return from the call to `sem_wait()` until it either locks the semaphore or the call is
 57193 interrupted by a signal.

57194 Upon successful return, the state of the semaphore shall be locked and shall remain locked until
 57195 the `sem_post()` function is executed and returns successfully.

57196 The `sem_wait()` function is interruptible by the delivery of a signal.

57197 **RETURN VALUE**
 57198 The `sem_trywait()` and `sem_wait()` functions shall return zero if the calling process successfully
 57199 performed the semaphore lock operation on the semaphore designated by `sem`. If the call was
 57200 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a
 57201 value of `-1` and set `errno` to indicate the error.

57202 **ERRORS**
 57203 The `sem_trywait()` function shall fail if:
 57204 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the
 57205 `sem_trywait()` operation.

57206 The `sem_trywait()` and `sem_wait()` functions may fail if:
 57207 [EDEADLK] A deadlock condition was detected.
 57208 [EINTR] A signal interrupted this function.
 57209 [EINVAL] The `sem` argument does not refer to a valid semaphore.

57210 **EXAMPLES**
 57211 None.

57212 **APPLICATION USAGE**
 57213 Applications using these functions may be subject to priority inversion, as discussed in XBD |
 57214 [Section 3.284](#) (on page 72).

57215 The `sem_trywait()` and `sem_wait()` functions are part of the Semaphores option and need not be
 57216 provided on all implementations.

57217 **RATIONALE**
 57218 None.

57219
57220**FUTURE DIRECTIONS**

None.

DRAFT

57237 **NAME**57238 `sem_unlink` — remove a named semaphore57239 **SYNOPSIS**57240 `#include <semaphore.h>`57241 `int sem_unlink(const char *name);`57242 **DESCRIPTION**

57243 The `sem_unlink()` function shall remove the semaphore named by the string *name*. If the
 57244 semaphore named by *name* is currently referenced by other processes, then `sem_unlink()` shall
 57245 have no effect on the state of the semaphore. If one or more processes have the semaphore open
 57246 when `sem_unlink()` is called, destruction of the semaphore is postponed until all references to the
 57247 semaphore have been destroyed by calls to `sem_close()`, `_exit()`, or `exec`. Calls to `sem_open()`
 57248 to recreate or reconnect to the semaphore refer to a new semaphore after `sem_unlink()` is called. The
 57249 `sem_unlink()` call shall not block until all references have been destroyed; it shall return
 57250 immediately.

57251 **RETURN VALUE**

57252 Upon successful completion, the `sem_unlink()` function shall return a value of 0. Otherwise, the
 57253 semaphore shall not be changed and the function shall return a value of -1 and set *errno* to
 57254 indicate the error.

57255 **ERRORS**57256 The `sem_unlink()` function shall fail if:

57257 [EACCES] Permission is denied to unlink the named semaphore.

57258 [ENOENT] The named semaphore does not exist.

57259 The `sem_unlink()` function may fail if:

57260 [ENAMETOOLONG]

57261 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems
 57262 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI
 57263 systems, or has a pathname component that is longer than
 57264 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or
 57265 longer than `{_XOPEN_NAME_MAX}` on XSI systems. A call to `sem_unlink()`
 57266 with a *name* argument that contains the same semaphore name as was
 57267 previously used in a successful `sem_open()` call shall not give an
 57268 [ENAMETOOLONG] error.

57269 **EXAMPLES**

57270 None.

57271 **APPLICATION USAGE**

57272 The `sem_unlink()` function is part of the Semaphores option and need not be available on all
 57273 implementations.

57274 **RATIONALE**

57275 None.

57276 **FUTURE DIRECTIONS**

57277 None.

CHANGE HISTORY

57282

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

57283

Issue 6

57284

The *sem_unlink()* function is marked as part of the Semaphores option.

57285

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

57286

57287

Issue 7

57288

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

57289

57290

The *sem_unlink()* function is moved from the Semaphores option to the Base.

57291 **NAME**
57292 `sem_wait` — lock a semaphore

57293 **SYNOPSIS**
57294 `#include <semaphore.h>`
57295 `int sem_wait(sem_t *sem);`

57296 **DESCRIPTION**
57297 Refer to *sem_trywait()*.

57298 **NAME**
 57299 semctl — XSI semaphore control operations

57300 **SYNOPSIS**

```
57301 XSI #include <sys/sem.h>
57302 int semctl(int semid, int semnum, int cmd, ...);
```

57303 **DESCRIPTION**

57304 The *semctl()* function operates on XSI semaphores (see XBD [Section 4.16](#), on page 101). It is
 57305 unspecified whether this function interoperates with the realtime interprocess communication
 57306 facilities defined in [Section 2.8](#) (on page 476).

57307 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.
 57308 The fourth argument is optional and depends upon the operation requested. If required, it is of
 57309 type **union semun**, which the application shall explicitly declare:

```
57310 union semun {
57311     int val;
57312     struct semid_ds *buf;
57313     unsigned short *array;
57314 } arg;
```

57315 The following semaphore control operations as specified by *cmd* are executed with respect to the
 57316 semaphore specified by *semid* and *semnum*. The level of permission required for each operation
 57317 is shown with each command; see [Section 2.7](#) (on page 474). The symbolic names for the values
 57318 of *cmd* are defined in the `<sys/sem.h>` header:

57319	GETVAL	Return the value of <i>semval</i> ; see <code><sys/sem.h></code> . Requires read permission.
57320	SETVAL	Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value corresponding to the specified semaphore in all processes is cleared. Requires alter permission; see Section 2.7 (on page 474).
57321		
57322		
57323		
57324	GETPID	Return the value of <i>sempid</i> . Requires read permission.
57325	GETNCNT	Return the value of <i>semmcnt</i> . Requires read permission.
57326	GETZCNT	Return the value of <i>semzcnt</i> . Requires read permission.

57327 The following values of *cmd* operate on each *semval* in the set of semaphores:

57328	GETALL	Return the value of <i>semval</i> for each semaphore in the semaphore set and place into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . Requires read permission.
57329		
57330		
57331	SETALL	Set the value of <i>semval</i> for each semaphore in the semaphore set according to the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> values corresponding to each specified semaphore in all processes are cleared. Requires alter permission.
57332		
57333		
57334		
57335		

57336 The following values of *cmd* are also available:

57337	IPC_STAT	Place the current value of each member of the semid_ds data structure associated with <i>semid</i> into the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . The contents of this structure are defined in <code><sys/sem.h></code> . Requires read permission.
57338		
57339		
57340		

semctl()

57341 57342 57343 57344 57345 57346 57347 57348 57349 57350 57351 57352 57353 57354 57355 57356 57357 57358 57359 57360 57361 57362 57363 57364 57365 57366 57367 57368 57369 57370 57371 57372 57373 57374 57375 57376 57377 57378 57379 57380	<p>IPC_SET</p> <p>Remove the semaphore identifier specified by <i>semid</i> from the system and destroy the set of semaphores and semid_ds data structure associated with it. 57381

EXAMPLES

57382

None.

57383

APPLICATION USAGE

57384

The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for backwards-compatibility.

57385

57386

57387

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to use the alternative interfaces.

CHANGE HISTORY

57400

First released in Issue 2. Derived from Issue 2 of the SVID.

57401

Issue 5

57402

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

57403

57404 **NAME**

57405 semget — get set of XSI semaphores

57406 **SYNOPSIS**

```
57407 XSI #include <sys/sem.h>
57408 int semget(key_t key, int nsems, int semflg);
```

57409 **DESCRIPTION**

57410 The *semget()* function operates on XSI semaphores (see XBD [Section 4.16](#), on page 101). It is
 57411 unspecified whether this function interoperates with the realtime interprocess communication
 57412 facilities defined in [Section 2.8](#) (on page 476).

57413 The *semget()* function shall return the semaphore identifier associated with *key*.

57414 A semaphore identifier with its associated **semid_ds** data structure and its associated set of
 57415 *nsems* semaphores (see [<sys/sem.h>](#)) is created for *key* if one of the following is true:

- 57416 • The argument *key* is equal to `IPC_PRIVATE`.
- 57417 • The argument *key* does not already have a semaphore identifier associated with it and
 57418 (*semflg* & `IPC_CREAT`) is non-zero.

57419 Upon creation, the **semid_ds** data structure associated with the new semaphore identifier is
 57420 initialized as follows:

- 57421 • In the operation permissions structure *sem_perm.cuid*, *sem_perm.uid*, *sem_perm.cgid*, and
 57422 *sem_perm.gid* shall be set equal to the effective user ID and effective group ID, respectively,
 57423 of the calling process.
- 57424 • The low-order 9 bits of *sem_perm.mode* shall be set equal to the low-order 9 bits of *semflg*.
- 57425 • The variable *sem_nsems* shall be set equal to the value of *nsems*.
- 57426 • The variable *sem_otime* shall be set equal to 0 and *sem_ctime* shall be set equal to the current
 57427 time.
- 57428 • The data structure associated with each semaphore in the set need not be initialized. The
 57429 *semctl()* function with the command `SETVAL` or `SETALL` can be used to initialize each
 57430 semaphore.

57431 **RETURN VALUE**

57432 Upon successful completion, *semget()* shall return a non-negative integer, namely a semaphore
 57433 identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

57434 **ERRORS**

57435 The *semget()* function shall fail if:

- | | | |
|-------|----------|---|
| 57436 | [EACCES] | A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see Section 2.7 (on page 474). |
| 57437 | | |
| 57438 | | |
| 57439 | [EEXIST] | A semaphore identifier exists for the argument <i>key</i> but $((\textit{semflg} \ \&\textit{IPC_CREAT}) \ \&\&(\textit{semflg} \ \&\textit{IPC_EXCL}))$ is non-zero. |
| 57440 | | |
| 57441 | [EINVAL] | The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0. |
| 57442 | | |
| 57443 | | |
| 57444 | | |

- 57445 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*
57446 &IPC_CREAT) is equal to 0.
- 57447 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the
57448 maximum number of allowed semaphores system-wide would be exceeded.

57449 EXAMPLES

57450 Creating a Semaphore Identifier

57451 The following example gets a unique semaphore key using the *ftok()* function, then gets a
57452 semaphore ID associated with that key using the *semget()* function (the first call also tests to
57453 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
57454 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the
57455 program attempts to create one semaphore with read/write permission for all. It also uses the
57456 IPC_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

57457 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in
57458 the *sbuf* array. The number of processes that can execute concurrently without queuing is
57459 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in
57460 the program.

```
57461 #include <sys/types.h>
57462 #include <stdio.h>
57463 #include <sys/ipc.h>
57464 #include <sys/sem.h>
57465 #include <sys/stat.h>
57466 #include <errno.h>
57467 #include <unistd.h>
57468 #include <stdlib.h>
57469 #include <pwd.h>
57470 #include <fcntl.h>
57471 #include <limits.h>
57472 ...
57473 key_t semkey;
57474 int semid, pfd, fv;
57475 struct sembuf sbuf;
57476 char *lgn;
57477 char filename[PATH_MAX+1];
57478 struct stat outstat;
57479 struct passwd *pw;
57480 ...
57481 /* Get unique key for semaphore. */
57482 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
57483     perror("IPC error: ftok"); exit(1);
57484 }
57485
57486 /* Get semaphore ID associated with this key. */
57487 if ((semid = semget(semkey, 0, 0)) == -1) {
57488     /* Semaphore does not exist - Create. */
57489     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
57490         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
57491     {
57492         /* Initialize the semaphore. */
57493         sbuf.sem_num = 0;

CHANGE HISTORY

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 6

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/122 is applied, updating the DESCRIPTION from “each semaphore in the set shall not be initialized” to “each semaphore in the set need not be initialized”.

57532 **NAME**
 57533 semop — XSI semaphore operations

57534 **SYNOPSIS**

```
57535 XSI #include <sys/sem.h>
57536 int semop(int semid, struct sembuf *sops, size_t nsops);
```

57537 **DESCRIPTION**

57538 The *semop()* function operates on XSI semaphores (see XBD Section 4.16, on page 101). It is
 57539 unspecified whether this function interoperates with the realtime interprocess communication
 57540 facilities defined in Section 2.8 (on page 476).

57541 The *semop()* function shall perform atomically a user-defined array of semaphore operations in
 57542 array order on the set of semaphores associated with the semaphore identifier specified by the
 57543 argument *semid*.

57544 The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The
 57545 implementation shall not modify elements of this array unless the application uses
 57546 implementation-defined extensions.

57547 The argument *nsops* is the number of such structures in the array.

57548 Each structure, **sembuf**, includes the following members:

Member Type	Member Name	Description
short	<i>sem_num</i>	Semaphore number.
short	<i>sem_op</i>	Semaphore operation.
short	<i>sem_flg</i>	Operation flags.

57549 Each semaphore operation specified by *sem_op* is performed on the corresponding semaphore
 57550 specified by *semid* and *sem_num*.

57551 The variable *sem_op* specifies one of three semaphore operations:

- 57552 If *sem_op* is a negative integer and the calling process has alter permission, one of the
 57553 following shall occur:
 57554
 - 57555 • If *semval*(see <sys/sem.h>) is greater than or equal to the absolute value of *sem_op*,
 57556 the absolute value of *sem_op* is subtracted from *semval*. Also, if (*sem_flg*
 57557 &SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be added to the
 57558 *semadj* value of the calling process for the specified semaphore.
 - 57559 • If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is
 57560 non-zero, *semop()* shall return immediately.
 - 57561 • If *semval* is less than the absolute value of *sem_op* and (*sem_flg* &IPC_NOWAIT) is 0,
 57562 *semop()* shall increment the *semncnt* associated with the specified semaphore and
 57563 suspend execution of the calling thread until one of the following conditions occurs:
 57564 — The value of *semval* becomes greater than or equal to the absolute value of
 57565 *sem_op*. When this occurs, the value of *semncnt* associated with the specified
 57566 semaphore shall be decremented, the absolute value of *sem_op* shall be
 57567 subtracted from *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the
 57568 absolute value of *sem_op* shall be added to the *semadj* value of the calling
 57569 process for the specified semaphore.
 57570
 57571
 57572

- 57573 — The *semid* for which the calling thread is awaiting action is removed from the
 57574 system. When this occurs, *errno* shall be set equal to [EIDRM] and -1 shall be
 57575 returned.
- 57576 — The calling thread receives a signal that is to be caught. When this occurs, the
 57577 value of *semncnt* associated with the specified semaphore shall be
 57578 decremented, and the calling thread shall resume execution in the manner
 57579 prescribed in *sigaction()*.
- 57580 2. If *sem_op* is a positive integer and the calling process has alter permission, the value of
 57581 *sem_op* shall be added to *semval* and, if (*sem_flg* &SEM_UNDO) is non-zero, the value of
 57582 *sem_op* shall be subtracted from the *semadj* value of the calling process for the specified
 57583 semaphore.
- 57584 3. If *sem_op* is 0 and the calling process has read permission, one of the following shall occur:
- 57585 • If *semval* is 0, *semop()* shall return immediately.
 - 57586 • If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is non-zero, *semop()* shall return
 57587 immediately.
 - 57588 • If *semval* is non-zero and (*sem_flg* &IPC_NOWAIT) is 0, *semop()* shall increment the
 57589 *semzcnt* associated with the specified semaphore and suspend execution of the
 57590 calling thread until one of the following occurs:
 - 57591 — The value of *semval* becomes 0, at which time the value of *semzcnt* associated
 57592 with the specified semaphore shall be decremented.
 - 57593 — The *semid* for which the calling thread is awaiting action is removed from the
 57594 system. When this occurs, *errno* shall be set equal to [EIDRM] and -1 shall be
 57595 returned.
 - 57596 — The calling thread receives a signal that is to be caught. When this occurs, the
 57597 value of *semzcnt* associated with the specified semaphore shall be
 57598 decremented, and the calling thread shall resume execution in the manner
 57599 prescribed in *sigaction()*.

57600 Upon successful completion, the value of *sempid* for each semaphore specified in the array
 57601 pointed to by *sops* shall be set equal to the process ID of the calling process.

57602 RETURN VALUE

57603 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to
 57604 indicate the error.

57605 ERRORS

57606 The *semop()* function shall fail if:

- | | | |
|-------|----------|--|
| 57607 | [E2BIG] | The value of <i>nsops</i> is greater than the system-imposed maximum. |
| 57608 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page
57609 474). |
| 57610 | [EAGAIN] | The operation would result in suspension of the calling process but (<i>sem_flg</i>
57611 &IPC_NOWAIT) is non-zero. |
| 57612 | [EFBIG] | The value of <i>sem_num</i> is less than 0 or greater than or equal to the number of
57613 semaphores in the set associated with <i>semid</i> . |
| 57614 | [EIDRM] | The semaphore identifier <i>semid</i> is removed from the system. |
| 57615 | [EINTR] | The <i>semop()</i> function was interrupted by a signal. |

57616	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit.
57617		
57618		
57619	[ENOSPC]	The limit on the number of individual processes requesting a SEM_UNDO would be exceeded.
57620		
57621	[ERANGE]	An operation would cause a <i>semval</i> to overflow the system-imposed limit, or an operation would cause a <i>semadj</i> value to overflow the system-imposed limit.
57622		
57623		

57624 EXAMPLES

57625 Setting Values in Semaphores

57626 The following example sets the values of the two semaphores associated with the *semid* identifier
57627 to the values contained in the *sb* array.

