Abstract

POSIX.1-200x defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. POSIX.1-200x is intended to be used by both application developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of POSIX.1-200x and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of POSIX.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-200x describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX[®]), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

Feedback

POSIX.1-200x has been prepared by the Austin Group. Feedback relating to the material contained in POSIX.1-200x may be submitted using the Austin Group web site at www.opengroup.org/austin/bugreport.html.

DRAFT

Introduction

1238

Note: This introduction is not part of POSIX.1-200x, Standard for Information Technology — Portable Operating System Interface (POSIX).

This draft standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.¹

The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group is to develop and maintain the core open systems interfaces that are the POSIX[®] 1003.1 (and former 1003.2) standards, ISO/IEC 9945 Parts 1 to 4, and the core of the Single UNIX Specification.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group’s Technical Standard designation, and an ISO/IEC designation.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see www.opengroup.org/austin.

Background

The developers of POSIX.1-200x represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, POSIX.1-200x describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application developers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,² an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of

-
1. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.
 2. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

Introduction

1280 standards.

1281 **Audience**

1282 The intended audience for POSIX.1-200x is all persons concerned with an industry-wide
1283 standard operating system based on the UNIX system. This includes at least four groups of
1284 people:

- 1285 1. Persons buying hardware and software systems
- 1286 2. Persons managing companies that are deciding on future corporate computing directions
- 1287 3. Persons implementing operating systems, and especially
- 1288 4. Persons developing applications where portability is an objective

1289 **Purpose**

1290 Several principles guided the development of POSIX.1-200x:

- 1291 • Application-Oriented

1292 The basic goal was to promote portability of application programs across UNIX system
1293 environments by developing a clear, consistent, and unambiguous standard for the
1294 interface specification of a portable operating system based on the UNIX system
1295 documentation. POSIX.1-200x codifies the common, existing definition of the UNIX
1296 system.

- 1297 • Interface, Not Implementation

1298 POSIX.1-200x defines an interface, not an implementation. No distinction is made between
1299 library functions and system calls; both are referred to as functions. No details of the
1300 implementation of any function are given (although historical practice is sometimes
1301 indicated in the RATIONALE section). Symbolic names are given for constants (such as
1302 signals and error numbers) rather than numbers.

- 1303 • Source, Not Object, Portability

1304 POSIX.1-200x has been written so that a program written and translated for execution on
1305 one conforming implementation may also be translated for execution on another
1306 conforming implementation. POSIX.1-200x does not guarantee that executable (object or
1307 binary) code will execute under a different conforming implementation than that for which
1308 it was translated, even if the underlying hardware is identical.

- 1309 • The C Language

1310 The system interfaces and header definitions are written in terms of the standard C
1311 language as specified in the ISO C standard.

- 1312 • No Superuser, No System Administration

1313 There was no intention to specify all aspects of an operating system. System
1314 administration facilities and functions are excluded from this standard, and functions
1315 usable only by the superuser have not been included. Still, an implementation of the
1316 standard interface may also implement features not in POSIX.1-200x. POSIX.1-200x is also
1317 not concerned with hardware constraints or system maintenance.

- 1318 • Minimal Interface, Minimally Defined

1319 In keeping with the historical design principles of the UNIX system, the mandatory core
1320 facilities of POSIX.1-200x have been kept as minimal as possible. Additional capabilities
1321 have been added as optional extensions.

- Broadly Implementable

The developers of POSIX.1-200x endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in POSIX.1-200x, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

When the original version—IEEE Std 1003.1-1988—was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and IEEE Std 1003.1-2001 and its technical corrigenda have consolidated this consensus, and this version reflects the significantly increased level of consensus arrived at since the original versions. The authors of the original versions tried, as much as possible, to follow the principles below when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories
2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

POSIX.1-200x is specifically not a codification of a particular vendor's product.

It should be noted that implementations will have different kinds of extensions. Some will reflect "historical usage" and will be preserved for execution of pre-existing applications. These functions should be considered "obsolescent" and the standard functions used for new applications. Some extensions will represent functions beyond the scope of POSIX.1-200x. These need to be used with careful management to be able to adapt to future extensions of POSIX.1-200x and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

A goal of POSIX.1-200x was to minimize additional work for application developers. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

Introduction

1364 **POSIX.1-200x**

1365 POSIX.1-200x defines the Portable Operating System Interface (POSIX) requirements and
1366 consists of the following topics arranged as a series of volumes within the standard:

- 1367 • Base Definitions
- 1368 • System Interfaces
- 1369 • Shell and Utilities
- 1370 • Rationale (Informative)

1371 **Base Definitions**

1372 The Base Definitions volume provides common definitions for this standard, therefore readers
1373 should be familiar with it before using the other volumes.

1374 This volume is structured as follows:

- 1375 • [Chapter 1](#) is an introduction.
- 1376 • [Chapter 2](#) defines the conformance requirements.
- 1377 • [Chapter 3](#) defines general terms used.
- 1378 • [Chapter 4](#) describes general concepts used.
- 1379 • [Chapter 5](#) describes the notation used to specify file input and output formats in this
1380 volume and the Shell and Utilities volume.
- 1381 • [Chapter 6](#) describes the portable character set and the process of character set definition.
- 1382 • *locale* describes the syntax for defining internationalization locales as well as the POSIX
1383 locale provided on all systems.
- 1384 • [Chapter 8](#) describes the use of environment variables for internationalization and other
1385 purposes.
- 1386 • [Chapter 9](#) describes the syntax of pattern matching using regular expressions employed by
1387 many utilities and matched by the *regcomp()* and *regexexec()* functions.
- 1388 • [Chapter 10](#) describes files and devices found on all systems.
- 1389 • [Chapter 11](#) describes the asynchronous terminal interface for many of the functions in the
1390 System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- 1391 • [Chapter 12](#) describes the policies for command line argument construction and parsing.
- 1392 • [Chapter 13](#) defines the contents of headers which declare constants, macros, and data
1393 structures that are needed by programs using the services provided by the System
1394 Interfaces volume.

1395 Comprehensive references are available in the index.

System Interfaces

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- [Chapter 1](#) explains the status of this volume and its relationship to other formal standards.
- [Chapter 2](#) contains important concepts, terms, and caveats relating to the rest of this volume.
- [Chapter 3](#) defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

Shell and Utilities

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- [Chapter 1](#) explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions in [Chapter 4](#).
- [Chapter 2](#) describes the command language used in POSIX-conformant systems.
- [Chapter 3](#) describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- [Chapter 4](#) consists of reference pages for all utilities available on POSIX-conformant systems.

Comprehensive references are available in the index.

Rationale (Informative)

This volume is being published to assist in the process of review. It contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers. It also contains notes of interest to application programmers on recommended programming practices, emphasizing the consequences of some aspects of POSIX.1-200x that may not be immediately apparent.

This volume is organized in parallel to the normative volumes of this standard, with a separate part for each of the three normative volumes.

Within this volume, the following terms are used:

base standard

The portions of POSIX.1-200x that are not optional, equivalent to the definitions of *classic* POSIX.1 and POSIX.2.

POSIX.0

Although this term is not used in the normative text of POSIX.1-200x, it is used in this volume to refer to IEEE Std 1003.0-1995.

POSIX.1b

Although this term is not used in the normative text of POSIX.1-200x, it is used in this volume to refer to the elements of the POSIX Realtime Extension amendment. (This was

Introduction

1437 earlier referred to as POSIX.4 during the standard development process.)

1438 **POSIX.1c**

1439 Although this term is not used in the normative text of POSIX.1-200x, it is used in this
1440 volume to refer to the POSIX Threads Extension amendment. (This was earlier referred to as
1441 POSIX.4a during the standard development process.)

1442 **standard developers**

1443 The individuals and companies in the development organizations responsible for
1444 POSIX.1-200x: the IEEE P1003.1 working groups, The Open Group Base working group,
1445 advised by the hundreds of individual technical experts who balloted the draft standards
1446 within the Austin Group, and the member bodies and technical experts of ISO/IEC
1447 JTC 1/SC22.

1448 **XSI option**

1449 The portions of POSIX.1-200x addressing the extension added for support of the Single
1450 UNIX Specification.

1451 **Typographical Conventions**

1452 The following typographical conventions are used throughout this standard. In the text, this
1453 standard is referred to as POSIX.1-200x, which is technically identical to The Open Group Base
1454 Specifications, Issue 7.

1455 The typographical conventions listed here are for ease of reading only. Editorial inconsistencies
1456 in the use of typography are unintentional and have no normative meaning in POSIX.1-200x.

1505**Notes:**

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *fscanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, '\ ' (or any of the other sequences such as ' ' ') is the same as the C constant '\\\ ' (or '\ ' ').
3. The style selected for some of the special characters, such as <newline>, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters <tab> or <newline>.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, "[]", are part of the syntax and do *not* indicate optional items. In syntax the '| ' symbol is used to separate alternatives, and ellipses ("...") are used to show that additional arguments are optional.

1506
1507
1508
1509
1510

Shading is used to identify extensions and options; see [Section 1.7.1](#) (on page 7).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

1511
1512
1513
1514
1515

Ranges of values are indicated with parentheses or brackets as follows:

- (a,b) means the range of all values from a to b , including neither a nor b .
- $[a,b]$ means the range of all values from a to b , including a and b .
- $[a,b)$ means the range of all values from a to b , including a , but not b .
- $(a,b]$ means the range of all values from a to b , including b , but not a .

1516
1517
1518
1519
1520

Note: A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol `POSIXstring` (where *string* may contain underscores) is represented by the C identifier `_POSIXstring`, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

1521

Participants

1522

1523

POSIX.1-200x was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22.

1525

1526

Notes to Reviewers

This section with side shading will not appear in the final copy. - Ed.

This section will be completed once the standard is approved.

Trademarks

1527

1528 The following information is given for the convenience of users of POSIX.1-200x and does not
1529 constitute an endorsement by the IEEE or The Open Group of these products. Equivalent
1530 products may be used if they can be shown to lead to the same results.

1531 There may be other products mentioned in the text that might be covered by trademark
1532 protection and readers are advised to verify them independently.

1533 1003.1™ is a trademark of the Institute of Electrical and Electronic Engineers, Inc.

1534 AIX® is a registered trademark of IBM Corporation.

1535 AT&T® is a registered trademark of AT&T in the U.S.A. and other countries.

1536 Boundaryless Information Flow™ and TOGAF™ are trademarks and Motif®, Making Standards
1537 Work®, OSF/1®, The Open Group®, UNIX®, and the “X” device are registered trademarks of
1538 The Open Group in the United States and other countries.

1539 BSD™ is a trademark of the University of California, Berkeley, U.S.A.

1540 Hewlett-Packard®, HP®, and HP-UX® are registered trademarks of Hewlett-Packard Company.

1541 IBM® is a registered trademark of International Business Machines Corporation.

1542 Linux® is a registered trademark of Linus Torvalds.

1543 POSIX® is a registered trademark of the Institute of Electrical and Electronic Engineers, Inc.

1544 Sun® and Sun Microsystems® are registered trademarks of Sun Microsystems, Inc.

1545 /usr/group® is a registered trademark of UniForum, the International Network of UNIX System
1546 Users.

Acknowledgements

1547

1548

1549

The contributions of the following organizations to the development of POSIX.1-200x are gratefully acknowledged:

1550

1551

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation.

1552

1553

1554

- Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems Inc. for permission to reproduce portions of their copyrighted documentation

1555

- ISO/IEC JTC 1/SC 22/WG 14 C Language Committee

1556

- Red Hat Inc. for permission to reproduce portions of its copyrighted documentation

1557

1558

POSIX.1-200x was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

Technical Standard

1 **Volume 1:**
2 **Base Definitions, Issue 7**

3 *The Open Group*
4 *The Institute of Electrical and Electronics Engineers, Inc.*

1.1 Scope

POSIX.1-200x defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both application developers and system implementors.

POSIX.1-200x comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of POSIX.1-200x, including utility conventions and C-language header definitions, are included in the Base Definitions volume of POSIX.1-200x.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of POSIX.1-200x.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of POSIX.1-200x.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of POSIX.1-200x and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of POSIX.1-200x.

The following areas are outside of the scope of POSIX.1-200x:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

POSIX.1-200x describes the external characteristics and facilities that are of importance to application developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in POSIX.1-200x are drawn from the following base documents:

- IEEE Std 1003.1, 2004 Edition (POSIX-1) (incorporating IEEE Std 1003.1-2001, IEEE Std 1003.1-2001/Cor 1-2002, and IEEE Std 1003.1-2001/Cor 2-2004)

- 40 • The Open Group Technical Standard, 2006, Extended API Set Part 1
- 41 • The Open Group Technical Standard, 2006, Extended API Set Part 2
- 42 • The Open Group Technical Standard, 2006, Extended API Set Part 3
- 43 • The Open Group Technical Standard, 2006, Extended API Set Part 4
- 44 • ISO/IEC 9899:1999, Programming Languages — C (including ISO/IEC
- 45 9899:1999/Cor.1:2001(E) and ISO/IEC 9899:1999/Cor.2:2004(E))

46 Emphasis has been placed on standardizing existing practice for existing users, with changes
47 and additions limited to correcting deficiencies in the following areas:

- 48 • Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1,
49 and ISO/IEC defect reports against ISO/IEC 9945
- 50 • Issues raised in corrigenda for The Open Group Technical Standards and working group
51 resolutions from The Open Group
- 52 • Issues arising from ISO TR 24715:2006, Conflicts between POSIX and the LSB
- 53 • Changes to make the text self-consistent with the additional material merged
- 54 • Features, marked Legacy or obsolescent in the base documents, have been considered for
55 removal in this version
- 56 • A review and reorganization of the options within the standard
- 57 • Alignment with the ISO/IEC 9899:1999 standard, including Technical Corrigendum 2

58 1.2 Conformance

59 Conformance requirements for POSIX.1-200x are defined in [Chapter 2](#) (on page 15).

60 1.3 Normative References

61 The following standards contain provisions which, through references in POSIX.1-200x,
62 constitute provisions of POSIX.1-200x. At the time of publication, the editions indicated were
63 valid. All standards are subject to revision, and parties to agreements based on POSIX.1-200x are
64 encouraged to investigate the possibility of applying the most recent editions of the standards
65 listed below. Members of IEC and ISO maintain registers of currently valid International
66 Standards.

87 1.4 Change History

88 Change history is described in the Rationale (Informative) volume of POSIX.1-200x, and in the
89 CHANGE HISTORY section of reference pages.

90 1.5 Terminology

91 For the purposes of POSIX.1-200x, the following terminology definitions apply:

92 **can**

93 Describes a permissible optional feature or behavior available to the user or application. The
94 feature or behavior is mandatory for an implementation that conforms to POSIX.1-200x. An
95 application can rely on the existence of the feature or behavior.

96 **implementation-defined**

97 Describes a value or behavior that is not defined by POSIX.1-200x but is selected by an
98 implementor. The value or behavior may vary among implementations that conform to
99 POSIX.1-200x. An application should not rely on the existence of the value or behavior. An
100 application that relies on such a value or behavior cannot be assured to be portable across
101 conforming implementations.

102 The implementor shall document such a value or behavior so that it can be used correctly
103 by an application.

104 **legacy**

105 Describes a feature or behavior that is being retained for compatibility with older
106 applications, but which has limitations which make it inappropriate for developing portable
107 applications. New applications should use alternative means of obtaining equivalent
108 functionality.

109 **may**

110 Describes a feature or behavior that is optional for an implementation that conforms to
111 POSIX.1-200x. An application should not rely on the existence of the feature or behavior. An
112 application that relies on such a feature or behavior cannot be assured to be portable across
113 conforming implementations.

114 To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

115 **shall**

116 For an implementation that conforms to POSIX.1-200x, describes a feature or behavior that
117 is mandatory. An application can rely on the existence of the feature or behavior.

118 For an application or user, describes a behavior that is mandatory. |

119 **should** |

120 For an implementation that conforms to POSIX.1-200x, describes a feature or behavior that |
121 is recommended but not mandatory. An application should not rely on the existence of the |
122 feature or behavior. An application that relies on such a feature or behavior cannot be |
123 assured to be portable across conforming implementations. |

124 For an application, describes a feature or behavior that is recommended programming |
125 practice for optimum portability. |

126 **undefined** |

127 Describes the nature of a value or behavior not defined by POSIX.1-200x which results from |
128 use of an invalid program construct or invalid data input. |

129 The value or behavior may vary among implementations that conform to POSIX.1-200x. An |
130 application should not rely on the existence or validity of the value or behavior. An |
131 application that relies on any particular value or behavior cannot be assured to be portable |
132 across conforming implementations. |

133 **unspecified** |

134 Describes the nature of a value or behavior not specified by POSIX.1-200x which results |
135 from use of a valid program construct or valid data input. |

136 The value or behavior may vary among implementations that conform to POSIX.1-200x. An |
137 application should not rely on the existence or validity of the value or behavior. An |
138 application that relies on any particular value or behavior cannot be assured to be portable |
139 across conforming implementations. |

140 1.6 Definitions and Concepts |

141 Definitions and concepts are defined in [Chapter 3](#) (on page 33) and [Chapter 4](#) (on page 95). |

142 1.7 Portability |

143 Some of the utilities in the Shell and Utilities volume of POSIX.1-200x and functions in the |
144 System Interfaces volume of POSIX.1-200x describe functionality that might not be fully portable |
145 to systems meeting the requirements for POSIX conformance (see [Chapter 2](#), on page 15). |

146 Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in |
147 the margin identifies the nature of the option, extension, or warning (see [Section 1.7.1](#), on page |
148 7). For maximum portability, an application should avoid such functionality. |

149 Unless the primary task of a utility is to produce textual material on its standard output, |
150 application developers should not rely on the format or content of any such material that may be |
151 produced. Where the primary task *is* to provide such material, but the output format is |
152 incompletely specified, the description is marked with the OF margin code and shading. |
153 Application developers are warned not to expect that the output of such an interface on one |
154 system is any guide to its behavior on another system. |

1.7.1 Codes

The codes and their meanings are as follows. See also [Section 1.7.2](#) (on page 13).

ADV **Advisory Information**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

BE **Batch Environment Services and Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the BE margin legend.

CD **C-Language Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the CD margin legend.

CPT **Process CPU-Time Clocks**

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the CPT margin legend.

CX **Extension to the ISO C standard**

The functionality described is an extension to the ISO C standard. Application developers may make use of an extension as it is supported on all POSIX.1-200x-conforming systems.

With each function or header from the ISO C standard, a statement to the effect that “any conflict is unintentional” is included. That is intended to refer to a direct conflict. POSIX.1-200x acts in part as a profile of the ISO C standard, and it may choose to further constrain behaviors allowed to vary by the ISO C standard. Such limitations and other compatible differences are not considered conflicts, even if a CX mark is missing. The markings are for information only.

Where additional semantics apply to a function or header, the material is identified by use of the CX margin legend.

FD **FORTRAN Development Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FD margin legend.

FR **FORTRAN Runtime Utilities**

The functionality described is optional.

Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the FR margin legend.

199	FSC	File Synchronization
200		The functionality described is optional. The functionality described is also an extension to the
201		ISO C standard.
202		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
203		Where additional semantics apply to a function, the material is identified by use of the FSC
204		margin legend.
205	IP6	IPV6
206		The functionality described is optional. The functionality described is also an extension to the
207		ISO C standard.
208		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
209		Where additional semantics apply to a function, the material is identified by use of the IP6
210		margin legend.
211	MC1	Non-Robust Mutex Priority Protection or Non-Robust Mutex Priority Inheritance or Robust
212		Mutex Priority Protection or Robust Mutex Priority Inheritance
213		The functionality described is optional. The functionality described is also an extension to the
214		ISO C standard.
215		This is a shorthand notation for combinations of multiple option codes.
216		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
217		Where additional semantics apply to a function, the material is identified by use of the MC1
218		margin legend.
219		Refer to Section 1.7.2 (on page 13).
220	ML	Process Memory Locking
221		The functionality described is optional. The functionality described is also an extension to the
222		ISO C standard.
223		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
224		Where additional semantics apply to a function, the material is identified by use of the ML
225		margin legend.
226	MLR	Range Memory Locking
227		The functionality described is optional. The functionality described is also an extension to the
228		ISO C standard.
229		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
230		Where additional semantics apply to a function, the material is identified by use of the MLR
231		margin legend.
232	MON	Monotonic Clock
233		The functionality described is optional. The functionality described is also an extension to the
234		ISO C standard.
235		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
236		Where additional semantics apply to a function, the material is identified by use of the MON
237		margin legend.
238	MSG	Message Passing
239		The functionality described is optional. The functionality described is also an extension to the
240		ISO C standard.
241		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.
242		Where additional semantics apply to a function, the material is identified by use of the MSG
243		margin legend.

244	MX	IEC 60559 Floating-Point
245		The functionality described is optional. The functionality described is also an extension to the
246		ISO C standard.
247		Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.
248		Where additional semantics apply to a function, the material is identified by use of the MX
249		margin legend.
250	OB	Obsolescent
251		The functionality described may be removed in a future version of this volume of POSIX.1-200x.
252		Strictly Conforming POSIX Applications and Strictly Conforming XSI Applications shall not use
253		obsolescent features.
254		Where applicable, the material is identified by use of the OB margin legend.
255	OF	Output Format Incompletely Specified
256		The functionality described is an XSI extension. The format of the output produced by the
257		utility is not fully specified. It is therefore not possible to post-process this output in a consistent
258		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
259		Where applicable, the material is identified by use of the OF margin legend.
260	OH	Optional Header
261		In the SYNOPSIS section of some interfaces in the System Interfaces volume of POSIX.1-200x an
262		included header is marked as in the following example:
263	OH	<code>#include <sys/types.h></code>
264		<code>#include <grp.h></code>
265		<code>struct group *getgrnam(const char *name);</code>
266		The OH margin legend indicates that the marked header is not required on XSI-conformant
267		systems.
268	PIO	Prioritized Input and Output
269		The functionality described is optional. The functionality described is also an extension to the
270		ISO C standard.
271		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
272		Where additional semantics apply to a function, the material is identified by use of the PIO
273		margin legend.
274	PS	Process Scheduling
275		The functionality described is optional. The functionality described is also an extension to the
276		ISO C standard.
277		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
278		Where additional semantics apply to a function, the material is identified by use of the PS
279		margin legend.
280	RPI	Robust Mutex Priority Inheritance
281		The functionality described is optional. The functionality described is also an extension to the
282		ISO C standard.
283		Where applicable, functions are marked with the RPI margin legend in the SYNOPSIS section.
284		Where additional semantics apply to a function, the material is identified by use of the RPI
285		margin legend.
286	RPP	Robust Mutex Priority Protection
287		The functionality described is optional. The functionality described is also an extension to the
288		ISO C standard.

289		Where applicable, functions are marked with the RPP margin legend in the SYNOPSIS section.
290		Where additional semantics apply to a function, the material is identified by use of the RPP
291		margin legend.
292	RS	Raw Sockets
293		The functionality described is optional. The functionality described is also an extension to the
294		ISO C standard.
295		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
296		Where additional semantics apply to a function, the material is identified by use of the RS
297		margin legend.
298	SD	Software Development Utilities
299		The functionality described is optional.
300		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
301		Where additional semantics apply to a utility, the material is identified by use of the SD margin
302		legend.
303	SHM	Shared Memory Objects
304		The functionality described is optional. The functionality described is also an extension to the
305		ISO C standard.
306		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
307		Where additional semantics apply to a function, the material is identified by use of the SHM
308		margin legend.
309	SIO	Synchronized Input and Output
310		The functionality described is optional. The functionality described is also an extension to the
311		ISO C standard.
312		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
313		Where additional semantics apply to a function, the material is identified by use of the SIO
314		margin legend.
315	SPN	Spawn
316		The functionality described is optional. The functionality described is also an extension to the
317		ISO C standard.
318		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
319		Where additional semantics apply to a function, the material is identified by use of the SPN
320		margin legend.
321	SS	Process Sporadic Server
322		The functionality described is optional. The functionality described is also an extension to the
323		ISO C standard.
324		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
325		Where additional semantics apply to a function, the material is identified by use of the SS
326		margin legend.
327	TCT	Thread CPU-Time Clocks
328		The functionality described is optional. The functionality described is also an extension to the
329		ISO C standard.
330		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.
331		Where additional semantics apply to a function, the material is identified by use of the TCT
332		margin legend.

333	TEF	Trace Event Filter
334		The functionality described is optional. This functionality is dependent on support for the Trace
335		option. The functionality described is also an extension to the ISO C standard.
336		Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.
337		Where additional semantics apply to a function, the material is identified by use of the TEF
338		margin legend.
339	TPI	Non-Robust Mutex Priority Inheritance
340		The functionality described is optional. The functionality described is also an extension to the
341		ISO C standard.
342		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
343		Where additional semantics apply to a function, the material is identified by use of the TPI
344		margin legend.
345	TPP	Non-Robust Mutex Priority Protection
346		The functionality described is optional. The functionality described is also an extension to the
347		ISO C standard.
348		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
349		Where additional semantics apply to a function, the material is identified by use of the TPP
350		margin legend.
351	TPS	Thread Execution Scheduling
352		The functionality described is optional. The functionality described is also an extension to the
353		ISO C standard.
354		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
355		Where additional semantics apply to a function, the material is identified by use of the TPS
356		margin legend.
357	TRC	Trace
358		The functionality described is optional. The functionality described is also an extension to the
359		ISO C standard.
360		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
361		Where additional semantics apply to a function, the material is identified by use of the TRC
362		margin legend.
363	TRI	Trace Inherit
364		The functionality described is optional. This functionality is dependent on support for the Trace
365		option. The functionality described is also an extension to the ISO C standard.
366		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
367		Where additional semantics apply to a function, the material is identified by use of the TRI
368		margin legend.
369	TRL	Trace Log
370		The functionality described is optional. This functionality is dependent on support for the Trace
371		option. The functionality described is also an extension to the ISO C standard.
372		Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.
373		Where additional semantics apply to a function, the material is identified by use of the TRL
374		margin legend.
375	TSA	Thread Stack Address Attribute
376		The functionality described is optional. The functionality described is also an extension to the
377		ISO C standard.

378		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
379		Where additional semantics apply to a function, the material is identified by use of the TSA
380		margin legend.
381	TSH	Thread Process-Shared Synchronization
382		The functionality described is optional. The functionality described is also an extension to the
383		ISO C standard.
384		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
385		Where additional semantics apply to a function, the material is identified by use of the TSH
386		margin legend.
387	TSP	Thread Sporadic Server
388		The functionality described is optional. The functionality described is also an extension to the
389		ISO C standard.
390		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
391		Where additional semantics apply to a function, the material is identified by use of the TSP
392		margin legend.
393	TSS	Thread Stack Size Attribute
394		The functionality described is optional. The functionality described is also an extension to the
395		ISO C standard.
396		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
397		Where additional semantics apply to a function, the material is identified by use of the TSS
398		margin legend.
399	TYM	Typed Memory Objects
400		The functionality described is optional. The functionality described is also an extension to the
401		ISO C standard.
402		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
403		Where additional semantics apply to a function, the material is identified by use of the TYM
404		margin legend.
405	UP	User Portability Utilities
406		The functionality described is optional.
407		Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
408		Where additional semantics apply to a utility, the material is identified by use of the UP margin
409		legend.
410	UU	UUCP Utilities
411		The functionality described is optional. The functionality described is also an extension to the
412		ISO C standard.
413		Where applicable, functions are marked with the UU margin legend in the SYNOPSIS section.
414		Where additional semantics apply to a function, the material is identified by use of the UU
415		margin legend.
416	XSI	X/Open System Interfaces
417		The functionality described is part of the X/Open Systems Interfaces option. Functionality
418		marked XSI is an extension to the ISO C standard. Application developers may confidently
419		make use of such extensions on all systems supporting the X/Open System Interfaces option.
420		If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that
421		reference page is an extension. See Section 2.1.4 (on page 19).

422 XSR **XSI STREAMS**
 423 The functionality described is optional. The functionality described is also an extension to the
 424 ISO C standard.

425 Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section.
 426 Where additional semantics apply to a function, the material is identified by use of the XSR
 427 margin legend.

428 1.7.2 Margin Code Notation

429 Some of the functionality described in POSIX.1-200x depends on support of more than one
 430 option, or independently may depend on several options. The following notation for margin
 431 codes is used to denote the following cases.

432 A Feature Dependent on One or Two Options

433 In this case, margin codes have a <space> separator; for example:

434 SHM This feature requires support for only the Shared Memory Objects option.

435 SHM TYM This feature requires support for both the Shared Memory Objects option and the Typed
 436 Memory Objects option; that is, an application which uses this feature is portable only between
 437 implementations that provide both options.

438 A Feature Dependent on Either of the Options Denoted

439 In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

440 SHM | TYM This feature is dependent on support for either the Shared Memory Objects option or the Typed
 441 Memory Objects option; that is, an application which uses this feature is portable between
 442 implementations that provide any (or all) of the options.

443 A Feature Dependent on More than Two Options

444 The following shorthand notations are used:

445 MC1 The MC1 margin code is shorthand for TPP | TPI | RPP | RPI. Features which are shaded with this
 446 margin code require support of either the Non-Robust Mutex Priority Protection option or the
 447 Non-Robust Mutex Priority Inheritance option or the Robust Mutex Priority Protection option or
 448 the Robust Mutex Priority Inheritance option.

449 Large Sections Dependent on an Option

450 Where large sections of text are dependent on support for an option, a lead-in text block is
 451 provided and shaded accordingly; for example:

452 XSI This section describes extensions to support interprocess communication. The functionality
 453 described in this section shall be provided on implementations that support the XSI option (and
 454 the rest of this section is not further shaded).

2.1 Implementation Conformance

For the purposes of POSIX.1-200x, the implementation conformance requirements given in this section apply.

2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within POSIX.1-200x that are required for POSIX conformance (see [Section 2.1.3](#), on page 16). These interfaces shall support the functional behavior described herein.
2. The system may support the X/Open System Interfaces (XSI) option as described in [Section 2.1.4](#) (on page 19).
3. The system may support one or more options as described under [Section 2.1.5](#) (on page 20). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
4. The system may provide additional utilities, functions, or facilities not required by POSIX.1-200x. Non-standard extensions of the utilities, functions, or facilities specified in POSIX.1-200x should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by POSIX.1-200x. The conformance document shall define an environment in which an application can be run with the behavior specified by POSIX.1-200x. In no case shall such an environment require modification of a Strictly Conforming POSIX Application (see [Section 2.2.1](#), on page 28).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to POSIX.1-200x. The conformance document shall have the same structure as POSIX.1-200x, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of POSIX.1-200x.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers [<limits.h>](#) (on page 253) and [<unistd.h>](#) (on page 412), stating values, the conditions under which those values may change, and the limits of such variations, if any.

493 The conformance document shall describe the behavior of the implementation for all
 494 implementation-defined features defined in POSIX.1-200x. This requirement shall be met by
 495 listing these features and providing either a specific reference to the system documentation or
 496 providing full syntax and semantics of these features. When the value or behavior in the
 497 implementation is designed to be variable or customized on each instantiation of the system, the
 498 implementation provider shall document the nature and permissible ranges of this variation.

499 The conformance document may specify the behavior of the implementation for those features
 500 where POSIX.1-200x states that implementations may vary or where features are identified as
 501 undefined or unspecified.

502 The conformance document shall not contain documentation other than that specified in the
 503 preceding paragraphs except where such documentation is specifically allowed or required by
 504 other provisions of POSIX.1-200x.

505 The phrases “shall document” or “shall be documented” in POSIX.1-200x mean that
 506 documentation of the feature shall appear in the conformance document, as described
 507 previously, unless there is an explicit reference in the conformance document to show where the
 508 information can be found in the system documentation.

509 The system documentation should also contain the information found in the conformance
 510 document.

511 2.1.3 POSIX Conformance

512 A conforming implementation shall meet the following criteria for POSIX conformance.

513 2.1.3.1 POSIX System Interfaces

514 The following requirements apply to the system interfaces (functions and headers):

- 515 • The system shall support all the mandatory functions and headers defined in
 516 POSIX.1-200x, and shall set the symbolic constant `_POSIX_VERSION` to the value `200xxxL`.
- 517 • Although all implementations conforming to POSIX.1-200x support all the features
 518 described below, there may be system-dependent or file system-dependent configuration
 519 procedures that can remove or modify any or all of these features. Such configurations
 520 should not be made if strict compliance is required.

521 The following symbolic constants shall be defined with a value other than `-1`. If a constant
 522 is defined with the value zero, applications should use the `sysconf()`, `pathconf()`, or
 523 `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the
 524 system at that time or for the particular pathname in question.

525 — `_POSIX_CHOWN_RESTRICTED`

526 The use of `chown()` is restricted to a process with appropriate privileges, and to
 527 changing the group ID of a file only to the effective group ID of the process or to one
 528 of its supplementary group IDs.

529 — `_POSIX_NO_TRUNC`

530 Pathname components longer than `{NAME_MAX}` generate an error.

- 531 • The following symbolic constants shall be defined by the implementation as follows:
 - 532 • Symbolic constants defined with the value `200xxxL`:

533 _POSIX_ASYNCHRONOUS_IO
 534 _POSIX_BARRIERS
 535 _POSIX_CLOCK_SELECTION
 536 _POSIX_MAPPED_FILES
 537 _POSIX_MEMORY_PROTECTION
 538 _POSIX_READER_WRITER_LOCKS
 539 _POSIX_REALTIME_SIGNALS
 540 _POSIX_SEMAPHORES
 541 _POSIX_SPIN_LOCKS
 542 _POSIX_THREAD_SAFE_FUNCTIONS
 543 _POSIX_THREADS
 544 _POSIX_TIMEOUTS
 545 _POSIX_TIMERS

- Symbolic constants defined with a value greater than zero:

547 _POSIX_JOB_CONTROL
 548 _POSIX_SAVED_IDS

- Symbolic constants defined with a value other than -1.

550 _POSIX_VDISABLE

551 **Note:** The symbols above represent historical options that are no longer allowed as options, but
 552 are retained here for backwards-compatibility of applications.

- The system may support one or more options (see [Section 2.1.6](#), on page 25) denoted by the following symbolic constants:

555 — _POSIX_ADVISORY_INFO
 556 — _POSIX_CPUTIME
 557 — _POSIX_FSYNC
 558 — _POSIX_IPV6
 559 — _POSIX_MEMLOCK
 560 — _POSIX_MEMLOCK_RANGE
 561 — _POSIX_MESSAGE_PASSING
 562 — _POSIX_MONOTONIC_CLOCK
 563 — _POSIX_PRIORITIZED_IO
 564 — _POSIX_PRIORITY_SCHEDULING
 565 — _POSIX_RAW_SOCKETS
 566 — _POSIX_SHARED_MEMORY_OBJECTS
 567 — _POSIX_SPAWN
 568 — _POSIX_SPORADIC_SERVER
 569 — _POSIX_SYNCHRONIZED_IO
 570 — _POSIX_THREAD_ATTR_STACKADDR

571 — _POSIX_THREAD_CPUTIME
 572 — _POSIX_THREAD_ATTR_STACKSIZE
 573 — _POSIX_THREAD_PRIO_INHERIT
 574 — _POSIX_THREAD_PRIO_PROTECT
 575 — _POSIX_THREAD_PRIORITY_SCHEDULING
 576 — _POSIX_THREAD_PROCESS_SHARED
 577 — _POSIX_THREAD_SPORADIC_SERVER
 578 — _POSIX_TRACE
 579 — _POSIX_TRACE_EVENT_FILTER
 580 — _POSIX_TRACE_INHERIT
 581 — _POSIX_TRACE_LOG
 582 — _POSIX_TYPED_MEMORY_OBJECTS
 583 — _XOPEN_CRYPT
 584 — _XOPEN_REALTIME
 585 — _XOPEN_REALTIME_THREADS
 586 — _XOPEN_STREAMS
 587 — _XOPEN_UNIX

588 If any of the symbolic constants `_POSIX_TRACE_EVENT_FILTER`, `_POSIX_TRACE_LOG`,
 589 or `_POSIX_TRACE_INHERIT` is defined to have a value other than `-1`, then the symbolic
 590 constant `_POSIX_TRACE` shall also be defined to have a value other than `-1`.

591 If the Advisory Information option is supported, there shall be at least one file system that
 592 supports the functionality.

593 2.1.3.2 *POSIX Shell and Utilities*

594 The following requirements apply to the shell and utilities:

- 595 • The system shall provide all the mandatory utilities in the Shell and Utilities volume of
 596 POSIX.1-200x with all the functional behavior described therein.
- 597 • The system shall support the Large File capabilities described in the Shell and Utilities
 598 volume of POSIX.1-200x.
- 599 • The system may support one or more options (see [Section 2.1.6](#), on page 25) denoted by the
 600 following symbolic constants. (The literal names below apply to the *getconf* utility.)

601 — POSIX2_C_DEV
 602 — POSIX2_CHAR_TERM
 603 — POSIX2_FORT_DEV
 604 — POSIX2_FORT_RUN
 605 — POSIX2_LOCALEDEF
 606 — POSIX2_PBS

- 607 — POSIX2_PBS_ACCOUNTING
- 608 — POSIX2_PBS_LOCATE
- 609 — POSIX2_PBS_MESSAGE
- 610 — POSIX2_PBS_TRACK
- 611 — POSIX2_SW_DEV
- 612 — POSIX2_UPE
- 613 — XOPEN_UNIX
- 614 — XOPEN_UUCP

615 Additional language bindings and development utility options may be provided in other related |
 616 standards or in a future version of this standard. In the former case, additional symbolic |
 617 constants of the same general form as shown in this subsection should be defined by the related |
 618 standard document and made available to the application without requiring POSIX.1-200x to be |
 619 updated.

620 2.1.4 XSI Conformance

621 XSI This section describes the criteria for implementations providing conformance to the X/Open
 622 System Interfaces (XSI) option (see [Section 3.442](#), on page 94). The functionality described in this
 623 section shall be provided on implementations that support the XSI option (and the rest of this
 624 section is not further shaded).

625 POSIX.1-200x describes utilities, functions, and facilities offered to application programs by the
 626 X/Open System Interfaces (XSI) option. An XSI-conforming implementation shall meet the
 627 criteria for POSIX conformance and the following requirements listed in this section.

628 XSI-conforming implementations shall set the symbolic constant `_XOPEN_UNIX` to a value
 629 other than `-1` and shall set the symbolic constant `_XOPEN_VERSION` to the value 700.

630 2.1.4.1 XSI System Interfaces

631 The following requirements apply to the system interfaces when the XSI option is supported:

- 632 • The system shall support all the functions and headers defined in POSIX.1-200x as part of
 633 the XSI option denoted by the XSI marking in the SYNOPSIS section, and any extensions
 634 marked with the XSI option marking (see [Section 1.7.1](#), on page 7) within the text.
- 635 • The system shall support the following options defined within POSIX.1-200x (see [Section](#) -
 636 [2.1.6](#), on page 25):
 - 637 — `_POSIX_FSYNC`
 - 638 — `_POSIX_THREAD_ATTR_STACKADDR`
 - 639 — `_POSIX_THREAD_ATTR_STACKSIZE`
 - 640 — `_POSIX_THREAD_PROCESS_SHARED`
- 641 • The system may support the following XSI Option Groups (see [Section 2.1.5.2](#), on page 21)
 642 defined within POSIX.1-200x:
 - 643 — Encryption
 - 644 — Realtime

- 645 — Advanced Realtime
- 646 — Realtime Threads
- 647 — Advanced Realtime Threads
- 648 — Tracing
- 649 — XSI STREAMS

650 2.1.4.2 XSI Shell and Utilities Conformance

651 The following requirements apply to the shell and utilities when the XSI option is supported:

- 652 • The system shall support all the utilities defined in the Shell and Utilities volume of
653 POSIX.1-200x as part of the XSI option denoted by the XSI marking in the SYNOPSIS
654 section, and any extensions marked with the XSI option marking (see [Section 1.7.1](#), on
655 page 7) within the text.
- 656 • The system shall support the User Portability Utilities option.
- 657 • The system shall support creation of locales (see [Chapter 7](#), on page 121).
- 658 • The C-language Development utility *c99* shall be supported.
- 659 • The XSI Development Utilities option may be supported. It consists of the following
660 software development utilities:

661	<i>admin</i>	<i>delta</i>	<i>rmdel</i>	<i>val</i>
662	<i>cflow</i>	<i>get</i>	<i>sact</i>	<i>what</i>
663	<i>ctags</i>	<i>nm</i>	<i>sccs</i>	
664	<i>cxref</i>	<i>prs</i>	<i>unget</i>	

665 2.1.5 Option Groups

666 An Option Group is a group of related functions or options defined within the System Interfaces
667 volume of POSIX.1-200x.

668 If an implementation supports an Option Group, then the system shall support the functional
669 behavior described herein.

670 If an implementation does not support an Option Group, then the system need not support the
671 functional behavior described herein.

672 2.1.5.1 Subprofiling Considerations

673 Profiling standards supporting functional requirements less than that required in POSIX.1-200x
674 may subset both mandatory and optional functionality required for POSIX Conformance (see
675 [Section 2.1.3](#), on page 16) or XSI Conformance (see [Section 2.1.4](#), on page 19). Such profiles shall
676 organize the subsets into Subprofiling Option Groups.

677 XRAT [Appendix E](#) (on page 3607) describes a representative set of such Subprofiling Option
678 Groups for use by profiles applicable to specialized realtime systems. POSIX.1-200x does not
679 require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols
680 defined in any header) or at runtime (via *sysconf()* or *getconf()*).

681 A Subprofiling Option Group may provide basic system functionality that other Subprofiling
682 Option Groups and other options depend upon.³ If a profile of POSIX.1-200x does not require an
683 implementation to provide a Subprofiling Option Group that provides features utilized by a
684 required Subprofiling Option Group (or option),⁴ the profile shall specify⁵ all of the following:

- 685 • Restricted or altered behavior of interfaces defined in POSIX.1-200x that may differ on an
- 686 implementation of the profile
- 687 • Additional behaviors that may produce undefined or unspecified results
- 688 • Additional implementation-defined behavior that implementations shall be required to
- 689 document in the profile's conformance document

690 if any of the above is a result of the profile not requiring an interface required by POSIX.1-200x.

691 The following additional rules shall apply to all profiles of POSIX.1-200x:

- 692 • Any application that conforms to that profile shall also conform to POSIX.1-200x (that is, a
- 693 profile shall not require restricted, altered, or extended behaviors of an implementation of
- 694 POSIX.1-200x).
- 695 • Profiles are permitted to add additional requirements to the limits defined in `<limits.h>`
- 696 and `<stdint.h>`, subject to the following:

697 For the limits in `<limits.h>` and `<stdint.h>`:

- 698 — If the limit is specified as having a fixed value, it shall not be changed by a profile.
- 699 — If a limit is specified as having a minimum or maximum acceptable value, it may be
- 700 changed by a profile as follows:
 - 701 — A profile may increase a minimum acceptable value, but shall not make a
 - 702 minimum acceptable value smaller.
 - 703 — A profile may reduce a maximum acceptable value, but shall not make a
 - 704 maximum acceptable value larger.
- 705 • A profile shall not change a limit specified as having a minimum or maximum value into a
- 706 limit specified as having a fixed value.
- 707 • A profile shall not create new limits.
- 708 • Any implementation that conforms to POSIX.1-200x (including all options and extended
- 709 limits required by the profile) shall also conform to that profile.

710 2.1.5.2 XSI Option Groups

711 XSI This section describes Option Groups to support the definition of XSI conformance within the
 712 System Interfaces volume of POSIX.1-200x. The functionality described in this section shall be
 713 provided on implementations that support the XSI option and the appropriate Option Group
 714 (and the rest of this section is not further shaded).

715 The following Option Groups are defined.

-
- 716 3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are
 - 717 needed by any interface in POSIX.1-200x that parses a *path* argument. If a profile requires support for the Device Input and Output
 - 718 profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname
 - 719 resolution is to behave in that profile, how the `O_CREAT` flag to `open()` is to be handled (and the use of the character 'a' in the *mode*
 - 720 argument of `open()` when a filename argument names a file that does not exist), and specify lots of other details.
 - 721 4. As an example, POSIX.1-200x requires that implementations claiming to support the Range Memory Locking option also support the
 - 722 Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that
 - 723 the Process Memory Locking option be supplied as long as the profile specifies everything an application developer or system implementor
 - 724 would have to know to build an application or implementation conforming to the profile.
 - 725 5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified
 - 726 results.

727 **Encryption**

728 The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes
729 the following functions:

730 `crypt()`, `encrypt()`, `setkey()`

731 These functions are marked CRYPT.

732 Due to export restrictions on the decoding algorithm in some countries, implementations may
733 be restricted in making these functions available. All the functions in the Encryption Option
734 Group may therefore return [ENOSYS] or, alternatively, `encrypt()` shall return [ENOSYS] for the
735 decryption operation.

736 An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to
737 a value other than `-1`.

738 **Realtime**

739 The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

740 This Option Group includes a set of realtime functions drawn from options within POSIX.1-200x
741 (see [Section 2.1.6](#), on page 25).

742 Where entire functions are included in the Option Group, the NAME section is marked with
743 REALTIME. Where additional semantics have been added to existing pages, the new material is
744 identified by use of the appropriate margin legend for the underlying option defined within
745 POSIX.1-200x.

746 An implementation that claims conformance to this Option Group shall set
747 `_XOPEN_REALTIME` to a value other than `-1`.

748 This Option Group consists of the set of the following options from within POSIX.1-200x (see
749 [Section 2.1.6](#), on page 25):

750 `_POSIX_FSYNC`
751 `_POSIX_MEMLOCK`
752 `_POSIX_MEMLOCK_RANGE`
753 `_POSIX_MESSAGE_PASSING`
754 `_POSIX_PRIORITIZED_IO`
755 `_POSIX_PRIORITY_SCHEDULING`
756 `_POSIX_SHARED_MEMORY_OBJECTS`
757 `_POSIX_SYNCHRONIZED_IO`

758 If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the
759 following symbolic constants shall be defined by the implementation to have the value `200xxxL`:

760 `_POSIX_MEMLOCK`
761 `_POSIX_MEMLOCK_RANGE`
762 `_POSIX_MESSAGE_PASSING`
763 `_POSIX_PRIORITY_SCHEDULING`
764 `_POSIX_SHARED_MEMORY_OBJECTS`
765 `_POSIX_SYNCHRONIZED_IO`

766 The functionality associated with `_POSIX_FSYNC` shall always be supported on XSI-conformant
767 systems.

768 Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If
769 `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by

770 *aioread()*, *aiowrite()*, and *lio_listio()* shall be submitted at a priority equal to the scheduling
 771 priority equal to a base scheduling priority minus *aiocbp->aioreqprio*. If Thread Execution
 772 Scheduling is not supported, then the base scheduling priority is that of the calling process;
 773 otherwise, the base scheduling priority is that of the calling thread. The implementation shall
 774 also document for which files I/O prioritization is supported.

775 **Advanced Realtime**

776 An implementation that claims conformance to this Option Group shall also support the
 777 Realtime Option Group.

778 Where entire functions are included in the Option Group, the NAME section is marked with
 779 ADVANCED REALTIME. Where additional semantics have been added to existing pages, the
 780 new material is identified by use of the appropriate margin legend for the underlying option
 781 defined within POSIX.1-200x.

782 This Option Group consists of the set of the following options from within POSIX.1-200x (see
 783 [Section 2.1.6](#), on page 25):

```
784     _POSIX_ADVISORY_INFO
785     _POSIX_CPUTIME
786     _POSIX_MONOTONIC_CLOCK
787     _POSIX_SPAWN
788     _POSIX_SPORADIC_SERVER
789     _POSIX_TYPED_MEMORY_OBJECTS
```

790 If the implementation supports the Advanced Realtime Option Group, then the following
 791 symbolic constants shall be defined by the implementation to have the value 200xxxL:

```
792     _POSIX_ADVISORY_INFO
793     _POSIX_CPUTIME
794     _POSIX_MONOTONIC_CLOCK
795     _POSIX_SPAWN
796     _POSIX_SPORADIC_SERVER
797     _POSIX_TYPED_MEMORY_OBJECTS
```

798 If the symbolic constant `_POSIX_SPORADIC_SERVER` is defined, then the symbolic constant
 799 `_POSIX_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the
 800 value 200xxxL.

801 **Realtime Threads**

802 The Realtime Threads Option Group is denoted by the symbolic constant
 803 `_XOPEN_REALTIME_THREADS`.

804 This Option Group consists of the set of the following options from within POSIX.1-200x (see
 805 [Section 2.1.6](#), on page 25):

```
806     _POSIX_THREAD_PRIO_INHERIT
807     _POSIX_THREAD_PRIO_PROTECT
808     _POSIX_THREAD_PRIORITY_SCHEDULING
```

809 Where applicable, whole pages are marked REALTIME THREADS, together with the
 810 appropriate option margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7).

811 An implementation that claims conformance to this Option Group shall set
 812 `_XOPEN_REALTIME_THREADS` to a value other than -1.

813 If the symbol `_XOPEN_REALTIME_THREADS` is defined to have a value other than `-1`, then the
 814 following options shall also be defined by the implementation to have the value `200xxxL`:

```
815     _POSIX_THREAD_PRIO_INHERIT
816     _POSIX_THREAD_PRIO_PROTECT
817     _POSIX_THREAD_PRIORITY_SCHEDULING
```

818 **Advanced Realtime Threads**

819 An implementation that claims conformance to this Option Group shall also support the
 820 Realtime Threads Option Group.

821 Where entire functions are included in the Option Group, the NAME section is marked with
 822 `ADVANCED_REALTIME_THREADS`. Where additional semantics have been added to existing
 823 pages, the new material is identified by use of the appropriate margin legend for the underlying
 824 option defined within `POSIX.1-200x`.

825 This Option Group consists of the set of the following options from within `POSIX.1-200x` (see
 826 [Section 2.1.6](#), on page 25):

```
827     _POSIX_THREAD_CPUTIME
828     _POSIX_THREAD_SPORADIC_SERVER
```

829 If the symbolic constant `_POSIX_THREAD_SPORADIC_SERVER` is defined to have the value
 830 `200xxxL`, then the symbolic constant `_POSIX_THREAD_PRIORITY_SCHEDULING` shall also be
 831 defined by the implementation to have the value `200xxxL`.

832 If the implementation supports the Advanced Realtime Threads Option Group, then the
 833 following symbolic constants shall be defined by the implementation to have the value `200xxxL`:

```
834     _POSIX_THREAD_CPUTIME
835     _POSIX_THREAD_SPORADIC_SERVER
```

836 **Tracing**

837 This Option Group includes a set of tracing functions drawn from options within `POSIX.1-200x`
 838 (see [Section 2.1.6](#), on page 25).

839 Where entire functions are included in the Option Group, the NAME section is marked with
 840 `TRACING`. Where additional semantics have been added to existing pages, the new material is
 841 identified by use of the appropriate margin legend for the underlying option defined within
 842 `POSIX.1-200x`.

843 This Option Group consists of the set of the following options from within `POSIX.1-200x` (see
 844 [Section 2.1.6](#), on page 25):

```
845     _POSIX_TRACE
846     _POSIX_TRACE_EVENT_FILTER
847     _POSIX_TRACE_LOG
848     _POSIX_TRACE_INHERIT
```

849 If the implementation supports the Tracing Option Group, then the following symbolic
 850 constants shall be defined by the implementation to have the value `200xxxL`:

851 _POSIX_TRACE
 852 _POSIX_TRACE_EVENT_FILTER
 853 _POSIX_TRACE_LOG
 854 _POSIX_TRACE_INHERIT

855 XSI STREAMS

856 OB XSR This section describes the XSI STREAMS Option Group, denoted by the symbolic constant
 857 _XOPEN_STREAMS. The functionality described in this section shall be provided on
 858 implementations that support the XSI STREAMS option (and the rest of this section is not
 859 further shaded).

860 This Option Group includes functionality related to STREAMS, a uniform mechanism for
 861 implementing networking services and other character-based I/O as described in XSH [Section](#)
 862 2.6 (on page 473).

863 It includes the following functions:

864	<i>fattach()</i>	<i>ioctl()</i>
865	<i>fdetach()</i>	<i>isastream()</i>
866	<i>getmsg()</i>	<i>putmsg()</i>
867	<i>getpmsg()</i>	<i>putpmsg()</i>

868 and the `<stropts.h>` header.

869 Where applicable, whole pages are marked STREAMS, together with the appropriate option
 870 margin legend for the SYNOPSIS section (see [Section 1.7.1](#), on page 7). Where additional
 871 semantics have been added to existing pages, the new material is identified by use of the
 872 appropriate margin legend for the underlying option defined within POSIX.1-200x.

873 An implementation that claims conformance to this Option Group shall set `_XOPEN_STREAMS`
 874 to a value other than `-1`.

875 2.1.6 Options

876 The symbolic constants defined in `<unistd.h>`, [Constants for Options and Option Groups](#) (on
 877 page 412) reflect implementation options for POSIX.1-200x. These symbols can be used by the
 878 application to determine which of three categories of support for optional facilities are provided
 879 by the implementation.

- 880 1. Option not supported for compilation.

881 The implementation advertises at compile time (by defining the constant in `<unistd.h>`
 882 with value `-1`, or by leaving it undefined) that the option is not supported for compilation
 883 and, at the time of compilation, is not supported for runtime use. In this case, the headers,
 884 data types, function interfaces, and utilities required only for the option need not be
 885 present. A later runtime check using the *fpathconf()*, *pathconf()*, or *sysconf* functions
 886 defined in the System Interfaces volume of POSIX.1-200x or the *getconf* utility defined in
 887 the Shell and Utilities volume of POSIX.1-200x can in some circumstances indicate that
 888 the option is supported at runtime. (For example, an old application binary might be run
 889 on a newer implementation to which support for the option has been added.)

- 890 2. Option always supported.

891 The implementation advertises at compile time (by defining the constant in `<unistd.h>`
 892 with a value greater than zero) that the option is supported both for compilation and for
 893 use at runtime. In this case, all headers, data types, function interfaces, and utilities
 894 required only for the option shall be available and shall operate as specified. Runtime

checks with *fpathconf()*, *pathconf()*, or *sysconf* shall indicate that the option is supported.

3. Option might or might not be supported at runtime.

The implementation advertises at compile time (by defining the constant in **<unistd.h>** with value zero) that the option is supported for compilation and might or might not be supported at runtime. In this case, the *fpathconf()*, *pathconf()*, or *sysconf()* functions defined in the System Interfaces volume of POSIX.1-200x or the *getconf* utility defined in the Shell and Utilities volume of POSIX.1-200x can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported at runtime. All headers, data types, and function interfaces required to compile and execute applications which use the option at runtime (after checking at runtime that the option is supported) shall be provided, but if the option is not supported at runtime they need not operate as specified. Utilities or other facilities required only for the option, but not needed to compile and execute such applications, need not be present.

If an option is not supported for compilation, an application that attempts to use anything associated only with the option is considered to be requiring an extension. Unless explicitly specified otherwise, the behavior of functions associated with an option that is not supported at runtime is unspecified, and an application that uses such functions without first checking *fpathconf()*, *pathconf()*, or *sysconf* is considered to be requiring an extension.

Margin codes are defined for each option (see [Section 1.7.1](#), on page 7).

2.1.6.1 System Interfaces

Refer to **<unistd.h>**, [Constants for Options and Option Groups](#) (on page 412) for the list of options.

2.1.6.2 Shell and Utilities

Each of these symbols shall be considered valid names by the implementation. Refer to **<unistd.h>**, [Constants for Options and Option Groups](#) (on page 412).

The literal names shown below apply only to the *getconf* utility.

CD POSIX2_C_DEV

The system supports the C-Language Development Utilities option.

The utilities in the C-Language Development Utilities option are used for the development of C-language applications, including compilation or translation of C source code and complex program generators for simple lexical tasks and processing of context-free grammars.

The utilities listed below may be provided by a conforming system; however, any system claiming conformance to the C-Language Development Utilities option shall provide all of the utilities listed.

c99

lex

yacc

POSIX2_CHAR_TERM

The system supports the Terminal Characteristics option. This value need not be present on a system not supporting the User Portability Utilities option.

Where applicable, the dependency is noted within the description of the utility.

This option applies only to systems supporting the User Portability Utilities option. If

938 supported, then the system supports at least one terminal type capable of all operations
939 described in POSIX.1-200x; see [Section 10.2](#) (on page 184).

940 FD **POSIX2_FORT_DEV**

941 The system supports the FORTRAN Development Utilities option.

942 The *fort77* FORTRAN compiler is the only utility in the FORTRAN Development Utilities
943 option. This is used for the development of FORTRAN language applications, including
944 compilation or translation of FORTRAN source code.

945 The *fort77* utility may be provided by a conforming system; however, any system claiming
946 conformance to the FORTRAN Development Utilities option shall provide the *fort77* utility.

947 FR **POSIX2_FORT_RUN**

948 The system supports the FORTRAN Runtime Utilities option.

949 The *asa* utility is the only utility in the FORTRAN Runtime Utilities option.

950 The *asa* utility may be provided by a conforming system; however, any system claiming
951 conformance to the FORTRAN Runtime Utilities option shall provide the *asa* utility.

952 **POSIX2_LOCALEDEF**

953 The system supports the Locale Creation Utilities option.

954 If supported, the system supports the creation of locales as described in the *localedef* utility.

955 The *localedef* utility may be provided by a conforming system; however, any system
956 claiming conformance to the Locale Creation Utilities option shall provide the *localedef*
957 utility.

958 OB BE **POSIX2_PBS**

959 The system supports the Batch Environment Services and Utilities option (see XCU [Chapter](#)
960 [3](#), on page 2319).

961 **Note:** The Batch Environment Services and Utilities option is a combination of mandatory and
962 optional batch services and utilities. The `POSIX_PBS` symbolic constant implies the system
963 supports all the mandatory batch services and utilities.

964 **POSIX2_PBS_ACCOUNTING**

965 The system supports the Batch Accounting option.

966 **POSIX2_PBS_CHECKPOINT**

967 The system supports the Batch Checkpoint/Restart option.

968 **POSIX2_PBS_LOCATE**

969 The system supports the Locate Batch Job Request option.

970 **POSIX2_PBS_MESSAGE**

971 The system supports the Batch Job Message Request option.

972 **POSIX2_PBS_TRACK**

973 The system supports the Track Batch Job Request option.

974 SD **POSIX2_SW_DEV**

975 The system supports the Software Development Utilities option.

976 The utilities in the Software Development Utilities option are used for the development of
977 applications, including compilation or translation of source code, the creation and
978 maintenance of library archives, and the maintenance of groups of inter-dependent
979 programs.

980 The utilities listed below may be provided by the conforming system; however, any system
981 claiming conformance to the Software Development Utilities option shall provide all of the

982 utilities listed here.

983 *ar*
 984 *make*
 985 *nm*
 986 *strip*

987 UP POSIX2_UPE

988 The system supports the User Portability Utilities option.

989 The utilities in the User Portability Utilities option shall be implemented on all systems that
 990 claim conformance to this option, except for the *vi* utility which is noted as having features
 991 that cannot be implemented on all terminal types; if the POSIX2_CHAR_TERM option is
 992 supported, the system shall support all such features on at least one terminal type; see
 993 [Section 10.2](#) (on page 184).

994 The list of utilities in the User Portability Utilities option is as follows:

995 *bg fg talk*
 996 *ex jobs vi*
 997 *fc more*

998 XSI XOPEN_UNIX

999 The system supports the X/Open System Interfaces (XSI) option (see [Section 2.1.4](#), on page
 1000 19).

1001 UU XOPEN_UUCP

1002 The system supports the UUCP Utilities option.

1003 The list of utilities in the UUCP Utilities option is as follows:

1004 *uucp*
 1005 *uustat*
 1006 < *uux*

1007 2.2 Application Conformance

1008 For the purposes of POSIX.1-200x, the application conformance requirements given in this
 1009 section apply.

1010 All applications claiming conformance to POSIX.1-200x shall use only language-dependent
 1011 services for the C programming language described in [Section 2.3](#) (on page 30), shall use only
 1012 the utilities and facilities defined in the Shell and Utilities volume of POSIX.1-200x, and shall fall
 1013 within one of the following categories.

1014 2.2.1 Strictly Conforming POSIX Application

1015 A Strictly Conforming POSIX Application is an application that requires only the facilities
 1016 described in POSIX.1-200x. Such an application:

- 1017 1. Shall accept any implementation behavior that results from actions it takes in areas
 1018 described in POSIX.1-200x as *implementation-defined* or *unspecified*, or where POSIX.1-200x
 1019 indicates that implementations may vary
- 1020 2. Shall not perform any actions that are described as producing *undefined* results

- 1021 3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-200x,
 1022 but shall not rely on any value in the range being greater than the minimums listed or
 1023 being less than the maximums listed in POSIX.1-200x
- 1024 4. Shall not use facilities designated as *obsolescent*
- 1025 5. Is required to tolerate and permitted to adapt to the presence or absence of optional
 1026 facilities whose availability is indicated by [Section 2.1.3](#) (on page 16)
- 1027 6. For the C programming language, shall not produce any output dependent on any
 1028 behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or
 1029 *implementation-defined*, unless the System Interfaces volume of POSIX.1-200x specifies the
 1030 behavior
- 1031 7. For the C programming language, shall not exceed any minimum implementation limit
 1032 defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of
 1033 POSIX.1-200x specifies a higher minimum implementation limit
- 1034 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 200xxxL before
 1035 any header is included

1036 Within POSIX.1-200x, any restrictions placed upon a Conforming POSIX Application shall
 1037 restrict a Strictly Conforming POSIX Application.

1038 2.2.2 Conforming POSIX Application

1039 2.2.2.1 ISO/IEC Conforming POSIX Application

1040 An ISO/IEC Conforming POSIX Application is an application that uses only the facilities
 1041 described in POSIX.1-200x and approved Conforming Language bindings for any ISO or IEC
 1042 standard. Such an application shall include a statement of conformance that documents all
 1043 options and limit dependencies, and all other ISO or IEC standards used.

1044 2.2.2.2 <National Body> Conforming POSIX Application

1045 A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming
 1046 POSIX Application in that it also may use specific standards of a single ISO/IEC member body
 1047 referred to here as <National Body>. Such an application shall include a statement of
 1048 conformance that documents all options and limit dependencies, and all other <National Body>
 1049 standards used.

1050 2.2.3 Conforming POSIX Application Using Extensions

1051 A Conforming POSIX Application Using Extensions is an application that differs from a
 1052 Conforming POSIX Application only in that it uses non-standard facilities that are consistent
 1053 with POSIX.1-200x. Such an application shall fully document its requirements for these extended
 1054 facilities, in addition to the documentation required of a Conforming POSIX Application. A
 1055 Conforming POSIX Application Using Extensions shall be either an ISO/IEC Conforming
 1056 POSIX Application Using Extensions or a <National Body> Conforming POSIX Application
 1057 Using Extensions (see [Section 2.2.2.1](#) and [Section 2.2.2.2](#)).

2.2.4 Strictly Conforming XSI Application

A Strictly Conforming XSI Application is an application that requires only the facilities described in POSIX.1-200x. Such an application:

1. Shall accept any implementation behavior that results from actions it takes in areas described in POSIX.1-200x as *implementation-defined* or *unspecified*, or where POSIX.1-200x indicates that implementations may vary
2. Shall not perform any actions that are described as producing *undefined* results
3. For symbolic constants, shall accept any value in the range permitted by POSIX.1-200x, but shall not rely on any value in the range being greater than the minimums listed or being less than the maximums listed in POSIX.1-200x
4. Shall not use facilities designated as *obsolescent*
5. Is required to tolerate and permitted to adapt to the presence or absence of optional facilities whose availability is indicated by [Section 2.1.4](#) (on page 19)
6. For the C programming language, shall not produce any output dependent on any behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-defined*, unless the System Interfaces volume of POSIX.1-200x specifies the behavior
7. For the C programming language, shall not exceed any minimum implementation limit defined in the ISO C standard, unless the System Interfaces volume of POSIX.1-200x specifies a higher minimum implementation limit
8. For the C programming language, shall define `_XOPEN_SOURCE` to be 700 before any header is included

Within POSIX.1-200x, any restrictions placed upon a Conforming POSIX Application shall restrict a Strictly Conforming XSI Application.

2.2.5 Conforming XSI Application Using Extensions

A Conforming XSI Application Using Extensions is an application that differs from a Strictly Conforming XSI Application only in that it uses non-standard facilities that are consistent with POSIX.1-200x. Such an application shall fully document its requirements for these extended facilities, in addition to the documentation required of a Strictly Conforming XSI Application.

2.3 Language-Dependent Services for the C Programming Language

Implementors seeking to claim conformance using the ISO C standard shall claim POSIX conformance as described in [Section 2.1.3](#) (on page 16).

2.4 Other Language-Related Specifications

1089
1090 POSIX.1-200x is currently specified in terms of the shell command language and ISO C. Bindings
1091 to other programming languages are being developed.

1092 If conformance to POSIX.1-200x is claimed for implementation of any programming language,
1093 the implementation of that language shall support the use of external symbols distinct to at least
1094 31 bytes in length in the source program text. (That is, identifiers that differ at or before the
1095 thirty-first byte shall be distinct.) If a national or international standard governing a language
1096 defines a maximum length that is less than this value, the language-defined maximum shall be
1097 supported. External symbols that differ only by case shall be distinct when the character set in
1098 use distinguishes uppercase and lowercase characters and the language permits (or requires)
1099 uppercase and lowercase characters to be distinct in external symbols.

For the purposes of POSIX.1-200x, the following terms and definitions apply. The Authoritative Dictionary of IEEE Standards Terms, Seventh Edition should be referenced for terms not defined in this section.

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

3.1 Abortive Release

An abrupt termination of a network connection that may result in the loss of data.

3.2 Absolute Pathname

A pathname beginning with a single or more than two slashes; see also [Section 3.265](#) (on page 70).

Note: Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

3.3 Access Mode

A particular form of access permitted to a file.

3.4 Additional File Access Control Mechanism

An implementation-defined mechanism that is layered upon the access control mechanisms defined here, but which do not grant permissions beyond those defined herein, although they may further restrict them.

Note: File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).

3.5 Address Space

The memory locations that can be referenced by a process or the threads of a process.

3.6 Advisory Information

An interface that advises the implementation on (portable) application behavior so that it can optimize the system.

1126 3.7 Affirmative Response

1127 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
1128 keyword **yesexpr**, matching an extended regular expression in the current locale.

1129 **Note:** The *LC_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 150).

1130 3.8 Alert

1131 To cause the user's terminal to give some audible or visual indication that an error or some other
1132 event has occurred. When the standard output is directed to a terminal device, the method for
1133 alerting the terminal user is unspecified. When the standard output is not directed to a terminal
1134 device, the alert is accomplished by writing the <alert> to standard output (unless the utility
1135 description indicates that the use of standard output produces undefined results in this case).

1136 3.9 Alert Character (<alert>)

1137 A character that in the output stream should cause a terminal to alert its user via a visual or
1138 audible notification. It is the character designated by '\a' in the C language. It is unspecified
1139 whether this character is the exact sequence transmitted to an output device by the system to
1140 accomplish the alert function.

1141 3.10 Alias Name

1142 In the shell command language, a word consisting solely of underscores, digits, and alphabets
1143 from the portable character set and any of the following characters: '!', '%', '&', '@', and '~'.

1144 Implementations may allow other characters within alias names as an extension.

1145 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 111).

1146 3.11 Alignment

1147 A requirement that objects of a particular type be located on storage boundaries with addresses
1148 that are particular multiples of a byte address.

1149 **Note:** See also the ISO C standard, Section B3.

1150 3.12 Alternate File Access Control Mechanism

1151 An implementation-defined mechanism that is independent of the access control mechanisms
1152 defined herein, and which if enabled on a file may either restrict or extend the permissions of a
1153 given user. POSIX.1-200x defines when such mechanisms can be enabled and when they are
1154 disabled.

1155 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).

1156 3.13 Alternate Signal Stack

1157 Memory associated with a thread, established upon request by the implementation for a thread,

1158 separate from the thread signal stack, in which signal handlers responding to signals sent to that
1159 thread may be executed.

1160 **3.14 Ancillary Data**

1161 Protocol-specific, local system-specific, or optional information. The information can be both
1162 local or end-to-end significant, header information, part of a data portion, protocol-specific, and
1163 implementation or system-specific.

1164 **3.15 Angle Brackets**

1165 The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase
1166 "enclosed in angle brackets", the symbol '`<`' immediately precedes the object to be enclosed,
1167 and '`>`' immediately follows it. When describing these characters in the portable character set,
1168 the names `<less-than-sign>` and `<greater-than-sign>` are used.

1169 **3.16 Application**

1170 A computer program that performs some desired function.

1171 **3.17 Application Address**

1172 Endpoint address of a specific application.

1173 **3.18 Application Program Interface (API)**

1174 The definition of syntax and semantics for providing computer system services.

1175 **3.19 Appropriate Privileges**

1176 An implementation-defined means of associating privileges with a process with regard to the
1177 function calls, function call options, and the commands that need special privileges. There may
1178 be zero or more such means. These means (or lack thereof) are described in the conformance
1179 document.

1180 **Note:** Function calls are defined in the System Interfaces volume of POSIX.1-200x, and commands are
1181 defined in the Shell and Utilities volume of POSIX.1-200x.

1182 3.20 Argument

1183 In the shell command language, a parameter passed to a utility as the equivalent of a single
1184 string in the *argv* array created by one of the *exec* functions. An argument is one of the options,
1185 option-arguments, or operands following the command name.

1186 **Note:** The Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 199) and XCU [Section](#)
1187 [2.9.1.1](#) (on page 2264).

1188 In the C language, an expression in a function call expression or a sequence of preprocessing
1189 tokens in a function-like macro invocation.

1190 3.21 Arm (a Timer)

1191 To start a timer measuring the passage of time, enabling notifying a process when the specified
1192 time or time interval has passed.

1193 3.22 Asterisk

1194 The character ' * '.

1195 3.23 Async-Cancel-Safe Function

1196 A function that may be safely invoked by an application while the asynchronous form of
1197 cancellation is enabled. No function is async-cancel-safe unless explicitly described as such.

1198 3.24 Asynchronous Events

1199 Events that occur independently of the execution of the application.

1200 3.25 Asynchronous Input and Output

1201 A functionality enhancement to allow an application process to queue data input and output
1202 commands with asynchronous notification of completion.

1203 3.26 Async-Signal-Safe Function

1204 A function that may be invoked, without restriction, from signal-catching functions. No function
1205 is async-signal-safe unless explicitly described as such.

1206 3.27 Asynchronously-Generated Signal

1207 A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals
1208 sent from the keyboard, and signals delivered to process groups. Being asynchronous is a
1209 property of how the signal was generated and not a property of the signal number. All signals
1210 may be generated asynchronously.

1211 **Note:** The *kill()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.

1212 3.28 Asynchronous I/O Completion

1213 For an asynchronous read or write operation, when a corresponding synchronous read or write
1214 would have completed and when any associated status fields have been updated.

1215 3.29 Asynchronous I/O Operation

1216 An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from
1217 further use of the processor.

1218 This implies that the process and the I/O operation may be running concurrently.

1219 3.30 Authentication

1220 The process of validating a user or process to verify that the user or process is not a counterfeit.

1221 3.31 Authorization

1222 The process of verifying that a user or process has permission to use a resource in the manner
1223 requested.

1224 To ensure security, the user or process would also need to be authenticated before granting
1225 access.

1226 3.32 Background Job

1227 See *Background Process Group* in [Section 3.34](#).

1228 3.33 Background Process

1229 A process that is a member of a background process group.

1230 3.34 Background Process Group (or Background Job)

1231 Any process group, other than a foreground process group, that is a member of a session that
1232 has established a connection with a controlling terminal.

1233 **3.35 Backquote**
 1234 The character ' ` ', also known as a grave accent.

1235 **3.36 Backslash**
 1236 The character ' \ ', also known as a reverse solidus.

1237 **3.37 Backspace Character (<backspace>)**
 1238 A character that, in the output stream, should cause printing (or displaying) to occur one
 1239 column position previous to the position about to be printed. If the position about to be printed
 1240 is at the beginning of the current line, the behavior is unspecified. It is the character designated
 1241 by ' \b ' in the C language. It is unspecified whether this character is the exact sequence
 1242 transmitted to an output device by the system to accomplish the backspace function. The
 1243 <backspace> defined here is not necessarily the ERASE special character.
 1244 **Note:** Special Characters are defined in detail in [Section 11.1.9](#) (on page 189).

1245 **3.38 Barrier**
 1246 A synchronization object that allows multiple threads to synchronize at a particular point in
 1247 their execution.

1248 **3.39 Basename**
 1249 The final, or only, filename in a pathname.

1250 **3.40 Basic Regular Expression (BRE)**
 1251 A regular expression (see [Section 3.315](#), on page 77) used by the majority of utilities that select
 1252 strings from a set of character strings.
 1253 **Note:** Basic Regular Expressions are described in detail in [Section 9.3](#) (on page 169).

1254 **3.41 Batch Access List**
 1255 A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a
 1256 batch queue.
 1257 A batch access list is associated with a batch queue. A batch server uses the batch access list of a
 1258 batch queue as one of the criteria in deciding to put a batch job in a batch queue.

1259 **3.42 Batch Administrator**
 1260 A user that is authorized to modify all the attributes of queues and jobs and to change the status
 1261 of a batch server.

1262 3.43 Batch Client

1263 A computational entity that utilizes batch services by making requests of batch servers.

1264 Batch clients often provide the means by which users access batch services, although a batch
1265 server may act as a batch client by virtue of making requests of another batch server.