```
57628 #include <sys/sem.h>
57629 ...
57630 int semid;
57631 struct sembuf sb[2];
57632 int nsops = 2;
57633 int result;
57634
57635 /* Adjust value of semaphore in the semaphore array semid. */
57636 sb[0].sem_num = 0;
57637 sb[0].sem_op = -1;
57638 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
57639 sb[1].sem_num = 1;
57640 sb[1].sem_op = 1;
57641 sb[1].sem_flg = 0;
57642
57643 result = semop(semid, sb, nsops);
```

57642 Creating a Semaphore Identifier

57643 The following example gets a unique semaphore key using the *ftok()* function, then gets a
57644 semaphore ID associated with that key using the *semget()* function (the first call also tests to
57645 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
57646 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the
57647 program attempts to create one semaphore with read/write permission for all. It also uses the
57648 IPC_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

57649 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in
57650 the *sbuf* array. The number of processes that can execute concurrently without queuing is
57651 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in
57652 the program.

57653 The final call to *semop()* acquires the semaphore and waits until it is free; the SEM_UNDO
57654 option releases the semaphore when the process exits, waiting until there are less than two
57655 processes running concurrently.

```
57656 #include <sys/types.h>
57657 #include <stdio.h>
57658 #include <sys/ipc.h>
57659 #include <sys/sem.h>
57660 #include <sys/stat.h>
57661 #include <errno.h>
```

```

57662     #include <unistd.h>
57663     #include <stdlib.h>
57664     #include <pwd.h>
57665     #include <fcntl.h>
57666     #include <limits.h>
57667     ...
57668     key_t semkey;
57669     int semid, pfd, fv;
57670     struct sembuf sbuf;
57671     char *lgn;
57672     char filename[PATH_MAX+1];
57673     struct stat outstat;
57674     struct passwd *pw;
57675     ...
57676     /* Get unique key for semaphore. */
57677     if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
57678         perror("IPC error: ftok"); exit(1);
57679     }
57680     /* Get semaphore ID associated with this key. */
57681     if ((semid = semget(semkey, 0, 0)) == -1) {
57682         /* Semaphore does not exist - Create. */
57683         if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
57684             S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
57685             {
57686                 /* Initialize the semaphore. */
57687                 sbuf.sem_num = 0;
57688                 sbuf.sem_op = 2; /* This is the number of runs without queuing. */
57689                 sbuf.sem_flg = 0;
57690                 if (semop(semid, &sbuf, 1) == -1) {
57691                     perror("IPC error: semop"); exit(1);
57692                 }
57693             }
57694         else if (errno == EEXIST) {
57695             if ((semid = semget(semkey, 0, 0)) == -1) {
57696                 perror("IPC error 1: semget"); exit(1);
57697             }
57698         }
57699         else {
57700             perror("IPC error 2: semget"); exit(1);
57701         }
57702     }
57703     ...
57704     sbuf.sem_num = 0;
57705     sbuf.sem_op = -1;
57706     sbuf.sem_flg = SEM_UNDO;
57707     if (semop(semid, &sbuf, 1) == -1) {
57708         perror("IPC Error: semop"); exit(1);
57709     }

```

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to use the alternative interfaces.

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 7

SD5-XSH-ERN-171 is applied, updating the DESCRIPTION to clarify the order in which the operations in *sops* will be performed when there are multiple operations.

DRAFT

57732 **NAME**

57733 send — send a message on a socket

57734 **SYNOPSIS**

57735 #include <sys/socket.h>

57736 ssize_t send(int socket, const void *buffer, size_t length, int flags);

57737 **DESCRIPTION**

57738 The *send()* function shall initiate transmission of a message from the specified socket to its peer.
 57739 The *send()* function shall send a message only when the socket is connected. If the socket is a
 57740 connectionless-mode socket, the message shall be sent to the pre-specified peer address.

57741 The *send()* function takes the following arguments:

57742	<i>socket</i>	Specifies the socket file descriptor.
57743	<i>buffer</i>	Points to the buffer containing the message to send.
57744	<i>length</i>	Specifies the length of the message in bytes.
57745	<i>flags</i>	Specifies the type of message transmission. Values of this argument are formed by logically OR'ing zero or more of the following flags:
57747	MSG_EOR	Terminates a record (if supported by the protocol).
57748	MSG_OOB	Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.
57751	MSG_NOSIGNAL	Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

57755 The length of the message to be sent is specified by the *length* argument. If the message is too
 57756 long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.

57757 Successful completion of a call to *send()* does not guarantee delivery of the message. A return
 57758 value of -1 indicates only locally-detected errors.

57759 If space is not available at the sending socket to hold the message to be transmitted, and the
 57760 socket file descriptor does not have O_NONBLOCK set, *send()* shall block until space is
 57761 available. If space is not available at the sending socket to hold the message to be transmitted,
 57762 and the socket file descriptor does have O_NONBLOCK set, *send()* shall fail. The *select()* and
 57763 *poll()* functions can be used to determine when it is possible to send more data.

57764 The socket in use may require the process to have appropriate privileges to use the *send()*
 57765 function.

57766 **RETURN VALUE**

57767 Upon successful completion, *send()* shall return the number of bytes sent. Otherwise, -1 shall be
 57768 returned and *errno* set to indicate the error.

57769 **ERRORS**57770 The *send()* function shall fail if:

57771 [EAGAIN] or [EWOULDBLOCK]

57772 The socket's file descriptor is marked O_NONBLOCK and the requested
 57773 operation would block.

- 57774 [EBADF] The *socket* argument is not a valid file descriptor.
- 57775 [ECONNRESET] A connection was forcibly closed by a peer.
- 57776 [EDESTADDRREQ]
57777 The socket is not connection-mode and no peer address is set.
- 57778 [EINTR] A signal interrupted *send()* before any data was transmitted.
- 57779 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.
- 57780 [ENOTCONN] The socket is not connected.
- 57781 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 57782 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
57783 more of the values set in *flags*.
- 57784 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
57785 no longer connected. In the latter case, and if the socket is of type
57786 SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.
- 57787 The *send()* function may fail if:
- 57788 [EACCES] The calling process does not have the appropriate privileges.
- 57789 [EIO] An I/O error occurred while reading from or writing to the file system.
- 57790 [ENETDOWN] The local network interface used to reach the destination is down.
- 57791 [ENETUNREACH]
57792 No route to the network is present.
- 57793 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

EXAMPLES

None.

APPLICATION USAGE

The *send()* function is equivalent to *sendto()* with a null pointer *dest_len* argument, and to *write()* if no flags are used.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD [<sys/socket.h>](#)

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

Issue 7

Austin Group Interpretation 1003.1-2001 #035 is applied, updating the DESCRIPTION to clarify the behavior when the socket is a connectionless-mode socket.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

57814 **NAME**

57815 sendmsg — send a message on a socket using a message structure

57816 **SYNOPSIS**

57817 #include <sys/socket.h>

57818 ssize_t sendmsg(int socket, const struct msghdr *message, int flags);

57819 **DESCRIPTION**

57820 The *sendmsg()* function shall send a message through a connection-mode or connectionless-
 57821 mode socket. If the socket is a connectionless-mode socket, the message shall be sent to the
 57822 address specified by **msghdr** if no pre-specified peer address has been set. If a peer address has
 57823 been pre-specified, either the message shall be sent to the address specified in **msghdr**
 57824 (overriding the pre-specified peer address), or the function shall return -1 and set *errno* to
 57825 [EISCONN]. If the socket is connection-mode, the destination address in **msghdr** shall be
 57826 ignored.

57827 The *sendmsg()* function takes the following arguments:

57828	<i>socket</i>	Specifies the socket file descriptor.
57829	<i>message</i>	Points to a msghdr structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored.
57832	<i>flags</i>	Specifies the type of message transmission. The application may specify 0 or the following flag:
57834	MSG_EOR	Terminates a record (if supported by the protocol).
57835	MSG_OOB	Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
57838	MSG_NOSIGNAL	Requests not to send the SIGPIPE signal if an attempt to send is made on a stream-oriented socket that is no longer connected. The [EPIPE] error shall still be returned.

57842 The *msg_iov* and *msg_iovlen* fields of *message* specify zero or more buffers containing the data to
 57843 be sent. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of
 57844 this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field
 57845 gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated
 57846 by *msg_iov* is sent in turn.

57847 Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A
 57848 return value of -1 indicates only locally-detected errors.

57849 If space is not available at the sending socket to hold the message to be transmitted and the
 57850 socket file descriptor does not have O_NONBLOCK set, the *sendmsg()* function shall block until
 57851 space is available. If space is not available at the sending socket to hold the message to be
 57852 transmitted and the socket file descriptor does have O_NONBLOCK set, the *sendmsg()* function
 57853 shall fail.

57854 If the socket protocol supports broadcast and the specified address is a broadcast address for the
 57855 socket protocol, *sendmsg()* shall fail if the SO_BROADCAST option is not set for the socket.

57856 The socket in use may require the process to have appropriate privileges to use the *sendmsg()*
 57857 function.

57858 **RETURN VALUE**

57859 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, *-1*
 57860 shall be returned and *errno* set to indicate the error.

57861 **ERRORS**

57862 The *sendmsg()* function shall fail if:

57863 [EAGAIN] or [EWOULDBLOCK]

57864 The socket's file descriptor is marked *O_NONBLOCK* and the requested
 57865 operation would block.

57866 [EAFNOSUPPORT]

57867 Addresses in the specified address family cannot be used with this socket.

57868 [EBADF] The *socket* argument is not a valid file descriptor.

57869 [ECONNRESET] A connection was forcibly closed by a peer.

57870 [EINTR] A signal interrupted *sendmsg()* before any data was transmitted.

57871 [EINVAL] The sum of the *iov_len* values overflows an *ssize_t*.

57872 [EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the
 57873 *msg_iovlen* member of the *msghdr* structure pointed to by *message* is less than
 57874 or equal to 0 or is greater than *{IOV_MAX}*.

57875 [ENOTCONN] The socket is connection-mode but is not connected.

57876 [ENOTSOCK] The *socket* argument does not refer to a socket.

57877 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
 57878 more of the values set in *flags*.

57879 [EPIPE] The socket is shut down for writing, or the socket is connection-mode and is
 57880 no longer connected. In the latter case, and if the socket is of type
 57881 *SOCK_STREAM*, the *SIGPIPE* signal is generated to the calling thread.

57882 If the address family of the socket is *AF_UNIX*, then *sendmsg()* shall fail if:

57883 [EIO] An I/O error occurred while reading from or writing to the file system.

57884 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
 57885 in the socket address.

57886 [ENAMETOOLONG]

57887 A component of a pathname exceeded *{NAME_MAX}* characters, or an entire
 57888 pathname exceeded *{PATH_MAX}* characters.

57889 [ENOENT] A component of the pathname does not name an existing file or the path name
 57890 is an empty string.

57891 [ENOTDIR] A component of the path prefix of the pathname in the socket address is not a
 57892 directory.

57893 The *sendmsg()* function may fail if:

57894 [EACCES] Search permission is denied for a component of the path prefix; or write access
 57895 to the named socket is denied.

57896 [EDESTADDRREQ]

57897 The socket is not connection-mode and does not have its peer address set, and
 57898 no destination address was specified.

57899	[EHOSTUNREACH]	
57900		The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).
57901		
57902	[EIO]	An I/O error occurred while reading from or writing to the file system.
57903	[EISCONN]	A destination address was specified and the socket is already connected.
57904	[ENETDOWN]	The local network interface used to reach the destination is down.
57905	[ENETUNREACH]	
57906		No route to the network is present.
57907	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
57908	[ENOMEM]	Insufficient memory was available to fulfill the request.
57909		If the address family of the socket is AF_UNIX, then <i>sendmsg()</i> may fail if:
57910	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.
57911		
57912	[ENAMETOOLONG]	
57913		Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
57914		

EXAMPLES

Done.

APPLICATION USAGE

The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #073 is applied, updating the DESCRIPTION.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

57935 **NAME**57936 `sendto` — send a message on a socket57937 **SYNOPSIS**

```
57938 #include <sys/socket.h>
57939
57939 ssize_t sendto(int socket, const void *message, size_t length,
57940               int flags, const struct sockaddr *dest_addr,
57941               socklen_t dest_len);
```

57942 **DESCRIPTION**

57943 The `sendto()` function shall send a message through a connection-mode or connectionless-mode
 57944 socket. If the socket is a connectionless-mode socket, the message shall be sent to the address
 57945 specified by `dest_addr` if no pre-specified peer address has been set. If a peer address has been
 57946 pre-specified, either the message shall be sent to the address specified by `dest_addr` (overriding
 57947 the pre-specified peer address), or the function shall return `-1` and set `errno` to `[EISCONN]`. If
 57948 the socket is connection-mode, `dest_addr` shall be ignored.

57949 The `sendto()` function takes the following arguments:

57950	<code>socket</code>	Specifies the socket file descriptor.
57951	<code>message</code>	Points to a buffer containing the message to be sent.
57952	<code>length</code>	Specifies the size of the message in bytes.
57953	<code>flags</code>	Specifies the type of message transmission. Values of this argument are 57954 formed by logically OR'ing zero or more of the following flags:
57955	<code>MSG_EOR</code>	Terminates a record (if supported by the protocol).
57956	<code>MSG_OOB</code>	Sends out-of-band data on sockets that support out-of- 57957 band data. The significance and semantics of out-of- 57958 band data are protocol-specific.
57959	<code>MSG_NOSIGNAL</code>	Requests not to send the SIGPIPE signal if an attempt to 57960 send is made on a stream-oriented socket that is no 57961 longer connected. The <code>[EPIPE]</code> error shall still be 57962 returned.
57963	<code>dest_addr</code>	Points to a <code>sockaddr</code> structure containing the destination address. The length 57964 and format of the address depend on the address family of the socket.
57965	<code>dest_len</code>	Specifies the length of the <code>sockaddr</code> structure pointed to by the <code>dest_addr</code> 57966 argument.

57967 If the socket protocol supports broadcast and the specified address is a broadcast address for the
 57968 socket protocol, `sendto()` shall fail if the `SO_BROADCAST` option is not set for the socket.

57969 The `dest_addr` argument specifies the address of the target. The `length` argument specifies the
 57970 length of the message.

57971 Successful completion of a call to `sendto()` does not guarantee delivery of the message. A return
 57972 value of `-1` indicates only locally-detected errors.

57973 If space is not available at the sending socket to hold the message to be transmitted and the
 57974 socket file descriptor does not have `O_NONBLOCK` set, `sendto()` shall block until space is
 57975 available. If space is not available at the sending socket to hold the message to be transmitted
 57976 and the socket file descriptor does have `O_NONBLOCK` set, `sendto()` shall fail.

57977 The socket in use may require the process to have appropriate privileges to use the `sendto()`

sendto()

57978 function.

57979 **RETURN VALUE**

57980 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise, `-1` shall
57981 be returned and *errno* set to indicate the error.

57982 **ERRORS**

57983 The *sendto()* function shall fail if:

57984 [EAFNOSUPPORT]

57985 Addresses in the specified address family cannot be used with this socket.

57986 [EAGAIN] or [EWOULDBLOCK]

57987 The socket's file descriptor is marked `O_NONBLOCK` and the requested
57988 operation would block.

57989 [EBADF] The *socket* argument is not a valid file descriptor.

57990 [ECONNRESET] A connection was forcibly closed by a peer.

57991 [EINTR] A signal interrupted *sendto()* before any data was transmitted.

57992 [EMSGSIZE] The message is too large to be sent all at once, as the socket requires.

57993 [ENOTCONN] The socket is connection-mode but is not connected.

57994 [ENOTSOCK] The *socket* argument does not refer to a socket.

57995 [EOPNOTSUPP] The *socket* argument is associated with a socket that does not support one or
57996 more of the values set in *flags*.

57997 [EPIPE]

57998 The socket is shut down for writing, or the socket is connection-mode and is
57999 no longer connected. In the latter case, and if the socket is of type
`SOCK_STREAM`, the `SIGPIPE` signal is generated to the calling thread.

58000 If the address family of the socket is `AF_UNIX`, then *sendto()* shall fail if:

58001 [EIO] An I/O error occurred while reading from or writing to the file system.

58002 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
58003 in the socket address.

58004 [ENAMETOOLONG]

58005 A component of a pathname exceeded `{NAME_MAX}` characters, or an entire
58006 pathname exceeded `{PATH_MAX}` characters.

58007 [ENOENT]

58008 A component of the pathname does not name an existing file or the pathname
is an empty string.

58009 [ENOTDIR]

58010 A component of the path prefix of the pathname in the socket address is not a
directory.

58011 The *sendto()* function may fail if:

58012 [EACCES]

58013 Search permission is denied for a component of the path prefix; or write access
to the named socket is denied.

58014 [EDESTADDRREQ]

58015 The socket is not connection-mode and does not have its peer address set, and
58016 no destination address was specified.

58017 [EHOSTUNREACH]

58018 The destination host cannot be reached (probably because the host is down or
58019 a remote router cannot reach it).

58020	[EINVAL]	The <i>dest_len</i> argument is not a valid length for the address family.
58021	[EIO]	An I/O error occurred while reading from or writing to the file system.
58022	[EISCONN]	A destination address was specified and the socket is already connected.
58023	[ENETDOWN]	The local network interface used to reach the destination is down.
58024	[ENETUNREACH]	
58025		No route to the network is present.
58026	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
58027	[ENOMEM]	Insufficient memory was available to fulfill the request.
58028		If the address family of the socket is AF_UNIX, then <i>sendto()</i> may fail if:
58029	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.
58030		
58031	[ENAMETOOLONG]	
58032		Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
58033

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretations 1003.1-2001 #035 and #073 are applied, updating the [EISCONN] error and the DESCRIPTION.

The MSG_NOSIGNAL flag is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

58055 **NAME**58056 `setbuf` — assign buffering to a stream58057 **SYNOPSIS**58058 `#include <stdio.h>`58059 `void setbuf(FILE *restrict stream, char *restrict buf);`58060 **DESCRIPTION**58061 CX The functionality described on this reference page is aligned with the ISO C standard. Any
58062 conflict between the requirements described here and the ISO C standard is unintentional. This
58063 volume of POSIX.1-200x defers to the ISO C standard.

58064 Except that it returns no value, the function call:

58065 `setbuf(stream, buf)`

58066 shall be equivalent to:

58067 `setvbuf(stream, buf, _IOFBF, BUFSIZ)`58068 if *buf* is not a null pointer, or to:58069 `setvbuf(stream, buf, _IONBF, BUFSIZ)`58070 if *buf* is a null pointer.58071 **RETURN VALUE**58072 The `setbuf()` function shall not return a value.58073 **ERRORS**

58074 No errors are defined.

58075 **EXAMPLES**

58076 None.

58077 **APPLICATION USAGE**58078 A common source of error is allocating buffer space as an “automatic” variable in a code block,
58079 and then failing to close the stream in the same block.58080 With `setbuf()`, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ
58081 bytes are used for the buffer area.58082 **RATIONALE**

58083 None.

58084 **FUTURE DIRECTIONS**

58085 None.

58123 **CHANGE HISTORY**

58124 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

58125 **NAME**

58126 setenv — add or change environment variable

58127 **SYNOPSIS**

```
58128 CX #include <stdlib.h>
58129 int setenv(const char *envname, const char *envval, int overwrite);
```

58130 **DESCRIPTION**

58131 The *setenv()* function shall update or add a variable in the environment of the calling process.
 58132 The *envname* argument points to a string containing the name of an environment variable to be
 58133 added or altered. The environment variable shall be set to the value to which *envval* points. The
 58134 function shall fail if *envname* points to a string which contains an '=' character. If the
 58135 environment variable named by *envname* already exists and the value of *overwrite* is non-zero,
 58136 the function shall return success and the environment shall be updated. If the environment
 58137 variable named by *envname* already exists and the value of *overwrite* is zero, the function shall
 58138 return success and the environment shall remain unchanged.

58139 If the application modifies *environ* or the pointers to which it points, the behavior of *setenv()* is
 58140 undefined. The *setenv()* function shall update the list of pointers to which *environ* points.

58141 The strings described by *envname* and *envval* are copied by this function.

58142 The *setenv()* function need not be thread-safe. A function that is not required to be thread-safe is
 58143 not required to be reentrant.

58144 **RETURN VALUE**

58145 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to
 58146 indicate the error, and the environment shall be unchanged.

58147 **ERRORS**

58148 The *setenv()* function shall fail if:

58149 [EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a
 58150 string containing an '=' character.

58151 [ENOMEM] Insufficient memory was available to add a variable or its value to the
 58152 environment.

58153 **EXAMPLES**

58154 None.

58155 **APPLICATION USAGE**

58156 See *exec*, for restrictions on changing the environment in multi-threaded applications.

58157 **RATIONALE**

58158 Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular, if
 58159 the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an
 58160 obsolete copy of the environment (as may any other copy of *environ*). However, other than the
 58161 aforementioned restriction, the standard developers intended that the traditional method of
 58162 walking through the environment by way of the *environ* pointer must be supported.

58163 It was decided that *setenv()* should be required by this version because it addresses a piece of
 58164 missing functionality, and does not impose a significant burden on the implementor.

58165 There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()*
 58166 function should be required as a mandatory function. The *setenv()* function was chosen because
 58167 it permitted the implementation of the *unsetenv()* function to delete environmental variables,

58168 without specifying an additional interface. The *putenv()* function is available as part of the XSI
58169 option.

58170 The standard developers considered requiring that *setenv()* indicate an error when a call to it
58171 would result in exceeding {ARG_MAX}. The requirement was rejected since the condition might
58172 be temporary, with the application eventually reducing the environment size. The ultimate
58173 success or failure depends on the size at the time of a call to *exec*, which returns an indication of
58174 this error condition.

58175 FUTURE DIRECTIONS

58176 None.

58250 XBD <sys/types.h>, <unistd.h>

58251 **CHANGE HISTORY**

58252 First released in Issue 1. Derived from Issue 1 of the SVID.

58253 **Issue 6**

58254 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

58255 The following new requirements on POSIX implementations derive from alignment with the
58256 Single UNIX Specification:

- 58257
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
58258 required for conforming implementations of previous POSIX specifications, it was not
58259 required for UNIX applications.

setgid()58260
58261
58262
58263
58264

- Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effects of `setgid()` in processes without appropriate privileges are changed.
- A requirement that the supplementary group list is not affected is added.

58265 **NAME**
58266 setgrent — reset the group database to the first entry

58267 **SYNOPSIS**

58268 XSI #include <grp.h>
58269 void setgrent(void);

58270 **DESCRIPTION**

58271 Refer to *endgrent()*.

58272 **NAME**
58273 sethostent — network host database functions

58274 **SYNOPSIS**
58275 #include <netdb.h>
58276 void sethostent(int stayopen);

58277 **DESCRIPTION**
58278 Refer to *endhostent()*.

58279 **NAME**

58280 setitimer — set the value of an interval timer

58281 **SYNOPSIS**

58282 OB XSI #include <sys/time.h>

58283 int setitimer(int *which*, const struct itimerval *restrict *value*,
58284 struct itimerval *restrict *ovalue*);58285 **DESCRIPTION**58286 Refer to [getitimer\(\)](#).

58287 **NAME**

58288 setjmp — set jump point for a non-local goto

58289 **SYNOPSIS**

58290 #include <setjmp.h>

58291 int setjmp(jmp_buf env);

58292 **DESCRIPTION**

58293 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58294 conflict between the requirements described here and the ISO C standard is unintentional. This
 58295 volume of POSIX.1-200x defers to the ISO C standard.

58296 A call to *setjmp()* shall save the calling environment in its *env* argument for later use by
 58297 *longjmp()*.

58298 It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in
 58299 order to access an actual function, or a program defines an external identifier with the name
 58300 *setjmp*, the behavior is undefined.

58301 An application shall ensure that an invocation of *setjmp()* appears in one of the following
 58302 contexts only:

- 58303
- The entire controlling expression of a selection or iteration statement
 - 58304 • One operand of a relational or equality operator with the other operand an integral
 58305 constant expression, with the resulting expression being the entire controlling expression
 58306 of a selection or iteration statement
 - 58307 • The operand of a unary '!' operator with the resulting expression being the entire
 58308 controlling expression of a selection or iteration
 - 58309 • The entire expression of an expression statement (possibly cast to **void**)

58310 If the invocation appears in any other context, the behavior is undefined.

58311 **RETURN VALUE**

58312 If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to
 58313 *longjmp()*, *setjmp()* shall return a non-zero value.

58314 **ERRORS**

58315 No errors are defined.

58316 **EXAMPLES**

58317 None.

58318 **APPLICATION USAGE**

58319 In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-
 58320 level subroutine of a program.

58321 **RATIONALE**

58322 None.

58323 **FUTURE DIRECTIONS**

58324 None.

58325 **SEE ALSO**58326 *longjmp()*, *sigsetjmp()*

58327 XBD <setjmp.h>

58328

CHANGE HISTORY

58329

First released in Issue 1. Derived from Issue 1 of the SVID.

58330

Issue 6

58331

The normative text is updated to avoid use of the term “must” for application requirements.

58332 **NAME**58333 setkey — set encoding key (**CRYPT**)58334 **SYNOPSIS**

```
58335 XSI #include <stdlib.h>
58336 void setkey(const char *key);
```

58337 **DESCRIPTION**

58338 The *setkey()* function provides access to an implementation-defined encoding algorithm. The
 58339 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical
 58340 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is
 58341 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used
 58342 with the algorithm to encode a string *block* passed to *encrypt()*.

58343 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to
 58344 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on
 58345 return, an error has occurred.

58346 The *setkey()* function need not be thread-safe. A function that is not required to be thread-safe is
 58347 not required to be reentrant.

58348 **RETURN VALUE**

58349 No values are returned.

58350 **ERRORS**58351 The *setkey()* function shall fail if:

58352 [ENOSYS] The functionality is not supported on this implementation.

58353 **EXAMPLES**

58354 None.

58355 **APPLICATION USAGE**

58356 Decoding need not be implemented in all environments. This is related to government
 58357 restrictions in some countries on encryption and decryption routines. Historical practice has
 58358 been to ship a different version of the encryption library without the decryption feature in the
 58359 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

58360 **RATIONALE**

58361 None.

58362 **FUTURE DIRECTIONS**

58363 None.

58364 **SEE ALSO**58365 *crypt()*, *encrypt()*58366 XBD [<stdlib.h>](#)58367 **CHANGE HISTORY**

58368 First released in Issue 1. Derived from Issue 1 of the SVID.

58369 **Issue 5**58370 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

58371 **NAME**

58372 setlocale — set program locale

58373 **SYNOPSIS**

58374 #include <locale.h>

58375 char *setlocale(int category, const char *locale);

58376 **DESCRIPTION**

58377 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 58378 conflict between the requirements described here and the ISO C standard is unintentional. This
 58379 volume of POSIX.1-200x defers to the ISO C standard.

58380 The *setlocale()* function selects the appropriate piece of the locale of the process, as specified by
 58381 the *category* and *locale* arguments, and may be used to change or query the entire locale of the
 58382 process or portions thereof. The value *LC_ALL* for *category* names the entire locale of the process;
 58383 other values for *category* name only a part of the locale of the process:

58384 *LC_COLLATE* Affects the behavior of regular expressions and the collation functions.

58385 *LC_CTYPE* Affects the behavior of regular expressions, character classification, character
 58386 conversion functions, and wide-character functions.

58387 CX *LC_MESSAGES* Affects what strings are expected by commands and utilities as affirmative or
 58388 negative responses.

58389 XSI It also affects what strings are given by commands and utilities as affirmative
 58390 or negative responses, and the content of messages.

58391 *LC_MONETARY* Affects the behavior of functions that handle monetary values.

58392 *LC_NUMERIC* Affects the behavior of functions that handle numeric values.

58393 *LC_TIME* Affects the behavior of the time conversion functions.

58394 The *locale* argument is a pointer to a character string containing the required setting of *category*.
 58395 The contents of this string are implementation-defined. In addition, the following preset values
 58396 of *locale* are defined for all settings of *category*:

58397 CX "POSIX" Specifies the minimal environment for C-language translation called the
 58398 POSIX locale. If *setlocale()* is not invoked, the POSIX locale is the default at
 58399 entry to *main()*.

58400 "C" Equivalent to "POSIX".

58401 CX "" Specifies an implementation-defined native environment. The determination
 58402 of the name of the new locale for the specified category depends on the value
 58403 of the associated environment variables, *LC_** and *LANG*; see XBD Chapter 7
 58404 (on page 121) and Chapter 8 (on page 159).

58405 A null pointer Used to direct *setlocale()* to query the current internationalized environment
 58406 and return the name of the locale.

58407 CX Setting all of the categories of the locale of the process is similar to successively setting each
 58408 individual category of the locale of the process, except that all error checking is done before any
 58409 actions are performed. To set all the categories of the locale of the process, *setlocale()* is invoked
 58410 as:

```
58411 setlocale(LC_ALL, "");
```

58412 In this case, *setlocale()* shall first verify that the values of all the environment variables it needs

58413 according to the precedence rules (described in XBD [Chapter 8](#), on page 159) indicate supported
 58414 locales. If the value of any of these environment variable searches yields a locale that is not
 58415 supported (and non-null), *setlocale()* shall return a null pointer and the locale of the process shall
 58416 not be changed. If all environment variables name supported locales, *setlocale()* shall proceed as
 58417 if it had been called for each category, using the appropriate value from the associated
 58418 environment variable or from the implementation-defined default if there is no such value.

58419 The locale state is common to all threads within a process.

RETURN VALUE

58420 Upon successful completion, *setlocale()* shall return the string associated with the specified
 58421 category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the locale of the
 58422 process is not changed.
 58423

58424 A null pointer for *locale* causes *setlocale()* to return a pointer to the string associated with the
 58425 *category* for the current locale of the process. The locale of the process shall not be changed.

58426 The string returned by *setlocale()* is such that a subsequent call with that string and its associated
 58427 *category* shall restore that part of the locale of the process. The application shall not modify the
 58428 string returned which may be overwritten by a subsequent call to *setlocale()*.

ERRORS

58429 No errors are defined.
 58430

EXAMPLES

58431 None.
 58432

APPLICATION USAGE

58433 The following code illustrates how a program can initialize the international environment for
 58434 one language, while selectively modifying the locale of the process such that regular expressions
 58435 and string operations can be applied to text recorded in a different language:
 58436

```
58437 setlocale(LC_ALL, "De");
58438 setlocale(LC_COLLATE, "Fr@dict");
```

58439 Internationalized programs must call *setlocale()* to initiate a specific language operation. This can
 58440 be done by calling *setlocale()* as follows:

```
58441 setlocale(LC_ALL, "");
```

58442 Changing the setting of *LC_MESSAGES* has no effect on catalogs that have already been opened
 58443 by calls to *catopen()*.

RATIONALE

58444 The ISO C standard defines a collection of functions to support internationalization. One of the
 58445 most significant aspects of these functions is a facility to set and query the *international*
 58446 *environment*. The international environment is a repository of information that affects the
 58447 behavior of certain functionality, namely:
 58448

- 58449 1. Character handling
- 58450 2. Collating
- 58451 3. Date/time formatting
- 58452 4. Numeric editing
- 58453 5. Monetary formatting
- 58454 6. Messaging

58455 The *setlocale()* function provides the application developer with the ability to set all or portions,
 58456 called *categories*, of the international environment. These categories correspond to the areas of
 58457 functionality mentioned above. The syntax for *setlocale()* is as follows:

58458 `char *setlocale(int category, const char *locale);`

58459 where *category* is the name of one of following categories, namely:

58460 `LC_COLLATE`
 58461 `LC_CTYPE`
 58462 `LC_MESSAGES`
 58463 `LC_MONETARY`
 58464 `LC_NUMERIC`
 58465 `LC_TIME`

58466 In addition, a special value called `LC_ALL` directs `setlocale()` to set all categories.

58467 There are two primary uses of `setlocale()`:

- 58468 1. Querying the international environment to find out what it is set to
- 58469 2. Setting the international environment, or *locale*, to a specific value

58470 The behavior of `setlocale()` in these two areas is described below. Since it is difficult to describe
 58471 the behavior in words, examples are used to illustrate the behavior of specific uses.

58472 To query the international environment, `setlocale()` is invoked with a specific category and the
 58473 NULL pointer as the locale. The NULL pointer is a special directive to `setlocale()` that tells it to
 58474 query rather than set the international environment. The following syntax is used to query the
 58475 name of the international environment:

58476 `setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \`
 58477 `LC_NUMERIC, LC_TIME}, (char *) NULL);`

58478 The `setlocale()` function shall return the string corresponding to the current international
 58479 environment. This value may be used by a subsequent call to `setlocale()` to reset the international
 58480 environment to this value. However, it should be noted that the return value from `setlocale()`
 58481 may be a pointer to a static area within the function and is not guaranteed to remain unchanged
 58482 (that is, it may be modified by a subsequent call to `setlocale()`). Therefore, if the purpose of
 58483 calling `setlocale()` is to save the value of the current international environment so it can be
 58484 changed and reset later, the return value should be copied to an array of `char` in the calling
 58485 program.

58486 There are three ways to set the international environment with `setlocale()`:

58487 `setlocale(category, string)`

58488 This usage sets a specific *category* in the international environment to a specific value
 58489 corresponding to the value of the *string*. A specific example is provided below:

58490 `setlocale(LC_ALL, "fr_FR.ISO-8859-1");`

58491 In this example, all categories of the international environment are set to the locale
 58492 corresponding to the string "fr_FR.ISO-8859-1", or to the French language as spoken in
 58493 France using the ISO/IEC 8859-1:1998 standard codeset.

58494 If the string does not correspond to a valid locale, `setlocale()` shall return a NULL pointer
 58495 and the international environment is not changed. Otherwise, `setlocale()` shall return the
 58496 name of the locale just set.

58497 `setlocale(category, "C")`

58498 The ISO C standard states that one locale must exist on all conforming implementations.
 58499 The name of the locale is C and corresponds to a minimal international environment needed
 58500 to support the C programming language.

58501 `setlocale(category, "")`

58502 This sets a specific category to an implementation-defined default. This corresponds to the
58503 value of the environment variables.

58504 **FUTURE DIRECTIONS**

58505 None.

58514 **CHANGE HISTORY**

58515 First released in Issue 3.

58516 **Issue 5**

58517 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

58518 **Issue 6**

58519 Extensions beyond the ISO C standard are marked.

58520 The normative text is updated to avoid use of the term “must” for application requirements.

58521 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/124 is applied, updating the
58522 DESCRIPTION to clarify the behavior of:

58523 `setlocale(LC_ALL, "");`

58524 **Issue 7**

58525 Functionality relating to the Threads option is moved to the Base.

58526 **NAME**
58527 setlogmask — set the log priority mask

58528 **SYNOPSIS**

58529 XSI #include <syslog.h>
58530 int setlogmask(int *maskpri*);

58531 **DESCRIPTION**

58532 Refer to *closelog()*.

setnetent()

58533 **NAME**
58534 setnetent — network database function

58535 **SYNOPSIS**
58536 #include <netdb.h>
58537 void setnetent(int *stayopen*);

58538 **DESCRIPTION**
58539 Refer to *endnetent()*.

58540 **NAME**

58541 setpgid — set process group ID for job control

58542 **SYNOPSIS**

58543 #include <unistd.h>

58544 int setpgid(pid_t pid, pid_t pgid);

58545 **DESCRIPTION**

58546 The *setpgid()* function shall either join an existing process group or create a new process group
 58547 within the session of the calling process. The process group ID of a session leader shall not
 58548 change. Upon successful completion, the process group ID of the process with a process ID that
 58549 matches *pid* shall be set to *pgid*. As a special case, if *pid* is 0, the process ID of the calling process
 58550 shall be used. Also, if *pgid* is 0, the process ID of the indicated process shall be used.

58551 **RETURN VALUE**

58552 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno*
 58553 shall be set to indicate the error.

58554 **ERRORS**58555 The *setpgid()* function shall fail if:

58556 [EACCES] The value of the *pid* argument matches the process ID of a child process of the
 58557 calling process and the child process has successfully executed one of the *exec*
 58558 functions.

58559 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by
 58560 the implementation.

58561 [EPERM] The process indicated by the *pid* argument is a session leader.

58562 [EPERM] The value of the *pid* argument matches the process ID of a child process of the
 58563 calling process and the child process is not in the same session as the calling
 58564 process.

58565 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of
 58566 the process indicated by the *pid* argument and there is no process with a
 58567 process group ID that matches the value of the *pgid* argument in the same
 58568 session as the calling process.

58569 [ESRCH] The value of the *pid* argument does not match the process ID of the calling
 58570 process or of a child process of the calling process.

58571 **EXAMPLES**

58572 None.

58573 **APPLICATION USAGE**

58574 None.

58575 **RATIONALE**

58576 The *setpgid()* function shall group processes together for the purpose of signaling, placement in
 58577 foreground or background, and other job control actions.

58578 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed
 58579 the specified new process group to assume any value. This presents certain security problems
 58580 and is more flexible than necessary to support job control.

58581 To provide tighter security, *setpgid()* only allows the calling process to join a process group
 58582 already in use inside its session or create a new process group whose process group ID was
 58583 equal to its process ID.

58584 When a job control shell spawns a new job, the processes in the job must be placed into a new
58585 process group via *setpgid()*. There are two timing constraints involved in this action:

- 58586 1. The new process must be placed in the new process group before the appropriate
58587 program is launched via one of the *exec* functions.
- 58588 2. The new process must be placed in the new process group before the shell can correctly
58589 send signals to the new process group.

58590 To address these constraints, the following actions are performed. The new processes call
58591 *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first
58592 constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of
58593 *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that
58594 the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization
58595 property was considered, but it was decided instead to merely allow the parent shell process to
58596 adjust the process group of its child processes via *setpgid()*. Both timing constraints are now
58597 satisfied by having both the parent shell and the child attempt to adjust the process group of the
58598 child process; it does not matter which succeeds first.

58599 Since it would be confusing to an application to have its process group change after it began
58600 executing (that is, after *exec*), and because the child process would already have adjusted its
58601 process group before this, the [EACCES] error was added to disallow this.

58602 One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original
58603 process group (the one in effect when the job control shell was executed). A job control shell
58604 does this before returning control back to its parent when it is terminating or suspending itself as
58605 a way of restoring its job control “state” back to what its parent would expect. (Note that the
58606 original process group of the job control shell typically matches the process group of its parent,
58607 but this is not necessarily always the case.)

58608 FUTURE DIRECTIONS

58609 None.

58610 SEE ALSO

58611 *exec*, *getpgrp()*, *setsid()*, *tcsetpgrp()*

58612 XBD [<sys/types.h>](#), [<unistd.h>](#)

58613 CHANGE HISTORY

58614 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

58615 Issue 6

58616 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

58617 The following new requirements on POSIX implementations derive from alignment with the
58618 Single UNIX Specification:

- 58619 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
58620 required for conforming implementations of previous POSIX specifications, it was not
58621 required for UNIX applications.
- 58622 • The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be
58623 defined in this version. This is a FIPS requirement.

58624 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in
58625 the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the
58626 process ID of the indicated process shall be used”. This change reverts the wording to as in the
58627 ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

58628 **NAME**
 58629 setpgrp — set the process group ID

58630 **SYNOPSIS**

58631 OB XSI #include <unistd.h>
 58632 pid_t setpgrp(void);

58633 **DESCRIPTION**

58634 If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the
 58635 calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then the
 58636 new session has no controlling terminal.

58637 The *setpgrp()* function has no effect when the calling process is a session leader.

58638 **RETURN VALUE**

58639 Upon completion, *setpgrp()* shall return the process group ID.

58640 **ERRORS**

58641 No errors are defined.

58642 **EXAMPLES**

58643 None.

58644 **APPLICATION USAGE**

58645 It is unspecified whether this function behaves as *setpgid(0,0)* or *setsid()* unless the process is
 58646 already a session leader. Therefore, applications are encouraged to use *setpgid()* or *setsid()* as
 58647 appropriate.

58648 **RATIONALE**

58649 None.

58650 **FUTURE DIRECTIONS**

58651 The *setpgrp()* function may be removed in a future version.

58652 **SEE ALSO**

58653 *exec, fork(), getpid(), getsid(), kill, setpgid(), setsid()*

58654 XBD <unistd.h>

58655 **CHANGE HISTORY**

58656 First released in Issue 4, Version 2.

58657 **Issue 5**

58658 Moved from X/OPEN UNIX extension to BASE.

58659 **Issue 7**

58660 The *setpgrp()* function is marked obsolescent.

setpriority()

58661 **NAME**
58662 setpriority — set the nice value

58663 **SYNOPSIS**

58664 XSI #include <sys/resource.h>
58665 int setpriority(int *which*, id_t *who*, int *nice*);

58666 **DESCRIPTION**

58667 Refer to [getpriority\(\)](#).

58668 **NAME**
58669 setprotoent — network protocol database functions

58670 **SYNOPSIS**
58671 #include <netdb.h>
58672 void setprotoent(int stayopen);

58673 **DESCRIPTION**
58674 Refer to *endprotoent()*.

setpwent()

58675 **NAME**
58676 setpwent — user database function

SYNOPSIS

58677 XSI #include <pwd.h>
58678
58679 void setpwent(void);

DESCRIPTION

58680 Refer to *endpwent()*.
58681

58682 **NAME**

58683 setregid — set real and effective group IDs

58684 **SYNOPSIS**

```
58685 XSI #include <unistd.h>
58686 int setregid(gid_t rgid, gid_t egid);
```

58687 **DESCRIPTION**58688 The *setregid()* function shall set the real and effective group IDs of the calling process.58689 If *rgid* is -1 , the real group ID shall not be changed; if *egid* is -1 , the effective group ID shall not
58690 be changed.

58691 The real and effective group IDs may be set to different values in the same call.

58692 Only a process with appropriate privileges can set the real group ID and the effective group ID
58693 to any valid value.58694 A non-privileged process can set either the real group ID to the saved set-group-ID from one of
58695 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group
58696 ID.58697 If the real group ID is being set (*rgid* is not -1), or the effective group ID is being set to a value +
58698 not equal to the real group ID, then the saved set-group-ID of the current process shall be set +
58699 equal to the new effective group ID. +

58700 Any supplementary group IDs of the calling process remain unchanged.

58701 **RETURN VALUE**58702 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
58703 indicate the error, and neither of the group IDs are changed.58704 **ERRORS**58705 The *setregid()* function shall fail if:58706 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.58707 [EPERM] The process does not have appropriate privileges and a change other than
58708 changing the real group ID to the saved set-group-ID, or changing the
58709 effective group ID to the real group ID or the saved set-group-ID, was
58710 requested.58711 **EXAMPLES**

58712 None.

58713 **APPLICATION USAGE**58714 If a non-privileged set-group-ID process sets its effective group ID to its real group ID, it can |
58715 only set its effective group ID back to the previous value if *rgid* was -1 in the *setregid()* call, since |
58716 the saved-group-ID is not changed in that case. If *rgid* was equal to the real group ID in the |
58717 *setregid()* call, then the saved set-group-ID will also have been changed to the real user ID. |58718 **RATIONALE**58719 Earlier versions of this standard did not specify whether the saved set-group-ID was affected by |
58720 *setregid()* calls. This version specifies common existing practice that constitutes an important |
58721 security feature. The ability to set both the effective group ID and saved set-group-ID to be the |
58722 same as the real group ID means that any security weakness in code that is executed after that |
58723 point cannot result in malicious code being executed with the previous effective group ID. |
58724 Privileged applications could already do this using just *setgid()*, but for non-privileged |

setregid()

58725 applications the only standard method available is to use this feature of *setregid()*.

58726 **FUTURE DIRECTIONS**

58727 None.

58728 **SEE ALSO**

58729 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*

58730 XBD <[unistd.h](#)>

58731 **CHANGE HISTORY**

58732 First released in Issue 4, Version 2.

58733 **Issue 5**

58734 Moved from X/OPEN UNIX extension to BASE.

58735 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the
58736 *exec* family of functions, not just *execve()*.

58737 **Issue 7**

58738 SD5-XSH-ERN-177 is applied, adding the ability to set both the effective group ID and saved set-
58739 group-ID to be the same as the real group ID.

58740 **NAME**

58741 setreuid — set real and effective user IDs

58742 **SYNOPSIS**

```
58743 XSI #include <unistd.h>
58744 int setreuid(uid_t ruid, uid_t euid);
```

58745 **DESCRIPTION**

58746 The *setreuid()* function shall set the real and effective user IDs of the current process to the
 58747 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is -1 , the corresponding effective
 58748 or real user ID of the current process shall be left unchanged.

58749 A process with appropriate privileges can set either ID to any value. An unprivileged process
 58750 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or
 58751 saved user ID of the process.

58752 If the real user ID is being set (*ruid* is not -1), or the effective user ID is being set to a value not
 58753 equal to the real user ID, then the saved set-user-ID of the current process shall be set equal to
 58754 the new effective user ID. +

58755 It is unspecified whether a process without appropriate privileges is permitted to change the real
 58756 user ID to match the current effective user ID or saved set-user-ID of the process. |

58757 **RETURN VALUE**

58758 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 58759 indicate the error.

58760 **ERRORS**

58761 The *setreuid()* function shall fail if:

- | | | |
|-------|----------|---|
| 58762 | [EINVAL] | The value of the <i>ruid</i> or <i>euid</i> argument is invalid or out-of-range. |
| 58763 | [EPERM] | The current process does not have appropriate privileges, and either an
58764 attempt was made to change the effective user ID to a value other than the real
58765 user ID or the saved set-user-ID or an attempt was made to change the real
58766 user ID to a value not permitted by the implementation. |

58767 **EXAMPLES**58768 **Setting the Effective User ID to the Real User ID**

58769 The following example sets the effective user ID of the calling process to the real user ID, so that
 58770 files created later will be owned by the current user. It also sets the saved set-user-ID to the real
 58771 user ID, so any future attempt to set the effective user ID back to its previous value will fail. |

```
58772 #include <unistd.h>
58773 #include <sys/types.h>
58774 ...
58775 setreuid(getuid(), getuid());
58776 ...
```

58777 **APPLICATION USAGE**

58778 None.

58798

58799 **NAME**
58800 setrlimit — control maximum resource consumption

58801 **SYNOPSIS**

58802 XSI `#include <sys/resource.h>`
58803 `int setrlimit(int resource, const struct rlimit *rlp);`

58804 **DESCRIPTION**

58805 Refer to [getrlimit\(\)](#).

setservent()

58806 **NAME**
58807 setservent — network services database functions

58808 **SYNOPSIS**
58809 #include <netdb.h>
58810 void setservent(int *stayopen*);

58811 **DESCRIPTION**
58812 Refer to *endservent()*.

58813 **NAME**

58814 setsid — create session and set process group ID

58815 **SYNOPSIS**

58816 #include <unistd.h>

58817 pid_t setsid(void);

58818 **DESCRIPTION**

58819 The *setsid()* function shall create a new session, if the calling process is not a process group
 58820 leader. Upon return the calling process shall be the session leader of this new session, shall be
 58821 the process group leader of a new process group, and shall have no controlling terminal. The
 58822 process group ID of the calling process shall be set equal to the process ID of the calling process.
 58823 The calling process shall be the only process in the new process group and the only process in
 58824 the new session.

58825 **RETURN VALUE**

58826 Upon successful completion, *setsid()* shall return the value of the new process group ID of the
 58827 calling process. Otherwise, it shall return (**pid_t**)-1 and set *errno* to indicate the error.

58828 **ERRORS**58829 The *setsid()* function shall fail if:

58830 [EPERM] The calling process is already a process group leader, or the process group ID
 58831 of a process other than the calling process matches the process ID of the
 58832 calling process.

58833 **EXAMPLES**

58834 None.

58835 **APPLICATION USAGE**

58836 None.

58837 **RATIONALE**

58838 The *setsid()* function is similar to the *setpgid()* function of System V. System V, without job
 58839 control, groups processes into process groups and creates new process groups via *setpgid()*; only
 58840 one process group may be part of a login session.

58841 Job control allows multiple process groups within a login session. In order to limit job control
 58842 actions so that they can only affect processes in the same login session, this volume of
 58843 POSIX.1-200x adds the concept of a session that is created via *setsid()*. The *setsid()* function also
 58844 creates the initial process group contained in the session. Additional process groups can be
 58845 created via the *setpgid()* function. A System V process group would correspond to a POSIX
 58846 System Interfaces session containing a single POSIX process group. Note that this function
 58847 requires that the calling process not be a process group leader. The usual way to ensure this is
 58848 true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function
 58849 guarantees that the process ID of the new process does not match any existing process group ID.

58850 **FUTURE DIRECTIONS**

58851 None.

58852 **SEE ALSO**58853 *getsid()*, *setpgid()*, *setpgid()*

58863**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

58864 **NAME**
 58865 setsockopt — set the socket options

58866 **SYNOPSIS**
 58867 #include <sys/socket.h>
 58868 int setsockopt(int socket, int level, int option_name,
 58869 const void *option_value, socklen_t option_len);

58870 **DESCRIPTION**
 58871 The *setsockopt()* function shall set the option specified by the *option_name* argument, at the
 58872 protocol level specified by the *level* argument, to the value pointed to by the *option_value*
 58873 argument for the socket associated with the file descriptor specified by the *socket* argument.

58874 The *level* argument specifies the protocol level at which the option resides. To set options at the
 58875 socket level, specify the *level* argument as SOL_SOCKET. To set options at other levels, supply
 58876 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate
 58877 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO_TCP
 58878 as defined in the **<netinet/in.h>** header.

58879 The *option_name* argument specifies a single option to set. The *option_name* argument and any
 58880 specified options are passed uninterpreted to the appropriate protocol module for
 58881 interpretations. The **<sys/socket.h>** header defines the socket-level options. The options are as
 58882 follows:

58883 SO_DEBUG Turns on recording of debugging information. This option enables or
 58884 disables debugging in the underlying protocol modules. This option takes
 58885 an **int** value. This is a Boolean option.

58886 SO_BROADCAST Permits sending of broadcast messages, if this is supported by the
 58887 protocol. This option takes an **int** value. This is a Boolean option.

58888 SO_REUSEADDR Specifies that the rules used in validating addresses supplied to *bind()*
 58889 should allow reuse of local addresses, if this is supported by the protocol.
 58890 This option takes an **int** value. This is a Boolean option.

58891 SO_KEEPALIVE Keeps connections active by enabling the periodic transmission of
 58892 messages, if this is supported by the protocol. This option takes an **int**
 58893 value.

58894 If the connected socket fails to respond to these messages, the connection
 58895 is broken and threads writing to that socket are notified with a SIGPIPE
 58896 signal. This is a Boolean option.

58897 SO_LINGER Lingers on a *close()* if data is present. This option controls the action taken
 58898 when unsent messages queue on a socket and *close()* is performed. If
 58899 SO_LINGER is set, the system shall block the calling thread during *close()*
 58900 until it can transmit the data or until the time expires. If SO_LINGER is
 58901 not specified, and *close()* is issued, the system handles the call in a way
 58902 that allows the calling thread to continue as quickly as possible. This
 58903 option takes a **linger** structure, as defined in the **<sys/socket.h>** header, to
 58904 specify the state of the option and linger interval.

58905 SO_OOBINLINE Leaves received out-of-band data (data marked urgent) inline. This option
 58906 takes an **int** value. This is a Boolean option.

58907	SO_SNDBUF	Sets send buffer size. This option takes an int value.
58908	SO_RCVBUF	Sets receive buffer size. This option takes an int value.
58909	SO_DONTROUTE	Requests that outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option takes an int value. This is a Boolean option.
58910		
58911		
58912		
58913		
58914	SO_RCVLOWAT	Sets the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option takes an int value. Note that not all implementations allow this option to be set.
58915		
58916		
58917		
58918		
58919		
58920		
58921		
58922	SO_RCVTIMEO	Sets the timeout value that specifies the maximum amount of time an input function waits until it completes. It accepts a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data is received. The default for this option is zero, which indicates that a receive operation shall not time out. This option takes a timeval structure. Note that not all implementations allow this option to be set.
58923		
58924		
58925		
58926		
58927		
58928		
58929		
58930		
58931		
58932	SO_SNDLOWAT	Sets the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option takes an int value. Note that not all implementations allow this option to be set.
58933		
58934		
58935		
58936		
58937	SO_SNDTIMEO	Sets the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data is sent. The default for this option is zero, which indicates that a send operation shall not time out. This option stores a timeval structure. Note that not all implementations allow this option to be set.
58938		
58939		
58940		
58941		
58942		
58943		
58944		
58945		
58946		
58947		
58948		
58949		
58950		
58951		
58952		

For Boolean options, 0 indicates that the option is disabled and 1 indicates that the option is enabled.

Options at other protocol levels vary in format and name.

RETURN VALUE

Upon successful completion, *setsockopt()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

ERRORS

The *setsockopt()* function shall fail if:

[EBADF] The *socket* argument is not a valid file descriptor.

58953	[EDOM]	The send and receive timeout values are too big to fit into the timeout fields in the socket structure.
58954		
58955	[EINVAL]	The specified option is invalid at the specified socket level or the socket has been shut down.
58956		
58957	[EISCONN]	The socket is already connected, and a specified option cannot be set while the socket is connected.
58958		
58959	[ENOPROTOOPT]	
58960		The option is not supported by the protocol.
58961	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
58962		The <i>setsockopt()</i> function may fail if:
58963	[ENOMEM]	There was insufficient memory available for the operation to complete.
58964	[ENOBUFS]	Insufficient resources are available in the system to complete the call.

EXAMPLES

None.

APPLICATION USAGE

The *setsockopt()* function provides an application program with the means to control socket behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts, or permit socket data broadcasts. The `<sys/socket.h>` header defines the socket-level options available to *setsockopt()*.

Options may exist at multiple protocol levels. The `SO_` options are always present at the uppermost socket level.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/125 is applied, updating the `SO_LINGER` option in the DESCRIPTION to refer to the calling thread rather than the process.

setstate()

58985 **NAME**
58986 setstate — switch pseudo-random number generator state arrays

58987 **SYNOPSIS**
58988 XSI #include <stdlib.h>
58989 char *setstate(const char *state);

58990 **DESCRIPTION**
58991 Refer to *initstate()*.

58992 **NAME**

58993 setuid — set user ID

58994 **SYNOPSIS**58995 #include <unistd.h>
58996 int setuid(uid_t uid);58997 **DESCRIPTION**58998 If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and
58999 the saved set-user-ID of the calling process to *uid*.59000 If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the
59001 saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-
59002 user-ID shall remain unchanged.59003 The *setuid()* function shall not affect the supplementary group list in any way.59004 **RETURN VALUE**59005 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
59006 indicate the error.59007 **ERRORS**59008 The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more
59009 of the following are true:

- 59010 [EINVAL] The value of the
- uid*
- argument is invalid and not supported by the
-
- 59011 implementation.
-
- 59012 [EPERM] The process does not have appropriate privileges and
- uid*
- does not match the
-
- 59013 real user ID or the saved set-user-ID.

59014 **EXAMPLES**

59015 None.

59016 **APPLICATION USAGE**

59017 None.

59018 **RATIONALE**59019 The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged
59020 processes reflect the behavior of different historical implementations. For portability, it is
59021 recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions
59022 instead.59023 The saved set-user-ID capability allows a program to regain the effective user ID established at
59024 the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the
59025 effective group ID established at the last *exec* call. These capabilities are derived from System V.
59026 Without them, a program might have to run as superuser in order to perform the same
59027 functions, because superuser can write on the user's files. This is a problem because such a
59028 program can write on any user's files, and so must be carefully written to emulate the
59029 permissions of the calling process properly. In System V, these capabilities have traditionally
59030 been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The
59031 fact that the behavior of those functions was different for privileged processes made them
59032 difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently
59033 for privileged and unprivileged users. When the caller had the appropriate privilege, the
59034 function set the real user ID, effective user ID, and saved set-user ID of the calling process on
59035 implementations that supported it. When the caller did not have the appropriate privilege, the
59036 function set only the effective user ID, subject to permission checks. The former use is generally

59037
59038
59039
59040

needed for utilities like *login* and *su*, which are not conforming applications and thus outside the scope of POSIX.1-200x. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

59041
59042
59043
59044
59045
59046
59047
59048
59049
59050

POSIX.1-200x augments the latter functionality with a mandatory feature named `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with the (implementation-defined) appropriate privilege. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by POSIX.1-200x. However, there are implementors who have been reluctant to support it given the limitation described above.

59051
59052
59053
59054
59055
59056
59057
59058
59059
59060

The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which always sets both the real and effective user IDs, like *setuid()* in POSIX.1-200x for privileged users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in POSIX.1-200x for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid()*, which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be deprecated or removed.

59061

The solution here is:

59062
59063
59064
59065

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid()*.
- Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for non-privileged and privileged processes.

59086
59087

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID, or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs. The changes included in POSIX.1-200x provide a new mechanism using *seteuid()* in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined. The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS` behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS` was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid()*. The standard developers considered that alternative to be less correct than the retention of the old behavior of *kill()* in such systems. Current conforming applications shall accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to

59088 check the saved set-user-ID rather than the effective user ID.

59089 FUTURE DIRECTIONS

59090 None.

59094 CHANGE HISTORY

59095 First released in Issue 1. Derived from Issue 1 of the SVID.

59096 Issue 6

59097 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

59098 The following new requirements on POSIX implementations derive from alignment with the
59099 Single UNIX Specification:

- 59100 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
59101 required for conforming implementations of previous POSIX specifications, it was not
59102 required for UNIX applications.
- 59103 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS
59104 requirement.

59105 The following changes were made to align with the IEEE P1003.1a draft standard:

- 59106 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 59107 • A requirement that the supplementary group list is not affected is added.

59108 **NAME**
59109 setutxent — reset the user accounting database to the first entry

59110 **SYNOPSIS**

59111 XSI #include <utmpx.h>
59112 void setutxent(void);

59113 **DESCRIPTION**

59114 Refer to *endutxent()*.

59115 **NAME**

59116 setvbuf — assign buffering to a stream

59117 **SYNOPSIS**

59118 #include <stdio.h>

59119 int setvbuf(FILE *restrict stream, char *restrict buf, int type,
59120 size_t size);59121 **DESCRIPTION**59122 CX The functionality described on this reference page is aligned with the ISO C standard. Any
59123 conflict between the requirements described here and the ISO C standard is unintentional. This
59124 volume of POSIX.1-200x defers to the ISO C standard.59125 The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an
59126 open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is
59127 performed on the stream. The argument *type* determines how *stream* shall be buffered, as
59128 follows:

- 59129
- {_IOFBF} shall cause input/output to be fully buffered.
59130 - {_IOLBF} shall cause input/output to be line buffered.
59131 - {_IONBF} shall cause input/output to be unbuffered.

59132 If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by
59133 *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the
59134 size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are
59135 unspecified.59136 For information about streams, see [Section 2.5](#) (on page 469).59137 **RETURN VALUE**59138 Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value
59139 CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to
59140 indicate the error.59141 **ERRORS**59142 The *setvbuf()* function may fail if:59143 CX [EBADF] The file descriptor underlying *stream* is not valid.59144 **EXAMPLES**

59145 None.

59146 **APPLICATION USAGE**59147 A common source of error is allocating buffer space as an “automatic” variable in a code block,
59148 and then failing to close the stream in the same block.59149 With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are
59150 used for the buffer area.59151 Applications should note that many implementations only provide line buffering on input from
59152 terminal devices.59153 **RATIONALE**

59154 None.

CHANGE HISTORY

59161

First released in Issue 1. Derived from Issue 1 of the SVID.

59162

Issue 6

59163

Extensions beyond the ISO C standard are marked.

59164

The *setvbuf()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

59165 **NAME**59166 shm_open — open a shared memory object (**REALTIME**)59167 **SYNOPSIS**