1266 3.44 Batch Destination

1267 The batch server in a batch system to which a batch job should be sent for processing.

1268 Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server.
1269 A batch destination may consist of a batch server-specific portion, a network-wide portion, or
1270 both. The batch server-specific portion is referred to as the "batch queue". The network-wide
1271 portion is referred to as a "batch server name".

1272 3.45 Batch Destination Identifier

1273 A string that identifies a specific batch destination.

1274 A string of characters in the portable character set used to specify a particular batch destination.

1275 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 111).

1276 3.46 Batch Directive

1277 A line from a file that is interpreted by the batch server. The line is usually in the form of a
1278 comment and is an additional means of passing options to the *qsub* utility.

1279 **Note:** The *qsub* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

1280 3.47 Batch Job

1281 A set of computational tasks for a computing system.

1282 Batch jobs are managed by batch servers.

1283 Once created, a batch job may be executing or pending execution. A batch job that is executing
1284 has an associated session leader (a process) that initiates and monitors the computational tasks
1285 of the batch job.

- 1286 **3.48 Batch Job Attribute**
- 1287 A named data type whose value affects the processing of a batch job.
- 1288 The values of the attributes of a batch job affect the processing of that job by the batch server that
- 1289 manages the batch job.
- 1290 **3.49 Batch Job Identifier**
- 1291 A unique name for a batch job. A name that is unique among all other batch job identifiers in a
- 1292 batch system and that identifies the batch server to which the batch job was originally
- 1293 submitted.
- 1294 **3.50 Batch Job Name**
- 1295 A label that is an attribute of a batch job. The batch job name is not necessarily unique.
- 1296 **3.51 Batch Job Owner**
- 1297 The *username@hostname* of the user submitting the batch job, where *username* is a user name (see
- 1298 also [Section 3.429](#), on page 92) and *hostname* is a network host name.
- 1299 **3.52 Batch Job Priority**
- 1300 A value specified by the user that may be used by an implementation to determine the order in
- 1301 which batch jobs are selected to be executed. Job priority has a numeric value in the range
- 1302 -1 024 to 1 023.
- 1303 **Note:** The batch job priority is not the execution priority (nice value) of the batch job.
- 1304 **3.53 Batch Job State**
- 1305 An attribute of a batch job which determines the types of requests that the batch server that
- 1306 manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING,
- 1307 HELD, WAITING, EXITING, and TRANSITING.
- 1308 **3.54 Batch Name Service**
- 1309 A service that assigns batch names that are unique within the batch name space, and that can
- 1310 translate a unique batch name into the location of the named batch entity.
- 1311 **3.55 Batch Name Space**
- 1312 The environment within which a batch name is known to be unique.

1313 **3.56 Batch Node**

1314 A host containing part or all of a batch system.

1315 A batch node is a host meeting at least one of the following conditions:

- 1316 • Capable of executing a batch client
- 1317 • Contains a routing batch queue
- 1318 • Contains an execution batch queue

1319 **3.57 Batch Operator**

1320 A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and
1321 may change the status of the batch server.

1322 **3.58 Batch Queue**

1323 A manageable object that represents a set of batch jobs and is managed by a single batch server.

1324 **Note:** A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from
1325 the batch queue for execution based on attributes such as priority, resource requirements, and
1326 hold conditions.

1327 See also XCU [Section 3.1.2](#) (on page 2320).

1328 **3.59 Batch Queue Attribute**

1329 A named data type whose value affects the processing of all batch jobs that are members of the
1330 batch queue.

1331 A batch queue has attributes that affect the processing of batch jobs that are members of the
1332 batch queue.

1333 **3.60 Batch Queue Position**

1334 The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue.
1335 This is defined in part by submission time and priority; see also [Section 3.61](#).

1336 **3.61 Batch Queue Priority**

1337 The maximum job priority allowed for any batch job in a given batch queue.

1338 The batch queue priority is set and may be changed by users with appropriate privilege. The
1339 priority is bounded in an implementation-defined manner.

1340 **3.62 Batch Rerunability**

1341 An attribute of a batch job indicating that it may be rerun after an abnormal termination from
1342 the beginning without affecting the validity of the results.

1364

1365
1366

3.63 Batch Restart

The action of resuming the processing of a batch job from the point of the last checkpoint. Typically, this is done if the batch job has been interrupted because of a system failure.

3.64 Batch Server

A computational entity that provides batch services.

3.65 Batch Server Name

A string of characters in the portable character set used to specify a particular server in a network.

Note: The Portable Character Set is defined in detail in [Section 6.1](#) (on page 111).

3.66 Batch Service

Computational and organizational services performed by a batch system on behalf of batch jobs. Batch services are of two types: requested and deferred.

Note: Batch Services are listed in XCU [Table 3-5](#) (on page 2333).

3.67 Batch Service Request

A solicitation of services from a batch client to a batch server.

A batch service request may entail the exchange of any number of messages between the batch client and the batch server.

When naming specific types of service requests, the term “request” is qualified by the type of request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

3.68 Batch Submission

The process by which a batch client requests that a batch server create a batch job via a *Queue Job Request* to perform a specified computational task.

3.69 Batch System

A collection of one or more batch servers.

- 1367 **3.70 Batch Target User**
1368 The name of a user on the batch destination batch server.
1369 The target user is the user name under whose account the batch job is to execute on the
1370 destination batch server.
- 1371 **3.71 Batch User**
1372 A user who is authorized to make use of batch services.
- 1373 **3.72 Bind**
1374 The process of assigning a network address to an endpoint.
- 1375 **3.73 Blank Character (<blank>)**
1376 One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE*
1377 category in the current locale. In the POSIX locale, a <blank> is either a <tab> or a <space>.
- 1378 **3.74 Blank Line**
1379 A line consisting solely of zero or more <blank>s terminated by a <newline>; see also [Section](#)
1380 [3.144](#) (on page 53).
- 1381 **3.75 Blocked Process (or Thread)**
1382 A process (or thread) that is waiting for some condition (other than the availability of a
1383 processor) to be satisfied before it can continue execution.
- 1384 **3.76 Blocking**
1385 A property of an open file description that causes function calls associated with it to wait for the
1386 requested action to be performed before returning.
- 1387 **3.77 Block-Mode Terminal**
1388 A terminal device operating in a mode incapable of the character-at-a-time input and output
1389 operations described by some of the standard utilities.
1390 **Note:** Output Devices and Terminal Types are defined in detail in [Section 10.2](#) (on page 184).

1391 3.78 Block Special File

1392 A file that refers to a device. A block special file is normally distinguished from a character
1393 special file by providing access to the device in a manner such that the hardware characteristics
1394 of the device are not visible.

1395 3.79 Braces

1396 The characters ‘{’ (left brace) and ‘}’ (right brace), also known as curly braces. When used in
1397 the phrase “enclosed in (curly) braces” the symbol ‘{’ immediately precedes the object to be
1398 enclosed, and ‘}’ immediately follows it. When describing these characters in the portable
1399 character set, the names <left-brace> and <right-brace> are used.

1400 3.80 Brackets

1401 The characters ‘[’ (left-bracket) and ‘]’ (right-bracket), also known as square brackets. When
1402 used in the phrase “enclosed in (square) brackets” the symbol ‘[’ immediately precedes the
1403 object to be enclosed, and ‘]’ immediately follows it. When describing these characters in the
1404 portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

1405 3.81 Broadcast

1406 The transfer of data from one endpoint to several endpoints, as described in RFC 919 and
1407 RFC 922.

1408 3.82 Built-In Utility (or Built-In)

1409 A utility implemented within a shell. The utilities referred to as special built-ins have special
1410 qualities. Unless qualified, the term “built-in” includes the special built-in utilities. Regular
1411 built-ins are not required to be actually built into the shell on the implementation, but they do
1412 have special command-search qualities.

1413 **Note:** Special Built-In Utilities are defined in detail in XCU [Section 2.14](#) (on page 2280). |

1414 Regular Built-In Utilities are defined in detail in XCU [Section 2.9.1.1](#) (on page 2264). |

1415 3.83 Byte

1416 An individually addressable unit of data storage that is exactly an octet, used to store a character
1417 or a portion of a character; see also [Section 3.86](#) (on page 45). A byte is composed of a
1418 contiguous sequence of 8 bits. The least significant bit is called the “low-order” bit; the most
1419 significant is called the “high-order” bit.

1420 **Note:** The definition of byte from the ISO C standard is broader than the above and might
1421 accommodate hardware architectures with different sized addressable units than octets.

1422 3.84 Byte Input/Output Functions

1423 The functions that perform byte-oriented input from streams or byte-oriented output to streams:
 1424 *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *gets()*, *perror()*,
 1425 *printf()*, *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

1426 **Note:** Functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

1427 3.85 Carriage-Return Character (<carriage-return>)

1428 A character that in the output stream indicates that printing should start at the beginning of the
 1429 same physical line in which the <carriage-return> occurred. It is the character designated by
 1430 ‘\r’ in the C language. It is unspecified whether this character is the exact sequence
 1431 transmitted to an output device by the system to accomplish the movement to the beginning of
 1432 the line.

1433 3.86 Character

1434 A sequence of one or more bytes representing a single graphic symbol or control code.

1435 **Note:** This term corresponds to the ISO C standard term multi-byte character, where a single-byte
 1436 character is a special case of a multi-byte character. Unlike the usage in the ISO C standard,
 1437 *character* here has no necessary relationship with storage space, and *byte* is used when storage
 1438 space is discussed.

1439 See the definition of the portable character set in [Section 6.1](#) (on page 111) for a further
 1440 explanation of the graphical representations of (abstract) characters, as opposed to character
 1441 encodings.

1442 3.87 Character Array

1443 An array of elements of type `char`.

1444 3.88 Character Class

1445 A named set of characters sharing an attribute associated with the name of the class. The classes
 1446 and the characters that they contain are dependent on the value of the *LC_CTYPE* category in
 1447 the current locale.

1448 **Note:** The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 124).

1449 3.89 Character Set

1450 A finite set of different characters used for the representation, organization, or control of data.

1451

3.90 Character Special File

1452

A file that refers to a device. One specific type of character special file is a terminal device file.

1453

Note: The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 185).

1454

3.91 Character String

1455

A contiguous sequence of characters terminated by and including the first null byte.

1456

3.92 Child Process

1457

A new process created (by *fork()*, *posix_spawn()*, or *posix_spawnp()*) by a given process. A child process remains the child of the creating process as long as both processes continue to exist.

1458

1459

Note: The *fork()*, *posix_spawn()*, and *posix_spawnp()* functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

1460

1461

3.93 Circumflex

1462

The character '^'.

1463

3.94 Clock

1464

A software or hardware object that can be used to measure the apparent or actual passage of time.

1465

1466

The current value of the time measured by a clock can be queried and, possibly, set to a value within the legal range of the clock.

1467

1468

3.95 Clock Jump

1469

The difference between two successive distinct values of a clock, as observed from the application via one of the “get time” operations.

1470

1471

3.96 Clock Tick

1472

An interval of time; an implementation-defined number of these occur each second. Clock ticks are one of the units that may be used to express a value found in type `clock_t`.

1473

1474

3.97 Coded Character Set

1475

A set of unambiguous rules that establishes a character set and the one-to-one relationship between each character of the set and its bit representation.

1476

3.98 Codeset

The result of applying rules that map a numeric code value to each element of a character set. An element of a character set may be related to more than one numeric code value but the reverse is not true. However, for state-dependent encodings the relationship between numeric code values and elements of a character set may be further controlled by state information. The character set may contain fewer elements than the total number of possible numeric code values; that is, some code values may be unassigned.

Note: Character Encoding is defined in detail in [Section 6.2](#) (on page 114).

3.99 Collating Element

The smallest entity used to determine the logical ordering of character or wide-character strings; see also [Section 3.101](#). A collating element consists of either a single character, or two or more characters collating as a single entity. The value of the `LC_COLLATE` category in the current locale determines the current set of collating elements.

3.100 Collation

The logical ordering of character or wide-character strings according to defined precedence rules. These rules identify a collation sequence between the collating elements, and such additional rules that can be used to order strings consisting of multiple collating elements.

3.101 Collation Sequence

The relative order of collating elements as determined by the setting of the `LC_COLLATE` category in the current locale. The collation sequence is used for sorting and is determined from the collating weights assigned to each collating element. In the absence of weights, the collation sequence is the order in which collating elements are specified between `order_start` and `order_end` keywords in the `LC_COLLATE` category.

Multi-level sorting is accomplished by assigning elements one or more collation weights, up to the limit `{COLL_WEIGHTS_MAX}`. On each level, elements may be given the same weight (at the primary level, called an equivalence class; see also [Section 3.150](#), on page 54) or be omitted from the sequence. Strings that collate equally using the first assigned weight (primary ordering) are then compared using the next assigned weight (secondary ordering), and so on.

Note: `{COLL_WEIGHTS_MAX}` is defined in detail in [<limits.h>](#).

3.102 Column Position

A unit of horizontal measure related to characters in a line.

It is assumed that each character in a character set has an intrinsic column width independent of any output device. Each printable character in the portable character set has a column width of one. The standard utilities, when used as described in POSIX.1-200x, assume that all characters have integral column widths. The column width of a character is not necessarily related to the internal representation of the character (numbers of bits or bytes).

The column position of a character in a line is defined as one plus the sum of the column widths of the preceding characters in the line. Column positions are numbered starting from 1.

1515 3.103 Command

1516 A directive to the shell to perform a particular task.

1517 **Note:** Shell Commands are defined in detail in XCU [Section 2.9](#) (on page 2263).

1518 3.104 Command Language Interpreter

1519 An interface that interprets sequences of text input as commands. It may operate on an input
1520 stream or it may interactively prompt and read commands from a terminal. It is possible for
1521 applications to invoke utilities through a number of interfaces, which are collectively considered
1522 to act as command interpreters. The most obvious of these are the *sh* utility and the *system()*
1523 function, although *popen()* and the various forms of *exec* may also be considered to behave as
1524 interpreters.

1525 **Note:** The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

1526 The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume
1527 of POSIX.1-200x.

1528 3.105 Composite Graphic Symbol

1529 A graphic symbol consisting of a combination of two or more other graphic symbols in a single
1530 character position, such as a diacritical mark and a base character.

1531 3.106 Condition Variable

1532 A synchronization object which allows a thread to suspend execution, repeatedly, until some
1533 associated predicate becomes true. A thread whose execution is suspended on a condition
1534 variable is said to be blocked on the condition variable.

1535 3.107 Connected Socket

1536 A connection-mode socket for which a connection has been established, or a connectionless-
1537 mode socket for which a peer address has been set. See also [Section 3.108](#), [Section 3.109](#), [Section](#)
1538 [3.110](#), and [Section 3.348](#) (on page 81).

1539 3.108 Connection

1540 An association established between two or more endpoints for the transfer of data

1541 3.109 Connection Mode

1542 The transfer of data in the context of a connection; see also [Section 3.110](#).

1543 3.110 Connectionless Mode

1544 The transfer of data other than in the context of a connection; see also [Section 3.109](#) and [Section](#)

1545 [3.123](#) (on page 50).

1546 **3.111 Control Character**

1547 A character, other than a graphic character, that affects the recording, processing, transmission,
1548 or interpretation of text.

1549 **3.112 Control Operator**

1550 In the shell command language, a token that performs a control function. It is one of the
1551 following symbols:

1552 & && () ; ;; newline | ||

1553 The end-of-input indicator used internally by the shell is also considered a control operator.

1554 **Note:** Token Recognition is defined in detail in XCU [Section 2.3](#) (on page 2247).

1555 **3.113 Controlling Process**

1556 The session leader that established the connection to the controlling terminal. If the terminal
1557 subsequently ceases to be a controlling terminal for this session, the session leader ceases to be
1558 the controlling process.

1559 **3.114 Controlling Terminal**

1560 A terminal that is associated with a session. Each session may have at most one controlling
1561 terminal associated with it, and a controlling terminal is associated with exactly one session.
1562 Certain input sequences from the controlling terminal cause signals to be sent to all processes in
1563 the foreground process group associated with the controlling terminal.

1564 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 185).

1565 **3.115 Conversion Descriptor**

1566 A per-process unique value used to identify an open codeset conversion.

1567 **3.116 Core File**

1568 A file of unspecified format that may be generated when a process terminates abnormally.

1569 **3.117 CPU Time (Execution Time)**

1570 The time spent executing a process or thread, including the time spent executing system services
1571 on behalf of that process or thread. If the Threads option is supported, then the value of the
1572 CPU-time clock for a process is implementation-defined. With this definition the sum of all the
1573 execution times of all the threads in a process might not equal the process execution time, even
1574 in a single-threaded process, because implementations may differ in how they account for time
1575 during context switches or for other reasons.

- 1576 **3.118 CPU-Time Clock**
1577 A clock that measures the execution time of a particular process or thread.
- 1578 **3.119 CPU-Time Timer**
1579 A timer attached to a CPU-time clock.
- 1580 **3.120 Current Job**
1581 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There
1582 is at most one current job; see also [Section 3.202](#) (on page 61).
- 1583 **3.121 Current Working Directory**
1584 See *Working Directory* in [Section 3.439](#) (on page 94).
- 1585 **3.122 Cursor Position**
1586 The line and column position on the screen denoted by the terminal's cursor.
- 1587 **3.123 Datagram**
1588 A unit of data transferred from one endpoint to another in connectionless mode service.
- 1589 **3.124 Data Segment**
1590 Memory associated with a process, that can contain dynamically allocated data.
- 1591 **3.125 Deferred Batch Service**
1592 A service that is performed as a result of events that are asynchronous with respect to requests.
1593 **Note:** Once a batch job has been created, it is subject to deferred services.
- 1594 **3.126 Device**
1595 A computer peripheral or an object that appears to the application as such.
- 1596 **3.127 Device ID**
1597 A non-negative integer used to identify a device.

- 1598 **3.128 Directory**
1599 A file that contains directory entries. No two directory entries in the same directory have the
1600 same name.
- 1601 **3.129 Directory Entry (or Link)**
1602 An object that associates a filename with a file. Several directory entries can associate names
1603 with the same file.
- 1604 **3.130 Directory Stream**
1605 A sequence of all the directory entries in a particular directory. An open directory stream may be
1606 implemented using a file descriptor.
- 1607 **3.131 Disarm (a Timer)**
1608 To stop a timer from measuring the passage of time, disabling any future process notifications
1609 (until the timer is armed again).
- 1610 **3.132 Display**
1611 To output to the user's terminal. If the output is not directed to a terminal, the results are
1612 undefined.
- 1613 **3.133 Display Line**
1614 A line of text on a physical device or an emulation thereof. Such a line will have a maximum
1615 number of characters which can be presented.
1616 **Note:** This may also be written as "line on the display".
- 1617 **3.134 Dollar Sign**
1618 The character '\$'.

1619 **3.135 Dot**

1620 In the context of naming files, the filename consisting of a single dot character (' . ').

1621 **Note:** In the context of shell special built-in utilities, see *dot* in XCU [Section 2.14](#) (on page 2280).

1622 Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

1623 **3.136 Dot-Dot**

1624 The filename consisting solely of two dot characters (" . . ").

1625 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

1626 **3.137 Double-Quote**

1627 The character ' " ', also known as quotation-mark.

1628 **Note:** The “double” adjective in this term refers to the two strokes in the character glyph.
1629 POSIX.1-200x never uses the term “double-quote” to refer to two apostrophes or quotation
1630 marks.

1631 **3.138 Downshifting**

1632 The conversion of an uppercase character that has a single-character lowercase representation
1633 into this lowercase representation.

1634 **3.139 Driver**

1635 A module that controls data transferred to and received from devices.

1636 **Note:** Drivers are traditionally written to be a part of the system implementation, although they are
1637 frequently written separately from the writing of the implementation. A driver may contain
1638 processor-specific code, and therefore be non-portable.

1639 **3.140 Effective Group ID**

1640 An attribute of a process that is used in determining various permissions, including file access
1641 permissions; see also [Section 3.187](#) (on page 59).

1642 **3.141 Effective User ID**

1643 An attribute of a process that is used in determining various permissions, including file access
1644 permissions; see also [Section 3.428](#) (on page 92).

1645 3.142 Eight-Bit Transparency

1646 The ability of a software component to process 8-bit characters without modifying or utilizing
1647 any part of the character in a way that is inconsistent with the rules of the current coded
1648 character set.

1649 3.143 Empty Directory

1650 A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link |
1651 to it (other than its own dot entry, if one exists), in dot-dot. No other links to the directory may |
1652 exist. It is unspecified whether an implementation can ever consider the root directory to be |
1653 empty.

1654 3.144 Empty Line

1655 A line consisting of only a <newline>; see also [Section 3.74](#) (on page 43).

1656 3.145 Empty String (or Null String)

1657 A string whose first byte is a null byte.

1658 3.146 Empty Wide-Character String

1659 A wide-character string whose first element is a null wide-character code.

1660 3.147 Encoding Rule

1661 The rules used to convert between wide-character codes and multi-byte character codes.

1662 **Note:** Stream Orientation and Encoding Rules are defined in detail in XSH [Section 2.5.2](#) (on page 472). |

1663 3.148 Entire Regular Expression

1664 The concatenated set of one or more basic regular expressions or extended regular expressions
1665 that make up the pattern specified for string selection.

1666 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 167).

1667 3.149 Epoch

1668 The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time
1669 (UTC).

1670 **Note:** See also *Seconds Since the Epoch* defined in [Section 4.15](#) (on page 100). |

1671 3.150 Equivalence Class

1672 A set of collating elements with the same primary collation weight.

1673 Elements in an equivalence class are typically elements that naturally group together, such as all
1674 accented letters based on the same base letter.

1675 The collation order of elements within an equivalence class is determined by the weights
1676 assigned on any subsequent levels after the primary weight.

1677 3.151 Era

1678 A locale-specific method for counting and displaying years.

1679 **Note:** The *LC_TIME* category is defined in detail in [Section 7.3.5](#) (on page 144).

1680 3.152 Event Management

1681 The mechanism that enables applications to register for and be made aware of external events
1682 such as data becoming available for reading.

1683 3.153 Executable File

1684 A regular file acceptable as a new process image file by the equivalent of the *exec* family of
1685 functions, and thus usable as one form of a utility. The standard utilities described as compilers
1686 can produce executable files, but other unspecified methods of producing executable files may
1687 also be provided. The internal format of an executable file is unspecified, but a conforming
1688 application cannot assume an executable file is a text file.

1689 3.154 Execute

1690 To perform command search and execution actions, as defined in the Shell and Utilities volume
1691 of POSIX.1-200x; see also [Section 3.199](#) (on page 61).

1692 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2264). |

1693 3.155 Execution Time

1694 See *CPU Time* in [Section 3.117](#) (on page 49).

1695 3.156 Execution Time Monitoring

1696 A set of execution time monitoring primitives that allow online measuring of thread and process
1697 execution times.

1698 **3.157 Expand**

1699 In the shell command language, when not qualified, the act of applying word expansions.

1700 **Note:** Word Expansions are defined in detail in XCU [Section 2.6](#) (on page 2253). |1701 **3.158 Extended Regular Expression (ERE)**1702 A regular expression (see also [Section 3.315](#), on page 77) that is an alternative to the Basic
1703 Regular Expression using a more extensive syntax, occasionally used by some utilities.1704 **Note:** Extended Regular Expressions are described in detail in [Section 9.4](#) (on page 174).1705 **3.159 Extended Security Controls**1706 Implementation-defined security controls allowed by the file access permission and appropriate
1707 privilege (see also [Section 3.19](#), on page 35) mechanisms, through which an implementation can
1708 support different security policies from those described in POSIX.1-200x.1709 **Note:** See also *Extended Security Controls* defined in [Section 4.3](#) (on page 95). |1710 File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).1711 **3.160 Feature Test Macro**

1712 A macro used to determine whether a particular set of features is included from a header.

1713 **Note:** See also XSH [Section 2.2](#) (on page 448). |1714 **3.161 Field**1715 In the shell command language, a unit of text that is the result of parameter expansion,
1716 arithmetic expansion, command substitution, or field splitting. During command processing, the
1717 resulting fields are used as the command name and its arguments.1718 **Note:** Parameter Expansion is defined in detail in XCU [Section 2.6.2](#) (on page 2254). |1719 Arithmetic Expansion is defined in detail in XCU [Section 2.6.4](#) (on page 2257). |1720 Command Substitution is defined in detail in XCU [Section 2.6.3](#) (on page 2256). |1721 Field Splitting is defined in detail in XCU [Section 2.6.5](#) (on page 2258). |1722 For further information on command processing, see XCU [Section 2.9.1](#) (on page 2263). |1723 **3.162 FIFO Special File (or FIFO)**

1724 A type of file with the property that data written to such a file is read on a first-in-first-out basis.

1725 **Note:** Other characteristics of FIFOs are described in the System Interfaces volume of POSIX.1-200x,
1726 *lseek()*, *open()*, *read()*, and *write()*.

1727 **3.163 File**

1728 An object that can be written to, or read from, or both. A file has certain attributes, including
 1729 access permissions and type. File types include regular file, character special file, block special
 1730 file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported
 1731 by the implementation.

1732 **3.164 File Description**

1733 See *Open File Description* in [Section 3.252](#) (on page 67).

1734 **3.165 File Descriptor**

1735 A per-process unique, non-negative integer used to identify an open file for the purpose of file
 1736 access. The value of a file descriptor is from zero to {OPEN_MAX}. A process can have no more
 1737 than {OPEN_MAX} file descriptors open simultaneously. File descriptors may also be used to
 1738 implement message catalog descriptors and directory streams; see also [Section 3.252](#) (on page
 1739 67).

1740 **Note:** {OPEN_MAX} is defined in detail in [<limits.h>](#).

1741 **3.166 File Group Class**

1742 The property of a file indicating access permissions for a process related to the group
 1743 identification of a process. A process is in the file group class of a file if the process is not in the
 1744 file owner class and if the effective group ID or one of the supplementary group IDs of the
 1745 process matches the group ID associated with the file. Other members of the class may be
 1746 implementation-defined.

1747 **3.167 File Mode**

1748 An object containing the file mode bits and file type of a file.

1749 **Note:** File mode bits and file types are defined in detail in [<sys/stat.h>](#).

1750 **3.168 File Mode Bits**

1751 A file's file permission bits, set-user-ID-on-execution bit (S_ISUID), set-group-ID-on-execution
 1752 bit (S_ISGID), and, on directories, the restricted deletion flag bit (S_ISVTX).

1753 **Note:** File Mode Bits are defined in detail in [<sys/stat.h>](#).

1754 **3.169 Filename**

1755 A name consisting of 1 to {NAME_MAX} bytes used to name a file. The characters composing
 1756 the name may be selected from the set of all character values excluding the slash character and
 1757 the null byte. The filenames dot and dot-dot have special meaning. A filename is sometimes
 1758 referred to as a "pathname component".

1759 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

1760 **3.170 File Offset**

1761 The byte position in the file where the next I/O operation begins. Each open file description
1762 associated with a regular file, block special file, or directory has a file offset. A character special
1763 file that does not refer to a terminal device may have a file offset. There is no file offset specified
1764 for a pipe or FIFO.

1765 **3.171 File Other Class**

1766 The property of a file indicating access permissions for a process related to the user and group
1767 identification of a process. A process is in the file other class of a file if the process is not in the
1768 file owner class or file group class.

1769 **3.172 File Owner Class**

1770 The property of a file indicating access permissions for a process related to the user
1771 identification of a process. A process is in the file owner class of a file if the effective user ID of
1772 the process matches the user ID of the file.

1773 **3.173 File Permission Bits**

1774 Information about a file that is used, along with other information, to determine whether a
1775 process has read, write, or execute/search permission to a file. The bits are divided into three
1776 parts: owner, group, and other. Each part is used with the corresponding file class of processes.
1777 These bits are contained in the file mode.

1778 **Note:** File modes are defined in detail in [<sys/stat.h>](#).

1779 File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).

1780 **3.174 File Serial Number**

1781 A per-file system unique identifier for a file.

1782 **3.175 File System**

1783 A collection of files and certain of their attributes. It provides a name space for file serial
1784 numbers referring to those files.

1785 **3.176 File Type**

1786 See *File* in [Section 3.163](#) (on page 56).

1787

3.177 Filter

1788

1789

1790

A command whose operation consists of reading data from standard input or a list of input files and writing data to standard output. Typically, its function is to perform some transformation on the data stream.

1791

3.178 First Open (of a File)

1792

When a process opens a file that is not currently an open file within any process.

1793

3.179 Flow Control

1794

1795

The mechanism employed by a communications provider that constrains a sending entity to wait until the receiving entities can safely receive additional data without loss.

1796

3.180 Foreground Job

1797

See *Foreground Process Group* in [Section 3.182](#).

1798

3.181 Foreground Process

1799

A process that is a member of a foreground process group.

1800

3.182 Foreground Process Group (or Foreground Job)

1801

1802

1803

1804

A process group whose member processes have certain privileges, denied to processes in background process groups, when accessing their controlling terminal. Each session that has established a connection with a controlling terminal has at most one process group of the session as the foreground process group of that controlling terminal.

1805

Note: The General Terminal Interface is defined in detail in [Chapter 11](#).

1806

3.183 Foreground Process Group ID

1807

The process group ID of the foreground process group.

1808 **3.184 Form-Feed Character (<form-feed>)**

1809 A character that in the output stream indicates that printing should start on the next page of an
 1810 output device. It is the character designated by ‘\f’ in the C language. If the <form-feed> is not
 1811 the first character of an output line, the result is unspecified. It is unspecified whether this
 1812 character is the exact sequence transmitted to an output device by the system to accomplish the
 1813 movement to the next page.

1814 **3.185 Graphic Character**

1815 A member of the **graph** character class of the current locale.

1816 **Note:** The **graph** character class is defined in detail in [Section 7.3.1](#) (on page 124).

1817 **3.186 Group Database**

1818 A system database that contains at least the following information for each group ID:

- 1819 • Group name
- 1820 • Numerical group ID
- 1821 • List of users allowed in the group

1822 The list of users allowed in the group is used by the *newgrp* utility.

1823 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

1824 **3.187 Group ID**

1825 A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify
 1826 a group of system users. Each system user is a member of at least one group. When the identity
 1827 of a group is associated with a process, a group ID value is referred to as a real group ID, an
 1828 effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

1829 **3.188 Group Name**

1830 A string that is used to identify a group; see also [Section 3.186](#). To be portable across conforming
 1831 systems, the value is composed of characters from the portable filename character set. The
 1832 hyphen should not be used as the first character of a portable group name.

1833 **3.189 Hard Limit**

1834 A system resource limitation that may be reset to a lesser or greater limit by a privileged process.
 1835 A non-privileged process is restricted to only lowering its hard limit.

1836 **3.190 Hard Link**

1837 The relationship between two directory entries that represent the same file; see also [Section 3.129](#)
 1838 (on page 51). The result of an execution of the *ln* utility (without the *-s* option) or the *link()*
 1839 function. This term is contrasted against symbolic link; see also [Section 3.373](#) (on page 84).

1840

3.191 Home Directory

1841

The directory specified by the *HOME* environment variable.

1842

3.192 Host Byte Order

1843

The arrangement of bytes in any integer type when using a specific machine architecture.

1844

Note: Two common methods of byte ordering are big-endian and little-endian. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage or transmission of binary data in which the least significant byte is placed first, with the rest in ascending order. See also [Section 4.9](#) (on page 98).

1845

1846

1847

1848

1849

3.193 Incomplete Line

1850

A sequence of one or more non-`<newline>`s at the end of the file.

1851

3.194 Inf

1852

A value representing +infinity or a value representing -infinity that can be stored in a floating type. Not all systems support the Inf values.

1853

1854

3.195 Instrumented Application

1855

An application that contains at least one call to the trace point function *posix_trace_event()*. Each process of an instrumented application has a mapping of trace event names to trace event type identifiers. This mapping is used by the trace stream that is created for that process.

1856

1857

1858

3.196 Interactive Shell

1859

A processing mode of the shell that is suitable for direct user interaction.

1860

3.197 Internationalization

1861

The provision within a computer program of the capability of making itself adaptable to the requirements of different native languages, local customs, and coded character sets.

1862

1863

3.198 Interprocess Communication

1864

A functionality enhancement to add a high-performance, deterministic interprocess communication facility for local communication.

1865

1866 **3.199 Invoke**

1867 To perform command search and execution actions, except that searching for shell functions and
 1868 special built-in utilities is suppressed; see also [Section 3.154](#) (on page 54).

1869 **Note:** Command Search and Execution is defined in detail in XCU [Section 2.9.1.1](#) (on page 2264). |

1870 **3.200 Job**

1871 A set of processes, comprising a shell pipeline, and any processes descended from it, that are all
 1872 in the same process group.

1873 **Note:** See also XCU [Section 2.9.2](#) (on page 2265). |

1874 **3.201 Job Control**

1875 A facility that allows users selectively to stop (suspend) the execution of processes and continue
 1876 (resume) their execution at a later point. The user typically employs this facility via the
 1877 interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

1878 **3.202 Job Control Job ID**

1879 A handle that is used to refer to a job. The job control job ID can be any of the forms shown in
 1880 the following table:

1881 **Table 3-1** Job Control Job ID Formats

Job Control Job ID	Meaning
%%	Current job.
%+	Current job.
%-	Previous job.
%n	Job number <i>n</i> .
%string	Job whose command begins with <i>string</i> .
%?string	Job whose command contains <i>string</i> .

1890 **3.203 Last Close (of a File)**

1891 When a process closes a file, resulting in the file not being an open file within any process.

1892 **3.204 Line**

1893 A sequence of zero or more non-`<newline>`s plus a terminating `<newline>`.

1894 **3.205 Linger**

1895 A period of time before terminating a connection, to allow outstanding data to be transferred.

1896 **3.206 Link**
1897 See *Directory Entry* in [Section 3.129](#) (on page 51).

1898 **3.207 Link Count**
1899 The number of directory entries that refer to a particular file.

1900 **3.208 Local Customs**
1901 The conventions of a geographical area or territory for such things as date, time, and currency
1902 formats.

1903 **3.209 Local Interprocess Communication (Local IPC)**
1904 The transfer of data between processes in the same system.

1905 **3.210 Locale**
1906 The definition of the subset of a user's environment that depends on language and cultural
1907 conventions.
1908 **Note:** Locales are defined in detail in [Chapter 7](#) (on page 121).

1909 **3.211 Localization**
1910 The process of establishing information within a computer system specific to the operation of
1911 particular native languages, local customs, and coded character sets.

1912 **3.212 Login**
1913 The unspecified activity by which a user gains access to the system. Each login is associated
1914 with exactly one login name.

1915 **3.213 Login Name**
1916 A user name that is associated with a login.

1917 **3.214 Map**
1918 To create an association between a page-aligned range of the address space of a process and
1919 some memory object, such that a reference to an address in that range of the address space
1920 results in a reference to the associated memory object. The mapped memory object is not
1921 necessarily memory-resident.

1922 3.215 Marked Message

1923 A STREAMS message on which a certain flag is set. Marking a message gives the application
1924 protocol-specific information. An application can use *ioctl()* to determine whether a given
1925 message is marked.

1926 **Note:** The *ioctl()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.

1927 3.216 Matched

1928 A state applying to a sequence of zero or more characters when the characters in the sequence
1929 correspond to a sequence of characters defined by a basic regular expression or extended regular
1930 expression pattern.

1931 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 167).

1932 3.217 Memory Mapped Files

1933 A facility to allow applications to access files as part of the address space.

1934 3.218 Memory Object

1935 One of:

- 1936 • A file (see [Section 3.163](#), on page 56)
- 1937 • A shared memory object (see [Section 3.340](#), on page 80)
- 1938 • A typed memory object (see [Section 3.421](#), on page 91)

1939 When used in conjunction with *mmap()*, a memory object appears in the address space of the
1940 calling process.

1941 **Note:** The *mmap()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.

1942 3.219 Memory-Resident

1943 The process of managing the implementation in such a way as to provide an upper bound on
1944 memory access times.

1945 3.220 Message

1946 In the context of programmatic message passing, information that can be transferred between
1947 processes or threads by being added to and removed from a message queue. A message consists
1948 of a fixed-size message buffer.

1949 3.221 Message Catalog

1950 In the context of providing natural language messages to the user, a file or storage area
1951 containing program messages, command prompts, and responses to prompts for a particular
1952 native language, territory, and codeset.

1953 3.222 Message Catalog Descriptor

1954 In the context of providing natural language messages to the user, a per-process unique value
1955 used to identify an open message catalog. A message catalog descriptor may be implemented
1956 using a file descriptor.

1957 3.223 Message Queue

1958 In the context of programmatic message passing, an object to which messages can be added and
1959 removed. Messages may be removed in the order in which they were added or in priority order.

1960 3.224 Mode

1961 A collection of attributes that specifies a file's type and its access permissions.

1962 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).

1963 3.225 Monotonic Clock

1964 A realtime clock whose value cannot be set via `clock_settime()` and which cannot have negative
1965 clock jumps.

1966 3.226 Mount Point

1967 Either the system root directory or a directory for which the `st_dev` field of structure `stat` differs
1968 from that of its parent directory.

1969 **Note:** The `stat` structure is defined in detail in [<sys/stat.h>](#).

1970 3.227 Multi-Character Collating Element

1971 A sequence of two or more characters that collate as an entity. For example, in some coded
1972 character sets, an accented character is represented by a non-spacing accent, followed by the
1973 letter. Other examples are the Spanish elements *ch* and *ll*.

1974 3.228 Mutex

1975 A synchronization object used to allow multiple threads to serialize their access to shared data.
1976 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has
1977 locked a mutex becomes its owner and remains the owner until that same thread unlocks the
1978 mutex.

- 1979 **3.229 Name**
- 1980 In the shell command language, a word consisting solely of underscores, digits, and alphabets
- 1981 from the portable character set. The first character of a name is not a digit.
- 1982 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 111).
- 1983 **3.230 Named STREAM**
- 1984 A STREAMS-based file descriptor that is attached to a name in the file system name space. All
- 1985 subsequent operations on the named STREAM act on the STREAM that was associated with the
- 1986 file descriptor until the name is disassociated from the STREAM.
- 1987 **3.231 NaN (Not a Number)**
- 1988 A set of values that may be stored in a floating type but that are neither Inf nor valid floating-
- 1989 point numbers. Not all systems support NaN values.
- 1990 **3.232 Native Language**
- 1991 A computer user's spoken or written language, such as American English, British English,
- 1992 Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.
- 1993 **3.233 Negative Response**
- 1994 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
- 1995 keyword **noexpr**, matching an extended regular expression in the current locale.
- 1996 **Note:** The *LC_MESSAGES* category is defined in detail in [Section 7.3.6](#) (on page 150).
- 1997 **3.234 Network**
- 1998 A collection of interconnected hosts.
- 1999 **Note:** The term "network" in POSIX.1-200x is used to refer to the network of hosts. The term "batch
- 2000 system" is used to refer to the network of batch servers.
- 2001 **3.235 Network Address**
- 2002 A network-visible identifier used to designate specific endpoints in a network. Specific
- 2003 endpoints on host systems have addresses, and host systems may also have addresses.

2004 3.236 Network Byte Order

2005 The way of representing any integer type such that, when transmitted over a network via a
2006 network endpoint, the `int` type is transmitted as an appropriate number of octets with the most
2007 significant octet first, followed by any other octets in descending order of significance.

2008 **Note:** This order is more commonly known as big-endian ordering. See also [Section 4.9](#) (on page 98).

2009 3.237 Newline Character (<newline>)

2010 A character that in the output stream indicates that printing should start at the beginning of the
2011 next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this
2012 character is the exact sequence transmitted to an output device by the system to accomplish the
2013 movement to the next line.

2014 3.238 Nice Value

2015 A number used as advice to the system to alter process scheduling. Numerically smaller values
2016 give a process additional preference when scheduling a process to run. Numerically larger
2017 values reduce the preference and make a process less likely to run. Typically, a process with a
2018 smaller nice value runs to completion more quickly than an equivalent process with a higher
2019 nice value. The symbol `{NZERO}` specifies the default nice value of the system.

2020 3.239 Non-Blocking

2021 A property of an open file description that causes function calls involving it to return without
2022 delay when it is detected that the requested action associated with the function call cannot be
2023 completed without unknown delay.

2024 **Note:** The exact semantics are dependent on the type of file associated with the open file description.
2025 For data reads from devices such as ttys and FIFOs, this property causes the read to return
2026 immediately when no data was available. Similarly, for writes, it causes the call to return
2027 immediately when the thread would otherwise be delayed in the write operation; for example,
2028 because no space was available. For networking, it causes functions not to await protocol events
2029 (for example, acknowledgements) to occur. See also [XSH Section 2.10.7](#) (on page 498).

2030 3.240 Non-Spacing Characters

2031 A character, such as a character representing a diacritical mark in the ISO/IEC 6937:2001
2032 standard coded character set, which is used in combination with other characters to form
2033 composite graphic symbols.

2034 3.241 NUL

2035 A character with all bits set to zero.

2036 3.242 Null Byte

2037 A byte with all bits set to zero.

2038
2039
2040
2041

3.243 Null Pointer

The value that is obtained by converting the number 0 into a pointer; for example, `(void *) 0`. The C language guarantees that this value does not match that of any legitimate pointer, so it is used by many functions that return pointers to indicate an error.

2042
2043

3.244 Null String

See *Empty String* in [Section 3.145](#) (on page 53).

2044
2045

3.245 Null Wide-Character Code

A wide-character code with all bits set to zero.

2046
2047

3.246 Number Sign

The character `'#'`, also known as hash sign.

2048
2049
2050
2051
2052

3.247 Object File

A regular file containing the output of a compiler, formatted as input to a linkage editor for linking with other object files into an executable form. The methods of linking are unspecified and may involve the dynamic linking of objects at runtime. The internal format of an object file is unspecified, but a conforming application cannot assume an object file is a text file.

2053
2054

3.248 Octet

Unit of data representation that consists of eight contiguous bits.

2055
2056
2057

3.249 Offset Maximum

An attribute of an open file description representing the largest value that can be used as a file offset.

2058
2059

3.250 Opaque Address

An address such that the entity making use of it requires no details about its contents or format.

2060
2061

3.251 Open File

A file that is currently associated with a file descriptor.

2062
2063

3.252 Open File Description

A record of how a process or group of processes is accessing a file. Each file descriptor refers to

2064 exactly one open file description, but an open file description can be referred to by more than
2065 one file descriptor. The file offset, file status, and file access modes are attributes of an open file
2066 description.

2067 **3.253 Operand**

2068 An argument to a command that is generally used as an object supplying information to a utility
2069 necessary to complete its processing. Operands generally follow the options in a command line.

2070 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 199).

2071 **3.254 Operator**

2072 In the shell command language, either a control operator or a redirection operator.

2073 **3.255 Option**

2074 An argument to a command that is generally used to specify changes in the utility's default
2075 behavior.

2076 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 199).

2077 **3.256 Option-Argument**

2078 A parameter that follows certain options. In some cases an option-argument is included within
2079 the same argument string as the option—in most cases it is the next argument.

2080 **Note:** Utility Argument Syntax is defined in detail in [Section 12.1](#) (on page 199).

2081 **3.257 Orientation**

2082 A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

2083 **Note:** For further information, see XSH [Section 2.5.2](#) (on page 472).

2084 **3.258 Orphaned Process Group**

2085 A process group in which the parent of every member is either itself a member of the group or is
2086 not a member of the group's session.

2087 **3.259 Page**

2088 The granularity of process memory mapping or locking.

2089 Physical memory and memory objects can be mapped into the address space of a process on
2090 page boundaries and in integral multiples of pages. Process address space can be locked into
2091 memory (made memory-resident) on page boundaries and in integral multiples of pages.

2092 **3.260 Page Size**

2093 The size, in bytes, of the system unit of memory allocation, protection, and mapping. On
2094 systems that have segment rather than page-based memory architectures, the term “page”
2095 means a segment.

2096 **3.261 Parameter**

2097 In the shell command language, an entity that stores values. There are three types of parameters:
2098 variables (named parameters), positional parameters, and special parameters. Parameter
2099 expansion is accomplished by introducing a parameter with the ‘\$’ character.

2100 **Note:** See also XCU [Section 2.5](#) (on page 2249).

2101 In the C language, an object declared as part of a function declaration or definition that acquires
2102 a value on entry to the function, or an identifier following the macro name in a function-like
2103 macro definition.

2104 **3.262 Parent Directory**

2105 When discussing a given directory, the directory that both contains a directory entry for the
2106 given directory and is represented by the pathname dot-dot in the given directory.

2107 When discussing other types of files, a directory containing a directory entry for the file under
2108 discussion.

2109 This concept does not apply to dot and dot-dot.

2110 **3.263 Parent Process**

2111 The process which created (or inherited) the process under discussion.

2112 **3.264 Parent Process ID**

2113 An attribute of a new process identifying the parent of the process. The parent process ID of a
2114 process is the process ID of its creator, for the lifetime of the creator. After the creator’s lifetime
2115 has ended, the parent process ID is the process ID of an implementation-defined system process.

2116 3.265 Pathname

2117 A character string that is used to identify a file. In the context of POSIX.1-200x, a pathname
 2118 consists of, at most, {PATH_MAX} bytes, including the terminating null byte. It has an optional
 2119 beginning slash, followed by zero or more filenames separated by slashes. A pathname may
 2120 optionally contain one or more trailing slashes. Multiple successive slashes are considered to be
 2121 the same as one slash.

2122 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

2123 3.266 Pathname Component

2124 See *Filename* in [Section 3.169](#) (on page 56).

2125 3.267 Path Prefix

2126 A pathname, with an optional ending slash, that refers to a directory.

2127 3.268 Pattern

2128 A sequence of characters used either with regular expression notation or for pathname
 2129 expansion, as a means of selecting various character strings or pathnames, respectively.

2130 **Note:** Regular Expressions are defined in detail in [Chapter 9](#) (on page 167).

2131 See also XCU [Section 2.6.6](#) (on page 2259).

2132 The syntaxes of the two types of patterns are similar, but not identical; POSIX.1-200x always
 2133 indicates the type of pattern being referred to in the immediate context of the use of the term.

2134 3.269 Period

2135 The character '.'. The term "period" is contrasted with dot (see also [Section 3.135](#), on page 52),
 2136 which is used to describe a specific directory entry.

2137 3.270 Permissions

2138 Attributes of an object that determine the privilege necessary to access or manipulate the object.

2139 **Note:** File Access Permissions are defined in detail in [Section 4.4](#) (on page 96).

2140 3.271 Persistence

2141 A mode for semaphores, shared memory, and message queues requiring that the object and its
 2142 state (including data, if any) are preserved after the object is no longer referenced by any
 2143 process.

2144 Persistence of an object does not imply that the state of the object is maintained across a system
 2145 crash or a system reboot.

2146 **3.272 Pipe**

2147 An object identical to a FIFO which has no links in the file hierarchy. |

2148 **Note:** The *pipe()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.2149 **3.273 Polling**2150 A scheduling scheme whereby the local process periodically checks until the pre-specified
2151 events (for example, read, write) have occurred.2152 **3.274 Portable Character Set**2153 The collection of characters that are required to be present in all locales supported by
2154 conforming systems.2155 **Note:** The Portable Character Set is defined in detail in [Section 6.1](#) (on page 111).2156 This term is contrasted against the smaller portable filename character set; see also [Section 3.275](#).2157 **3.275 Portable Filename Character Set**

2158 The set of characters from which portable filenames are constructed.

2159 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
2160 a b c d e f g h i j k l m n o p q r s t u v w x y z
2161 0 1 2 3 4 5 6 7 8 9 . _ -

2162 The last three characters are the period, underscore, and hyphen characters, respectively.

2163 **3.276 Positional Parameter**2164 In the shell command language, a parameter denoted by a single digit or one or more digits in
2165 curly braces.2166 **Note:** For further information, see XCU [Section 2.5.1](#) (on page 2249). |2167 **3.277 Preallocation**

2168 The reservation of resources in a system for a particular use.

2169 Preallocation does not imply that the resources are immediately allocated to that use, but merely
2170 indicates that they are guaranteed to be available in bounded time when needed.

2171 **3.278 Preempted Process (or Thread)**

2172 A running thread whose execution is suspended due to another thread becoming runnable at a
2173 higher priority.

2174 **3.279 Previous Job**

2175 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the
2176 current job exits. There is at most one previous job; see also [Section 3.202](#) (on page 61).

2177 **3.280 Printable Character**

2178 One of the characters included in the **print** character classification of the *LC_CTYPE* category in
2179 the current locale.

2180 **Note:** The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 124).

2181 **3.281 Printable File**

2182 A text file consisting only of the characters included in the **print** and **space** character
2183 classifications of the *LC_CTYPE* category and the <backspace>, all in the current locale.

2184 **Note:** The *LC_CTYPE* category is defined in detail in [Section 7.3.1](#) (on page 124).

2185 **3.282 Priority**

2186 A non-negative integer associated with processes or threads whose value is constrained to a
2187 range defined by the applicable scheduling policy. Numerically higher values represent higher
2188 priorities.

2189 **3.283 Priority Band**

2190 The queuing order applied to normal priority STREAMS messages. High priority STREAMS
2191 messages are not grouped by priority bands. The only differentiation made by the STREAMS
2192 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate
2193 between priority bands.

2194 **3.284 Priority Inversion**

2195 A condition in which a thread that is not voluntarily suspended (waiting for an event or time
2196 delay) is not running while a lower priority thread is running. Such blocking of the higher
2197 priority thread is often caused by contention for a shared resource.

2198 **3.285 Priority Scheduling**

2199 A performance and determinism improvement facility to allow applications to determine the
2200 order in which threads that are ready to run are granted access to processor resources.

2201 3.286 Priority-Based Scheduling

2202 Scheduling in which the selection of a running thread is determined by the priorities of the
2203 runnable processes or threads.

2204 3.287 Privilege

2205 See *Appropriate Privileges* in [Section 3.19](#) (on page 35).

2206 3.288 Process

2207 An address space with one or more threads executing within that address space, and the
2208 required system resources for those threads.

2209 **Note:** Many of the system resources defined by POSIX.1-200x are shared among all of the threads
2210 within a process. These include the process ID, the parent process ID, process group ID, session
2211 membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-ID,
2212 supplementary group IDs, current working directory, root directory, file mode creation mask,
2213 and file descriptors.

2214 3.289 Process Group

2215 A collection of processes that permits the signaling of related processes. Each process in the
2216 system is a member of a process group that is identified by a process group ID. A newly created
2217 process joins the process group of its creator.

2218 3.290 Process Group ID

2219 The unique positive integer identifier representing a process group during its lifetime.

2220 **Note:** See also *Process Group ID Reuse* defined in [Section 4.13](#) (on page 100).

2221 3.291 Process Group Leader

2222 A process whose process ID is the same as its process group ID.

2223 3.292 Process Group Lifetime

2224 A period of time that begins when a process group is created and ends when the last remaining
2225 process in the group leaves the group, due either to the end of the lifetime of the last process or
2226 to the last remaining process calling the *setsid()* or *setpgid()* functions.

2227 **Note:** The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of
2228 POSIX.1-200x.

2229 **3.293 Process ID**

2230 The unique positive integer identifier representing a process during its lifetime.

2231 **Note:** See also *Process ID Reuse* defined in [Section 4.13](#) (on page 100). |2232 **3.294 Process Lifetime**

2233 The period of time that begins when a process is created and ends when its process ID is
 2234 returned to the system. After a process is created by *fork()*, *posix_spawn()*, or *posix_spawnnp()*, it is
 2235 considered active. At least one thread of control and address space exist until it terminates. It
 2236 then enters an inactive state where certain resources may be returned to the system, although
 2237 some resources, such as the process ID, are still in use. When another process executes a *wait()*,
 2238 *waitid()*, or *waitpid()* function for an inactive process, the remaining resources are returned to
 2239 the system. The last resource to be returned to the system is the process ID. At this time, the
 2240 lifetime of the process ends.

2241 **Note:** The *fork()*, *posix_spawn()*, *posix_spawnnp()*, *wait()*, *waitid()*, and *waitpid()* functions are defined in
 2242 detail in the System Interfaces volume of POSIX.1-200x.

2243 **3.295 Process Memory Locking**

2244 A performance improvement facility to bind application programs into the high-performance
 2245 random access memory of a computer system. This avoids potential latencies introduced by the
 2246 operating system in storing parts of a program that were not recently referenced on secondary
 2247 memory devices.

2248 **3.296 Process Termination**

2249 There are two kinds of process termination:

- 2250 1. Normal termination occurs by a return from *main()*, when requested with the *exit()*,
 2251 *_exit()*, or *_Exit()* functions; or when the last thread in the process terminates by
 2252 returning from its start function, by calling the *pthread_exit()* function, or through
 2253 cancellation.
- 2254 2. Abnormal termination occurs when requested by the *abort()* function or when some
 2255 signals are received.

2256 **Note:** The *_exit()*, *_Exit()*, *abort()*, and *exit()* functions are defined in detail in the System Interfaces
 2257 volume of POSIX.1-200x.

2258 **3.297 Process-To-Process Communication**

2259 The transfer of data between processes.

2260 **3.298 Process Virtual Time**

2261 The measurement of time in units elapsed by the system clock while a process is executing.

2262 3.299 Program

2263 A prepared sequence of instructions to the system to accomplish a defined task. The term
2264 “program” in POSIX.1-200x encompasses applications written in the Shell Command Language,
2265 complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level languages.

2266 3.300 Protocol

2267 A set of semantic and syntactic rules for exchanging information.

2268 3.301 Pseudo-Terminal

2269 A facility that provides an interface that is identical to the terminal subsystem, except where
2270 noted otherwise in POSIX.1-200x. A pseudo-terminal is composed of two devices: the “master
2271 device” and a “slave device”. The slave device provides processes with an interface that is
2272 identical to the terminal interface, although there need not be hardware behind that interface.
2273 Anything written on the master device is presented to the slave as an input and anything
2274 written on the slave device is presented as an input on the master side.

2275 3.302 Radix Character

2276 The character that separates the integer part of a number from the fractional part.

2277 3.303 Read-Only File System

2278 A file system that has implementation-defined characteristics restricting modifications.

2279 **Note:** File Times Update is described in detail in [Section 4.8](#) (on page 97).

2280 3.304 Read-Write Lock

2281 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous
2282 read-only access to data while allowing only one thread to have write access at any given time.
2283 They are typically used to protect data that is read-only more frequently than it is changed.

2284 Read-write locks can be used to synchronize threads in the current process and other processes if
2285 they are allocated in memory that is writable and shared among the cooperating processes and
2286 have been initialized for this behavior.

2287 3.305 Real Group ID

2288 The attribute of a process that, at the time of process creation, identifies the group of the user
2289 who created the process; see also [Section 3.187](#) (on page 59).

- 2290 **3.306 Real Time**
- 2291 Time measured as total units elapsed by the system clock without regard to which thread is
- 2292 executing.
- 2293 **3.307 Realtime Signal Extension**
- 2294 A determinism improvement facility to enable asynchronous signal notifications to an
- 2295 application to be queued without impacting compatibility with the existing signal functions.
- 2296 **3.308 Real User ID**
- 2297 The attribute of a process that, at the time of process creation, identifies the user who created the
- 2298 process; see also [Section 3.428](#) (on page 92).
- 2299 **3.309 Record**
- 2300 A collection of related data units or words which is treated as a unit.
- 2301 **3.310 Redirection**
- 2302 In the shell command language, a method of associating files with the input or output of
- 2303 commands.
- 2304 **Note:** For further information, see XCU [Section 2.7](#) (on page 2259).
- 2305 **3.311 Redirection Operator**
- 2306 In the shell command language, a token that performs a redirection function. It is one of the
- 2307 following symbols:
- 2308 < > >| << >> <& >& <<- <>
- 2309 **3.312 Reentrant Function**
- 2310 A function whose effect, when called by two or more threads, is guaranteed to be as if the
- 2311 threads each executed the function one after another in an undefined order, even if the actual
- 2312 execution is interleaved.
- 2313 **3.313 Referenced Shared Memory Object**
- 2314 A shared memory object that is open or has one or more mappings defined on it.
- 2315 **3.314 Refresh**
- 2316 To ensure that the information on the user's terminal screen is up-to-date.

2317 **3.315 Regular Expression**

2318 A pattern that selects specific strings from a set of character strings.

2319 **Note:** Regular Expressions are described in detail in [Chapter 9](#) (on page 167).

2320 **3.316 Region**

2321 In the context of the address space of a process, a sequence of addresses.

2322 In the context of a file, a sequence of offsets.

2323 **3.317 Regular File**

2324 A file that is a randomly accessible sequence of bytes, with no further structure imposed by the
2325 system.

2326 **3.318 Relative Pathname**

2327 A pathname not beginning with a slash.

2328 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

2329 **3.319 Relocatable File**

2330 A file holding code or data suitable for linking with other object files to create an executable or a
2331 shared object file.

2332 **3.320 Relocation**

2333 The process of connecting symbolic references with symbolic definitions. For example, when a
2334 program calls a function, the associated call instruction transfers control to the proper
2335 destination address at execution.

2336 **3.321 Requested Batch Service**

2337 A service that is either rejected or performed prior to a response from the service to the
2338 requester.

2339 **3.322 (Time) Resolution**

2340 The minimum time interval that a clock can measure or whose passage a timer can detect.

2341 3.323 Robust Mutex

2342 A mutex with the *robust* attribute set.

2343 **Note:** The *robust* attribute is defined in detail by the `pthread_mutexattr_getrobust()` function.

2344 3.324 Root Directory

2345 A directory, associated with a process, that is used in pathname resolution for pathnames that
2346 begin with a slash.

2347 3.325 Runnable Process (or Thread)

2348 A thread that is capable of being a running thread, but for which no processor is available.

2349 3.326 Running Process (or Thread)

2350 A thread currently executing on a processor. On multi-processor systems there may be more
2351 than one such thread in a system at a time.

2352 3.327 Saved Resource Limits

2353 An attribute of a process that provides some flexibility in the handling of unrepresentable
2354 resource limits, as described in the *exec* family of functions and `setrlimit()`.

2355 **Note:** The *exec* and `setrlimit()` functions are defined in detail in the System Interfaces volume of
2356 POSIX.1-200x.

2357 3.328 Saved Set-Group-ID

2358 An attribute of a process that allows some flexibility in the assignment of the effective group ID
2359 attribute, as described in the *exec* family of functions and `setgid()`.

2360 **Note:** The *exec* and `setgid()` functions are defined in detail in the System Interfaces volume of
2361 POSIX.1-200x.

2362 3.329 Saved Set-User-ID

2363 An attribute of a process that allows some flexibility in the assignment of the effective user ID
2364 attribute, as described in the *exec* family of functions and `setuid()`.

2365 **Note:** The *exec* and `setuid()` functions are defined in detail in the System Interfaces volume of
2366 POSIX.1-200x.

2367 3.330 Scheduling

2368 The application of a policy to select a runnable process or thread to become a running process or
2369 thread, or to alter one or more of the thread lists.

2370 3.331 Scheduling Allocation Domain

2371 The set of processors on which an individual thread can be scheduled at any given time.

2372 3.332 Scheduling Contention Scope

2373 A property of a thread that defines the set of threads against which that thread competes for
2374 resources.

2375 For example, in a scheduling decision, threads sharing scheduling contention scope compete for
2376 processor resources. In POSIX.1-200x, a thread has scheduling contention scope of either
2377 PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

2378 3.333 Scheduling Policy

2379 A set of rules that is used to determine the order of execution of processes or threads to achieve
2380 some goal.

2381 **Note:** Scheduling Policy is defined in detail in [Section 4.14](#) (on page 100).

2382 3.334 Screen

2383 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a
2384 physical display device or may occupy the entire physical area of the display device.

2385 3.335 Scroll

2386 To move the representation of data vertically or horizontally relative to the terminal screen.
2387 There are two types of scrolling:

- 2388 1. The cursor moves with the data.
- 2389 2. The cursor remains stationary while the data moves.

2390 3.336 Semaphore

2391 A minimum synchronization primitive to serve as a basis for more complex synchronization
2392 mechanisms to be defined by the application program.

2393 **Note:** Semaphores are defined in detail in [Section 4.16](#) (on page 101).

2394 3.337 Session

2395 A collection of process groups established for job control purposes. Each process group is a
2396 member of a session. A process is considered to be a member of the session of which its process
2397 group is a member. A newly created process joins the session of its creator. A process can alter
2398 its session membership; see *setsid()*. There can be multiple process groups in the same session.

2399 **Note:** The *setsid()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.

2400 3.338 Session Leader

2401 A process that has created a session.

2402 **Note:** For further information, see the *setsid()* function defined in the System Interfaces volume of
2403 POSIX.1-200x.

2404 3.339 Session Lifetime

2405 The period between when a session is created and the end of the lifetime of all the process
2406 groups that remain as members of the session.

2407 3.340 Shared Memory Object

2408 An object that represents memory that can be mapped concurrently into the address space of
2409 more than one process.

2410 3.341 Shell

2411 A program that interprets sequences of text input as commands. It may operate on an input
2412 stream or it may interactively prompt and read commands from a terminal.

2413 3.342 Shell, the

2414 The Shell Command Language Interpreter; a specific instance of a shell.

2415 **Note:** For further information, see the *sh* utility defined in the Shell and Utilities volume of
2416 POSIX.1-200x.

2417 3.343 Shell Script

2418 A file containing shell commands. If the file is made executable, it can be executed by specifying
2419 its name as a simple command. Execution of a shell script causes a shell to execute the
2420 commands within the script. Alternatively, a shell can be requested to execute the commands in
2421 a shell script by specifying the name of the shell script as the operand to the *sh* utility.

2422 **Note:** Simple Commands are defined in detail in XCU [Section 2.9.1](#) (on page 2263).

2423 The *sh* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

2424 3.344 Signal

2425 A mechanism by which a process or thread may be notified of, or affected by, an event occurring
2426 in the system. Examples of such events include hardware exceptions and specific actions by
2427 processes. The term signal is also used to refer to the event itself.

2428 3.345 Signal Stack

2429 Memory established for a thread, in which signal handlers catching signals sent to that thread

2430 are executed.

2431 **3.346 Single-Quote**

2432 The character ' ' , also known as apostrophe.

2433 **3.347 Slash**

2434 The character ' / ' , also known as solidus.

2435 **3.348 Socket**

2436 A file of a particular type that is used as a communications endpoint for process-to-process
2437 communication as described in the System Interfaces volume of POSIX.1-200x.

2438 **3.349 Socket Address**

2439 An address associated with a socket or remote endpoint, including an address family identifier
2440 and addressing information specific to that address family. The address may include multiple
2441 parts, such as a network address associated with a host system and an identifier for a specific
2442 endpoint.

2443 **3.350 Soft Limit**

2444 A resource limitation established for each process that the process may set to any value less than
2445 or equal to the hard limit.

2446 **3.351 Source Code**

2447 When dealing with the Shell Command Language, input to the command language interpreter.
2448 The term "shell script" is synonymous with this meaning.

2449 When dealing with an ISO/IEC-conforming programming language, source code is input to a
2450 compiler conforming to that ISO/IEC standard.

2451 Source code also refers to the input statements prepared for the following standard utilities: *awk*,
2452 *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc*.

2453 Source code can also refer to a collection of sources meeting any or all of these meanings.

2454 **Note:** The *awk*, *bc*, *ed*, *lex*, *localedef*, *make*, *sed*, and *yacc* utilities are defined in detail in the Shell and
2455 Utilities volume of POSIX.1-200x.

2456

3.352 Space Character (<space>)

2457

2458

2459

The character defined in the portable character set as <space>. The <space> is a member of the **space** character class of the current locale, but represents the single character, and not all of the possible members of the class; see also [Section 3.434](#) (on page 93).

2460

3.353 Spawn

2461

2462

A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient replacement for *fork()/exec*.

2463

3.354 Special Built-In

2464

See *Built-In Utility* in [Section 3.82](#) (on page 44).

2465

3.355 Special Parameter

2466

2467

2468

In the shell command language, a parameter named by a single character from the following list:

* @ # ? ! - \$ 0

Note: For further information, see XCU [Section 2.5.2](#) (on page 2250).

2469

3.356 Spin Lock

2470

A synchronization object used to allow multiple threads to serialize their access to shared data.

2471

3.357 Sporadic Server

2472

2473

A scheduling policy for threads and processes that reserves a certain amount of execution capacity for processing aperiodic events at a given priority level.

2474

3.358 Standard Error

2475

An output stream usually intended to be used for diagnostic messages.

2476

3.359 Standard Input

2477

An input stream usually intended to be used for primary data input.

2478

3.360 Standard Output

2479

An output stream usually intended to be used for primary data output.

2480 3.361 Standard Utilities

2481 The utilities described in the Shell and Utilities volume of POSIX.1-200x.

2482 3.362 Stream

2483 Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence
2484 of characters, as described by the ISO C standard. Such objects can be created by the *fdopen()*,
2485 *fmemopen()*, *fopen()*, *open_memstream()*, or *popen()* functions, and are associated with a file
2486 descriptor. A stream provides the additional services of user-selectable buffering and formatted
2487 input and output; see also [Section 3.363](#).

2488 **Note:** For further information, see XSH [Section 2.5](#) (on page 469).

2489 The *fdopen()*, *fmemopen()*, *fopen()*, *open_memstream()*, and *popen()* functions are defined in detail
2490 in the System Interfaces volume of POSIX.1-200x.

2491 3.363 STREAM

2492 Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an
2493 open device or pseudo-device. It optionally includes one or more intermediate processing
2494 modules that are interposed between the process end of the STREAM and the device driver (or
2495 pseudo-device driver) end of the STREAM; see also [Section 3.362](#).

2496 **Note:** For further information, see XSH [Section 2.6](#) (on page 473).

2497 3.364 STREAM End

2498 The STREAM end is the driver end of the STREAM and is also known as the downstream end of
2499 the STREAM.

2500 3.365 STREAM Head

2501 The STREAM head is the beginning of the STREAM and is at the boundary between the system
2502 and the application process. This is also known as the upstream end of the STREAM.

2503 3.366 STREAMS Multiplexor

2504 A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected
2505 above is referred to as N-to-1, or “upper multiplexing”. Multiplexing with STREAMS connected
2506 below is referred to as 1-to-N or “lower multiplexing”.

2507 3.367 String

2508 A contiguous sequence of bytes terminated by and including the first null byte.

2509 3.368 Subshell

2510 A shell execution environment, distinguished from the main or current shell execution
2511 environment.

2512 **Note:** For further information, see XCU [Section 2.12](#) (on page 2277). |

2513 3.369 Successfully Transferred

2514 For a write operation to a regular file, when the system ensures that all data written is readable
2515 on any subsequent open of the file (even one that follows a system or power failure) in the
2516 absence of a failure of the physical storage medium.

2517 For a read operation, when an image of the data on the physical storage medium is available to
2518 the requesting process.

2519 3.370 Supplementary Group ID

2520 An attribute of a process used in determining file access permissions. A process has up to
2521 {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The
2522 supplementary group IDs of a process are set to the supplementary group IDs of the parent
2523 process when the process is created.

2524 3.371 Suspended Job

2525 A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the
2526 process group to stop. A suspended job is a background job, but a background job is not
2527 necessarily a suspended job.

2528 3.372 Symbolic Constant

2529 An object-like macro defined with a constant value. +

2530 Unless stated otherwise, the following shall apply to every symbolic constant: +

- 2531 • It expands to a compile-time constant expression with an integer type. +
- 2532 • It may be defined as another type of constant—e.g., an enumeration constant—as well as +
2533 being a macro. +
- 2534 • It need not be usable in `#if` preprocessing directives. +

2535 3.373 Symbolic Link

2536 A type of file with the property that when the file is encountered during pathname resolution, a
2537 string stored by the file is used to modify the pathname resolution. The stored string has a
2538 length of {SYMLINK_MAX} bytes or fewer.

2539 **Note:** Pathname Resolution is defined in detail in [Section 4.12](#) (on page 99).

2540 **3.374 Synchronized Input and Output**

2541 A determinism and robustness improvement mechanism to enhance the data input and output
2542 mechanisms, so that an application can ensure that the data being manipulated is physically
2543 present on secondary mass storage devices.

2544 **3.375 Synchronized I/O Completion**

2545 The state of an I/O operation that has either been successfully transferred or diagnosed as
2546 unsuccessful.

2547 **3.376 Synchronized I/O Data Integrity Completion**

2548 For read, when the operation has been completed or diagnosed if unsuccessful. The read is
2549 complete only when an image of the data has been successfully transferred to the requesting
2550 process. If there were any pending write requests affecting the data to be read at the time that
2551 the synchronized read operation was requested, these write requests are successfully transferred
2552 prior to reading the data.

2553 For write, when the operation has been completed or diagnosed if unsuccessful. The write is
2554 complete only when the data specified in the write request is successfully transferred and all file
2555 system information required to retrieve the data is successfully transferred.

2556 File attributes that are not necessary for data retrieval (access time, modification time, status
2557 change time) need not be successfully transferred prior to returning to the calling process.

2558 **3.377 Synchronized I/O File Integrity Completion**

2559 Identical to a synchronized I/O data integrity completion with the addition that all file
2560 attributes relative to the I/O operation (including access time, modification time, status change
2561 time) are successfully transferred prior to returning to the calling process.

2562 **3.378 Synchronized I/O Operation**

2563 An I/O operation performed on a file that provides the application assurance of the integrity of
2564 its data and files.

2565 **3.379 Synchronous I/O Operation**

2566 An I/O operation that causes the thread requesting the I/O to be blocked from further use of the
2567 processor until that I/O operation completes.

2568 **Note:** A synchronous I/O operation does not imply synchronized I/O data integrity completion or
2569 synchronized I/O file integrity completion.

2570 **3.380 Synchronously-Generated Signal**

2571 A signal that is attributable to a specific thread.

2572 For example, a thread executing an illegal instruction or touching invalid memory causes a

2573 synchronously-generated signal. Being synchronous is a property of how the signal was
2574 generated and not a property of the signal number.

2575 3.381 System

2576 An implementation of POSIX.1-200x.

2577 3.382 System Boot

2578 An unspecified sequence of events that may result in the loss of transitory data; that is, data that
2579 is not saved in permanent storage. For example, message queues, shared memory, semaphores,
2580 and processes.

2581 3.383 System Clock

2582 A clock with at least one second resolution that contains seconds since the Epoch.

2583 3.384 System Console

2584 A device that receives messages sent by the *syslog()* function, and the *fntmsg()* function when
2585 the MM_CONSOLE flag is set.

2586 **Note:** The *syslog()* and *fntmsg()* functions are defined in detail in the System Interfaces volume of
2587 POSIX.1-200x.

2588 3.385 System Crash

2589 An interval initiated by an unspecified circumstance that causes all processes (possibly other +
2590 than special system processes) to be terminated in an undefined manner, after which any +
2591 changes to the state and contents of files created or written to by an application prior to the +
2592 interval are undefined, except as required elsewhere in POSIX.1-200x.

2593 3.386 System Databases

2594 An implementation provides two system databases: the “group database” (see also [Section](#)
2595 [3.186](#), on page 59) and the “user database” (see also [Section 3.427](#), on page 92).

2596 3.387 System Documentation

2597 All documentation provided with an implementation except for the conformance document.
2598 Electronically distributed documents for an implementation are considered part of the system
2599 documentation.

2600 3.388 System Process

2601 An object other than a process executing an application, that is provided by the system and has a

2602 process ID.

2603 **3.389 System Reboot**

2604 See *System Boot* defined in [Section 3.382](#) (on page 86).

2605 **3.390 System Trace Event**

2606 A trace event that is generated by the implementation, in response either to a system-initiated
 2607 action or to an application-requested action, except for a call to *posix_trace_event()*. When
 2608 supported by the implementation, a system-initiated action generates a process-independent
 2609 system trace event and an application-requested action generates a process-dependent system
 2610 trace event. For a system trace event not defined by POSIX.1-200x, the associated trace event
 2611 type identifier is derived from the implementation-defined name for this trace event, and the
 2612 associated data is of implementation-defined content and length.

2613 **3.391 System-Wide**

2614 Pertaining to events occurring in all processes existing in an implementation at a given point in
 2615 time.

2616 **3.392 Tab Character (<tab>)**

2617 A character that in the output stream indicates that printing or displaying should start at the
 2618 next horizontal tabulation position on the current line. It is the character designated by '`\t`' in
 2619 the C language. If the current position is at or past the last defined horizontal tabulation
 2620 position, the behavior is unspecified. It is unspecified whether this character is the exact
 2621 sequence transmitted to an output device by the system to accomplish the tabulation.

2622 **3.393 Terminal (or Terminal Device)**

2623 A character special file that obeys the specifications of the general terminal interface.

2624 **Note:** The General Terminal Interface is defined in detail in [Chapter 11](#) (on page 185).

2625 **3.394 Text Column**

2626 A roughly rectangular block of characters capable of being laid out side-by-side next to other
 2627 text columns on an output page or terminal screen. The widths of text columns are measured in
 2628 column positions.

2629 3.395 Text File

2630 A file that contains characters organized into one or more lines. The lines do not contain NUL
 2631 characters and none can exceed {LINE_MAX} bytes in length, including the <newline>.
 2632 Although POSIX.1-200x does not distinguish between text files and binary files (see the ISO C
 2633 standard), many utilities only produce predictable or meaningful output when operating on text
 2634 files. The standard utilities that have such restrictions always specify “text files” in their STDIN
 2635 or INPUT FILES sections.

2636 3.396 Thread

2637 A single flow of control within a process. Each thread has its own thread ID, scheduling priority
 2638 and policy, *errno* value, thread-specific key/value bindings, and the required system resources to
 2639 support a flow of control. Anything whose address may be determined by a thread, including
 2640 but not limited to static variables, storage obtained via *malloc()*, directly addressable storage
 2641 obtained through implementation-defined functions, and automatic variables, are accessible to
 2642 all threads in the same process.