```
59168 SHM #include <sys/mman.h>
59169 int shm_open(const char *name, int oflag, mode_t mode);
```

59170 **DESCRIPTION**

59171 The *shm_open()* function shall establish a connection between a shared memory object and a file
 59172 descriptor. It shall create an open file description that refers to the shared memory object and a
 59173 file descriptor that refers to that open file description. The file descriptor is used by other
 59174 functions to refer to that shared memory object. The *name* argument points to a string naming a
 59175 shared memory object. It is unspecified whether the name appears in the file system and is
 59176 visible to other functions that take pathnames as arguments. The *name* argument conforms to the
 59177 construction rules for a pathname, except that the interpretation of slash characters other than
 59178 the leading slash character in *name* is implementation-defined, and that the length limits for the
 59179 *name* argument are implementation-defined and need not be the same as the pathname limits
 59180 {PATH_MAX} and {NAME_MAX}. If *name* begins with the slash character, then processes
 59181 calling *shm_open()* with the same value of *name* refer to the same shared memory object, as long
 59182 as that name has not been removed. If *name* does not begin with the slash character, the effect is
 59183 implementation-defined.

59184 If successful, *shm_open()* shall return a file descriptor for the shared memory object that is the
 59185 lowest numbered file descriptor not currently open for that process. The open file description is
 59186 new, and therefore the file descriptor does not share it with any other processes. It is unspecified
 59187 whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file
 59188 descriptor is set.

59189 The file status flags and file access modes of the open file description are according to the value
 59190 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the
 59191 **<fcntl.h>** header. Applications specify exactly one of the first two values (access modes) below
 59192 in the value of *oflag*:

59193 O_RDONLY Open for read access only.

59194 O_RDWR Open for read or write access.

59195 Any combination of the remaining flags may be specified in the value of *oflag*:

59196 O_CREAT If the shared memory object exists, this flag has no effect, except as noted |
 59197 under O_EXCL below. Otherwise, the shared memory object is created. The |
 59198 user ID of the shared memory object shall be set to the effective user ID of the |
 59199 process. The group ID of the shared memory object shall be set to the effective |
 59200 group ID of the process; however, if the *name* argument is visible in the file |
 59201 system, the group ID may be set to the group ID of the containing directory. |
 59202 The permission bits of the shared memory object shall be set to the value of |
 59203 the *mode* argument except those set in the file mode creation mask of the |
 59204 process. When bits in *mode* other than the file permission bits are set, the effect |
 59205 is unspecified. The *mode* argument does not affect whether the shared memory |
 59206 object is opened for reading, for writing, or for both. The shared memory |
 59207 object has a size of zero.

59208 O_EXCL If O_EXCL and O_CREAT are set, *shm_open()* fails if the shared memory
 59209 object exists. The check for the existence of the shared memory object and the
 59210 creation of the object if it does not exist is atomic with respect to other

shm_open()

59211 processes executing *shm_open()* naming the same shared memory object with
 59212 O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the
 59213 result is undefined.

59214 O_TRUNC If the shared memory object exists, and it is successfully opened O_RDWR, the
 59215 object shall be truncated to zero length and the mode and owner shall be
 59216 unchanged by this function call. The result of using O_TRUNC with
 59217 O_RDONLY is undefined.

59218 When a shared memory object is created, the state of the shared memory object, including all
 59219 data associated with the shared memory object, persists until the shared memory object is
 59220 unlinked and all other references are gone. It is unspecified whether the name and shared
 59221 memory object state remain valid after a system reboot.

RETURN VALUE

59222 Upon successful completion, the *shm_open()* function shall return a non-negative integer
 59223 representing the lowest numbered unused file descriptor. Otherwise, it shall return -1 and set
 59224 *errno* to indicate the error.

ERRORS

59226 The *shm_open()* function shall fail if:

59228 [EACCES] The shared memory object exists and the permissions specified by *oflag* are
 59229 denied, or the shared memory object does not exist and permission to create
 59230 the shared memory object is denied, or O_TRUNC is specified and write
 59231 permission is denied.

59232 [EEXIST] O_CREAT and O_EXCL are set and the named shared memory object already
 59233 exists.

59234 [EINTR] The *shm_open()* operation was interrupted by a signal.

59235 [EINVAL] The *shm_open()* operation is not supported for the given name.

59236 [EMFILE] All file descriptors available to the process are currently open.

59237 [ENFILE] Too many shared memory objects are currently open in the system.

59238 [ENOENT] O_CREAT is not set and the named shared memory object does not exist.

59239 [ENOSPC] There is insufficient space for the creation of the new shared memory object.

59240 The *shm_open()* function may fail if:

59241 [ENAMETOOLONG]

59242 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems
 59243 XSI that do not support the XSI option or exceeds `{_XOPEN_PATH_MAX}` on XSI
 59244 systems, or has a pathname component that is longer than
 59245 XSI `{_POSIX_NAME_MAX}` on systems that do not support the XSI option or
 59246 longer than `{_XOPEN_NAME_MAX}` on XSI systems.

EXAMPLES**Creating and Mapping a Shared Memory Object**

59248 The following code segment demonstrates the use of *shm_open()* to create a shared memory
 59249 object which is then sized using *ftruncate()* before being mapped into the process address space
 59250 using *mmap()*:

```
59252 #include <unistd.h>
59253 #include <sys/mman.h>
59254 ...
```

```

59255     #define MAX_LEN 10000
59256     struct region {           /* Defines "structure" of shared memory */
59257         int len;
59258         char buf[MAX_LEN];
59259     };
59260     struct region *rptr;
59261     int fd;

59262     /* Create shared memory object and set its size */

59263     fd = shm_open("/myregion", O_CREAT | O_RDWR, S_IRUSR | S_IWUSR);
59264     if (fd == -1)
59265         /* Handle error */;

59266     if (ftruncate(fd, sizeof(struct region)) == -1)
59267         /* Handle error */;

59268     /* Map shared memory object */

59269     rptr = mmap(NULL, sizeof(struct region),
59270                PROT_READ | PROT_WRITE, MAP_SHARED, fd, 0);
59271     if (rptr == MAP_FAILED)
59272         /* Handle error */;

59273     /* Now we can refer to mapped region using fields of rptr;
59274        for example, rptr->len */
59275     ...

```

APPLICATION USAGE

None.

RATIONALE

When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared Memory Objects option is supported, the *shm_open()* function shall obtain a descriptor to the shared memory object to be mapped.

There is ample precedent for having a file descriptor represent several types of objects. In the POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory. Many implementations simply have an operations vector, which is indexed by the file descriptor type and does very different operations. Note that in some cases the file descriptor passed to generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned by alternate functions, such as *pipe()*. The latter technique is used by *shm_open()*.

Note that such shared memory objects can actually be implemented as mapped files. In both cases, the size can be set after the open using *ftruncate()*. The *shm_open()* function itself does not create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm_open()* function may be implemented using a macro that invokes *open()*, and the *shm_unlink()* function may be implemented using a macro that invokes *unlink()*.

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual

59303 memory hardware support in order to ensure that the memory is contiguous.

59304 The set of valid open flags to *shm_open()* was restricted to *O_RDONLY*, *O_RDWR*, *O_CREAT*,
59305 and *O_TRUNC* because these could be easily implemented on most memory mapping systems.
59306 This volume of POSIX.1-200x is silent on the results if the implementation cannot supply the
59307 requested file access because of implementation-defined reasons, including hardware ones.

59308 The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the
59309 implementation cannot complete a request.

59310 [EACCES] indicates for implementation-defined reasons, probably hardware-related, that the
59311 implementation cannot comply with a requested mode because it conflicts with another
59312 requested mode. An example might be that an application desires to open a memory object two
59313 times, mapping different areas with different access modes. If the implementation cannot map a
59314 single area into a process space in two places, which would be required if different access modes
59315 were required for the two areas, then the implementation may inform the application at the time
59316 of the second open.

59317 [ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the
59318 implementation cannot comply with a requested mode at all. An example would be that the
59319 hardware of the implementation cannot support write-only shared memory areas.

59320 On all implementations, it may be desirable to restrict the location of the memory objects to
59321 specific file systems for performance (such as a RAM disk) or implementation-defined reasons
59322 (shared memory supported directly only on certain file systems). The *shm_open()* function may
59323 be used to enforce these restrictions. There are a number of methods available to the application
59324 to determine an appropriate name of the file or the location of an appropriate directory. One way
59325 is from the environment via *getenv()*. Another would be from a configuration file.

59326 This volume of POSIX.1-200x specifies that memory objects have initial contents of zero when
59327 created. This is consistent with current behavior for both files and newly allocated memory. For
59328 those implementations that use physical memory, it would be possible that such
59329 implementations could simply use available memory and give it to the process uninitialized.
59330 This, however, is not consistent with standard behavior for the uninitialized data area, the stack,
59331 and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security
59332 reasons. Thus, initializing memory objects to zero is required.

59333 FUTURE DIRECTIONS

59334 None.

Issue 7

59347

Austin Group Interpretation 1003.1-2001 #077 is applied, clarifying the *name* argument and changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

59348

59349

SD5-XSH-ERN-170 is applied, updating the DESCRIPTION to clarify the wording for setting the user ID and group ID of the shared memory object. +

59350

59351 **NAME**59352 shm_unlink — remove a shared memory object (**REALTIME**)59353 **SYNOPSIS**

```
59354 SHM #include <sys/mman.h>
59355 int shm_unlink(const char *name);
```

59356 **DESCRIPTION**

59357 The *shm_unlink()* function shall remove the name of the shared memory object named by the
59358 string pointed to by *name*.

59359 If one or more references to the shared memory object exist when the object is unlinked, the
59360 name shall be removed before *shm_unlink()* returns, but the removal of the memory object
59361 contents shall be postponed until all open and map references to the shared memory object have
59362 been removed.

59363 Even if the object continues to exist after the last *shm_unlink()*, reuse of the name shall
59364 subsequently cause *shm_open()* to behave as if no shared memory object of this name exists (that
59365 is, *shm_open()* will fail if `O_CREAT` is not set, or will create a new shared memory object if
59366 `O_CREAT` is set).

59367 **RETURN VALUE**

59368 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be
59369 returned and *errno* set to indicate the error. If `-1` is returned, the named shared memory object
59370 shall not be changed by this function call.

59371 **ERRORS**59372 The *shm_unlink()* function shall fail if:

59373 [EACCES] Permission is denied to unlink the named shared memory object.

59374 [ENOENT] The named shared memory object does not exist.

59375 The *shm_unlink()* function may fail if:

59376 [ENAMETOOLONG]

59377 The length of the *name* argument exceeds `{_POSIX_PATH_MAX}` on systems
59378 that do not support the XSI option `or exceeds {_XOPEN_PATH_MAX}` on XSI
59379 systems, `or has a pathname component that is longer than`
59380 `{_POSIX_NAME_MAX}` on systems that do not support the XSI option `or`
59381 `longer than {_XOPEN_NAME_MAX}` on XSI systems. A call to *shm_unlink()*
59382 with a *name* argument that contains the same shared memory object name as
59383 was previously used in a successful *shm_open()* call shall not give an
59384 [ENAMETOOLONG] error.

59385 **EXAMPLES**

59386 None.

59387 **APPLICATION USAGE**

59388 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual
59389 fashion. Names of memory objects that were allocated with *shm_open()* are deleted with
59390 *shm_unlink()*. Note that the actual memory object is not destroyed until the last close and
59391 unmap on it have occurred if it was already in use.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *shm_unlink()* function is marked as part of the Shared Memory Objects option.

In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm_unlink()* will not attach to the old shared memory object.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Shared Memory Objects option.

Issue 7

Austin Group Interpretation 1003.1-2001 #077 is applied, changing [ENAMETOOLONG] from a “shall fail” to a “may fail” error.

DRAFT

59410 **NAME**

59411 shmat — XSI shared memory attach operation

59412 **SYNOPSIS**

```
59413 XSI #include <sys/shm.h>
59414 void *shmat(int shmid, const void *shmaddr, int shmflg);
```

59415 **DESCRIPTION**

59416 The *shmat()* function operates on XSI shared memory (see XBD [Section 3.340](#), on page 80). It is
 59417 unspecified whether this function interoperates with the realtime interprocess communication
 59418 facilities defined in [Section 2.8](#) (on page 476).

59419 The *shmat()* function attaches the shared memory segment associated with the shared memory
 59420 identifier specified by *shmid* to the address space of the calling process. The segment is attached
 59421 at the address specified by one of the following criteria:

- 59422 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected
 59423 by the system.
- 59424 • If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is non-zero, the segment is
 59425 attached at the address given by (*shmaddr* - ((*uintptr_t*)*shmaddr* %SHMLBA)). The character
 59426 ‘%’ is the C-language remainder operator.
- 59427 • If *shmaddr* is not a null pointer and (*shmflg* &SHM_RND) is 0, the segment is attached at
 59428 the address given by *shmaddr*.
- 59429 • The segment is attached for reading if (*shmflg* &SHM_RDONLY) is non-zero and the
 59430 calling process has read permission; otherwise, if it is 0 and the calling process has read
 59431 and write permission, the segment is attached for reading and writing.

59432 **RETURN VALUE**

59433 Upon successful completion, *shmat()* shall increment the value of *shm_nattch* in the data
 59434 structure associated with the shared memory ID of the attached shared memory segment and
 59435 return the segment’s start address.

59436 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return -1, and *errno*
 59437 shall be set to indicate the error.

59438 **ERRORS**

59439 The *shmat()* function shall fail if:

- | | | |
|-------|----------|--|
| 59440 | [EACCES] | Operation permission is denied to the calling process; see Section 2.7 (on page 474). |
| 59442 | [EINVAL] | The value of <i>shmid</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of (<i>shmaddr</i> - ((<i>uintptr_t</i>) <i>shmaddr</i> %SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, (<i>shmflg</i> &SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory. |
| 59447 | [EMFILE] | The number of shared memory segments attached to the calling process would exceed the system-imposed limit. |
| 59449 | [ENOMEM] | The available data space is not large enough to accommodate the shared memory segment. |

59451

EXAMPLES

59452

None.

59453

APPLICATION USAGE

59454

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to use the alternative interfaces.

Issue 6

59473

The Open Group Corrigendum U021/13 is applied.

59474 **NAME**
 59475 shmctl — XSI shared memory control operations

59476 **SYNOPSIS**

```
59477 XSI #include <sys/shm.h>
59478 int shmctl(int shmid, int cmd, struct shm_id_ds *buf);
```

59479 **DESCRIPTION**

59480 The *shmctl()* function operates on XSI shared memory (see XBD [Section 3.340](#), on page 80). It is
 59481 unspecified whether this function interoperates with the realtime interprocess communication
 59482 facilities defined in [Section 2.8](#) (on page 476).

59483 The *shmctl()* function provides a variety of shared memory control operations as specified by
 59484 *cmd*. The following values for *cmd* are available:

59485 **IPC_STAT** Place the current value of each member of the **shm_id_ds** data structure
 59486 associated with *shmid* into the structure pointed to by *buf*. The contents of the
 59487 structure are defined in **<sys/shm.h>**.

59488 **IPC_SET** Set the value of the following members of the **shm_id_ds** data structure
 59489 associated with *shmid* to the corresponding value found in the structure
 59490 pointed to by *buf*:

59491 shm_perm.uid
 59492 shm_perm.gid
 59493 shm_perm.mode Low-order nine bits.

59494 IPC_SET can only be executed by a process that has an effective user ID equal
 59495 to either that of a process with appropriate privileges or to the value of
 59496 *shm_perm.cuid* or *shm_perm.uid* in the **shm_id_ds** data structure associated with
 59497 *shmid*.

59498 **IPC_RMID** Remove the shared memory identifier specified by *shmid* from the system and
 59499 destroy the shared memory segment and **shm_id_ds** data structure associated
 59500 with it. IPC_RMID can only be executed by a process that has an effective user
 59501 ID equal to either that of a process with appropriate privileges or to the value
 59502 of *shm_perm.cuid* or *shm_perm.uid* in the **shm_id_ds** data structure associated
 59503 with *shmid*.

59504 **RETURN VALUE**

59505 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return -1 and set *errno* to
 59506 indicate the error.

59507 **ERRORS**

59508 The *shmctl()* function shall fail if:

59509 [EACCES] The argument *cmd* is equal to IPC_STAT and the calling process does not have
 59510 read permission; see [Section 2.7](#) (on page 474).

59511 [EINVAL] The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*
 59512 is not a valid command.

59513 [EPERM] The argument *cmd* is equal to IPC_RMID or IPC_SET and the effective user ID
 59514 of the calling process is not equal to that of a process with appropriate
 59515 privileges and it is not equal to the value of *shm_perm.cuid* or *shm_perm.uid* in
 59516 the data structure associated with *shmid*.

59517 The *shmctl()* function may fail if:

59518 [EOVERFLOW] The *cmd* argument is `IPC_STAT` and the *gid* or *uid* value is too large to be
59519 stored in the structure pointed to by the *buf* argument.

59520 EXAMPLES

59521 None.

59522 APPLICATION USAGE

59523 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
59524 Application developers who need to use IPC should design their applications so that modules
59525 using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to use the
59526 alternative interfaces.

59540 DIRECTIONS to a new APPLICATION USAGE section.

59541 **NAME**
 59542 `shmdt` — XSI shared memory detach operation

59543 **SYNOPSIS**

```
59544 XSI #include <sys/shm.h>
59545 int shmdt(const void *shmaddr);
```

59546 **DESCRIPTION**

59547 The `shmdt()` function operates on XSI shared memory (see XBD [Section 3.340](#), on page 80). It is
 59548 unspecified whether this function interoperates with the realtime interprocess communication
 59549 facilities defined in [Section 2.8](#) (on page 476).

59550 The `shmdt()` function detaches the shared memory segment located at the address specified by
 59551 `shmaddr` from the address space of the calling process.

59552 **RETURN VALUE**

59553 Upon successful completion, `shmdt()` shall decrement the value of `shm_nattch` in the data
 59554 structure associated with the shared memory ID of the attached shared memory segment and
 59555 return 0.

59556 Otherwise, the shared memory segment shall not be detached, `shmdt()` shall return `-1`, and `errno`
 59557 shall be set to indicate the error.

59558 **ERRORS**

59559 The `shmdt()` function shall fail if:

59560 [EINVAL] The value of `shmaddr` is not the data segment start address of a shared memory
 59561 segment.

59562 **EXAMPLES**

59563 None.

59564 **APPLICATION USAGE**

59565 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 59566 Application developers who need to use IPC should design their applications so that modules
 59567 using the IPC routines described in [Section 2.7](#) (on page 474) can be easily modified to use the
 59568 alternative interfaces.

59582

59583 **NAME**
 59584 shmget — get an XSI shared memory segment

59585 **SYNOPSIS**

```
59586 XSI #include <sys/shm.h>
59587 int shmget(key_t key, size_t size, int shmflg);
```

59588 **DESCRIPTION**

59589 The *shmget()* function operates on XSI shared memory (see XBD [Section 3.340](#), on page 80). It is
 59590 unspecified whether this function interoperates with the realtime interprocess communication
 59591 facilities defined in [Section 2.8](#) (on page 476).

59592 The *shmget()* function shall return the shared memory identifier associated with *key*.

59593 A shared memory identifier, associated data structure, and shared memory segment of at least
 59594 *size* bytes (see [<sys/shm.h>](#)) are created for *key* if one of the following is true:

- 59595 • The argument *key* is equal to `IPC_PRIVATE`.
- 59596 • The argument *key* does not already have a shared memory identifier associated with it and
 59597 (*shmflg* & `IPC_CREAT`) is non-zero.

59598 Upon creation, the data structure associated with the new shared memory identifier shall be
 59599 initialized as follows:

- 59600 • The values of *shm_perm.cuid*, *shm_perm.uid*, *shm_perm.cgid*, and *shm_perm.gid* are set equal
 59601 to the effective user ID and effective group ID, respectively, of the calling process.
- 59602 • The low-order nine bits of *shm_perm.mode* are set equal to the low-order nine bits of *shmflg*.
- 59603 • The value of *shm_segsz* is set equal to the value of *size*.
- 59604 • The values of *shm_lpid*, *shm_nattch*, *shm_atime*, and *shm_dtime* are set equal to 0.
- 59605 • The value of *shm_ctime* is set equal to the current time.

59606 When the shared memory segment is created, it shall be initialized with all zero values.

59607 **RETURN VALUE**

59608 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared
 59609 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

59610 **ERRORS**

59611 The *shmget()* function shall fail if:

- | | | |
|-------|----------|---|
| 59612 | [EACCES] | A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see Section 2.7 (on page 474). |
| 59613 | | |
| 59614 | | |
| 59615 | [EEXIST] | A shared memory identifier exists for the argument <i>key</i> but (<i>shmflg</i> & <code>IPC_CREAT</code>) && (<i>shmflg</i> & <code>IPC_EXCL</code>) is non-zero. |
| 59616 | | |
| 59617 | [EINVAL] | A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum. |
| 59618 | | |
| 59619 | [EINVAL] | No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> and <i>size</i> is not 0. |
| 59620 | | |
| 59621 | | |

59622	[ENOENT]	A shared memory identifier does not exist for the argument <i>key</i> and (<i>shmflg</i> &IPC_CREAT) is 0.
59623		
59624	[ENOMEM]	A shared memory identifier and associated shared memory segment shall be created, but the amount of available physical memory is not sufficient to fill the request.
59625		
59626		
59627	[ENOSPC]	A shared memory identifier is to be created, but the system-imposed limit on the maximum number of allowed shared memory identifiers system-wide would be exceeded.
59628		
59629		

EXAMPLES

None.

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Moved from SHARED MEMORY to BASE.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

59651 **NAME**

59652 shutdown — shut down socket send and receive operations

59653 **SYNOPSIS**

59654 #include <sys/socket.h>

59655 int shutdown(int *socket*, int *how*);59656 **DESCRIPTION**59657 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket
59658 associated with the file descriptor *socket* to be shut down.59659 The *shutdown()* function takes the following arguments:59660 *socket* Specifies the file descriptor of the socket.59661 *how* Specifies the type of shutdown. The values are as follows:

59662 SHUT_RD Disables further receive operations.

59663 SHUT_WR Disables further send operations.

59664 SHUT_RDWR Disables further send and receive operations.

59665 The *shutdown()* function disables subsequent send and/or receive operations on a socket,
59666 depending on the value of the *how* argument.59667 **RETURN VALUE**59668 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*
59669 set to indicate the error.59670 **ERRORS**59671 The *shutdown()* function shall fail if:59672 [EBADF] The *socket* argument is not a valid file descriptor.59673 [EINVAL] The *how* argument is invalid.

59674 [ENOTCONN] The socket is not connected.

59675 [ENOTSOCK] The *socket* argument does not refer to a socket.59676 The *shutdown()* function may fail if:

59677 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

59691

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

59692 **NAME**

59693 sigaction — examine and change a signal action

59694 **SYNOPSIS**

```
59695 CX #include <signal.h>
59696 int sigaction(int sig, const struct sigaction *restrict act,
59697 struct sigaction *restrict oact);
```

59698 **DESCRIPTION**

59699 The *sigaction()* function allows the calling process to examine and/or specify the action to be
 59700 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are
 59701 defined in **<signal.h>**.

59702 The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>**
 59703 header to include at least the following members:

Member Type	Member Name	Description
void(*) (int)	<i>sa_handler</i>	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
sigset_t	<i>sa_mask</i>	Additional set of signals to be blocked during execution of signal-catching function.
int	<i>sa_flags</i>	Special flags to affect behavior of signal.
void(*) (int, siginfo_t *, void *)	<i>sa_sigaction</i>	Pointer to a signal-catching function.

59714 The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application
 59715 shall not use both simultaneously.

59716 If the argument *act* is not a null pointer, it points to a structure specifying the action to be
 59717 associated with the specified signal. If the argument *oact* is not a null pointer, the action
 59718 previously associated with the signal is stored in the location pointed to by the argument *oact*. If
 59719 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to
 59720 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall
 59721 not be added to the signal mask using this mechanism; this restriction shall be enforced by the
 59722 system without causing an error to be indicated.

59723 If the SA_SIGINFO flag (see below) is cleared in the *sa_flags* field of the **sigaction** structure, the
 59724 *sa_handler* field identifies the action to be associated with the specified signal. If the
 59725 SA_SIGINFO flag is set in the *sa_flags* field, the *sa_sigaction* field specifies a signal-catching
 59726 function.

59727 The *sa_flags* field can be used to modify the behavior of the specified signal.

59728 The following flags, defined in the **<signal.h>** header, can be set in *sa_flags*:

59729 XSI	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop or stopped children continue.
59730		
59731		If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is not set in <i>sa_flags</i> , and the implementation supports the SIGCHLD signal, then a SIGCHLD signal shall be generated for the calling process whenever any of its child processes stop and a SIGCHLD signal may be generated for the calling process whenever any of its stopped child processes are continued. If <i>sig</i>
59732		
59733		
59734 XSI		
59735		

59736			is SIGCHLD and the SA_NOCLDSTOP flag is set in <i>sa_flags</i> , then the implementation shall not generate a SIGCHLD signal in this way.
59737			
59738	XSI	SA_ONSTACK	If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.
59739			
59740			
59741		SA_RESETHAND	If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.
59742			
59743			Note: SIGILL and SIGTRAP cannot be automatically reset when delivered;
59744			the system silently enforces this restriction.
59745			Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.
59746			
59747			In addition, if this flag is set, <i>sigaction()</i> may behave as if the SA_NODEFER flag were also set.
59748			
59749		SA_RESTART	This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If an interruptible function which uses a timeout is restarted, the duration of the timeout following the restart is set to an unspecified value that does not exceed the original timeout value. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR].
59750			
59751			
59752			
59753			
59754			
59755			
59756			
59757		SA_SIGINFO	If cleared and the signal is caught, the signal-catching function shall be entered as:
59758			
59759			<pre>void func(int signo);</pre>
59760			where <i>signo</i> is the only argument to the signal-catching function. In this case, the application shall use the <i>sa_handler</i> member to describe the signal-catching function and the application shall not modify the <i>sa_sigaction</i> member.
59761			
59762			
59763			
59764			If SA_SIGINFO is set and the signal is caught, the signal-catching function shall be entered as:
59765			
59766			<pre>void func(int signo, siginfo_t *info, void *context);</pre>
59767			where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type siginfo_t explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type ucontext_t to refer to the receiving thread's context that was interrupted when the signal was delivered. In this case, the application shall use the <i>sa_sigaction</i> member to describe the signal-catching function and the application shall not modify the <i>sa_handler</i> member.
59768			
59769			
59770			
59771			
59772			
59773			
59774			
59775			The <i>si_signo</i> member contains the system-generated signal number.
59776	XSI		The <i>si_errno</i> member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.
59777			
59778			
59779			The <i>si_code</i> member contains a code identifying the cause of the signal.
59780			If the value of <i>si_code</i> is less than or equal to 0, then the signal was generated by a process and <i>si_pid</i> and <i>si_uid</i> , respectively, indicate the process ID and the real user ID of the sender. The <signal.h> header
59781			
59782			

59783 description contains information about the signal-specific contents of the
59784 elements of the **siginfo_t** type.

59785 **SA_NOCLDWAIT** If set, and *sig* equals SIGCHLD, child processes of the calling processes
59786 shall not be transformed into zombie processes when they terminate. If
59787 the calling process subsequently waits for its children, and the process has
59788 no unwaited-for children that were transformed into zombie processes, it
59789 shall block until all of its children terminate, and *wait()*, *waitid()*, and
59790 *waitpid()* shall fail and set *errno* to [ECHILD]. Otherwise, terminating
59791 child processes shall be transformed into zombie processes, unless
59792 SIGCHLD is set to SIG_IGN.

59793 **SA_NODEFER** If set and *sig* is caught, *sig* shall not be added to the thread's signal mask
59794 on entry to the signal handler unless it is included in *sa_mask*. Otherwise,
59795 *sig* shall always be added to the thread's signal mask on entry to the
59796 signal handler.

59797 When a signal is caught by a signal-catching function installed by *sigaction()*, a new signal mask
59798 is calculated and installed for the duration of the signal-catching function (or until a call to either
59799 *sigprocmask()* or *sigsuspend()* is made). This mask is formed by taking the union of the current
59800 signal mask and the value of the *sa_mask* for the signal being delivered, and unless
59801 SA_NODEFER or SA_RESETHAND is set, then including the signal being delivered. If and
59802 when the user's signal handler returns normally, the original signal mask is restored.

59803 Once an action is installed for a specific signal, it shall remain installed until another action is
59804 explicitly requested (by another call to *sigaction()*), until the SA_RESETHAND flag causes
59805 resetting of the handler, or until one of the *exec* functions is called.

59806 If the previous action for *sig* had been established by *signal()*, the values of the fields returned in
59807 the structure pointed to by *oact* are unspecified, and in particular *oact->sa_handler* is not
59808 necessarily the same value passed to *signal()*. However, if a pointer to the same structure or a
59809 copy thereof is passed to a subsequent call to *sigaction()* via the *act* argument, handling of the
59810 signal shall be as if the original call to *signal()* were repeated.

59811 If *sigaction()* fails, no new signal handler is installed.

59812 It is unspecified whether an attempt to set the action for a signal that cannot be caught or
59813 ignored to SIG_DFL is ignored or causes an error to be returned with *errno* set to [EINVAL].

59814 If SA_SIGINFO is not set in *sa_flags*, then the disposition of subsequent occurrences of *sig* when
59815 it is already pending is implementation-defined; the signal-catching function shall be invoked
59816 with a single argument. If SA_SIGINFO is set in *sa_flags*, then subsequent occurrences of *sig*
59817 generated by *sigqueue()* or as a result of any signal-generating function that supports the
59818 specification of an application-defined value (when *sig* is already pending) shall be queued in
59819 FIFO order until delivered or accepted; the signal-catching function shall be invoked with three
59820 arguments. The application specified value is passed to the signal-catching function as the
59821 *si_value* member of the **siginfo_t** structure.

59822 The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the
59823 same signal is unspecified.

59824 **RETURN VALUE**

59825 Upon successful completion, *sigaction()* shall return 0; otherwise, -1 shall be returned, *errno* shall
59826 be set to indicate the error, and no new signal-catching function shall be installed.

59827 **ERRORS**59828 The *sigaction()* function shall fail if:59829 [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a
59830 signal that cannot be caught or ignore a signal that cannot be ignored.59831 [ENOTSUP] The SA_SIGINFO bit flag is set in the *sa_flags* field of the **sigaction** structure.59832 The *sigaction()* function may fail if:59833 [EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be
59834 caught or ignored (or both).59835 In addition, the *sigaction()* function may fail if the SA_SIGINFO flag is set in the *sa_flags* field of
59836 the **sigaction** structure for a signal not in the range SIGRTMIN to SIGRTMAX.59837 **EXAMPLES**59838 **Establishing a Signal Handler**59839 The following example demonstrates the use of *sigaction()* to establish a handler for the SIGINT
59840 signal.