2643 **Note:** The *malloc()* function is defined in detail in the System Interfaces volume of POSIX.1-200x.

2644 3.397 Thread ID

2645 Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t**
 2646 called a thread ID.

2647 3.398 Thread List

2648 An ordered set of runnable threads that all have the same ordinal value for their priority.

2649 The ordering of threads on the list is determined by a scheduling policy or policies. The set of
 2650 thread lists includes all runnable threads in the system.

2651 3.399 Thread-Safe

2652 A function that may be safely invoked concurrently by multiple threads. Each function defined
 2653 in the System Interfaces volume of POSIX.1-200x is thread-safe unless explicitly stated
 2654 otherwise. Examples are any “pure” function, a function which holds a mutex locked while it is
 2655 accessing static storage, or objects shared among threads.

2656 3.400 Thread-Specific Data Key

2657 A process global handle of type **pthread_key_t** which is used for naming thread-specific data.

2658 Although the same key value may be used by different threads, the values bound to the key by
 2659 *pthread_setspecific()* and accessed by *pthread_getspecific()* are maintained on a per-thread basis
 2660 and persist for the life of the calling thread.

2661 **Note:** The *pthread_getspecific()* and *pthread_setspecific()* functions are defined in detail in the System
 2662 Interfaces volume of POSIX.1-200x.

- 2663 **3.401 Tilde**
2664 The character '~'.
- 2665 **3.402 Timeouts**
2666 A method of limiting the length of time an interface will block; see also [Section 3.75](#) (on page 43).
- 2667 **3.403 Timer**
2668 A mechanism that can notify a thread when the time as measured by a particular clock has
2669 reached or passed a specified value, or when a specified amount of time has passed.
- 2670 **3.404 Timer Overrun**
2671 A condition that occurs each time a timer, for which there is already an expiration signal queued
2672 to the process, expires.
- 2673 **3.405 Token**
2674 In the shell command language, a sequence of characters that the shell considers as a single unit
2675 when reading input. A token is either an operator or a word.
2676 **Note:** The rules for reading input are defined in detail in XCU [Section 2.3](#) (on page 2247).
- 2677 **3.406 Trace Analyzer Process**
2678 A process that extracts trace events from a trace stream to retrieve information about the
2679 behavior of an application.
- 2680 **3.407 Trace Controller Process**
2681 A process that creates a trace stream for tracing a process.
- 2682 **3.408 Trace Event**
2683 A data object that represents an action executed by the system, and that is recorded in a trace
2684 stream.
- 2685 **3.409 Trace Event Type**
2686 A data object type that defines a class of trace event.

- 2687 **3.410 Trace Event Type Mapping**
2688 A one-to-one mapping between trace event types and trace event names.
- 2689 **3.411 Trace Filter**
2690 A filter that allows the trace controller process to specify those trace event types that are to be
2691 ignored; that is, not generated.
- 2692 **3.412 Trace Generation Version**
2693 A data object that is an implementation-defined character string, generated by the trace system
2694 and describing the origin and version of the trace system.
- 2695 **3.413 Trace Log**
2696 The flushed image of a trace stream, if the trace stream is created with a trace log.
- 2697 **3.414 Trace Point**
2698 An action that may cause a trace event to be generated.
- 2699 **3.415 Trace Stream**
2700 An opaque object that contains trace events plus internal data needed to interpret those trace
2701 events.
- 2702 **3.416 Trace Stream Identifier**
2703 A handle to manage tracing operations in a trace stream.
- 2704 **3.417 Trace System**
2705 A system that allows both system and user trace events to be generated into a trace stream.
2706 These trace events can be retrieved later.
- 2707 **3.418 Traced Process**
2708 A process for which at least one trace stream has been created. A traced process is also called a
2709 target process.
- 2710 **3.419 Tracing Status of a Trace Stream**
2711 A status that describes the state of an active trace stream. The tracing status of a trace stream can
2712 be retrieved from the trace stream attributes. An active trace stream can be in one of two states:

2713 running or suspended.

2714 **3.420 Typed Memory Name Space**

2715 A system-wide name space that contains the names of the typed memory objects present in the
2716 system. It is configurable for a given implementation.

2717 **3.421 Typed Memory Object**

2718 A combination of a typed memory pool and a typed memory port. The entire contents of the
2719 pool are accessible from the port. The typed memory object is identified through a name that
2720 belongs to the typed memory name space.

2721 **3.422 Typed Memory Pool**

2722 An extent of memory with the same operational characteristics. Typed memory pools may be
2723 contained within each other.

2724 **3.423 Typed Memory Port**

2725 A hardware access path to one or more typed memory pools.

2726 **3.424 Unbind**

2727 Remove the association between a network address and an endpoint.

2728 **3.425 Unit Data**

2729 See *Datagram* in [Section 3.123](#) (on page 50).

2730 **3.426 Upshifting**

2731 The conversion of a lowercase character that has a single-character uppercase representation into
2732 this uppercase representation.

2733 3.427 User Database

2734 A system database that contains at least the following information for each user ID:

- 2735 • User name
- 2736 • Numerical user ID
- 2737 • Initial numerical group ID
- 2738 • Initial working directory
- 2739 • Initial user program

2740 The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under
2741 which the initial values are operative are implementation-defined.

2742 If the initial user program field is null, an implementation-defined program is used.

2743 If the initial working directory field is null, the interpretation of that field is implementation-
2744 defined.

2745 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of POSIX.1-200x.

2746 3.428 User ID

2747 A non-negative integer that is used to identify a system user. When the identity of a user is
2748 associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or
2749 a saved set-user-ID.

2750 3.429 User Name

2751 A string that is used to identify a user; see also [Section 3.427](#). To be portable across systems
2752 conforming to POSIX.1-200x, the value is composed of characters from the portable filename
2753 character set. The hyphen should not be used as the first character of a portable user name.

2754 3.430 User Trace Event

2755 A trace event that is generated explicitly by the application as a result of a call to
2756 *posix_trace_event()*.

2757 3.431 Utility

2758 A program, excluding special built-in utilities provided as part of the Shell Command Language,
2759 that can be called by name from a shell to perform a specific task, or related set of tasks.

2760 **Note:** For further information on special built-in utilities, see XCU [Section 2.14](#) (on page 2280).

2761 3.432 Variable

2762 In the shell command language, a named parameter.

2763 **Note:** For further information, see XCU [Section 2.5](#) (on page 2249).

2764 **3.433 Vertical-Tab Character (<vertical-tab>)**

2765 A character that in the output stream indicates that printing should start at the next vertical
2766 tabulation position. It is the character designated by '`\v`' in the C language. If the current
2767 position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is
2768 unspecified whether this character is the exact sequence transmitted to an output device by the
2769 system to accomplish the tabulation.

2770 **3.434 White Space**

2771 A sequence of one or more characters that belong to the **space** character class as defined via the
2772 `LC_CTYPE` category in the current locale.

2773 In the POSIX locale, white space consists of one or more `<blank>`s (`<space>`s and `<tab>`s),
2774 `<newline>`s, `<carriage-return>`s, `<form-feed>`s, and `<vertical-tab>`s.

2775 **3.435 Wide-Character Code (C Language)**

2776 An integer value corresponding to a single graphic symbol or control code.

2777 **Note:** C Language Wide-Character Codes are defined in detail in [Section 6.3](#) (on page 115).

2778 **3.436 Wide-Character Input/Output Functions**

2779 The functions that perform wide-oriented input from streams or wide-oriented output to
2780 streams: `fgetwc()`, `fgetws()`, `fputwc()`, `fputws()`, `fwprintf()`, `fwscanf()`, `getwc()`, `getwchar()`, `putwc()`,
2781 `putwchar()`, `ungetwc()`, `vwprintf()`, `vwscanf()`, `vwprintf()`, `vwscanf()`, `wprintf()`, and `wscanf()`.

2782 **Note:** These functions are defined in detail in the System Interfaces volume of POSIX.1-200x.

2783 **3.437 Wide-Character String**

2784 A contiguous sequence of wide-character codes terminated by and including the first null wide-
2785 character code.

2786 **3.438 Word**

2787 In the shell command language, a token other than an operator. In some cases a word is also a
 2788 portion of a word token: in the various forms of parameter expansion, such as $\${name-word}$,
 2789 and variable assignment, such as $name=word$, the word is the portion of the token depicted by
 2790 *word*. The concept of a word is no longer applicable following word expansions—only fields
 2791 remain.

2792 **Note:** For further information, see XCU [Section 2.6.2](#) (on page 2254) and [Section 2.6](#) (on page 2253).

2793 **3.439 Working Directory (or Current Working Directory)**

2794 A directory, associated with a process, that is used in pathname resolution for pathnames that do
 2795 not begin with a slash.

2796 **3.440 Worldwide Portability Interface**

2797 Functions for handling characters in a codeset-independent manner.

2798 **3.441 Write**

2799 To output characters to a file, such as standard output or standard error. Unless otherwise stated,
 2800 standard output is the default output destination for all uses of the term “write”; see the
 2801 distinction between display and write in [Section 3.132](#) (on page 51).

2802 **3.442 XSI**

2803 The X/Open System Interfaces (XSI) option is the core application programming interface for C
 2804 and *sh* programming for systems conforming to the Single UNIX Specification. This is a
 2805 superset of the mandatory requirements for conformance to POSIX.1-200x.

2806 **3.443 XSI-Conformant**

2807 A system which allows an application to be built using a set of services that are consistent across
 2808 all systems that conform to POSIX.1-200x and that support the XSI option.

2809 **Note:** See also [Chapter 2](#) (on page 15).

2810 **3.444 Zombie Process**

2811 A process that has terminated and that is deleted when its exit status has been reported to
 2812 another process which is waiting for that process to terminate.

2813 **3.445 ± 0**

2814 The algebraic sign provides additional information about any variable that has the value zero
 2815 when the representation allows the sign to be determined.

2816

2817

2818

For the purposes of POSIX.1-200x, the general concepts given in [Chapter 4](#) apply.

2819

2820

2821

Note: No shading to denote extensions or options occurs in this chapter. Where the terms and definitions given in this chapter are used elsewhere in text related to extensions and options, they are shaded as appropriate.

2822

4.1 Concurrent Execution

2823

2824

Functions that suspend the execution of the calling thread shall not cause the execution of other threads to be indefinitely suspended.

2825

4.2 Directory Protection

2826

2827

If a directory is writable and the mode bit `S_ISVTX` is set on the directory, a process may remove or rename files within that directory only if one or more of the following is true:

2828

- The effective user ID of the process is the same as that of the owner ID of the file.

2829

- The effective user ID of the process is the same as that of the owner ID of the directory.

2830

- The process has appropriate privileges.

2831

If the `S_ISVTX` bit is set on a non-directory file, the behavior is unspecified.

2832

4.3 Extended Security Controls

2833

2834

2835

2836

An implementation may provide implementation-defined extended security controls (see [Section 3.159](#), on page 55). These permit an implementation to provide security mechanisms to implement different security policies than those described in POSIX.1-200x. These mechanisms shall not alter or override the defined semantics of any of the interfaces in POSIX.1-200x.

4.4 File Access Permissions

The standard file access control mechanism uses the file permission bits, as described below.

Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An additional access control mechanism shall only further restrict the access permissions defined by the file permission bits. An alternate file access control mechanism shall:

- Specify file permission bits for the file owner class, file group class, and file other class of that file, corresponding to the access permissions.
- Be enabled only by explicit user action, on a per-file basis by the file owner or a user with the appropriate privilege.
- Be disabled for a file after the file permission bits are changed for that file with *chmod()*. The disabling of the alternate mechanism need not disable any additional mechanisms supported by an implementation.

Whenever a process requests file access permission for read, write, or execute/search, if no additional mechanism denies access, access shall be determined as follows:

- If a process has the appropriate privilege:
 - If read, write, or directory search permission is requested, access shall be granted.
 - If execute permission is requested, access shall be granted if execute permission is granted to at least one user by the file permission bits or by an alternate access control mechanism; otherwise, access shall be denied.
- Otherwise:
 - The file permission bits of a file contain read, write, and execute/search permissions for the file owner class, file group class, and file other class.
 - Access shall be granted if an alternate access control mechanism is not enabled and the requested access permission bit is set for the class (file owner class, file group class, or file other class) to which the process belongs, or if an alternate access control mechanism is enabled and it allows the requested access; otherwise, access shall be denied.

POSIX.1-200x does not provide a way to open a directory for searching. It is unspecified whether directory search permission is granted based on the file access modes of the directory's file descriptor or on the mode of the directory at the time the directory is searched.

4.5 File Hierarchy

Files in the system are organized in a hierarchical structure in which all of the non-terminal nodes are directories and all of the terminal nodes are any other type of file. Since multiple directory entries may refer to the same file, the hierarchy is properly described as a "directed graph".

2872 4.6 Filenames

2873 Uppercase and lowercase letters shall retain their unique identities between conforming
2874 implementations.

2875 4.7 Filename Portability

2876 For a filename to be portable across implementations conforming to POSIX.1-200x, it shall
2877 consist only of the portable filename character set as defined in [Section 3.275](#) (on page 71).

2878 Portable filenames shall not have the hyphen character as the first character since this may cause
2879 problems when filenames are passed as command line arguments.

2880 4.8 File Times Update

2881 Each file has three distinct associated timestamps: the time of last data access, the time of last
2882 data modification, and the time the file status last changed. These values are returned in the file
2883 characteristics structure `struct stat`, as described in [<sys/stat.h>](#) (on page 370).

2884 Each function or utility in POSIX.1-200x that reads or writes data or changes file status indicates
2885 which of the appropriate timestamps shall be “marked for update”. If an implementation of
2886 such a function or utility marks for update one of these timestamps in a place or time not
2887 specified by POSIX.1-200x, this shall be documented, except that any changes caused by
2888 pathname resolution need not be documented. For the other functions or utilities in
2889 POSIX.1-200x (those that are not explicitly required to read or write file data or change file
2890 status, but that in some implementations happen to do so), the effect is unspecified.

2891 An implementation may update timestamps that are marked for update immediately, or it may
2892 update such timestamps periodically. At the point in time when an update occurs, any marked
2893 timestamps shall be set to the current time and the update marks shall be cleared. All
2894 timestamps that are marked for update shall be updated when the file ceases to be open by any
2895 process or before a `stat()`, `fstat()`, `lstat()`, `fsync()`, `futimens()`, `utime()`, `utimensat()`, or `utimes()` is
2896 successfully performed on the file. Other times at which updates are done are unspecified.
2897 Marks for update, and updates themselves, shall not be done for files on read-only file systems;
2898 see [Section 3.303](#) (on page 75).

2899 The resolution of timestamps of files in a file system is implementation-defined, but shall be no
2900 coarser than one-second resolution. The three timestamps shall always have values that are
2901 supported by the file system. Whenever any of a file’s timestamps are to be set to a value V
2902 according to the rules of the preceding paragraphs of this section, the implementation shall
2903 immediately set the timestamp to the greatest value supported by the file system that is not
2904 greater than V .

4.9 Host and Network Byte Orders

When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be stored in several octets. The convention is that all such values are stored with 8 bits in each octet, and with the first (lowest-addressed) octet holding the most-significant bits. This is called “network byte order”.

Network byte order may not be convenient for processing actual values. For this, it is more sensible for values to be stored as ordinary integers. This is known as “host byte order”. In host byte order:

- The most significant bit might not be stored in the first byte in address order.
- Bits might not be allocated to bytes in any obvious order at all.

8-bit values stored in `uint8_t` objects do not require conversion to or from host byte order, as they have the same representation. 16 and 32-bit values can be converted using the `htonl()`, `htons()`, `ntohl()`, and `ntohs()` functions. When reading data that is to be converted to host byte order, it should either be received directly into a `uint16_t` or `uint32_t` object or should be copied from an array of bytes using `memcpy()` or similar. Passing the data through other types could cause the byte order to be changed. Similar considerations apply when sending data.

4.10 Measurement of Execution Time

The mechanism used to measure execution time shall be implementation-defined. The implementation shall also define to whom the CPU time that is consumed by interrupt handlers and system services on behalf of the operating system will be charged. See [Section 3.117](#) (on page 49).

4.11 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

<code>fork()</code>	<code>pthread_mutex_trylock()</code>	<code>pthread_rwlock_unlock()</code>
<code>pthread_barrier_wait()</code>	<code>pthread_mutex_unlock()</code>	<code>pthread_rwlock_wrlock()</code>
<code>pthread_cond_broadcast()</code>	<code>pthread_spin_lock()</code>	<code>sem_post()</code>
<code>pthread_cond_signal()</code>	<code>pthread_spin_trylock()</code>	<code>sem_timedwait()</code>
<code>pthread_cond_timedwait()</code>	<code>pthread_spin_unlock()</code>	<code>sem_trywait()</code>
<code>pthread_cond_wait()</code>	<code>pthread_rwlock_rdlock()</code>	<code>sem_wait()</code>
<code>pthread_create()</code>	<code>pthread_rwlock_timedrdlock()</code>	<code>semctl()</code>
<code>pthread_join()</code>	<code>pthread_rwlock_timedwrlock()</code>	<code>semop()</code>
<code>pthread_mutex_lock()</code>	<code>pthread_rwlock_tryrdlock()</code>	<code>wait()</code>
<code>pthread_mutex_timedlock()</code>	<code>pthread_rwlock_trywrlock()</code>	<code>waitpid()</code>

The `pthread_once()` function shall synchronize memory for the first call in each thread for a given `pthread_once_t` object.

The `pthread_mutex_lock()` function need not synchronize memory if the mutex type is `PTHREAD_MUTEX_RECURSIVE` and the calling thread already owns the mutex. The

2947 *pthread_mutex_unlock()* function need not synchronize memory if the mutex type is
2948 PTHREAD_MUTEX_RECURSIVE and the mutex has a lock count greater than one.

2949 Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified
2950 whether the invocation causes memory to be synchronized.

2951 Applications may allow more than one thread of control to read a memory location
2952 simultaneously.

2953 4.12 Pathname Resolution

2954 Pathname resolution is performed for a process to resolve a pathname to a particular file in a file
2955 hierarchy. There may be multiple pathnames that resolve to the same file.

2956 Each filename in the pathname is located in the directory specified by its predecessor (for
2957 example, in the pathname fragment *a/b*, file *b* is located in directory *a*). Pathname resolution
2958 shall fail if this cannot be accomplished. If the pathname begins with a slash, the predecessor of
2959 the first filename in the pathname shall be taken to be the root directory of the process (such
2960 pathnames are referred to as “absolute pathnames”). If the pathname does not begin with a
2961 slash, the predecessor of the first filename of the pathname shall be taken to be either the current
2962 working directory of the process or for certain interfaces the directory identified by a file
2963 descriptor passed to the interface (such pathnames are referred to as “relative pathnames”).

2964 The interpretation of a pathname component is dependent on the value of {NAME_MAX} and
2965 _POSIX_NO_TRUNC associated with the path prefix of that component. If any pathname
2966 component is longer than {NAME_MAX}, the implementation shall consider this an error.

2967 A pathname that contains at least one non-slash character and that ends with one or more
2968 trailing slashes shall be resolved as if a single dot character (‘.’) were appended to the
2969 pathname.

2970 If a symbolic link is encountered during pathname resolution, the behavior shall depend on
2971 whether the pathname component is at the end of the pathname and on the function being
2972 performed. If all of the following are true, then pathname resolution is complete:

- 2973 1. This is the last pathname component of the pathname.
- 2974 2. The pathname has no trailing slash.
- 2975 3. The function is required to act on the symbolic link itself, or certain arguments direct that
2976 the function act on the symbolic link itself.

2977 In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the
2978 symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers
2979 this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be
2980 returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created.
2981 If the resulting pathname does not begin with a slash, the predecessor of the first filename of the
2982 pathname is taken to be the directory containing the symbolic link.

2983 If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and
2984 return an error indication. The same may happen if during the resolution process more symbolic
2985 links were followed than the implementation allows. This implementation-defined limit shall
2986 not be smaller than {SYMLOOP_MAX}.

2987 The special filename dot shall refer to the directory specified by its predecessor. The special
2988 filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case,
2989 in the root directory, dot-dot may refer to the root directory itself.

2990 A pathname consisting of a single slash shall resolve to the root directory of the process. A null

2991 pathname shall not be successfully resolved. A pathname that begins with two successive
 2992 slashes may be interpreted in an implementation-defined manner, although more than two
 2993 leading slashes shall be treated as a single slash.

2994 4.13 Process ID Reuse

2995 A process group ID shall not be reused by the system until the process group lifetime ends.

2996 A process ID shall not be reused by the system until the process lifetime ends. In addition, if
 2997 there exists a process group whose process group ID is equal to that process ID, the process ID
 2998 shall not be reused by the system until the process group lifetime ends. A process that is not a
 2999 system process shall not have a process ID of 1.

3000 4.14 Scheduling Policy

3001 A scheduling policy affects process or thread ordering:

- 3002 • When a process or thread is a running thread and it becomes a blocked thread
- 3003 • When a process or thread is a running thread and it becomes a preempted thread
- 3004 • When a process or thread is a blocked thread and it becomes a runnable thread
- 3005 • When a running thread calls a function that can change the priority or scheduling policy of
 3006 a process or thread
- 3007 • In other scheduling policy-defined circumstances

3008 Conforming implementations shall define the manner in which each of the scheduling policies
 3009 may modify the priorities or otherwise affect the ordering of processes or threads at each of the
 3010 occurrences listed above. Additionally, conforming implementations shall define in what other
 3011 circumstances and in what manner each scheduling policy may modify the priorities or affect
 3012 the ordering of processes or threads.

3013 4.15 Seconds Since the Epoch

3014 A value that approximates the number of seconds that have elapsed since the Epoch. A
 3015 Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*),
 3016 hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900
 3017 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the
 3018 expression below.

3019 If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and
 3020 the value is non-negative, the value is related to a Coordinated Universal Time name according
 3021 to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all
 3022 integer types:

3023
$$tm_sec + tm_min*60 + tm_hour*3600 + tm_yday*86400 +$$
 3024
$$(tm_year-70)*31536000 + ((tm_year-69)/4)*86400 -$$
 3025
$$((tm_year-1)/100)*86400 + ((tm_year+299)/400)*86400$$

3026 The relationship between the actual time of day and the current value for seconds since the
 3027 Epoch is unspecified.

3028 How any changes to the value of seconds since the Epoch are made to align to a desired
 3029 relationship with the current actual time is implementation-defined. As represented in seconds

3030 since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

3031 **Note:** The last three terms of the expression add in a day for each year that follows a leap year starting
 3032 with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973,
 3033 the second subtracts a day back out every 100 years starting in 2001, and the third adds a day
 3034 back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that
 3035 is, the remainder is discarded leaving only the integer quotient.

3036 4.16 Semaphore

3037 A minimum synchronization primitive to serve as a basis for more complex synchronization
 3038 mechanisms to be defined by the application program.

3039 For the semaphores associated with the Semaphores option, a semaphore is represented as a
 3040 shareable resource that has a non-negative integer value. When the value is zero, there is a
 3041 (possibly empty) set of threads awaiting the availability of the semaphore.

3042 For the semaphores associated with the X/Open System Interfaces (XSI) option, a semaphore is
 3043 a positive integer (0 through 32767). The *semget()* function can be called to create a set or array of
 3044 semaphores. A semaphore set can contain one or more semaphores up to an implementation-
 3045 defined value.

3046 Semaphore Lock Operation

3047 An operation that is applied to a semaphore. If, prior to the operation, the value of the
 3048 semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and
 3049 added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

3050 Semaphore Unlock Operation

3051 An operation that is applied to a semaphore. If, prior to the operation, there are any threads in
 3052 the set of threads awaiting the semaphore, then some thread from that set shall be removed from
 3053 the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

3054 4.17 Thread-Safety

3055 Refer to XSH [Section 2.9](#) (on page 485).

3056 4.18 Tracing

3057 The trace system allows a traced process to have a selection of events created for it. Traces
 3058 consist of streams of trace event types.

3059 A trace event type is identified on the one hand by a trace event type name, also referenced as a
 3060 trace event name, and on the other hand by a trace event type identifier. A trace event name is a
 3061 human-readable string. A trace event type identifier is an opaque identifier used by the trace
 3062 system. There shall be a one-to-one relationship between trace event type identifiers and trace
 3063 event names for a given trace stream and also for a given traced process. The trace event type
 3064 identifier shall be generated automatically from a trace event name by the trace system either
 3065 when a trace controller process invokes *posix_trace_trid_eventid_open()* or when an instrumented
 3066 application process invokes *posix_trace_eventid_open()*. Trace event type identifiers are used to
 3067 filter trace event types, to allow interpretation of user data, and to identify the kind of trace
 3068 point that generated a trace event.

3069 Each trace event shall be of a particular trace event type, and associated with a trace event type
 3070 identifier. The execution of a trace point shall generate a trace event if a trace stream has been
 3071 created and started for the process that executed the trace point and if the corresponding trace
 3072 event type identifier is not ignored by filtering.

3073 A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a
 3074 trace log is associated with the trace stream, except that:

- 3075 • For a trace stream, if no resources are available for the event, the event is lost.
- 3076 • For a trace log, if no resources are available for the event, or a flush operation does not
 3077 succeed, the event is lost.

3078 A trace event recorded in an active trace stream may be retrieved by an application having the
 3079 appropriate privileges.

3080 A trace event recorded in a trace log may be retrieved by an application having the appropriate
 3081 privileges after opening the trace log as a pre-recorded trace stream, with the function
 3082 *posix_trace_open()*.

3083 When a trace event is reported it is possible to retrieve the following:

- 3084 • A trace event type identifier
- 3085 • A timestamp
- 3086 • The process ID of the traced process, if the trace event is process-dependent
- 3087 • Any optional trace event data including its length
- 3088 • If the Threads option is supported, the thread ID, if the trace event is process-dependent
- 3089 • The program address at which the trace point was invoked

3090 Trace events may be mapped from trace event types to trace event names. One such mapping
 3091 shall be associated with each trace stream. An active trace stream is associated with a traced
 3092 process, and also with its children if the Trace Inherit option is supported and also the
 3093 inheritance policy is set to `_POSIX_TRACE_INHERIT`. Therefore each traced process has a
 3094 mapping of the trace event names to trace event type identifiers that have been defined for that
 3095 process.

3096 Traces can be recorded into either trace streams or trace logs.

3097 The implementation and format of a trace stream are unspecified. A trace stream need not be
 3098 and generally is not persistent. A trace stream may be either active or pre-recorded:

- 3099 • An active trace stream is a trace stream that has been created and has not yet been shut
 3100 down. It can be of one of the two following classes:
 - 3101 1. An active trace stream without a trace log that was created with the
 3102 *posix_trace_create()* function
 - 3103 2. If the Trace Log option is supported, an active trace stream with a trace log that was
 3104 created with the *posix_trace_create_withlog()* function
- 3105 • A pre-recorded trace stream is a trace stream that was opened from a trace log object using
 3106 the *posix_trace_open()* function.

3107 An active trace stream can loop. This behavior means that when the resources allocated by the
 3108 trace system for the trace stream are exhausted, the trace system reuses the resources associated
 3109 with the oldest recorded trace events to record new trace events.

3110 If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This

3111 operation causes the trace system to write trace events from the trace stream to the associated
3112 trace log, following the defined policies or using an explicit function call. After this operation,
3113 the trace system may reuse the resources associated with the flushed trace events.

3114 An active trace stream with or without a trace log can be cleared. This operation shall cause all
3115 the resources associated with this trace stream to be reinitialized. The trace stream shall behave
3116 as if it was returning from its creation, except that the mapping of trace event type identifiers to
3117 trace event names shall not be cleared. If a trace log was associated with this trace stream, the
3118 trace log shall also be reinitialized.

3119 A trace log shall be recorded when the *posix_trace_shutdown()* operation is invoked or during
3120 tracing, depending on the tracing strategy which is defined by a log policy. After the trace
3121 stream has been shut down, the trace information can be retrieved from the associated trace log
3122 using the same interface used to retrieve information from an active trace stream.

3123 For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance
3124 attribute is `_POSIX_TRACE_INHERIT`, the initial targeted traced process shall be traced together
3125 with all of its future children. The *posix_pid* member of each trace event in a trace stream shall be
3126 the process ID of the traced process.

3127 Each trace point may be an implementation-defined action such as a context switch, or an
3128 application-programmed action such as a call to a specific operating system service (for
3129 example, *fork()*) or a call to *posix_trace_event()*.

3130 Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace
3131 events. By default, no trace events are filtered.

3132 The results of the tracing operations can be analyzed and monitored by a trace controller process
3133 or a trace analyzer process.

3134 Only the trace controller process has control of the trace stream it has created. The control of the
3135 operation of a trace stream is done using its corresponding trace stream identifier. The trace
3136 controller process is able to:

- 3137 • Initialize the attributes of a trace stream
- 3138 • Create the trace stream
- 3139 • Start and stop tracing
- 3140 • Know the mapping of the traced process
- 3141 • If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- 3142 • Shut the trace stream down

3143 A traced process may also be a trace controller process. Only the trace controller process can
3144 control its trace stream(s). A trace stream created by a trace controller process shall be shut down
3145 if its controller process terminates or executes another file.

3146 A trace controller process may also be a trace analyzer process. Trace analysis can be done
3147 concurrently with the traced process or can be done off-line, in the same or in a different
3148 platform.

3149 4.19 Treatment of Error Conditions for Mathematical Functions

3150 For all the functions in the `<math.h>` header, an application wishing to check for error situations
 3151 should set `errno` to 0 and call `feclearexcept(FE_ALL_EXCEPT)` before calling the function. On
 3152 return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW |`
 3153 `FE_UNDERFLOW)` is non-zero, an error has occurred.

3154 The following error conditions are defined for all functions in the `<math.h>` header.

3155 4.19.1 Domain Error

3156 A “domain error” shall occur if an input argument is outside the domain over which the
 3157 mathematical function is defined. The description of each function lists any required domain
 3158 errors; an implementation may define additional domain errors, provided that such errors are
 3159 consistent with the mathematical definition of the function.

3160 On a domain error, the function shall return an implementation-defined value; if the integer
 3161 expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [EDOM]; if
 3162 the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “invalid”
 3163 floating-point exception shall be raised.

3164 4.19.2 Pole Error

3165 A “pole error” occurs if the mathematical result of the function is an exact infinity (for example,
 3166 `log(0.0)`).

3167 On a pole error, the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or
 3168 `HUGE_VALL` according to the return type, with the same sign as the correct value of the
 3169 function; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall
 3170 be set to [ERANGE]; if the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-
 3171 zero, the “divide-by-zero” floating-point exception shall be raised.

3172 4.19.3 Range Error

3173 A “range error” shall occur if the finite mathematical result of the function cannot be
 3174 represented in an object of the specified type, due to extreme magnitude.

3175 4.19.3.1 Result Overflows

3176 A floating result overflows if the magnitude of the mathematical result is finite but so large that
 3177 the mathematical result cannot be represented without extraordinary roundoff error in an object
 3178 of the specified type. If a floating result overflows and default rounding is in effect, then the
 3179 function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL`
 3180 according to the return type, with the same sign as the correct value of the function; if the integer
 3181 expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [ERANGE]; if
 3182 the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “overflow”
 3183 floating-point exception shall be raised.

3184 4.19.3.2 Result Underflows

3185 The result underflows if the magnitude of the mathematical result is so small that the
 3186 mathematical result cannot be represented, without extraordinary roundoff error, in an object of
 3187 the specified type. If the result underflows, the function shall return an implementation-defined
 3188 value whose magnitude is no greater than the smallest normalized positive number in the
 3189 specified type; if the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 3190 whether `errno` is set to [ERANGE] is implementation-defined; if the integer expression

3191 (math_errhandling & MATH_ERREXCEPT) is non-zero, whether the “underflow” floating-point
3192 exception is raised is implementation-defined.

3193 4.20 Treatment of NaN Arguments for the Mathematical Functions

3194 For functions called with a NaN argument, no errors shall occur and a NaN shall be returned,
3195 except where stated otherwise.

3196 If a function with one or more NaN arguments returns a NaN result, the result should be the
3197 same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

3198 On implementations that support the IEC 60559:1989 standard floating point, functions with
3199 signaling NaN argument(s) shall be treated as if the function were called with an argument that
3200 is a required domain error and shall return a quiet NaN result, except where stated otherwise.

3201 **Note:** The function might never see the signaling NaN, since it might trigger when the arguments are
3202 evaluated during the function call.

3203 On implementations that support the IEC 60559:1989 standard floating point, for those
3204 functions that do not have a documented domain error, the following shall apply:

3205 These functions shall fail if:

3206 Domain Error Any argument is a signaling NaN.

3207 Either, the integer expression (math_errhandling & MATH_ERRNO) is non-zero and *errno*
3208 shall be set to [EDOM], or the integer expression (math_errhandling &
3209 MATH_ERREXCEPT) is non-zero and the invalid floating-point exception shall be raised.

3210 4.21 Utility

3211 A utility program shall be either an executable file, such as might be produced by a compiler or
3212 linker system from computer source code, or a file of shell source code, directly interpreted by
3213 the shell. The program may have been produced by the user, provided by the system
3214 implementor, or acquired from an independent distributor.

3215 The system may implement certain utilities as shell functions (see XCU [Section 2.9.5](#), on page |
3216 2270) or built-in utilities, but only an application that is aware of the command search order (as |
3217 described in XCU [Section 2.9.1.1](#), on page 2264) or of performance characteristics can discern |
3218 differences between the behavior of such a function or built-in utility and that of an executable |
3219 file.

4.22 Variable Assignment

In the shell command language, a word consisting of the following parts:

varname=value

When used in a context where assignment is defined to occur and at no other time, the *value* (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

Note: For further information, see XCU [Section 2.9.1](#) (on page 2263).

The *varname* and *value* parts shall meet the requirements for a name and a word, respectively, except that they are delimited by the embedded unquoted equals-sign, in addition to other delimiters.

Note: Additional delimiters are described in XCU [Section 2.3](#) (on page 2247).

When a variable assignment is done, the variable shall be created if it did not already exist. If *value* is not specified, the variable shall be given a null value.

Note: An alternative form of variable assignment:

symbol=value

(where *symbol* is a valid word delimited by an equals-sign, but not a valid name) produces unspecified results. The form *symbol=value* is used by the KornShell *name[expression]=value* syntax.

File Format Notation

The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility descriptions use a syntax to describe the data organization within the files, when that organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces volume of POSIX.1-200x *printf()* function, as described in this chapter. When used in STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that could have been used to write the text to be read, not a format that could be used by the System Interfaces volume of POSIX.1-200x *scanf()* function to read the input file.

The description of an individual record is as follows:

"<format>", [*<arg1>*, *<arg2>*, . . . , *<argn>*]

The *format* is a character string that contains three types of objects defined below:

1. *Characters* that are not "escape sequences" or "conversion specifications", as described below, shall be copied to the output.
2. *Escape Sequences* represent non-graphic characters.
3. *Conversion Specifications* specify the output format of each argument; see below.

The following characters have the following special meaning in the format string:

- ' ' (An empty character position.) Represents one or more <blank>s.
- Δ Represents exactly one <space>.

Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

3257

Table 5-1 Escape Sequences and Associated Actions

3258

3259

3260

3261

3262

3263

3264

3265

3266

3267

3268

3269

3270

3271

3272

3273

Escape Sequence	Represents Character	Terminal Action
'\\'	backslash	Print the character '\\ '.
'\a'	alert	Attempt to alert the user through audible or visible notification.
'\b'	backspace	Move the printing position to one column before the current position, unless the current position is the start of a line.
'\f'	form-feed	Move the printing position to the initial printing position of the next logical page.
'\n'	newline	Move the printing position to the start of the next line.
'\r'	carriage-return	Move the printing position to the start of the current line.
'\t'	tab	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
'\v'	vertical-tab	Move the printing position to the start of the next vertical tab position. If there are no more vertical tab positions left on the page, the behavior is undefined.

3274

3275

Each conversion specification is introduced by the percent-sign character ('%'). After the character '%', the following shall appear in sequence:

3276

3277

flags Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

3278

3279

3280

3281

field width An optional string of decimal digits to specify a minimum field width. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag ('-'), described below, has been given) to the field width.

3282

3283

3284

3285

3286

3287

3288

precision Gives the minimum number of digits to appear for the *d*, *o*, *i*, *u*, *x*, or *X* conversion specifiers (the field is padded with leading zeros), the number of digits to appear after the radix character for the *e* and *f* conversion specifiers, the maximum number of significant digits for the *g* conversion specifier; or the maximum number of bytes to be written from a string in the *s* conversion specifier. The precision shall take the form of a period ('.') followed by a decimal digit string; a null digit string is treated as zero.

3289

3290

3291

conversion specifier characters
A conversion specifier character (see below) that indicates the type of conversion to be applied.

3292

The *flag* characters and their meanings are:

3293

3294

3295

3296

3297

3298

3299

3300

3301

3302

- The result of the conversion shall be left-justified within the field.

+ The result of a signed conversion shall always begin with a sign ('+' or '-').

<space> If the first character of a signed conversion is not a sign, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.

The value shall be converted to an alternative form. For *c*, *d*, *i*, *u*, and *s* conversion specifiers, the behavior is undefined. For the *o* conversion specifier, it shall increase the precision to force the first digit of the result to be a zero. For *x* or *X* conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively. For *e*, *E*, *f*, *g*, and *G* conversion specifiers, the result shall always contain a radix

File Format Notation

3303		character, even if no digits follow the radix character. For <code>g</code> and <code>G</code> conversion
3304		specifiers, trailing zeros shall not be removed from the result as they usually are.
3305	0	For <code>d</code> , <code>i</code> , <code>o</code> , <code>u</code> , <code>x</code> , <code>X</code> , <code>e</code> , <code>E</code> , <code>f</code> , <code>g</code> , and <code>G</code> conversion specifiers, leading zeros (following
3306		any indication of sign or base) shall be used to pad to the field width; no space
3307		padding is performed. If the <code>'0'</code> and <code>'-'</code> flags both appear, the <code>'0'</code> flag shall be
3308		ignored. For <code>d</code> , <code>i</code> , <code>o</code> , <code>u</code> , <code>x</code> , and <code>X</code> conversion specifiers, if a precision is specified, the
3309		<code>'0'</code> flag shall be ignored. For other conversion specifiers, the behavior is
3310		undefined.
3311		Each conversion specifier character shall result in fetching zero or more arguments. The results
3312		are undefined if there are insufficient arguments for the format. If the format is exhausted while
3313		arguments remain, the excess arguments shall be ignored.
3314		The conversion specifiers and their meanings are:
3315	<code>d,i,o,u,x,X</code>	The integer argument shall be written as signed decimal (<code>d</code> or <code>i</code>), unsigned octal
3316		(<code>o</code>), unsigned decimal (<code>u</code>), or unsigned hexadecimal notation (<code>x</code> and <code>X</code>). The <code>d</code> and
3317		<code>i</code> specifiers shall convert to signed decimal in the style <code>"[-]dddd"</code> . The <code>x</code>
3318		conversion specifier shall use the numbers and letters <code>"0123456789abcdef"</code> and
3319		the <code>X</code> conversion specifier shall use the numbers and letters
3320		<code>"0123456789ABCDEF"</code> . The <i>precision</i> component of the argument shall specify
3321		the minimum number of digits to appear. If the value being converted can be
3322		represented in fewer digits than the specified minimum, it shall be expanded with
3323		leading zeros. The default precision shall be 1. The result of converting a zero
3324		value with a precision of 0 shall be no characters. If both the field width and
3325		precision are omitted, the implementation may precede, follow, or precede and
3326		follow numeric arguments of types <code>d</code> , <code>i</code> , and <code>u</code> with <code><blank></code> s; arguments of type <code>o</code>
3327		(octal) may be preceded with leading zeros.
3328	<code>f</code>	The floating-point number argument shall be written in decimal notation in the
3329		style <code>[-]ddd.ddd</code> , where the number of digits after the radix character (shown here
3330		as a decimal point) shall be equal to the <i>precision</i> specification. The <code>LC_NUMERIC</code>
3331		locale category shall determine the radix character to use in this format. If the
3332		<i>precision</i> is omitted from the argument, six digits shall be written after the radix
3333		character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3334	<code>e,E</code>	The floating-point number argument shall be written in the style <code>[-]d.ddde±dd</code> (the
3335		symbol <code>'±'</code> indicates either a plus or minus sign), where there is one digit before
3336		the radix character (shown here as a decimal point) and the number of digits after
3337		it is equal to the precision. The <code>LC_NUMERIC</code> locale category shall determine the
3338		radix character to use in this format. When the precision is missing, six digits shall
3339		be written after the radix character; if the precision is 0, no radix character shall
3340		appear. The <code>E</code> conversion specifier shall produce a number with <code>E</code> instead of <code>e</code>
3341		introducing the exponent. The exponent shall always contain at least two digits.
3342		However, if the value to be written requires an exponent greater than two digits,
3343		additional exponent digits shall be written as necessary.
3344	<code>g,G</code>	The floating-point number argument shall be written in style <code>f</code> or <code>e</code> (or in style <code>F</code>
3345		or <code>E</code> in the case of a <code>G</code> conversion specifier), with the precision specifying the
3346		number of significant digits. The style used depends on the value converted: style
3347		<code>e</code> (or <code>E</code>) shall be used only if the exponent resulting from the conversion is less
3348		than <code>-4</code> or greater than or equal to the precision. Trailing zeros are removed from
3349		the result. A radix character shall appear only if it is followed by a digit.

- 3350 c The integer argument shall be converted to an **unsigned char** and the resulting
3351 byte shall be written.
- 3352 s The argument shall be taken to be a string and bytes from the string shall be
3353 written until the end of the string or the number of bytes indicated by the *precision*
3354 specification of the argument is reached. If the precision is omitted from the
3355 argument, it shall be taken to be infinite, so all bytes up to the end of the string
3356 shall be written.
- 3357 % Write a '%' character; no argument is converted.
- 3358 In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of
3359 a conversion is wider than the field width, the field is simply expanded to contain the
3360 conversion result. The term "field width" should not be confused with the term "precision"
3361 used in the description of %s.

3362 Examples

3363 To represent the output of a program that prints a date and time in the form Sunday, July 3,
3364 10:02, where *weekday* and *month* are strings:

3365 "%s, Δ%sΔ%d, Δ%d: %.2d\n" <weekday>, <month>, <day>, <hour>, <min>

3366 To show 'π' written to 5 decimal places:

3367 "piΔ=Δ%.5f\n", <value of π>

3368 To show an input file format consisting of five colon-separated fields:

3369 "%s:%s:%s:%s:%s\n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of POSIX.1-200x. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:2000 standard.

Table 6-1 Portable Character Set

Symbolic Name	Glyph	UCS	Description
<NUL>		<U0000>	NULL (NUL)

3487	<left-brace>	{	<U007B>	LEFT CURLY BRACKET
3488	<left-curly-bracket>	{	<U007B>	LEFT CURLY BRACKET
3489	<vertical-line>		<U007C>	VERTICAL LINE
3490	<right-brace>	}	<U007D>	RIGHT CURLY BRACKET
3491	<right-curly-bracket>	}	<U007D>	RIGHT CURLY BRACKET
3492	<tilde>	~	<U007E>	TILDE

3493 POSIX.1-200x uses character names other than the above, but only in an informative way; for
 3494 example, in examples to illustrate the use of characters beyond the portable character set with
 3495 the facilities of POSIX.1-200x.

3496 **Table 6-1** (on page 111) defines the characters in the portable character set and the corresponding
 3497 symbolic character names used to identify each character in a character set description file. The
 3498 table contains more than one symbolic character name for characters whose traditional name
 3499 differs from the chosen name. Characters defined in **Table 6-2** (on page 116) may also be used in
 3500 character set description files.

3501 POSIX.1-200x places only the following requirements on the encoded values of the characters in
 3502 the portable character set:

- 3503 • If the encoded values associated with each member of the portable character set are not
 3504 invariant across all locales supported by the implementation, if an application accesses any
 3505 pair of locales where the character encodings differ, or accesses data from an application
 3506 running in a locale which has different encodings from the application's current locale, the
 3507 results are unspecified.
- 3508 • The encoded values associated with the digits 0 to 9 shall be such that the value of each
 3509 character after 0 shall be one greater than the value of the previous character.
- 3510 • A null character, NUL, which has all bits set to zero, shall be in the set of characters.

- 3511 • The encoded values associated with the members of the portable character set are each
3512 represented in a single byte. Moreover, if the value is stored in an object of C-language
3513 type **char**, it is guaranteed to be positive (except the NUL, which is always zero).

3514 Conforming implementations shall support certain character and character set attributes, as
3515 defined in [Section 7.2](#) (on page 122).

3516 6.2 Character Encoding

3517 The POSIX locale contains the characters in [Table 6-1](#) (on page 111), which have the properties
3518 listed in [Section 7.3.1](#) (on page 124). In other locales, the presence, meaning, and representation
3519 of any additional characters are locale-specific.

3520 In locales other than the POSIX locale, a character may have a state-dependent encoding. There
3521 are two types of these encodings:

- 3522 • A single-shift encoding (where each character not in the initial shift state is preceded by a
3523 shift code) can be defined if each shift-code and character sequence is considered a multi-
3524 byte character. This is done using the concatenated-constant format in a character set
3525 description file, as described in [Section 6.4](#) (on page 115). If the implementation supports a
3526 character encoding of this type, all of the standard utilities in the Shell and Utilities volume
3527 of POSIX.1-200x shall support it. Use of a single-shift encoding with any of the functions in
3528 the System Interfaces volume of POSIX.1-200x that do not specifically mention the effects
3529 of state-dependent encoding is implementation-defined.
- 3530 • A locking-shift encoding (where the state of the character is determined by a shift code
3531 that may affect more than the single character following it) cannot be defined with the
3532 current character set description file format. Use of a locking-shift encoding with any of
3533 the standard utilities in the Shell and Utilities volume of POSIX.1-200x or with any of the
3534 functions in the System Interfaces volume of POSIX.1-200x that do not specifically mention
3535 the effects of state-dependent encoding is implementation-defined.

3536 While in the initial shift state, all characters in the portable character set shall retain their usual
3537 interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the
3538 sequence shall be a function of the current shift state. A byte with all bits zero shall be
3539 interpreted as the null character independent of shift state. Such a byte shall not occur as part of
3540 any other character.

3541 The maximum allowable number of bytes in a character in the current locale shall be indicated
3542 by {MB_CUR_MAX}, defined in the `<stdlib.h>` header and by the `<mb_cur_max>` value in a
3543 character set description file; see [Section 6.4](#) (on page 115). The implementation's maximum
3544 number of bytes in a character shall be defined by the C-language macro {MB_LEN_MAX}.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's `LC_CTYPE` definition (see [Section 7.3.1](#), on page 124) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see [Section 3.245](#), on page 67), and terminates wide-character strings (see [Section 3.435](#), on page 93). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation. POSIX.1-200x provides no means of defining a wide-character codeset.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in POSIX.1-200x as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

POSIX.1-200x does not require that multiple character sets or codesets be supported. Although multiple charmap files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's `-f` option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in [Table 6-1](#) (on page 111), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in [Table 6-1](#) (on page 111) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs `'{', '}', '_-', '\/', '\', ' . ', and '^'` have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in [Table 6-2](#) (on page 116) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in [Table 6-2](#) (on page 116) may be the same as characters found in [Table 6-1](#) (on page 111); both names shall be provided for each encoding.

3584

Table 6-2 Control Character Set

3585
3586
3587
3588
3589
3590

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>		<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>		<FF>	<IS3>	<SO>	<VT>

3591
3592
3593

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank>s, followed by the value to be assigned to the symbol.

3594
3595
3596

<code_set_name> The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 111).

3597
3598

<mb_cur_max> The maximum number of bytes in a multi-byte character. This shall default to 1.

3599
3600
3601

XSI

<mb_cur_min> An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, <mb_cur_min> shall always be 1.

3602
3603
3604
3605

<escape_char> The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to backslash ('\''), which is the character used in all the following text and examples, unless otherwise noted.

3606
3607
3608

<comment_char> The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the number sign ('#').

3609
3610
3611
3612
3613
3614

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string "CHARMAP" starting in column 1, and preceding a trailer line containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a <comment_char> in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file) shall be in either of two forms:

3615
3616

```
"%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

or:

3617
3618

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,  
  <encoding>, <comments>
```

3619
3620
3621
3622
3623

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 111), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence "<\\>" represents the symbolic name ">" enclosed between angle brackets.

3624
3625
3626
3627
3628

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 111), followed by an integer formed by one or more decimal digits. Both integers shall contain the same number of digits. The characters preceding the integer shall be identical in the two symbolic

3629 names, and the integer formed by the digits in the second symbolic name shall be equal to or
 3630 greater than the integer formed by the digits in the first name. This shall be interpreted as a
 3631 series of symbolic names formed from the common part and each of the integers between the
 3632 first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the
 3633 symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

3634 A character set mapping definition line shall exist for all symbolic names specified in Table 6-1
 3635 (on page 111), and shall define the coded character value that corresponds to the character
 3636 indicated in the table, or the coded character value that corresponds to the control character
 3637 symbolic name. If the control characters commonly associated with the symbolic names in Table
 3638 6-2 (on page 116) are supported by the implementation, the symbolic name and the
 3639 corresponding encoding value shall be included in the file. Additional unique symbolic names
 3640 may be included. A coded character value can be represented by more than one symbolic name.

3641 The encoding part is expressed as one (for single-byte character values) or more concatenated
 3642 decimal, octal, or hexadecimal constants in the following formats:

```
3643 "%cd%u", <escape_char>, <decimal byte value>
3644 "%cx%x", <escape_char>, <hexadecimal byte value>
3645 "%c%o", <escape_char>, <octal byte value>
```

3646 Decimal constants shall be represented by two or three decimal digits, preceded by the escape
 3647 character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143".
 3648 Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape
 3649 character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal
 3650 constants shall be represented by two or three octal digits, preceded by the escape character;
 3651 for example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an
 3652 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the
 3653 same type, and interpreted in sequence from first to last with the first byte of the multi-
 3654 byte character specified by the first byte in the sequence. The manner in which these constants
 3655 are represented in the character stored in the system is implementation-defined. (This notation
 3656 was chosen for reasons of portability. There is no requirement that the internal representation in
 3657 the computer memory be in this same order.) Omitting bytes from a multi-byte character
 3658 definition produces undefined results.

3659 In lines defining ranges of symbolic names, the encoded value shall be the value for the first
 3660 symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic
 3661 names defined by the range shall have encoding values in increasing order. Bytes shall be
 3662 treated as unsigned octets, and carry shall be propagated between the bytes as necessary to
 3663 represent the range. However, because this causes a null byte in the second or subsequent bytes
 3664 of a character, such a declaration should not be specified. For example, the line:

```
3665 <j0101>...<j0104> \d129\d254
```

3666 is interpreted as:

```
3667 <j0101>          \d129\d254
3668 <j0102>          \d129\d255
3669 <j0103>          \d130\d00
3670 <j0104>          \d130\d01
```

3671 The expanded declaration of the symbol <j0103> in the above example is an invalid
 3672 specification, because it contains a null byte in the second byte of a character.

3673 The comment is optional.

3674 POSIX.1-200x provides no means of defining a wide-character codeset. |

3675 The following declarations can follow the character set mapping definitions (after the "END

3676 CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in
3677 column 1, followed by the value(s) to be associated to the keyword, as defined below.

3678 **WIDTH** A non-negative integer value defining the column width (see [Section 3.102](#), on
3679 page 47) for the printable characters in the coded character set specified in [Table](#)
3680 [6-1](#) (on page 111) and [Table 6-2](#) (on page 116). Coded character set character values
3681 shall be defined using symbolic character names followed by column width
3682 values. Defining a character with more than one **WIDTH** produces undefined
3683 results. The **END WIDTH** keyword shall be used to terminate the **WIDTH**
3684 definitions. Specifying the width of a non-printable character in a **WIDTH**
3685 declaration produces undefined results.

3686 **WIDTH_DEFAULT**
3687 A non-negative integer value defining the default column width for any printable
3688 character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT**
3689 keyword is included in the charmap, the default character width shall be 1.

3690 Example

3691 After the "END CHARMAP" statement, a syntax for a width definition would be:

```
3692 WIDTH
3693 <A> 1
3694 <B> 1
3695 <C>...<Z> 1
3696 ...
3697 <fool>...<foon> 2
3698 ...
3699 END WIDTH
```

3700 In this example, the numerical code point values represented by the symbols **<A>** and **** are
3701 assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on)
3702 are also assigned a width of 1. Using **<A>...<Z>** would have required fewer lines, but the
3703 alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have
3704 been added as appropriate.

3705 6.4.1 State-Dependent Character Encodings

3706 This section addresses the use of state-dependent character encodings (that is, those in which the
3707 encoding of a character is dependent on one or more shift codes that may precede it).

3708 A single-shift encoding (where each character not in the initial shift state is preceded by a shift
3709 code) can be defined in the charmap format if each shift-code/character sequence is considered
3710 a multi-byte character, defined using the concatenated-constant format described in [Section 6.4](#)
3711 (on page 115). If the implementation supports a character encoding of this type, all of the
3712 standard utilities shall support it. A locking-shift encoding (where the state of the character is
3713 determined by a shift code that may affect more than the single character following it) could be
3714 defined with an extension to the charmap format described in [Section 6.4](#) (on page 115). If the
3715 implementation supports a character encoding of this type, any of the standard utilities that
3716 describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

- 3717 1. The utility shall process the statefully encoded data as a concatenation of state-
3718 independent characters. The presence of redundant locking shifts shall not affect the
3719 comparison of two statefully encoded strings.

3720
3721
3722

2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall produce output that contains locking shifts at the beginning or end of the resulting data, if appropriate, to retain correct state information.

7.1 General

A locale is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

LC_CTYPE Character classification and case conversion.

LC_COLLATE Collation order.

LC_MONETARY Monetary formatting.

LC_NUMERIC Numeric, non-monetary formatting.

LC_TIME Date and time formats.

LC_MESSAGES Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of POSIX.1-200x shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of POSIX.1-200x shall also be modified based on the current locale, as defined by the last call to *setlocale()*.

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the *_POSIX2_LOCALEDEF* symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of POSIX.1-200x shall provide one or more locales that behave as described in this chapter. The input to the utility is described in Section 7.3 (on page 122). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale (see Section 7.2, on page 122). When the value of a locale environment variable begins with a slash ('/'), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a slash, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by invoking the *setlocale()* function (or equivalent) with the appropriate value. If the function is invoked with an empty string, such as:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as

3762 defined in [Chapter 8](#) (on page 159).

3763 7.2 POSIX Locale

3764 Conforming systems shall provide a POSIX locale, also known as the C locale. The behavior of
3765 standard utilities and functions in the POSIX locale shall be as if the locale was defined via the
3766 *localedef* utility with input data from the POSIX locale tables in [Section 7.3](#).

3767 The tables in [Section 7.3](#) describe the characteristics and behavior of the POSIX locale for data
3768 consisting entirely of characters from the portable character set and the control character set. For
3769 other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall
3770 be the default locale when the *setlocale()* function is not called.

3771 The POSIX locale can be specified by assigning to the appropriate environment variables the
3772 values "C" or "POSIX".

3773 All implementations shall define a locale as the default locale, to be invoked when no
3774 environment variables are set, or set to the empty string. This default locale can be the POSIX
3775 locale or any other implementation-defined locale. Some implementations may provide facilities
3776 for local installation administrators to set the default locale, customizing it for each location.
3777 POSIX.1-200x does not require such a facility.

3778 7.3 Locale Definition

3779 The capability to specify additional locales to those provided by an implementation is optional,
3780 denoted by the `_POSIX2_LOCALEDEF` symbol. If the option is not supported, only
3781 implementation-supplied locales are available. Such locales shall be documented using the
3782 format specified in this section.

3783 Locales can be described with the file format presented in this section. The file format is that
3784 accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the
3785 "locale definition file", but no locales shall be affected by this file unless it is processed by
3786 *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility
3787 shall apply to *localedef* or to any other similar utility used to install locale information using the
3788 locale definition file format described here.

3789 The locale definition file shall contain one or more locale category source definitions, and shall
3790 not contain more than one definition for the same locale category. If the file contains source
3791 definitions for more than one category, implementation-defined categories, if present, shall
3792 appear after the categories defined by [Section 7.1](#) (on page 121). A category source definition
3793 contains either the definition of a category or a **copy** directive. For a description of the **copy**
3794 directive, see *localedef*. In the event that some of the information for a locale category, as
3795 specified in this volume of POSIX.1-200x, is missing from the locale source definition, the
3796 behavior of that category, if it is referenced, is unspecified.

3797 A category source definition shall consist of a category header, a category body, and a category
3798 trailer. A category header shall consist of the character string naming of the category, beginning
3799 with the characters `LC_`. The category trailer shall consist of the string "END", followed by one
3800 or more <blank>s and the string used in the corresponding category header.

3801 The category body shall consist of one or more lines of text. Each line shall contain an identifier,
3802 optionally followed by one or more operands. Identifiers shall be either keywords, identifying a
3803 particular locale element, or collating elements. In addition to the keywords defined in this
3804 volume of POSIX.1-200x, the source can contain implementation-defined keywords. Each
3805 keyword within a locale shall have a unique name (that is, two categories cannot have a

3806 commonly-named keyword); no keyword shall start with the characters *LC_*. Identifiers shall be
 3807 separated from the operands by one or more <blank>s.

3808 Operands shall be characters, collating elements, or strings of characters. Strings shall be
 3809 enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the <escape
 3810 character>, described below. When a keyword is followed by more than one operand, the
 3811 operands shall be separated by semicolons; <blank>s shall be allowed both before and after a
 3812 semicolon.

3813 The first category header in the file can be preceded by a line modifying the comment character.
 3814 It shall have the following format, starting in column 1:

```
3815 "comment_char %c\n", <comment character>
```

3816 The comment character shall default to the number sign ('#'). Blank lines and lines containing
 3817 the <comment character> in the first position shall be ignored.

3818 The first category header in the file can be preceded by a line modifying the escape character to
 3819 be used in the file. It shall have the following format, starting in column 1:

```
3820 "escape_char %c\n", <escape character>
```

3821 The escape character shall default to backslash, which is the character used in all examples
 3822 shown in this volume of POSIX.1-200x.

3823 A line can be continued by placing an escape character as the last character on the line; this
 3824 continuation character shall be discarded from the input. Although the implementation need not
 3825 accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall
 3826 place no limits on the accumulated length of the continued line. Comment lines shall not be
 3827 continued on a subsequent line using an escaped <newline>.

3828 Individual characters, characters in strings, and collating elements shall be represented using
 3829 symbolic names, as defined below. In addition, characters can be represented using the
 3830 characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic
 3831 notation is used, the resultant locale definitions are in many cases not portable between systems.
 3832 The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when
 3833 used to represent itself it shall be preceded by the escape character. The following rules apply to
 3834 character representation:

- 3835 1. A character can be represented via a symbolic name, enclosed within angle brackets '<'
 3836 and '>'. The symbolic name, including the angle brackets, shall exactly match a
 3837 symbolic name defined in the charmap file specified via the *localedef -f* option, and it shall
 3838 be replaced by a character value determined from the value associated with the symbolic
 3839 name in the charmap file. The use of a symbolic name not found in the charmap file shall
 3840 constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it
 3841 shall constitute a warning condition (see *localedef* for a description of actions resulting
 3842 from errors and warnings). The specification of a symbolic name in a **collating-element**
 3843 or **collating-symbol** section that duplicates a symbolic name in the charmap file (if
 3844 present) shall be an error. Use of the escape character or a right angle bracket within a
 3845 symbolic name is invalid unless the character is preceded by the escape character.

3846 For example:

```
3847 <c>; <c-cedilla> " <M><a><y> "
```

- 3848 2. A character in the portable character set can be represented by the character itself, in
 3849 which case the value of the character is implementation-defined. (Implementations may
 3850 allow other characters to be represented as themselves, but such locale definitions are not
 3851 portable.) Within a string, the double-quote character, the escape character, and the right

3852 angle bracket character shall be escaped (preceded by the escape character) to be
3853 interpreted as the character itself. Outside strings, the characters:

3854 `, ; < > escape_char`

3855 shall be escaped to be interpreted as the character itself.

3856 For example:

3857 `c "May"`

3858 3. A character can be represented as an octal constant. An octal constant shall be specified as
3859 the escape character followed by two or three octal digits. Each constant shall represent a
3860 byte value. Multi-byte values can be represented by concatenated constants specified in
3861 byte order with the last constant specifying the least significant byte of the character.

3862 For example:

3863 `\143;\347;\143\150 "\115\141\171"`

3864 4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall
3865 be specified as the escape character followed by an 'x' followed by two hexadecimal
3866 digits. Each constant shall represent a byte value. Multi-byte values can be represented by
3867 concatenated constants specified in byte order with the last constant specifying the least
3868 significant byte of the character.

3869 For example:

3870 `\x63;\xe7;\x63\x68 "\x4d\x61\x79"`

3871 5. A character can be represented as a decimal constant. A decimal constant shall be
3872 specified as the escape character followed by a 'd' followed by two or three decimal
3873 digits. Each constant represents a byte value. Multi-byte values can be represented by
3874 concatenated constants specified in byte order with the last constant specifying the least
3875 significant byte of the character.

3876 For example:

3877 `\d99;\d231;\d99\d104 "\d77\d97\d121"`

3878 Implementations may accept single-digit octal, decimal, or hexadecimal constants following the
3879 escape character. Only characters existing in the character set for which the locale definition is
3880 created shall be specified, whether using symbolic names, the characters themselves, or octal,
3881 decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the
3882 charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not
3883 present in the charmap file can be specified and shall be ignored, as specified under item 1
3884 above.

3885 7.3.1 LC_CTYPE

3886 The *LC_CTYPE* category shall define character classification, case conversion, and other
3887 character attributes. In addition, a series of characters can be represented by three adjacent
3888 periods representing an ellipsis symbol ("..."). The ellipsis specification shall be interpreted
3889 as meaning that all values between the values preceding and following it represent valid
3890 characters. The ellipsis specification shall be valid only within a single encoded character set;
3891 that is, within a group of characters of the same size. An ellipsis shall be interpreted as including
3892 in the list all characters with an encoded value higher than the encoded value of the character
3893 preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

3894 For example:

3895 `\x30; . . . ; \x39;`

3896 includes in the character class all characters with encoded values between the endpoints.

3897 The following keywords shall be recognized. In the descriptions, the term “automatically
3898 included” means that it shall not be an error either to include or omit any of the referenced
3899 characters; the implementation provides them if missing (even if the entire keyword is missing)
3900 and accepts them silently if present. When the implementation automatically includes a missing
3901 character, it shall have an encoded value dependent on the charmap file in effect (see the
3902 description of the *localedef* `-f` option); otherwise, it shall have a value derived from an
3903 implementation-defined character mapping.

3904 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included
3905 characters. These only need to be specified if the character values (that is, encoding) differ from
3906 the implementation default values. It is not possible to define a locale without these
3907 automatically included characters unless some implementation extension is used to prevent
3908 their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and,
3909 thus, it might not be possible for conforming applications to work properly.

3910 **copy** Specify the name of an existing locale which shall be used as the definition of
3911 this category. If this keyword is specified, no other keyword shall be specified.

3912 **upper** Define characters to be classified as uppercase letters.

3913 In the POSIX locale, the 26 uppercase letters shall be included:

3914 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

3915 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,
3916 **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as
3917 defined in [Section 6.4](#) (on page 115) (the portable character set), are
3918 automatically included in this class.

3919 **lower** Define characters to be classified as lowercase letters.

3920 In the POSIX locale, the 26 lowercase letters shall be included:

3921 a b c d e f g h i j k l m n o p q r s t u v w x y z

3922 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,
3923 **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the
3924 portable character set are automatically included in this class.

3925 **alpha** Define characters to be classified as letters.

3926 In the POSIX locale, all characters in the classes **upper** and **lower** shall be
3927 included.

3928 In a locale definition file, no character specified for the keywords **cntrl**, **digit**,
3929 **punct**, or **space** shall be specified. Characters classified as either **upper** or
3930 **lower** are automatically included in this class.

3931 **digit** Define the characters to be classified as numeric digits.

3932 In the POSIX locale, only:

3933 0 1 2 3 4 5 6 7 8 9

3934 shall be included.

3935 In a locale definition file, only the digits <zero>, <one>, <two>, <three>,

3936		<four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in
3937		contiguous ascending sequence by numerical value. The digits <zero> to
3938		<nine> of the portable character set are automatically included in this class.
3939	alnum	Define characters to be classified as letters and numeric digits. Only the
3940		characters specified for the alpha and digit keywords shall be specified.
3941		Characters specified for the keywords alpha and digit are automatically
3942		included in this class.
3943	space	Define characters to be classified as white-space characters.
3944		In the POSIX locale, exactly <space>, <form-feed>, <newline>, <carriage-
3945		return>, <tab>, and <vertical-tab> shall be included.
3946		In a locale definition file, no character specified for the keywords upper ,
3947		lower , alpha , digit , graph , or xdigit shall be specified. The <space>, <form-
3948		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
3949		character set, and any characters included in the class blank are automatically
3950		included in this class.
3951	cntrl	Define characters to be classified as control characters.
3952		In the POSIX locale, no characters in classes alpha or print shall be included.
3953		In a locale definition file, no character specified for the keywords upper ,
3954		lower , alpha , digit , punct , graph , print , or xdigit shall be specified.
3955	punct	Define characters to be classified as punctuation characters.
3956		In the POSIX locale, neither the <space> nor any characters in classes alpha ,
3957		digit , or cntrl shall be included.
3958		In a locale definition file, no character specified for the keywords upper ,
3959		lower , alpha , digit , cntrl , xdigit , or as the <space> shall be specified.
3960	graph	Define characters to be classified as printable characters, not including the
3961		<space>.
3962		In the POSIX locale, all characters in classes alpha , digit , and punct shall be
3963		included; no characters in class cntrl shall be included.
3964		In a locale definition file, characters specified for the keywords upper , lower ,
3965		alpha , digit , xdigit , and punct are automatically included in this class. No
3966		character specified for the keyword cntrl shall be specified.
3967	print	Define characters to be classified as printable characters, including the
3968		<space>.
3969		In the POSIX locale, all characters in class graph shall be included; no
3970		characters in class cntrl shall be included.
3971		In a locale definition file, characters specified for the keywords upper , lower ,
3972		alpha , digit , xdigit , punct , graph , and the <space> are automatically included
3973		in this class. No character specified for the keyword cntrl shall be specified.
3974	xdigit	Define the characters to be classified as hexadecimal digits.
3975		In the POSIX locale, only:
3976		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
3977		shall be included.

3978		In a locale definition file, only the characters defined for the class digit shall be specified, in contiguous ascending sequence by numerical value, followed by one or more sets of six characters representing the hexadecimal digits 10 to 15 inclusive, with each set in ascending order (for example, <A>, , <C>, <D>, <E>, <F>, <a>, , <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the portable character set are automatically included in this class.
3979		
3980		
3981		
3982		
3983		
3984		
3985	blank	Define characters to be classified as <blank>s.
3986		In the POSIX locale, only the <space> and <tab> shall be included.
3987		In a locale definition file, the <space> and <tab> are automatically included in this class.
3988		
3989	charclass	Define one or more locale-specific character class names as strings separated by semicolons. Each named character class can then be defined subsequently in the <i>LC_CTYPE</i> definition. A character class name shall consist of at least one and at most {CHARCLASS_NAME_MAX} bytes of alphanumeric characters from the portable filename character set. The first character of a character class name shall not be a digit. The name shall not match any of the <i>LC_CTYPE</i> keywords defined in this volume of POSIX.1-200x. Future versions of this standard will not specify any <i>LC_CTYPE</i> keywords containing uppercase letters.
3990		
3991		
3992		
3993		
3994		
3995		
3996		
3997		
3998	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific character class. In the POSIX locale, locale-specific named character classes need not exist.
3999		
4000		
4001		If a class name is defined by a charclass keyword, but no characters are subsequently assigned to it, this is not an error; it represents a class without any characters belonging to it.
4002		
4003		
4004		The <i>charclass-name</i> can be used as the <i>property</i> argument to the <i>wctype()</i> function, in regular expression and shell pattern-matching bracket expressions, and by the <i>tr</i> command.
4005		
4006		
4007	toupper	Define the mapping of lowercase letters to uppercase letters.
4008		In the POSIX locale, at a minimum, the 26 lowercase characters:
4009		a b c d e f g h i j k l m n o p q r s t u v w x y z
4010		shall be mapped to the corresponding 26 uppercase characters:
4011		A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
4012		In a locale definition file, the operand shall consist of character pairs, separated by semicolons. The characters in each character pair shall be separated by a comma and the pair enclosed by parentheses. The first character in each pair is the lowercase letter, the second the corresponding uppercase letter. Only characters specified for the keywords lower and upper shall be specified. The lowercase letters <a> to <z>, and their corresponding uppercase letters <A> to <Z>, of the portable character set are automatically included in this mapping, but only when the toupper keyword is omitted from the locale definition.
4013		
4014		
4015		
4016		
4017		
4018		
4019		
4020		
4021	tolower	Define the mapping of uppercase letters to lowercase letters.
4022		In the POSIX locale, at a minimum, the 26 uppercase characters:

4023 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
 4024 shall be mapped to the corresponding 26 lowercase characters:
 4025 a b c d e f g h i j k l m n o p q r s t u v w x y z

4026 In a locale definition file, the operand shall consist of character pairs,
 4027 separated by semicolons. The characters in each character pair shall be
 4028 separated by a comma and the pair enclosed by parentheses. The first
 4029 character in each pair is the uppercase letter, the second the corresponding
 4030 lowercase letter. Only characters specified for the keywords **lower** and **upper**
 4031 shall be specified. If the **tolower** keyword is omitted from the locale definition,
 4032 the mapping is the reverse mapping of the one specified for **toupper**.

4033 The following table shows the character class combinations allowed:

4034 **Table 7-1** Valid Character Class Combinations

In Class	Can Also Belong To										
	upper	lower	alpha	digit	space	cntrl	punct	graph	print	xdigit	blank
4037 upper	—	—	A	x	x	x	x	A	A	—	x
4038 lower	—	—	A	x	x	x	x	A	A	—	x
4039 alpha	—	—	—	x	x	x	x	A	A	—	x
4040 digit	x	x	x	x	x	x	x	A	A	A	x
4041 space	x	x	x	x	—	—	*	*	*	x	—
4042 cntrl	x	x	x	x	—	—	x	x	x	x	—
4043 punct	x	x	x	x	—	x	—	A	A	x	—
4044 graph	—	—	—	—	—	x	—	—	A	—	—
4045 print	—	—	—	—	—	x	—	—	—	—	—
4046 xdigit	—	—	—	—	x	x	x	A	A	—	x
4047 blank	x	x	x	x	A	—	*	*	*	x	—

4048 **Notes:**

- 4049 1. Explanation of codes:
 4050 A Automatically included; see text.
 4051 — Permitted.
 4052 x Mutually-exclusive.
 4053 * See note 2.
- 4054 2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or
 4055 **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters
 4056 can be classified as any of **punct**, **graph**, or **print**.