```

59841 #include <signal.h>
59842 static void handler(int signum)
59843 {
59844     /* Take appropriate actions for signal delivery */
59845 }
59846 int main()
59847 {
59848     struct sigaction sa;
59849     sa.sa_handler = handler;
59850     sigemptyset(&sa.sa_mask);
59851     sa.sa_flags = SA_RESTART; /* Restart functions if
59852                             interrupted by handler */
59853     if (sigaction(SIGINT, &sa, NULL) == -1)
59854         /* Handle error */;
59855     /* Further code */
59856 }

```

59857 **APPLICATION USAGE**

59858 The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In
59859 particular, *sigaction()* and *signal()* should not be used in the same process to control the same
59860 signal. The behavior of reentrant functions, as defined in the DESCRIPTION, is as specified by
59861 this volume of POSIX.1-200x, regardless of invocation from a signal-catching function. This is the
59862 only intended meaning of the statement that reentrant functions may be used in signal-catching
59863 functions without restrictions. Applications must still consider all effects of such functions on
59864 such things as data structures, files, and process state. In particular, application developers need
59865 to consider the restrictions on interactions when interrupting *sleep()* and interactions among
59866 multiple handles for a file description. The fact that any specific function is listed as reentrant
59867 does not necessarily mean that invocation of that function from a signal-catching function is
59868 recommended.

59869 In order to prevent errors arising from interrupting non-reentrant function calls, applications
59870 should protect calls to these functions either by blocking the appropriate signals or through the
59871 use of some programmatic semaphore (see *semget()*, *sem_init()*, *sem_open()*, and so on). Note in
59872 particular that even the "safe" functions may modify *errno*; the signal-catching function, if not

executing as an independent thread, should save and restore its value in order to avoid the possibility that delivery of a signal in between an error return from a function that sets *errno* and the subsequent examination of *errno* could result in the signal-catching function changing the value of *errno*. Naturally, the same principles apply to the reentrancy of application routines and asynchronous data access. Note that *longjmp()* and *siglongjmp()* are not in the list of reentrant functions. This is because the code executing after *longjmp()* and *siglongjmp()* can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use *longjmp()* and *siglongjmp()* from within signal handlers require rigorous protection in order to be portable. Many of the other functions that are excluded from the list are traditionally implemented using either *malloc()* or *free()* functions or the standard I/O library, both of which traditionally use data structures in a non-reentrant manner. Since any combination of different functions using a common data structure can cause reentrancy problems, this volume of POSIX.1-200x does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

If the signal occurs other than as the result of calling *abort()*, *kill()*, or *raise()*, the behavior is undefined if the signal handler calls any function in the standard library other than one of the functions listed in the table above or refers to any object other than *errno* with static storage duration other than by assigning a value to a static storage duration variable of type **volatile sig_atomic_t**. Unless all signal handlers have *errno* set on return as it was on entry, the value of *errno* is unspecified.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving thread resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If *longjmp()* or *_longjmp()* is used to leave the signal handler, then the signal mask must be explicitly restored.

This volume of POSIX.1-200x defines the third argument of a signal handling function when SA_SIGINFO is set as a **void *** instead of a **ucontext_t ***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext_t ***.

The BSD optional four argument signal handling function is not supported by this volume of POSIX.1-200x. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
             char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA_SIGINFO is set.

Since the *sigaction()* function is allowed but not required to set SA_NODEFER when the application sets the SA_RESETHAND flag, applications which depend on the SA_RESETHAND functionality for the newly installed signal handler must always explicitly set SA_NODEFER when they set SA_RESETHAND in order to be portable.

RATIONALE

Although this volume of POSIX.1-200x requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact* argument. In other words, if SIGKILL is included in the *sa_mask* field of *act*, it is unspecified whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa_mask* field of *oact*.

The SA_NOCLDSTOP flag, when supplied in the *act->sa_flags* parameter, allows overloading

59922 SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated
 59923 child. Most conforming applications that catch SIGCHLD are expected to install signal-catching
 59924 functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on
 59925 each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of
 59926 interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the
 59927 signal-catching routine when they stop.

59928 Some historical implementations also define other mechanisms for stopping processes, such as
 59929 the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when
 59930 processes stop due to this mechanism; however, that is beyond the scope of this volume of
 59931 POSIX.1-200x.

59932 This volume of POSIX.1-200x requires that calls to *sigaction()* that supply a NULL *act* argument
 59933 succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or
 59934 SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases
 59935 and, in this respect, their behavior varies from *sigaction()*.

59936 This volume of POSIX.1-200x requires that *sigaction()* properly save and restore a signal action
 59937 set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is
 59938 true, nor could there be given the greater amount of information conveyed by the **sigaction**
 59939 structure. Because of this, applications should avoid using both functions for the same signal in
 59940 the same process. Since this cannot always be avoided in case of general-purpose library
 59941 routines, they should always be implemented with *sigaction()*.

59942 It was intended that the *signal()* function should be implementable as a library routine using
 59943 *sigaction()*.

59944 The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990
 59945 standard to allow the application to request on a per-signal basis via an additional signal action
 59946 flag that the extra parameters, including the application-defined signal value, if any, be passed to
 59947 the signal-catching function.

59948 FUTURE DIRECTIONS

59949 None.

59955 CHANGE HISTORY

59956 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

59957 Issue 5

59958 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX
 59959 Threads Extension.

59960 In the DESCRIPTION, the second argument to *func* when SA_SIGINFO is set is no longer
 59961 permitted to be NULL, and the description of permitted **siginfo_t** contents is expanded by
 59962 reference to [<signal.h>](#).

59963 Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP]
 59964 error is deleted.

59965 Issue 6

59966 The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on
 59967 Other Functions”, a reference to *sigpending()* is added.

59968 In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal

59969	Effects on Other Functions” are moved to a separate section of this volume of POSIX.1-200x.	
59970	Text describing functionality from the Realtime Signals Extension option is marked.	
59971	The following changes are made for alignment with the ISO POSIX-1: 1996 standard:	
59972	<ul style="list-style-type: none"> • The [ENOTSUP] error condition is added. 	
59973	The normative text is updated to avoid use of the term “must” for application requirements.	
59974	The restrict keyword is added to the <i>sigaction()</i> prototype for alignment with the	
59975	ISO/IEC 9899: 1999 standard.	
59976	References to the <i>wait3()</i> function are removed.	
59977	The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an	
59978	extension over the ISO C standard.	
59979	IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table	
59980	describing the sigaction structure.	
59981	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/127 is applied, removing text from the	
59982	DESCRIPTION duplicated later in the same section.	
59983	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/128 is applied, updating the	
59984	DESCRIPTION and APPLICATION USAGE sections. Changes are made to refer to the thread	
59985	rather than the process.	
59986	IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/129 is applied, adding the example to the	
59987	EXAMPLES section.	
59988	Issue 7	
59989	Austin Group Interpretations 1003.1-2001 #065 and #084 are applied, clarifying the role of the	
59990	SA_NODEFER flag with respect to the signal mask, and clarifying the SA_RESTART flag for	
59991	interrupted functions which use timeouts.	
59992	Austin Group Interpretation 1003.1-2001 #004 is applied.	
59993	SD5-XSH-ERN-167 is applied, updating the APPLICATION USAGE section.	+
59994	SD5-XSH-ERN-172 is applied, updating the DESCRIPTION to make optional the requirement	+
59995	that when the SA_RESETHAND flag is set, <i>sigaction()</i> shall behave as if the SA_NODEFER flag	+
59996	were also set.	+
59997	Functionality relating to the Realtime Signals Extension option is moved to the Base.	

59998 **NAME**
 59999 sigaddset — add a signal to a signal set

60000 **SYNOPSIS**

60001 CX

```
#include <signal.h>
```

 60002

```
int sigaddset(sigset_t *set, int signo);
```

60003 **DESCRIPTION**

60004 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed
 60005 to by *set*.

60006 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type
 60007 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
 60008 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
 60009 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
 60010 *sigwaitinfo()*, the results are undefined.

60011 **RETURN VALUE**

60012 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return -1 and set *errno*
 60013 to indicate the error.

60014 **ERRORS**

60015 The *sigaddset()* function may fail if:

60016 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

60017 **EXAMPLES**

60028 XBD **<signal.h>**

60029 **CHANGE HISTORY**

60030 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

60031 **Issue 5**

60032 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
 60033 previous issues.

60034 **Issue 6**

60035 The normative text is updated to avoid use of the term “must” for application requirements.

60036 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
 60037 extension over the ISO C standard.

60038 **NAME**
 60039 sigaltstack — set and get signal alternate stack context

60040 **SYNOPSIS**

```
60041 XSI #include <signal.h>
60042 int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);
```

60043 **DESCRIPTION**

60044 The *sigaltstack()* function allows a process to define and examine the state of an alternate stack
 60045 for signal handlers for the current thread. Signals that have been explicitly declared to execute
 60046 on the alternate stack shall be delivered on the alternate stack.

60047 If *ss* is not a null pointer, it points to a **stack_t** structure that specifies the alternate signal stack
 60048 that shall take effect upon return from *sigaltstack()*. The *ss_flags* member specifies the new stack
 60049 state. If it is set to *SS_DISABLE*, the stack is disabled and *ss_sp* and *ss_size* are ignored.
 60050 Otherwise, the stack shall be enabled, and the *ss_sp* and *ss_size* members specify the new address
 60051 and size of the stack.

60052 The range of addresses starting at *ss_sp* up to but not including *ss_sp+ss_size* is available to the
 60053 implementation for use as the stack. This function makes no assumptions regarding which end
 60054 is the stack base and in which direction the stack grows as items are pushed.

60055 If *oss* is not a null pointer, on successful completion it shall point to a **stack_t** structure that
 60056 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss_sp*
 60057 and *ss_size* members specify the address and size of that stack. The *ss_flags* member specifies the
 60058 stack's state, and may contain one of the following values:

60059 **SS_ONSTACK** The process is currently executing on the alternate signal stack. Attempts to
 60060 modify the alternate signal stack while the process is executing on it fail. This
 60061 flag shall not be modified by processes.

60062 **SS_DISABLE** The alternate signal stack is currently disabled.

60063 The value **SIGSTKSZ** is a system default specifying the number of bytes that would be used to
 60064 cover the usual case when manually allocating an alternate stack area. The value **MINSIGSTKSZ**
 60065 is defined to be the minimum stack size for a signal handler. In computing an alternate stack
 60066 size, a program should add that amount to its stack requirements to allow for the system
 60067 implementation overhead. The constants **SS_ONSTACK**, **SS_DISABLE**, **SIGSTKSZ**, and
 60068 **MINSIGSTKSZ** are defined in **<signal.h>**.

60069 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new
 60070 process image.

60071 In some implementations, a signal (whether or not indicated to execute on the alternate stack)
 60072 shall always execute on the alternate stack if it is delivered while another signal is being caught
 60073 using the alternate stack.

60074 Use of this function by library threads that are not bound to kernel-scheduled entities results in
 60075 undefined behavior.

60076 **RETURN VALUE**

60077 Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return -1 and set *errno*
 60078 to indicate the error.

60079 ERRORS

60080 The *sigaltstack()* function shall fail if:

- 60081 [EINVAL] The *ss* argument is not a null pointer, and the *ss_flags* member pointed to by *ss*
60082 contains flags other than SS_DISABLE.
- 60083 [ENOMEM] The size of the alternate stack area is less than MINSIGSTKSZ.
- 60084 [EPERM] An attempt was made to modify an active stack.

60085 EXAMPLES**60086 Allocating Memory for an Alternate Stack**

60087 The following example illustrates a method for allocating memory for an alternate stack.

```
60088 #include <signal.h>
60089 ...
60090 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
60091     /* Error return. */
60092     sigstk.ss_size = SIGSTKSZ;
60093     sigstk.ss_flags = 0;
60094     if (sigaltstack(&sigstk, (stack_t *)0) < 0)
60095         perror("sigaltstack");
```

60096 APPLICATION USAGE

60097 On some implementations, stack space is automatically extended as needed. On those
60098 implementations, automatic extension is typically not available for an alternate stack. If the stack
60099 overflows, the behavior is undefined.

60119 NAME

60120 sigdelset — delete a signal from a signal set

60121 SYNOPSIS

```
60122 CX #include <signal.h>
60123 int sigdelset(sigset_t *set, int signo);
```

60124 DESCRIPTION

60125 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set
60126 pointed to by *set*.

60127 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type
60128 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
60129 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
60130 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
60131 *sigwaitinfo()*, the results are undefined.

60132 RETURN VALUE

60133 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return -1 and set *errno*
60134 to indicate the error.

60135 ERRORS

60136 The *sigdelset()* function may fail if:

60137	[EINVAL]	The <i>signo</i> argument is not a valid signal number, or is an unsupported signal
60138		number.

60154 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
60155 previous issues.

60156 Issue 6

60157 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
60158 extension over the ISO C standard.

60159 **NAME**

60160 sigemptyset — initialize and empty a signal set

60161 **SYNOPSIS**

```
60162 CX #include <signal.h>
60163 int sigemptyset(sigset_t *set);
```

60164 **DESCRIPTION**

60165 The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined
60166 in POSIX.1-200x are excluded.

60167 **RETURN VALUE**

60168 Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return -1 and set
60169 *errno* to indicate the error.

60170 **ERRORS**

60171 No errors are defined.

60172 **EXAMPLES**

60173 None.

60174 **APPLICATION USAGE**

60175 None.

60176 **RATIONALE**

60177 The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or set)
60178 all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the
60179 structure, such as a version field, to permit binary-compatibility between releases where the size
60180 of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any
60181 other use of the signal set, even if such use is read-only (for example, as an argument to
60182 *sigpending()*). This function is not intended for dynamic allocation.

60183 The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or
60184 exclude) all the signals defined in this volume of POSIX.1-200x. Although it is outside the scope
60185 of this volume of POSIX.1-200x to place this requirement on signals that are implemented as
60186 extensions, it is recommended that implementation-defined signals also be affected by these
60187 functions. However, there may be a good reason for a particular signal not to be affected. For
60188 example, blocking or ignoring an implementation-defined signal may have undesirable side
60189 effects, whereas the default action for that signal is harmless. In such a case, it would be
60190 preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.

60191 In early proposals there was no distinction between invalid and unsupported signals (the names
60192 of optional signals that were not supported by an implementation were not defined by that
60193 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.
60194 With that distinction, it is not necessary to require implementations of these functions to
60195 determine whether an optional signal is actually supported, as that could have a significant
60196 performance impact for little value. The error could have been required for invalid signals and
60197 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is
60198 optional in both cases.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an extension over the ISO C standard.

60210 **NAME**
 60211 sigfillset — initialize and fill a signal set

60212 **SYNOPSIS**

60213 CX `#include <signal.h>`
 60214 `int sigfillset(sigset_t *set);`

60215 **DESCRIPTION**

60216 The *sigfillset()* function shall initialize the signal set pointed to by *set*, such that all signals
 60217 defined in this volume of POSIX.1-200x are included.

60218 **RETURN VALUE**

60219 Upon successful completion, *sigfillset()* shall return 0; otherwise, it shall return -1 and set *errno*
 60220 to indicate the error.

60221 **ERRORS**

60222 No errors are defined.

60223 **EXAMPLES**

60224 None.

60225 **APPLICATION USAGE**

60226 None.

60227 **RATIONALE**

60228 Refer to *sigemptyset()* (on page 1881).

60229 **FUTURE DIRECTIONS**

60230 None.

60231 **SEE ALSO**

60234 XBD [<signal.h>](#)

60235 **CHANGE HISTORY**

60236 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

60237 **Issue 6**

60238 The SYNOPSIS is marked CX since the presence of this function in the `<signal.h>` header is an
 60239 extension over the ISO C standard.

60240 **NAME**

60241 sighold, sigignore, sigpause, sigrelse, sigset — signal management

60242 **SYNOPSIS**