4057 **7.3.1.1 LC_CTYPE Category in the POSIX Locale**

4058 The character classifications for the POSIX locale follow; the code listing depicts the *localedef*
 4059 input, and the table represents the same information, sorted by character.

```

4060 LC_CTYPE
4061 # The following is the POSIX locale LC_CTYPE.
4062 # "alpha" is by default "upper" and "lower"
4063 # "alnum" is by definition "alpha" and "digit"
4064 # "print" is by default "alnum", "punct", and the <space>
4065 # "graph" is by default "alnum" and "punct"
4066 #
```

```

4067     upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
4068           <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>

7.3.2 LC_COLLATE

The `LC_COLLATE` category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of POSIX.1-200x (*sort*, *uniq*, and so on), regular expression matching (see [Chapter 9](#), on page 167), and the *strcoll()*, *strxfrm()*, *wcscoll()*, and *wcsxfrm()* functions in the System Interfaces volume of POSIX.1-200x.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements.** Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).
2. **User-defined ordering of collating elements.** Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or more (up to the limit `[COLL_WEIGHTS_MAX]`), as defined in [<limits.h>](#) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.

- 4265 4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
- 4266 5. **Equivalence class definition.** Two or more collating elements have the same collation
- 4267 value (primary weight).
- 4268 6. **Ordering by weights.** When two strings are compared to determine their relative order,
- 4269 the two strings are first broken up into a series of collating elements; the elements in each
- 4270 successive pair of elements are then compared according to the relative primary weights
- 4271 for the elements. If equal, and more than one weight has been assigned, then the pairs of
- 4272 collating elements are re-compared according to the relative subsequent weights, until
- 4273 either a pair of collating elements compare unequal or the weights are exhausted.

4274 The following keywords shall be recognized in a collation sequence definition. They are

4275 described in detail in the following sections.

4276	copy	Specify the name of an existing locale which shall be used as the
4277		definition of this category. If this keyword is specified, no other keyword
4278		shall be specified.
4279	collating-element	Define a collating-element symbol representing a multi-character
4280		collating element. This keyword is optional.
4281	collating-symbol	Define a collating symbol for use in collation order statements. This
4282		keyword is optional.
4283	order_start	Define collation rules. This statement shall be followed by one or more
4284		collation order statements, assigning character collation values and
4285		collation weights to collating elements.
4286	order_end	Specify the end of the collation-order statements.

4287 7.3.2.1 *The collating-element Keyword*

4288 In addition to the collating elements in the character set, the **collating-element** keyword can be

4289 used to define multi-character collating elements. The syntax is as follows:

4290 `"collating-element %s from \"%s\"\\n", <collating-symbol>, <string>`

4291 The `<collating-symbol>` operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A `<collating-element>` defined via this keyword is only recognized with the `LC_COLLATE` category.

4296 For example:

```
4297 collating-element <ch> from "<c><h>"
4298 collating-element <e-acute> from "<acute><e>"
4299 collating-element <ll> from "ll"
```

4300 7.3.2.2 *The collating-symbol Keyword*

4301 This keyword shall be used to define symbols for use in collation sequence statements; that is,

4302 between the **order_start** and the **order_end** keywords. The syntax is as follows:

4303 `"collating-symbol %s\\n", <collating-symbol>`

4304 The `<collating-symbol>` shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. A `<collating-symbol>` defined via this keyword is only recognized within the `LC_COLLATE` category.

4308 For example:

```
4309 collating-symbol <UPPER_CASE>
4310 collating-symbol <HIGH>
```

4311 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative
4312 position in the character order sequence. While such a symbolic name does not represent any
4313 collating element, it can be used as a weight.

4314 7.3.2.3 The *order_start* Keyword

4315 The **order_start** keyword shall precede collation order entries and also define the number of
4316 weights for this collation sequence definition and other collation rules. The syntax is as follows:

```
4317 "order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...
```

4318 The operands to the **order_start** keyword are optional. If present, the operands define rules to be
4319 applied when strings are compared. The number of operands define how many weights each
4320 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the
4321 first operand defines rules to be applied when comparing strings using the first (primary)
4322 weight; the second when comparing strings using the second weight, and so on. Operands shall
4323 be separated by semicolons (';'). Each operand shall consist of one or more collation
4324 directives, separated by commas (','). If the number of operands exceeds the
4325 {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following
4326 directives shall be supported:

4327 **forward** Specifies that comparison operations for the weight level shall proceed from start
4328 of string towards the end of string.

4329 **backward** Specifies that comparison operations for the weight level shall proceed from end of
4330 string towards the beginning of string.

4331 **position** Specifies that comparison operations for the weight level shall consider the relative
4332 position of elements in the strings not subject to **IGNORE**. The string containing
4333 an element not subject to **IGNORE** after the fewest collating elements subject to
4334 **IGNORE** from the start of the compare shall collate first. If both strings contain a
4335 character not subject to **IGNORE** in the same relative position, the collating values
4336 assigned to the elements shall determine the ordering. In case of equality,
4337 subsequent characters not subject to **IGNORE** shall be considered in the same
4338 manner.

4339 The directives **forward** and **backward** are mutually-exclusive.

4340 If no operands are specified, a single **forward** operand shall be assumed.

4341 For example:

```
4342 order_start    forward;backward
```

4343 7.3.2.4 Collation Order

4344 The **order_start** keyword shall be followed by collating identifier entries. The syntax for the
4345 collating element entries is as follows:

```
4346 "%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...
```

4347 Each *collating-identifier* shall consist of either a character (in any of the forms defined in [Section](#)
4348 [7.3](#), on page 122), a *collating-element*, a *collating-symbol*, an ellipsis, or the special symbol
4349 **UNDEFINED**. The order in which collating elements are specified determines the character
4350 order sequence, such that each collating element shall compare less than the elements following

4351 it.

4352 A *<collating-element>* shall be used to specify multi-character collating elements, and indicates
 4353 that the character sequence specified via the *<collating-element>* is to be collated as a unit and in
 4354 the relative order specified by its place.

4355 A *<collating-symbol>* can be used to define a position in the relative order for use in weights. No
 4356 weights shall be specified with a *<collating-symbol>*.

4357 The ellipsis symbol specifies that a sequence of characters shall collate according to their
 4358 encoded character values. It shall be interpreted as indicating that all characters with a coded
 4359 character set value higher than the value of the character in the preceding line, and lower than
 4360 the coded character set value for the character in the following line, in the current coded
 4361 character set, shall be placed in the character collation order between the previous and the
 4362 following character in ascending order according to their coded character set values. An initial
 4363 ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing
 4364 ellipsis as if the following line specified the highest coded character set value in the current
 4365 coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do
 4366 not specify characters in the current coded character set. The use of the ellipsis symbol ties the
 4367 definition to a specific coded character set and may preclude the definition from being portable
 4368 between implementations.

4369 The symbol **UNDEFINED** shall be interpreted as including all coded character set values not
 4370 specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character
 4371 collation order at the point indicated by the symbol, and in ascending order according to their
 4372 coded character set values. If no **UNDEFINED** symbol is specified, and the current coded
 4373 character set contains characters not specified in this section, the utility shall issue a warning
 4374 message and place such characters at the end of the character collation order.

4375 The optional operands for each collation-element shall be used to define the primary, secondary,
 4376 or subsequent weights for the collating element. The first operand specifies the relative primary
 4377 weight, the second the relative secondary weight, and so on. Two or more collation-elements can
 4378 be assigned the same weight; they belong to the same "equivalence class" if they have the same
 4379 primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE**
 4380 are removed, unless the **position** collation directive is specified for the corresponding level with
 4381 the **order_start** keyword. Then each successive pair of elements shall be compared according to
 4382 the relative weights for the elements. If the two strings compare equal, the process shall be
 4383 repeated for the next weight level, up to the limit {COLL_WEIGHTS_MAX}.

4384 Weights shall be expressed as characters (in any of the forms specified in [Section 7.3](#), on page
 4385 122), *<collating-symbol>*s, *<collating-element>*s, an ellipsis, or the special symbol **IGNORE**. A
 4386 single character, a *<collating-symbol>*, or a *<collating-element>* shall represent the relative position
 4387 in the character collating sequence of the character or symbol, rather than the character or
 4388 characters themselves. Thus, rather than assigning absolute values to weights, a particular
 4389 weight is expressed using the relative order value assigned to a collating element based on its
 4390 order in the character collation sequence.

4391 One-to-many mapping is indicated by specifying two or more concatenated characters or
 4392 symbolic names. For example, if the *<eszet>* is given the string "*<s><s>*" as a weight,
 4393 comparisons are performed as if all occurrences of the *<eszet>* are replaced by "*<s><s>*"
 4394 (assuming that "*<s>*" has the collating weight "*<s>*"). If it is necessary to define *<eszet>* and
 4395 "*<s><s>*" as an equivalence class, then a collating element must be defined for the string "ss".

4396 All characters specified via an ellipsis shall by default be assigned unique weights, equal to the
 4397 relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special
 4398 symbol shall by default be assigned the same primary weight (that is, they belong to the same
 4399 equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each

4400 character in the sequence shall have unique weights, equal to the relative order of their character
 4401 in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error
 4402 if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

4403 The special keyword **IGNORE** as a weight shall indicate that when strings are compared using
 4404 the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that
 4405 is, as if the string did not contain the collating element. In regular expressions and pattern
 4406 matching, all characters that are subject to **IGNORE** in their primary weight form an
 4407 equivalence class.

4408 An empty operand shall be interpreted as the collating element itself.

4409 For example, the order statement:

```
4410 <a>    <a>;<a>
```

4411 is equal to:

```
4412 <a>
```

4413 An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be
 4414 interpreted as the value of each character defined by the ellipsis.

4415 The collation order as defined in this section affects the interpretation of bracket expressions in
 4416 regular expressions (see [Section 9.3.5](#), on page 170).

4417 For example:

```
4418 order_start  forward;backward
4419 UNDEFINED   IGNORE;IGNORE
4420 <LOW>
4421 <space>     <LOW>;<space>
4422 ...         <LOW>;...
4423 <a>         <a>;<a>
4424 <a-acute>   <a>;<a-acute>
4425 <a-grave>   <a>;<a-grave>
4426 <A>        <a>;<A>
4427 <A-acute>   <a>;<A-acute>
4428 <A-grave>   <a>;<A-grave>
4429 <ch>       <ch>;<ch>
4430 <Ch>       <ch>;<Ch>
4431 <s>        <s>;<s>
4432 <eszet>    "<s><s>";"<eszet><eszet>"
4433 order_end
```

4434 This example is interpreted as follows:

- 4435 1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or
 4436 via the ellipsis) shall be ignored for collation purposes.
- 4437 2. All characters between <space> and 'a' shall have the same primary equivalence class
 4438 and individual secondary weights based on their ordinal encoded values.
- 4439 3. All characters based on the uppercase or lowercase character 'a' belong to the same
 4440 primary equivalence class.
- 4441 4. The multi-character collating element <ch> is represented by the collating symbol <ch>
 4442 and belongs to the same primary equivalence class as the multi-character collating
 4443 element <Ch>.

4444 7.3.2.5 *The order_end Keyword*4445 The collating order entries shall be terminated with an **order_end** keyword.4446 7.3.2.6 *LC_COLLATE Category in the POSIX Locale*4447 The collation sequence definition of the POSIX locale follows; the code listing depicts the
4448 *localedef* input.

```

4449 LC_COLLATE

```

7.3.3 LC_MONETARY

The *LC_MONETARY* category shall define the rules and symbols that are used to format monetary numeric information.

This information is available through the *localeconv()* function and is used by the *strfmon()* function.

Some of the information is also available in an alternative form via the *nl_langinfo()* function (see CRNCYSTR in [<langinfo.h>](#)).

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the *lconv* structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the empty string (" ") for unspecified or size zero string items.

4596 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
 4597 [Section 7.4](#) (on page 151). For some keywords, the strings can contain only integers. Keywords
 4598 that are not provided, string values set to the empty string (" "), or integer keywords set to -1,
 4599 are used to indicate that the value is not available in the locale. The following keywords shall be
 4600 recognized:

4601	copy	Specify the name of an existing locale which shall be used as the 4602 definition of this category. If this keyword is specified, no other keyword 4603 shall be specified.
4604		Note: This is a <i>localedef</i> utility keyword, unavailable through <i>localeconv()</i> .
4605	int_curr_symbol	The international currency symbol. The operand shall be a four-character 4606 string, with the first three characters containing the alphabetic 4607 international currency symbol. The international currency symbol should 4608 be chosen in accordance with those specified in the ISO 4217 standard. 4609 The fourth character shall be the character used to separate the 4610 international currency symbol from the monetary quantity.
4611	currency_symbol	The string that shall be used as the local currency symbol.
4612	mon_decimal_point	The operand is a string containing the symbol that shall be used as the 4613 decimal delimiter (radix character) in monetary formatted quantities.
4614	mon_thousands_sep	The operand is a string containing the symbol that shall be used as a 4615 separator for groups of digits to the left of the decimal delimiter in 4616 formatted monetary quantities.
4617	mon_grouping	Define the size of each group of digits in formatted monetary quantities. 4618 The operand is a sequence of integers separated by semicolons. Each 4619 integer specifies the number of digits in each group, with the initial 4620 integer defining the size of the group immediately preceding the decimal 4621 delimiter, and the following integers defining the preceding groups. If the 4622 last integer is not -1, then the size of the previous group (if any) shall be 4623 repeatedly used for the remainder of the digits. If the last integer is -1, 4624 then no further grouping shall be performed.
4625	positive_sign	A string that shall be used to indicate a non-negative-valued formatted 4626 monetary quantity.
4627	negative_sign	A string that shall be used to indicate a negative-valued formatted 4628 monetary quantity.
4629	int_frac_digits	An integer representing the number of fractional digits (those to the right 4630 of the decimal delimiter) to be written in a formatted monetary quantity 4631 using int_curr_symbol .
4632	frac_digits	An integer representing the number of fractional digits (those to the right 4633 of the decimal delimiter) to be written in a formatted monetary quantity 4634 using currency_symbol .
4635	p_cs_precedes	An integer set to 1 if the currency_symbol precedes the value for a 4636 monetary quantity with a non-negative value, and set to 0 if the symbol 4637 succeeds the value.
4638	p_sep_by_space	Set to a value indicating the separation of the currency_symbol , the sign 4639 string, and the value for a non-negative formatted monetary quantity.
4640		The values of p_sep_by_space , n_sep_by_space , int_p_sep_by_space , 4641 and int_n_sep_by_space are interpreted according to the following:

4642		0	No space separates the currency symbol and value.
4643		1	If the currency symbol and sign string are adjacent, a space separates them from the value; otherwise, a space separates the currency symbol from the value.
4644			
4645			
4646		2	If the currency symbol and sign string are adjacent, a space separates them; otherwise, a space separates the sign string from the value.
4647			
4648	n_cs_precedes		An integer set to 1 if the currency_symbol precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4649			
4650			
4651	n_sep_by_space		Set to a value indicating the separation of the currency_symbol , the sign string, and the value for a negative formatted monetary quantity.
4652			
4653	p_sign_posn		An integer set to a value indicating the positioning of the positive_sign for a monetary quantity with a non-negative value. The following integer values shall be recognized for int_n_sign_posn , int_p_sign_posn , n_sign_posn , and p_sign_posn :
4654			
4655			
4656			
4657		0	Parentheses enclose the quantity and the currency_symbol .
4658		1	The sign string precedes the quantity and the currency_symbol .
4659		2	The sign string succeeds the quantity and the currency_symbol .
4660		3	The sign string precedes the currency_symbol .
4661		4	The sign string succeeds the currency_symbol .
4662	n_sign_posn		An integer set to a value indicating the positioning of the negative_sign for a negative formatted monetary quantity.
4663			
4664	int_p_cs_precedes		An integer set to 1 if the int_curr_symbol precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4665			
4666			
4667	int_n_cs_precedes		An integer set to 1 if the int_curr_symbol precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4668			
4669			
4670	int_p_sep_by_space		Set to a value indicating the separation of the int_curr_symbol , the sign string, and the value for a non-negative internationally formatted monetary quantity.
4671			
4672			
4673	int_n_sep_by_space		Set to a value indicating the separation of the int_curr_symbol , the sign string, and the value for a negative internationally formatted monetary quantity.
4674			
4675			
4676	int_p_sign_posn		An integer set to a value indicating the positioning of the positive_sign for a positive monetary quantity formatted with the international format.
4677			
4678	int_n_sign_posn		An integer set to a value indicating the positioning of the negative_sign for a negative monetary quantity formatted with the international format.
4679			

4680 7.3.3.1 *LC_MONETARY Category in the POSIX Locale*

4681 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the
 4682 *localedef* input, the table representing the same information with the addition of *localeconv()* and
 4683 *nl_langinfo()* formats. All values are unspecified in the POSIX locale.

```

4684 LC_MONETARY

The entry N/A indicates that the value is not available in the POSIX locale.

7.3.4 LC_NUMERIC

The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-monetary numeric information. This information is available through the *localeconv()* function.

Some of the information is also available in an alternative form via the *nl_langinfo()* function.

The following items are defined in this category of the locale. The item names are the keywords recognized by the *localedef* utility when defining a locale. They are also similar to the member names of the *lconv* structure defined in [<locale.h>](#); see [<locale.h>](#) for the exact symbols in the header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the empty string (" ") for unspecified or size zero string items.

In a locale definition file, the operands are strings, formatted as indicated by the grammar in [Section 7.4](#) (on page 151). For some keywords, the strings can only contain integers. Keywords that are not provided, string values set to the empty string (" "), or integer keywords set to -1, shall be used to indicate that the value is not available in the locale. The following keywords shall be recognized:

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* utility keyword, unavailable through *localeconv()*.

decimal_point The operand is a string containing the symbol that shall be used as the decimal delimiter (radix character) in numeric, non-monetary formatted quantities. This keyword cannot be omitted and cannot be set to the empty string. In contexts where standards limit the **decimal_point** to a single byte, the result of specifying a multi-byte operand shall be unspecified.

4757 **thousands_sep** The operand is a string containing the symbol that shall be used as a separator
4758 for groups of digits to the left of the decimal delimiter in numeric, non-
4759 monetary formatted monetary quantities. In contexts where standards limit
4760 the **thousands_sep** to a single byte, the result of specifying a multi-byte
4761 operand shall be unspecified.

4762 **grouping** Define the size of each group of digits in formatted non-monetary quantities.
4763 The operand is a sequence of integers separated by semicolons. Each integer
4764 specifies the number of digits in each group, with the initial integer defining
4765 the size of the group immediately preceding the decimal delimiter, and the
4766 following integers defining the preceding groups. If the last integer is not -1 ,
4767 then the size of the previous group (if any) shall be repeatedly used for the
4768 remainder of the digits. If the last integer is -1 , then no further grouping shall
4769 be performed.

4770 7.3.4.1 *LC_NUMERIC Category in the POSIX Locale*

4771 The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing
4772 depicting the *localedef* input, the table representing the same information with the addition of
4773 *localeconv()* values, and *nl_langinfo()* constants.

```
4774 LC_NUMERIC
4775 # This is the POSIX locale definition for
4776 # the LC_NUMERIC category.
4777 #
4778 decimal_point    "<period>"
4779 thousands_sep    ""
4780 grouping         -1
4781 #
4782 END LC_NUMERIC
```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
decimal_point	RADIXCHAR	"."	"."	.
thousands_sep	THOUSEP	N/A	""	""
grouping	—	N/A	""	-1

4788 The entry N/A indicates that the value is not available in the POSIX locale.

4789 7.3.5 LC_TIME

4790 The *LC_TIME* category shall define the interpretation of the conversion specifications supported
4791 by the *date* utility and shall affect the behavior of the *strftime()*, *wcsftime()*, *strptime()*, and
4792 *nl_langinfo()* functions. Since the interfaces for C-language access and locale definition differ
4793 significantly, they are described separately.

4794 7.3.5.1 *LC_TIME Locale Definition*

4795 In a locale definition, the following mandatory keywords shall be recognized:

4796 **copy** Specify the name of an existing locale which shall be used as the definition of
4797 this category. If this keyword is specified, no other keyword shall be specified.

4798 **abday** Define the abbreviated weekday names, corresponding to the $\%a$ conversion
4799 specification (conversion specification in the *strftime()*, *wcsftime()*, and
4800 *strptime()* functions). The operand shall consist of seven semicolon-separated

4801		strings, each surrounded by double-quotes. The first string shall be the
4802		abbreviated name of the day corresponding to Sunday, the second the
4803		abbreviated name of the day corresponding to Monday, and so on.
4804	day	Define the full weekday names, corresponding to the %A conversion
4805		specification. The operand shall consist of seven semicolon-separated strings,
4806		each surrounded by double-quotes. The first string is the full name of the day
4807		corresponding to Sunday, the second the full name of the day corresponding
4808		to Monday, and so on.
4809	abmon	Define the abbreviated month names, corresponding to the %b conversion
4810		specification. The operand shall consist of twelve semicolon-separated strings,
4811		each surrounded by double-quotes. The first string shall be the abbreviated
4812		name of the first month of the year (January), the second the abbreviated
4813		name of the second month, and so on.
4814	mon	Define the full month names, corresponding to the %B conversion
4815		specification. The operand shall consist of twelve semicolon-separated strings,
4816		each surrounded by double-quotes. The first string shall be the full name of
4817		the first month of the year (January), the second the full name of the second
4818		month, and so on.
4819	d_t_fmt	Define the appropriate date and time representation, corresponding to the %c
4820		conversion specification. The operand shall consist of a string containing any
4821		combination of characters and conversion specifications. In addition, the
4822		string can contain escape sequences defined in the table in Table 5-1 (on page
4823		108) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').
4824	d_fmt	Define the appropriate date representation, corresponding to the %x
4825		conversion specification. The operand shall consist of a string containing any
4826		combination of characters and conversion specifications. In addition, the
4827		string can contain escape sequences defined in Table 5-1 (on page 108).
4828	t_fmt	Define the appropriate time representation, corresponding to the %X
4829		conversion specification. The operand shall consist of a string containing any
4830		combination of characters and conversion specifications. In addition, the
4831		string can contain escape sequences defined in Table 5-1 (on page 108).
4832	am_pm	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i>
4833		strings, corresponding to the %p conversion specification. The operand shall
4834		consist of two strings, separated by a semicolon, each surrounded by double-
4835		quotes. The first string shall represent the <i>ante-meridiem</i> designation, the last
4836		string the <i>post-meridiem</i> designation.
4837	t_fmt_ampm	Define the appropriate time representation in the 12-hour clock format with
4838		am_pm , corresponding to the %r conversion specification. The operand shall
4839		consist of a string and can contain any combination of characters and
4840		conversion specifications. If the string is empty, the 12-hour format is not
4841		supported in the locale.
4842	era	Define how years are counted and displayed for each era in a locale. The
4843		operand shall consist of semicolon-separated strings. Each string shall be an
4844		era description segment with the format:
4845		<i>direction:offset:start_date:end_date:era_name:era_format</i>
4846		according to the definitions below. There can be as many era description
4847		segments as are necessary to describe the different eras.

4848	Note:	The start of an era might not be the earliest point in the era—it may be the
4849		latest. For example, the Christian era BC starts on the day before January 1,
4850		AD 1, and increases with earlier time.
4851	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate
4852		that years closer to the <i>start_date</i> have lower numbers than those
4853		closer to the <i>end_date</i> . The '-' character shall indicate that years
4854		closer to the <i>start_date</i> have higher numbers than those closer to
4855		the <i>end_date</i> .
4856	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era,
4857		corresponding to the %Ey conversion specification.
4858	<i>start_date</i>	A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the
4859		year, month, and day numbers respectively of the start of the era.
4860		Years prior to AD 1 shall be represented as negative numbers.
4861	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
4862		or one of the two special values "-*" or "+*". The value "-*" shall
4863		indicate that the ending date is the beginning of time. The
4864		value "+*" shall indicate that the ending date is the end of time.
4865	<i>era_name</i>	A string representing the name of the era, corresponding to the
4866		%EC conversion specification.
4867	<i>era_format</i>	A string for formatting the year in the era, corresponding to the
4868		%EY conversion specification.
4869	era_d_fmt	Define the format of the date in alternative era notation, corresponding to the
4870		%Ex conversion specification.
4871	era_t_fmt	Define the locale's appropriate alternative time format, corresponding to the
4872		%EX conversion specification.
4873	era_d_t_fmt	Define the locale's appropriate alternative date and time format,
4874		corresponding to the %Ec conversion specification.
4875	alt_digits	Define alternative symbols for digits, corresponding to the %O modified
4876		conversion specification. The operand shall consist of semicolon-separated
4877		strings, each surrounded by double-quotes. The first string shall be the
4878		alternative symbol corresponding with zero, the second string the symbol
4879		corresponding with one, and so on. Up to 100 alternative symbol strings can
4880		be specified. The %O modifier shall indicate that the string corresponding to
4881		the value specified via the conversion specification shall be used instead of the
4882		value.

4883 7.3.5.2 LC_TIME C-Language Access

4884 The following constants used to identify items of *langinfo* data can be used as arguments to the
 4885 *nl_langinfo()* function to access information in the *LC_TIME* category. These constants are
 4886 defined in the **<langinfo.h>** header.

4887	ABDAY_x	The abbreviated weekday names (for example, Sun), where <i>x</i> is a number
4888		from 1 to 7.
4889	DAY_x	The full weekday names (for example, Sunday), where <i>x</i> is a number from 1 to
4890		7.

4891	ABMON_x	The abbreviated month names (for example, Jan), where <i>x</i> is a number from 1 to 12.
4892		
4893	MON_x	The full month names (for example, January), where <i>x</i> is a number from 1 to 12.
4894		
4895	D_T_FMT	The appropriate date and time representation.
4896	D_FMT	The appropriate date representation.
4897	T_FMT	The appropriate time representation.
4898	AM_STR	The appropriate ante-meridiem affix.
4899	PM_STR	The appropriate post-meridiem affix.
4900	T_FMT_AMPM	The appropriate time representation in the 12-hour clock format with AM_STR and PM_STR.
4901		
4902	ERA	The era description segments, which describe how years are counted and displayed for each era in a locale. Each era description segment shall have the format:
4903		
4904		
4905		<i>direction:offset:start_date:end_date:era_name:era_format</i>
4906		according to the definitions below. There can be as many era description segments as are necessary to describe the different eras. Era description segments are separated by semicolons.
4907		
4908		
4909		<i>direction</i> Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .
4910		
4911		
4912		
4913		
4914		<i>offset</i> The number of the year closest to the <i>start_date</i> in the era.
4915		<i>start_date</i> A date in the form <i>yyyy/mm/dd</i> , where <i>yyyy</i> , <i>mm</i> , and <i>dd</i> are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
4916		
4917		
4918		<i>end_date</i> The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.
4919		
4920		
4921		
4922		<i>era_name</i> The era, corresponding to the %EC conversion specification.
4923		<i>era_format</i> The format of the year in the era, corresponding to the %EY conversion specification.
4924		
4925	ERA_D_FMT	The era date format.
4926	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX conversion specification.
4927		
4928	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
4929		
4930	ALT_DIGITS	The alternative symbols for digits, corresponding to the %O conversion specification modifier. The value consists of semicolon-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be
4931		
4932		
4933		

4934 specified.

4935 7.3.5.3 LC_TIME Category in the POSIX Locale

4936 The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the
4937 *localedef* input; the table represents the same information with the addition of *localedef* keywords,
4938 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*
4939 functions, and *nl_langinfo()* constants.

```

4940 LC_TIME
4941 # This is the POSIX locale definition for
4942 # the LC_TIME category.
4943 #
4944 # Abbreviated weekday names (%a)
4945 abday      "<S><u><n>" ; "<M><o><n>" ; "<T><u><e>" ; "<W><e><d>" ; \

5044

The entry N/A indicates the value is not available in the POSIX locale.

5045

7.3.6 LC_MESSAGES

5046
5047
5048

The *LC_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. This information is available through the *nl_langinfo()* function.

5049
5050
5051

The message catalog used by the standard utilities and selected by the *catopen()* function shall be determined by the setting of *NLSPATH*; see [Chapter 8](#) (on page 159). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

5052

The following keywords shall be recognized as part of the locale definition file.

5053
5054

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

5055

Note: This is a *localedef* keyword, unavailable through *nl_langinfo()*.

5056
5057
5058

yesexpr The operand consists of an extended regular expression (see [Section 9.4](#), on page 174) that describes the acceptable affirmative response to a question expecting an affirmative or negative response.

5059
5060
5061

noexpr The operand consists of an extended regular expression that describes the acceptable negative response to a question expecting an affirmative or negative response.

5062

7.3.6.1 LC_MESSAGES Category in the POSIX Locale

5063
5064
5065

The format and values for affirmative and negative responses of the POSIX locale follow; the code listing depicting the *localedef* input, the table representing the same information with the addition of *nl_langinfo()* constants.

7.4 Locale Definition Grammar

5078

5079

5080

5081

The grammar and lexical conventions in this section shall together describe the syntax for the locale definition source. The general conventions for this style of grammar are described in XCU [Section 1.3](#) (on page 2235). The grammar shall take precedence over the text in this chapter.

7.4.1 Locale Lexical Conventions

5082

The lexical conventions for the locale definition grammar are described in this section.

5083

5084

5085

The following tokens shall be processed (in addition to those string constants shown in the grammar):

5086

LOC_NAME A string of characters representing the name of a locale.

5087

CHAR Any single character.

5088

NUMBER A decimal number, represented by one or more decimal digits.

5089

5090

5091

COLLSYMBOL A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a **COLLELEMENT** symbol.

5092

5093

COLLELEMENT A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a **COLLSYMBOL** symbol.

5094

5095

5096

5097

CHARCLASS A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {**CHARCLASS_NAME_MAX**} bytes, and optionally surrounded by double-quotes.

5098

5099

CHARSYMBOL A symbolic name, enclosed between angle brackets, from the current charmap (if any).

5100

5101

5102

5103

OCTAL_CHAR One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a backslash) followed by two or more octal digits.

5104

5105

5106

5107

HEX_CHAR One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant *x* and two or more hexadecimal digits.

5108

5109

5110

5111

DECIMAL_CHAR One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character 'd' and two or more decimal digits.

5112

ELLIPSIS The string " . . . ".

5113

5114

EXTENDED_REG_EXP An extended regular expression as defined in the grammar in [Section 9.5](#) (on page 177).

5115

EOL The line termination character <newline>.

7.4.2 Locale Grammar

5116
5117 This section presents the grammar for the locale definition.

```

5118 %token      LOC_NAME

```

8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of POSIX.1-200x for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain the character '='. For values to be portable across systems conforming to POSIX.1-200x, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in an environment of a process has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of POSIX.1-200x consist solely of uppercase letters, digits, and the '_' (underscore) from the characters defined in Table 6-1 (on page 111) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

Note: Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, manipulating the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of POSIX.1-200x.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

5396	ARFLAGS	IFS	MAILPATH	PS1
5397	CC	LANG	MAILRC	PS2
5398	CDPATH	LC_ALL	MAKEFLAGS	PS3
5399	CFLAGS	LC_COLLATE	MAKESHELL	PS4
5400	CHARSET	LC_CTYPE	MANPATH	PWD
5401	COLUMNS	LC_MESSAGES	MBOX	RANDOM
5402	DATMSK	LC_MONETARY	MORE	SECONDS
5403	DEAD	LC_NUMERIC	MSGVERB	SHELL
5404	EDITOR	LC_TIME	NLSPATH	TERM
5405	ENV	LDFLAGS	NPROC	TERMCAP
5406	EXINIT	LEX	OLDPWD	TERMINFO
5407	FC	LFLAGS	OPTARG	TMPDIR
5408	FCEDIT	LINENO	OPTERR	TZ
5409	FFLAGS	LINES	OPTIND	USER
5410	GET	LISTER	PAGER	VISUAL
5411	GFLAGS	LOGNAME	PATH	YACC
5412	HISTFILE	LPDEST	PPID	YFLAGS
5413	HISTORY	MAIL	PRINTER	
5414	HISTSIZE	MAILCHECK	PROCLANG	
5415	HOME	MAILER	PROJECTDIR	

5416 If the variables in the following two sections are present in the environment during the
 5417 execution of an application or utility, they shall be given the meaning described below. Some are
 5418 placed into the environment by the implementation at the time the user logs in; all can be added
 5419 or changed by the user or any ancestor of the current process. The implementation adds or
 5420 changes environment variables named in POSIX.1-200x only as specified in POSIX.1-200x. If
 5421 they are defined in the application's environment, the utilities in the Shell and Utilities volume
 5422 of POSIX.1-200x and the functions in the System Interfaces volume of POSIX.1-200x assume they
 5423 have the specified meaning. Conforming applications shall not set these environment variables
 5424 to have meanings other than as described. See *getenv()* (on page 973) and XCU Section 2.12 (on
 5425 page 2277) for methods of accessing these variables.

5426 8.2 Internationalization Variables

5427 This section describes environment variables that are relevant to the operation of
 5428 internationalized interfaces described in POSIX.1-200x.

5429 Users may use the following environment variables to announce specific localization
 5430 requirements to applications. Applications can retrieve this information using the *setlocale()*
 5431 function to initialize the correct behavior of the internationalized interfaces. The descriptions of
 5432 the internationalization environment variables describe the resulting behavior only when the
 5433 application locale is initialized in this way. The use of the internationalization variables by
 5434 utilities described in the Shell and Utilities volume of POSIX.1-200x is described in the
 5435 ENVIRONMENT VARIABLES section for those utilities in addition to the global effects
 5436 described in this section.

5437 **LANG** This variable shall determine the locale category for native language, local
 5438 customs, and coded character set in the absence of the *LC_ALL* and other *LC_**
 5439 (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*,
 5440 *LC_TIME*) environment variables. This can be used by applications to
 5441 determine the language to use for error messages and instructions, collating
 5442 sequences, date formats, and so on.

5443 5444 5445 5446 5447	<i>LC_ALL</i>	This variable shall determine the values for all locale categories. The value of the <i>LC_ALL</i> environment variable has precedence over any of the other environment variables starting with <i>LC_</i> (<i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> , <i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i>) and the <i>LANG</i> environment variable.
5448 5449 5450 5451 5452	<i>LC_COLLATE</i>	This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the <i>strcoll()</i> and <i>strxfrm()</i> functions. Additional semantics of this variable, if any, are implementation-defined.
5453 5454 5455 5456 5457 5458 5459	<i>LC_CTYPE</i>	This variable shall determine the locale category for character handling functions, such as <i>tolower()</i> , <i>toupper()</i> , and <i>isalpha()</i> . This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.
5460 5461 5462 5463 5464 5465 5466 5467	<i>LC_MESSAGES</i>	This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the <i>catopen()</i> function in determining the message catalog. Additional semantics of this variable, if any, are implementation-defined. The language and cultural conventions of diagnostic and informative messages whose format is unspecified by POSIX.1-200x should be affected by the setting of <i>LC_MESSAGES</i> .
5468 5469 5470	<i>LC_MONETARY</i>	This variable shall determine the locale category for monetary-related numeric formatting information. Additional semantics of this variable, if any, are implementation-defined.
5471 5472 5473 5474 5475	<i>LC_NUMERIC</i>	This variable shall determine the locale category for numeric formatting (for example, thousands separator and radix character) information in various utilities as well as the formatted I/O operations in <i>printf()</i> and <i>scanf()</i> and the string conversion functions in <i>strtod()</i> . Additional semantics of this variable, if any, are implementation-defined.
5476 5477 5478	<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting information. It affects the behavior of the time functions in <i>strptime()</i> . Additional semantics of this variable, if any, are implementation-defined.
5479 5480 5481 5482	<i>NLSPATH</i>	This variable shall contain a sequence of templates that the <i>catopen()</i> function uses when attempting to locate message catalogs. Each template consists of an optional prefix, one or more conversion specifications, a filename, and an optional suffix.
5483		For example:
5484		<code>NLSPATH="/system/nlslib/%N.cat"</code>
5485 5486 5487		defines that <i>catopen()</i> should look for all message catalogs in the directory /system/nlslib , where the catalog name should be constructed from the <i>name</i> parameter passed to <i>catopen()</i> (<i>%N</i>), with the suffix .cat .
5488 5489		Conversion specifications consist of a <code>'%'</code> symbol, followed by a single-letter keyword. The following keywords are currently defined:

- 5490 %N The value of the *name* parameter passed to *catopen()*.
- 5491 %L The value of the *LC_MESSAGES* category.
- 5492 %l The *language* element from the *LC_MESSAGES* category.
- 5493 %t The *territory* element from the *LC_MESSAGES* category.
- 5494 %c The *codeset* element from the *LC_MESSAGES* category.
- 5495 %% A single '%' character.

5496 An empty string is substituted if the specified value is not currently defined.
 5497 The separators underscore ('_') and period ('.') are not included in the %t
 5498 and %c conversion specifications.

5499 Templates defined in *NLSPATH* are separated by colons (':'). A leading or
 5500 two adjacent colons "::" is equivalent to specifying %N. For example:

5501 `NLSPATH=":%N.cat:/nlslib/%L/%N.cat"`

5502 indicates to *catopen()* that it should look for the requested message catalog in
 5503 *name*, *name.cat*, and */nlslib/category/name.cat*, where *category* is the value of the
 5504 *LC_MESSAGES* category of the current locale.

5505 Users should not set the *NLSPATH* variable unless they have a specific reason
 5506 to override the default system path. Setting *NLSPATH* to override the default
 5507 system path produces undefined results in the standard utilities and in
 5508 applications with appropriate privileges.

5509 The environment variables *LANG*, *LC_ALL*, *LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*,
 5510 *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*, and *NLSPATH* provide for the support of
 5511 internationalized applications. The standard utilities shall make use of these environment
 5512 variables as described in this section and the individual ENVIRONMENT VARIABLES sections
 5513 for the utilities. If these variables specify locale categories that are not based upon the same
 5514 underlying codeset, the results are unspecified.

5515 The values of locale categories shall be determined by a precedence order; the first condition met
 5516 below determines the value:

- 5517 1. If the *LC_ALL* environment variable is defined and is not null, the value of *LC_ALL* shall
 5518 be used.
- 5519 2. If the *LC_** environment variable (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*,
 5520 *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) is defined and is not null, the value of the
 5521 environment variable shall be used to initialize the category that corresponds to the
 5522 environment variable.
- 5523 3. If the *LANG* environment variable is defined and is not null, the value of the *LANG*
 5524 environment variable shall be used.
- 5525 4. If the *LANG* environment variable is not set or is set to the empty string, the
 5526 implementation-defined default locale shall be used.

5527 If the locale value is "C" or "POSIX", the POSIX locale shall be used and the standard utilities
 5528 behave in accordance with the rules in [Section 7.2](#) (on page 122) for the associated category.

5529 If the locale value begins with a slash, it shall be interpreted as the pathname of a file that was
 5530 created in the output format used by the *localedef* utility; see OUTPUT FILES under *localedef*.
 5531 Referencing such a pathname shall result in that locale being used for the indicated category.

5532 XSI If the locale value has the form:

5533 `language[_territory][.codeset]`

5534 it refers to an implementation-provided locale, where settings of language, territory, and codeset
5535 are implementation-defined.

5536 `LC_COLLATE`, `LC_CTYPE`, `LC_MESSAGES`, `LC_MONETARY`, `LC_NUMERIC`, and `LC_TIME` are
5537 defined to accept an additional field `@modifier`, which allows the user to select a specific instance
5538 of localization data within a single category (for example, for selecting the dictionary as opposed
5539 to the character ordering of data). The syntax for these environment variables is thus defined as:

5540 `[language[_territory][.codeset][@modifier]]`

5541 For example, if a user wanted to interact with the system in French, but required to sort German
5542 text files, `LANG` and `LC_COLLATE` could be defined as:

5543 `LANG=Fr_FR`
5544 `LC_COLLATE=De_DE`

5545 This could be extended to select dictionary collation (say) by use of the `@modifier` field; for
5546 example:

5547 `LC_COLLATE=De_DE@dict`

5548 An implementation may support other formats.

5549 If the locale value is not recognized by the implementation, the behavior is unspecified.

5550 At runtime, these values are bound to the locale of a process by calling the `setlocale()` function.

5551 Additional criteria for determining a valid locale name are implementation-defined.

5552 8.3 Other Environment Variables

5553 **`COLUMNS`** This variable shall represent a decimal integer >0 used to indicate the user's
5554 preferred width in column positions for the terminal screen or window; see
5555 [Section 3.102](#) (on page 47). If this variable is unset or null, the implementation
5556 determines the number of columns, appropriate for the terminal or window,
5557 in an unspecified manner. When `COLUMNS` is set, any terminal-width
5558 information implied by `TERM` is overridden. Users and conforming
5559 applications should not set `COLUMNS` unless they wish to override the
5560 system selection and produce output unrelated to the terminal characteristics.

5561 Users should not need to set this variable in the environment unless there is a
5562 specific reason to override the implementation's default behavior, such as to
5563 display data in an area arbitrarily smaller than the terminal or window.

5564 XSI **`DATEMSK`** Indicates the pathname of the template file used by `getdate()`.

5565 **`HOME`** The system shall initialize this variable at the time of login to be a pathname of
5566 the user's home directory. See [<pwd.h>](#).

5567 **`LINES`** This variable shall represent a decimal integer >0 used to indicate the user's
5568 preferred number of lines on a page or the vertical screen or window size in
5569 lines. A line in this case is a vertical measure large enough to hold the tallest
5570 character in the character set being displayed. If this variable is unset or null,

5571		the implementation determines the number of lines, appropriate for the
5572		terminal or window (size, terminal baud rate, and so on), in an unspecified
5573		manner. When <i>LINES</i> is set, any terminal-height information implied by
5574		<i>TERM</i> is overridden. Users and conforming applications should not set <i>LINES</i>
5575		unless they wish to override the system selection and produce output
5576		unrelated to the terminal characteristics.
5577		Users should not need to set this variable in the environment unless there is a
5578		specific reason to override the implementation's default behavior, such as to
5579		display data in an area arbitrarily smaller than the terminal or window.
5580	<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's
5581		login name. See <pwd.h> . For a value of <i>LOGNAME</i> to be portable across
5582		implementations of POSIX.1-200x, the value should be composed of characters
5583		from the portable filename character set.
5584	XSI <i>MSGVERB</i>	Describes which message components shall be used in writing messages by
5585		<i>fmtmsg()</i> .
5586	<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain
5587		functions and utilities apply in searching for an executable file known only by
5588		a filename. The prefixes shall be separated by a colon (':'). When a non-
5589		zero-length prefix is applied to this filename, a slash shall be inserted between
5590		the prefix and the filename. A zero-length prefix is a legacy feature that
5591		indicates the current working directory. It appears as two adjacent colons
5592		("::"), as an initial colon preceding the rest of the list, or as a trailing colon
5593		following the rest of the list. A strictly conforming application shall use an
5594		actual pathname (such as <i>.</i>) to represent the current working directory in
5595		<i>PATH</i> . The list shall be searched from beginning to end, applying the filename
5596		to each prefix, until an executable file with the specified name and appropriate
5597		execution permissions is found. If the pathname being sought contains a slash,
5598		the search through the path prefixes shall not be performed. If the pathname
5599		begins with a slash, the specified path is resolved (see Section 4.12 , on page
5600		99). If <i>PATH</i> is unset or is set to null, the path search is implementation-
5601		defined.
5602	<i>PWD</i>	This variable shall represent an absolute pathname of the current working
5603		directory. It shall not contain any filename components of dot or dot-dot. The
5604		value is set by the <i>cd</i> utility.
5605	<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command
5606		language interpreter. If this interpreter does not conform to the Shell
5607		Command Language in XCU Chapter 2 (on page 2245), utilities may behave
5608		differently from those described in POSIX.1-200x.
5609	<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for
5610		programs that need a place to create temporary files.
5611	<i>TERM</i>	This variable shall represent the terminal type for which output is to be
5612		prepared. This information is used by utilities and application programs
5613		wishing to exploit special capabilities specific to a terminal. The format and
5614		allowable values of this environment variable are unspecified.
5615	<i>TZ</i>	This variable shall represent timezone information. The contents of the
5616		environment variable named <i>TZ</i> shall be used by the <i>ctime()</i> , <i>ctime_r()</i> ,
5617		<i>localtime()</i> , <i>localtime_r()</i> , <i>strftime()</i> , <i>mktime()</i> , functions, and by various
5618		utilities, to override the default timezone. The value of <i>TZ</i> has one of the two

5619 forms (spaces inserted for clarity):

5620 *:characters*

5621 or:

5622 *std offset dst offset, rule*

5623 If *TZ* is of the first format (that is, if the first character is a colon), the
5624 characters following the colon are handled in an implementation-defined
5625 manner.

5626 The expanded format (for all *TZs* whose value does not have a colon as the
5627 first character) is as follows:

5628 *stdoffset[dst[offset]][,start[/time],end[/time]]*

5629 Where:

5630 *std* and *dst* Indicate no less than three, nor more than {TZNAME_MAX},
5631 bytes that are the designation for the standard (*std*) or the
5632 alternative (*dst*—such as Daylight Savings Time) timezone. Only
5633 *std* is required; if *dst* is missing, then the alternative time does
5634 not apply in this locale.

5635 Each of these fields may occur in either of two formats quoted or
5636 unquoted:

5637 — In the quoted form, the first character shall be the less-than
5638 ('<') character and the last character shall be the greater-
5639 than ('>') character. All characters between these quoting
5640 characters shall be alphanumeric characters from the portable character set in the current locale, the plus-sign
5641 ('+') character, or the minus-sign ('-') character. The *std*
5642 and *dst* fields in this case shall not include the quoting
5643 characters.
5644

5645 — In the unquoted form, all characters in these fields shall be
5646 alphabetic characters from the portable character set in the
5647 current locale.

5648 The interpretation of these fields is unspecified if either field is
5649 less than three bytes (except for the case when *dst* is missing),
5650 more than {TZNAME_MAX} bytes, or if they contain characters
5651 other than those specified.

5652 *offset* Indicates the value added to the local time to arrive at
5653 Coordinated Universal Time. The *offset* has the form:

5654 *hh[:mm[:ss]]*

5655 The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*)
5656 shall be required and may be a single digit. The *offset* following
5657 *std* shall be required. If no *offset* follows *dst*, the alternative time
5658 is assumed to be one hour ahead of standard time. One or more
5659 digits may be used; the value is always interpreted as a decimal
5660 number. The hour shall be between zero and 24, and the minutes
5661 (and seconds)—if present—between zero and 59. The result of
5662 using values outside of this range is unspecified. If preceded by
5663 a '-', the timezone shall be east of the Prime Meridian;

5664 otherwise, it shall be west (which may be indicated by an
 5665 optional preceding '+').

5666 *rule* Indicates when to change to and back from the alternative time.
 5667 The *rule* has the form:

5668 *date[/time],date[/time]*

5669 where the first *date* describes when the change from standard to
 5670 alternative time occurs and the second *date* describes when the
 5671 change back happens. Each *time* field describes when, in current
 5672 local time, the change to the other time is made.

5673 The format of *date* is one of the following:

5674 *Jn* The Julian day n ($1 \leq n \leq 365$). Leap days shall not be
 5675 counted. That is, in all years—including leap years—
 5676 February 28 is day 59 and March 1 is day 60. It is
 5677 impossible to refer explicitly to the occasional February
 5678 29.

5679 *n* The zero-based Julian day ($0 \leq n \leq 365$). Leap days shall
 5680 be counted, and it is possible to refer to February 29.

5681 *Mm.n.d* The d 'th day ($0 \leq d \leq 6$) of week n of month m of the
 5682 year ($1 \leq n \leq 5$, $1 \leq m \leq 12$, where week 5 means "the last
 5683 d day in month m " which may occur in either the fourth
 5684 or the fifth week). Week 1 is the first week in which the
 5685 d 'th day occurs. Day zero is Sunday.

5686 The *time* has the same format as *offset* except that no leading sign
 5687 ('-' or '+') is allowed. The default, if *time* is not given, shall be
 5688 02:00:00.

Regular Expressions

5689

5690

5691

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

5692

5693

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

5694

5695

5696

5697

5698

The Basic Regular Expression (BRE) notation and construction rules in [Section 9.3](#) (on page 169) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in [Section 9.4](#) (on page 174); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of POSIX.1-200x under *regcomp()*, *regexec()*, and related functions.

5699

5700

5701

5702

5703

5704

9.1 Regular Expression Definitions

5705

For the purposes of this section, the following definitions shall apply:

5706

entire regular expression

The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

5708

5709

matched

A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

5710

5711

5712

5713

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

5714

5715

5716

5717

5718

5719

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where “first” is defined to mean “begins earliest in the string”. If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example, the BRE “bb*” matches the second to fourth characters of the string “abbbc”, and the ERE “(wee|week)(knights|night)” matches all ten characters of the string “weeknights”.

5720

5721

5722

5723

5724

5725

5726

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE “\(. *\) . *” against “abcdef”, the subexpression “(\1)” is “abcdef”, and matching

5727

5728

5729

5730 the BRE "`\(a*\)`" against "bc", the subexpression "`(\1)`" is the null string.

5731 When a multi-character collating element in a bracket expression (see [Section 9.3.5](#), on page
5732 170) is involved, the longest sequence shall be measured in characters consumed from the
5733 string to be matched; that is, the collating element counts not as one element, but as the
5734 number of characters it matches.

5735 **BRE (ERE) matching a single character**

5736 A BRE or ERE that shall match either a single character or a single collating element.

5737 Only a BRE or ERE of this type that includes a bracket expression (see [Section 9.3.5](#), on page
5738 170) can match a collating element.

5739 **BRE (ERE) matching multiple characters**

5740 A BRE or ERE that shall match a concatenation of single characters or collating elements.

5741 Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE
5742 (ERE) special characters.

5743 **invalid**

5744 This section uses the term "invalid" for certain constructs or conditions. Invalid REs shall
5745 cause the utility or function using the RE to generate an error condition. When invalid is not
5746 used, violations of the specified syntax or semantics for REs produce undefined results: this
5747 may entail an error, enabling an extended syntax for that RE, or using the construct in error
5748 as literal characters to be matched. For example, the BRE construct "`\{1, 2, 3\}`" does not
5749 comply with the grammar. A conforming application cannot rely on it producing an error
5750 nor matching the literal characters "`\{1, 2, 3\}`".

5751 **9.2 Regular Expression General Requirements**

5752 The requirements in this section shall apply to both basic and extended regular expressions.

5753 The use of regular expressions is generally associated with text processing. REs (BREs and EREs)
5754 operate on text strings; that is, zero or more characters followed by an end-of-string delimiter
5755 (typically NUL). Some utilities employing regular expressions limit the processing to lines; that
5756 is, zero or more characters followed by a <newline>. In the regular expression processing
5757 described in POSIX.1-200x, the <newline> is regarded as an ordinary character and both a
5758 period and a non-matching list can match one. The Shell and Utilities volume of POSIX.1-200x
5759 specifies within the individual descriptions of those standard utilities employing regular
5760 expressions whether they permit matching of <newline>s; if not stated otherwise, the use of
5761 literal <newline>s or any escape sequence equivalent produces undefined results. Those utilities
5762 (like *grep*) that do not allow <newline>s to match are responsible for eliminating any <newline>
5763 from strings before matching against the RE. The *regcomp()* function in the System Interfaces
5764 volume of POSIX.1-200x, however, can provide support for such processing without violating
5765 the rules of this section.

5766 The interfaces specified in POSIX.1-200x do not permit the inclusion of a NUL character in an RE
5767 or in the string to be matched. If during the operation of a standard utility a NUL is included in
5768 the text designated to be matched, that NUL may designate the end of the text string for the
5769 purposes of matching.

5770 When a standard utility or function that uses regular expressions specifies that pattern matching
5771 shall be performed without regard to the case (uppercase or lowercase) of either data or
5772 patterns, then when each character in the string is matched against the pattern, not only the
5773 character, but also its case counterpart (if any), shall be matched. This definition of case-
5774 insensitive processing is intended to allow matching of multi-character collating elements as
5775 well as characters, as each character in the string is matched using both its cases. For example, in

5776 a locale where "Ch" is a multi-character collating element and where a matching list expression
 5777 matches such elements, the RE "[[.Ch.]]" when matched against the string "char" is in
 5778 reality matched against "ch", "Ch", "cH", and "CH".

5779 The implementation shall support any regular expression that does not exceed 256 bytes in
 5780 length.

5781 9.3 Basic Regular Expressions

5782 9.3.1 BREs Matching a Single Character or Collating Element

5783 A BRE ordinary character, a special character preceded by a backslash, or a period shall match a
 5784 single character. A bracket expression shall match a single character or a single collating
 5785 element.

5786 9.3.2 BRE Ordinary Characters

5787 An ordinary character is a BRE that matches itself: any character in the supported character set,
 5788 except for the BRE special characters listed in [Section 9.3.3](#).

5789 The interpretation of an ordinary character preceded by a backslash ('*ch*') is undefined, except
 5790 for:

- 5791 • The characters ') ', ' (', ' { ', and ' } '
- 5792 • The digits 1 to 9 inclusive (see [Section 9.3.6](#), on page 172)
- 5793 • A character inside a bracket expression

5794 9.3.3 BRE Special Characters

5795 A BRE special character has special properties in certain contexts. Outside those contexts, or
 5796 when preceded by a backslash, such a character is a BRE that matches the special character itself.
 5797 The BRE special characters and the contexts in which they have their special meaning are as
 5798 follows:

5799 . [*ch* The period, left-bracket, and backslash shall be special except when used in a bracket
 5800 expression (see [Section 9.3.5](#), on page 170). An expression containing a '*ch*' that is not
 5801 preceded by a backslash and is not part of a bracket expression produces undefined
 5802 results.

5803 * The asterisk shall be special except when used:

- 5804 • In a bracket expression
- 5805 • As the first character of an entire BRE (after an initial '*ch*', if any)
- 5806 • As the first character of a subexpression (after an initial '*ch*', if any); see [Section](#)
 5807 [9.3.6](#) (on page 172)

5808 ^ The circumflex shall be special when used as:

- 5809 • An anchor (see [Section 9.3.8](#), on page 173)
- 5810 • The first character of a bracket expression (see [Section 9.3.5](#), on page 170)

5811 \$ The dollar sign shall be special when used as an anchor.

5812 **9.3.4 Periods in BREs**

5813 A period (' . '), when used outside a bracket expression, is a BRE that shall match any character
5814 in the supported character set except NUL.

5815 **9.3.5 RE Bracket Expression**

5816 A bracket expression (an expression enclosed in square brackets, "[]") is an RE that shall
5817 match a single collating element contained in the non-empty set of collating elements
5818 represented by the bracket expression.

5819 The following rules and definitions apply to bracket expressions:

5820 1. A bracket expression is either a matching list expression or a non-matching list
5821 expression. It consists of one or more expressions: collating elements, collating symbols,
5822 equivalence classes, character classes, or range expressions. The right-bracket ('] ') shall
5823 lose its special meaning and represent itself in a bracket expression if it occurs first in the
5824 list (after an initial circumflex (' ^ '), if any). Otherwise, it shall terminate the bracket
5825 expression, unless it appears in a collating symbol (such as "[.] . ") or is the ending
5826 right-bracket for a collating symbol, equivalence class, or character class. The special
5827 characters ' . ', ' * ', ' [', and ' \ ' (period, asterisk, left-bracket, and backslash,
5828 respectively) shall lose their special meaning within a bracket expression.

5829 The character sequences "[. ", "[= ", and "[: " (left-bracket followed by a period,
5830 equals-sign, or colon) shall be special inside a bracket expression and are used to delimit
5831 collating symbols, equivalence class expressions, and character class expressions. These
5832 symbols shall be followed by a valid expression and the matching terminating sequence
5833 " .] ", " =] ", or " :] ", as described in the following items.

5834 2. A matching list expression specifies a list that shall match any single-character collating
5835 element in any of the expressions represented in the list. The first character in the list shall
5836 not be the circumflex; for example, "[abc]" is an RE that matches any of the characters
5837 ' a ', ' b ', or ' c '. It is unspecified whether a matching list expression matches a multi-
5838 character collating element that is matched by one of the expressions.

5839 3. A non-matching list expression begins with a circumflex (' ^ '), and specifies a list that
5840 shall match any single-character collating element except for the expressions represented
5841 in the list after the leading circumflex. For example, "[^ abc]" is an RE that matches any
5842 character except the characters ' a ', ' b ', or ' c '. It is unspecified whether a non-
5843 matching list expression matches a multi-character collating element that is not matched
5844 by any of the expressions. The circumflex shall have this special meaning only when it
5845 occurs first in the list, immediately following the left-bracket.

5846 4. A collating symbol is a collating element enclosed within bracket-period (" [. " and
5847 " .] ") delimiters. Collating elements are defined as described in [Section 7.3.2.4](#) (on page
5848 134). Conforming applications shall represent multi-character collating elements as
5849 collating symbols when it is necessary to distinguish them from a list of the individual
5850 characters that make up the multi-character collating element. For example, if the string
5851 " ch " is a collating element defined using the line:

```
5852           collating-element <ch-digraph> from "<c><h>"
```

5853 in the locale definition, the expression "[[. ch .]]" shall be treated as an RE containing
5854 the collating symbol ' ch ', while "[ch]" shall be treated as an RE matching ' c ' or ' h '.
5855 Collating symbols are recognized only inside bracket expressions. If the string is not a

collating element in the current locale, the expression is invalid.

- 5856
- 5857
- 5858
- 5859
- 5860
- 5861
- 5862
- 5863
- 5864
- 5865
5. An equivalence class expression shall represent the set of collating elements belonging to an equivalence class, as described in [Section 7.3.2.4](#) (on page 134). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal (" [= " and "=]") delimiters. For example, if 'a', 'â', and '^' belong to the same equivalence class, then "[[=a=]b]", "[[=â=]b]", and "[[=^=]b]" are each equivalent to "[aâ^b]". If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a collating symbol.
 6. A character class expression shall represent the union of two sets:
 - a. The set of single-character collating elements whose characters belong to the character class, as defined in the *LC_CTYPE* category in the current locale.
 - b. An unspecified set of multi-character collating elements.

5866

5867

5868

5869

5870

5871

All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon (" [: " and " :]") delimiters.

5872

The following character class expressions shall be supported in all locales:

5873

5874

5875

[:alnum:]	[:cntrl:]	[:lower:]	[:space:]
[:alpha:]	[:digit:]	[:print:]	[:upper:]
[:blank:]	[:graph:]	[:punct:]	[:xdigit:]

5876

In addition, character class expressions of the form:

5877

[:name:]

5878

5879

are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

- 5880
- 5881
- 5882
- 5883
- 5884
- 5885
7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a hyphen ('-').

5886

In the following, all examples assume the POSIX locale.

5887

5888

5889

5890

5891

5892

The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

5893

5894

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a-m-o]") is undefined.

5895

5896

5897

5898

5899

5900

The hyphen character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[-ac]" and "[ac-]" are equivalent and match any of the characters 'a', 'c', or '-'; "[^-ac]" and "[^ac-]" are equivalent and match any characters except 'a', 'c', or '-'; the expression "[%- -]" matches any of the characters between '%' and '-' inclusive; the expression "[--@]" matches any of the characters between '-'

5901 and '@' inclusive; and the expression "[a--@]" is either invalid or equivalent to '@',
 5902 because the letter 'a' follows the symbol '-' in the POSIX locale. To use a hyphen as the
 5903 starting range point, it shall either come first in the bracket expression or be specified as a
 5904 collating symbol; for example, "[][.-.]-0]", which matches either a right bracket or
 5905 any character or collating element that collates between hyphen and 0, inclusive.

5906 If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the
 5907 '^', if any) and the '-' last within the bracket expression.

5908 9.3.6 BREs Matching Multiple Characters

5909 The following rules can be used to construct BREs matching multiple characters from BREs
 5910 matching a single character:

- 5911 1. The concatenation of BREs shall match the concatenation of the strings matched by each
 5912 component of the BRE.
- 5913 2. A subexpression can be defined within a BRE by enclosing it between the character pairs
 5914 "\" and "\". Such a subexpression shall match whatever it would have matched
 5915 without the "\" and "\" , except that anchoring within subexpressions is optional
 5916 behavior; see [Section 9.3.8](#) (on page 173). Subexpressions can be arbitrarily nested.
- 5917 3. The back-reference expression '\n' shall match the same (possibly empty) string of
 5918 characters as was matched by a subexpression enclosed between "\" and "\"
 5919 preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the
 5920 *n*th subexpression (the one that begins with the *n*th "\" from the beginning of the
 5921 pattern and ends with the corresponding paired "\"). The expression is invalid if less
 5922 than *n* subexpressions precede the '\n'. The string matched by a contained
 5923 subexpression shall be within the string matched by the containing subexpression. If the
 5924 containing subexpression does not match, or if there is no match for the contained
 5925 subexpression within the string matched by the containing subexpression, then back-
 5926 reference expressions corresponding to the contained subexpression shall not match.
 5927 When a subexpression matches more than one string, a back-reference expression
 5928 corresponding to the subexpression shall refer to the last matched string. For example, the
 5929 expression "^(.*)\1\$" matches lines consisting of two adjacent appearances of the
 5930 same string, and the expression "\(a)*\1" fails to match 'a', the expression
 5931 "\(a\(b)*)*\2" fails to match 'abab', and the expression "^(ab*)*\1\$" matches
 5932 'ababbabb', but fails to match 'ababbab'.
- 5933 4. When a BRE matching a single character, a subexpression, or a back-reference is followed
 5934 by the special character asterisk ('*'), together with that asterisk it shall match what zero
 5935 or more consecutive occurrences of the BRE would match. For example, "[ab]*" and
 5936 "[ab][ab]" are equivalent when matching the string "ab".
- 5937 5. When a BRE matching a single character, a subexpression, or a back-reference is followed
 5938 by an interval expression of the format "{m}", "{m,}", or "{m,n}", together
 5939 with that interval expression it shall match what repeated consecutive occurrences of the
 5940 BRE would match. The values of *m* and *n* are decimal integers in the range $0 \leq m \leq n \leq \{RE_DUP_MAX\}$, where *m* specifies the exact or minimum number of occurrences
 5941 and *n* specifies the maximum number of occurrences. The expression "{m}" shall
 5942 match exactly *m* occurrences of the preceding BRE, "{m,}" shall match at least *m*
 5943 occurrences, and "{m,n}" shall match any number of occurrences between *m* and *n*,
 5944 inclusive.
 5945

5946 For example, in the string "abababcccccd" the BRE "c\{3}" is matched by
 5947 characters seven to nine, the BRE "\(ab*)\{4,}" is not matched at all, and the BRE
 5948 "c\{1,3}d" is matched by characters ten to thirteen.

5949 The behavior of multiple adjacent duplication symbols ('*' and intervals) produces undefined
5950 results.

5951 A subexpression repeated by an asterisk ('*') or an interval expression shall not match a null
5952 expression unless this is the only match for the repetition or it is necessary to satisfy the exact or
5953 minimum number of occurrences for the interval expression.

5954 9.3.7 BRE Precedence

5955 The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Subexpressions/back-references	\(\) \n
Single-character-BRE duplication	* \{m,n\}
Concatenation	
Anchoring	^ \$

5964 9.3.8 BRE Expression Anchoring

5965 A BRE can be limited to matching strings that begin or end a line; this is called "anchoring".
5966 The circumflex and dollar sign special characters shall be considered BRE anchors in the
5967 following contexts:

- 5968 1. A circumflex ('^') shall be an anchor when used as the first character of an entire BRE.
5969 The implementation may treat the circumflex as an anchor when used as the first
5970 character of a subexpression. The circumflex shall anchor the expression (or optionally
5971 subexpression) to the beginning of a string; only sequences starting at the first character
5972 of a string shall be matched by the BRE. For example, the BRE "^ab" matches "ab" in
5973 the string "abcdef", but fails to match in the string "cdefab". The BRE "\(^ab\)"
5974 may match the former string. A portable BRE shall escape a leading circumflex in a
5975 subexpression to match a literal circumflex.
- 5976 2. A dollar sign ('\$') shall be an anchor when used as the last character of an entire BRE.
5977 The implementation may treat a dollar sign as an anchor when used as the last character
5978 of a subexpression. The dollar sign shall anchor the expression (or optionally
5979 subexpression) to the end of the string being matched; the dollar sign can be said to
5980 match the end-of-string following the last character.
- 5981 3. A BRE anchored by both '^' and '\$' shall match only an entire string. For example, the
5982 BRE "^abcdef\$" matches strings consisting only of "abcdef".

5983 9.4 Extended Regular Expressions

5984 The extended regular expression (ERE) notation and construction rules shall apply to utilities
5985 defined as using extended regular expressions; any exceptions to the following rules are noted
5986 in the descriptions of the specific utilities using EREs.

5987 9.4.1 EREs Matching a Single Character or Collating Element

5988 An ERE ordinary character, a special character preceded by a backslash, or a period shall match
5989 a single character. A bracket expression shall match a single character or a single collating
5990 element. An ERE matching a single character enclosed in parentheses shall match the same as
5991 the ERE without parentheses would have matched.

5992 9.4.2 ERE Ordinary Characters

5993 An ordinary character is an ERE that matches itself. An ordinary character is any character in the
5994 supported character set, except for the ERE special characters listed in [Section 9.4.3](#). The
5995 interpretation of an ordinary character preceded by a backslash ('\ ') is undefined.

5996 9.4.3 ERE Special Characters

5997 An ERE special character has special properties in certain contexts. Outside those contexts, or
5998 when preceded by a backslash, such a character shall be an ERE that matches the special
5999 character itself. The extended regular expression special characters and the contexts in which
6000 they shall have their special meaning are as follows:

6001 . [\ (The period, left-bracket, backslash, and left-parenthesis shall be special except when
6002 used in a bracket expression (see [Section 9.3.5](#), on page 170). Outside a bracket
6003 expression, a left-parenthesis immediately followed by a right-parenthesis produces
6004 undefined results.

6005) The right-parenthesis shall be special when matched with a preceding left-parenthesis,
6006 both outside a bracket expression.

6007 * + ? { The asterisk, plus-sign, question-mark, and left-brace shall be special except when used
6008 in a bracket expression (see [Section 9.3.5](#), on page 170). Any of the following uses
6009 produce undefined results:

- 6010 • If these characters appear first in an ERE, or immediately following a vertical-line,
6011 circumflex, or left-parenthesis
- 6012 • If a left-brace is not part of a valid interval expression (see [Section 9.4.6](#), on page
6013 175)

6014 | The vertical-line is special except when used in a bracket expression (see [Section 9.3.5](#),
6015 on page 170). A vertical-line appearing first or last in an ERE, or immediately
6016 following a vertical-line or a left-parenthesis, or immediately preceding a right-
6017 parenthesis, produces undefined results.

6018 ^ The circumflex shall be special when used as:

- 6019 • An anchor (see [Section 9.4.9](#), on page 176)
- 6020 • The first character of a bracket expression (see [Section 9.3.5](#), on page 170)

6021 \$ The dollar sign shall be special when used as an anchor.

9.4.4 Periods in EREs

A period ('.'), when used outside a bracket expression, is an ERE that shall match any character in the supported character set except NUL.

9.4.5 ERE Bracket Expression

The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see [Section 9.3.5](#) (on page 170).

9.4.6 EREs Matching Multiple Characters

The following rules shall be used to construct EREs matching multiple characters from EREs matching a single character:

1. A concatenation of EREs shall match the concatenation of the character sequences matched by each component of the ERE. A concatenation of EREs enclosed in parentheses shall match whatever the concatenation without the parentheses matches. For example, both the ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of the string "abcdefabcdef".
2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character plus-sign ('+'), together with that plus-sign it shall match what one or more consecutive occurrences of the ERE would match. For example, the ERE "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde". And, "[ab]+" and "[ab][ab]*" are equivalent.
3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character asterisk ('*'), together with that asterisk it shall match what zero or more consecutive occurrences of the ERE would match. For example, the ERE "b*c" matches the first character in the string "cabbbbcde", and the ERE "b*cd" matches the third to seventh characters in the string "cabbbbcdebbbbbbcbdbc". And, "[ab]*" and "[ab][ab]" are equivalent when matching the string "ab".
4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by the special character question-mark ('?'), together with that question-mark it shall match what zero or one consecutive occurrences of the ERE would match. For example, the ERE "b?c" matches the second character in the string "acabbbbcde".
5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that interval expression it shall match what repeated consecutive occurrences of the ERE would match. The values of *m* and *n* are decimal integers in the range $0 \leq m \leq n \leq \{RE_DUP_MAX\}$, where *m* specifies the exact or minimum number of occurrences and *n* specifies the maximum number of occurrences. The expression "{m}" matches exactly *m* occurrences of the preceding ERE, "{m,}" matches at least *m* occurrences, and "{m,n}" matches any number of occurrences between *m* and *n*, inclusive.

For example, in the string "abababcccccccd" the ERE "c{3}" is matched by characters seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

The behavior of multiple adjacent duplication symbols ('+', '*', '?', and intervals) produces undefined results.

An ERE matching a single character repeated by an '*', '?', or an interval expression shall not match a null expression unless this is the only match for the repetition or it is necessary to satisfy the exact or minimum number of occurrences for the interval expression.

9.4.7 ERE Alternation

Two EREs separated by the special character vertical-line ('|') shall match a string that is matched by either. For example, the ERE "a(bc|d)" matches the string "abc" and the string "ad". Single characters, or expressions matching single characters, separated by the vertical bar and enclosed in parentheses, shall be treated as an ERE matching a single character.

9.4.8 ERE Precedence

The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Grouping	()
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ \$
Alternation	

For example, the ERE "abba|cde" matches either the string "abba" or the string "cde" (rather than the string "abbade" or "abbcde", because concatenation has a higher order of precedence than alternation).

9.4.9 ERE Expression Anchoring

An ERE can be limited to matching strings that begin or end a line; this is called "anchoring". The circumflex and dollar sign special characters shall be considered ERE anchors when used anywhere outside a bracket expression. This shall have the following effects:

1. A circumflex ('^') outside a bracket expression shall anchor the expression or subexpression it begins to the beginning of a string; such an expression or subexpression can match only a sequence starting at the first character of a string. For example, the EREs "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "a^b" is valid, but can never match because the 'a' prevents the expression "^b" from matching starting at the first character.
2. A dollar sign ('\$') outside a bracket expression shall anchor the expression or subexpression it ends to the end of a string; such an expression or subexpression can match only a sequence ending at the last character of a string. For example, the EREs "ef\$" and "(ef\$)" match "ef" in the string "abcdef", but fail to match in the string "cdefab", and the ERE "e\$f" is valid, but can never match because the 'f' prevents the expression "e\$" from matching ending at the last character.

9.5 Regular Expression Grammar

Grammars describing the syntax of both basic and extended regular expressions are presented in this section. The grammar takes precedence over the text. See XCU [Section 1.3](#) (on page 2235).

9.5.1 BRE/ERE Grammar Lexical Conventions

The lexical conventions for regular expressions are as described in this section.

Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

The following tokens are processed (in addition to those string constants shown in the grammar):

COLL_ELEM_SINGLE

Any single-character collating element, unless it is a **META_CHAR**.

COLL_ELEM_MULTI

Any multi-character collating element.

BACKREF

Applicable only to basic regular expressions. The character string consisting of '`\`' followed by a single-digit numeral, '1' to '9'.

DUP_COUNT

Represents a numeric constant. It shall be an integer in the range $0 \leq \text{DUP_COUNT} \leq \{\text{RE_DUP_MAX}\}$. This token is only recognized when the context of the grammar requires it. At all other times, digits not preceded by '`\`' are treated as **ORD_CHAR**.

META_CHAR

One of the characters:

`^` When found first in a bracket expression

`-` When found anywhere but first (after an initial '`^`', if any) or last in a bracket expression, or as the ending range point in a range expression

`]` When found anywhere but first (after an initial '`^`', if any) in a bracket expression

L_ANCHOR

Applicable only to basic regular expressions. The character '`^`' when it appears as the first character of a basic regular expression and when not **QUOTED_CHAR**. The '`^`' may be recognized as an anchor elsewhere; see [Section 9.3.8](#) (on page 173).

ORD_CHAR

A character, other than one of the special characters in **SPEC_CHAR**.

QUOTED_CHAR

In a BRE, one of the character sequences:

`\^` `\.` `*` `\[` `\$` `\\`

In an ERE, one of the character sequences:

`\^` `\.` `\[` `\$` `\(` `\)` `\|`

`*` `\+` `\?` `\{` `\\`

R_ANCHOR

(Applicable only to basic regular expressions.) The character '`$`' when it appears as the last character of a basic regular expression and when not **QUOTED_CHAR**. The '`$`' may be recognized as an anchor elsewhere; see [Section 9.3.8](#) (on page 173).

6140 **SPEC_CHAR** For basic regular expressions, one of the following special characters:

6141 . Anywhere outside bracket expressions

6142 \
6143 [Anywhere outside bracket expressions

6144 ^ When used as an anchor (see [Section 9.3.8](#), on page 173) or when
6145 first in a bracket expression

6146 \$ When used as an anchor

6147 * Anywhere except first in an entire RE, anywhere in a bracket
6148 expression, directly following "\(", directly following an
6149 anchoring '^'

6150 For extended regular expressions, shall be one of the following special
6151 characters found anywhere outside bracket expressions:

6152 ^ . [\$ () |
6153 * + ? { \
6154 (The close-parenthesis shall be considered special in this context only if
6155 matched with a preceding open-parenthesis.)

6156 9.5.2 RE and Bracket Expression Grammar

6157 This section presents the grammar for basic regular expressions, including the bracket
6158 expression grammar that is common to both BREs and EREs.

```
6159   %token    ORD_CHAR QUOTED_CHAR DUP_COUNT
6160   %token    BACKREF L_ANCHOR R_ANCHOR

6241         | Open_dot COLL_ELEM_MULTI Dot_close
6242         | Open_dot META_CHAR Dot_close
6243         ;
6244     equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
6245         | Open_equal COLL_ELEM_MULTI Equal_close
6246         ;
6247     character_class  : Open_colon class_name Colon_close
6248         ;

```

6249 The BRE grammar does not permit **L_ANCHOR** or **R_ANCHOR** inside "`\(`" and "`\)`" (which
6250 implies that '`^`' and '`$`' are ordinary characters). This reflects the semantic limits on the
6251 application, as noted in [Section 9.3.8](#) (on page 173). Implementations are permitted to extend the
6252 language to interpret '`^`' and '`$`' as anchors in these locations, and as such, conforming
6253 applications cannot use unescaped '`^`' and '`$`' in positions inside "`\(`" and "`\)`" that might
6254 be interpreted as anchors.

6255 9.5.3 ERE Grammar

6256 This section presents the grammar for extended regular expressions, excluding the bracket
6257 expression grammar.

6258 **Note:** The bracket expression grammar and the associated `%token` lines are identical between BREs
6259 and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```

6260 %token  ORD_CHAR QUOTED_CHAR DUP_COUNT
6261 %start  extended_reg_exp
6262 %%
6263 /* -----
6264    Extended Regular Expression
6265    ----- */
6266
6267 extended_reg_exp : ERE_branch
6268                 | extended_reg_exp '|' ERE_branch
6269                 ;
6270 ERE_branch      : ERE_expression
6271                 | ERE_branch ERE_expression
6272                 ;
6273 ERE_expression : one_char_or_coll_elem_ERE
6274                 | '^'
6275                 | '$'
6276                 | '(' extended_reg_exp ')'
6277                 | ERE_expression ERE_dupl_symbol
6278                 ;
6279 one_char_or_coll_elem_ERE : ORD_CHAR
6280                           | QUOTED_CHAR
6281                           | '.'
6282                           | bracket_expression

```

```

6283                                     ;
6284 ERE_dupl_symbol      : '*'
6285                       | '+'
6286                       | '?'
6287                       | '{' DUP_COUNT '}'
6288                       | '{' DUP_COUNT ',' '}'
6289                       | '{' DUP_COUNT ',' DUP_COUNT '}'
6290                                     ;

```

The ERE grammar does not permit several constructs that previous sections specify as having undefined results:

- **ORD_CHAR** preceded by '`\`'
- One or more *ERE_dupl_symbols* appearing first in an ERE, or immediately following '|', '^', or '('
- '{' not part of a valid *ERE_dupl_symbol*
- '|' appearing first or last in an ERE, or immediately following '|' or '(', or immediately preceding ')'

Implementations are permitted to extend the language to allow these. Conforming applications cannot use such constructs.

*Directory Structure and Devices***10.1 Directory Structure and Files**

The following directories shall exist on conforming systems and conforming applications shall make use of them only as described. Strictly conforming applications shall not assume the ability to create files in any of these directories, unless specified below.

/ The root directory.

/dev Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

The following directory shall exist on conforming systems and shall be used as described:

/tmp A directory made available for applications that need a place to create temporary files. Applications shall be allowed to create files in this directory, but shall not assume that such files are preserved between invocations of the application.

The following files shall exist on conforming systems and shall be both readable and writable:

/dev/null An infinite data source and data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

/dev/tty In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for applications that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

The following file shall exist on conforming systems and need not be readable or writable:

/dev/console The **/dev/console** file is a generic name given to the system console (see [Section 3.384](#), on page 86). It is usually linked to an implementation-defined special file. It shall provide an interface to the system console conforming to the requirements of [Chapter 11](#) (on page 185).

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of POSIX.1-200x historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. POSIX.1-200x states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document in the system documentation which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by POSIX.1-200x, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

POSIX.1-200x uses a notational convention based on historical practice that identifies some of the control characters defined in Section 7.3.1 (on page 124) in a manner easily remembered by users on many terminals. The correspondence between this “<control>-char” notation and the actual control characters is shown in the following table. When POSIX.1-200x refers to a character by its <control>-name, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y		
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-]	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-^	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-_	<US>	<US>
<control>-P	<DLE>	<DLE>	<control>-?		

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

General Terminal Interface

6369

6370

6371

6372

6373

6374

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

6375

11.1 Interface Characteristics

6376

11.1.1 Opening a Terminal Device File

6377

6378

6379

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

6380

6381

6382

6383

6384

As described in *open()*, opening a terminal device file with the `O_NONBLOCK` flag clear shall cause the thread to block until the terminal device is ready and available. If `CLOCAL` mode is not set, this means blocking until a connection is established. If `CLOCAL` mode is set in the terminal, or the `O_NONBLOCK` flag is specified in the *open()*, the *open()* function shall return a file descriptor without waiting for a connection to be established.

6385

11.1.2 Process Groups

6386

6387

6388

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in [Section 11.1.9](#) (on page 189).

6389

6390

6391

6392

6393

6394

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp()* and *tcsetpgrp()*. The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see [Section 11.1.4](#) (on page 186).

6395

6396

6397

6398

6399

6400

6401

When there is no longer any process whose process ID or process group ID matches the foreground process group ID, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process group ID, but whose process group ID does not. No actions defined in POSIX.1-200x, other than allocation of a controlling terminal or a successful call to *tcsetpgrp()*, shall cause a process group to become the foreground process group of the terminal.

6402 11.1.3 The Controlling Terminal

6403 A terminal may belong to a process as its controlling terminal. Each process of a session that has
 6404 a controlling terminal has the same controlling terminal. A terminal may be the controlling
 6405 terminal for at most one session. The controlling terminal for a session is allocated by the session
 6406 leader in an implementation-defined manner. If a session leader has no controlling terminal, and
 6407 opens a terminal device file that is not already associated with a session without using the
 6408 O_NOCTTY option (see *open()*), it is implementation-defined whether the terminal becomes the
 6409 controlling terminal of the session leader. If a process which is not a session leader opens a
 6410 terminal file, or the O_NOCTTY option is used on *open()*, then that terminal shall not become
 6411 the controlling terminal of the calling process. When a controlling terminal becomes associated
 6412 with a session, its foreground process group shall be set to the process group of the session
 6413 leader.

6414 The controlling terminal is inherited by a child process during a *fork()* function call. A process
 6415 relinquishes its controlling terminal when it creates a new session with the *setsid()* function;
 6416 other processes remaining in the old session that had this terminal as their controlling terminal
 6417 continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in
 6418 the current session) associated with the controlling terminal, it is unspecified whether all
 6419 processes that had that terminal as their controlling terminal cease to have any controlling
 6420 terminal. Whether and how a session leader can reacquire a controlling terminal after the
 6421 controlling terminal has been relinquished in this fashion is unspecified. A process does not
 6422 relinquish its controlling terminal simply by closing all of its file descriptors associated with the
 6423 controlling terminal if other processes continue to have it open.

6424 When a controlling process terminates, the controlling terminal is dissociated from the current
 6425 session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by
 6426 other processes in the earlier session may be denied, with attempts to access the terminal treated
 6427 as if a modem disconnect had been sensed.

6428 11.1.4 Terminal Access Control

6429 If a process is in the foreground process group of its controlling terminal, read operations shall
 6430 be allowed, as described in [Section 11.1.5](#) (on page 187). Any attempts by a process in a
 6431 background process group to read from its controlling terminal cause its process group to be
 6432 sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is
 6433 ignoring or blocking the SIGTTIN signal, or if the process group of the reading process is
 6434 orphaned, the *read()* shall return -1 , with *errno* set to [EIO] and no signal shall be sent. The
 6435 default action of the SIGTTIN signal shall be to stop the process to which it is sent. See
 6436 [<signal.h>](#).

6437 If a process is in the foreground process group of its controlling terminal, write operations shall
 6438 be allowed as described in [Section 11.1.8](#) (on page 189). Attempts by a process in a background
 6439 process group to write to its controlling terminal shall cause the process group to be sent a
 6440 SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if
 6441 TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is
 6442 allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the
 6443 process group of the writing process is orphaned, and the writing process is not ignoring or
 6444 blocking the SIGTTOU signal, the *write()* shall return -1 , with *errno* set to [EIO] and no signal
 6445 shall be sent.

6446 Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that
 6447 TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set
 6448 (see [Section 11.2.5](#) (on page 195), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, and
 6449 *tcsetpgrp()*).

6450 11.1.5 Input Processing and Reading Data

6451 A terminal device associated with a terminal device file may operate in full-duplex mode, so
 6452 that data may arrive even while output is occurring. Each terminal device file has an input
 6453 queue associated with it, into which incoming data is stored by the system before being read by
 6454 a process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be
 6455 stored in the input queue. The behavior of the system when this limit is exceeded is
 6456 implementation-defined.

6457 Two general kinds of input processing are available, determined by whether the terminal device
 6458 file is in canonical mode or non-canonical mode. These modes are described in [Section 11.1.6](#) and
 6459 [Section 11.1.7](#) (on page 188). Additionally, input characters are processed according to the *c_iflag*
 6460 (see [Section 11.2.2](#), on page 191) and *c_lflag* (see [Section 11.2.5](#), on page 195) fields. Such
 6461 processing can include “echoing”, which in general means transmitting input characters
 6462 immediately back to the terminal when they are received from the terminal. This is useful for
 6463 terminals that can operate in full-duplex mode.

6464 The manner in which data is provided to a process reading from a terminal device file is
 6465 dependent on whether the terminal file is in canonical or non-canonical mode, and on whether
 6466 or not the O_NONBLOCK flag is set by *open()* or *fcntl()*.

6467 If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available
 6468 or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be
 6469 completed, without blocking, in one of three ways:

- 6470 1. If there is enough data available to satisfy the entire request, the *read()* shall complete
 6471 successfully and shall return the number of bytes read.
- 6472 2. If there is not enough data available to satisfy the entire request, the *read()* shall complete
 6473 successfully, having read as much data as possible, and shall return the number of bytes it
 6474 was able to read.
- 6475 3. If there is no data available, the *read()* shall return -1 , with *errno* set to [EAGAIN].

6476 When data is available depends on whether the input processing mode is canonical or non-
 6477 canonical. [Section 11.1.6](#) and [Section 11.1.7](#) (on page 188) describe each of these input processing
 6478 modes.

6479 11.1.6 Canonical Mode Input Processing

6480 In canonical mode input processing, terminal input is processed in units of lines. A line is
 6481 delimited by a newline character (NL), an end-of-file character (EOF), or an end-of-line (EOL)
 6482 character. See [Section 11.1.9](#) (on page 189) for more information on EOF and EOL. This means
 6483 that a read request shall not return until an entire line has been typed or a signal has been
 6484 received. Also, no matter how many bytes are requested in the *read()* call, at most one line shall
 6485 be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even
 6486 one, may be requested in a *read()* without losing information.

6487 If {MAX_CANON} is defined for this terminal device, it shall be a limit on the number of bytes
 6488 in a line. The behavior of the system when this limit is exceeded is implementation-defined. If
 6489 {MAX_CANON} is not defined, there shall be no such limit; see *pathconf()*.

6490 Erase and kill processing occur when either of two special characters, the ERASE and KILL
 6491 characters (see [Section 11.1.9](#), on page 189), is received. This processing shall affect data in the
 6492 input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited
 6493 data makes up the current line. The ERASE character shall delete the last character in the current
 6494 line, if there is one. The KILL character shall delete all data in the current line, if there is any.
 6495 The ERASE and KILL characters shall have no effect if there is no data in the current line. The

6496 ERASE and KILL characters themselves shall not be placed in the input queue.

6497 11.1.7 Non-Canonical Mode Input Processing

6498 In non-canonical mode input processing, input bytes are not assembled into lines, and erase and
 6499 kill processing shall not occur. The values of the MIN and TIME members of the *c_cc* array are
 6500 used to determine how to process the bytes received. POSIX.1-200x does not specify whether
 6501 the setting of O_NONBLOCK takes precedence over MIN or TIME settings. Therefore, if
 6502 O_NONBLOCK is set, *read()* may return immediately, regardless of the setting of MIN or TIME.
 6503 Also, if no data is available, *read()* may either return 0, or return -1 with *errno* set to [EAGAIN].

6504 MIN represents the minimum number of bytes that should be received when the *read()* function
 6505 returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and
 6506 short-term data transmissions. If MIN is greater than {MAX_INPUT}, the response to the request
 6507 is undefined. The four possible values for MIN and TIME and their interactions are described
 6508 below.

6509 Case A: MIN>0, TIME>0

6510 In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is
 6511 received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction
 6512 between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall
 6513 be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer
 6514 is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN
 6515 bytes are received, the characters received to that point shall be returned to the user. Note that if
 6516 TIME expires at least one byte shall be returned because the timer would not have been enabled
 6517 unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and
 6518 TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is
 6519 in the buffer at the time of the *read()*, the result shall be as if data has been received immediately
 6520 after the *read()*.

6521 Case B: MIN>0, TIME=0

6522 In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A
 6523 pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall
 6524 block until MIN bytes are received), or a signal is received. A program that uses case B to read
 6525 record-based terminal I/O may block indefinitely in the read operation.

6526 Case C: MIN=0, TIME>0

6527 In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read
 6528 timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied
 6529 as soon as a single byte is received or the read timer expires. Note that in case C if the timer
 6530 expires, no bytes shall be returned. If the timer does not expire, the only way the read can be
 6531 satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely
 6532 waiting for a byte; if no byte is received within TIME*0.1 seconds after the read is initiated, the
 6533 *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the
 6534 *read()*, the timer shall be started as if data has been received immediately after the *read()*.

6535 **Case D: MIN=0, TIME=0**

6536 The minimum of either the number of bytes requested or the number of bytes currently
 6537 available shall be returned without waiting for more bytes to be input. If no characters are
 6538 available, *read()* shall return a value of zero, having read no data.

6539 **11.1.8 Writing Data and Output Processing**

6540 When a process writes one or more bytes to a terminal device file, they are processed according
 6541 to the *c_oflag* field (see [Section 11.2.3](#), on page 192). The implementation may provide a
 6542 buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have
 6543 been scheduled for transmission to the device, but the transmission has not necessarily
 6544 completed. See *write()* for the effects of *O_NONBLOCK* on *write()*.

6545 **11.1.9 Special Characters**

6546 Certain characters have special functions on input or output or both. These functions are
 6547 summarized as follows:

6548 **INTR** Special character on input, which is recognized if the *ISIG* flag is set. Generates a
 6549 *SIGINT* signal which is sent to all processes in the foreground process group for which
 6550 the terminal is the controlling terminal. If *ISIG* is set, the *INTR* character shall be
 6551 discarded when processed.

6552 **QUIT** Special character on input, which is recognized if the *ISIG* flag is set. Generates a
 6553 *SIGQUIT* signal which is sent to all processes in the foreground process group for
 6554 which the terminal is the controlling terminal. If *ISIG* is set, the *QUIT* character shall be
 6555 discarded when processed.

6556 **ERASE** Special character on input, which is recognized if the *ICANON* flag is set. Erases the
 6557 last character in the current line; see [Section 11.1.6](#) (on page 187). It shall not erase
 6558 beyond the start of a line, as delimited by an *NL*, *EOF*, or *EOL* character. If *ICANON* is
 6559 set, the *ERASE* character shall be discarded when processed.

6560 **KILL** Special character on input, which is recognized if the *ICANON* flag is set. Deletes the
 6561 entire line, as delimited by an *NL*, *EOF*, or *EOL* character. If *ICANON* is set, the *KILL*
 6562 character shall be discarded when processed.

6563 **EOF** Special character on input, which is recognized if the *ICANON* flag is set. When
 6564 received, all the bytes waiting to be read are immediately passed to the process without
 6565 waiting for a newline, and the *EOF* is discarded. Thus, if there are no bytes waiting
 6566 (that is, the *EOF* occurred at the beginning of a line), a byte count of zero shall be
 6567 returned from the *read()*, representing an end-of-file indication. If *ICANON* is set, the
 6568 *EOF* character shall be discarded when processed.

6569 **NL** Special character on input, which is recognized if the *ICANON* flag is set. It is the line
 6570 delimiter newline. It cannot be changed.

6571 **EOL** Special character on input, which is recognized if the *ICANON* flag is set. It is an
 6572 additional line delimiter, like *NL*.

6573 **SUSP** If the *ISIG* flag is set, receipt of the *SUSP* character shall cause a *SIGTSTP* signal to be
 6574 sent to all processes in the foreground process group for which the terminal is the
 6575 controlling terminal, and the *SUSP* character shall be discarded when processed.

6576 **STOP** Special character on both input and output, which is recognized if the *IXON* (output
 6577 control) or *IXOFF* (input control) flag is set. Can be used to suspend output
 6578 temporarily. It is useful with CRT terminals to prevent output from disappearing before

6579 it can be read. If IXON is set, the STOP character shall be discarded when processed.

6580 START Special character on both input and output, which is recognized if the IXON (output
6581 control) or IXOFF (input control) flag is set. Can be used to resume output that has been
6582 suspended by a STOP character. If IXON is set, the START character shall be discarded
6583 when processed.

6584 CR Special character on input, which is recognized if the ICANON flag is set; it is the
6585 carriage-return character. When ICANON and ICRNL are set and IGNCR is not set,
6586 this character shall be translated into an NL, and shall have the same effect as an NL
6587 character.

6588 The NL and CR characters cannot be changed. It is implementation-defined whether the START
6589 and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and
6590 SUSP shall be changeable to suit individual tastes. Special character functions associated with
6591 changeable special control characters can be disabled individually.

6592 If two or more special characters have the same value, the function performed when that
6593 character is received is undefined.

6594 A special character is recognized not only by its value, but also by its context; for example, an
6595 implementation may support multi-byte sequences that have a meaning different from the
6596 meaning of the bytes when considered individually. Implementations may also support
6597 additional single-byte functions. These implementation-defined multi-byte or single-byte
6598 functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without
6599 interpretation, except as required to recognize the special characters defined in this section.

6600 XSI If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding '\'
6601 character, in which case no special function shall occur.

6602 11.1.10 Modem Disconnect

6603 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if
6604 CLOCAL is not set in the *c_flag* field for the terminal (see Section 11.2.4, on page 194), the
6605 SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling
6606 terminal. Unless other arrangements have been made, this shall cause the controlling process to
6607 terminate (see *exit()*). Any subsequent read from the terminal device shall return the value of
6608 zero, indicating end-of-file; see *read()*. Thus, processes that read a terminal file and test for end-
6609 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read()*
6610 also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent
6611 *write()* to the terminal device shall return -1, with *errno* set to [EIO], until the device is closed.

6612 11.1.11 Closing a Terminal Device File

6613 The last process to close a terminal device file shall cause any output to be sent to the device and
6614 any input to be discarded. If HUPCL is set in the control modes and the communications port
6615 supports a disconnect function, the terminal device shall perform a disconnect.

6616 **11.2 Parameters that Can be Set**6617 **11.2.1 The termios Structure**

6618 Routines that need to control certain terminal I/O characteristics shall do so by using the
 6619 **termios** structure as defined in the `<termios.h>` header. The members of this structure include
 6620 (but are not limited to):

Member Type	Array Size	Member Name	Description
<code>tcflag_t</code>		<code>c_iflag</code>	Input modes.
<code>tcflag_t</code>		<code>c_oflag</code>	Output modes.
<code>tcflag_t</code>		<code>c_cflag</code>	Control modes.
<code>tcflag_t</code>		<code>c_lflag</code>	Local modes.
<code>cc_t</code>	NCCS	<code>c_cc[]</code>	Control characters.

6628 The types `tcflag_t` and `cc_t` are defined in the `<termios.h>` header. They shall be unsigned
 6629 integer types.

6630 **11.2.2 Input Modes**

6631 Values of the `c_iflag` field describe the basic terminal input control, and are composed of the
 6632 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
 6633 symbols in this table are defined in `<termios.h>`:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

6647 In the context of asynchronous serial data transmission, a break condition shall be defined as a
 6648 sequence of zero-valued bits that continues for more than the time to send one byte. The entire
 6649 sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a
 6650 time equivalent to more than one byte. In contexts other than asynchronous serial data
 6651 transmission, the definition of a break condition is implementation-defined.

6652 If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the
 6653 input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the
 6654 break condition shall flush the input and output queues, and if the terminal is the controlling
 6655 terminal of a foreground process group, the break condition shall generate a single SIGINT
 6656 signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break
 6657 condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

6658 If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

6659 If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than
 6660 break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is
 6661 a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid
 6662 ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff
 6663 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be
 6664 given to the application as a single byte 0x00.

6665 If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking
 6666 shall be disabled, allowing output parity generation without input parity errors. Note that
 6667 whether input parity checking is enabled or disabled is independent of whether parity detection
 6668 is enabled or disabled (see Section 11.2.4, on page 194). If parity detection is enabled but input
 6669 parity checking is disabled, the hardware to which the terminal is connected shall recognize the
 6670 parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

6671 If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits
 6672 shall be processed.

6673 If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a
 6674 received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a
 6675 received CR character shall be translated into an NL character.

6676 XSI If IXANY is set, any input character shall restart output that has been suspended.

6677 If IXON is set, start/stop output control shall be enabled. A received STOP character shall
 6678 suspend output and a received START character shall restart output. When IXON is set, START
 6679 and STOP characters are not read, but merely perform flow control functions. When IXON is not
 6680 set, the START and STOP characters shall be read.

6681 If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP
 6682 characters, which are intended to cause the terminal device to stop transmitting data, as needed
 6683 to prevent the input queue from overflowing and causing implementation-defined behavior,
 6684 and shall transmit START characters, which are intended to cause the terminal device to resume
 6685 transmitting data, as soon as the device can continue transmitting data without risk of
 6686 overflowing the input queue. The precise conditions under which STOP and START characters
 6687 are transmitted are implementation-defined.

6688 The initial input control value after *open()* is implementation-defined.

6689 11.2.3 Output Modes

6690 The *c_oflag* field specifies the terminal interface's treatment of output, and is composed of the
 6691 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
 6692 symbols in the following table are defined in [<termios.h>](#):

6693	Mask Name	Description
6694	OPOST	Perform output processing.
6695	XSI	ONLCR
6696	OCRNL	Map NL to CR-NL on output.
6697	ONOCR	Map CR to NL on output.
6698	ONLRET	No CR output at column 0.
6699	ONLRET	NL performs CR function.
6700	OFILL	Use fill characters for delay.
6701	OFDEL	Fill is DEL, else NUL.
6702	NLDLY	Select newline delays:
6703	NL0	Newline character type 0.
6704	NL1	Newline character type 1.
6705	CRDLY	Select carriage-return delays:
6706	CR0	Carriage-return delay type 0.
6707	CR1	Carriage-return delay type 1.
6708	CR2	Carriage-return delay type 2.
6709	CR3	Carriage-return delay type 3.
6710	TABDLY	Select horizontal-tab delays:
6711	TAB0	Horizontal-tab delay type 0.
6712	TAB1	Horizontal-tab delay type 1.
6713	TAB2	Horizontal-tab delay type 2.
6714	TAB3	Expand tabs to spaces.
6715	BSDLY	Select backspace delays:
6716	BS0	Backspace-delay type 0.
6717	BS1	Backspace-delay type 1.
6718	VTDLY	Select vertical-tab delays:
6719	VT0	Vertical-tab delay type 0.
6720	VT1	Vertical-tab delay type 1.
6721	FFDLY	Select form-feed delays:
6722	FF0	Form-feed delay type 0.
6723	FF1	Form-feed delay type 1.

6723 If OPOST is set, output data shall be post-processed as described below, so that lines of text are
 6724 modified to appear appropriately on the terminal device; otherwise, characters shall be
 6725 transmitted without change.

6726 XSI If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is
 6727 set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character
 6728 shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is
 6729 assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays
 6730 specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed
 6731 function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the
 6732 CR character is actually transmitted.

6733 The delay bits specify how long transmission stops to allow for mechanical or other movement
 6734 when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If
 6735 OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful
 6736 for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character
 6737 shall be DEL; otherwise, NUL.

6738 If a form-feed or vertical-tab delay is specified, it shall last for about 2 seconds.

6739 Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be
 6740 used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

6741 Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be

6742 about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall
6743 transmit two fill characters, and type 2 four fill characters.

6744 Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be
6745 about 0.10 seconds. Type 3 specifies that tabs shall be expanded into spaces. If OFILL is set, two
6746 fill characters shall be transmitted for any delay.

6747 Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be
6748 transmitted.

6749 The actual delays depend on line speed and system load.

6750 The initial output control value after *open()* is implementation-defined.

6751 11.2.4 Control Modes

6752 The *c_cflag* field describes the hardware control of the terminal, and is composed of the bitwise-
6753 inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in
6754 this table are defined in [<termios.h>](#); not all values specified are required to be supported by the
6755 underlying hardware:

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

6768 In addition, the input and output baud rates are stored in the **termios** structure. The symbols in
6769 the following table are defined in [<termios.h>](#). Not all values specified are required to be
6770 supported by the underlying hardware.

6771 **Note:** The term “baud” is used historically here, but is not technically correct. This is properly “bits +
6772 per second”, which may not be the same as baud. However, the term is used because of the +
6773 historical usage and understanding. +

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

6783 The following functions are provided for getting and setting the values of the input and output
6784 baud rates in the **termios** structure: *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, and *cfsetospeed()*.
6785 The effects on the terminal device shall not become effective and not all errors need be detected
6786 until the *tcsetattr()* function is successfully called.

6787 The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not
6788 set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-
6789 order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read.
6790 CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used;
6791 otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

6792 If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

6793 If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to
6794 each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity
6795 shall be used.

6796 If HUPCL is set, the modem control lines for the port shall be lowered when the last process
6797 with the port open closes the port or the process terminates. The modem connection shall be
6798 broken.

6799 If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If
6800 CLOCAL is clear, the modem status lines shall be monitored.

6801 Under normal circumstances, a call to the `open()` function shall wait for the modem connection
6802 to complete. However, if the `O_NONBLOCK` flag is set (see `open()`) or if CLOCAL has been set,
6803 the `open()` function shall return immediately without waiting for the connection.

6804 If the object for which the control modes are set is not an asynchronous serial connection, some
6805 of the modes may be ignored; for example, if an attempt is made to set the baud rate on a
6806 network connection to a terminal on another host, the baud rate need not be set on the
6807 connection between that terminal and the machine to which it is directly connected.

6808 The initial hardware control value after `open()` is implementation-defined.

6809 11.2.5 Local Modes

6810 The `c_iflag` field of the argument structure is used to control various functions. It is composed of
6811 the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
6812 symbols in this table are defined in `<termios.h>`; not all values specified are required to be
6813 supported by the underlying hardware:

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

6824 If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input
6825 characters shall not be echoed.

6826 If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if
6827 possible, the last character in the current line from the display. If there is no character to erase, an
6828 implementation may echo an indication that this was the case, or do nothing.

6829 If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the
6830 line from the display or shall echo the newline character after the KILL character.

- 6831 If ECHONL and ICANON are set, the newline character shall be echoed even if ECHO is not set.
- 6832 If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit
6833 functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as
6834 described in Section 11.1.6 (on page 187).
- 6835 If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall
6836 not be satisfied until at least MIN bytes have been received or the timeout value TIME expired
6837 between bytes. The time value represents tenths of a second. See Section 11.1.7 (on page 188) for
6838 more details.
- 6839 If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is
6840 implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF.
6841 If IEXTEN is not set, implementation-defined functions shall not be recognized and the
6842 corresponding input characters are processed as described for ICANON, ISIG, IXON, and
6843 IXOFF.
- 6844 If ISIG is set, each input character shall be checked against the special control characters INTR,
6845 QUIT, and SUSP. If an input character matches one of these control characters, the function
6846 associated with that character shall be performed. If ISIG is not set, no checking shall be done.
6847 Thus these special input functions are possible only if ISIG is set.
- 6848 If NOFLSH is set, the normal flush of the input and output queues associated with the INTR,
6849 QUIT, and SUSP characters shall not be done.
- 6850 If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to
6851 write to its controlling terminal if it is not in the foreground process group for that terminal. This
6852 signal, by default, stops the members of the process group. Otherwise, the output generated by
6853 that process shall be output to the current output stream. Processes that are blocking or ignoring
6854 SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal shall
6855 not be sent.
- 6856 The initial local control value after *open()* is implementation-defined.

6857 11.2.6 Special Control Characters

6858 The special control character values shall be defined by the array *c_cc*. The subscript name and
6859 description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF		EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR	VINTR	INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

6874 The subscript values are unique, except that the VMIN and VTIME subscripts may have the
6875 same values as the VEOF and VEOL subscripts, respectively.

6876 Implementations that do not support changing the START and STOP characters may ignore the
6877 character values in the `c_cc` array indexed by the VSTART and VSTOP subscripts when
6878 `tcsetattr()` is called, but shall return the value in use when `tgetattr()` is called.

6879 The initial values of all control characters are implementation-defined.

6880 If the value of one of the changeable special control characters (see [Section 11.1.9](#), on page 189) is
6881 `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the
6882 disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special
6883 meaning for the VMIN and VTIME entries of the `c_cc` array.

12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout POSIX.1-200x for describing the arguments processed by the utilities.

Within POSIX.1-200x, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see XCU Section 2.9.1, on page 2263):

```
utility_name[-a][[-b]][-c option_argument]
          [-d|-e][[-f[option_argument]]][operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility_name*. It is followed by options, option-arguments, and operands. The arguments that consist of hyphens and single letters or digits, such as 'a', are known as "options" (or, historically, "flags"). Certain options are followed by an "option-argument", as shown with [-c *option_argument*]. The arguments following the last options and option-arguments are named "operands".
2. Option-arguments are shown separated from their options by <blank>s, except when the option-argument is enclosed in the '[' and ']' notation to indicate that it is optional. This reflects the situation in which an optional option-argument (if present) is included within the same argument string as the option; for a mandatory option-argument, it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page 201) require that the option be a separate argument from its option-argument and that option-arguments not be optional, but there are some exceptions in POSIX.1-200x to ensure continued operation of historical applications:
 - a. If the SYNOPSIS of a standard utility shows an option with a mandatory option-argument (as with [-c *option_argument*] in the example), a conforming application shall use separate arguments for that option and its option-argument. However, a conforming implementation shall also permit applications to specify the option and option-argument in the same argument string without intervening <blank>s.
 - b. If the SYNOPSIS shows an optional option-argument (as with [-f[*option_argument*]] in the example), a conforming application shall place any option-argument for that option directly adjacent to the option in the same argument string, without intervening <blank>s. If the utility receives an argument containing only the option, it shall behave as specified in its description for an omitted option-argument; it shall not treat the next argument (if any) as the option-argument for that option.
3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of Section 12.2 (on page 201) applies. If an

6926 option that does not have option-arguments is repeated, the results are undefined, unless
6927 otherwise stated.

6928 4. Frequently, names of parameters that require substitution by actual values are shown
6929 with embedded underscores. Alternatively, parameters are shown as follows:

6930 `<parameter name>`

6931 The angle brackets are used for the symbolic grouping of a phrase representing a single
6932 parameter and conforming applications shall not include them in data submitted to the
6933 utility.

6934 5. When a utility has only a few permissible options, they are sometimes shown
6935 individually, as in the example. Utilities with many flags generally show all of the
6936 individual flags (that do not take option-arguments) grouped, as in:

6937 `utility_name [-abcDxyz][-p arg][operand]`

6938 Utilities with very complex arguments may be shown as follows:

6939 `utility_name [options][operands]`

6940 6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a
6941 numeric value:

- 6942 • The number is interpreted as a decimal integer.
- 6943 • Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric
6944 values.
- 6945 • When the utility description states that it accepts negative numbers as operands or
6946 option-arguments, numerals in the range -2 147 483 647 to 2 147 483 647 are
6947 syntactically recognized as numeric values.
- 6948 • Ranges greater than those listed here are allowed.

6949 This does not mean that all numbers within the allowable range are necessarily
6950 semantically correct. A standard utility that accepts an option-argument or operand that
6951 is to be interpreted as a number, and for which a range of values smaller than that shown
6952 above is permitted by the POSIX.1-200x, describes that smaller range along with the
6953 description of the option-argument or operand. If an error is generated, the utility's
6954 diagnostic message shall indicate that the value is out of the supported range, not that it
6955 is syntactically incorrect.

6956 7. Arguments or option-arguments enclosed in the '[' and ']' notation are optional and
6957 can be omitted. Conforming applications shall not include the '[' and ']' symbols in
6958 data submitted to the utility.

6959 8. Arguments separated by the '|' vertical bar notation are mutually-exclusive.
6960 Conforming applications shall not include the '|' symbol in data submitted to the utility.
6961 Alternatively, mutually-exclusive options and operands may be listed with multiple
6962 synopsis lines.

6963
6964
6965
6966
6967
6968
6969
6970
6971
6972
6973
6974
6975
6976
6977

For example:

```
utility_name -d[-a][-c option_argument][operand...]  
utility_name[-a][-b][operand...]
```

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the '[' and ']' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

6978
6979
6980

9. Ellipses ("...") are used to denote that one or more occurrences of an operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The form:

6981
6982
6983
6984

```
utility_name [-g option_argument]...[operand...]
```

indicates that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in [Section 12.2](#).)

6985

The form:

6986

```
utility_name -f option_argument [-f option_argument]... [operand...]
```

6987
6988

indicates that the `-f` option is required to appear at least once and may appear multiple times.

6989
6990
6991

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of POSIX.1-200x, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

6992

12.2 Utility Syntax Guidelines

6993
6994
6995
6996

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The `getopt()` function in the System Interfaces volume of POSIX.1-200x assists utilities in handling options and operands that conform to these guidelines.

6997
6998

Operands and option-arguments can contain characters not specified in the portable character set.

6999
7000
7001
7002

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

- 7003 **Guideline 1:** Utility names should be between two and nine characters, inclusive.
- 7004 **Guideline 2:** Utility names should include lowercase letters (the **lower** character
7005 classification) and digits only from the portable character set.
- 7006 **Guideline 3:** Each option name should be a single alphanumeric character (the **alnum**
7007 character classification) from the portable character set. The **-W** (capital-W)
7008 option shall be reserved for vendor options.
- 7009 Multi-digit options should not be allowed.
- 7010 **Guideline 4:** All options should be preceded by the **'-'** delimiter character.
- 7011 **Guideline 5:** Options without option-arguments should be accepted when grouped behind
7012 one **'-'** delimiter.
- 7013 **Guideline 6:** Each option and option-argument should be a separate argument, except as
7014 noted in [Section 12.1](#) (on page 199), item (2).
- 7015 **Guideline 7:** Option-arguments should not be optional.
- 7016 **Guideline 8:** When multiple option-arguments are specified to follow a single option, they
7017 should be presented as a single argument, using commas within that
7018 argument or <blank>s within that argument to separate them.
- 7019 **Guideline 9:** All options should precede operands on the command line.
- 7020 **Guideline 10:** The first **--** argument that is not an option-argument should be accepted as a
7021 delimiter indicating the end of options. Any following arguments should be
7022 treated as operands, even if they begin with the **'-'** character.
- 7023 **Guideline 11:** The order of different options relative to one another should not matter, unless
7024 the options are documented as mutually-exclusive and such an option is
7025 documented to override any incompatible options preceding it. If an option
7026 that has option-arguments is repeated, the option and option-argument
7027 combinations should be interpreted in the order specified on the command
7028 line.
- 7029 **Guideline 12:** The order of operands may matter and position-related interpretations should
7030 be determined on a utility-specific basis.
- 7031 **Guideline 13:** For utilities that use operands to represent files to be opened for either reading
7032 or writing, the **'-'** operand should be used to mean only standard input (or
7033 standard output when it is clear from context that an output file is being
7034 specified) or a file named **'-'**.
- 7035 **Guideline 14:** If an argument can be identified according to Guidelines 3 through 10 as an
7036 option, or as a group of options without option-arguments behind one **'-'**
7037 delimiter, then it should be treated as such.

7038 The utilities in the Shell and Utilities volume of POSIX.1-200x that claim conformance to these
7039 guidelines shall conform completely to these guidelines as if these guidelines contained the term
7040 "shall" instead of "should". On some implementations, the utilities accept usage in violation of
7041 these guidelines for backwards-compatibility as well as accepting the required form.

7042 Where a utility described in the Shell and Utilities volume of POSIX.1-200x as conforming to
7043 these guidelines is required to accept the operand **'-'** to mean standard input or output, this
7044 usage is explained in the OPERANDS section. Otherwise, if such a utility uses operands to
7045 represent files, it is implementation-defined whether the operand **'-'** stands for standard input
7046 (or standard output), or for a file named **'-'**.

7047
7048
7049

It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.

This chapter describes the contents of headers.

Headers contain function prototypes, the definition of symbolic constants, common structures, preprocessor macros, and defined types. Each function in the System Interfaces volume of POSIX.1-200x specifies the headers that an application shall include in order to use that function. In most cases, only one header is required. These headers are present on an application development system; they need not be present on the target execution system.

Format of Entries

The entries in this chapter are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS and DESCRIPTION.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described.

DESCRIPTION

This section describes the functionality of the header.

APPLICATION USAGE

This section is informative. This section gives warnings and advice to application developers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of POSIX.1-200x, the normative material is to be taken as correct.

RATIONALE

This section is informative. This section contains historical information concerning the contents of this volume of POSIX.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is informative. This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

SEE ALSO

This section is informative. This section gives references to related information.

CHANGE HISTORY

This section is informative. This section shows the derivation of the entry and any significant changes that have been made to it.

7085 **NAME**7086 aio.h — asynchronous input and output (**REALTIME**)7087 **SYNOPSIS**

7088 #include <aio.h>

7089 **DESCRIPTION**7090 The <aio.h> header shall define the **aio_cb** structure which shall include at least the following
7091 members:

7092	int	aio_fildes	File descriptor.
7093	off_t	aio_offset	File offset.
7094	volatile void	*aio_buf	Location of buffer.
7095	size_t	aio_nbytes	Length of transfer.
7096	int	aio_reqprio	Request priority offset.
7097	struct sigevent	aio_sigevent	Signal number and value.
7098	int	aio_lio_opcode	Operation to be performed.

7099 The <aio.h> header shall define the following symbolic constants:

7100 **AIO_ALLDONE** A return value indicating that none of the requested operations could be
7101 canceled since they are already complete.7102 **AIO_CANCELED** A return value indicating that all requested operations have been
7103 canceled.7104 **AIO_NOTCANCELED**7105 A return value indicating that some of the requested operations could not
7106 be canceled since they are in progress.7107 **LIO_NOP** A *lio_listio()* element operation option indicating that no transfer is
7108 requested.7109 **LIO_NOWAIT** A *lio_listio()* synchronization operation indicating that the calling thread
7110 is to continue execution while the *lio_listio()* operation is being
7111 performed, and no notification is given when the operation is complete.7112 **LIO_READ** A *lio_listio()* element operation option requesting a read.7113 **LIO_WAIT** A *lio_listio()* synchronization operation indicating that the calling thread
7114 is to suspend until the *lio_listio()* operation is complete.7115 **LIO_WRITE** A *lio_listio()* element operation option requesting a write.7116 The following shall be declared as functions and may also be defined as macros. Function
7117 prototypes shall be provided.

```

7118 int      aio_cancel(int, struct aio_cb *);
7119 int      aio_error(const struct aio_cb *);
7120 int      aio_fsync(int, struct aio_cb *);
7121 int      aio_read(struct aio_cb *);
7122 ssize_t  aio_return(struct aio_cb *);
7123 int      aio_suspend(const struct aio_cb *const [], int,
7124                    const struct timespec *);
7125 int      aio_write(struct aio_cb *);
7126 int      lio_listio(int, struct aio_cb *restrict const [restrict], int,
7127                    struct sigevent *restrict);

```

7128 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>,

7129 <signal.h>, <sys/types.h>, and <time.h>.

7130 **APPLICATION USAGE**

7131 None.

7132 **RATIONALE**

7133 None.

7134 **FUTURE DIRECTIONS**

7135 None.

7136 **SEE ALSO**

7137 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>

7138 XSH *fsync()*, *lseek()*, *read*, *write* |

7139 **CHANGE HISTORY**

7140 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

7141 **Issue 6**

7142 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7143 The description of the constants is expanded.

7144 The **restrict** keyword is added to the prototype for *lio_listio()*.

7145 **Issue 7**

7146 The <aio.h> header is moved from the Asynchronous Input and Output option to the Base.

7147 This reference page is clarified with respect to macros and symbolic constants. +

DRAFT

7148 **NAME**

7149 arpa/inet.h — definitions for internet operations

7150 **SYNOPSIS**

7151 #include <arpa/inet.h>

7152 **DESCRIPTION**7153 The **in_port_t** and **in_addr_t** types shall be defined as described in <netinet/in.h>.7154 The **in_addr** structure shall be defined as described in <netinet/in.h>.7155 IP6 The **INET_ADDRSTRLEN** and **INET6_ADDRSTRLEN** macros shall be defined as described in
7156 <netinet/in.h>.7157 The following shall be declared as functions, or defined as macros, or both. If functions are
7158 declared, function prototypes shall be provided.

7159 uint32_t htonl(uint32_t);

7160 uint16_t htons(uint16_t);

7161 uint32_t ntohl(uint32_t);

7162 uint16_t ntohs(uint16_t);

7163 The **uint32_t** and **uint16_t** types shall be defined as described in <inttypes.h>.7164 The following shall be declared as functions and may also be defined as macros. Function
7165 prototypes shall be provided.

7166 in_addr_t inet_addr(const char *);

7167 char *inet_ntoa(struct in_addr);

7168 const char *inet_ntop(int, const void *restrict, char *restrict,
7169 socklen_t);

7170 int inet_pton(int, const char *restrict, void *restrict);

7171 Inclusion of the <arpa/inet.h> header may also make visible all symbols from <netinet/in.h>
7172 and <inttypes.h>.7173 **APPLICATION USAGE**

7174 None.

7175 **RATIONALE**

7176 None.

7177 **FUTURE DIRECTIONS**

7178 None.

7179 **SEE ALSO**

7180 <inttypes.h>, <netinet/in.h>

7181 XSH *htonl()*, *inet_addr()*7182 **CHANGE HISTORY**

7183 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7184 The **restrict** keyword is added to the prototypes for *inet_ntop()* and *inet_pton()*.7185 **Issue 7**

7186 SD5-XBD-ERN-6 is applied.

7187 **NAME**
 7188 `assert.h` — verify program assertion

7189 **SYNOPSIS**
 7190 `#include <assert.h>`

7191 **DESCRIPTION**

7192 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7193 conflict between the requirements described here and the ISO C standard is unintentional. This
 7194 volume of POSIX.1-200x defers to the ISO C standard.

7195 The **<assert.h>** header shall define the `assert()` macro. It refers to the macro `NDEBUG` which is
 7196 not defined in the header. If `NDEBUG` is defined as a macro name before the inclusion of this
 7197 header, the `assert()` macro shall be defined simply as:

7198 `#define assert(ignore)((void) 0)`

7199 Otherwise, the macro behaves as described in `assert()`.

7200 The `assert()` macro shall be redefined according to the current state of `NDEBUG` each time
 7201 **<assert.h>** is included.

7202 The `assert()` macro shall be implemented as a macro, not as a function. If the macro definition is
 7203 suppressed in order to access an actual function, the behavior is undefined.

7204 **APPLICATION USAGE**

7205 None.

7206 **RATIONALE**

7207 None.

7208 **FUTURE DIRECTIONS**

7209 None.

7210 **SEE ALSO**

7211 XSH `assert()`

7212 **CHANGE HISTORY**

7213 First released in Issue 1. Derived from Issue 1 of the SVID.

7214 **Issue 6**

7215 The definition of the `assert()` macro is changed for alignment with the ISO/IEC 9899:1999
 7216 standard.

7217 **NAME**

7218 complex.h — complex arithmetic

7219 **SYNOPSIS**

7220 #include <complex.h>

7221 **DESCRIPTION**

7222 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7223 conflict between the requirements described here and the ISO C standard is unintentional. This
 7224 volume of POSIX.1-200x defers to the ISO C standard.

7225 The <complex.h> header shall define the following macros:

7226 complex Expands to **_Complex**.7227 **_Complex_I** Expands to a constant expression of type **const float _Complex**, with the value
 7228 of the imaginary unit (that is, a number i such that $i^2=-1$).7229 imaginary Expands to **_Imaginary**.7230 **_Imaginary_I** Expands to a constant expression of type **const float _Imaginary** with the
 7231 value of the imaginary unit.7232 **I** Expands to either **_Imaginary_I** or **_Complex_I**. If **_Imaginary_I** is not defined,
 7233 **I** expands to **_Complex_I**.7234 The macros **imaginary** and **_Imaginary_I** shall be defined if and only if the implementation
 7235 supports imaginary types.7236 An application may undefine and then, perhaps, redefine the **complex**, **imaginary**, and **I** macros.7237 The following shall be declared as functions and may also be defined as macros. Function
 7238 prototypes shall be provided.

```

7239 double      cabs(double complex);
7240 float      cabsf(float complex);
7241 long double cabsl(long double complex);
7242 double complex  cacos(double complex);
7243 float complex  cacosf(float complex);
7244 double complex  cacosh(double complex);
7245 float complex  cacoshf(float complex);
7246 long double complex  cacoshl(long double complex);
7247 long double complex  cacosl(long double complex);
7248 double      carg(double complex);
7249 float      cargf(float complex);
7250 long double cargl(long double complex);
7251 double complex  casin(double complex);
7252 float complex  casinf(float complex);
7253 double complex  casinh(double complex);
7254 float complex  casinhf(float complex);
7255 long double complex  casinhl(long double complex);
7256 long double complex  casinl(long double complex);
7257 double complex  catan(double complex);
7258 float complex  catanf(float complex);
7259 double complex  catanh(double complex);
7260 float complex  catanhf(float complex);
7261 long double complex  catanhl(long double complex);
7262 long double complex  catanl(long double complex);

```

```

7263     double complex      ccos(double complex);
7264     float complex       ccosf(float complex);
7265     double complex      ccosh(double complex);
7266     float complex       ccoshf(float complex);
7267     long double complex ccoshl(long double complex);
7268     long double complex ccosl(long double complex);
7269     double complex      cexp(double complex);
7270     float complex       cexpf(float complex);
7271     long double complex cexpl(long double complex);
7272     double              cimag(double complex);
7273     float               cimagf(float complex);
7274     long double         cimagl(long double complex);
7275     double complex      clog(double complex);
7276     float complex       clogf(float complex);
7277     long double complex clogl(long double complex);
7278     double complex      conj(double complex);
7279     float complex       conjf(float complex);
7280     long double complex conjl(long double complex);
7281     double complex      cpow(double complex, double complex);
7282     float complex       cpowf(float complex, float complex);
7283     long double complex cpowl(long double complex, long double complex);
7284     double complex      cproj(double complex);
7285     float complex       cprojf(float complex);
7286     long double complex cprojl(long double complex);
7287     double              creal(double complex);
7288     float               crealf(float complex);
7289     long double         creall(long double complex);
7290     double complex      csin(double complex);
7291     float complex       csinf(float complex);
7292     double complex      csinh(double complex);
7293     float complex       csinhf(float complex);
7294     long double complex csinhl(long double complex);
7295     long double complex csinl(long double complex);
7296     double complex      csqrt(double complex);
7297     float complex       csqrtf(float complex);
7298     long double complex csqrtl(long double complex);
7299     double complex      ctan(double complex);
7300     float complex       ctanf(float complex);
7301     double complex      ctanh(double complex);
7302     float complex       ctanhf(float complex);
7303     long double complex ctanhl(long double complex);
7304     long double complex ctanl(long double complex);

```

APPLICATION USAGE

Values are interpreted as radians, not degrees.

RATIONALE

The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the identifier *i* for other purposes. The application can use a different identifier, say *j*, for the imaginary unit by following the inclusion of the <complex.h> header with:

```

7311     #undef I
7312     #define j _Imaginary_I

```

An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a sufficiently convenient and more generally useful notation for imaginary terms. The

7315 corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or
7316 notational convenience will not result in widening types.

7317 On systems with imaginary types, the application has the ability to control whether use of the
7318 macro `I` introduces an imaginary type, by explicitly defining `I` to be `_Imaginary_I` or `_Complex_I`.
7319 Disallowing imaginary types is useful for some applications intended to run on
7320 implementations without support for such types.

7321 The macro `_Imaginary_I` provides a test for whether imaginary types are supported.

7322 The `cis()` function ($\cos(x) + I\sin(x)$) was considered but rejected because its implementation is
7323 easy and straightforward, even though some implementations could compute sine and cosine
7324 more efficiently in tandem.

7325 FUTURE DIRECTIONS

7326 The following function names and the same names suffixed with *f* or *l* are reserved for future
7327 use, and may be added to the declarations in the <complex.h> header.

7328 `cerf()` `cexpm1()` `clog2()`
7329 `cerfc()` `clog10()` `clgamma()`
7330 `cexp2()` `clog1p()` `ctgamma()`

7334 CHANGE HISTORY

7335 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

7336 **NAME**
7337 cpio.h — cpio archive values

7338 **SYNOPSIS**
7339 #include <cpio.h>

7340 **DESCRIPTION**
7341 The <cpio.h> header shall define the symbolic constants needed by the *c_mode* field of the *cpio* |
7342 archive format, with the names and values given in the following table:

Name	Description	Value (Octal)
C_IRUSR	Read by owner.	0000400
C_IWUSR	Write by owner.	0000200
C_IXUSR	Execute by owner.	0000100
C_IRGRP	Read by group.	0000040
C_IWGRP	Write by group.	0000020
C_IXGRP	Execute by group.	0000010
C_IROTH	Read by others.	0000004
C_IWOTH	Write by others.	0000002
C_IXOTH	Execute by others.	0000001
C_ISUID	Set user ID.	0004000
C_ISGID	Set group ID.	0002000
C_ISVTX	On directories, restricted deletion flag.	0001000
C_ISDIR	Directory.	0040000
C_ISFIFO	FIFO.	0010000
C_ISREG	Regular file.	0100000
C_ISBLK	Block special.	0060000
C_ISCHR	Character special.	0020000
C_ISCTG	Reserved.	0110000
C_ISLNK	Symbolic link.	0120000
C_ISSOCK	Socket.	0140000

7364 The <cpio.h> header shall define the following symbolic constant as a string: |

7365 MAGIC "070707"

7366 **APPLICATION USAGE**
7367 None.

7368 **RATIONALE**
7369 None.

7370 **FUTURE DIRECTIONS**
7371 None.

7372 **SEE ALSO**
7373 XCU *pax* |

7374 **CHANGE HISTORY**
7375 First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988
7376 standard.

7377 **Issue 6**
7378 The SEE ALSO is updated to refer to *pax*.

7379

Issue 7

7380

The **<pio.h>** header is moved from the XSI option to the Base.

7381

This reference page is clarified with respect to macros and symbolic constants.

+

7382 **NAME**7383 `ctype.h` — character types7384 **SYNOPSIS**7385 `#include <ctype.h>`7386 **DESCRIPTION**

7387 CX Some of the functionality described on this reference page extends the ISO C standard.
 7388 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 448) to
 7389 enable the visibility of these symbols in this header.

7390 The <ctype.h> header shall provide a definition for a type `locale_t` as defined in <locale.h>
 7391 representing a locale object.

7392 The following shall be declared as functions and may also be defined as macros. Function
 7393 prototypes shall be provided for use with ISO C standard compilers.

```

7394 int isalnum(int);
7395 CX int isalnum_l(int, locale_t);
7396 int isalpha(int);
7397 CX int isalpha_l(int, locale_t);
7398 OB XSI int isascii(int);
7399 int isblank(int);
7400 CX int isblank_l(int, locale_t);
7401 int iscntrl(int);
7402 CX int iscntrl_l(int, locale_t);
7403 int isdigit(int);
7404 CX int isdigit_l(int, locale_t);
7405 int isgraph(int);
7406 CX int isgraph_l(int, locale_t);
7407 int islower(int);
7408 CX int islower_l(int, locale_t);
7409 int isprint(int);
7410 CX int isprint_l(int, locale_t);
7411 int ispunct(int);
7412 CX int ispunct_l(int, locale_t);
7413 int isspace(int);
7414 CX int isspace_l(int, locale_t);
7415 int isupper(int);
7416 CX int isupper_l(int, locale_t);
7417 int isxdigit(int);
7418 CX int isxdigit_l(int, locale_t);
7419 OB XSI int toascii(int);
7420 int tolower(int);
7421 CX int tolower_l(int, locale_t);
7422 int toupper(int);
7423 CX int toupper_l(int, locale_t);

```

7424 The <ctype.h> header shall define the following as macros:

```

7425 OB XSI int _toupper(int);
7426 int _tolower(int);

```

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

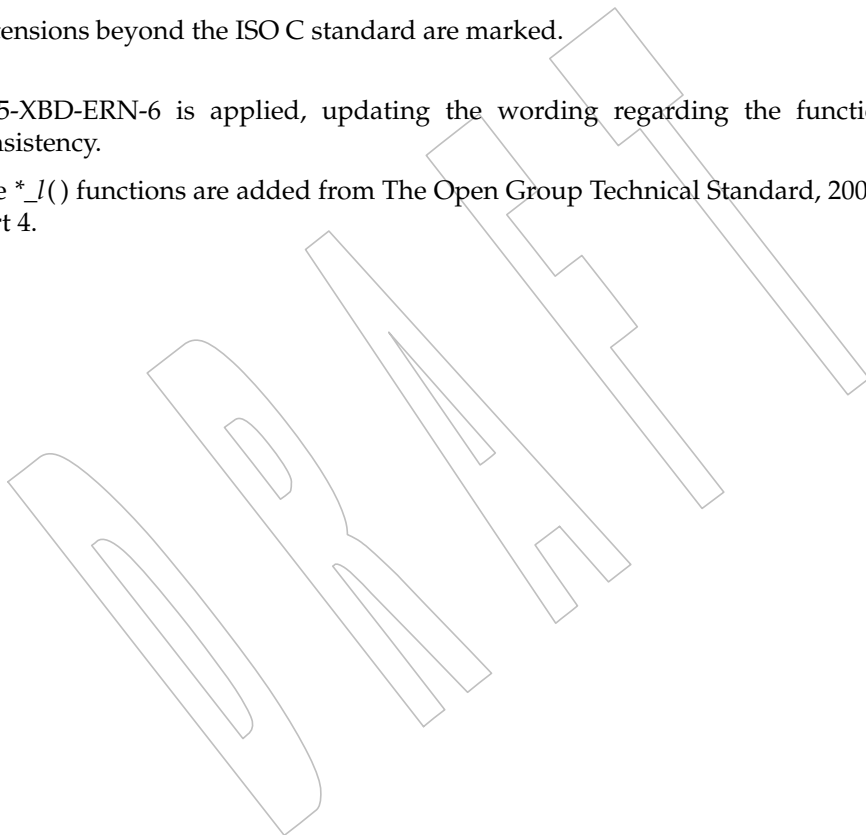

Issue 6

Extensions beyond the ISO C standard are marked.

Issue 7

SD5-XBD-ERN-6 is applied, updating the wording regarding the function declarations for consistency.

The *_l() functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

7447 **NAME**

7448 dirent.h — format of directory entries

7449 **SYNOPSIS**

7450 #include <dirent.h>

7451 **DESCRIPTION**

7452 The internal format of directories is unspecified.

7453 The <dirent.h> header shall define the following type:

7454 **DIR** A type representing a directory stream. The **DIR** type may be an incomplete type. |7455 It shall also define the structure **dirent** which shall include the following members:7456 XSI `ino_t d_ino` File serial number.7457 `char d_name[]` Name of entry.7458 XSI The type `ino_t` shall be defined as described in <sys/types.h>.7459 The character array `d_name` is of unspecified size, but the number of bytes preceding the
7460 terminating null byte shall not exceed {NAME_MAX}.7461 The following shall be declared as functions and may also be defined as macros. Function
7462 prototypes shall be provided.7463 `int alphasort(const struct dirent **, const struct dirent **);`7464 `int closedir(DIR *);`7465 `int dirfd(DIR *);`7466 `DIR *fdopendir(int);`7467 `DIR *opendir(const char *);`7468 `struct dirent *readdir(DIR *);`7469 `int readdir_r(DIR *restrict, struct dirent *restrict,`
7470 `struct dirent **restrict);`7471 `void rewinddir(DIR *);`7472 `int scandir(const char *, struct dirent ***,`7473 `int (*)(const struct dirent *),`7474 `int (*)(const struct dirent **),`7475 `const struct dirent **);`7476 XSI `void seekdir(DIR *, long);`7477 `long telldir(DIR *);`7478 **APPLICATION USAGE**

7479 None.

7480 **RATIONALE**7481 Information similar to that in the <dirent.h> header is contained in a file <sys/dir.h> in 4.2 BSD
7482 and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of
7483 POSIX.1-200x is **struct direct**. The filename was changed because the name <sys/dir.h> was also
7484 used in earlier implementations to refer to definitions related to the older access method; this
7485 produced name conflicts. The name of the structure was changed because this volume of
7486 POSIX.1-200x does not completely define what is in the structure, so it could be different on
7487 some implementations from **struct direct**.7488 The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:7489 `sizeof(d_name)`

7490 is incorrect; use:
 7491 `strlen(d_name)`
 7492 instead.

7493 The array of `char d_name` is not a fixed size. Implementations may need to declare `struct dirent`
 7494 with an array size for `d_name` of 1, but the actual number of characters provided matches (or
 7495 only slightly exceeds) the length of the filename.

7496 FUTURE DIRECTIONS

7497 None.

7501 CHANGE HISTORY

7502 First released in Issue 2.

7503 Issue 5

7504 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

7505 Issue 6

7506 The Open Group Corrigendum U026/7 is applied, correcting the prototype for `readdir_r()`.

7507 The `restrict` keyword is added to the prototype for `readdir_r()`.

7508 Issue 7

7509 The `alphasort()`, `dirfd()`, and `scandir()` functions are added from The Open Group Technical
 7510 Standard, 2006, Extended API Set Part 1.

7511 The `fopendir()` function is added from The Open Group Technical Standard, 2006, Extended API
 7512 Set Part 2.

7513 Austin Group Interpretation 1003.1-2001 #110 is applied, clarifying the definition of the `DIR` +
 7514 type.

7515 **NAME**7516 `dlfcn.h` — dynamic linking7517 **SYNOPSIS**7518 `#include <dlfcn.h>`7519 **DESCRIPTION**7520 The `<dlfcn.h>` header shall define at least the following symbolic constants for use in the
7521 construction of a `dlopen()` *mode* argument:7522 `RTLD_LAZY` Relocations are performed at an implementation-defined time.7523 `RTLD_NOW` Relocations are performed when the object is loaded.7524 `RTLD_GLOBAL` All symbols are available for relocation processing of other modules.7525 `RTLD_LOCAL` All symbols are not made available for relocation processing by other
7526 modules.7527 The following shall be declared as functions and may also be defined as macros. Function
7528 prototypes shall be provided.7529 `int dlclose(void *);`
7530 `char *dlerror(void);`
7531 `void *dlopen(const char *, int);`
7532 `void *dlsym(void *restrict, const char *restrict);`7533 **APPLICATION USAGE**

7534 None.

7535 **RATIONALE**

7536 None.

7537 **FUTURE DIRECTIONS**

7538 None.

7542 First released in Issue 5.

7543 **Issue 6**7544 The `restrict` keyword is added to the prototype for `dlsym()`.7545 **Issue 7**7546 The `<dlfcn.h>` header is moved from the XSI option to the Base.

7547 This reference page is clarified with respect to macros and symbolic constants. +

7548 **NAME**7549 `errno.h` — system error numbers7550 **SYNOPSIS**7551 `#include <errno.h>`7552 **DESCRIPTION**7553 **CX** Some of the functionality described on this reference page extends the ISO C standard. Any
7554 conflict between the requirements described here and the ISO C standard is unintentional. This
7555 volume of POSIX.1-200x defers to the ISO C standard.

7556 The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

7557 The <errno.h> header shall provide a declaration for *errno*. The symbol *errno* shall expand to a +
7558 modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an identifier declared |
7559 with external linkage. If a macro definition is suppressed in order to access an actual object, or a |
7560 program defines an identifier with the name *errno*, the behavior is undefined. |7561 The <errno.h> header shall define the following macros which shall expand to integer constant |
7562 expressions with type **int**, distinct positive values (except as noted below), and which shall be |
7563 suitable for use in **#if** preprocessing directives: |

7564 [E2BIG] Argument list too long.

7565 [EACCES] Permission denied.

7566 [EADDRINUSE] Address in use.

7567 [EADDRNOTAVAIL] Address not available.

7568 [EAFNOSUPPORT] Address family not supported.

7569 [EAGAIN] Resource unavailable, try again (may be the same value as |
7570 [EWOULDBLOCK]).

7571 [EALREADY] Connection already in progress.

7572 [EBADF] Bad file descriptor.

7573 [EBADMSG] Bad message.

7574 [EBUSY] Device or resource busy.

7575 [ECANCELED] Operation canceled.

7576 [ECHILD] No child processes.

7577 [ECONNABORTED] Connection aborted.

7578 [ECONNREFUSED] Connection refused.

7579 [ECONNRESET] Connection reset.

7580 [EDEADLK] Resource deadlock would occur.

7581 [EDESTADDRREQ] Destination address required.

7582 [EDOM] Mathematics argument out of domain of function.

7583 [EDQUOT] Reserved.

7584		[EEXIST]	File exists.
7585		[EFAULT]	Bad address.
7586		[EFBIG]	File too large.
7587		[EHOSTUNREACH]	Host is unreachable.
7588		[EIDRM]	Identifier removed.
7589		[EILSEQ]	Illegal byte sequence.
7590		[EINPROGRESS]	Operation in progress.
7591		[EINTR]	Interrupted function.
7592		[EINVAL]	Invalid argument.
7593		[EIO]	I/O error.
7594		[EISCONN]	Socket is connected.
7595		[EISDIR]	Is a directory.
7596		[ELOOP]	Too many levels of symbolic links.
7597		[EMFILE]	File descriptor value too large.
7598		[EMLINK]	Too many links.
7599		[EMSGSIZE]	Message too large.
7600		[EMULTIHOP]	Reserved.
7601		[ENAMETOOLONG]	Filename too long.
7602		[ENETDOWN]	Network is down.
7603		[ENETRESET]	Connection aborted by network.
7604		[ENETUNREACH]	Network unreachable.
7605		[ENFILE]	Too many files open in system.
7606		[ENOBUFS]	No buffer space available.
7607	OB XSR	[ENODATA]	No message is available on the STREAM head read queue.
7608		[ENODEV]	No such device.
7609		[ENOENT]	No such file or directory.
7610		[ENOEXEC]	Executable file format error.
7611		[ENOLCK]	No locks available.
7612		[ENOLINK]	Reserved.
7613		[ENOMEM]	Not enough space.
7614		[ENOMSG]	No message of the desired type.
7615		[ENOPROTOPT]	Protocol not available.
7616		[ENOSPC]	No space left on device.
7617	OB XSR	[ENOSR]	No STREAM resources.
7618	OB XSR	[ENOSTR]	Not a STREAM.

7619	[ENOSYS]	Function not supported.
7620	[ENOTCONN]	The socket is not connected.
7621	[ENOTDIR]	Not a directory.
7622	[ENOTEMPTY]	Directory not empty.
7623	[ENOTRECOVERABLE]	
7624		State not recoverable.
7625	[ENOTSOCK]	Not a socket.
7626	[ENOTSUP]	Not supported (may be the same value as [EOPNOTSUPP]).
7627	[ENOTTY]	Inappropriate I/O control operation.
7628	[ENXIO]	No such device or address.
7629	[EOPNOTSUPP]	Operation not supported on socket (may be the same value as
7630		[ENOTSUP]).
7631	[EOVERFLOW]	Value too large to be stored in data type.
7632	[EOWNERDEAD]	Previous owner died.
7633	[EPERM]	Operation not permitted.
7634	[EPIPE]	Broken pipe.
7635	[EPROTO]	Protocol error.
7636	[EPROTONOSUPPORT]	
7637		Protocol not supported.
7638	[EPROTOTYPE]	Protocol wrong type for socket.
7639	[ERANGE]	Result too large.
7640	[EROFS]	Read-only file system.
7641	[ESPIPE]	Invalid seek.
7642	[ESRCH]	No such process.
7643	[ESTALE]	Reserved.
7644	OB XSR [ETIME]	Stream <i>ioctl()</i> timeout.
7645	[ETIMEDOUT]	Connection timed out.
7646	[ETXTBSY]	Text file busy.
7647	[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
7648	[EXDEV]	Cross-device link.

APPLICATION USAGE

Additional error numbers may be defined on conforming systems; see the System Interfaces volume of POSIX.1-200x.

RATIONALE

None.

FUTURE DIRECTIONS

None.

7658

CHANGE HISTORY

7659

First released in Issue 1. Derived from Issue 1 of the SVID.

7660

Issue 5

7661

Updated for alignment with the POSIX Realtime Extension.

7662

Issue 6

7663

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

7664

7665

- The majority of the error conditions previously marked as extensions are now mandatory, except for the STREAMS-related error conditions.

7666

7667

Values for *errno* are now required to be distinct positive values rather than non-zero values. This change is for alignment with the ISO/IEC 9899: 1999 standard.

7668

7669

Issue 7

7670

Austin Group Interpretation 1003.1-2001 #050 is applied.

7671

The [ENOTRECOVERABLE] and [EOWNERDEAD] errors are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

7672

7673

Functionality relating to the XSI STREAMS option is marked obsolescent.

7674

Functionality relating to the Threads option is moved to the Base.

7675

This reference page is clarified with respect to macros and symbolic constants. +

7676 NAME

7677 fcntl.h — file control options

7678 SYNOPSIS

7679 #include <fcntl.h>

7680 DESCRIPTION

7681 The <fcntl.h> header shall define the following symbolic constants for the *cmd* argument used
 7682 by *fcntl()*. The values shall be unique and shall be suitable for use in *#if* preprocessing
 7683 directives.

7684 F_DUPFD Duplicate file descriptor.

7685 F_GETFD Get file descriptor flags.

7686 F_SETFD Set file descriptor flags.

7687 F_GETFL Get file status flags and file access modes.

7688 F_SETFL Set file status flags.

7689 F_GETLK Get record locking information.

7690 F_SETLK Set record locking information.

7691 F_SETLKW Set record locking information; wait if blocked.

7692 F_GETOWN Get process or process group ID to receive SIGURG signals.

7693 F_SETOWN Set process or process group ID to receive SIGURG signals.

7694 The <fcntl.h> header shall define the following symbolic constant used for the *fcntl()* file
 7695 descriptor flags, which shall be suitable for use in *#if* preprocessing directives.

7696 FD_CLOEXEC Close the file descriptor upon execution of an *exec* family function.

7697 The <fcntl.h> header shall also define the following symbolic constants for the *l_type* argument
 7698 used for record locking with *fcntl()*. The values shall be unique and shall be suitable for use in
 7699 *#if* preprocessing directives.

7700 F_RDLCK Shared or read lock.

7701 F_UNLCK Unlock.

7702 F_WRLCK Exclusive or write lock.

7703 The <fcntl.h> header shall define the values used for *l_whence*, *SEEK_SET*, *SEEK_CUR*, and
 7704 *SEEK_END* as described in <unistd.h>.

7705 The <fcntl.h> header shall define the following symbolic constants as file creation flags for use
 7706 in the *oflag* value to *open()* and *openat()*. The values shall be bitwise-distinct and shall be
 7707 suitable for use in *#if* preprocessing directives.

7708 O_CREAT Create file if it does not exist.

7709 O_EXCL Exclusive use flag.

7710 O_NOCTTY Do not assign controlling terminal.

7711 O_TRUNC Truncate flag.

7712 The *fcntl.h()* header shall define the following symbolic constants for use as file status flags for
 7713 *open()*, *openat()*, and *fcntl()*. The values shall be suitable for use in *#if* preprocessing directives.

7714		O_APPEND	Set append mode.
7715	SIO	O_DSYNC	Write according to synchronized I/O data integrity completion.
7716		O_NONBLOCK	Non-blocking mode.
7717	SIO	O_RSYNC	Synchronized read I/O operations.
7718		O_SYNC	Write according to synchronized I/O file integrity completion.
7719		The <fcntl.h> header shall define the following symbolic constant for use as the mask for file access modes. The value shall be suitable for use in #if preprocessing directives.	
7720			
7721		O_ACCMODE	Mask for file access modes.
7722		The <fcntl.h> header shall define the following symbolic constants for use as the file access modes for <i>open()</i> , <i>openat()</i> , and <i>fcntl()</i> . The values shall be suitable for use in #if preprocessing directives.	
7723			
7724			
7725		O_EXEC	Open for execute only (non-directory files). Use of this flag on directories is currently unspecified.
7726			
7727		O_RDONLY	Open for reading only.
7728		O_RDWR	Open for reading and writing.
7729		O_WRONLY	Open for writing only.
7730		The <fcntl.h> header shall define the symbolic constants for file modes for use as values of mode_t as described in <sys/stat.h>.	
7731			
7732		The <fcntl.h> header shall define the following symbolic constant as a special value used in place of a file descriptor for the <i>*at()</i> functions which take a directory file descriptor as a parameter:	
7733			
7734			
7735		AT_FDCWD	Use the current working directory to determine the target of relative file paths.
7736			
7737		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>faccessat()</i> :	
7738			
7739		AT_EACCESS	Check access using effective user and group ID.
7740		The <fcntl.h> header shall define the following symbolic constant as a value for the <i>flag</i> used by <i>fstatat()</i> , <i>fchmodat()</i> , <i>fchownat()</i> , and <i>utimensat()</i> :	
7741			
7742		AT_SYMLINK_NOFOLLOW	
7743			Do not follow symbolic links.
7744		The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by <i>linkat()</i> :	
7745			
7746		AT_SYMLINK_FOLLOW	
7747			Follow symbolic link.
7748		The <fcntl.h> header shall define the following symbolic constants as value for the flag used by <i>open()</i> and <i>openat()</i> :	
7749			
7750		O_DIRECTORY	Fail if not a directory.
7751		O_NOFOLLOW	Do not follow symbolic links.
7752		The <fcntl.h> header shall define the following symbolic constant as a value for the flag used by <i>unlinkat()</i> :	
7753			

7754 AT_REMOVEDIR Remove directory instead of file.

7755 ADV The <fcntl.h> header shall define the following symbolic constants for the *advice* argument used |
7756 by *posix_fadvise()*:

7757 POSIX_FADV_DONTNEED
7758 The application expects that it will not access the specified data in the near future. +

7759 POSIX_FADV_NOREUSE
7760 The application expects to access the specified data once and then not reuse it thereafter. +

7761 POSIX_FADV_NORMAL
7762 The application has no advice to give on its behavior with respect to the specified data. It is
7763 the default characteristic if no advice is given for an open file. -

7764 POSIX_FADV_RANDOM
7765 The application expects to access the specified data in a random order.

7766 POSIX_FADV_SEQUENTIAL
7767 The application expects to access the specified data sequentially from lower offsets to higher
7768 offsets. +

7769 POSIX_FADV_WILLNEED
7770 The application expects to access the specified data in the near future. -

7771 The <fcntl.h> header shall define the **flock** structure describing a file lock. It shall include the
7772 following members:

7773 short l_type Type of lock; F_RDLCK, F_WRLCK, F_UNLCK.
7774 short l_whence Flag for starting offset.
7775 off_t l_start Relative offset in bytes.
7776 off_t l_len Size; if 0 then until EOF.
7777 pid_t l_pid Process ID of the process holding the lock; returned with F_GETLK.

7778 The <fcntl.h> header shall define the **mode_t**, **off_t**, and **pid_t** types as described in
7779 <sys/types.h>.

7780 The following shall be declared as functions and may also be defined as macros. Function
7781 prototypes shall be provided.

7782 int creat(const char *, mode_t);
7783 int fcntl(int, int, ...);
7784 int open(const char *, int, ...);
7785 int openat(int, const char *, int, ...);
7786 ADV int posix_fadvise(int, off_t, off_t, int);
7787 int posix_fallocate(int, off_t, off_t);

7788 Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and
7789 <unistd.h>.

APPLICATION USAGE

Although no existing implementation defines `AT_SYMLINK_FOLLOW` and `AT_SYMLINK_NOFOLLOW` as the same numeric value, POSIX.1-200x does not prohibit that as the two constants are not used with the same interfaces.

RATIONALE

While many of the symbolic constants introduced in the `<fcntl.h>` header do not strictly need to be used in `#if` preprocessor directives, widespread historic practice has defined them as macros that are usable in such constructs, and examination of existing applications has shown that they are occasionally used in such a way. Therefore it was decided to retain this requirement on an implementation in POSIX.1-200x.

FUTURE DIRECTIONS

The meaning of the `O_EXEC` flag on directories may be specified in a future version.

XSH *creat()*, *exec*, *fcntl()*, *futimens()*, *open()*, *posix_fadvise()*, *posix_fallocate()*, *posix_madvise()*

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- `O_DSYNC` and `O_RSYNC` are marked as part of the Synchronized Input and Output option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The definition of the `mode_t`, `off_t`, and `pid_t` types is mandated.

The `F_GETOWN` and `F_SETOWN` values are added for sockets.

The *posix_fadvise()*, *posix_fallocate()*, and *posix_madvise()* functions are added for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for *posix_madvise()* to `<sys/mman.h>`.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/18 is applied, updating the prototypes for *posix_fadvise()* and *posix_fallocate()* to be large file-aware, using `off_t` instead of `size_t`.

Issue 7

The *openat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Additional flags are added to support *faccessat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*, *open()*, *openat()*, and *unlinkat()*.

This reference page is clarified with respect to macros and symbolic constants. +

Changes are made related to support for finegrained timestamps.

7830 NAME

7831 fenv.h — floating-point environment

7832 SYNOPSIS

7833 #include <fenv.h>

7834 DESCRIPTION

7835 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7836 conflict between the requirements described here and the ISO C standard is unintentional. This
 7837 volume of POSIX.1-200x defers to the ISO C standard.

7838 The <fenv.h> header shall define the following data types through **typedef**:

7839 **fenv_t** Represents the entire floating-point environment. The floating-point environment
 7840 refers collectively to any floating-point status flags and control modes supported
 7841 by the implementation.

7842 **feexcept_t** Represents the floating-point status flags collectively, including any status the
 7843 implementation associates with the flags. A floating-point status flag is a system
 7844 variable whose value is set (but never cleared) when a floating-point exception is
 7845 raised, which occurs as a side effect of exceptional floating-point arithmetic to
 7846 provide auxiliary information. A floating-point control mode is a system variable
 7847 whose value may be set by the user to affect the subsequent behavior of floating-
 7848 point arithmetic.

7849 The <fenv.h> header shall define each of the following macros if and only if the implementation
 7850 supports the floating-point exception by means of the floating-point functions *feclearexcept()*,
 7851 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. The defined macros shall
 7852 expand to integer constant expressions with values such that bitwise ORs of all combinations of
 7853 the macros result in distinct values.

7854 FE_DIVBYZERO
 7855 FE_INEXACT
 7856 FE_INVALID
 7857 FE_OVERFLOW
 7858 FE_UNDERFLOW

7859 MX If the implementation supports the IEC 60559 Floating-Point option, all five macros shall be
 7860 defined. Additional implementation-defined floating-point exceptions with macros beginning
 7861 with FE_ and an uppercase letter may also be specified by the implementation.

7862 The <fenv.h> header shall define the macro FE_ALL_EXCEPT as the bitwise-inclusive OR of all
 7863 floating-point exception macros defined by the implementation, if any. If no such macros are
 7864 defined, then the macro FE_ALL_EXCEPT shall be defined as zero.

7865 The <fenv.h> header shall define each of the following macros if and only if the implementation
 7866 supports getting and setting the represented rounding direction by means of the *fegetround()*
 7867 and *fesetround()* functions. The defined macros shall expand to integer constant expressions
 7868 whose values are distinct non-negative values.

7869 FE_DOWNWARD
 7870 FE_TONEAREST
 7871 FE_TOWARDZERO
 7872 FE_UPWARD

7873 MX If the implementation supports the IEC 60559 Floating-Point option, all four macros shall be
 7874 defined. Additional implementation-defined rounding directions with macros beginning with

7875 FE_ and an uppercase letter may also be specified by the implementation.

7876 The <fenv.h> header shall define the following macro, which represents the default floating-
7877 point environment (that is, the one installed at program startup) and has type pointer to const-
7878 qualified `fenv_t`. It can be used as an argument to the functions within the <fenv.h> header that
7879 manage the floating-point environment.

7880 `FE_DFL_ENV`

7881 The following shall be declared as functions and may also be defined as macros. Function
7882 prototypes shall be provided.