```
60243 OB XSI #include <signal.h>
60244 int sighold(int sig);
60245 int sigignore(int sig);
60246 int sigpause(int sig);
60247 int sigrelse(int sig);
60248 void (*sigset(int sig, void (*disp)(int)))(int);
```

60249 **DESCRIPTION**

60250 Use of any of these functions is unspecified in a multi-threaded process.

60251 The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal
60252 management.

60253 The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal,
60254 which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's
60255 disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If *sigset()* is
60256 used, and *disp* is the address of a signal handler, the system shall add *sig* to the signal mask of
60257 the calling process before executing the signal handler; when the signal handler returns, the
60258 system shall restore the signal mask of the calling process to its state prior to the delivery of the
60259 signal. In addition, if *sigset()* is used, and *disp* is equal to SIG_HOLD, *sig* shall be added to the
60260 signal mask of the calling process and *sig*'s disposition shall remain unchanged. If *sigset()* is
60261 used, and *disp* is not equal to SIG_HOLD, *sig* shall be removed from the signal mask of the
60262 calling process.

60263 The *sighold()* function shall add *sig* to the signal mask of the calling process.60264 The *sigrelse()* function shall remove *sig* from the signal mask of the calling process.60265 The *sigignore()* function shall set the disposition of *sig* to SIG_IGN.

60266 The *sigpause()* function shall remove *sig* from the signal mask of the calling process and suspend
60267 the calling process until a signal is received. The *sigpause()* function shall restore the signal mask
60268 of the process to its original state before returning.

60269 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes
60270 shall not be transformed into zombie processes when they terminate. If the calling process
60271 subsequently waits for its children, and the process has no unwaited-for children that were
60272 transformed into zombie processes, it shall block until all of its children terminate, and *wait()*,
60273 *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

60274 **RETURN VALUE**

60275 Upon successful completion, *sigset()* shall return SIG_HOLD if the signal had been blocked and
60276 the signal's previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be
60277 returned and *errno* set to indicate the error.

60278 The *sigpause()* function shall suspend execution of the thread until a signal is received,
60279 whereupon it shall return -1 and set *errno* to [EINTR].

60280 For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be
60281 returned and *errno* set to indicate the error.

60282 **ERRORS**

60283 These functions shall fail if:

60284 [EINVAL] The *sig* argument is an illegal signal number.60285 The *sigset()* and *sigignore()* functions shall fail if:60286 [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a
60287 signal that cannot be ignored.60288 **EXAMPLES**

60289 None.

60290 **APPLICATION USAGE**60291 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling
60292 signals; new applications should use the *sigaction()* function instead of the obsolescent *sigset()*
60293 function.60294 The *sighold()* function, in conjunction with *sigrelse()* or *sigpause()*, may be used to establish
60295 critical regions of code that require the delivery of a signal to be temporarily deferred. For
60296 broader portability, the *pthread_sigmask()* or *sigprocmask()* functions should be used instead of
60297 the obsolescent *sighold()* and *sigrelse()* functions.60298 For broader portability, the *sigsuspend()* function should be used instead of the obsolescent
60299 *sigpause()* function.60300 **RATIONALE**60301 Each of these historic functions has a direct analog in the other functions which are required to
60302 be per-thread and thread-safe (aside from *sigprocmask()*, which is replaced by *pthread_sigmask()*).
60303 The *sigset()* function can be implemented as a simple wrapper for *sigaction()*. The *sighold()*
60304 function is equivalent to *sigprocmask()* or *pthread_sigmask()* with SIG_BLOCK set. The *sigignore()*
60305 function is equivalent to *sigaction()* with SIG_IGN set. The *sigpause()* function is equivalent to
60306 *sigsuspend()*. The *sigrelse()* function is equivalent to *sigprocmask()* or *pthread_sigmask()* with
60307 SIG_UNBLOCK set.60308 **FUTURE DIRECTIONS**

60309 These functions may be removed in a future version.

60310 **SEE ALSO**60311 Section 2.4 (on page 463), *exec*, *pause()*, *pthread_sigmask()*, *sigaction()*, *signal()*, *sigsuspend()*, *wait*,
60312 *waitid()*

60313 XBD <signal.h>

60314 **CHANGE HISTORY**

60315 First released in Issue 4, Version 2.

60316 **Issue 5**

60317 Moved from X/OPEN UNIX extension to BASE.

60318 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of
60319 the process to its original state before returning.60320 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends
60321 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to
60322 [EINTR].60323 **Issue 6**

60324 The normative text is updated to avoid use of the term “must” for application requirements.

60325 References to the *wait3()* function are removed.

60326 The XSI functions are split out into their own reference page.

60327

Issue 7

60328

SD5-XSH-ERN-113 and SD5-XSH-ERN-42 are applied, marking these functions obsolescent and updating the APPLICATION USAGE and RATIONALE sections.

60329

60330 **NAME**
 60331 siginterrupt — allow signals to interrupt functions

60332 **SYNOPSIS**

60333 OB XSI `#include <signal.h>`
 60334 `int siginterrupt(int sig, int flag);`

60335 **DESCRIPTION**

60336 The *siginterrupt()* function shall change the restart behavior when a function is interrupted by
 60337 the specified signal. The function *siginterrupt(sig, flag)* has an effect as if implemented as:

```
60338 int siginterrupt(int sig, int flag) {
60339     int ret;
60340     struct sigaction act;
60341
60342     (void) sigaction(sig, NULL, &act);
60343     if (flag)
60344         act.sa_flags &= ~SA_RESTART;
60345     else
60346         act.sa_flags |= SA_RESTART;
60347     ret = sigaction(sig, &act, NULL);
60348     return ret;
60349 }
```

60349 **RETURN VALUE**

60350 Upon successful completion, *siginterrupt()* shall return 0; otherwise, -1 shall be returned and
 60351 *errno* set to indicate the error.

60352 **ERRORS**

60353 The *siginterrupt()* function shall fail if:

60354 [EINVAL] The *sig* argument is not a valid signal number.

60355 **EXAMPLES**

60356 None.

60357 **APPLICATION USAGE**

60358 The *siginterrupt()* function supports programs written to historical system interfaces.
 60359 Applications should use the *sigaction()* with the SA_RESTART flag instead of the obsolescent
 60360 *siginterrupt()* function.

60361 **RATIONALE**

60362 None.

60363 **FUTURE DIRECTIONS**

60364 None.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in the sample implementation given in the DESCRIPTION.

60374

60375

Issue 7

60376

The *siginterrupt()* function is marked obsolescent.

60377 **NAME**

60378 sigismember — test for a signal in a signal set

60379 **SYNOPSIS**

```
60380 CX #include <signal.h>
60381 int sigismember(const sigset_t *set, int signo);
```

60382 **DESCRIPTION**

60383 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set
 60384 pointed to by *set*.

60385 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type
 60386 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
 60387 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
 60388 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
 60389 *sigwaitinfo()*, the results are undefined.

60390 **RETURN VALUE**

60391 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of
 60392 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.

60393 **ERRORS**

60394 The *sigismember()* function may fail if:

60395 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
 60396 number.

60397 **EXAMPLES**

60398 None.

60399 **APPLICATION USAGE**

60400 None.

60401 **RATIONALE**

60402 None.

60403 **FUTURE DIRECTIONS**

60404 None.

60405 **SEE ALSO**

60406 Section 2.4 (on page 463), *pthread_sigmask()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigfillset()*,
 60407 *sigemptyset()*, *sigpending()*, *sigsuspend()*

60408 XBD **<signal.h>**

60409 **CHANGE HISTORY**

60410 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

60411 **Issue 5**

60412 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
 60413 previous issues.

60414 **Issue 6**

60415 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
 60416 extension over the ISO C standard.

60417 **NAME**
 60418 siglongjmp — non-local goto with signal handling

60419 **SYNOPSIS**
 60420 CX `#include <setjmp.h>`
 60421 `void siglongjmp(sigjmp_buf env, int val);`

60422 **DESCRIPTION**
 60423 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 60424 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 60425 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env*
 60426 argument was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

60427 **RETURN VALUE**
 60428 After *siglongjmp()* is completed, program execution shall continue as if the corresponding
 60429 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function
 60430 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

60431 **ERRORS**
 60432 No errors are defined.

60433 **EXAMPLES**
 60434 None.

60435 **APPLICATION USAGE**
 60436 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant
 60437 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

60438 **RATIONALE**
 60439 None.

60440 **FUTURE DIRECTIONS**
 60441 None.

60442 **SEE ALSO**
 60443 *longjmp()*, *pthread_sigmask()*, *setjmp()*, *sigsetjmp()*, *sigsuspend()*
 60444 XBD `<setjmp.h>`

60445 **CHANGE HISTORY**
 60446 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

60447 **Issue 5**
 60448 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

60449 **Issue 6**
 60450 The DESCRIPTION is rewritten in terms of *longjmp()*.
 60451 The SYNOPSIS is marked CX since the presence of this function in the `<setjmp.h>` header is an
 60452 extension over the ISO C standard.

60453 **NAME**60454 `signal` — signal management60455 **SYNOPSIS**60456 `#include <signal.h>`60457 `void (*signal(int sig, void (*func)(int)))(int);`60458 **DESCRIPTION**60459 CX The functionality described on this reference page is aligned with the ISO C standard. Any
60460 conflict between the requirements described here and the ISO C standard is unintentional. This
60461 volume of POSIX.1-200x defers to the ISO C standard.

60462 Use of this function is unspecified in a multi-threaded process.

60463 The `signal()` function chooses one of three ways in which receipt of the signal number `sig` is to be
60464 subsequently handled. If the value of `func` is `SIG_DFL`, default handling for that signal shall
60465 occur. If the value of `func` is `SIG_IGN`, the signal shall be ignored. Otherwise, the application
60466 shall ensure that `func` points to a function to be called when that signal occurs. An invocation of
60467 such a function because of a signal, or (recursively) of any further functions called by that
60468 invocation (other than functions in the standard library), is called a “signal handler”.60469 When a signal occurs, and `func` points to a function, it is implementation-defined whether the
60470 equivalent of a:60471 `signal(sig, SIG_DFL);`60472 is executed or the implementation prevents some implementation-defined set of signals (at least
60473 including `sig`) from occurring until the current signal handling has completed. (If the value of `sig`
60474 is `SIGILL`, the implementation may alternatively define that no action is taken.) Next the
60475 equivalent of:60476 `(*func)(sig);`60477 is executed. If and when the function returns, if the value of `sig` was `SIGFPE`, `SIGILL`, or
60478 `SIGSEGV` or any other implementation-defined value corresponding to a computational
60479 exception, the behavior is undefined. Otherwise, the program shall resume execution at the
60480 point it was interrupted. If the signal occurs as the result of calling the `abort()`, `raise()`, `kill()`,
60481 `pthread_kill()`, or `sigqueue()` function, the signal handler shall not call the `raise()` function.60482 CX If the signal occurs other than as the result of calling `abort()`, `raise()`, `kill()`, `pthread_kill()`, or
60483 `sigqueue()`, the behavior is undefined if the signal handler refers to any object with static storage
60484 duration other than by assigning a value to an object declared as volatile `sig_atomic_t`, or if the
60485 signal handler calls any function in the standard library other than one of the functions listed in
60486 [Section 2.4](#) (on page 463). Furthermore, if such a call fails, the value of `errno` is unspecified.

60487 At program start-up, the equivalent of:

60488 `signal(sig, SIG_IGN);`

60489 is executed for some signals, and the equivalent of:

60490 `signal(sig, SIG_DFL);`60491 CX is executed for all other signals (see [exec](#)).

60492 RETURN VALUE

60493 If the request can be honored, *signal()* shall return the value of *func* for the most recent call to
 60494 *signal()* for the specified signal *sig*. Otherwise, SIG_ERR shall be returned and a positive value
 60495 shall be stored in *errno*.

60496 ERRORS

60497 The *signal()* function shall fail if:

60498 CX [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a
 60499 signal that cannot be caught or ignore a signal that cannot be ignored.

60500 The *signal()* function may fail if:

60501 CX [EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be
 60502 caught or ignored (or both).

60503 EXAMPLES

60504 None.

60505 APPLICATION USAGE

60506 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling
 60507 signals; new applications should use *sigaction()* rather than *signal()*.

60508 RATIONALE

60509 None.

60510 FUTURE DIRECTIONS

60511 None.

60515 CHANGE HISTORY

60516 First released in Issue 1. Derived from Issue 1 of the SVID.

60517 Issue 5

60518 Moved from X/OPEN UNIX extension to BASE.

60519 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the signal mask of
 60520 the process to its original state before returning.

60521 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends
 60522 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to
 60523 [EINTR].

60524 Issue 6

60525 Extensions beyond the ISO C standard are marked.

60526 The normative text is updated to avoid use of the term “must” for application requirements.

60527 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

60528 References to the *wait3()* function are removed.

60529 The *sighold()*, *sigignore()*, *sigelse()*, and *sigset()* functions are split out onto their own reference
 60530 page.

60531 **NAME**

60532 signbit — test sign

60533 **SYNOPSIS**

60534 #include <math.h>

60535 int signbit(real-floating x);

60536 **DESCRIPTION**

60537 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 60538 conflict between the requirements described here and the ISO C standard is unintentional. This
 60539 volume of POSIX.1-200x defers to the ISO C standard.

60540 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,
 60541 zeros, and infinities have a sign bit.

60542 **RETURN VALUE**

60543 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is
 60544 negative.

60559 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

sigpause()

60560 **NAME**
60561 sigpause — remove a signal from the signal mask and suspend the thread

SYNOPSIS

60562 OB XSI #include <signal.h>
60563
60564 int sigpause(int *sig*);

DESCRIPTION

60565 Refer to *sighold()*.
60566

60567 **NAME**
 60568 sigpending — examine pending signals

60569 **SYNOPSIS**

60570 CX `#include <signal.h>`
 60571 `int sigpending(sigset_t *set);`

60572 **DESCRIPTION**

60573 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of
 60574 signals that are blocked from delivery to the calling thread and that are pending on the process
 60575 or the calling thread.

60576 **RETURN VALUE**

60577 Upon successful completion, *sigpending()* shall return 0; otherwise, -1 shall be returned and
 60578 *errno* set to indicate the error.

60579 **ERRORS**

60580 No errors are defined.

60581 **EXAMPLES**

60582 None.

60583 **APPLICATION USAGE**

60584 None.

60585 **RATIONALE**

60586 None.

60587 **FUTURE DIRECTIONS**

60588 None.

60589 **SEE ALSO**

60590 *exec*, *pthread_sigmask()*, *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *sigismember()*

60591 XBD [<signal.h>](#)

60592 **CHANGE HISTORY**

60593 First released in Issue 3.

60594 **Issue 5**

60595 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

60596 **Issue 6**

60597 The SYNOPSIS is marked CX since the presence of this function in the `<signal.h>` header is an
 60598 extension over the ISO C standard.

60599 **NAME**
60600 sigprocmask — examine and change blocked signals

60601 **SYNOPSIS**

```
60602 CX #include <signal.h>  
60603 int sigprocmask(int how, const sigset_t *restrict set,  
60604 sigset_t *restrict oset);
```

60605 **DESCRIPTION**

60606 Refer to *pthread_sigmask()*.

60607 **NAME**
 60608 sigqueue — queue a signal to a process

60609 **SYNOPSIS**

```
60610 CX #include <signal.h>
60611 int sigqueue(pid_t pid, int signo, const union sigval value);
```

60612 **DESCRIPTION**

60613 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value
 60614 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking
 60615 is performed but no signal is actually sent. The null signal can be used to check the validity of
 60616 *pid*.

60617 The conditions required for a process to have permission to queue a signal to another process are
 60618 the same as for the *kill()* function.

60619 The *sigqueue()* function shall return immediately. If SA_SIGINFO is set for *signo* and if the
 60620 resources were available to queue the signal, the signal shall be queued and sent to the receiving
 60621 process. If SA_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving
 60622 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this
 60623 call.

60624 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked
 60625 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*
 60626 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the
 60627 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the
 60628 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.
 60629 The selection order between realtime and non-realtime signals, or between multiple pending
 60630 non-realtime signals, is unspecified.

60631 **RETURN VALUE**

60632 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*
 60633 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set
 60634 *errno* to indicate the error.

60635 **ERRORS**

60636 The *sigqueue()* function shall fail if:

60637 [EAGAIN] No resources are available to queue the signal. The process has already
 60638 queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or
 60639 a system-wide resource limit has been exceeded.

60640 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

60641 [EPERM] The process does not have the appropriate privilege to send the signal to the
 60642 receiving process.

60643 [ESRCH] The process *pid* does not exist.

EXAMPLES

60644 None.
60645

APPLICATION USAGE

60646 None.
60647

RATIONALE

60648 The *sigqueue()* function allows an application to queue a realtime signal to itself or to another
60649 process, specifying the application-defined value. This is common practice in realtime
60650 applications on existing realtime systems. It was felt that specifying another function in the
60651 *sig...* name space already carved out for signals was preferable to extending the interface to
60652 *kill()*.
60653

60654 Such a function became necessary when the put/get event function of the message queues was
60655 removed. It should be noted that the *sigqueue()* function implies reduced performance in a
60656 security-conscious implementation as the access permissions between the sender and receiver
60657 have to be checked on each send when the *pid* is resolved into a target process. Such access
60658 checks were necessary only at message queue open in the previous interface.

60659 The standard developers required that *sigqueue()* have the same semantics with respect to the
60660 null signal as *kill()*, and that the same permission checking be used. But because of the difficulty
60661 of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the
60662 interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function
60663 queues a signal to a single process specified by the *pid* argument.

60664 The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An
60665 explicit limit on the number of queued signals that a process could send was introduced. While
60666 the limit is “per-sender”, this volume of POSIX.1-200x does not specify that the resources be part
60667 of the state of the sender. This would require either that the sender be maintained after exit until
60668 all signals that it had sent to other processes were handled or that all such signals that had not
60669 yet been acted upon be removed from the queue(s) of the receivers. This volume of
60670 POSIX.1-200x does not preclude this behavior, but an implementation that allocated queuing