```
7883 int feclearexcept(int);
7884 int fegetenv(fenv_t *);
7885 int fegetexceptflag(fexcept_t *, int);
7886 int fegetround(void);
7887 int feholdexcept(fenv_t *);
7888 int feraiseexcept(int);
7889 int fesetenv(const fenv_t *);
7890 int fesetexceptflag(const fexcept_t *, int);
7891 int fesetround(int);
7892 int fetestexcept(int);
7893 int feupdateenv(const fenv_t *);
```

7894 The `FENV_ACCESS` pragma provides a means to inform the implementation when an
7895 application might access the floating-point environment to test floating-point status flags or run
7896 under non-default floating-point control modes. The pragma shall occur either outside external
7897 declarations or preceding all explicit declarations and statements inside a compound statement.
7898 When outside external declarations, the pragma takes effect from its occurrence until another
7899 `FENV_ACCESS` pragma is encountered, or until the end of the translation unit. When inside a
7900 compound statement, the pragma takes effect from its occurrence until another `FENV_ACCESS`
7901 pragma is encountered (including within a nested compound statement), or until the end of the
7902 compound statement; at the end of a compound statement the state for the pragma is restored to
7903 its condition just before the compound statement. If this pragma is used in any other context, the
7904 behavior is undefined. If part of an application tests floating-point status flags, sets floating-
7905 point control modes, or runs under non-default mode settings, but was translated with the state
7906 for the `FENV_ACCESS` pragma off, the behavior is undefined. The default state (on or off) for
7907 the pragma is implementation-defined. (When execution passes from a part of the application
7908 translated with `FENV_ACCESS` off to a part translated with `FENV_ACCESS` on, the state of the
7909 floating-point status flags is unspecified and the floating-point control modes have their default
7910 settings.)

7911 APPLICATION USAGE

7912 This header is designed to support the floating-point exception status flags and directed-
7913 rounding control modes required by the IEC 60559:1989 standard, and other similar floating-
7914 point state information. Also it is designed to facilitate code portability among all systems.

7915 Certain application programming conventions support the intended model of use for the
7916 floating-point environment:

- 7917 • A function call does not alter its caller's floating-point control modes, clear its caller's
7918 floating-point status flags, nor depend on the state of its caller's floating-point status flags
7919 unless the function is so documented.
- 7920 • A function call is assumed to require default floating-point control modes, unless its
7921 documentation promises otherwise.

- A function call is assumed to have the potential for raising floating-point exceptions, unless its documentation promises otherwise.

With these conventions, an application can safely assume default floating-point control modes (or be unaware of them). The responsibilities associated with accessing the floating-point environment fall on the application that does so explicitly.

Even though the rounding direction macros may expand to constants corresponding to the values of `FLT_ROUNDS`, they are not required to do so.

For example:

```
#include <fenv.h>
void f(double x)
{
    #pragma STDC FENV_ACCESS ON
    void g(double);
    void h(double);
    /* ... */
    g(x + 1);
    h(x + 1);
    /* ... */
}
```

If the function `g()` might depend on status flags set as a side effect of the first `x+1`, or if the second `x+1` might depend on control modes set as a side effect of the call to function `g()`, then the application shall contain an appropriately placed invocation as follows:

```
#pragma STDC FENV_ACCESS ON
```

RATIONALE

The `fexcept_t` Type

`fexcept_t` does not have to be an integer type. Its values must be obtained by a call to `fegetexceptflag()`, and cannot be created by logical operations from the exception macros. An implementation might simply implement `fexcept_t` as an `int` and use the representations reflected by the exception macros, but is not required to; other representations might contain extra information about the exceptions. `fexcept_t` might be a `struct` with a member for each exception (that might hold the address of the first or last floating-point instruction that caused that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an `fexcept_t`, and so the user cannot inspect it.

Exception and Rounding Macros

Macros corresponding to unsupported modes and rounding directions are not defined by the implementation and must not be defined by the application. An application might use `#ifndef` to test for this.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

7965

First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

7966

7967

7968

The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*, *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the ISO/IEC 9899:1999 standard, Defect Report 202.

7969

Issue 7

7970

SD5-XBD-ERN-48 and ISO C TC2 #37 (SD5-XBD-ERN-49) are applied.

7971

SD5-XBD-ERN-69 is applied.

7972

This reference page is clarified with respect to macros and symbolic constants.

+

7973 NAME

7974 float.h — floating types

7975 SYNOPSIS

7976 #include <float.h>

7977 DESCRIPTION

7978 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7979 conflict between the requirements described here and the ISO C standard is unintentional. This
 7980 volume of POSIX.1-200x defers to the ISO C standard.

7981 The characteristics of floating types are defined in terms of a model that describes a
 7982 representation of floating-point numbers and values that provide information about an
 7983 implementation's floating-point arithmetic.

7984 The following parameters are used to define the model for each floating-point type:

7985 *s* Sign (± 1).

7986 *b* Base or radix of exponent representation (an integer > 1).

7987 *e* Exponent (an integer between a minimum e_{\min} and a maximum e_{\max}).

7988 *p* Precision (the number of base-*b* digits in the significand).

7989 f_k Non-negative integers less than *b* (the significand digits).

7990 A floating-point number *x* is defined by the following model:

$$x = sb^e \sum_{k=1}^p f_k b^{-k}, e_{\min} \leq e \leq e_{\max}$$

7991 In addition to normalized floating-point numbers ($f_1 > 0$ if $x \neq 0$), floating types may be able to
 7992 contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x \neq 0$,
 7993 $e = e_{\min}$, $f_1 = 0$) and unnormalized floating-point numbers ($x \neq 0$, $e > e_{\min}$, $f_1 = 0$), and values that are
 7994 not floating-point numbers, such as infinities and NaNs. A *NaN* is an encoding signifying Not-a-
 7995 Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a
 7996 floating-point exception; a *signaling NaN* generally raises a floating-point exception when
 7997 occurring as an arithmetic operand.

7998 An implementation may give zero and non-numeric values, such as infinities and NaNs, a sign,
 7999 or may leave them unsigned. Wherever such values are unsigned, any requirement in
 8000 POSIX.1-200x to retrieve the sign shall produce an unspecified sign and any requirement to set
 8001 the sign shall be ignored.

8002 The accuracy of the floating-point operations ('+', '-', '*', '/') and of the functions in
 8003 <math.h> and <complex.h> that return floating-point results is implementation-defined, as is
 8004 the accuracy of the conversion between floating-point internal representations and string
 8005 representations performed by the functions in <stdio.h>, <stdlib.h>, and <wchar.h>. The
 8006 implementation may state that the accuracy is unknown.

8007 All integer values in the <float.h> header, except FLT_ROUNDS, shall be constant expressions
 8008 suitable for use in #if preprocessing directives; all floating values shall be constant expressions.
 8009 All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have
 8010 separate names for all three floating-point types. The floating-point model representation is
 8011 provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

8012 The rounding mode for floating-point addition is characterized by the implementation-defined

8013 value of FLT_ROUNDS:

- 8014 -1 Indeterminable.
- 8015 0 Toward zero.
- 8016 1 To nearest.
- 8017 2 Toward positive infinity.
- 8018 3 Toward negative infinity.

8019 All other values for FLT_ROUNDS characterize implementation-defined rounding behavior.

8020 The values of operations with floating operands and values subject to the usual arithmetic
8021 conversions and of floating constants are evaluated to a format whose range and precision may
8022 be greater than required by the type. The use of evaluation formats is characterized by the
8023 implementation-defined value of FLT_EVAL_METHOD:

- 8024 -1 Indeterminable.
- 8025 0 Evaluate all operations and constants just to the range and precision of the type.
- 8026 1 Evaluate operations and constants of type **float** and **double** to the range and precision of
8027 the **double** type; evaluate **long double** operations and constants to the range and precision
8028 of the **long double** type.
- 8029 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8030 All other negative values for FLT_EVAL_METHOD characterize implementation-defined
8031 behavior.

8032 The values given in the following list shall be defined as constant expressions with
8033 implementation-defined values that are greater or equal in magnitude (absolute value) to those
8034 shown, with the same sign.

- 8035 • Radix of exponent representation, b .
8036 FLT_RADIX 2
- 8037 • Number of base-FLT_RADIX digits in the floating-point significand, p .
8038 FLT_MANT_DIG
8039 DBL_MANT_DIG
8040 LDBL_MANT_DIG
- 8041 • Number of decimal digits, n , such that any floating-point number in the widest supported
8042 floating type with p_{\max} radix b digits can be rounded to a floating-point number with n
8043 decimal digits and back again without change to the value.

$$\left\{ \begin{array}{ll} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil 1 + p_{\max} \log_{10} b \right\rceil & \text{otherwise} \end{array} \right.$$

8044 DECIMAL_DIG 10

8045
8046
8047

- Number of decimal digits, q , such that any floating-point number with q decimal digits can be rounded into a floating-point number with p radix b digits and back again without change to the q decimal digits.

$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \lceil (p - 1) \log_{10} b \rceil & \text{otherwise} \end{cases}$$

8096 **CHANGE HISTORY**

8097 First released in Issue 4. Derived from the ISO C standard.

8098 **Issue 6**

8099 The description of the operations with floating-point values is updated for alignment with the
8100 ISO/IEC 9899:1999 standard.

8101 **Issue 7**

8102 ISO C TC2 #4 (SD5-XBD-ERN-50) and ISO C TC2 #5 (SD5-XBD-ERN-51) are applied.

8103 **NAME**8104 `fmtmsg.h` — message display structures8105 **SYNOPSIS**8106 XSI `#include <fmtmsg.h>`8107 **DESCRIPTION**

8108 The <fmtmsg.h> header shall define the following symbolic constants:

8109	MM_HARD	Source of the condition is hardware.
8110	MM_SOFT	Source of the condition is software.
8111	MM_FIRM	Source of the condition is firmware.
8112	MM_APPL	Condition detected by application.
8113	MM_UTIL	Condition detected by utility.
8114	MM_OPSYS	Condition detected by operating system.
8115	MM_RECOVER	Recoverable error.
8116	MM_NRECOV	Non-recoverable error.
8117	MM_HALT	Error causing application to halt.
8118	MM_ERROR	Application has encountered a non-fatal fault.
8119	MM_WARNING	Application has detected unusual non-error condition.
8120	MM_INFO	Informative message.
8121	MM_NOSEV	No severity level provided for the message.
8122	MM_PRINT	Display message on standard error.
8123	MM_CONSOLE	Display message on system console.

8124 The table below indicates the null values and identifiers for *fmtmsg()* arguments. The
 8125 <fmtmsg.h> header shall define the symbolic constants in the **Identifier** column, which shall
 8126 have the type indicated in the **Type** column:

Argument	Type	Null-Value	Identifier
<i>label</i>	char *	(char*)0	MM_NULLLBL
<i>severity</i>	int	0	MM_NULLSEV
<i>class</i>	long	0L	MM_NULLMC
<i>text</i>	char *	(char*)0	MM_NULLTXT
<i>action</i>	char *	(char*)0	MM_NULLACT
<i>tag</i>	char *	(char*)0	MM_NULLTAG

8134 The <fmtmsg.h> header shall also define the following symbolic constants for use as return
 8135 values for *fmtmsg()*:

8136	MM_OK	The function succeeded.
8137	MM_NOTOK	The function failed completely.
8138	MM_NOMSG	The function was unable to generate a message on standard error, but 8139 otherwise succeeded.

8140 MM_NOCON The function was unable to generate a console message, but otherwise
8141 succeeded.

8142 The following shall be declared as a function and may also be defined as a macro. A function
8143 prototype shall be provided.

```
8144 int fmtmsg(long, const char *, int,  
8145 const char *, const char *, const char *);
```

8186 **NAME**

8187 ftw.h — file tree traversal

8188 **SYNOPSIS**8189 XSI `#include <ftw.h>`8190 **DESCRIPTION**8191 The <ftw.h> header shall define the **FTW** structure that includes at least the following members:8192 `int base`
8193 `int level`8194 The <ftw.h> header shall define the following symbolic constants for use as values of the third
8195 argument to the application-supplied function that is passed as the second argument to *ftw()*
8196 and *nftw()*:8197 **FTW_F** File.
8198 **FTW_D** Directory.
8199 **FTW_DNR** Directory without read permission.
8200 **FTW_DP** Directory with subdirectories visited.
8201 **FTW_NS** Unknown type; *stat()* failed.
8202 **FTW_SL** Symbolic link.
8203 **FTW_SLN** Symbolic link that names a nonexistent file.8204 The <ftw.h> header shall define the following symbolic constants for use as values of the fourth
8205 argument to *nftw()*:8206 **FTW_PHYS** Physical walk, does not follow symbolic links. Otherwise, *nftw()* follows
8207 links but does not walk down any path that crosses itself.
8208 **FTW_MOUNT** The walk does not cross a mount point.
8209 **FTW_DEPTH** All subdirectories are visited before the directory itself.
8210 **FTW_CHDIR** The walk changes to each directory before reading it.8211 The following shall be declared as functions and may also be defined as macros. Function
8212 prototypes shall be provided.8213 `int ftw(const char *, int (*)(const char *, const struct stat *,`
8214 `int), int);`
8215 `int nftw(const char *, int (*)(const char *, const struct stat *,`
8216 `int, struct FTW *), int, int);`8217 The <ftw.h> header shall define the **stat** structure and the symbolic names for *st_mode* and the
8218 file type test macros as described in <sys/stat.h>.

8219 Inclusion of the <ftw.h> header may also make visible all symbols from <sys/stat.h>.

DRAFT

8236 **NAME**

8237 glob.h — pathname pattern-matching types

8238 **SYNOPSIS**

8239 #include <glob.h>

8240 **DESCRIPTION**8241 The <glob.h> header shall define the structures and symbolic constants used by the *glob()*
8242 function.8243 The structure type **glob_t** shall contain at least the following members:8244 `size_t gl_pathc` Count of paths matched by *pattern*.
8245 `char **gl_pathv` Pointer to a list of matched pathnames.
8246 `size_t gl_offs` Slots to reserve at the beginning of *gl_pathv*.8247 The **size_t** type shall be defined as described in <sys/types.h>.8248 The <glob.h> header shall define the following symbolic constants as values for the *flags* |
8249 argument:8250 **GLOB_APPEND** Append generated pathnames to those previously obtained.
8251 **GLOB_DOOFFS** Specify how many null pointers to add to the beginning of *gl_pathv*.
8252 **GLOB_ERR** Cause *glob()* to return on error.
8253 **GLOB_MARK** Each pathname that is a directory that matches *pattern* has a slash
8254 appended.
8255 **GLOB_NOCHECK** If *pattern* does not match any pathname, then return a list consisting of
8256 only *pattern*.
8257 **GLOB_NOESCAPE** Disable backslash escaping.
8258 **GLOB_NOSORT** Do not sort the pathnames returned.

8259 The <glob.h> header shall define the following symbolic constants as error return values: |

8260 **GLOB_ABORTED** The scan was stopped because **GLOB_ERR** was set or *(*errfunc)()*
8261 returned non-zero.
8262 **GLOB_NOMATCH** The *pattern* does not match any existing pathname, and
8263 **GLOB_NOCHECK** was not set in *flags*.
8264 **GLOB_NOSPACE** An attempt to allocate memory failed.8265 The following shall be declared as functions and may also be defined as macros. Function
8266 prototypes shall be provided.8267 `int glob(const char *restrict, int, int (*)(const char *, int),` |
8268 `glob_t *restrict);`
8269 `void globfree(glob_t *);`

8358 First released in Issue 4.

8359 **Issue 6**8360 The **restrict** keyword is added to the prototype for *iconv()*.8361 **Issue 7**8362 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

8363 The <iconv.h> header is moved from the XSI option to the Base.

8364 **NAME**

8365 inttypes.h — fixed size integer types

8366 **SYNOPSIS**

8367 #include <inttypes.h>

8368 **DESCRIPTION**

8369 CX Some of the functionality described on this reference page extends the ISO C standard.
 8370 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 8371 enable the visibility of these symbols in this header.

8372 The <inttypes.h> header shall include the <stdint.h> header.

8373 The <inttypes.h> header shall include a definition of at least the following type:

8374 **imaxdiv_t** Structure type that is the type of the value returned by the *imaxdiv()* function.

8375 The following macros shall be defined. Each expands to a character string literal containing a
 8376 conversion specifier, possibly modified by a length modifier, suitable for use within the *format*
 8377 argument of a formatted input/output function when converting the corresponding integer
 8378 type. These macros have the general form of PRI (character string literals for the *fprintf()* and
 8379 *fwprintf()* family of functions) or SCN (character string literals for the *fscanf()* and *fwscanf()*
 8380 family of functions), followed by the conversion specifier, followed by a name corresponding to
 8381 a similar type name in <stdint.h>. In these names, *N* represents the width of the type as
 8382 described in <stdint.h>. For example, *PRIdFAST32* can be used in a format string to print the
 8383 value of an integer of type *int_fast32_t*.

8384 The *fprintf()* macros for signed integers are:

8385	PRId <i>N</i>	PRIdLEAST <i>N</i>	PRIdFAST <i>N</i>	PRIdMAX	PRIdPTR
8386	PRIdi <i>N</i>	PRIdiLEAST <i>N</i>	PRIdiFAST <i>N</i>	PRIdiMAX	PRIdiPTR

8387 The *fprintf()* macros for unsigned integers are:

8388	PRIo <i>N</i>	PRIoLEAST <i>N</i>	PRIoFAST <i>N</i>	PRIoMAX	PRIoPTR
8389	PRIU <i>N</i>	PRIULEAST <i>N</i>	PRIUFAST <i>N</i>	PRIUMAX	PRIUPTR
8390	PRIx <i>N</i>	PRIXLEAST <i>N</i>	PRIXFAST <i>N</i>	PRIXMAX	PRIXPTR
8391	PRIXN	PRIXLEASTN	PRIXFASTN	PRIXMAX	PRIXPTR

8392 The *fscanf()* macros for signed integers are:

8393	SCNd <i>N</i>	SCNdLEAST <i>N</i>	SCNdFAST <i>N</i>	SCNdMAX	SCNdPTR
8394	SCNi <i>N</i>	SCNiLEAST <i>N</i>	SCNiFAST <i>N</i>	SCNiMAX	SCNiPTR

8395 The *fscanf()* macros for unsigned integers are:

8396	SCNo <i>N</i>	SCNoLEAST <i>N</i>	SCNoFAST <i>N</i>	SCNoMAX	SCNoPTR
8397	SCNu <i>N</i>	SCNuLEAST <i>N</i>	SCNuFAST <i>N</i>	SCNuMAX	SCNuPTR
8398	SCNx <i>N</i>	SCNxLEAST <i>N</i>	SCNxFAST <i>N</i>	SCNxMAX	SCNxPTR

8399 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and
 8400 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be
 8401 defined unless the implementation does not have a suitable modifier for the type.

8402 The following shall be declared as functions and may also be defined as macros. Function
 8403 prototypes shall be provided.

8404 `intmax_t imaxabs(intmax_t);`

```

8405     imaxdiv_t imaxdiv(intmax_t, intmax_t);
8406     intmax_t  strtouimax(const char *restrict, char **restrict, int);
8407     uintmax_t strtoumax(const char *restrict, char **restrict, int);
8408     intmax_t  wcstouimax(const wchar_t *restrict, wchar_t **restrict, int);
8409     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);

```

EXAMPLES

```

8410     #include <inttypes.h>
8411     #include <wchar.h>
8412     int main(void)
8413     {
8414         uintmax_t i = UINTMAX_MAX; // This type always exists.
8415         wprintf(L"The largest integer value is %020"
8416             PRIxMAX "\n", i);
8417         return 0;
8418     }
8419

```

APPLICATION USAGE

8420 The purpose of <inttypes.h> is to provide a set of integer types whose definitions are consistent
8421 across machines and independent of operating systems and other implementation
8422 idiosyncrasies. It defines, via **typedef**, integer types of various sizes. Implementations are free to
8423 **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of
8424 this header will greatly increase the portability of applications across platforms.
8425

RATIONALE

8426 The ISO/IEC 9899:1990 standard specified that the language should support four signed and
8427 unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on
8428 their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and
8429 not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits
8430 to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to
8431 assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems
8432 for users who migrate from one system to another which assigns different sizes to integer types,
8433 because the ISO C standard integer promotion rule can produce silent changes unexpectedly.
8434 The need for defining an extended integer type increased with the introduction of 64-bit
8435 systems.
8436

FUTURE DIRECTIONS

8437 Macro names beginning with PRI or SCN followed by any lowercase letter or 'x' may be added
8438 to the macros defined in the <inttypes.h> header.
8439

8478 **NAME**
8479 langinfo.h — language information constants

8480 **SYNOPSIS**
8481 #include <langinfo.h>

8482 **DESCRIPTION**
8483 The <langinfo.h> header defines the symbolic constants used to identify items of *langinfo* data |
8484 (see *nl_langinfo()*). -

8485 The **nl_item** type shall be defined as described in <nl/types.h>. |

8486 The <langinfo.h> header shall define the following symbolic constants with type **nl_item**. The |
8487 entries under **Category** indicate in which *setlocale()* category each item is defined.

Constant	Category	Meaning
8488 CODESET	<i>LC_CTYPE</i>	Codeset name.
8489 D_T_FMT	<i>LC_TIME</i>	String for formatting date and time.
8490 D_FMT	<i>LC_TIME</i>	Date format string.
8491 T_FMT	<i>LC_TIME</i>	Time format string.
8492 T_FMT_AMPM	<i>LC_TIME</i>	a.m. or p.m. time format string.
8493 AM_STR	<i>LC_TIME</i>	Ante-meridiem affix.
8494 PM_STR	<i>LC_TIME</i>	Post-meridiem affix.
8495 DAY_1	<i>LC_TIME</i>	Name of the first day of the week (for example, Sunday).
8496 DAY_2	<i>LC_TIME</i>	Name of the second day of the week (for example, Monday).
8497 DAY_3	<i>LC_TIME</i>	Name of the third day of the week (for example, Tuesday).
8498 DAY_4	<i>LC_TIME</i>	Name of the fourth day of the week
8499		(for example, Wednesday).
8500 DAY_5	<i>LC_TIME</i>	Name of the fifth day of the week (for example, Thursday).
8501 DAY_6	<i>LC_TIME</i>	Name of the sixth day of the week (for example, Friday).
8502 DAY_7	<i>LC_TIME</i>	Name of the seventh day of the week
8503		(for example, Saturday).
8504 ABDAY_1	<i>LC_TIME</i>	Abbreviated name of the first day of the week.
8505 ABDAY_2	<i>LC_TIME</i>	Abbreviated name of the second day of the week.
8506 ABDAY_3	<i>LC_TIME</i>	Abbreviated name of the third day of the week.
8507 ABDAY_4	<i>LC_TIME</i>	Abbreviated name of the fourth day of the week.
8508 ABDAY_5	<i>LC_TIME</i>	Abbreviated name of the fifth day of the week.
8509 ABDAY_6	<i>LC_TIME</i>	Abbreviated name of the sixth day of the week.
8510 ABDAY_7	<i>LC_TIME</i>	Abbreviated name of the seventh day of the week.
8511 MON_1	<i>LC_TIME</i>	Name of the first month of the year.
8512 MON_2	<i>LC_TIME</i>	Name of the second month.
8513 MON_3	<i>LC_TIME</i>	Name of the third month.
8514 MON_4	<i>LC_TIME</i>	Name of the fourth month.
8515 MON_5	<i>LC_TIME</i>	Name of the fifth month.
8516 MON_6	<i>LC_TIME</i>	Name of the sixth month.
8517 MON_7	<i>LC_TIME</i>	Name of the seventh month.
8518 MON_8	<i>LC_TIME</i>	Name of the eighth month.
8519 MON_9	<i>LC_TIME</i>	Name of the ninth month.
8520 MON_10	<i>LC_TIME</i>	Name of the tenth month.
8521 MON_11	<i>LC_TIME</i>	Name of the eleventh month.
8522 MON_12	<i>LC_TIME</i>	Name of the twelfth month.
8523 ABMON_1	<i>LC_TIME</i>	Abbreviated name of the first month.
8524 ABMON_2	<i>LC_TIME</i>	Abbreviated name of the second month.

Constant	Category	Meaning
8526 ABMON_3	LC_TIME	Abbreviated name of the third month.
8527 ABMON_4	LC_TIME	Abbreviated name of the fourth month.
8528 ABMON_5	LC_TIME	Abbreviated name of the fifth month.
8529 ABMON_6	LC_TIME	Abbreviated name of the sixth month.
8530 ABMON_7	LC_TIME	Abbreviated name of the seventh month.
8531 ABMON_8	LC_TIME	Abbreviated name of the eighth month.
8532 ABMON_9	LC_TIME	Abbreviated name of the ninth month.
8533 ABMON_10	LC_TIME	Abbreviated name of the tenth month.
8534 ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
8535 ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
8536 ERA	LC_TIME	Era description segments.
8537 ERA_D_FMT	LC_TIME	Era date format string.
8538 ERA_D_T_FMT	LC_TIME	Era date and time format string.
8539 ERA_T_FMT	LC_TIME	Era time format string.
8540 ALT_DIGITS	LC_TIME	Alternative symbols for digits.
8541 RADIXCHAR	LC_NUMERIC	Radix character.
8542 THOUSEP	LC_NUMERIC	Separator for thousands.
8543 YESEXPR	LC_MESSAGES	Affirmative response expression.
8544 NOEXPR	LC_MESSAGES	Negative response expression.
8545 CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '-' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").

8551 If the locale's values for **p_cs_precedes** and **n_cs_precedes** do not match, the value of
 8552 *nl_langinfo*(CRNCYSTR) and *nl_langinfo_l*(CRNCYSTR,loc) is unspecified. +

8553 The following shall be declared as a function and may also be defined as a macro. A function
 8554 prototype shall be provided.

```
8555 char *nl_langinfo(nl_item);
8556 char *nl_langinfo_l(nl_item, locale_t);
```

8557 Inclusion of the <langinfo.h> header may also make visible all symbols from <nl_types.h>.

8558 APPLICATION USAGE

8559 Wherever possible, users are advised to use functions compatible with those in the ISO C
 8560 standard to access items of *langinfo* data. In particular, the *strftime*() function should be used to
 8561 access date and time information defined in category *LC_TIME*. The *localeconv*() function
 8562 should be used to access information corresponding to *RADIXCHAR*, *THOUSEP*, and
 8563 *CRNCYSTR*.

8564 RATIONALE

8565 None.

8566 FUTURE DIRECTIONS

8567 None.

8584**CHANGE HISTORY**

First released in Issue 2.

Issue 5

The constants YESSTR and NOSTR are marked LEGACY.

Issue 6

The constants YESSTR and NOSTR are removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/9 is applied, adding a sentence to the "Meaning" column entry for the CRNCYSTR constant. This change is to accommodate historic practice.

Issue 7

The <langinfo.h> header is moved from the XSI option to the Base.

The *nl_langinfo_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

This reference page is clarified with respect to macros and symbolic constants. +

8585 **NAME**
 8586 libgen.h — definitions for pattern matching functions

8587 **SYNOPSIS**
 8588 XSI `#include <libgen.h>`

8589 **DESCRIPTION**
 8590 The following shall be declared as functions and may also be defined as macros. Function
 8591 prototypes shall be provided.

8592 `char *basename(char *);`
 8593 `char *dirname(char *);`

8594 **APPLICATION USAGE**
 8595 None.

8596 **RATIONALE**
 8597 None.

8598 **FUTURE DIRECTIONS**
 8599 None.

8600 **SEE ALSO**
 8601 XSH *basename*, *dirname*

8602 **CHANGE HISTORY**
 8603 First released in Issue 4, Version 2.

8604 **Issue 5**
 8605 The function prototypes for *basename()* and *dirname()* are changed to indicate that the first
 8606 argument is of type **char *** rather than **const char ***.

8607 **Issue 6**
 8608 The `__loc1` symbol and the *regcmp()* and *regex()* functions are removed.

8609 **NAME**
 8610 limits.h — implementation-defined constants

8611 **SYNOPSIS**
 8612 #include <limits.h>

8613 **DESCRIPTION**

8614 CX Some of the functionality described on this reference page extends the ISO C standard.
 8615 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 8616 enable the visibility of these symbols in this header.

8617 Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such
 8618 symbols are not shown as CX shaded.

8619 The <limits.h> header shall define macros and symbolic constants for various limits. Different
 8620 categories of limits are described below, representing various limits on resources that the
 8621 implementation imposes on applications. All macros and symbolic constants defined in this
 8622 header shall be suitable for use in #if preprocessing directives.

8623 Implementations may choose any appropriate value for each limit, provided it is not more
 8624 restrictive than the Minimum Acceptable Values listed below. Symbolic constant names
 8625 beginning with _POSIX may be found in <unistd.h>.

8626 Applications should not assume any particular value for a limit. To achieve maximum
 8627 portability, an application should not require more resource than the Minimum Acceptable
 8628 Value quantity. However, an application wishing to avail itself of the full amount of a resource
 8629 available on an implementation may make use of the value given in <limits.h> on that
 8630 particular implementation, by using the macros and symbolic constants listed below. It should
 8631 be noted, however, that many of the listed limits are not invariant, and at runtime, the value of
 8632 the limit may differ from those given in this header, for the following reasons:

- 8633 • The limit is pathname-dependent.
- 8634 • The limit differs between the compile and runtime machines.

8635 For these reasons, an application may use the *fpathconf()*, *pathconf()*, and *sysconf()* functions to
 8636 determine the actual value of a limit at runtime.

8637 The items in the list ending in _MIN give the most negative values that the mathematical types
 8638 are guaranteed to be capable of representing. Numbers of a more negative value may be
 8639 supported on some implementations, as indicated by the <limits.h> header on the
 8640 implementation, but applications requiring such numbers are not guaranteed to be portable to
 8641 all implementations. For positive constants ending in _MIN, this indicates the minimum
 8642 acceptable value.

8643 **Runtime Invariant Values (Possibly Indeterminate)**

8644 A definition of one of the symbolic constants in the following list shall be omitted from
 8645 <limits.h> on specific implementations where the corresponding value is equal to or greater
 8646 than the stated minimum, but is unspecified.

8647 This indetermination might depend on the amount of available memory space on a specific
 8648 instance of a specific implementation. The actual value supported by a specific instance shall be
 8649 provided by the *sysconf()* function.

8650 {AIO_LISTIO_MAX}
 8651 Maximum number of I/O operations in a single list I/O call supported by the
 8652 implementation.

8653 Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}

8654 {AIO_MAX}

8655 Maximum number of outstanding asynchronous I/O operations supported by the

8656 implementation.

8657 Minimum Acceptable Value: {_POSIX_AIO_MAX}

8658 {AIO_PRIO_DELTA_MAX}

8659 The maximum amount by which a process can decrease its asynchronous I/O priority level

8660 from its own scheduling priority.

8661 Minimum Acceptable Value: 0

8662 {ARG_MAX}

8663 Maximum length of argument to the *exec* functions including environment data.

8664 Minimum Acceptable Value: {_POSIX_ARG_MAX}

8665 {ATEXIT_MAX}

8666 Maximum number of functions that may be registered with *atexit()*.

8667 Minimum Acceptable Value: 32

8668 {CHILD_MAX}

8669 Maximum number of simultaneous processes per real user ID.

8670 Minimum Acceptable Value: {_POSIX_CHILD_MAX}

8671 {DELAYTIMER_MAX}

8672 Maximum number of timer expiration overruns.

8673 Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}

8674 {HOST_NAME_MAX}

8675 Maximum length of a host name (not including the terminating null) as returned from the

8676 *gethostname()* function.

8677 Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}

8678 XSI {IOV_MAX}

8679 Maximum number of *iovec* structures that one process has available for use with *readv()* or

8680 *writev()*.

8681 Minimum Acceptable Value: {_XOPEN_IOV_MAX}

8682 {LOGIN_NAME_MAX}

8683 Maximum length of a login name.

8684 Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}

8685 MSG {MQ_OPEN_MAX}

8686 The maximum number of open message queue descriptors a process may hold.

8687 Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}

8688 MSG {MQ_PRIO_MAX}

8689 The maximum number of message priorities supported by the implementation.

8690 Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}

8691 {OPEN_MAX}

8692 A value one greater than the maximum value that the system may assign to a newly-created

8693 file descriptor.

8694 Minimum Acceptable Value: {_POSIX_OPEN_MAX}

8695 {PAGESIZE}

8696 Size in bytes of a page.

8697 Minimum Acceptable Value: 1

8698	XSI	{PAGE_SIZE}
8699		Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is
8700		defined with the same value.
8701		{PTHREAD_DESTRUCTOR_ITERATIONS}
8702		Maximum number of attempts made to destroy a thread's thread-specific data values on
8703		thread exit.
8704		Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
8705		{PTHREAD_KEYS_MAX}
8706		Maximum number of data keys that can be created by a process.
8707		Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}
8708		{PTHREAD_STACK_MIN}
8709		Minimum size in bytes of thread stack storage.
8710		Minimum Acceptable Value: 0
8711		{PTHREAD_THREADS_MAX}
8712		Maximum number of threads that can be created per process.
8713		Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}
8714		{RE_DUP_MAX}
8715		The number of repeated occurrences of a BRE or ERE interval expression; see Section 9.3.6
8716		(on page 172) and Section 9.4.6 (on page 175).
8717		Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}
8718		{RTSIG_MAX}
8719		Maximum number of realtime signals reserved for application use in this implementation.
8720		Minimum Acceptable Value: {_POSIX_RTSIG_MAX}
8721		{SEM_NSEMS_MAX}
8722		Maximum number of semaphores that a process may have.
8723		Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}
8724		{SEM_VALUE_MAX}
8725		The maximum value a semaphore may have.
8726		Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}
8727		{SIGQUEUE_MAX}
8728		Maximum number of queued signals that a process may send and have pending at the
8729		receiver(s) at any time.
8730		Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}
8731	SSI/TSP	{SS_REPL_MAX}
8732		The maximum number of replenishment operations that may be simultaneously pending
8733		for a particular sporadic server scheduler.
8734		Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}
8735		{STREAM_MAX}
8736		The number of streams that one process can have open at one time. If defined, it has the
8737		same value as {FOPEN_MAX} (see <stdio.h>).
8738		Minimum Acceptable Value: {_POSIX_STREAM_MAX}
8739		{SYMLOOP_MAX}
8740		Maximum number of symbolic links that can be reliably traversed in the resolution of a
8741		pathname in the absence of a loop.
8742		Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}
8743		{TIMER_MAX}
8744		Maximum number of timers per process supported by the implementation.
8745		Minimum Acceptable Value: {_POSIX_TIMER_MAX}

8746 OB TRC {TRACE_EVENT_NAME_MAX}
 8747 Maximum length of the trace event name.
 8748 Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}

8749 OB TRC {TRACE_NAME_MAX}
 8750 Maximum length of the trace generation version string or of the trace stream name.
 8751 Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}

8752 OB TRC {TRACE_SYS_MAX}
 8753 Maximum number of trace streams that may simultaneously exist in the system.
 8754 Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}

8755 OB TRC {TRACE_USER_EVENT_MAX}
 8756 Maximum number of user trace event type identifiers that may simultaneously exist in a
 8757 traced process, including the predefined user trace event
 8758 POSIX_TRACE_UNNAMED_USER_EVENT.
 8759 Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}

8760 {TTY_NAME_MAX}
 8761 Maximum length of terminal device name.
 8762 Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}

8763 {TZNAME_MAX}
 8764 Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).
 8765 Minimum Acceptable Value: {_POSIX_TZNAME_MAX}

8766 **Note:** The length given by {TZNAME_MAX} does not include the quoting characters mentioned in
 8767 Section 8.3 (on page 163).

8768 Pathname Variable Values

8769 The values in the following list may be constants within an implementation or may vary from
 8770 one pathname to another. For example, file systems or directories may have different
 8771 characteristics.

8772 A definition of one of the symbolic constants in the following list shall be omitted from the
 8773 <limits.h> header on specific implementations where the corresponding value is equal to or
 8774 greater than the stated minimum, but where the value can vary depending on the file to which it
 8775 is applied. The actual value supported for a specific pathname shall be provided by the
 8776 *pathconf()* function.

8777 {FILESIZEBITS}
 8778 Minimum number of bits needed to represent, as a signed integer value, the maximum size
 8779 of a regular file allowed in the specified directory.
 8780 Minimum Acceptable Value: 32

8781 {LINK_MAX}
 8782 Maximum number of links to a single file.
 8783 Minimum Acceptable Value: {_POSIX_LINK_MAX}

8784 {MAX_CANON}
 8785 Maximum number of bytes in a terminal canonical input line.
 8786 Minimum Acceptable Value: {_POSIX_MAX_CANON}

8787 {MAX_INPUT}
 8788 Minimum number of bytes for which space is available in a terminal input queue; therefore,
 8789 the maximum number of bytes a conforming application may require to be typed as input
 8790 before reading them.
 8791 Minimum Acceptable Value: {_POSIX_MAX_INPUT}

8792		{NAME_MAX}
8793		Maximum number of bytes in a filename (not including terminating null).
8794		Minimum Acceptable Value: {_POSIX_NAME_MAX}
8795	XSI	Minimum Acceptable Value: {_XOPEN_NAME_MAX}
8796		{PATH_MAX}
8797		Maximum number of bytes in a pathname, including the terminating null character.
8798		Minimum Acceptable Value: {_POSIX_PATH_MAX}
8799	XSI	Minimum Acceptable Value: {_XOPEN_PATH_MAX}
8800		{PIPE_BUF}
8801		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
8802		Minimum Acceptable Value: {_POSIX_PIPE_BUF}
8803	ADV	{POSIX_ALLOC_SIZE_MIN}
8804		Minimum number of bytes of storage actually allocated for any portion of a file.
8805		Minimum Acceptable Value: Not specified.
8806	ADV	{POSIX_REC_INCR_XFER_SIZE}
8807		Recommended increment for file transfer sizes between the
8808		{POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
8809		Minimum Acceptable Value: Not specified.
8810	ADV	{POSIX_REC_MAX_XFER_SIZE}
8811		Maximum recommended file transfer size.
8812		Minimum Acceptable Value: Not specified.
8813	ADV	{POSIX_REC_MIN_XFER_SIZE}
8814		Minimum recommended file transfer size.
8815		Minimum Acceptable Value: Not specified.
8816	ADV	{POSIX_REC_XFER_ALIGN}
8817		Recommended file transfer buffer alignment.
8818		Minimum Acceptable Value: Not specified.
8819		{SYMLINK_MAX}
8820		Maximum number of bytes in a symbolic link.
8821		Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

8822 Runtime Inceasable Values

8823 The magnitude limitations in the following list shall be fixed by specific implementations. An
 8824 application should assume that the value of the symbolic constant defined by <limits.h> in a
 8825 specific implementation is the minimum that pertains whenever the application is run under
 8826 that implementation. A specific instance of a specific implementation may increase the value
 8827 relative to that supplied by <limits.h> for that implementation. The actual value supported by a
 8828 specific instance shall be provided by the *sysconf()* function.

8829		{BC_BASE_MAX}
8830		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
8831		Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}
8832		{BC_DIM_MAX}
8833		Maximum number of elements permitted in an array by the <i>bc</i> utility.
8834		Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}
8835		{BC_SCALE_MAX}
8836		Maximum <i>scale</i> value allowed by the <i>bc</i> utility.
8837		Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}

8838 {BC_STRING_MAX}
 8839 Maximum length of a string constant accepted by the *bc* utility.
 8840 Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}

8841 {CHARCLASS_NAME_MAX}
 8842 Maximum number of bytes in a character class name.
 8843 Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}

8844 {COLL_WEIGHTS_MAX}
 8845 Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order**
 8846 keyword in the locale definition file; see [Chapter 7](#) (on page 121).
 8847 Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}

8848 {EXPR_NEST_MAX}
 8849 Maximum number of expressions that can be nested within parentheses by the *expr* utility.
 8850 Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}

8851 {LINE_MAX}
 8852 Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
 8853 standard input or another file), when the utility is described as processing text files. The
 8854 length includes room for the trailing <newline>.
 8855 Minimum Acceptable Value: {_POSIX2_LINE_MAX}

8856 {NGROUPS_MAX}
 8857 Maximum number of simultaneous supplementary group IDs per process.
 8858 Minimum Acceptable Value: {_POSIX2_NGROUPS_MAX}

8859 {RE_DUP_MAX}
 8860 Maximum number of repeated occurrences of a regular expression permitted when using
 8861 the interval notation $\{m,n\}$; see [Chapter 9](#) (on page 167).
 8862 Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

Maximum Values

8863
 8864 The symbolic constants in the following list shall be defined in <limits.h> with the values
 8865 shown. These are the most restrictive values for certain features on an implementation. A
 8866 conforming implementation shall provide values no larger than these values. A conforming
 8867 application must not require a smaller value for correct operation.

8868 {_POSIX_CLOCKRES_MIN}
 8869 The resolution of the CLOCK_REALTIME clock, in nanoseconds.
 8870 Value: 20 000 000

8871 MON If the Monotonic Clock option is supported, the resolution of the CLOCK_MONOTONIC
 8872 clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

Minimum Values

8873
 8874 The symbolic constants in the following list shall be defined in <limits.h> with the values
 8875 shown. These are the most restrictive values for certain features on an implementation
 8876 conforming to this volume of POSIX.1-200x. Related symbolic constants are defined elsewhere in
 8877 this volume of POSIX.1-200x which reflect the actual implementation and which need not be as
 8878 restrictive. A conforming implementation shall provide values at least this large. A strictly
 8879 conforming application must not require a larger value for correct operation.

8880 {_POSIX_AIO_LISTIO_MAX}
 8881 The number of I/O operations that can be specified in a list I/O call.
 8882 Value: 2

8883	{_POSIX_AIO_MAX}	
8884		The number of outstanding asynchronous I/O operations.
8885		Value: 1
8886	{_POSIX_ARG_MAX}	
8887		Maximum length of argument to the <i>exec</i> functions including environment data.
8888		Value: 4 096
8889	{_POSIX_CHILD_MAX}	
8890		Maximum number of simultaneous processes per real user ID.
8891		Value: 25
8892	{_POSIX_DELAYTIMER_MAX}	
8893		The number of timer expiration overruns.
8894		Value: 32
8895	{_POSIX_HOST_NAME_MAX}	
8896		Maximum length of a host name (not including the terminating null) as returned from the <i>gethostname()</i> function.
8897		Value: 255
8899	{_POSIX_LINK_MAX}	
8900		Maximum number of links to a single file.
8901		Value: 8
8902	{_POSIX_LOGIN_NAME_MAX}	
8903		The size of the storage required for a login name, in bytes, including the terminating null.
8904		Value: 9
8905	{_POSIX_MAX_CANON}	
8906		Maximum number of bytes in a terminal canonical input queue.
8907		Value: 255
8908	{_POSIX_MAX_INPUT}	
8909		Maximum number of bytes allowed in a terminal input queue.
8910		Value: 255
8911	MSG	{_POSIX_MQ_OPEN_MAX}
8912		The number of message queues that can be open for a single process.
8913		Value: 8
8914	MSG	{_POSIX_MQ_PRIO_MAX}
8915		The maximum number of message priorities supported by the implementation.
8916		Value: 32
8917		{_POSIX_NAME_MAX}
8918		Maximum number of bytes in a filename (not including terminating null).
8919		Value: 14
8920		{_POSIX_NGROUPS_MAX}
8921		Maximum number of simultaneous supplementary group IDs per process.
8922		Value: 8
8923		{_POSIX_OPEN_MAX}
8924		Maximum number of files that one process can have open at any one time.
8925		Value: 20
8926		{_POSIX_PATH_MAX}
8927		Maximum number of bytes in a pathname.
8928		Value: 256

8929 { _POSIX_PIPE_BUF}
8930 Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
8931 Value: 512

8932 { _POSIX_RE_DUP_MAX}
8933 The number of repeated occurrences of a BRE permitted by the *regex*(*)* and *regcomp*(*)*
8934 functions when using the interval notation $\{m,n\}$; see [Section 9.3.6](#) (on page 172).
8935 Value: 255

8936 { _POSIX_RTSIG_MAX}
8937 The number of realtime signal numbers reserved for application use.
8938 Value: 8

8939 { _POSIX_SEM_NSEMS_MAX}
8940 The number of semaphores that a process may have.
8941 Value: 256

8942 { _POSIX_SEM_VALUE_MAX}
8943 The maximum value a semaphore may have.
8944 Value: 32 767

8945 { _POSIX_SIGQUEUE_MAX}
8946 The number of queued signals that a process may send and have pending at the receiver(s)
8947 at any time.
8948 Value: 32

8949 { _POSIX_SSIZE_MAX}
8950 The value that can be stored in an object of type **ssize_t**.
8951 Value: 32 767

8952 SS | TSP { _POSIX_SS_REPL_MAX}
8953 The number of replenishment operations that may be simultaneously pending for a
8954 particular sporadic server scheduler.
8955 Value: 4

8956 { _POSIX_STREAM_MAX}
8957 The number of streams that one process can have open at one time.
8958 Value: 8

8959 { _POSIX_SYMLINK_MAX}
8960 The number of bytes in a symbolic link.
8961 Value: 255

8962 { _POSIX_SYMLINK_MAX}
8963 The number of symbolic links that can be traversed in the resolution of a pathname in the
8964 absence of a loop.
8965 Value: 8

8966 { _POSIX_THREAD_DESTRUCTOR_ITERATIONS}
8967 The number of attempts made to destroy a thread's thread-specific data values on thread
8968 exit.
8969 Value: 4

8970 { _POSIX_THREAD_KEYS_MAX}
8971 The number of data keys per process.
8972 Value: 128

8973 { _POSIX_THREAD_THREADS_MAX}
8974 The number of threads per process.
8975 Value: 64

8976 { _POSIX_TIMER_MAX}
8977 The per-process number of timers.
8978 Value: 32

8979 OB TRC { _POSIX_TRACE_EVENT_NAME_MAX}
8980 The length in bytes of a trace event name.
8981 Value: 30

8982 OB TRC { _POSIX_TRACE_NAME_MAX}
8983 The length in bytes of a trace generation version string or a trace stream name.
8984 Value: 8

8985 OB TRC { _POSIX_TRACE_SYS_MAX}
8986 The number of trace streams that may simultaneously exist in the system.
8987 Value: 8

8988 OB TRC { _POSIX_TRACE_USER_EVENT_MAX}
8989 The number of user trace event type identifiers that may simultaneously exist in a traced
8990 process, including the predefined user trace event
8991 POSIX_TRACE_UNNAMED_USER_EVENT.
8992 Value: 32

8993 { _POSIX_TTY_NAME_MAX}
8994 The size of the storage required for a terminal device name, in bytes, including the
8995 terminating null.
8996 Value: 9

8997 { _POSIX_TZNAME_MAX}
8998 Maximum number of bytes supported for the name of a timezone (not of the *TZ* variable).
8999 Value: 6

9000 **Note:** The length given by { _POSIX_TZNAME_MAX} does not include the quoting characters
9001 mentioned in [Section 8.3](#) (on page 163).

9002 { _POSIX2_BC_BASE_MAX}
9003 Maximum *obase* values allowed by the *bc* utility.
9004 Value: 99

9005 { _POSIX2_BC_DIM_MAX}
9006 Maximum number of elements permitted in an array by the *bc* utility.
9007 Value: 2 048

9008 { _POSIX2_BC_SCALE_MAX}
9009 Maximum *scale* value allowed by the *bc* utility.
9010 Value: 99

9011 { _POSIX2_BC_STRING_MAX}
9012 Maximum length of a string constant accepted by the *bc* utility.
9013 Value: 1 000

9014 { _POSIX2_CHARCLASS_NAME_MAX}
9015 Maximum number of bytes in a character class name.
9016 Value: 14

9017 { _POSIX2_COLL_WEIGHTS_MAX}
9018 Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order**
9019 keyword in the locale definition file; see [Chapter 7](#) (on page 121).
9020 Value: 2

9021 { _POSIX2_EXPR_NEST_MAX}
9022 Maximum number of expressions that can be nested within parentheses by the *expr* utility.
9023 Value: 32

9024		{_POSIX2_LINE_MAX}
9025		Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
9026		standard input or another file), when the utility is described as processing text files. The
9027		length includes room for the trailing <newline>.
9028		Value: 2 048
9029		{_POSIX2_RE_DUP_MAX}
9030		Maximum number of repeated occurrences of a regular expression permitted when using
9031		the interval notation $\{m,n\}$; see Chapter 9 (on page 167).
9032		Value: 255
9033	XSI	{_XOPEN_IOV_MAX}
9034		Maximum number of iovec structures that one process has available for use with <i>readv()</i> or
9035		<i>writev()</i> .
9036		Value: 16
9037	XSI	{_XOPEN_NAME_MAX}
9038		Maximum number of bytes in a filename (not including the terminating null).
9039		Value: 255
9040	XSI	{_XOPEN_PATH_MAX}
9041		Maximum number of bytes in a pathname.
9042		Value: 1 024

9043 Numerical Limits

9044 The macros in the following list shall be defined in <limits.h> and, except for {CHAR_BIT}, |
 9045 {LONG_BIT}, {MB_LEN_MAX}, and {WORD_BIT}, shall be replaced by expressions that have |
 9046 the same type as would an expression that is an object of the corresponding type converted |
 9047 according to the integer promotions.

9048 If the value of an object of type **char** is treated as a signed integer when used in an expression,
 9049 the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX}
 9050 is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value
 9051 of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

9052		{CHAR_BIT}
9053		Number of bits in a type char .
9054	CX	Value: 8
9055		{CHAR_MAX}
9056		Maximum value of type char .
9057		Value: {UCHAR_MAX} or {SCHAR_MAX}
9058		{CHAR_MIN}
9059		Minimum value of type char .
9060		Value: {SCHAR_MIN} or 0
9061		{INT_MAX}
9062		Maximum value of an int .
9063	CX	Minimum Acceptable Value: 2 147 483 647
9064		{INT_MIN}
9065		Minimum value of type int .
9066	CX	Maximum Acceptable Value: -2 147 483 647
9067		{LLONG_MAX}
9068		Maximum value of type long long .
9069		Minimum Acceptable Value: +9 223 372 036 854 775 807

9070 {LLONG_MIN}
 9071 Minimum value of type **long long**.
 9072 Maximum Acceptable Value: -9 223 372 036 854 775 807

9073 {LONG_BIT}
 9074 Number of bits in a **long**.
 9075 Minimum Acceptable Value: 32

9076 {LONG_MAX}
 9077 Maximum value of a **long**.
 9078 Minimum Acceptable Value: +2 147 483 647

9079 {LONG_MIN}
 9080 Minimum value of type **long**.
 9081 Maximum Acceptable Value: -2 147 483 647

9082 {MB_LEN_MAX}
 9083 Maximum number of bytes in a character, for any supported locale.
 9084 Minimum Acceptable Value: 1

9085 {SCHAR_MAX}
 9086 Maximum value of type **signed char**.
 9087 CX Value: +127

9088 {SCHAR_MIN}
 9089 Minimum value of type **signed char**.
 9090 CX Value: -128

9091 {SHRT_MAX}
 9092 Maximum value of type **short**.
 9093 Minimum Acceptable Value: +32 767

9094 {SHRT_MIN}
 9095 Minimum value of type **short**.
 9096 Maximum Acceptable Value: -32 767

9097 {SSIZE_MAX}
 9098 Maximum value of an object of type **ssize_t**.
 9099 Minimum Acceptable Value: {_POSIX_SSIZE_MAX}

9100 {UCHAR_MAX}
 9101 Maximum value of type **unsigned char**.
 9102 CX Value: 255

9103 {UINT_MAX}
 9104 Maximum value of type **unsigned**.
 9105 CX Minimum Acceptable Value: 4 294 967 295

9106 {ULLONG_MAX}
 9107 Maximum value of type **unsigned long long**.
 9108 Minimum Acceptable Value: 18 446 744 073 709 551 615

9109 {ULONG_MAX}
 9110 Maximum value of type **unsigned long**.
 9111 Minimum Acceptable Value: 4 294 967 295

9112 {USHRT_MAX}
 9113 Maximum value for a type **unsigned short**.
 9114 Minimum Acceptable Value: 65 535

9115 {WORD_BIT}
 9116 Number of bits in a type `int`.
 9117 Minimum Acceptable Value: 32

9118 Other Invariant Values

9119 The following symbolic constants shall be defined in <limits.h>:

9120 {NL_ARGMAX}
 9121 Maximum value of *n* in conversion specifications using the "%n\$" sequence in calls to the
 9122 `printf()` and `scanf()` families of functions.
 9123 Minimum Acceptable Value: 9

9124 XSI {NL_LANGMAX}
 9125 Maximum number of bytes in a *LANG* name.
 9126 Minimum Acceptable Value: 14

9127 {NL_MSGMAX}
 9128 Maximum message number.
 9129 Minimum Acceptable Value: 32 767

9130 {NL_SETMAX}
 9131 Maximum set number.
 9132 Minimum Acceptable Value: 255

9133 {NL_TEXTMAX}
 9134 Maximum number of bytes in a message string.
 9135 Minimum Acceptable Value: {_POSIX2_LINE_MAX}

9136 XSI {NZERO}
 9137 Default process priority.
 9138 Minimum Acceptable Value: 20

9139 APPLICATION USAGE

9140 None.

9141 RATIONALE

9142 A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified
 9143 for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request
 9144 for several reasons:

- 9145 • They wanted to avoid making any changes to the standard that could break conforming
 9146 applications, and the requested change could have that effect.
- 9147 • The use of multiple hard links to a file cannot always be replaced with use of symbolic
 9148 links. Symbolic links are semantically different from hard links in that they associate a
 9149 pathname with another pathname rather than a pathname with a file. This has
 9150 implications for access control, file permanence, and transparency.
- 9151 • The original standard developers had considered the issue of allowing for
 9152 implementations that did not in general support hard links, and decided that this would
 9153 reduce consensus on the standard.

9154 Systems that support historical versions of the development option of the ISO POSIX-2 standard
 9155 retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

9156 {PATH_MAX}
 9157 IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the
 9158 definition of pathname and the description of {PATH_MAX}, allowing application
 9159 developers to allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has
 9160 been removed by correction to the {PATH_MAX} definition to include the null character.

9161 With this change, applications that previously allocated {PATH_MAX} bytes will continue to
 9162 succeed.

9163 {SYMLINK_MAX}

9164 This symbol refers to space for data that is stored in the file system, as opposed to
 9165 {PATH_MAX} which is the length of a name that can be passed to a function. In some
 9166 existing implementations, the filenames pointed to by symbolic links are stored in the
 9167 inodes of the links, so it is important that {SYMLINK_MAX} not be constrained to be as
 9168 large as {PATH_MAX}.

9169 FUTURE DIRECTIONS

9170 None.

9174 CHANGE HISTORY

9175 First released in Issue 1.

9176 Issue 5

9177 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 9178 Threads Extension.

9179 {FILESIZEBITS} is added for the Large File Summit extensions.

9180 The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to
 9181 make 32-bit values the minimum requirement.

9182 The entry is restructured to improve readability.

9183 Issue 6

9184 The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR_MIN},
 9185 {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum
 9186 acceptable values.

9187 The following new requirements on POSIX implementations derive from alignment with the
 9188 Single UNIX Specification:

- 9189 • The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- 9190 • The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- 9191 • The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

9192 Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX},
 9193 {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

9194 The following values are added for alignment with IEEE Std 1003.1d-1999:

9195 {_POSIX_SS_REPL_MAX}
 9196 {SS_REPL_MAX}
 9197 {POSIX_ALLOC_SIZE_MIN}
 9198 {POSIX_REC_INCR_XFER_SIZE}
 9199 {POSIX_REC_MAX_XFER_SIZE}
 9200 {POSIX_REC_MIN_XFER_SIZE}
 9201 {POSIX_REC_XFER_ALIGN}

9202 Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN}
 9203 for alignment with IEEE Std 1003.1j-2000.

9204 The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment

9205 with the ISO/IEC 9899:1999 standard.

9206 The following values are added for alignment with IEEE Std 1003.1q-2000:

```
9207 { _POSIX_TRACE_EVENT_NAME_MAX }
9208 { _POSIX_TRACE_NAME_MAX }
9209 { _POSIX_TRACE_SYS_MAX }
9210 { _POSIX_TRACE_USER_EVENT_MAX }
9211 { TRACE_EVENT_NAME_MAX }
9212 { TRACE_NAME_MAX }
9213 { TRACE_SYS_MAX }
9214 { TRACE_USER_EVENT_MAX }
```

9215 The new limits {_XOPEN_NAME_MAX} and {_XOPEN_PATH_MAX} are added as minimum
9216 values for {PATH_MAX} and {NAME_MAX} limits on XSI-conformant systems.

9217 The LEGACY symbols {PASS_MAX} and {TMP_MAX} are removed.

9218 The values for the limits {CHAR_BIT}, {SCHAR_MAX}, and {UCHAR_MAX} are now required
9219 to be 8, +127, and 255, respectively.

9220 The value for the limit {CHAR_MAX} is now {UCHAR_MAX} or {SCHAR_MAX}.

9221 The value for the limit {CHAR_MIN} is now {SCHAR_MIN} or zero.

9222 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of
9223 {_POSIX_CHILD_MAX} from 6 to 25. This is for FIPS 151-2 alignment.

9224 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/19 is applied, updating the values for
9225 {INT_MAX}, {UINT_MAX}, and {INT_MIN} to be CX extensions over the ISO C standard, and
9226 correcting {WORD_BIT} from 16 to 32.

9227 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/20 is applied, removing
9228 {CHARCLASS_NAME_MAX} from the "Other Invariant Values" section (it also occurs under
9229 "Runtime Inceasable Values").

9230 Issue 7

9231 SD5-XBD-ERN-36 is applied, changing the description of {RE_DUP_MAX}.

9232 {NL_NMAX} is removed; it should have been removed in Issue 6.

9233 The Trace option values are marked obsolescent.

9234 The {ATEXIT_MAX}, {LONG_BIT}, {NL_MSGMAX}, {NL_SETMAX}, {NL_TEXTMAX}, and
9235 {WORD_BIT} values are moved from the XSI option to the Base.

9236 The AIO_* and _POSIX_AIO_* values are moved from the Asynchronous Input and Output
9237 option to the Base.

9238 The {_POSIX_RT_SIG_MAX}, {_POSIX_SIGQUEUE_MAX}, {RTSIG_MAX}, and
9239 {SIGQUEUE_MAX} values are moved from the Realtime Signals Extension option to the Base.

9240 Functionality relating to the Threads and Timers options is moved to the Base.

9241 This reference page is clarified with respect to macros and symbolic constants. +

9242 **NAME**

9243 locale.h — category macros

9244 **SYNOPSIS**

9245 #include <locale.h>

9246 **DESCRIPTION**

9247 CX Some of the functionality described on this reference page extends the ISO C standard. Any
 9248 conflict between the requirements described here and the ISO C standard is unintentional. This
 9249 volume of POSIX.1-200x defers to the ISO C standard.

9250 The <locale.h> header shall provide a definition for **lconv** structure, which shall include at least
 9251 the following members. (See the definitions of *LC_MONETARY* in [Section 7.3.3](#) (on page 139)
 9252 and [Section 7.3.4](#) (on page 143).)

```

9253 char    *currency_symbol
9254 char    *decimal_point
9255 char    frac_digits
9256 char    *grouping
9257 char    *int_curr_symbol
9258 char    int_frac_digits
9259 char    int_n_cs_precedes
9260 char    int_n_sep_by_space
9261 char    int_n_sign_posn
9262 char    int_p_cs_precedes
9263 char    int_p_sep_by_space
9264 char    int_p_sign_posn
9265 char    *mon_decimal_point
9266 char    *mon_grouping
9267 char    *mon_thousands_sep
9268 char    *negative_sign
9269 char    n_cs_precedes
9270 char    n_sep_by_space
9271 char    n_sign_posn
9272 char    *positive_sign
9273 char    p_cs_precedes
9274 char    p_sep_by_space
9275 char    p_sign_posn
9276 char    *thousands_sep
  
```

9277 The <locale.h> header shall define NULL (as defined in <stddef.h>) and at least the following
 9278 as macros:

```

9279 LC_ALL
9280 LC_COLLATE
9281 LC_CTYPE
9282 CX LC_MESSAGES
9283 LC_MONETARY
9284 LC_NUMERIC
9285 LC_TIME
  
```

9286 which shall expand to integer constant expressions with distinct values for use as the first
 9287 argument to the *setlocale()* function.

9288 Implementations may add additional masks using the form *LC_** and an uppercase letter.

9289 CX The <locale.h> header shall contain at least the following macros representing bitmasks for use
 9290 with the *newlocale()* function for each supported locale category:

```

9291 LC_COLLATE_MASK
9292 LC_CTYPE_MASK
9293 LC_MESSAGES_MASK
9294 LC_MONETARY_MASK
9295 LC_NUMERIC_MASK
9296 LC_TIME_MASK

```

9297 Implementations may add additional masks using the form `LC_*_MASK`.

9298 In addition, a macro to set the bits for all categories set shall be defined:

```

9299 LC_ALL_MASK

```

9300 The <locale.h> header shall define `LC_GLOBAL_LOCALE`, a special locale object descriptor
 9301 used by the *uselocale()* function.

9302 The <locale.h> header shall provide a definition for a type `locale_t` representing a locale object.

9303 The following shall be declared as functions and may also be defined as macros. Function
 9304 prototypes shall be provided for use with ISO C standard compilers.

```

9305 struct lconv *localeconv(void);
9306 CX locale_t duplocale(locale_t);
9307 void freelocale(locale_t);
9308 locale_t newlocale(int, const char *, locale_t);
9309 char *setlocale(int, const char *);
9310 CX locale_t uselocale (locale_t);

```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO[Chapter 8](#) (on page 159), [<stddef.h>](#)XSH [localeconv\(\)](#), [setlocale\(\)](#)**CHANGE HISTORY**

First released in Issue 3.

Included for alignment with the ISO C standard.

Issue 6

9324 The `lconv` structure is expanded with new members (`int_n_cs_precedes`, `int_n_sep_by_space`,
 9325 `int_n_sign_posn`, `int_p_cs_precedes`, `int_p_sep_by_space`, and `int_p_sign_posn`) for alignment
 9326 with the ISO/IEC 9899:1999 standard.

Extensions beyond the ISO C standard are marked.

9328

Issue 7

9329

The *duplocale()*, *freelocale()*, *newlocale()*, and *uselocale()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

9330

9331

This reference page is clarified with respect to macros and symbolic constants.

+

9332 **NAME**9333 `math.h` — mathematical declarations9334 **SYNOPSIS**9335 `#include <math.h>`9336 **DESCRIPTION**

9337 CX Some of the functionality described on this reference page extends the ISO C standard.
 9338 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 9339 enable the visibility of these symbols in this header.

9340 The <math.h> header shall include definitions for at least the following types:

9341 **float_t** A real-floating type at least as wide as **float**.9342 **double_t** A real-floating type at least as wide as **double**, and at least as wide as **float_t**.

9343 If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if
 9344 FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2,
 9345 they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise
 9346 implementation-defined.

9347 The <math.h> header shall define the following macros, where real-floating indicates that the
 9348 argument shall be an expression of real-floating type:

```
9349 int fpclassify(real-floating x);
9350 int isfinite(real-floating x);
9351 int isinf(real-floating x);
9352 int isnan(real-floating x);
9353 int isnormal(real-floating x);
9354 int signbit(real-floating x);
9355 int isgreater(real-floating x, real-floating y);
9356 int isgreaterequal(real-floating x, real-floating y);
9357 int isless(real-floating x, real-floating y);
9358 int islessequal(real-floating x, real-floating y);
9359 int islessgreater(real-floating x, real-floating y);
9360 int isunordered(real-floating x, real-floating y);
```

9361 The <math.h> header shall define the following symbolic constants. The values shall have type
 9362 **double** and shall be accurate within the precision of the **double** type.

9363	XSI	M_E	Value of e
9364	XSI	M_LOG2E	Value of $\log_2 e$
9365	XSI	M_LOG10E	Value of $\log_{10} e$
9366	XSI	M_LN2	Value of $\log_e 2$
9367	XSI	M_LN10	Value of $\log_e 10$
9368	XSI	M_PI	Value of π
9369	XSI	M_PI_2	Value of $\pi/2$
9370	XSI	M_PI_4	Value of $\pi/4$
9371	XSI	M_1_PI	Value of $1/\pi$

9372	XSI	M_2_PI	Value of $2/\pi$		
9373	XSI	M_2_SQRTPI	Value of $2/\sqrt{\pi}$		
9374	XSI	M_SQRT2	Value of $\sqrt{2}$		
9375	XSI	M_SQRT1_2	Value of $1/\sqrt{2}$		
9378		The <math.h> header shall define the following symbolic constant:			
9379	OB XSI	MAXFLOAT	Same value as FLT_MAX in <float.h>.		
9380		The <math.h> header shall define the following macros:		+	
9381		HUGE_VAL	A positive double constant expression, not necessarily representable as a		
9382			float . Used as an error value returned by the mathematics library.		
9383			HUGE_VAL evaluates to +infinity on systems supporting IEEE Std 754-1985.		
9384		HUGE_VALF	A positive float constant expression. Used as an error value returned by the		
9385			mathematics library. HUGE_VALF evaluates to +infinity on systems		
9386			supporting IEEE Std 754-1985.		
9387		HUGE_VALL	A positive long double constant expression. Used as an error value returned		
9388			by the mathematics library. HUGE_VALL evaluates to +infinity on systems		
9389			supporting IEEE Std 754-1985.		
9390		INFINITY	A constant expression of type float representing positive or unsigned infinity,		
9391			if available; else a positive constant of type float that overflows at translation		
9392			time.		
9393		NAN	A constant expression of type float representing a quiet NaN. This macro is		
9394			only defined if the implementation supports quiet NaNs for the float type.		
9395		The following macros shall be defined for number classification. They represent the mutually-			
9396		exclusive kinds of floating-point values. They expand to integer constant expressions with			
9397		distinct values. Additional implementation-defined floating-point classifications, with macro			
9398		definitions beginning with FP_ and an uppercase letter, may also be specified by the			
9399		implementation.			
9400		FP_INFINITE			
9401		FP_NAN			
9402		FP_NORMAL			
9403		FP_SUBNORMAL			
9404		FP_ZERO			
9405		The following optional macros indicate whether the <i>fma()</i> family of functions are fast compared			
9406		with direct code:			
9407		FP_FAST_FMA			
9408		FP_FAST_FMAF			
9409		FP_FAST_FMAL			
9410		If defined, the FP_FAST_FMA macro shall expand to the integer constant 1 and shall indicate			
9411		that the <i>fma()</i> function generally executes about as fast as, or faster than, a multiply and an add			
9412		of double operands. If undefined, the speed of execution is unspecified. The other macros have			
9413		the equivalent meaning for the float and long double versions.			
9414		The following macros shall expand to integer constant expressions whose values are returned by			
9415		<i>ilogb(x)</i> if <i>x</i> is zero or NaN, respectively. The value of FP_ILOGB0 shall be either { INT_MIN } or			
9416		-{ INT_MAX }. The value of FP_ILOGBNAN shall be either { INT_MAX } or { INT_MIN }.			

9417 FP_ILOGB0
 9418 FP_ILOGBNAN

9419 The following macros shall expand to the integer constants 1 and 2, respectively;

9420 MATH_ERRNO
 9421 MATH_ERREXCEPT

9422 The following macro shall expand to an expression that has type **int** and the value
 9423 MATH_ERRNO, MATH_ERREXCEPT, or the bitwise-inclusive OR of both:

9424 math_errhandling

9425 The value of `math_errhandling` is constant for the duration of the program. It is unspecified
 9426 whether `math_errhandling` is a macro or an identifier with external linkage. If a macro definition
 9427 is suppressed or a program defines an identifier with the name `math_errhandling`, the behavior
 9428 is undefined. If the expression `(math_errhandling & MATH_ERREXCEPT)` can be non-zero, the
 9429 implementation shall define the macros `FE_DIVBYZERO`, `FE_INVALID`, and `FE_OVERFLOW` in
 9430 <fenv.h>.

9431 The following shall be declared as functions and may also be defined as macros. Function
 9432 prototypes shall be provided.

```

9433 double      acos(double);
9434 float       acosf(float);
9435 double      acosh(double);
9436 float       acoshf(float);
9437 long double acoshl(long double);
9438 long double acosl(long double);
9439 double      asin(double);
9440 float       asinf(float);
9441 double      asinh(double);
9442 float       asinhf(float);
9443 long double asinhl(long double);
9444 long double asinl(long double);
9445 double      atan(double);
9446 double      atan2(double, double);
9447 float       atan2f(float, float);
9448 long double atan2l(long double, long double);
9449 float       atanf(float);
9450 double      atanh(double);
9451 float       atanhf(float);
9452 long double atanh1(long double);
9453 long double atanl(long double);
9454 double      cbrt(double);
9455 float       cbrtf(float);
9456 long double cbrtl(long double);
9457 double      ceil(double);
9458 float       ceilf(float);
9459 long double ceill(long double);
9460 double      copysign(double, double);
9461 float       copysignf(float, float);
9462 long double copysignl(long double, long double);
9463 double      cos(double);
9464 float       cosf(float);
9465 double      cosh(double);
  
```

```

9466     float      coshf(float);
9467     long double coshl(long double);
9468     long double cosl(long double);
9469     double      erf(double);
9470     double      erfc(double);
9471     float       erfcf(float);
9472     long double erfcl(long double);
9473     float       erff(float);
9474     long double erfl(long double);
9475     double      exp(double);
9476     double      exp2(double);
9477     float       exp2f(float);
9478     long double exp2l(long double);
9479     float       expf(float);
9480     long double expl(long double);
9481     double      expml(double);
9482     float       expmlf(float);
9483     long double expmll(long double);
9484     double      fabs(double);
9485     float       fabsf(float);
9486     long double fabsl(long double);
9487     double      fdim(double, double);
9488     float       fdimf(float, float);
9489     long double fdiml(long double, long double);
9490     double      floor(double);
9491     float       floorf(float);
9492     long double floorl(long double);
9493     double      fma(double, double, double);
9494     float       fmaf(float, float, float);
9495     long double fmal(long double, long double, long double);
9496     double      fmax(double, double);
9497     float       fmaxf(float, float);
9498     long double fmaxl(long double, long double);
9499     double      fmin(double, double);
9500     float       fminf(float, float);
9501     long double fminl(long double, long double);
9502     double      fmod(double, double);
9503     float       fmodf(float, float);
9504     long double fmodl(long double, long double);
9505     double      frexp(double, int *);
9506     float       frexpf(float, int *);
9507     long double frexpl(long double, int *);
9508     double      hypot(double, double);
9509     float       hypotf(float, float);
9510     long double hypotl(long double, long double);
9511     int         ilogb(double);
9512     int         ilogbf(float);
9513     int         ilogbl(long double);
9514     double      j0(double);
9515     double      j1(double);
9516     double      jn(int, double);
9517     double      ldexp(double, int);
9518     float       ldexpf(float, int);
9519     long double ldexpl(long double, int);

```

```

9520     double      lgamma(double);
9521     float       lgammaf(float);
9522     long double  lgammal(long double);
9523     long long    llrint(double);
9524     long long    llrintf(float);
9525     long long    llrintl(long double);
9526     long long    llround(double);
9527     long long    llroundf(float);
9528     long long    llroundl(long double);
9529     double      log(double);
9530     double      log10(double);
9531     float       log10f(float);
9532     long double  log10l(long double);

9559     double      nextafter(double, double);
9560     float       nextafterf(float, float);
9561     long double  nextafterl(long double, long double);
9562     double      nexttoward(double, long double);
9563     float       nexttowardf(float, long double);
9564     long double  nexttowardl(long double, long double);
9565     double      pow(double, double);
9566     float       powf(float, float);
9567     long double  powl(long double, long double);
9568     double      remainder(double, double);
9569     float       remainderf(float, float);
9570     long double  remainderl(long double, long double);
9571     double      remquo(double, double, int *);
9572     float       remquof(float, float, int *);
9573     long double  remquol(long double, long double, int *);

```

```

9574     double    rint(double);
9575     float     rintf(float);
9576     long double rintl(long double);
9577     double    round(double);
9578     float     roundf(float);
9579     long double roundl(long double);
9580     double    scalbln(double, long);
9581     float     scalblnf(float, long);
9582     long double scalblnl(long double, long);
9583     double    scalbn(double, int);
9584     float     scalbnf(float, int);
9585     long double scalbnl(long double, int);
9586     double    sin(double);
9587     float     sinf(float);
9588     double    sinh(double);
9589     float     sinhf(float);
9590     long double sinhl(long double);
9591     long double sinl(long double);
9592     double    sqrt(double);
9593     float     sqrtf(float);
9594     long double sqrtl(long double);
9595     double    tan(double);
9596     float     tanf(float);
9597     double    tanh(double);
9598     float     tanhf(float);
9599     long double tanhl(long double);
9600     long double tanl(long double);
9601     double    tgamma(double);
9602     float     tgammaf(float);
9603     long double tgamma1(long double);
9604     double    trunc(double);
9605     float     truncf(float);
9606     long double trunc1(long double);
9607     XSI     double    y0(double);
9608     double    y1(double);
9609     double    yn(int, double);

```

9610 The following external variable shall be defined:

```

9611     XSI     extern int signgam;

```

9612 The behavior of each of the functions defined in <math.h> is specified in the System Interfaces
9613 volume of POSIX.1-200x for all representable values of its input arguments, except where stated
9614 otherwise. Each function shall execute as if it were a single operation without generating any
9615 externally visible exceptional conditions.

APPLICATION USAGE

The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is off) the implementation to contract expressions. Each pragma can occur either outside external declarations or preceding all explicit declarations and statements inside a compound statement. When outside external declarations, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT pragma is encountered (including within a nested compound statement), or until the end of the compound statement; at the end of a compound statement the state for the pragma is restored to its condition just before the compound statement. If this pragma is used in any other context, the behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

Applications should use FLT_MAX as defined in <float.h> instead of the obsolescent MAXFLOAT.

RATIONALE

Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type **double**. All the names formed by appending 'f' or 'l' to a name in <math.h> were reserved to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999 standard provides for all three versions of math functions.

The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their capability is available through *sprintf()*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1.

Issue 6

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/21 is applied, making it clear that the meaning of the FP_FAST_FMA macro is unspecified if the macro is undefined.

Issue 7

ISO C TC2 #47 (SD5-XBD-ERN-52) is applied, clarifying the wording of the FP_FAST_FMA macro.

The MAXFLOAT constant is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

9655 **NAME**

9656 monetary.h — monetary types

9657 **SYNOPSIS**

9658 #include <monetary.h>

9659 **DESCRIPTION**

9660 The <monetary.h> header shall define the following types:

9661 **size_t** As described in <stddef.h>.9662 **ssize_t** As described in <sys/types.h>.9663 The following shall be declared as functions and may also be defined as macros. Function
9664 prototypes shall be provided for use with ISO C standard compilers.9665 `ssize_t strfmon(char *restrict, size_t, const char *restrict, ...);`9666 `ssize_t strfmon_l(char *restrict, size_t, locale_t,`9667 `const char *restrict, ...);`9668 **APPLICATION USAGE**

9669 None.

9670 **RATIONALE**

9671 None.

9672 **FUTURE DIRECTIONS**

9673 None.

9674 **SEE ALSO**

9675 <stddef.h>, <sys/types.h>

9676 XSH *strfmon()*9677 **CHANGE HISTORY**

9678 First released in Issue 4.

9679 **Issue 6**9680 The **restrict** keyword is added to the prototype for *strfmon()*.9681 **Issue 7**

9682 The <monetary.h> header is moved from the XSI option to the Base.

9683 The *strmon_l()* function is added from The Open Group Technical Standard, 2006, Extended API
9684 Set Part 4.

9685 **NAME**9686 mqqueue.h — message queues (**REALTIME**)9687 **SYNOPSIS**

9688 MSG #include <mqqueue.h>

9689 **DESCRIPTION**9690 The <mqqueue.h> header shall define the **mqd_t** type, which is used for message queue
9691 descriptors. This is not an array type.9692 The <mqqueue.h> header shall define the **sigevent** structure (as described in <signal.h>) and the
9693 **mq_attr** structure, which is used in getting and setting the attributes of a message queue.
9694 Attributes are initially set when the message queue is created. An **mq_attr** structure shall have at
9695 least the following fields:9696 long mq_flags Message queue flags.
9697 long mq_maxmsg Maximum number of messages.
9698 long mq_msgsize Maximum message size.
9699 long mq_curmsgs Number of messages currently queued.9700 The following shall be declared as functions and may also be defined as macros. Function
9701 prototypes shall be provided.9702 int mq_close(mqd_t);
9703 int mq_getattr(mqd_t, struct mq_attr *);
9704 int mq_notify(mqd_t, const struct sigevent *);
9705 mqd_t mq_open(const char *, int, ...);
9706 ssize_t mq_receive(mqd_t, char *, size_t, unsigned *);
9707 int mq_send(mqd_t, const char *, size_t, unsigned);
9708 int mq_setattr(mqd_t, const struct mq_attr *restrict,
9709 struct mq_attr *restrict);
9710 ssize_t mq_timedreceive(mqd_t, char *restrict, size_t,
9711 unsigned *restrict, const struct timespec *restrict);
9712 int mq_timedsend(mqd_t, const char *, size_t, unsigned,
9713 const struct timespec *);
9714 int mq_unlink(const char *);9715 Inclusion of the <mqqueue.h> header may make visible symbols defined in the headers
9716 <fcntl.h>, <signal.h>, <sys/types.h>, and <time.h>.9717 **APPLICATION USAGE**

9718 None.

9719 **RATIONALE**

9726 *mq_unlink()*

9727

CHANGE HISTORY

9728

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

9729

Issue 6

9730

The <mqqueue.h> header is marked as part of the Message Passing option.

9731

The *mq_timedreceive()* and *mq_timedsend()* functions are added for alignment with IEEE Std 1003.1d-1999.

9732

9733

The **restrict** keyword is added to the prototypes for *mq_setattr()* and *mq_timedreceive()*.

9734 **NAME**
 9735 ndbm.h — definitions for ndbm database operations

9736 **SYNOPSIS**
 9737 XSI `#include <ndbm.h>`

9738 **DESCRIPTION**
 9739 The <ndbm.h> header shall define the **datum** type as a structure that includes at least the
 9740 following members:

9741 `void *dptr` A pointer to the application's data.
 9742 `size_t dsize` The size of the object pointed to by *dptr*.

9743 The **size_t** type shall be defined as described in <stddef.h>.

9744 The <ndbm.h> header shall define the **DBM** type.

9745 The <ndbm.h> header shall define the following symbolic constants as possible values for the
 9746 *store_mode* argument to *dbm_store()*:

9747 **DBM_INSERT** Insertion of new entries only.

9748 **DBM_REPLACE** Allow replacing existing entries.

9749 The following shall be declared as functions and may also be defined as macros. Function
 9750 prototypes shall be provided.

9751 `int dbm_clearerr(DBM *);`
 9752 `void dbm_close(DBM *);`
 9753 `int dbm_delete(DBM *, datum);`
 9754 `int dbm_error(DBM *);`
 9755 `datum dbm_fetch(DBM *, datum);`
 9756 `datum dbm_firstkey(DBM *);`
 9757 `datum dbm_nextkey(DBM *);`
 9758 `DBM *dbm_open(const char *, int, mode_t);`
 9759 `int dbm_store(DBM *, datum, datum, int);`

9760 The **mode_t** type shall be defined through **typedef** as described in <sys/types.h>.

9761 APPLICATION USAGE

9762 None.

9763 RATIONALE

9764 None.

9765 FUTURE DIRECTIONS

9766 None.

9770 CHANGE HISTORY

9771 First released in Issue 4, Version 2.

- 9772 **Issue 5**
9773 References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.
- 9774 **Issue 7**
9775 This reference page is clarified with respect to macros and symbolic constants. +

9776 **NAME**

9777 net/if.h — sockets local interfaces

9778 **SYNOPSIS**

9779 #include <net/if.h>

9780 **DESCRIPTION**9781 The <net/if.h> header shall define the **if_nameindex** structure that includes at least the
9782 following members:9783 unsigned if_index Numeric index of the interface.
9784 char *if_name Null-terminated name of the interface.9785 The <net/if.h> header shall define the following symbolic constant for the length of a buffer |
9786 containing an interface name (including the terminating NULL character):

9787 IF_NAMESIZE Interface name length.

9788 The following shall be declared as functions and may also be defined as macros. Function
9789 prototypes shall be provided.9790 unsigned if_nametoindex(const char *);
9791 char *if_indextoname(unsigned, char *);

9806 **NAME**
 9807 netdb.h — definitions for network database operations

9808 **SYNOPSIS**
 9809 #include <netdb.h>

9810 **DESCRIPTION**
 9811 The <netdb.h> header may define the **in_port_t** type and the **in_addr_t** type as described in
 9812 <netinet/in.h>.

9813 The <netdb.h> header shall define the **hostent** structure that includes at least the following
 9814 members:

9815	char	*h_name	Official name of the host.
9816	char	**h_aliases	A pointer to an array of pointers to 9817 alternative host names, terminated by a 9818 null pointer.
9819	int	h_addrtype	Address type.
9820	int	h_length	The length, in bytes, of the address.
9821	char	**h_addr_list	A pointer to an array of pointers to network 9822 addresses (in network byte order) for the host, 9823 terminated by a null pointer.

9824 The <netdb.h> header shall define the **netent** structure that includes at least the following
 9825 members:

9826	char	*n_name	Official, fully-qualified (including the 9827 domain) name of the host.
9828	char	**n_aliases	A pointer to an array of pointers to 9829 alternative network names, terminated by a 9830 null pointer.
9831	int	n_addrtype	The address type of the network.
9832	uint32_t	n_net	The network number, in host byte order.

9833 The **uint32_t** type shall be defined as described in <inttypes.h>.

9834 The <netdb.h> header shall define the **protoent** structure that includes at least the following
 9835 members:

9836	char	*p_name	Official name of the protocol.
9837	char	**p_aliases	A pointer to an array of pointers to 9838 alternative protocol names, terminated by 9839 a null pointer.
9840	int	p_proto	The protocol number.

9841 The <netdb.h> header shall define the **servent** structure that includes at least the following
 9842 members:

9843	char	*s_name	Official name of the service.
9844	char	**s_aliases	A pointer to an array of pointers to 9845 alternative service names, terminated by 9846 a null pointer.
9847	int	s_port	A value which, when converted to uint16_t , 9848 yields the port number in network byte order 9849 at which the service resides.
9850	char	*s_proto	The name of the protocol to use when 9851 contacting the service.

9852 The <netdb.h> header shall define the IPPORT_RESERVED symbolic constant with the value of
9853 the highest reserved Internet port number.

9854 Address Information Structure

9855 The <netdb.h> header shall define the **addrinfo** structure that includes at least the following
9856 members:

9857	int	ai_flags	Input flags.
9858	int	ai_family	Address family of socket.
9859	int	ai_socktype	Socket type.
9860	int	ai_protocol	Protocol of socket.
9861	socklen_t	ai_addrlen	Length of socket address.
9862	struct sockaddr	*ai_addr	Socket address of socket.
9863	char	*ai_canonname	Canonical name of service location.
9864	struct addrinfo	*ai_next	Pointer to next in list.

9865 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-
9866 distinct integer constants for use in the *flags* field of the **addrinfo** structure:

9867	AI_PASSIVE	Socket address is intended for <i>bind()</i> .
9868	AI_CANONNAME	Request for canonical name.
9869		
9870	AI_NUMERICHOST	Return numeric host address as name.
9871		
9872	AI_NUMERICSERV	Inhibit service name resolution.
9873		
9874	AI_V4MAPPED	If no IPv6 addresses are found, query for IPv4 addresses and return them to 9875 the caller as IPv4-mapped IPv6 addresses.
9876	AI_ALL	Query for both IPv4 and IPv6 addresses.
9877	AI_ADDRCONFIG	Query for IPv4 addresses only when an IPv4 address is configured; query for 9878 IPv6 addresses only when an IPv6 address is configured. 9879

9880 The <netdb.h> header shall define the following symbolic constants that evaluate to bitwise-
9881 distinct integer constants for use in the *flags* argument to *getnameinfo()*:

9882	NI_NOFQDN	Only the nodename portion of the FQDN is returned for local hosts.
9883	NI_NUMERICHOST	The numeric form of the node's address is returned instead of its name.
9884		
9885	NI_NAMEREQD	Return an error if the node's name cannot be located in the database.
9886	NI_NUMERICSERV	The numeric form of the service address is returned instead of its name.
9887		
9888	NI_NUMERICSERVICE	
9889	NI_NUMERICSERVICE	For IPv6 addresses, the numeric form of the scope identifier is returned 9890 instead of its name.
9891	NI_DGRAM	Indicates that the service is a datagram service (SOCK_DGRAM).

9892 **Address Information Errors**

9893 The <netdb.h> header shall define the following symbolic constants for use as error values for
 9894 *getaddrinfo()* and *getnameinfo()*. The values shall be suitable for use in #if preprocessing
 9895 directives.

9896 EAI_AGAIN The name could not be resolved at this time. Future attempts may succeed.

9897 EAI_BADFLAGS The flags had an invalid value.

9898 EAI_FAIL A non-recoverable error occurred.

9899 EAI_FAMILY The address family was not recognized or the address length was invalid for
 9900 the specified family.

9901 EAI_MEMORY There was a memory allocation failure.

9902 EAI_NONAME The name does not resolve for the supplied parameters.

9903 NI_NAMEREQD is set and the host's name cannot be located, or both
 9904 *nodename* and *servname* were null.

9905 EAI_SERVICE The service passed was not recognized for the specified socket type.

9906 EAI_SOCKTYPE The intended socket type was not recognized.

9907 EAI_SYSTEM A system error occurred. The error code can be found in *errno*.

9908 EAI_OVERFLOW
 9909 An argument buffer overflowed.

9910 The following shall be declared as functions and may also be defined as macros. Function
 9911 prototypes shall be provided.

```

9912 void          endhostent(void);
9913 void          endnetent(void);
9914 void          endprotoent(void);
9915 void          endservent(void);
9916 void          freeaddrinfo(struct addrinfo *);
9917 const char    *gai_strerror(int);
9918 int           getaddrinfo(const char *restrict, const char *restrict,
9919                          const struct addrinfo *restrict,
9920                          struct addrinfo **restrict);
9921 struct hostent *gethostent(void);
9922 int           getnameinfo(const struct sockaddr *restrict, socklen_t,
9923                          char *restrict, socklen_t, char *restrict,
9924                          socklen_t, int);
9925 struct netent *getnetbyaddr(uint32_t, int);
9926 struct netent *getnetbyname(const char *);
9927 struct netent *getnetent(void);
9928 struct protoent *getprotobyname(const char *);
9929 struct protoent *getprotobynumber(int);
9930 struct protoent *getprotoent(void);
9931 struct servent *getservbyname(const char *, const char *);
9932 struct servent *getservbyport(int, const char *);
9933 struct servent *getservent(void);
9934 void          sethostent(int);
9935 void          setnetent(int);
9936 void          setprotoent(int);
9937 void          setservent(int);

```

9938 The type **socklen_t** shall be defined through **typedef** as described in <sys/socket.h>.

9939 Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,
9940 <sys/socket.h>, and <inttypes.h>.

9941 APPLICATION USAGE

9942 None.

9943 RATIONALE

9944 None.

9945 FUTURE DIRECTIONS

9946 None.

9947 SEE ALSO

9948 <inttypes.h>, <netinet/in.h>, <sys/socket.h>

9949 XSH *bind()*, *endhostent()*, *endnetent()*, *endprotoent()*, *endservent()*, *freeaddrinfo()*, *getnameinfo()*

9950 CHANGE HISTORY

9951 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9952 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for
9953 *gai_strerror()* from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

9954 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the
9955 NI_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes
9956 are for alignment with IPv6.

9957 Issue 7

9958 SD5-XBD-ERN-14 is applied, changing the description of the *s_port* member of the **servent**
9959 structure.

9960 The obsolescent *h_errno* external integer, and the obsolescent *gethostbyaddr()*, and
9961 *gethostbyname()* functions are removed, along with the HOST_NOT_FOUND, NO_DATA,
9962 NO_RECOVERY, and TRY_AGAIN macros.

9963 This reference page is clarified with respect to macros and symbolic constants.

9964 **NAME**

9965 netinet/in.h — Internet address family

9966 **SYNOPSIS**

9967 #include <netinet/in.h>

9968 **DESCRIPTION**

9969 The <netinet/in.h> header shall define the following types:

9970 **in_port_t** Equivalent to the type **uint16_t** as defined in <inttypes.h>.9971 **in_addr_t** Equivalent to the type **uint32_t** as defined in <inttypes.h>.9972 The **sa_family_t** type shall be defined as described in <sys/socket.h>.9973 The **uint8_t** and **uint32_t** type shall be defined as described in <inttypes.h>. Inclusion of the
9974 <netinet/in.h> header may also make visible all symbols from <inttypes.h> and <sys/socket.h>.9975 The <netinet/in.h> header shall define the **in_addr** structure that includes at least the following
9976 member:

9977 in_addr_t s_addr

9978 The <netinet/in.h> header shall define the **sockaddr_in** structure that includes at least the
9979 following members:9980 sa_family_t sin_family AF_INET.
9981 in_port_t sin_port Port number.
9982 struct in_addr sin_addr IP address.9983 The *sin_port* and *sin_addr* members shall be in network byte order.9984 The **sockaddr_in** structure is used to store addresses for the Internet address family. Values of
9985 this type shall be cast by applications to **struct sockaddr** for use with socket functions.9986 IP6 The <netinet/in.h> header shall define the **in6_addr** structure that contains at least the following
9987 member:

9988 uint8_t s6_addr[16]

9989 This array is used to contain a 128-bit IPv6 address, stored in network byte order.

9990 The <netinet/in.h> header shall define the **sockaddr_in6** structure that includes at least the
9991 following members:9992 sa_family_t sin6_family AF_INET6.
9993 in_port_t sin6_port Port number.
9994 uint32_t sin6_flowinfo IPv6 traffic class and flow information.
9995 struct in6_addr sin6_addr IPv6 address.
9996 uint32_t sin6_scope_id Set of interfaces for a scope.9997 The *sin6_port* and *sin6_addr* members shall be in network byte order.9998 The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since
9999 implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.10000 The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the
10001 scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, the application
10002 shall ensure that *sin6_scope_id* is a link index. For a site scope *sin6_addr*, the application shall
10003 ensure that *sin6_scope_id* is a site index. The mapping of *sin6_scope_id* to an interface or set of
10004 interfaces is implementation-defined.

10005		The <netinet/in.h> header shall declare the following external variable:
10006		<code>const struct in6_addr in6addr_any</code>
10007		This variable is initialized by the system to contain the wildcard IPv6 address. The
10008		<netinet/in.h> header also defines the IN6ADDR_ANY_INIT macro. This macro must be
10009		constant at compile time and can be used to initialize a variable of type struct in6_addr to the
10010		IPv6 wildcard address.
10011		The <netinet/in.h> header shall declare the following external variable:
10012		<code>const struct in6_addr in6addr_loopback</code>
10013		This variable is initialized by the system to contain the loopback IPv6 address. The
10014		<netinet/in.h> header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be
10015		constant at compile time and can be used to initialize a variable of type struct in6_addr to the
10016		IPv6 loopback address.
10017		The <netinet/in.h> header shall define the ipv6_mreq structure that includes at least the
10018		following members:
10019		<code>struct in6_addr ipv6mr_multiaddr</code> IPv6 multicast address.
10020		<code>unsigned ipv6mr_interface</code> Interface index.
10021		The <netinet/in.h> header shall define the following symbolic constants for use as values of the
10022		<i>level</i> argument of <i>getsockopt()</i> and <i>setsockopt()</i> :
10023		IPPROTO_IP Internet protocol.
10024	IP6	IPPROTO_IPV6 Internet Protocol Version 6.
10025		IPPROTO_ICMP Control message protocol.
10026	RS	IPPROTO_RAW Raw IP Packets Protocol.
10027		IPPROTO_TCP Transmission control protocol.
10028		IPPROTO_UDP User datagram protocol.
10029		The <netinet/in.h> header shall define the following symbolic constants for use as destination
10030		addresses for <i>connect()</i> , <i>sendmsg()</i> , and <i>sendto()</i> :
10031		INADDR_ANY IPv4 local host address.
10032		INADDR_BROADCAST IPv4 broadcast address.
10033		The <netinet/in.h> header shall define the following symbolic constant, with the value
10034		specified, to help applications declare buffers of the proper size to store IPv4 addresses in string
10035		form:
10036		INET_ADDRSTRLEN 16. Length of the string form for IP.
10037		The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as defined in <arpa/inet.h>.
10038		Inclusion of the <netinet/in.h> header may also make visible all symbols from <arpa/inet.h>.
10039	IP6	The <netinet/in.h> header shall define the following symbolic constant, with the value
10040		specified, to help applications declare buffers of the proper size to store IPv6 addresses in string
10041		form:
10042		INET6_ADDRSTRLEN 46. Length of the string form for IPv6.

10043	IP6	The <netinet/in.h> header shall define the following symbolic constants, with distinct integer values, for use in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at protocol level IPPROTO_IPV6:
10044		
10045		
10046		IPV6_JOIN_GROUP Join a multicast group.
10047		IPV6_LEAVE_GROUP Quit a multicast group.
10048		IPV6_MULTICAST_HOPS
10049		Multicast hop limit.
10050		IPV6_MULTICAST_IF Interface to use for outgoing multicast packets.
10051		IPV6_MULTICAST_LOOP
10052		Multicast packets are delivered back to the local application.
10053		IPV6_UNICAST_HOPS Unicast hop limit.
10054		IPV6_V6ONLY Restrict AF_INET6 socket to IPv6 communications only.
10055		The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses.
10056		Each macro is of type int and takes a single argument of type const struct in6_addr * :
10057		IN6_IS_ADDR_UNSPECIFIED
10058		Unspecified address.
10059		IN6_IS_ADDR_LOOPBACK
10060		Loopback address.
10061		IN6_IS_ADDR_MULTICAST
10062		Multicast address.
10063		IN6_IS_ADDR_LINKLOCAL
10064		Unicast link-local address.
10065		IN6_IS_ADDR_SITELOCAL
10066		Unicast site-local address.
10067		IN6_IS_ADDR_V4MAPPED
10068		IPv4 mapped address.
10069		IN6_IS_ADDR_V4COMPAT
10070		IPv4-compatible address.
10071		IN6_IS_ADDR_MC_NODELOCAL
10072		Multicast node-local address.
10073		IN6_IS_ADDR_MC_LINKLOCAL
10074		Multicast link-local address.
10075		IN6_IS_ADDR_MC_SITELOCAL
10076		Multicast site-local address.
10077		IN6_IS_ADDR_MC_ORGLOCAL
10078		Multicast organization-local address.
10079		IN6_IS_ADDR_MC_GLOBAL
10080		Multicast global address.

10081 **APPLICATION USAGE**

10123 **NAME**

10124 nl_types.h — data types

10125 **SYNOPSIS**

10126 #include <nl_types.h>

10127 **DESCRIPTION**

10128 The <nl_types.h> header shall contain definitions of at least the following types:

10129 **nl_catd** Used by the message catalog functions *catopen()*, *catgets()*, and *catclose()*
 10130 to identify a catalog descriptor.

10131 **nl_item** Used by *nl_langinfo()* to identify items of *langinfo* data. Values of objects
 10132 of type **nl_item** are defined in <langinfo.h>.

10133 The <nl_types.h> header shall contain definitions of at least the following symbolic constants:

10134 **NL_SETD** Used by *gencat* when no *\$set* directive is specified in a message text source
 10135 file. This constant can be passed as the value of *set_id* on subsequent calls
 10136 to *catgets()* (that is, to retrieve messages from the default message set).
 10137 The value of **NL_SETD** is implementation-defined.

10138 **NL_CAT_LOCALE** Value that must be passed as the *oflag* argument to *catopen()* to ensure that
 10139 message catalog selection depends on the *LC_MESSAGES* locale category,
 10140 rather than directly on the *LANG* environment variable.

10141 The following shall be declared as functions and may also be defined as macros. Function
10142 prototypes shall be provided.

```
10143 int      catclose(nl_catd);
10144 char    *catgets(nl_catd, int, int, const char *);
10145 nl_catd catopen(const char *, int);
```

10157 First released in Issue 2.

10158 **Issue 7**

10159 The <nl_types.h> header is moved from the XSI option to the Base.

10160 This reference page is clarified with respect to macros and symbolic constants. +

10161 **NAME**
 10162 poll.h — definitions for the poll() function

10163 **SYNOPSIS**
 10164 #include <poll.h>

10165 **DESCRIPTION**
 10166 The <poll.h> header shall define the **pollfd** structure that includes at least the following
 10167 members:

10168	int	fd	The following descriptor being polled.
10169	short	events	The input event flags (see below).
10170	short	revents	The output event flags (see below).

10171 The <poll.h> header shall define the following type through **typedef**:

10172 **nfds_t** An unsigned integer type used for the number of file descriptors.

10173 The implementation shall support one or more programming environments in which the width
 10174 of **nfds_t** is no greater than the width of type **long**. The names of these programming
 10175 environments can be obtained using the *confstr()* function or the *getconf* utility.

10176 The following symbolic constants shall be defined, zero or more of which may be OR'ed
 10177 together to form the *events* or *revents* members in the **pollfd** structure:

10178	POLLIN	Data other than high-priority data may be read without blocking.
10179	POLLRDNORM	Normal data may be read without blocking.
10180	POLLRDBAND	Priority data may be read without blocking.
10181	POLLPRI	High priority data may be read without blocking.
10182	POLLOUT	Normal data may be written without blocking.
10183	POLLWRNORM	Equivalent to POLLOUT.
10184	POLLWRBAND	Priority data may be written.
10185	POLLERR	An error has occurred (<i>revents</i> only).
10186	POLLHUP	Device has been disconnected (<i>revents</i> only).
10187	POLLNVAL	Invalid <i>fd</i> member (<i>revents</i> only).

10188 The significance and semantics of normal, priority, and high-priority data are file and device-
 10189 specific.

10190 The following shall be declared as a function and may also be defined as a macro. A function
 10191 prototype shall be provided.

10192 int poll(struct pollfd [], nfds_t, int);

10203 First released in Issue 4, Version 2.

10204 **Issue 6**10205 The description of the symbolic constants is updated to match the *poll()* function.10206 Text related to STREAMS has been moved to the *poll()* reference page.10207 A note is added to the DESCRIPTION regarding the significance and semantics of normal,
10208 priority, and high-priority data.10209 **Issue 7**

10210 The <poll.h> header is moved from the XSI option to the Base.

10211 **NAME**

10212 pthread.h — threads

10213 **SYNOPSIS**

10214 #include <pthread.h>

10215 **DESCRIPTION**

10216 The <pthread.h> header shall define the following symbolic constants: |

10217 PTHREAD_BARRIER_SERIAL_THREAD

10218 PTHREAD_CANCEL_ASYNCHRONOUS

10219 PTHREAD_CANCEL_ENABLE

10220 PTHREAD_CANCEL_DEFERRED

10221 PTHREAD_CANCEL_DISABLE

10222 PTHREAD_CANCELED

10223 PTHREAD_CREATE_DETACHED -

10224 PTHREAD_CREATE_JOINABLE

10225 TPS PTHREAD_EXPLICIT_SCHED

10226 PTHREAD_INHERIT_SCHED

10227 PTHREAD_MUTEX_DEFAULT

10228 PTHREAD_MUTEX_ERRORCHECK

10229 PTHREAD_MUTEX_NORMAL -

10230 PTHREAD_MUTEX_RECURSIVE

10231 PTHREAD_MUTEX_ROBUST

10232 PTHREAD_MUTEX_STALLED

10233 PTHREAD_ONCE_INIT

10234 RPI | TPI PTHREAD_PRIO_INHERIT

10235 MC1 PTHREAD_PRIO_NONE

10236 RPP | TPP PTHREAD_PRIO_PROTECT

10237 PTHREAD_PROCESS_SHARED

10238 PTHREAD_PROCESS_PRIVATE

10239 TPS PTHREAD_SCOPE_PROCESS -

10240 PTHREAD_SCOPE_SYSTEM

10241 The <pthread.h> header shall define the following compile-time constant expressions valid as +
10242 initializers for the following types: +

Name	Initializer for Type
PTHREAD_COND_INITIALIZER	pthread_cond_t
PTHREAD_MUTEX_INITIALIZER	pthread_mutex_t
PTHREAD_RWLOCK_INITIALIZER	pthread_rwlock_t

10247 The following types shall be defined as described in <sys/types.h>:

10248 pthread_attr_t

10249 pthread_barrier_t

10250 pthread_barrierattr_t

10251 pthread_cond_t

10252 pthread_condattr_t

10253 pthread_key_t

10254 pthread_mutex_t

10255 pthread_mutexattr_t

10256 pthread_once_t

10257 pthread_rwlock_t

10258 **pthread_rwlockattr_t**
 10259 **pthread_spinlock_t**
 10260 **pthread_t**

10261 The following shall be declared as functions and may also be defined as macros. Function
 10262 prototypes shall be provided.

```

10263 int pthread_atfork(void (*)(void), void (*)(void),
10264                  void (*)(void));

 10418 *pthread_setcancelstate()*, *pthread_spin_destroy()*, *pthread_spin_lock()*, *pthread_spin_unlock()*

CHANGE HISTORY

10419 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

10420 The RTT margin markers are broken out into their POSIX options.

10421 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the
 10422 *pthread_cond_wait()* function.

10423 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the
 10424 *pthread_setschedparam()* function so that its second argument is of type **int**.

10425 The *pthread_getcpuclockid()* and *pthread_mutex_timedlock()* functions are added for alignment
 10426 with IEEE Std 1003.1d-1999.

10427 The following functions are added for alignment with IEEE Std 1003.1j-2000:

10428 *pthread_barrier_destroy()*, *pthread_barrier_init()*, *pthread_barrier_wait()*,
 10429 *pthread_barrierattr_destroy()*, *pthread_barrierattr_getpshared()*, *pthread_barrierattr_init()*,
 10430 *pthread_barrierattr_setpshared()*, *pthread_condattr_getclock()*, *pthread_condattr_setclock()*,
 10431 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_spin_destroy()*,
 10432 *pthread_spin_init()*, *pthread_spin_lock()*, *pthread_spin_trylock()*, and *pthread_spin_unlock()*.

10433 PTHREAD_RWLOCK_INITIALIZER is removed for alignment with IEEE Std 1003.1j-2000.

10434 Functions previously marked as part of the Read-Write Locks option are now moved to the
 10435 Threads option.

10436 The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize()*,
 10437 *pthread_attr_getinheritsched()*, *pthread_attr_getschedparam()*, *pthread_attr_getschedpolicy()*,
 10438 *pthread_attr_getscope()*, *pthread_attr_getstackaddr()*, *pthread_attr_getstacksize()*,
 10439 *pthread_attr_getschedparam()*, *pthread_barrier_init()*, *pthread_barrierattr_getpshared()*,
 10440 *pthread_cond_init()*, *pthread_cond_signal()*, *pthread_cond_timedwait()*, *pthread_cond_wait()*,
 10441 *pthread_condattr_getclock()*, *pthread_condattr_getpshared()*, *pthread_create()*,
 10442 *pthread_getschedparam()*, *pthread_mutex_getprioceiling()*, *pthread_mutex_init()*,
 10443 *pthread_mutex_setprioceiling()*, *pthread_mutexattr_getprioceiling()*, *pthread_mutexattr_getprotocol()*,
 10444 *pthread_mutexattr_getpshared()*, *pthread_mutexattr_gettype()*, *pthread_rwlock_init()*,
 10445 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_rwlockattr_getpshared()*, and
 10446 *pthread_sigmask()*.

10447 IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and
 10448 <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI option.

10449 IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for
 10450 the *pthread_kill()* and *pthread_sigmask()* functions. These are required to be in the <signal.h>
 10451 header. They are allowed here through the name space rules.

10452 IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread_setschedprio()* function.

10453 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors
 10454 that were in contradiction with the System Interfaces volume of POSIX.1-200x.

Issue 7

10455 SD5-XBD-ERN-55 is applied, adding the **restrict** keyword to the *pthread_mutex_timedlock()*
 10456 function prototype.

10457 SD5-XBD-ERN-62 is applied.

10458 Austin Group Interpretation 1003.1-2001 #048 is applied.

10462 The <pthread.h> header is moved from the Threads option to the Base.

10463 The PTHREAD_MUTEX_NORMAL, PTHREAD_MUTEX_ERRORCHECK,
10464 PTHREAD_MUTEX_RECURSIVE, and PTHREAD_MUTEX_DEFAULT extended mutex types
10465 are moved from the XSI option to the Base.

10466 The PTHREAD_MUTEX_ROBUST and PTHREAD_MUTEX_STALLED symbols and the
10467 *pthread_mutex_consistent()*, *pthread_mutexattr_getrobust()*, and *pthread_mutexattr_setrobust()*
10468 functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

10469 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options
10470 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex
10471 or Robust Mutex Priority Inheritance, respectively.

10472 This reference page is clarified with respect to macros and symbolic constants. +

10473 **NAME**
 10474 `pwd.h` — password structure

10475 **SYNOPSIS**
 10476 `#include <pwd.h>`

10477 **DESCRIPTION**
 10478 The `<pwd.h>` header shall provide a definition for **struct passwd**, which shall include at least
 10479 the following members:

10480	<code>char</code>	<code>*pw_name</code>	User's login name.
10481	<code>uid_t</code>	<code>pw_uid</code>	Numerical user ID.
10482	<code>gid_t</code>	<code>pw_gid</code>	Numerical group ID.
10483	<code>char</code>	<code>*pw_dir</code>	Initial working directory.
10484	<code>char</code>	<code>*pw_shell</code>	Program to use as shell.

10485 The `gid_t`, `uid_t`, and `size_t` types shall be defined as described in `<sys/types.h>`.

10486 The following shall be declared as functions and may also be defined as macros. Function
 10487 prototypes shall be provided.

```

10488 struct passwd *getpwnam(const char *);
10489 int           getpwnam_r(const char *, struct passwd *, char *,
10490                        size_t, struct passwd **);
10491 struct passwd *getpwuid(uid_t);
10492 int           getpwuid_r(uid_t, struct passwd *, char *,
10493                        size_t, struct passwd **);
10494 XSI void      endpwent(void);
10495 struct passwd *getpwent(void);
10496 void      setpwent(void);

```

10506 **CHANGE HISTORY**
 10507 First released in Issue 1.

10508 **Issue 5**
 10509 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

10510 **Issue 6**
 10511 The following new requirements on POSIX implementations derive from alignment with the
 10512 Single UNIX Specification:

- 10513 • The `gid_t` and `uid_t` types are mandated.

10514

10515

- The *getpwnam_r()* and *getpwuid_r()* functions are marked as part of the Thread-Safe Functions option.

10516

Issue 7

10517

SD5-XBD-ERN-56 is applied, adding a reference to **<sys/types.h>** for the **size_t** type.

10518 **NAME**10519 `regex.h` — regular expression matching types10520 **SYNOPSIS**10521 `#include <regex.h>`10522 **DESCRIPTION**10523 The <regex.h> header shall define the structures and symbolic constants used by the `regcomp()`,
10524 `regexexec()`, `regerror()`, and `regfree()` functions.10525 The structure type `regex_t` shall contain at least the following member:10526 `size_t re_nsub` Number of parenthesized subexpressions.10527 The type `size_t` shall be defined as described in <sys/types.h>.10528 The type `regoff_t` shall be defined as a signed integer type that can hold the largest value that
10529 can be stored in either a type `ptrdiff_t` or a type `ssize_t`. The structure type `regmatch_t` shall
10530 contain at least the following members:10531 `regoff_t rm_so` Byte offset from start of string
10532 to start of substring.
10533 `regoff_t rm_eo` Byte offset from start of string of the
10534 first character after the end of substring.10535 The <regex.h> header shall define the following symbolic constants for the `cflags` parameter to
10536 the `regcomp()` function: |10537 `REG_EXTENDED` Use Extended Regular Expressions.10538 `REG_ICASE` Ignore case in match.10539 `REG_NOSUB` Report only success or fail in `regexexec()`.10540 `REG_NEWLINE` Change the handling of <newline>.10541 The <regex.h> header shall define the following symbolic constants for the `eflags` parameter to
10542 the `regexexec()` function: |10543 `REG_NOTBOL` The circumflex character ('`^`'), when taken as a special character, does
10544 not match the beginning of *string*.10545 `REG_NOTEOL` The dollar sign ('`$`'), when taken as a special character, does not match
10546 the end of *string*.

10547 The <regex.h> header shall define the following symbolic constants as error return values: |

10548 `REG_NOMATCH` `regexexec()` failed to match.10549 `REG_BADPAT` Invalid regular expression.10550 `REG_ECOLLATE` Invalid collating element referenced.10551 `REG_ECTYPE` Invalid character class type referenced.10552 `REG_EESCAPE` Trailing '`\`' in pattern.10553 `REG_ESUBREG` Number in `\digit` invalid or in error.10554 `REG_EBRACK` "`[]`" imbalance.10555 `REG_EPAREN` "`\(\)`" or "`()`" imbalance.

<regex.h>

Headers

10556	REG_EBRACE	"\{\}" imbalance.
10557	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than
10558		two numbers, first larger than second.
10559	REG_ERANGE	Invalid endpoint in range expression.
10560	REG_ESPACE	Out of memory.
10561	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.

10562 The following shall be declared as functions and may also be defined as macros. Function
10563 prototypes shall be provided.

```
10564 int regcomp(regex_t *restrict, const char *restrict, int);
10565 size_t regerror(int, const regex_t *restrict, char *restrict, size_t);
10566 int regexec(const regex_t *restrict, const char *restrict, size_t,
10567             regmatch_t [restrict], int);
10568 void regfree(regex_t *);
```

10569 The implementation may define additional macros or constants using names beginning with
10570 REG_.

10578 [<sys/types.h>](#)

10579 XSH *regcomp()*

10580 CHANGE HISTORY

10581 First released in Issue 4.

10582 Originally derived from the ISO POSIX-2 standard.

10583 Issue 6

10584 The REG_ENOSYS constant is marked obsolescent.

10585 The **restrict** keyword is added to the prototypes for *regcomp()*, *regerror()*, and *regexec()*.

10586 A statement is added that the **size_t** type is defined as described in [<sys/types.h>](#).

10587 Issue 7

10588 SD5-XBD-ERN-60 is applied.

10589 The obsolescent REG_ENOSYS constant is removed.

10590 This reference page is clarified with respect to macros and symbolic constants.

10591 **NAME**
 10592 sched.h — execution scheduling

10593 **SYNOPSIS**
 10594 #include <sched.h>

10595 **DESCRIPTION**
 10596 The <sched.h> header shall define the **sched_param** structure, which contains the scheduling
 10597 parameters required for implementation of each supported scheduling policy. This structure
 10598 shall contain at least the following member:

10599 int sched_priority Process or thread execution scheduling priority.

10600 SS|TSP The **sched_param** structure defined in <sched.h> shall contain the following members in
 10601 addition to those specified above:

10602	int	sched_ss_low_priority	Low scheduling priority for
10603			sporadic server.
10604	struct timespec	sched_ss_repl_period	Replenishment period for
10605			sporadic server.
10606	struct timespec	sched_ss_init_budget	Initial budget for sporadic server.
10607	int	sched_ss_max_repl	Maximum pending replenishments for
10608			sporadic server.

10609 Each process or thread is controlled by an associated scheduling policy and priority. Associated
 10610 with each policy is a priority range. Each policy definition specifies the minimum priority range
 10611 for that policy. The priority ranges for each policy may overlap the priority ranges of other
 10612 policies.

10613 Four scheduling policies are defined; others may be defined by the implementation. The four
 10614 standard policies are indicated by the values of the following symbolic constants:

10615 PS|TPS **SCHED_FIFO** First in-first out (FIFO) scheduling policy.

10616 PS|TPS **SCHED_RR** Round robin scheduling policy.

10617 SS|TSP **SCHED_SPORADIC** Sporadic server scheduling policy.

10618 PS|TPS **SCHED_OTHER** Another scheduling policy.

10619 The values of these constants are distinct.

10620 The following shall be declared as functions and may also be defined as macros. Function
 10621 prototypes shall be provided.

10622	PS TPS	int	sched_get_priority_max(int);
10623		int	sched_get_priority_min(int);
10624	PS	int	sched_getparam(pid_t, struct sched_param *);
10625		int	sched_getscheduler(pid_t);
10626	PS TPS	int	sched_rr_get_interval(pid_t, struct timespec *);
10627	PS	int	sched_setparam(pid_t, const struct sched_param *);
10628		int	sched_setscheduler(pid_t, int, const struct sched_param *);
10629		int	sched_yield(void);

10630 Inclusion of the <sched.h> header may make visible all symbols from the <time.h> header.

10631 **APPLICATION USAGE**

10632 None.

10633 **RATIONALE**

10634 None.

10635 **FUTURE DIRECTIONS**

10636 None.

10637 **SEE ALSO**10638 [<time.h>](#)10639 **CHANGE HISTORY**

10640 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10641 **Issue 6**

10642 The <sched.h> header is marked as part of the Process Scheduling option.

10643 Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC
10644 scheduling policy is added for alignment with IEEE Std 1003.1d-1999.10645 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose
10646 members *sched_ss_repl_period* and *sched_ss_init_budget* should be type **struct timespec** and not
10647 **timespec**.

10648 Symbols from <time.h> may be made visible when <sched.h> is included.

10649 IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied,
10650 aligning the function prototype shading and margin codes with the System Interfaces volume of
10651 IEEE Std 1003.1-2001.10652 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/23 is applied, updating the
10653 DESCRIPTION to differentiate between thread and process execution.10654 **Issue 7**

10655 SD5-XBD-ERN-13 is applied.

10656 Austin Group Interpretation 1003.1-2001 #064 is applied.

10657 The <sched.h> headers is moved from the Threads option to the Base.

10658 **NAME**
 10659 search.h — search tables

10660 **SYNOPSIS**
 10661 XSI `#include <search.h>`

10662 **DESCRIPTION**
 10663 The <search.h> header shall define the **ENTRY** type for structure **entry** which shall include the
 10664 following members:

10665 char *key
 10666 void *data

10667 and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as
 10668 follows:

10669 enum { FIND, ENTER } ACTION;
 10670 enum { preorder, postorder, endorder, leaf } VISIT;

10671 The **size_t** type shall be defined as described in <sys/types.h>.

10672 The following shall be declared as functions and may also be defined as macros. Function
 10673 prototypes shall be provided.

10674 int hcreate(size_t);
 10675 void hdestroy(void);
 10676 ENTRY *hsearch(ENTRY, ACTION);
 10677 void insque(void *, void *);
 10678 void *lfind(const void *, const void *, size_t *,
 10679 size_t, int (*)(const void *, const void *));
 10680 void *lsearch(const void *, void *, size_t *,
 10681 size_t, int (*)(const void *, const void *));
 10682 void remque(void *);
 10683 void *tdelete(const void *restrict, void **restrict,
 10684 int (*)(const void *, const void *));
 10685 void *tfind(const void *, void *const *,
 10686 int (*)(const void *, const void *));
 10687 void *tsearch(const void *, void **,
 10688 int (*)(const void *, const void *));
 10689 void twalk(const void *,
 10690 void (*)(const void *, VISIT, int));

10691 **APPLICATION USAGE**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and *tsearch()*.

The **restrict** keyword is added to the prototype for *tdelete()*.

10706 **NAME**

10707 semaphore.h — semaphores

10708 **SYNOPSIS**

10709 #include <semaphore.h>

10710 **DESCRIPTION**

10711 The <semaphore.h> header shall define the **sem_t** type, used in performing semaphore
 10712 operations. The semaphore may be implemented using a file descriptor, in which case
 10713 applications are able to open up at least a total of {OPEN_MAX} files and semaphores.

10714 The <semaphore.h> header shall define the symbolic constant SEM_FAILED which shall have
 10715 type **sem_t** *.

10716 The following shall be declared as functions and may also be defined as macros. Function
 10717 prototypes shall be provided.

```

10718 int     sem_close(sem_t *);
10719 int     sem_destroy(sem_t *);
10720 int     sem_getvalue(sem_t *restrict, int *restrict);
10721 int     sem_init(sem_t *, int, unsigned);
10722 sem_t *sem_open(const char *, int, ...);
10723 int     sem_post(sem_t *);
10724 int     sem_timedwait(sem_t *restrict, const struct timespec *restrict);
10725 int     sem_trywait(sem_t *);
10726 int     sem_unlink(const char *);
10727 int     sem_wait(sem_t *);

```

10728 Inclusion of the <semaphore.h> header may make visible symbols defined in the <fcntl.h>,
 10729 <sys/types.h>, and <time.h> headers.

10730 **APPLICATION USAGE**

10731 None.

 10739 *sem_trywait()*, *sem_unlink()*

10740 **CHANGE HISTORY**

10741 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10742 **Issue 6**

10743 The <semaphore.h> header is marked as part of the Semaphores option.

10744 The Open Group Corrigendum U021/3 is applied, adding a description of SEM_FAILED.

10745 The *sem_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.10746 The **restrict** keyword is added to the prototypes for *sem_getvalue()* and *sem_timedwait()*.

<semaphore.h>*Headers*

10747

Issue 7

10748

SD5-XBD-ERN-57 is applied, allowing the header to make visible symbols from the **<time.h>** header.

10749

10750

The **<semaphore.h>** header is moved from the Semaphores option to the Base.

10751

This reference page is clarified with respect to macros and symbolic constants.

+

10752 **NAME**

10753 setjmp.h — stack environment declarations

10754 **SYNOPSIS**

10755 #include <setjmp.h>

10756 **DESCRIPTION**

10757 CX Some of the functionality described on this reference page extends the ISO C standard.
 10758 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 10759 enable the visibility of these symbols in this header.

10760 CX The <setjmp.h> header shall define the array types **jmp_buf** and **sigjmp_buf**.

10761 The following shall be declared as functions and may also be defined as macros. Function
 10762 prototypes shall be provided.

10763 void longjmp(jmp_buf, int);

10764 CX void siglongjmp(sigjmp_buf, int);

10765 OB XSI void _longjmp(jmp_buf, int);

10766 The following may be declared as functions, or defined as macros, or both. If functions are
 10767 declared, function prototypes shall be provided.

10768 int setjmp(jmp_buf);

10769 CX int sigsetjmp(sigjmp_buf, int);

10770 OB XSI int _setjmp(jmp_buf);

10771 **APPLICATION USAGE**

10774 None.

10775 **FUTURE DIRECTIONS**

10776 None.

10777 **SEE ALSO**10778 XSH Section 2.2 (on page 448), *longjmp()*, *_longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*10779 **CHANGE HISTORY**

10780 First released in Issue 1.

10781 **Issue 6**

10782 Extensions beyond the ISO C standard are marked.

10783 **Issue 7**

10784 SD5-XBD-ERN-6 is applied.

10785 **NAME**10786 `signal.h` — signals10787 **SYNOPSIS**10788 `#include <signal.h>`10789 **DESCRIPTION**

10790 CX Some of the functionality described on this reference page extends the ISO C standard.
 10791 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 10792 enable the visibility of these symbols in this header.

10793 The <signal.h> header shall define the following macros, which shall expand to constant
 10794 expressions with distinct values that have a type compatible with the second argument to, and
 10795 the return value of, the *signal()* function, and whose values shall compare unequal to the
 10796 address of any declarable function.

10797 `SIG_DFL` Request for default signal handling.

10798 `SIG_ERR` Return value from *signal()* in case of error.

10799 OB CX `SIG_HOLD` Request that signal be held.

10800 `SIG_IGN` Request that signal be ignored.

10801 The <signal.h> header shall define the following data types through **typedef**:

10802 `sig_atomic_t` Possibly volatile-qualified integer type of an object that can be accessed as
 10803 an atomic entity, even in the presence of asynchronous interrupts.

10804 CX `sigset_t` Integer or structure type of an object used to represent sets of signals.

10805 CX `pid_t` As described in <sys/types.h>.

10806 CX The <signal.h> header shall define the **sigevent** structure, which has at least the following
 10807 members:

10808 `int sigev_notify` Notification type.

10809 `int sigev_signo` Signal number.

10810 `union sigval sigev_value` Signal value.

10811 `void (*sigev_notify_function)(union sigval)`
 10812 Notification function.

10813 `pthread_attr_t *sigev_notify_attributes` Notification attributes.

10814 The <signal.h> header shall define the following symbolic constants for the values of
 10815 *sigev_notify*:

10816 `SIGEV_NONE` No asynchronous notification is delivered when the event of interest
 10817 occurs.

10818 `SIGEV_SIGNAL` A queued signal, with an application-defined value, is generated when
 10819 the event of interest occurs.

10820 `SIGEV_THREAD` A notification function is called to perform notification.

10821 The **sigval** union shall be defined as:

10822 `int sival_int` Integer signal value.

10823 `void *sival_ptr` Pointer signal value.

10824 The <signal.h> header shall declare the macros `SIGRTMIN` and `SIGRTMAX`, which shall expand
 10825 to positive integer expressions with type **int**, but which need not be constant expressions. These
 10826 macros specify a range of signal numbers that are reserved for application use and for which the

10827 realtime signal behavior specified in this volume of POSIX.1-200x is supported. The signal
10828 numbers in this range do not overlap any of the signals specified in the following table.

10829 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal
10830 numbers.

10831 It is implementation-defined whether realtime signal behavior is supported for other signals.

10832 The <signal.h> header shall define the following macros that are used to refer to the signals that
10833 occur in the system. Signals defined here begin with the letters SIG followed by an uppercase
10834 letter. The macros shall expand to positive integer constant expressions with type **int** and
10835 distinct values. The value 0 is reserved for use as the null signal (see *kill()*). Additional
10836 implementation-defined signals may occur in the system.

10837 CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT,
10838 SIGSEGV, and SIGTERM to be defined.

10839 The following signals shall be supported on all implementations (default actions are explained
10840 below the table):

Signal	Default Action	Description
SIGABRT	A	Process abort signal.
SIGALRM	T	Alarm clock.
SIGBUS	A	Access to an undefined portion of a memory object.
SIGCHLD	I	Child process terminated, stopped, or continued.
SIGCONT	C	Continue executing, if stopped.
SIGFPE	A	Erroneous arithmetic operation.
SIGHUP	T	Hangup.
SIGILL	A	Illegal instruction.
SIGINT	T	Terminal interrupt signal.
SIGKILL	T	Kill (cannot be caught or ignored).
SIGPIPE	T	Write on a pipe with no one to read it.
SIGQUIT	A	Terminal quit signal.
SIGSEGV	A	Invalid memory reference.
SIGSTOP	S	Stop executing (cannot be caught or ignored).
SIGTERM	T	Termination signal.
SIGTSTP	S	Terminal stop signal.
SIGTTIN	S	Background process attempting read.
SIGTTOU	S	Background process attempting write.
SIGUSR1	T	User-defined signal 1.
SIGUSR2	T	User-defined signal 2.
SIGPOLL	T	Pollable event.
SIGPROF	T	Profiling timer expired.
SIGSYS	A	Bad system call.
SIGTRAP	A	Trace/breakpoint trap.
SIGURG	I	High bandwidth data is available at a socket.
SIGVTALRM	T	Virtual timer expired.
SIGXCPU	A	CPU time limit exceeded.
SIGXFSZ	A	File size limit exceeded.

10871		The default actions are as follows:	
10872		T Abnormal termination of the process.	-
10873	XSI	A Abnormal termination of the process with additional actions.	
10874		I Ignore the signal.	
10875		S Stop the process.	
10876		C Continue the process, if it is stopped; otherwise, ignore the signal.	
10877		The effects on the process in each case are described in XSH Section 2.4.3 (on page 465).	
10878	CX	The <signal.h> header shall provide a declaration of struct sigaction , including at least the following members:	
10879			
10880		void (*sa_handler)(int) Pointer to a signal-catching function	
10881		or one of the SIG_IGN or SIG_DFL.	
10882		sigset_t sa_mask Set of signals to be blocked during execution	
10883		of the signal handling function.	
10884		int sa_flags Special flags.	
10885		void (*sa_sigaction)(int, siginfo_t *, void *)	
10886		Pointer to a signal-catching function.	
10887	XSI	The storage occupied by <i>sa_handler</i> and <i>sa_sigaction</i> may overlap, and a conforming application shall not use both simultaneously.	
10888			
10889		The <signal.h> header shall define the following macros which shall expand to integer constant expressions that need not be usable in #if preprocessing directives:	
10890			
10891	CX	SIG_BLOCK The resulting set is the union of the current set and the signal set pointed to by the argument <i>set</i> .	-
10892			
10893	CX	SIG_UNBLOCK The resulting set is the intersection of the current set and the complement of the signal set pointed to by the argument <i>set</i> .	
10894			
10895	CX	SIG_SETMASK The resulting set is the signal set pointed to by the argument <i>set</i> .	
10896		The <signal.h> header shall also define the following symbolic constants:	+
10897	CX	SA_NOCLDSTOP Do not generate SIGCHLD when children stop	+
10898	XSI	or stopped children continue.	
10899	XSI	SA_ONSTACK Causes signal delivery to occur on an alternate stack.	
10900		SA_RESETHAND Causes signal dispositions to be set to SIG_DFL on entry to signal handlers.	
10901			
10902		SA_RESTART Causes certain functions to become restartable.	
10903		SA_SIGINFO Causes extra information to be passed to signal handlers at the time of receipt of a signal.	
10904			
10905		SA_NOCLDWAIT Causes implementations not to create zombie processes on child death.	
10906		SA_NODEFER Causes signal not to be automatically blocked on entry to signal handler.	
10907	XSI	SS_ONSTACK Process is executing on an alternate signal stack.	
10908	XSI	SS_DISABLE Alternate signal stack is disabled.	
10909	XSI	MINSIGSTKSZ Minimum stack size for a signal handler.	
10910	XSI	SIGSTKSZ Default size in bytes for the alternate signal stack.	
10911	CX	The <signal.h> header shall define the mcontext_t type through typedef .	

10912	CX	The <signal.h> header shall define the ucontext_t type as a structure that shall include at least the following members:
10913		
10914		<code>ucontext_t *uc_link</code> Pointer to the context that is resumed
10915		when this context returns.
10916		<code>sigset_t uc_sigmask</code> The set of signals that are blocked when this
10917		context is active.
10918		<code>stack_t uc_stack</code> The stack used by this context.
10919		<code>mcontext_t uc_mcontext</code> A machine-specific representation of the saved
10920		context.
10921		The <signal.h> header shall define the stack_t type as a structure that includes at least the
10922		following members:
10923		<code>void *ss_sp</code> Stack base or pointer.
10924		<code>size_t ss_size</code> Stack size.
10925		<code>int ss_flags</code> Flags.
10926	XSI	The size_t type shall be defined as described in <sys/types.h>.
10927	CX	The <signal.h> header shall define the siginfo_t type as a structure that includes at least the
10928		following members:
10929	CX	<code>int si_signo</code> Signal number.
10930		<code>int si_code</code> Signal code.
10931	XSI	<code>int si_errno</code> If non-zero, an <i>errno</i> value associated with
10932		this signal, as defined in <errno.h>.
10933	CX	<code>pid_t si_pid</code> Sending process ID.
10934		<code>uid_t si_uid</code> Real user ID of sending process.
10935		<code>void *si_addr</code> Address of faulting instruction.
10936		<code>int si_status</code> Exit value or signal.
10937	OB XSR	<code>long si_band</code> Band event for SIGPOLL.
10938	CX	<code>union sigval si_value</code> Signal value.
10939	CX	The <signal.h> header shall define the symbolic constants in the Code column of the following
10940		table for use as values of <i>si_code</i> that are signal-specific or non-signal-specific reasons why the
10941		signal was generated.

	Signal	Code	Reason		
10942	CX	SIGILL	ILL_ILLOPC	Illegal opcode.	
10943			ILL_ILLOPN	Illegal operand.	
10944			ILL_ILLADR	Illegal addressing mode.	
10945			ILL_ILLTRP	Illegal trap.	
10946			ILL_PRVOPC	Privileged opcode.	
10947			ILL_PRVREG	Privileged register.	
10948			ILL_COPROC	Coprocessor error.	
10949			ILL_BADSTK	Internal stack error.	
10950					
10951			SIGFPE	FPE_INTDIV	Integer divide by zero.
10952	FPE_INTOVF	Integer overflow.			
10953	FPE_FLTDIV	Floating-point divide by zero.			
10954	FPE_FLTOVF	Floating-point overflow.			
10955	FPE_FLTUND	Floating-point underflow.			
10956	FPE_FLTRES	Floating-point inexact result.			
10957	FPE_FLTINV	Invalid floating-point operation.			
10958	FPE_FLTSUB	Subscript out of range.			
10959	SIGSEGV	SEGV_MAPERR	Address not mapped to object.		
10960			SEGV_ACCERR	Invalid permissions for mapped object.	
10961	SIGBUS	BUS_ADRALN	Invalid address alignment.		
10962			BUS_ADRERR	Nonexistent physical address.	
10963			BUS_OBJERR	Object-specific hardware error.	
10964	XSI	SIGTRAP	TRAP_BRKPT	Process breakpoint.	
10965			TRAP_TRACE	Process trace trap.	
10966	CX	SIGCHLD	CLD_EXITED	Child has exited.	
10967			CLD_KILLED	Child has terminated abnormally and did not create a core file.	
10968			CLD_DUMPED	Child has terminated abnormally and created a core file.	
10969			CLD_TRAPPED	Traced child has trapped.	
10970			CLD_STOPPED	Child has stopped.	
10971			CLD_CONTINUED	Stopped child has continued.	
10972	OB XSR	SIGPOLL	POLL_IN	Data input available.	
10973			POLL_OUT	Output buffers available.	
10974			POLL_MSG	Input message available.	
10975			POLL_ERR	I/O error.	
10976			POLL_PRI	High priority input available.	
10977			POLL_HUP	Device disconnected.	
10978	CX	Any	SI_USER	Signal sent by <i>kill()</i> .	
10979			SI_QUEUE	Signal sent by the <i>sigqueue()</i> .	
10980			SI_TIMER	Signal generated by expiration of a timer set by <i>timer_settime()</i> .	
10981			SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.	
10982			SI_MESGQ	Signal generated by arrival of a message on an empty message queue	
10983					
10984					

10985 CX Implementations may support additional *si_code* values not included in this list, may generate
 10986 values included in this list under circumstances other than those described in this list, and may
 10987 contain extensions or limitations that prevent some values from being generated.
 10988 Implementations do not generate a different value from the ones described in this list for
 10989 circumstances described in this list.

10990 CX In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	void * <i>si_addr</i>	Address of faulting instruction.
SIGSEGV SIGBUS	void * <i>si_addr</i>	Address of faulting memory reference.
SIGCHLD	pid_t <i>si_pid</i> int <i>si_status</i> uid_t <i>si_uid</i>	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
SIGPOLL	long <i>si_band</i>	Band event for POLL_IN, POLL_OUT, or POLL_MSG

11000 For some implementations, the value of *si_addr* may be inaccurate.

11001 The following shall be declared as functions and may also be defined as macros. Function
11002 prototypes shall be provided.

```

11003 CX int kill(pid_t, int);
11004 XSI int killpg(pid_t, int);
11005 CX void psiginfo(siginfo_t *, const char *);
11006 void psignal(int, const char *);
11007 int pthread_kill(pthread_t, int);
11008 int pthread_sigmask(int, const sigset_t *restrict,
11009 sigset_t *restrict);
11010 int raise(int);
11011 CX int sigaction(int, const struct sigaction *restrict,
11012 struct sigaction *restrict);
11013 int sigaddset(sigset_t *, int);
11014 XSI int sigaltstack(const stack_t *restrict, stack_t *restrict);
11015 CX int sigdelset(sigset_t *, int);
11016 int sigemptyset(sigset_t *);
11017 int sigfillset(sigset_t *);
11018 OB XSI int sighold(int);
11019 int sigignore(int);
11020 int siginterrupt(int, int);
11021 CX int sigismember(const sigset_t *, int);
11022 void (*signal(int, void (*)(int)))(int);
11023 OB XSI int sigpause(int);
11024 CX int sigpending(sigset_t *);
11025 int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
11026 int sigqueue(pid_t, int, const union sigval);
11027 OB XSI int sigrelse(int);
11028 void (*sigset(int, void (*)(int)))(int);
11029 CX int sigsuspend(const sigset_t *);
11030 int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
11031 const struct timespec *restrict);
11032 int sigwait(const sigset_t *restrict, int *restrict);
11033 int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);

```

11034 CX Inclusion of the <signal.h> header may make visible all symbols from the <time.h> header.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

The SIGPOLL and SIGPROF signals may be removed in a future version.

SEE ALSO

<errno.h>, <stropts.h>, <sys/types.h>, <time.h>

XSH Section 2.2 (on page 448), *alarm()*, *ioctl()*, *kill*, *killpg()*, *pthread_sigmask()*, *raise()*, *sigaction()*, *sigaddset()*, *sigaltstack()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, *siginterrupt()*, *sigismember()*, *signal()*, *sigpending()*, *sigqueue()*, *sigsuspend()*, *sigtimedwait()*, *timer_create()*, *wait*, *waitid()*

CHANGE HISTORY

First released in Issue 1.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is removed.

Issue 6

The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for abnormal termination is clarified.

The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()* function.

The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev_notify_function* function member of the **sigevent** structure.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now mandated. This is also a FIPS requirement.
- The **pid_t** definition is mandated.

The RT markings are changed to RTS to denote that the semantics are part of the Realtime Signals Extension option.

The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*, *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from <time.h> may be made visible when <signal.h> is included.

Extensions beyond the ISO C standard are marked.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive text for members of **struct sigaction**.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of the *sa_sigaction* member of **struct sigaction**.

IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/24 is applied, reworking the ordering of the **siginfo_t** type structure in the DESCRIPTION. This is an editorial change and no normative change is intended.

11089
11090
11091
11092
11093
11094
11095

Issue 7

SD5-XBD-ERN-5 is applied.

SD5-XBD-ERN-39 is applied, removing the **sigstack** structure which should have been removed at the same time as the LEGACY *sigstack()* function.

SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the **size_t** type.

Austin Group Interpretation 1003.1-2001 #034 is applied.

The **ucontext_t** and **mcontext_t** structures are added here from the obsolescent <ucontext.h> header.

The *psiginfo()* and *psignal()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The SIGPOLL and SIGPROF signals and text relating to the XSI STREAMS option are marked obsolescent.

The SA_RESETHAND, SA_RESTART, SA_SIGINFO, SA_NOCLDWAIT, and SA_NODEFER constants are moved from the XSI option to the Base.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

This reference page is clarified with respect to macros and symbolic constants. +

SIGRTMIN and SIGRTMAX are required to be positive integer expressions.

DRAFT

11096 NAME

11097 spawn.h — spawn (ADVANCED REALTIME)

11098 SYNOPSIS

11099 SPN #include <spawn.h>

11100 DESCRIPTION

11101 The <spawn.h> header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t**
11102 types used in performing spawn operations.11103 The <spawn.h> header shall define the following symbolic constants for use as the flags that
11104 may be set in a **posix_spawnattr_t** object using the *posix_spawnattr_setflags()* function:

11105 POSIX_SPAWN_RESETEIDS

11106 POSIX_SPAWN_SETPGROUP

11107 PS POSIX_SPAWN_SETSCHEDPARAM

11108 POSIX_SPAWN_SETSCHEDULER

11109 POSIX_SPAWN_SETSIGDEF

11110 POSIX_SPAWN_SETSIGMASK

11111 The following shall be declared as functions and may also be defined as macros. Function
11112 prototypes shall be provided.

```

11113 int  posix_spawn(pid_t *restrict, const char *restrict,
11114                const posix_spawn_file_actions_t *,
11115                const posix_spawnattr_t *restrict, char *const [restrict],
11116                char *const [restrict]);
11117 int  posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
11118                int);
11119 int  posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
11120                int, int);
11121 int  posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
11122                int, const char *restrict, int, mode_t);
11123 int  posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
11124 int  posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
11125 int  posix_spawnattr_destroy(posix_spawnattr_t *);
11126 int  posix_spawnattr_getflags(const posix_spawnattr_t *restrict,      -
11127                short *restrict);
11128 int  posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
11129                pid_t *restrict);
11130 PS  int  posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
11131                struct sched_param *restrict);
11132 int  posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
11133                int *restrict);
11134 int  posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,  +
11135                sigset_t *restrict);
11136 int  posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,    +
11137                sigset_t *restrict);
11138 int  posix_spawnattr_init(posix_spawnattr_t *);
11139 int  posix_spawnattr_setflags(posix_spawnattr_t *, short);          -
11140 int  posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);

```

```

11141 PS      int  posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11142          const struct sched_param *restrict);
11143          int  posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11144          int  posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,      +
11145          const sigset_t *restrict);                                          +
11146          int  posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11147          const sigset_t *restrict);
11148          int  posix_spawn(pid_t *restrict, const char *restrict,
11149          const posix_spawn_file_actions_t *,
11150          const posix_spawnattr_t *restrict,
11151          char *const [restrict], char *const [restrict]);

```

11152 Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h>,
 11153 <signal.h>, and <sys/types.h> headers.

11154 APPLICATION USAGE

11155 None.

11156 RATIONALE

11157 None.

11158 FUTURE DIRECTIONS

11159 None.

11160 SEE ALSO

11166 CHANGE HISTORY

11167 First released in Issue 6. Included for alignment with IEEE Std 1003.1d-1999.

11168 The **restrict** keyword is added to the prototypes for *posix_spawn()*,
 11169 *posix_spawn_file_actions_addopen()*, *posix_spawnattr_getsigdefault()*, *posix_spawnattr_getflags()*,
 11170 *posix_spawnattr_getpgroup()*, *posix_spawnattr_getschedparam()*, *posix_spawnattr_getschedpolicy()*,
 11171 *posix_spawnattr_getsigmask()*, *posix_spawnattr_setsigdefault()*, *posix_spawnattr_setschedparam()*,
 11172 *posix_spawnattr_setsigmask()*, and *posix_spawnnp()*.

11173 Issue 7

11174 This reference page is clarified with respect to macros and symbolic constants. +

11175 **NAME**

11176 stdarg.h — handle variable argument list

11177 **SYNOPSIS**

```
11178     #include <stdarg.h>
11179
11179     void va_start(va_list ap, argN);
11180     void va_copy(va_list dest, va_list src);
11181     type va_arg(va_list ap, type);
11182     void va_end(va_list ap);
```

11183 **DESCRIPTION**

11184 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11185 conflict between the requirements described here and the ISO C standard is unintentional. This
 11186 volume of POSIX.1-200x defers to the ISO C standard.

11187 The <stdarg.h> header shall contain a set of macros which allows portable functions that accept
 11188 variable argument lists to be written. Functions that have variable argument lists (such as
 11189 *printf()*) but do not use these macros are inherently non-portable, as different systems use
 11190 different argument-passing conventions.

11191 The type **va_list** shall be defined for variables used to traverse the list.

11192 The *va_start()* macro is invoked to initialize *ap* to the beginning of the list before any calls to
 11193 *va_arg()*.

11194 The *va_copy()* macro initializes *dest* as a copy of *src*, as if the *va_start()* macro had been applied
 11195 to *dest* followed by the same sequence of uses of the *va_arg()* macro as had previously been used
 11196 to reach the present state of *src*. Neither the *va_copy()* nor *va_start()* macro shall be invoked to
 11197 reinitialize *dest* without an intervening invocation of the *va_end()* macro for the same *dest*.

11198 The object *ap* may be passed as an argument to another function; if that function invokes the
 11199 *va_arg()* macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall
 11200 be passed to the *va_end()* macro prior to any further reference to *ap*. The parameter *argN* is the
 11201 identifier of the rightmost parameter in the variable parameter list in the function definition (the
 11202 one just before the *...*). If the parameter *argN* is declared with the **register** storage class, with a
 11203 function type or array type, or with a type that is not compatible with the type that results after
 11204 application of the default argument promotions, the behavior is undefined.

11205 The *va_arg()* macro shall return the next argument in the list pointed to by *ap*. Each invocation
 11206 of *va_arg()* modifies *ap* so that the values of successive arguments are returned in turn. The *type*
 11207 parameter shall be a type name specified such that the type of a pointer to an object that has the
 11208 specified type can be obtained simply by postfixing a *'*'* to type. If there is no actual next
 11209 argument, or if *type* is not compatible with the type of the actual next argument (as promoted
 11210 according to the default argument promotions), the behavior is undefined, except for the
 11211 following cases:

- 11212 • One type is a signed integer type, the other type is the corresponding unsigned integer
 11213 type, and the value is representable in both types.
- 11214 • One type is a pointer to **void** and the other is a pointer to a character type.
- 11215 XSI • Both types are pointers.

11216 Different types can be mixed, but it is up to the routine to know what type of argument is
 11217 expected.

11218 The *va_end()* macro is used to clean up; it invalidates *ap* for use (unless *va_start()* or *va_copy()* is
 11219 invoked again).

11220 Each invocation of the *va_start()* and *va_copy()* macros shall be matched by a corresponding
 11221 invocation of the *va_end()* macro in the same function.

11222 Multiple traversals, each bracketed by *va_start()* ... *va_end()*, are possible.

11223 EXAMPLES

11224 This example is a possible implementation of *execl()*:

```

11225 #include <stdarg.h>
11226 #define MAXARGS 31
11227 /*
11228  * execl is called by
11229  * execl(file, arg1, arg2, ..., (char *)0);
11230  */
11231 int execl(const char *file, const char *args, ...)
11232 {
11233     va_list ap;
11234     char *array[MAXARGS + 1];
11235     int argno = 0;
11236     va_start(ap, args);
11237     while (args != 0 && argno < MAXARGS)
11238     {
11239         array[argno++] = args;
11240         args = va_arg(ap, const char *);
11241     }
11242     array[argno] = (char *) 0;
11243     va_end(ap);
11244     return execv(file, array);
11245 }
```

11246 APPLICATION USAGE

11247 It is up to the calling routine to communicate to the called routine how many arguments there
 11248 are, since it is not always possible for the called routine to determine this in any other way. For
 11249 example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell
 11250 how many arguments are there by the *format* argument.

11251 RATIONALE

11252 None.

11253 FUTURE DIRECTIONS

11254 None.

11255 SEE ALSO

11256 XSH *exec*, *printf*

11257 CHANGE HISTORY

11258 First released in Issue 4. Derived from the ANSI C standard.

11259 Issue 6

11260 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

11261 **NAME**

11262 stdbool.h — boolean type and values

11263 **SYNOPSIS**

11264 #include <stdbool.h>

11265 **DESCRIPTION**

11266 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11267 conflict between the requirements described here and the ISO C standard is unintentional. This
 11268 volume of POSIX.1-200x defers to the ISO C standard.

11269 The <stdbool.h> header shall define the following macros:

11270 bool Expands to **_Bool**.

11271 true Expands to the integer constant 1.

11272 false Expands to the integer constant 0.

11273 __bool_true_false_are_defined

11274 Expands to the integer constant 1.

11275 An application may undefine and then possibly redefine the macros bool, true, and false.

11276 **APPLICATION USAGE**

11277 None.

11278 **RATIONALE**

11279 None.

11280 **FUTURE DIRECTIONS**

11281 The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature
 11282 and may be removed in a future version.

11283 **SEE ALSO**

11284 None.

11285 **CHANGE HISTORY**

11286 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

11287 **NAME**

11288 stddef.h — standard type definitions

11289 **SYNOPSIS**

11290 #include <stddef.h>

11291 **DESCRIPTION**

11292 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11293 conflict between the requirements described here and the ISO C standard is unintentional. This
 11294 volume of POSIX.1-200x defers to the ISO C standard.

11295 The <stddef.h> header shall define the following macros:

11296 CX **NULL** Null pointer constant. The macro shall expand to an integer constant expression +
 11297 with the value 0 cast to type **void ***.

11298 offsetof(*type*, *member-designator*)

11299 Integer constant expression of type **size_t**, the value of which is the offset in bytes
 11300 to the structure member (*member-designator*), from the beginning of its structure
 11301 (*type*).

11302 The <stddef.h> header shall define the following types:

11303 **ptrdiff_t** Signed integer type of the result of subtracting two pointers.

11304 **wchar_t** Integer type whose range of values can represent distinct wide-character codes for
 11305 all members of the largest character set specified among the locales supported by
 11306 the compilation environment: the null character has the code value 0 and each
 11307 member of the portable character set has a code value equal to its value when used
 11308 as the lone character in an integer character constant.

11309 **size_t** Unsigned integer type of the result of the *sizeof* operator.

11310 The implementation shall support one or more programming environments in which the widths
 11311 of **ptrdiff_t**, **size_t**, and **wchar_t** are no greater than the width of type **long**. The names of these
 11312 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

11313 **APPLICATION USAGE**

11314 None.

11315 **RATIONALE**

11316 The ISO C standard does not require the **NULL** macro to include the cast to type **void *** and |
 11317 specifies that the **NULL** macro be implementation-defined. POSIX.1-200x requires the cast and |
 11318 therefore need not be implementation-defined.

11319 **FUTURE DIRECTIONS**

11320 None.

11321 **SEE ALSO**

Issue 7

11328

This reference page is clarified with respect to macros and symbolic constants.

+

11329 **NAME**

11330 stdint.h — integer types

11331 **SYNOPSIS**

11332 #include <stdint.h>

11333 **DESCRIPTION**

11334 **CX** Some of the functionality described on this reference page extends the ISO C standard.
 11335 Applications shall define the appropriate feature test macro (see XSH [Section 2.2](#), on page 448) to
 11336 enable the visibility of these symbols in this header.

11337 The <stdint.h> header shall declare sets of integer types having specified widths, and shall
 11338 define corresponding sets of macros. It shall also define macros that specify limits of integer
 11339 types corresponding to types defined in other standard headers.

11340 **Note:** The “width” of an integer type is the number of bits used to store its value in a pure binary
 11341 system; the actual type may use more bits than that (for example, a 28-bit type could be stored
 11342 in 32 bits of actual storage). An N -bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to
 11343 $2^{N-1}-1$, while an N -bit unsigned type has values in the range 0 to 2^N-1 .

11344 Types are defined in the following categories:

- 11345 • Integer types having certain exact widths
- 11346 • Integer types having at least certain specified widths
- 11347 • Fastest integer types having at least certain specified widths
- 11348 • Integer types wide enough to hold pointers to objects
- 11349 • Integer types having greatest width

11350 (Some of these types may denote the same type.)

11351 Corresponding macros specify limits of the declared types and construct suitable constants.

11352 For each type described herein that the implementation provides, the <stdint.h> header shall
 11353 declare that **typedef** name and define the associated macros. Conversely, for each type described
 11354 herein that the implementation does not provide, the <stdint.h> header shall not declare that
 11355 **typedef** name, nor shall it define the associated macros. An implementation shall provide those
 11356 types described as required, but need not provide any of the others (described as optional).

11357 **Integer Types**

11358 When **typedef** names differing only in the absence or presence of the initial u are defined, they
 11359 shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999
 11360 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also
 11361 provide the other.

11362 In the following descriptions, the symbol N represents an unsigned decimal integer with no
 11363 leading zeros (for example, 8 or 24, but not 04 or 048).

- 11364 • Exact-width integer types

11365 The **typedef** name **int N _t** designates a signed integer type with width N , no padding bits,
 11366 and a two’s-complement representation. Thus, **int8_t** denotes a signed integer type with a
 11367 width of exactly 8 bits.

11368 The **typedef** name **uint N _t** designates an unsigned integer type with width N . Thus,
 11369 **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

11370	CX	The following types are required:
11371		int8_t
11372		int16_t
11373		int32_t
11374		uint8_t
11375		uint16_t
11376		uint32_t
11377		If an implementation provides integer types with width 64 that meet these requirements,
11378		then the following types are required:
11379		int64_t
11380		uint64_t
11381	CX	In particular, this will be the case if any of the following are true:
11382		— The implementation supports the <code>_POSIX_V7_ILP32_OFFBIG</code> programming
11383		environment and the application is being built in the <code>_POSIX_V7_ILP32_OFFBIG</code>
11384		programming environment (see the Shell and Utilities volume of POSIX.1-200x, c99,
11385		Programming Environments).
11386		— The implementation supports the <code>_POSIX_V7_LP64_OFF64</code> programming
11387		environment and the application is being built in the <code>_POSIX_V7_LP64_OFF64</code>
11388		programming environment.
11389		— The implementation supports the <code>_POSIX_V7_LPBIG_OFFBIG</code> programming
11390		environment and the application is being built in the <code>_POSIX_V7_LPBIG_OFFBIG</code>
11391		programming environment.
11392		All other types of this form are optional.
11393		• Minimum-width integer types
11394		◁ The typedef name int_leastN_t designates a signed integer type with a width of at least <i>N</i> ,
11395		such that no signed integer type with lesser size has at least the specified width. Thus,
11396		int_least32_t denotes a signed integer type with a width of at least 32 bits.
11397		The typedef name uint_leastN_t designates an unsigned integer type with a width of at
11398		least <i>N</i> , such that no unsigned integer type with lesser size has at least the specified width.
11399		Thus, uint_least16_t denotes an unsigned integer type with a width of at least 16 bits.
11400		The following types are required:
11401		int_least8_t
11402		int_least16_t
11403		int_least32_t
11404		int_least64_t
11405		uint_least8_t
11406		uint_least16_t
11407		uint_least32_t
11408		uint_least64_t
11409		All other types of this form are optional.
11410		• Fastest minimum-width integer types
11411		Each of the following types designates an integer type that is usually fastest to operate
11412		with among all integer types that have at least the specified width.

11413 The designated type is not guaranteed to be fastest for all purposes; if the implementation
 11414 has no clear grounds for choosing one type over another, it will simply pick some integer
 11415 type satisfying the signedness and width requirements.

11416 The **typedef** name **int_fastN_t** designates the fastest signed integer type with a width of at
 11417 least *N*. The **typedef** name **uint_fastN_t** designates the fastest unsigned integer type with
 11418 a width of at least *N*.

11419 The following types are required:

11420 **int_fast8_t**
 11421 **int_fast16_t**
 11422 **int_fast32_t**
 11423 **int_fast64_t**
 11424 **uint_fast8_t**
 11425 **uint_fast16_t**
 11426 **uint_fast32_t**
 11427 **uint_fast64_t**

11428 All other types of this form are optional.

- 11429 • Integer types capable of holding object pointers

11430 The following type designates a signed integer type with the property that any valid
 11431 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and
 11432 the result will compare equal to the original pointer:

11433 **intptr_t**

11434 The following type designates an unsigned integer type with the property that any valid
 11435 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and
 11436 the result will compare equal to the original pointer:

11437 **uintptr_t**

11438 XSI On XSI-conformant systems, the **intptr_t** and **uintptr_t** types are required; otherwise, they
 11439 are optional.

- 11440 • Greatest-width integer types

11441 The following type designates a signed integer type capable of representing any value of
 11442 any signed integer type:

11443 **intmax_t**

11444 The following type designates an unsigned integer type capable of representing any value
 11445 of any unsigned integer type:

11446 **uintmax_t**

11447 These types are required.

11448 **Note:** Applications can test for optional types by using the corresponding limit macro from [Limits of](#)
 11449 [Specified-Width Integer Types](#) (on page 330).

11450 **Limits of Specified-Width Integer Types**

11451 The following macros specify the minimum and maximum limits of the types declared in the
 11452 <stdint.h> header. Each macro name corresponds to a similar type name in [Integer Types](#) (on
 11453 page 327).

11454 Each instance of any defined macro shall be replaced by a constant expression suitable for use in
 11455 #if preprocessing directives, and this expression shall have the same type as would an
 11456 expression that is an object of the corresponding type converted according to the integer
 11457 promotions. Its implementation-defined value shall be equal to or greater in magnitude
 11458 (absolute value) than the corresponding value given below, with the same sign, except where
 11459 stated to be exactly the given value.

11460 • Limits of exact-width integer types

11461 — Minimum values of exact-width signed integer types:

11462 {INTN_MIN} Exactly $-(2^{N-1})$

11463 — Maximum values of exact-width signed integer types:

11464 {INTN_MAX} Exactly $2^{N-1}-1$

11465 — Maximum values of exact-width unsigned integer types:

11466 {UINTN_MAX} Exactly 2^N-1

11467 • Limits of minimum-width integer types

11468 — Minimum values of minimum-width signed integer types:

11469 {INT_LEASTN_MIN} $-(2^{N-1}-1)$

11470 — Maximum values of minimum-width signed integer types:

11471 {INT_LEASTN_MAX} $2^{N-1}-1$

11472 — Maximum values of minimum-width unsigned integer types:

11473 {UINT_LEASTN_MAX} 2^N-1

11474 • Limits of fastest minimum-width integer types

11475 — Minimum values of fastest minimum-width signed integer types:

11476 {INT_FASTN_MIN} $-(2^{N-1}-1)$

11477 — Maximum values of fastest minimum-width signed integer types:

11478 {INT_FASTN_MAX} $2^{N-1}-1$

11479 — Maximum values of fastest minimum-width unsigned integer types:

11480 {UINT_FASTN_MAX} 2^N-1

11481 • Limits of integer types capable of holding object pointers

11482 — Minimum value of pointer-holding signed integer type:

11483 {INTPTR_MIN} $-(2^{15}-1)$

11484 — Maximum value of pointer-holding signed integer type:

11485 {INTPTR_MAX} $2^{15}-1$

11486 — Maximum value of pointer-holding unsigned integer type:

11487 {UINTPTR_MAX} $2^{16} - 1$

11488 • Limits of greatest-width integer types

11489 — Minimum value of greatest-width signed integer type:

11490 {INTMAX_MIN} $-(2^{63} - 1)$

11491 — Maximum value of greatest-width signed integer type:

11492 {INTMAX_MAX} $2^{63} - 1$

11493 — Maximum value of greatest-width unsigned integer type:

11494 {UINTMAX_MAX} $2^{64} - 1$

11495 Limits of Other Integer Types

11496 The following macros specify the minimum and maximum limits of integer types corresponding
11497 to types defined in other standard headers.

11498 Each instance of these macros shall be replaced by a constant expression suitable for use in **#if**
11499 preprocessing directives, and this expression shall have the same type as would an expression
11500 that is an object of the corresponding type converted according to the integer promotions. Its
11501 implementation-defined value shall be equal to or greater in magnitude (absolute value) than
11502 the corresponding value given below, with the same sign.

- 11503 • Limits of **ptrdiff_t**:

11504 {PTRDIFF_MIN} -65 535

11505 {PTRDIFF_MAX} +65 535

- 11506 • Limits of **sig_atomic_t**:

11507 {SIG_ATOMIC_MIN} See below.

11508 {SIG_ATOMIC_MAX} See below.

- 11509 • Limit of **size_t**:

11510 {SIZE_MAX} 65 535

- 11511 • Limits of **wchar_t**:

11512 {WCHAR_MIN} See below.

11513 {WCHAR_MAX} See below.

- 11514 • Limits of **wint_t**:

11515 {WINT_MIN} See below.

11516 {WINT_MAX} See below.

11517 If **sig_atomic_t** (see the <signal.h> header) is defined as a signed integer type, the value of
11518 {SIG_ATOMIC_MIN} shall be no greater than -127 and the value of {SIG_ATOMIC_MAX} shall
11519 be no less than 127; otherwise, **sig_atomic_t** shall be defined as an unsigned integer type, and
11520 the value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no
11521 less than 255.

11522 If **wchar_t** (see the <stddef.h> header) is defined as a signed integer type, the value of
11523 {WCHAR_MIN} shall be no greater than -127 and the value of {WCHAR_MAX} shall be no less
11524 than 127; otherwise, **wchar_t** shall be defined as an unsigned integer type, and the value of
11525 {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255.

11526 If **wint_t** (see the <wchar.h> header) is defined as a signed integer type, the value of

11527 {WINT_MIN} shall be no greater than -32767 and the value of {WINT_MAX} shall be no less
 11528 than 32767 ; otherwise, **wint_t** shall be defined as an unsigned integer type, and the value of
 11529 {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65535 .

11530 **Macros for Integer Constant Expressions**

11531 The following macros expand to integer constant expressions suitable for initializing objects that
 11532 have integer types corresponding to types defined in the <stdint.h> header. Each macro name
 11533 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*
 11534 *integer types*.

11535 Each invocation of one of these macros shall expand to an integer constant expression suitable
 11536 for use in **#if** preprocessing directives. The type of the expression shall have the same type as
 11537 would an expression that is an object of the corresponding type converted according to the
 11538 integer promotions. The value of the expression shall be that of the argument.

11539 The argument in any instance of these macros shall be a decimal, octal, or hexadecimal constant
 11540 with a value that does not exceed the limits for the corresponding type.

- 11541 • Macros for minimum-width integer constant expressions

11542 The macro *INTN_C(value)* shall expand to an integer constant expression corresponding to
 11543 the type **int_leastN_t**. The macro *UINTN_C(value)* shall expand to an integer constant
 11544 expression corresponding to the type **uint_leastN_t**. For example, if **uint_least64_t** is a
 11545 name for the type **unsigned long long**, then *UINT64_C(0x123)* might expand to the integer
 11546 constant `0x123ULL`.

- 11547 • Macros for greatest-width integer constant expressions

11548 The following macro expands to an integer constant expression having the value specified
 11549 by its argument and the type **intmax_t**:

11550 *INTMAX_C(value)*

11551 The following macro expands to an integer constant expression having the value specified
 11552 by its argument and the type **uintmax_t**:

11553 *UINTMAX_C(value)*

11554 **APPLICATION USAGE**

11555 None.

11556 **RATIONALE**

11557 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in
 11558 freestanding environments, which might not support the formatted I/O functions. In some
 11559 environments, if the formatted conversion support is not wanted, using this header instead of
 11560 the <inttypes.h> header avoids defining such a large number of macros.

11561 As a consequence of adding **int8_t**, the following are true:

- 11562 • A byte is exactly 8 bits.
- 11563 • {CHAR_BIT} has the value 8, {SCHAR_MAX} has the value 127, {SCHAR_MIN} has the
 11564 value -128 , and {UCHAR_MAX} has the value 255.

11565 (The POSIX standard explicitly requires 8-bit char and two's-complement arithmetic.)

11566 **FUTURE DIRECTIONS**

11567 **typedef** names beginning with **int** or **uint** and ending with **_t** may be added to the types defined
 11568 in the <stdint.h> header. Macro names beginning with **INT** or **UINT** and ending with **_MAX**,
 11569 **_MIN**, or **_C** may be added to the macros defined in the <stdint.h> header.

11578 **NAME**11579 `stdio.h` — standard buffered input/output11580 **SYNOPSIS**11581 `#include <stdio.h>`11582 **DESCRIPTION**

11583 CX Some of the functionality described on this reference page extends the ISO C standard.
 11584 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 11585 enable the visibility of these symbols in this header.

11586 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11587 expressions:

11588 CX **BUFSIZ** Size of <stdio.h> buffers. This shall expand to a positive value.

11589 CX **L_ctermid** Maximum size of character array to hold `ctermid()` output.

11590 OB **L_tmpnam** Maximum size of character array to hold `tmpnam()` output.

11591 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11592 expressions with distinct values:

11593 **_IOFBF** Input/output fully buffered.

11594 **_IOLBF** Input/output line buffered.

11595 **_IONBF** Input/output unbuffered.

11596 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11597 expressions with distinct values:

11598 **SEEK_CUR** Seek relative to current position.

11599 **SEEK_END** Seek relative to end-of-file.

11600 **SEEK_SET** Seek relative to start-of-file.

11601 The <stdio.h> header shall define the following macros which shall expand to integer constant
 11602 expressions denoting implementation limits:

11603 **{FILENAME_MAX}** Maximum size in bytes of the longest filename string that the
 11604 implementation guarantees can be opened.

11605 **{FOPEN_MAX}** Number of streams which the implementation guarantees can be open
 11606 simultaneously. The value is at least eight.

11607 OB **{TMP_MAX}** Minimum number of unique filenames generated by `tmpnam()`.
 11608 Maximum number of times an application can call `tmpnam()` reliably. The
 11609 value of **{TMP_MAX}** is at least 25.

11610 OB XSI On XSI-conformant systems, the value of **{TMP_MAX}** is at least 10 000.

11611 The <stdio.h> header shall define the following macro which shall expand to an integer constant
 11612 expression with type **int** and a negative value:

11613 **EOF** End-of-file return value.

11614 The <stdio.h> header shall define **NULL** as described in <stddef.h>.

11615 The <stdio.h> header shall define the following macro which shall expand to a string constant:

11616	OB XSI	P_tmpdir	Default directory prefix for <i>tempnam()</i> .
11617			The <stdio.h> header shall define the following macros which shall expand to expressions of
11618			type “pointer to FILE ” that point to the FILE objects associated, respectively, with the standard
11619			error, input, and output streams:
11620		<i>stderr</i>	Standard error output stream.
11621		<i>stdin</i>	Standard input stream.
11622		<i>stdout</i>	Standard output stream.
11623			The following data types shall be defined through typedef :
11624		FILE	A structure containing information about a file.
11625		fpos_t	A non-array type containing all information needed to specify uniquely
11626			every position within a file.
11627	CX	va_list	As described in <stdarg.h>.
11628		size_t	As described in <stddef.h>.
11629	CX	ssize_t	As described in <sys/types.h>.
11630			The following shall be declared as functions and may also be defined as macros. Function
11631			prototypes shall be provided.
11632		void	clearerr(FILE *);
11633	CX	char	*ctermid(char *);
11634		int	dprintf(int, const char *, ...)

vfscanf()

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Large File System extensions are added.

The constant `L_cuserid` and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as extensions and LEGACY.

The *cuserid()* and *getopt()* functions are marked LEGACY.

Issue 6

The constant `L_cuserid` and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed as they were previously marked LEGACY.

The *cuserid()*, *getopt()*, and *getw()* functions are removed as they were previously marked LEGACY.

Several functions are marked as part of the Thread-Safe Functions option.

This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the description of the `fpos_t` type is now explicitly updated to exclude array types.

Extensions beyond the ISO C standard are marked.

Issue 7

The *dprintf()*, *fmemopen()*, *getdelim()*, *getline()*, and *open_memstream()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *renameat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

The *gets()*, *tmpnam()*, and *tempnam()* functions and the `L_tmpnam` macro are marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

+

11741	NAME			
11742		stdlib.h	— standard library definitions	
11743	SYNOPSIS			
11744		#include	<stdlib.h>	
11745	DESCRIPTION			
11746	CX	Some of the functionality described on this reference page extends the ISO C standard. Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to enable the visibility of these symbols in this header.		
11747				
11748				
11749		The <stdlib.h> header shall define the following macros which shall expand to integer constant expressions:		
11750				
11751		EXIT_FAILURE	Unsuccessful termination for <i>exit()</i> ; evaluates to a non-zero value.	
11752		EXIT_SUCCESS	Successful termination for <i>exit()</i> ; evaluates to 0.	-
11753		{RAND_MAX}	Maximum value returned by <i>rand()</i> ; at least 32767.	
11754		The <stdlib.h> header shall define the following macro which shall expand to a positive integer expression with type size_t :		
11755				+
11756		{MB_CUR_MAX}	Maximum number of bytes in a character specified by the current locale (category <i>LC_CTYPE</i>).	
11757				
11758		The <stdlib.h> header shall define NULL as described in <stddef.h>.		
11759				+
11759		The following data types shall be defined through typedef :		
11760		div_t	Structure type returned by the <i>div()</i> function.	
11761		ldiv_t	Structure type returned by the <i>ldiv()</i> function.	
11762		lldiv_t	Structure type returned by the <i>lldiv()</i> function.	
11763		size_t	As described in <stddef.h>.	
11764		wchar_t	As described in <stddef.h>.	
11765	CX	In addition, the following symbolic constants and macros shall be defined as in <sys/wait.h>:		
11766		WEXITSTATUS		
11767		WIFEXITED		-
11768		WIFSIGNALED		
11769		WIFSTOPPED		
11770		WNOHANG		+
11771		WSTOPSIG		
11772		WTERMSIG		
11773		WUNTRACED		+
11774		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.		
11775				
11776		void	_Exit (int);	
11777	XSI	long	a64l (const char *);	
11778		void	abort (void);	
11779		int	abs (int);	
11780		int	atexit (void (*)(void));	
11781		double	atof (const char *);	

```

11782         int          atoi(const char *);
11783         long         atol(const char *);
11784         long long    atoll(const char *);
11785         void         *bsearch(const void *, const void *, size_t, size_t,
11786                               int (*)(const void *, const void *));
11787         void         *calloc(size_t, size_t);
11788         div_t        div(int, int);
11789     XSI         double   drand48(void);
11790         double       erand48(unsigned short [3]);
11791         void         exit(int);
11792         void         free(void *);

CHANGE HISTORY

First released in Issue 3.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

The *ttyslot()* and *valloc()* functions are marked LEGACY.

The type of the third argument to *initstate()* is changed from **int** to **size_t**. The type of the return value from *setstate()* is changed from **char** to **char ***, and the type of the first argument is changed from **char *** to **const char ***.

Issue 6

The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath()* to be consistent with the reference page.

The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv()* to be consistent with the reference page.

The *rand_r()* function is marked as part of the Thread-Safe Functions option.

Function prototypes for *setenv()* and *unsetenv()* are added.

The *posix_memalign()* function is added for alignment with IEEE Std 1003.1d-1999.

This reference page is updated to align with the ISO/IEC 9899:1999 standard.

The *ecvt()*, *fcvt()*, *gcvt()*, and *mktemp()* functions are marked LEGACY.

The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.

Extensions beyond the ISO C standard are marked.

11878	Issue 7	
11879	SD5-XBD-ERN-79 is applied.	+
11880	The LEGACY functions are removed.	
11881	The <i>mkdtemp()</i> function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.	
11882		
11883	The <i>rand_r()</i> function is marked obsolescent.	+
11884	This reference page is clarified with respect to macros and symbolic constants.	

11885 NAME

11886 string.h — string operations

11887 SYNOPSIS

11888 #include <string.h>

11889 DESCRIPTION

11890 CX Some of the functionality described on this reference page extends the ISO C standard.
 11891 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 11892 enable the visibility of these symbols in this header.

11893 The <string.h> header shall define NULL and size_t as described in <stddef.h>.

11894 The following shall be declared as functions and may also be defined as macros. Function
 11895 prototypes shall be provided for use with ISO C standard compilers.

```

11896 XSI void *memcpy(void *restrict, const void *restrict, int, size_t);
11897 void *memchr(const void *, int, size_t);
11898 int memcmp(const void *, const void *, size_t);
11899 void *memcpy(void *restrict, const void *restrict, size_t);
11900 void *memmove(void *, const void *, size_t);
11901 void *memset(void *, int, size_t);
11902 CX char *strcpy(char *restrict, const char *restrict);
11903 char *strncpy(char *restrict, const char *restrict, size_t);
11904 char *strcat(char *restrict, const char *restrict);
11905 char *strchr(const char *, int);
11906 int strcmp(const char *, const char *);
11907 int strcoll(const char *, const char *);
11908 CX int strcoll_l(const char *, const char *, locale_t);
11909 char *strcpy(char *restrict, const char *restrict);
11910 size_t strcspn(const char *, const char *);
11911 CX char *strdup(const char *);
11912 char *strerror(int);
11913 CX char *strerror_l(int, locale_t);
11914 int strerror_r(int, char *, size_t);
11915 size_t strlen(const char *);
11916 char *strncat(char *restrict, const char *restrict, size_t);
11917 int strncmp(const char *, const char *, size_t);
11918 char *strncpy(char *restrict, const char *restrict, size_t);
11919 CX char *strndup(const char *, size_t);
11920 size_t strnlen(const char *, size_t);
11921 char *strpbrk(const char *, const char *);
11922 char *strrchr(const char *, int);
11923 CX char *strsignal(int);
11924 size_t strspn(const char *, const char *);
11925 char *strstr(const char *, const char *);
11926 char *strtok(char *restrict, const char *restrict);
11927 CX char *strtok_r(char *restrict, const char *restrict, char **restrict);
11928 size_t strxfrm(char *restrict, const char *restrict, size_t);
11929 CX size_t strxfrm_l(char *restrict, const char *restrict,
11930 size_t, locale_t);

```

11931 CX Inclusion of the <string.h> header may also make visible all symbols from <stddef.h>.

11951	Issue 7	
11952	SD5-XBD-ERN-15 is applied, correcting the prototype for the strerror_r() function.	
11953	The stpcpy() , stpncpy() , strndup() , strlen() , and strsignal() functions are added from The Open	
11954	Group Technical Standard, 2006, Extended API Set Part 1.	
11955	The strcoll_l() , strerror_l() , and strxfrm_l() functions are added from The Open Group Technical	
11956	Standard, 2006, Extended API Set Part 4.	
11957	This reference page is clarified with respect to macros and symbolic constants.	+

11958 **NAME**
 11959 strings.h — string operations

11960 **SYNOPSIS**
 11961 #include <strings.h>

11962 **DESCRIPTION**
 11963 The following shall be declared as functions and may also be defined as macros. Function
 11964 prototypes shall be provided for use with ISO C standard compilers.

11965 XSI `int ffs(int);`
 11966 `int strcasecmp(const char *, const char *);`
 11967 `int strcasecmp_l(const char *, const char *, locale_t);`
 11968 `int strncasecmp(const char *, const char *, size_t);`
 11969 `int strncasecmp_l(const char *, const char *, size_t, locale_t);`

11970 The `size_t` type shall be defined as described in <sys/types.h>.

11971 **APPLICATION USAGE**
 11972 None.

11973 **RATIONALE**
 11974 None.

11975 **FUTURE DIRECTIONS**
 11976 None.

11977 **SEE ALSO**
 11978 <sys/types.h>

11979 XSH `ffs()`, `strcasecmp()`

11980 **CHANGE HISTORY**
 11981 First released in Issue 4, Version 2.

11982 **Issue 6**
 11983 The Open Group Corrigendum U021/2 is applied, correcting the prototype for `index()` to be
 11984 consistent with the reference page.

11985 The `bcmp()`, `bcopy()`, `bzero()`, `index()`, and `rindex()` functions are marked LEGACY.

11986 **Issue 7**
 11987 SD5-XBD-ERN-56 is applied, adding a reference to <sys/types.h> for the `size_t` type.

11988 The LEGACY functions are removed.

11989 The <strings.h> header is moved from the XSI option to the Base.

11990 The `strcasecmp_l()` and `strncasecmp_l()` functions are added from The Open Group Technical
 11991 Standard, 2006, Extended API Set Part 4.

11992 **NAME**11993 stropts.h — STREAMS interface (**STREAMS**)11994 **SYNOPSIS**

11995 OB XSR #include <stropts.h>

11996 **DESCRIPTION**11997 The <stropts.h> header shall define the **bandinfo** structure that includes at least the following
11998 members:11999 int bi_flag Flushing type.
12000 unsigned char bi_pri Priority band.12001 The <stropts.h> header shall define the **strpeek** structure that includes at least the following
12002 members:12003 struct strbuf ctlbuf The control portion of the message.
12004 struct strbuf databuf The data portion of the message.
12005 t_uscalar_t flags RS_HIPRI or 0.12006 The <stropts.h> header shall define the **strbuf** structure that includes at least the following
12007 members:12008 char *buf Pointer to buffer.
12009 int len Length of data.
12010 int maxlen Maximum buffer length.12011 The <stropts.h> header shall define the **strfdinsert** structure that includes at least the following
12012 members:12013 struct strbuf ctlbuf The control portion of the message.
12014 struct strbuf databuf The data portion of the message.
12015 int fildes File descriptor of the other STREAM.
12016 t_uscalar_t flags RS_HIPRI or 0.
12017 int offset Relative location of the stored value.12018 The <stropts.h> header shall define the **striocfl** structure that includes at least the following
12019 members:12020 int ic_cmd *ioctl()* command.
12021 char *ic_dp Pointer to buffer.
12022 int ic_len Length of data.
12023 int ic_timeout Timeout for response.12024 The <stropts.h> header shall define the **strrecvfd** structure that includes at least the following
12025 members:12026 int fda Received file descriptor.
12027 gid_t gid GID of sender.
12028 uid_t uid UID of sender.12029 The **uid_t** and **gid_t** types shall be defined through **typedef** as described in <sys/types.h>.12030 The <stropts.h> header shall define the **t_scalar_t** and **t_uscalar_t** types, respectively, as signed
12031 and unsigned opaque types of equal length of at least 32 bits.12032 The <stropts.h> header shall define the **str_list** structure that includes at least the following
12033 members:

12034 struct str_mlist *sl_modlist STREAMS module names.
 12035 int sl_nmods Number of STREAMS module names.

12036 The <stropts.h> header shall define the **str_mlist** structure that includes at least the following
 12037 member:

12038 char l_name[FMNAMESZ+1] A STREAMS module name.

12039 The <stropts.h> header shall define at least the following symbolic constants for use as the
 12040 *request* argument to *ioctl()*:

12041 L_ATMARK Is the top message “marked”?

12042 L_CANPUT Is a band writable?

12043 L_CKBAND See if any messages exist in a band.

12044 L_FDINSERT Send implementation-defined information about another STREAM.

12045 L_FIND Look for a STREAMS module.

12046 L_FLUSH Flush a STREAM.

12047 L_FLUSHBAND Flush one band of a STREAM.

12048 L_GETBAND Get the band of the top message on a STREAM.

12049 L_GETCLTIME Get close time delay.

12050 L_GETSIG Retrieve current notification signals.

12051 L_GRDOPT Get the read mode.

12052 L_GWROPT Get the write mode.

12053 L_LINK Connect two STREAMS.

12054 L_LIST Get all the module names on a STREAM.

12055 L_LOOK Get the top module name.

12056 L_NREAD Size the top message.

12057 L_PEEK Peek at the top message on a STREAM.

12058 L_PLINK Persistently connect two STREAMS.

12059 L_POP Pop a STREAMS module.

12060 L_PUNLINK Dismantle a persistent STREAMS link.

12061 L_PUSH Push a STREAMS module.

12062 L_RECVFD Get a file descriptor sent via L_SENDFD.

12063 L_SENDFD Pass a file descriptor through a STREAMS pipe.

12064 L_SETCLTIME Set close time delay.

12065 L_SETSIG Ask for notification signals.

12066 L_SRDOPT Set the read mode.

12067 L_STR Send a STREAMS *ioctl()*.

12068 L_SWROPT Set the write mode.

12069 L_UNLINK Disconnect two STREAMS.

12070 The <stropts.h> header shall define at least the following symbolic constant for use with
 12071 L_LOOK:

12072	FMNAMESZ	The minimum size in bytes of the buffer referred to by the <i>arg</i> argument.
12073	The <stropts.h> header shall define at least the following symbolic constants for use with	
12074	L_FLUSH:	
12075	FLUSHR	Flush read queues.
12076	FLUSHRW	Flush read and write queues.
12077	FLUSHW	Flush write queues.
12078	The <stropts.h> header shall define at least the following symbolic constants for use with	
12079	L_SETSIG:	
12080	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of
12081		SIGPOLL when a priority message reaches the front of the STREAM head read
12082		queue.
12083	S_ERROR	Notification of an error condition reaches the STREAM head.
12084	S_HANGUP	Notification of a hangup reaches the STREAM head.
12085	S_HIPRI	A high-priority message is present on a STREAM head read queue.
12086	S_INPUT	A message, other than a high-priority message, has arrived at the head of a
12087		STREAM head read queue.
12088	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the
12089		front of the STREAM head read queue.
12090	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM
12091		head is no longer full. This notifies the process that there is room on the queue
12092		for sending (or writing) normal data downstream.
12093	S_RDBAND	A message with a non-zero priority band has arrived at the head of a
12094		STREAM head read queue.
12095	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a
12096		STREAM head read queue.
12097	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is
12098		no longer full.
12099	S_WRNORM	Equivalent to S_OUTPUT.
12100	The <stropts.h> header shall define at least the following symbolic constant for use with	
12101	L_PEEK:	
12102	RS_HIPRI	Only look for high-priority messages.
12103	The <stropts.h> header shall define at least the following symbolic constants for use with	
12104	L_SRDOPT:	
12105	RMSGD	Message-discard mode.
12106	RMSGN	Message-non-discard mode.
12107	RNORM	Byte-STREAM mode, the default.
12108	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
12109	RPROTDIS	Discard the control part of a message, delivering any data part, when a
12110		process issues a <i>read()</i> .
12111	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the
12112		front of the STREAM head read queue.

<stropts.h>

Headers

12113 The **<stropts.h>** header shall define at least the following symbolic constant for use with |
 12114 `L_SWOPT`:

12115 `SNDZERO` Send a zero-length message downstream when a `write()` of 0 bytes occurs.

12116 The **<stropts.h>** header shall define at least the following symbolic constants for use with |
 12117 `L_ATMARK`:

12118 `ANYMARK` Check if the message is marked.

12119 `LASTMARK` Check if the message is the last one marked on the queue.

12120 The **<stropts.h>** header shall define at least the following symbolic constant for use with |
 12121 `L_UNLINK`:

12122 `MUXID_ALL` Unlink all STREAMs linked to the STREAM associated with *fildev*.

12123 The **<stropts.h>** header shall define the following symbolic constants for `getmsg()`, `getpmsg()`, |
 12124 `putmsg()`, and `putpmsg()`:

12125 `MORECTL` More control information is left in message.

12126 `MOREDATA` More data is left in message.

12127 `MSG_ANY` Receive any message.

12128 `MSG_BAND` Receive message from specified band.

12129 `MSG_HIPRI` Send/receive high-priority message.

12130 The **<stropts.h>** header may make visible all of the symbols from **<unistd.h>**.

12131 The following shall be declared as functions and may also be defined as macros. Function
 12132 prototypes shall be provided.

```

12133 int  fattach(int, const char *);
12134 int  fdetach(const char *);
12135 int  getmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12136         int *restrict);
12137 int  getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,
12138            int *restrict, int *restrict);
12139 int  isastream(int);
12140 int  ioctl(int, int, ...);
12141 int  putmsg(int, const struct strbuf *, const struct strbuf *, int);
12142 int  putpmsg(int, const struct strbuf *, const struct strbuf *, int,
12143            int);
  
```

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

The *flags* members of the **strpeek** and **strfdinsert** structures are changed from **type long** to **t_uscalar_t**.

Issue 6

This header is marked as part of the XSI STREAMS Option Group.

The **restrict** keyword is added to the prototypes for *getmsg()* and *getpmsg()*.

Issue 7

The <**stropts.h**> header is marked obsolescent.

This reference page is clarified with respect to macros and symbolic constants.

+

12164 **NAME**

12165 sys/ipc.h — XSI interprocess communication access structure

12166 **SYNOPSIS**12167 XSI `#include <sys/ipc.h>`12168 **DESCRIPTION**12169 The <sys/ipc.h> header is used by three mechanisms for XSI interprocess communication (IPC):
12170 messages, semaphores, and shared memory. All use a common structure type, **ipc_perm**, to pass
12171 information used in determining permission to perform an IPC operation.12172 The **ipc_perm** structure shall contain the following members:

12173	<code>uid_t</code>	<code>uid</code>	Owner's user ID.
12174	<code>gid_t</code>	<code>gid</code>	Owner's group ID.
12175	<code>uid_t</code>	<code>cuid</code>	Creator's user ID.
12176	<code>gid_t</code>	<code>cgid</code>	Creator's group ID.
12177	<code>mode_t</code>	<code>mode</code>	Read/write permission.

12178 The **uid_t**, **gid_t**, **mode_t**, and **key_t** types shall be defined as described in <sys/types.h>.

12179 The <sys/ipc.h> header shall define the following symbolic constants. |

12180 Mode bits:

12181 `IPC_CREAT` Create entry if key does not exist.12182 `IPC_EXCL` Fail if key exists.12183 `IPC_NOWAIT` Error if request must wait.

12184 Keys:

12185 `IPC_PRIVATE` Private key.

12186 Control commands:

12187 `IPC_RMID` Remove identifier.12188 `IPC_SET` Set options.12189 `IPC_STAT` Get options.12190 The following shall be declared as a function and may also be defined as a macro. A function
12191 prototype shall be provided.12192 `key_t ftok(const char *, int);`12193 **APPLICATION USAGE**

12194 None.

12195 **RATIONALE**

12196 None.

CHANGE HISTORY

12203

First released in Issue 2. Derived from System V Release 2.0.

12204

Issue 7

12205

This reference page is clarified with respect to macros and symbolic constants.

+

12206 **NAME**
 12207 sys/mman.h — memory management declarations

12208 **SYNOPSIS**
 12209 #include <sys/mman.h>

12210 **DESCRIPTION**
 12211 The <sys/mman.h> header shall define the following symbolic constants for use as protection
 12212 options:

12213 PROT_EXEC Page can be executed.
 12214 PROT_NONE Page cannot be accessed.
 12215 PROT_READ Page can be read.
 12216 PROT_WRITE Page can be written.

12217 The <sys/mman.h> header shall define the following symbolic constants for use as flag options:

12218 MAP_FIXED Interpret *addr* exactly.
 12219 MAP_PRIVATE Changes are private.
 12220 MAP_SHARED Share changes.

12221 XSI/SIO The <sys/mman.h> header shall define the following symbolic constants for the *msync()*
 12222 function:

12223 MS_ASYNC Perform asynchronous writes.
 12224 MS_INVALIDATE Invalidate mappings.
 12225 MS_SYNC Perform synchronous writes.

12226 ML The <sys/mman.h> header shall define the following symbolic constants for the *mlockall()*
 12227 function:

12228 MCL_CURRENT Lock currently mapped pages.
 12229 MCL_FUTURE Lock pages that become mapped.

12230 The <sys/mman.h> header shall define the symbolic constant MAP_FAILED which shall have
 12231 type **void *** and shall be used to indicate a failure from the *mmap()* function .

12232 ADV If the Advisory Information option is supported, the <sys/mman.h> header shall define
 12233 symbolic constants for the *advice* argument to the *posix_madvise()* function as follows:

12234 POSIX_MADV_DONTNEED
 12235 The application expects that it will not access the specified range in the near future.
 12236 POSIX_MADV_NORMAL
 12237 The application has no advice to give on its behavior with respect to the specified range. It
 12238 is the default characteristic if no advice is given for a range of memory.
 12239 POSIX_MADV_RANDOM
 12240 The application expects to access the specified range in a random order.
 12241 POSIX_MADV_SEQUENTIAL
 12242 The application expects to access the specified range sequentially from lower addresses to
 12243 higher addresses.

12244		POSIX_MADV_WILLNEED
12245		The application expects to access the specified range in the near future.
12246	TYM	The <sys/mman.h> header shall define the following symbolic constants for use as flags for the <i>posix_typed_mem_open()</i> function:
12247		
12248		POSIX_TYPED_MEM_ALLOCATE
12249		Allocate on <i>mmap()</i> .
12250		POSIX_TYPED_MEM_ALLOCATE_CONTIG
12251		Allocate contiguously on <i>mmap()</i> .
12252		POSIX_TYPED_MEM_MAP_ALLOCATABLE
12253		Map on <i>mmap()</i> , without affecting allocatability.
12254		The mode_t , off_t , and size_t types shall be defined as described in <sys/types.h>.
12255	TYM	The <sys/mman.h> header shall define the structure posix_typed_mem_info , which includes at least the following member:
12256		
12257		<code>size_t posix_tmi_length</code> Maximum length which may be allocated
12258		from a typed memory object.
12259		The following shall be declared as functions and may also be defined as macros. Function
12260		prototypes shall be provided.
12261	MLR	<code>int mlock(const void *, size_t);</code>
12262	ML	<code>int mlockall(int);</code>
12263		<code>void *mmap(void *, size_t, int, int, int, off_t);</code>
12264		<code>int mprotect(void *, size_t, int);</code>
12265	XSI SIO	<code>int msync(void *, size_t, int);</code>
12266	MLR	<code>int munlock(const void *, size_t);</code>
12267	ML	<code>int munlockall(void);</code>
12268		<code>int munmap(void *, size_t);</code>
12269	ADV	<code>int posix_madvise(void *, size_t, int);</code>
12270	TYM	<code>int posix_mem_offset(const void *restrict, size_t, off_t *restrict,</code>
12271		<code>size_t *restrict, int *restrict);</code>
12272		<code>int posix_typed_mem_get_info(int, struct posix_typed_mem_info *);</code>
12273		<code>int posix_typed_mem_open(const char *, int, int);</code>
12274	SHM	<code>int shm_open(const char *, int, mode_t);</code>
12275		<code>int shm_unlink(const char *);</code>
12276		APPLICATION USAGE
12277		None.
12278		RATIONALE
12279		None.
12280		FUTURE DIRECTIONS
12281		None.
12282		SEE ALSO
12283		<sys/types.h>
12284		XSH <i>mlock()</i> , <i>mlockall()</i> , <i>mmap()</i> , <i>mprotect()</i> , <i>msync()</i> , <i>munmap()</i> , <i>posix_mem_offset()</i> ,

CHANGE HISTORY

12286 First released in Issue 4, Version 2.
12287

Issue 5

12288 Updated for alignment with the POSIX Realtime Extension.
12289

Issue 6

12290 The <sys/mman.h> header is marked as dependent on support for either the Memory Mapped
12291 Files, Process Memory Locking, or Shared Memory Objects options.
12292

12293 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 12294 • The TYM margin code is added to the list of margin codes for the <sys/mman.h> header
12295 line, as well as for other lines.
- 12296 • The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG,
12297 and POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.
- 12298 • The `posix_tmi_length` structure is added.
- 12299 • The `posix_mem_offset()`, `posix_typed_mem_get_info()`, and `posix_typed_mem_open()` functions
12300 are added.

12301 The `restrict` keyword is added to the prototype for `posix_mem_offset()`.

12302 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for `posix_madvise()`.

12303 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and
12304 shading errors for the `mlock()` and `munlock()` functions.

12305 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code
12306 for the `mmap()` function from MF|SHM to MC3 (notation for MF|SHM|TYM).

12307 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code
12308 for the `munmap()` function from MF|SHM to MC3 (notation for MF|SHM|TYM).

Issue 7

12309 SD5-XBD-ERN-5 is applied, rewriting the DESCRIPTION.
12310

12311 Functionality relating to the Memory Protection and Memory Mapped Files options is moved to
12312 the Base.

12313 This reference page is clarified with respect to macros and symbolic constants. +

12314 **NAME**
 12315 `sys/msg.h` — XSI message queue structures

12316 **SYNOPSIS**
 12317 XSI `#include <sys/msg.h>`

12318 DESCRIPTION

12319 The `<sys/msg.h>` header shall define the following data types through **typedef**:

12320 **msgqnum_t** Used for the number of messages in the message queue.

12321 **msglen_t** Used for the number of bytes allowed in a message queue.

12322 These types shall be unsigned integer types that are able to store values at least as large as a type
 12323 **unsigned short**.

12324 The `<sys/msg.h>` header shall define the following symbolic constant as a message operation
 12325 flag:

12326 **MSG_NOERROR** No error if big message.

12327 The **msqid_ds** structure shall contain the following members:

12328	<code>struct ipc_perm</code>	<code>msg_perm</code>	Operation permission structure.
12329	<code>msgqnum_t</code>	<code>msg_qnum</code>	Number of messages currently on queue.
12330	<code>msglen_t</code>	<code>msg_qbytes</code>	Maximum number of bytes allowed on queue.
12331	<code>pid_t</code>	<code>msg_lspid</code>	Process ID of last <code>msgsnd()</code> .
12332	<code>pid_t</code>	<code>msg_lrpid</code>	Process ID of last <code>msgrcv()</code> .
12333	<code>time_t</code>	<code>msg_stime</code>	Time of last <code>msgsnd()</code> .
12334	<code>time_t</code>	<code>msg_rtime</code>	Time of last <code>msgrcv()</code> .
12335	<code>time_t</code>	<code>msg_ctime</code>	Time of last change.

12336 The **pid_t**, **time_t**, **key_t**, **size_t**, and **ssize_t** types shall be defined as described in
 12337 `<sys/types.h>`.

12338 The following shall be declared as functions and may also be defined as macros. Function
 12339 prototypes shall be provided.

```
12340 int      msgctl(int, int, struct msqid_ds *);
12341 int      msgget(key_t, int);
12342 ssize_t  msgrcv(int, void *, size_t, long, int);
12343 int      msgsnd(int, const void *, size_t, int);
```

12344 In addition, all of the symbols from `<sys/ipc.h>` shall be defined when this header is included.

12345 APPLICATION USAGE

CHANGE HISTORY

12355

First released in Issue 2. Derived from System V Release 2.0.

12356

Issue 7

12357

This reference page is clarified with respect to macros and symbolic constants. +

12358 **NAME**
 12359 `sys/resource.h` — definitions for XSI resource operations

12360 **SYNOPSIS**
 12361 XSI `#include <sys/resource.h>`

12362 **DESCRIPTION**
 12363 The <sys/resource.h> header shall define the following symbolic constants as possible values of
 12364 the *which* argument of `getpriority()` and `setpriority()`:

12365 `PRIO_PROCESS` Identifies the *who* argument as a process ID.
 12366 `PRIO_PGRP` Identifies the *who* argument as a process group ID.
 12367 `PRIO_USER` Identifies the *who* argument as a user ID.

12368 The following type shall be defined through **typedef**:

12369 `rlim_t` Unsigned integer type used for limit values.

12370 The <sys/resource.h> header shall define the following symbolic constants, which shall have
 12371 values suitable for use in `#if` preprocessing directives:

12372 `RLIM_INFINITY` A value of `rlim_t` indicating no limit.
 12373 `RLIM_SAVED_MAX` A value of type `rlim_t` indicating an unrepresentable saved hard
 12374 limit.
 12375 `RLIM_SAVED_CUR` A value of type `rlim_t` indicating an unrepresentable saved soft limit.

12376 On implementations where all resource limits are representable in an object of type `rlim_t`,
 12377 `RLIM_SAVED_MAX` and `RLIM_SAVED_CUR` need not be distinct from `RLIM_INFINITY`.

12378 The following symbolic constants shall be defined as possible values of the *who* parameter of
 12379 `getrusage()`:

12380 `RUSAGE_SELF` Returns information about the current process.
 12381 `RUSAGE_CHILDREN` Returns information about children of the current process.

12382 The <sys/resource.h> header shall define the `rlimit` structure that includes at least the following
 12383 members:

12384 `rlim_t rlim_cur` The current (soft) limit.
 12385 `rlim_t rlim_max` The hard limit.

12386 The <sys/resource.h> header shall define the `rusage` structure that includes at least the
 12387 following members:

12388 `struct timeval ru_utime` User time used.
 12389 `struct timeval ru_stime` System time used.

12390 The `timeval` structure shall be defined as described in <sys/time.h>.

12391 The following symbolic constants shall be defined as possible values for the *resource* argument of
 12392 `getrlimit()` and `setrlimit()`:

12393 `RLIMIT_CORE` Limit on size of **core** file.
 12394 `RLIMIT_CPU` Limit on CPU time per process.

12395	RLIMIT_DATA	Limit on data segment size.
12396	RLIMIT_FSIZE	Limit on file size.
12397	RLIMIT_NOFILE	Limit on number of open files.
12398	RLIMIT_STACK	Limit on stack size.
12399	RLIMIT_AS	Limit on address space size.

12400 The following shall be declared as functions and may also be defined as macros. Function
12401 prototypes shall be provided.

```
12402 int getpriority(int, id_t);
12403 int getrlimit(int, struct rlimit *);
12404 int getrusage(int, struct rusage *);
12405 int setpriority(int, id_t, int);
12406 int setrlimit(int, const struct rlimit *);
```

12407 The `id_t` type shall be defined through **typedef** as described in <sys/types.h>.

12408 Inclusion of the <sys/resource.h> header may also make visible all symbols from <sys/time.h>.

12409 APPLICATION USAGE

12410 None.

12411 RATIONALE

12412 None.

12424 **NAME**

12425 sys/select.h — select types

12426 **SYNOPSIS**

12427 #include <sys/select.h>

12428 **DESCRIPTION**12429 The <sys/select.h> header shall define the **timeval** structure that includes at least the following
12430 members:

12431	time_t	tv_sec	Seconds.
12432	suseconds_t	tv_usec	Microseconds.

12433 The **time_t** and **suseconds_t** types shall be defined as described in <sys/types.h>.12434 The **sigset_t** type shall be defined as described in <signal.h>.12435 The **timespec** structure shall be defined as described in <time.h>.12436 The <sys/select.h> header shall define the **fd_set** type as a structure.12437 The <sys/select.h> header shall define the following symbolic constant, which shall have a value
12438 suitable for use in #if preprocessing directives:12439 **FD_SETSIZE** Maximum number of file descriptors in an **fd_set** structure.12440 The following shall be declared as functions, defined as macros, or both. If functions are
12441 declared, function prototypes shall be provided.

```

12442 void FD_CLR(int, fd_set *);
12443 int  FD_ISSET(int, fd_set *);
12444 void FD_SET(int, fd_set *);
12445 void FD_ZERO(fd_set *);

```

12446 If implemented as macros, these may evaluate their arguments more than once, so applications
12447 should ensure that the arguments they supply are never expressions with side effects.12448 The following shall be declared as functions and may also be defined as macros. Function
12449 prototypes shall be provided.

```

12450 int  pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12451             const struct timespec *restrict, const sigset_t *restrict);
12452 int  select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12453            struct timeval *restrict);

```

12454 Inclusion of the <sys/select.h> header may make visible all symbols from the headers
12455 <signal.h>, <sys/time.h>, and <time.h>.12456 **APPLICATION USAGE**

12457 None.

12458 **RATIONALE**

12459 None.

12460 **FUTURE DIRECTIONS**

12461 None.

CHANGE HISTORY

12466

First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

12467

The requirement for the **fd_set** structure to have a member *fds_bits* has been removed as per The Open Group Base Resolution bwg2001-005.

12468

12469

Issue 7

12470

SD5-XBD-ERN-6 is applied, reordering the DESCRIPTION.

12471

This reference page is clarified with respect to macros and symbolic constants. +

12472 **NAME**
 12473 sys/sem.h — XSI semaphore facility

12474 **SYNOPSIS**
 12475 XSI `#include <sys/sem.h>`

12476 **DESCRIPTION**

12477 The <sys/sem.h> header shall define the following symbolic constant for use as a semaphore
 12478 operation flag:

12479 SEM_UNDO Set up adjust on exit entry.

12480 The <sys/sem.h> header shall define the following symbolic constants for use as commands for
 12481 the *semctl()* function:

12482 GETNCNT Get *semncnt*.

12483 GETPID Get *sempid*.

12484 GETVAL Get *semval*.

12485 GETALL Get all cases of *semval*.

12486 GETZCNT Get *semzcnt*.

12487 SETVAL Set *semval*.

12488 SETALL Set all cases of *semval*.

12489 The <sys/sem.h> header shall define the **semid_ds** structure which shall contain the following
 12490 members:

12491 struct ipc_perm sem_perm Operation permission structure.

12492 unsigned short sem_nsems Number of semaphores in set.

12493 time_t sem_otime Last *semop()* time.

12494 time_t sem_ctime Last time changed by *semctl()*.

12495 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in <sys/types.h>.

12496 A semaphore shall be represented by an anonymous structure containing the following
 12497 members:

12498 unsigned short semval Semaphore value.

12499 pid_t sempid Process ID of last operation.

12500 unsigned short semncnt Number of processes waiting for *semval*
 12501 to become greater than current value.

12502 unsigned short semzcnt Number of processes waiting for *semval*
 12503 to become 0.

12504 The <sys/sem.h> header shall define the **sembuf** structure which shall contain the following
 12505 members:

12506 unsigned short sem_num Semaphore number.

12507 short sem_op Semaphore operation.

12508 short sem_flg Operation flags.

12509 The following shall be declared as functions and may also be defined as macros. Function
 12510 prototypes shall be provided.

12511 int semctl(int, int, int, ...);

12512 int semget(key_t, int, int);

12513 int semop(int, struct sembuf *, size_t);

12514 In addition, all of the symbols from <sys/ipc.h> shall be defined when this header is included.

12515 **APPLICATION USAGE**

12516 None.

12517 **RATIONALE**

12518 None.

DRAFT

12528 **NAME**
 12529 sys/shm.h — XSI shared memory facility

12530 **SYNOPSIS**
 12531 XSI `#include <sys/shm.h>`

12532 DESCRIPTION

12533 The <sys/shm.h> header shall define the following symbolic constants:

12534 SHM_RDONLY Attach read-only (else read-write).

12535 SHM_RND Round attach address to SHMLBA.

12536 SHMLBA Segment low boundary address multiple.

12537 The following data types shall be defined through **typedef**:

12538 **shmatt_t** Unsigned integer used for the number of current attaches that must be able to
 12539 store values at least as large as a type **unsigned short**.

12540 The **shmid_ds** structure shall contain the following members:

12541	<code>struct ipc_perm</code>	<code>shm_perm</code>	Operation permission structure.
12542	<code>size_t</code>	<code>shm_segsz</code>	Size of segment in bytes.
12543	<code>pid_t</code>	<code>shm_lpid</code>	Process ID of last shared memory operation.
12544	<code>pid_t</code>	<code>shm_cpid</code>	Process ID of creator.
12545	<code>shmatt_t</code>	<code>shm_nattch</code>	Number of current attaches.
12546	<code>time_t</code>	<code>shm_atime</code>	Time of last <i>shmat</i> ().
12547	<code>time_t</code>	<code>shm_dtime</code>	Time of last <i>shmdt</i> ().
12548	<code>time_t</code>	<code>shm_ctime</code>	Time of last change by <i>shmctl</i> ().

12549 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in <sys/types.h>.

12550 The following shall be declared as functions and may also be defined as macros. Function
 12551 prototypes shall be provided.

```
12552 void *shmat(int, const void *, int);
12553 int shmctl(int, int, struct shmid_ds *);
12554 int shmdt(const void *);
12555 int shmget(key_t, size_t, int);
```

12556 In addition, all of the symbols from <sys/ipc.h> shall be defined when this header is included.

12557 APPLICATION USAGE

The type of *shm_segsz* is changed from **int** to **size_t**.

Issue 7

This reference page is clarified with respect to macros and symbolic constants.

+

12572 **NAME**

12573 sys/socket.h — main sockets header

12574 **SYNOPSIS**

12575 #include <sys/socket.h>

12576 **DESCRIPTION**12577 The <sys/socket.h> header shall define the type **socklen_t**, which is an integer type of width of
12578 at least 32 bits; see APPLICATION USAGE.12579 The <sys/socket.h> header shall define the unsigned integer type **sa_family_t**.12580 The <sys/socket.h> header shall define the **sockaddr** structure that includes at least the
12581 following members:12582 sa_family_t sa_family Address family.
12583 char sa_data[] Socket address (variable-length data).12584 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,
12585 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.12586 The <sys/socket.h> header shall define the **sockaddr_storage** structure. This structure shall be:

- 12587
- Large enough to accommodate all supported protocol-specific address structures
 - Aligned at an appropriate boundary so that pointers to it can be cast as pointers to
12588 protocol-specific address structures and used to access the fields of those structures
12589 without alignment problems
- 12590

12591 The **sockaddr_storage** structure shall contain at least the following members:

12592 sa_family_t ss_family

12593 When a **sockaddr_storage** structure is cast as a **sockaddr** structure, the *ss_family* field of the
12594 **sockaddr_storage** structure shall map onto the *sa_family* field of the **sockaddr** structure. When a
12595 **sockaddr_storage** structure is cast as a protocol-specific address structure, the *ss_family* field
12596 shall map onto a field of that structure that is of type **sa_family_t** and that identifies the
12597 protocol's address family.12598 The <sys/socket.h> header shall define the **msghdr** structure that includes at least the following
12599 members:12600 void *msg_name Optional address.
12601 socklen_t msg_namelen Size of address.
12602 struct iovec *msg_iov Scatter/gather array.
12603 int msg_iovlen Members in *msg_iov*.
12604 void *msg_control Ancillary data; see below.
12605 socklen_t msg_controllen Ancillary data buffer *len*.
12606 int msg_flags Flags on received message.12607 The **msghdr** structure is used to minimize the number of directly supplied parameters to the
12608 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the
12609 *recvmsg()* function and *value* only for the *sendmsg()* function.12610 The **iovec** structure shall be defined as described in <sys/uio.h>.12611 The <sys/socket.h> header shall define the **cmsghdr** structure that includes at least the
12612 following members:12613 socklen_t cmsg_len Data byte count, including the **cmsghdr**.
12614 int cmsg_level Originating protocol.

12615 int msg_type Protocol-specific type.

12616 The **msg_hdr** structure is used for storage of ancillary data object information.

12617 Ancillary data consists of a sequence of pairs, each consisting of a **msg_hdr** structure followed
12618 by a data array. The data array contains the ancillary data message, and the **msg_hdr** structure
12619 contains descriptive information that allows an application to correctly parse the data.

12620 The values for *msg_level* shall be legal values for the *level* argument to the *getsockopt()* and
12621 *setsockopt()* functions. The system documentation shall specify the *msg_type* definitions for the
12622 supported protocols.

12623 Ancillary data is also possible at the socket level. The <sys/socket.h> header shall define the
12624 following symbolic constant for use as the *msg_type* value when *msg_level* is SOL_SOCKET:

12625 SCM_RIGHTS Indicates that the data array contains the access rights to be sent or
12626 received.

12627 The <sys/socket.h> header shall define the following macros to gain access to the data arrays in
12628 the ancillary data associated with a message header:

12629 MSG_DATA(*msg*)

12630 If the argument is a pointer to a **msg_hdr** structure, this macro shall return an unsigned
12631 character pointer to the data array associated with the **msg_hdr** structure.

12632 MSG_NXTHDR(*mhdr, msg*)

12633 If the first argument is a pointer to a **msg_hdr** structure and the second argument is a pointer
12634 to a **msg_hdr** structure in the ancillary data pointed to by the *msg_control* field of that
12635 **msg_hdr** structure, this macro shall return a pointer to the next **msg_hdr** structure, or a null
12636 pointer if this structure is the last **msg_hdr** in the ancillary data.

12637 MSG_FIRSTHDR(*mhdr*)

12638 If the argument is a pointer to a **msg_hdr** structure, this macro shall return a pointer to the
12639 first **msg_hdr** structure in the ancillary data associated with this **msg_hdr** structure, or a null
12640 pointer if there is no ancillary data associated with the **msg_hdr** structure.

12641 The <sys/socket.h> header shall define the **linger** structure that includes at least the following
12642 members:

12643 int l_onoff Indicates whether linger option is enabled.

12644 int l_linger Linger time, in seconds.

12645 The <sys/socket.h> header shall define the following symbolic constants with distinct values:

12646 SOCK_DGRAM Datagram socket.

12647 SOCK_RAW Raw Protocol Interface.

12648 SOCK_SEQPACKET Sequenced-packet socket.

12649 SOCK_STREAM Byte-stream socket.

12650 The <sys/socket.h> header shall define the following symbolic constant for use as the *level*
12651 argument of *setsockopt()* and *getsockopt()*.

12652 SOL_SOCKET Options to be accessed at socket level, not protocol level.

12653 The <sys/socket.h> header shall define the following symbolic constants with distinct values for
12654 use as the *option_name* argument in *getsockopt()* or *setsockopt()* calls:

12655 SO_ACCEPTCONN Socket is accepting connections.

12656 SO_BROADCAST Transmission of broadcast messages is supported.

12657	SO_DEBUG	Debugging information is being recorded.
12658	SO_DONTROUTE	Bypass normal routing.
12659	SO_ERROR	Socket error status.
12660	SO_KEEPALIVE	Connections are kept alive with periodic messages.
12661	SO_LINGER	Socket lingers on close.
12662	SO_OOBINLINE	Out-of-band data is transmitted in line.
12663	SO_RCVBUF	Receive buffer size.
12664	SO_RCVLOWAT	Receive “low water mark”.
12665	SO_RCVTIMEO	Receive timeout.
12666	SO_REUSEADDR	Reuse of local addresses is supported.
12667	SO_SNDBUF	Send buffer size.
12668	SO_SNDLOWAT	Send “low water mark”.
12669	SO_SNDTIMEO	Send timeout.
12670	SO_TYPE	Socket type.
12671	The <sys/socket.h> header shall define the following symbolic constant for use as the maximum	
12672	<i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
12673	SOMAXCONN	The maximum <i>backlog</i> queue length.
12674	The <sys/socket.h> header shall define the following symbolic constants with distinct values for	
12675	use as the valid values for the <i>msg_flags</i> field in the msghdr structure, or the <i>flags</i> parameter in	
12676	<i>recv()</i> , <i>recvfrom()</i> , <i>recvmsg()</i> , <i>send()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
12677	MSG_CTRUNC	Control data truncated.
12678	MSG_DONTROUTE	Send without using routing tables.
12679	MSG_EOR	Terminates a record (if supported by the protocol).
12680	MSG_OOB	Out-of-band data.
12681	MSG_NOSIGNAL	No SIGPIPE generated when an attempt to send is made on a stream-
12682		oriented socket that is no longer connected.
12683	MSG_PEEK	Leave received data in queue.
12684	MSG_TRUNC	Normal data truncated.
12685	MSG_WAITALL	Attempt to fill the read buffer.
12686	The <sys/socket.h> header shall define the following symbolic constants with distinct values:	
12687	AF_INET	Internet domain sockets for use with IPv4 addresses.
12688	IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
12689	AF_UNIX	UNIX domain sockets.
12690	AF_UNSPEC	Unspecified.
12691	The <sys/socket.h> header shall define the following symbolic constants with distinct values:	
12692	SHUT_RD	Disables further receive operations.

12693 SHUT_RDWR Disables further send and receive operations.

12694 SHUT_WR Disables further send operations.

12695 The `ssize_t` type shall be defined as described in <sys/types.h>.

12696 The following shall be declared as functions and may also be defined as macros. Function
12697 prototypes shall be provided.

```
12698 int accept(int, struct sockaddr *restrict, socklen_t *restrict);
12699 int bind(int, const struct sockaddr *, socklen_t);
12700 int connect(int, const struct sockaddr *, socklen_t);
12701 int getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
12702 int getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
12703 int getsockopt(int, int, int, void *restrict, socklen_t *restrict);
12704 int listen(int, int);
12705 ssize_t recv(int, void *, size_t, int);
12706 ssize_t recvfrom(int, void *restrict, size_t, int,
12707 struct sockaddr *restrict, socklen_t *restrict);
12708 ssize_t recvmsg(int, struct msghdr *, int);
12709 ssize_t send(int, const void *, size_t, int);
12710 ssize_t sendmsg(int, const struct msghdr *, int);
12711 ssize_t sendto(int, const void *, size_t, int, const struct sockaddr *,
12712 socklen_t);
12713 int setsockopt(int, int, int, const void *, socklen_t);
12714 int shutdown(int, int);
12715 int socketatmark(int);
12716 int socket(int, int, int);
12717 int socketpair(int, int, int, int [2]);
```

12718 Inclusion of <sys/socket.h> may also make visible all symbols from <sys/unistd.h>.

12719 APPLICATION USAGE

12720 To forestall portability problems, it is recommended that applications not use values larger than
12721 $2^{31} - 1$ for the `socklen_t` type.

12722 The `sockaddr_storage` structure solves the problem of declaring storage for automatic variables
12723 which is both large enough and aligned enough for storing the socket address data structure of
12724 any family. For example, code with a file descriptor and without the context of the address
12725 family can pass a pointer to a variable of this type, where a pointer to a socket address structure
12726 is expected in calls such as `getpeername()`, and determine the address family by accessing the
12727 received content after the call.

12728 The example below illustrates a data structure which aligns on a 64-bit boundary. An
12729 implementation-defined field `_ss_align` following `_ss_pad1` is used to force a 64-bit alignment
12730 which covers proper alignment good enough for needs of at least `sockaddr_in6` (IPv6) and
12731 `sockaddr_in` (IPv4) address data structures. The size of padding field `_ss_pad1` depends on the
12732 chosen alignment boundary. The size of padding field `_ss_pad2` depends on the value of overall
12733 size chosen for the total size of the structure. This size and alignment are represented in the
12734 above example by implementation-defined (not required) constants `_SS_MAXSIZE` (chosen
12735 value 128) and `_SS_ALIGNMENT` (with chosen value 8). Constants `_SS_PAD1SIZE` (derived
12736 value 6) and `_SS_PAD2SIZE` (derived value 112) are also for illustration and not required. The
12737 implementation-defined definitions and structure field names above start with an underscore to
12738 denote implementation private name space. Portable code is not expected to access or reference
12739 those fields or constants.

```
12740 /*
12741 * Desired design of maximum size and alignment.
12742 */
```

```

12743     #define _SS_MAXSIZE 128
12744         /* Implementation-defined maximum size. */
12745     #define _SS_ALIGNSIZE (sizeof(int64_t))
12746         /* Implementation-defined desired alignment. */
12747
12748     /*
12749     * Definitions used for sockaddr_storage structure paddings design.
12750     */
12751     #define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
12752     #define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t)+ \
12753         _SS_PAD1SIZE + _SS_ALIGNSIZE))
12754     struct sockaddr_storage {
12755         sa_family_t  ss_family; /* Address family. */
12756     /*
12757     * Following fields are implementation-defined.
12758     */
12759     char  _ss_pad1[_SS_PAD1SIZE];
12760         /* 6-byte pad; this is to make implementation-defined
12761         pad up to alignment field that follows explicit in
12762         the data structure. */
12763     int64_t  _ss_align; /* Field to force desired structure
12764         storage alignment. */
12765     char  _ss_pad2[_SS_PAD2SIZE];
12766         /* 112-byte pad to achieve desired size,
12767         _SS_MAXSIZE value minus size of ss_family
12768         __ss_pad1, __ss_align fields is 112. */
12769     };

```

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the prototypes for [accept\(\)](#), [getpeername\(\)](#), [getsockname\(\)](#), [getsockopt\(\)](#), and [recvfrom\(\)](#).

Issue 7SD5-XBD-ERN-56 is applied, adding a reference to [<sys/types.h>](#) for the **ssize_t** type.

SD5-XBD-ERN-62 is applied.

The [MSG_NOSIGNAL\(\)](#) macro is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

This reference page is clarified with respect to macros and symbolic constants. +

12787 **NAME**12788 sys/stat.h — data returned by the `stat()` function12789 **SYNOPSIS**

12790 #include <sys/stat.h>

12791 **DESCRIPTION**12792 The <sys/stat.h> header shall define the structure of the data returned by the functions `fstat()`,
12793 `lstat()`, and `stat()`.12794 The **stat** structure shall contain at least the following members:

12795		<code>dev_t st_dev</code>	Device ID of device containing file.
12796		<code>ino_t st_ino</code>	File serial number.
12797		<code>mode_t st_mode</code>	Mode of file (see below).
12798		<code>nlink_t st_nlink</code>	Number of hard links to the file.
12799		<code>uid_t st_uid</code>	User ID of file.
12800		<code>gid_t st_gid</code>	Group ID of file.
12801	XSI	<code>dev_t st_rdev</code>	Device ID (if file is character or block special).
12802		<code>off_t st_size</code>	For regular files, the file size in bytes.
12803			For symbolic links, the length in bytes of the
12804			pathname contained in the symbolic link.
12805	SHM		For a shared memory object, the length in bytes.
12806	TYM		For a typed memory object, the length in bytes.
12807			For other file types, the use of this field is
12808			unspecified.
12809		<code>struct timespec st_atim</code>	Last data access timestamp.
12810		<code>struct timespec at_mtim</code>	Last data modification timestamp.
12811		<code>struct timespec st_ctim</code>	Last file status change timestamp.
12812	XSI	<code>blksize_t st_blksize</code>	A file system-specific preferred I/O block size
12813			for this object. In some file system types, this
12814			may vary from file to file.
12815		<code>blkcnt_t st_blocks</code>	Number of blocks allocated for this object.

12816 The `st_ino` and `st_dev` fields taken together uniquely identify the file within the system. The
 12817 **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types shall be
 12818 defined as described in <sys/types.h>. The **timespec** structure shall be defined as described in
 12819 <time.h>. Times shall be given in seconds since the Epoch.

12820 Which structure members have meaningful values depends on the type of file. For further
 12821 information, see the descriptions of `fstat()`, `lstat()`, and `stat()` in the System Interfaces volume of
 12822 POSIX.1-200x.

12823 For compatibility with earlier versions of this standard, the `st_atime` macro shall be defined with
 12824 the value `st_atim.tv_sec`. Similarly, `st_ctime` and `st_mtime` shall be defined as macros with the
 12825 values `st_ctim.tv_sec` and `st_mtim.tv_sec`, respectively.

12826 The <sys/stat.h> header shall define the following symbolic constants for the file types encoded
 12827 in type **mode_t**. The values shall be suitable for use in **#if** preprocessing directives:

12828	XSI	S_IFMT	Type of file.
12829		S_IFBLK	Block special.

12830	S_IFCHR	Character special.
12831	S_IFIFO	FIFO special.
12832	S_IFREG	Regular.
12833	S_IFDIR	Directory.
12834	S_IFLNK	Symbolic link.
12835	S_IFSOCK	Socket.

12836 The <sys/stat.h> header shall define the following symbolic constants for the file mode bits
 12837 encoded in type **mode_t**, with the indicated numeric values. These macros shall expand to an
 12838 expression which has a type that allows them to be used, either singly or OR'ed together, as the
 12839 third argument to *open()* without the need for a **mode_t** cast. The values shall be suitable for use
 12840 in **#if** preprocessing directives.

S_IROTH	04	Read permission, others.
S_IWOTH	02	Write permission, others.
S_IXOTH	01	Execute/search permission, others.
S_ISUID	04000	Set-user-ID on execution.
S_ISGID	02000	Set-group-ID on execution.
S_ISVTX	01000	On directories, restricted deletion flag.

XSI

12863 The following macros shall be provided to test whether a file is of the specified type. The value
 12864 *m* supplied to the macros is the value of *st_mode* from a **stat** structure. The macro shall evaluate
 12865 to a non-zero value if the test is true; 0 if the test is false.

12866	S_ISBLK(<i>m</i>)	Test for a block special file.
12867	S_ISCHR(<i>m</i>)	Test for a character special file.
12868	S_ISDIR(<i>m</i>)	Test for a directory.
12869	S_ISFIFO(<i>m</i>)	Test for a pipe or FIFO special file.
12870	S_ISREG(<i>m</i>)	Test for a regular file.
12871	S_ISLNK(<i>m</i>)	Test for a symbolic link.
12872	S_ISSOCK(<i>m</i>)	Test for a socket.

12873 The implementation may implement message queues, semaphores, or shared memory objects as
 12874 distinct file types. The following macros shall be provided to test whether a file is of the
 12875 specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat**
 12876 structure. The macro shall evaluate to a non-zero value if the specified object is implemented as
 12877 a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*.
 12878 Otherwise, the macro shall evaluate to zero.

12879 S_TYPEISMQ(*buf*) Test for a message queue.

12880 S_TYPEISSEM(*buf*) Test for a semaphore.

12881 S_TYPEISSHM(*buf*) Test for a shared memory object.

12882 TYM The implementation may implement typed memory objects as distinct file types, and the
 12883 following macro shall test whether a file is of the specified type. The value of the *buf* argument
 12884 supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero
 12885 value if the specified object is implemented as a distinct file type and the specified file type is
 12886 contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

12887 S_TYPEISTMO(*buf*) Test macro for a typed memory object.

12888 The following symbolic constants shall be defined as distinct integer values outside of the range +
 12889 [0,999 999 999], for use with the *futimens()* and *utimensat()* functions: +

12890 UTIME_NOW

12891 UTIME_OMIT

12892 The following shall be declared as functions and may also be defined as macros. Function
 12893 prototypes shall be provided.

12894 int chmod(const char *, mode_t);

12895 int fchmod(int, mode_t);

12896 int fchmodat(int, const char *, mode_t, int);

12897 int fstat(int, struct stat *);

12898 int fstatat(int, const char *restrict, struct stat *restrict, int); |

12899 int futimens(int, const struct timespec [2]); |

12900 int lstat(const char *restrict, struct stat *restrict);

12901 int mkdir(const char *, mode_t);

12902 int mkdirat(int, const char *, mode_t);

12903 int mkfifo(const char *, mode_t);

12904 int mkfifoat(int, const char *, mode_t);

12905 XSI int mknod(const char *, mode_t, dev_t);

12906 int mknodat(int, const char *, mode_t, dev_t);

12907 int stat(const char *restrict, struct stat *restrict);

12908 mode_t umask(mode_t);

12909 int utimensat(int, const char *, const struct timespec [2], int); +

APPLICATION USAGE

12910 Use of the macros is recommended for determining the type of a file.

RATIONALE

12912 A conforming C-language application must include <sys/stat.h> for functions that have
 12913 arguments or return values of type **mode_t**, so that symbolic values for that type can be used.
 12914 An alternative would be to require that these constants are also defined by including
 12915 <sys/types.h>.

12917 The S_ISUID and S_ISGID bits may be cleared on any write, not just on *open()*, as some
 12918 historical implementations do.

12919 System calls that update the time entry fields in the **stat** structure must be documented by the
 12920 implementors. POSIX-conforming systems should not update the time entry fields for functions
 12921 listed in the System Interfaces volume of POSIX.1-200x unless the standard requires that they do,
 12922 except in the case of documented extensions to the standard.

12923 Upon assignment, file timestamps are immediately converted to the resolution of the file system +
 12924 by truncation (i.e., the recorded time can be older than the actual time). For example, if the file +

12925 system resolution is 1 microsecond, then a conforming *stat()* must always return an +
 12926 *st_mtim.tv_nsec* that is a multiple of 1000. Some older implementations returned higher- +
 12927 resolution timestamps while the inode information was cached, and then spontaneously +
 12928 truncated the *tv_nsec* fields when they were stored to and retrieved from disk, but this behavior +
 12929 does not conform. +

12930 Note that *st_dev* must be unique within a Local Area Network (LAN) in a “system” made up of +
 12931 multiple computers’ file systems connected by a LAN.

12932 Networked implementations of a POSIX-conforming system must guarantee that all files visible +
 12933 within the file tree (including parts of the tree that may be remotely mounted from other +
 12934 machines on the network) on each individual processor are uniquely identified by the +
 12935 combination of the *st_ino* and *st_dev* fields.

12936 The unit for the *st_blocks* member of the **stat** structure is not defined within POSIX.1-200x. In +
 12937 some implementations it is 512 bytes. It may differ on a file system basis. There is no correlation +
 12938 between values of the *st_blocks* and *st_blksize*, and the *f_bsize* (from <sys/statvfs.h>) structure +
 12939 members.

12940 Traditionally, some implementations defined the multiplier for *st_blocks* in <sys/param.h> as the +
 12941 symbol DEV_BSIZE.

12942 Some earlier versions of this standard did not specify values for the file mode bit macros. The +
 12943 expectation was that some implementors might choose to use a different encoding for these bits +
 12944 than the traditional one, and that new applications would use symbolic file modes instead of +
 12945 numeric. This version of the standard specifies the traditional encoding, in recognition that +
 12946 nearly 20 years after the first publication of this standard numeric file modes are still in +
 12947 widespread use by application writers, and that all conforming implementations still use the +
 12948 traditional encoding. +

12949 FUTURE DIRECTIONS

12950 No new S_IFMT symbolic names for the file type values of **mode_t** will be defined by +
 12951 POSIX.1-200x; if new file types are required, they will only be testable through *S_ISxx()* or +
 12952 *S_TYPEISxxx()* macros instead.

12956 CHANGE HISTORY

12957 First released in Issue 1. Derived from Issue 1 of the SVID.

12958 Issue 5

12959 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

12960 The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from +
 12961 **long** to **blkcnt_t**.

12962 Issue 6

12963 The *S_TYPEISMQ()*, *S_TYPEISSEM()*, and *S_TYPEISSHM()* macros are unconditionally +
 12964 mandated.

12965 The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize_t** +
 12966 and **blkcnt_t** have been described.

12967 The following new requirements on POSIX implementations derive from alignment with the +
 12968 Single UNIX Specification:

- 12969 • The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

12970 **S_IFSOCK** and **S_ISSOCK** are added for sockets.

12971	The description of stat structure members is changed to reflect contents when file type is a	
12972	symbolic link.	
12973	The test macro <code>S_TYPEISTMO</code> is added for alignment with IEEE Std 1003.1j-2000.	
12974	The restrict keyword is added to the prototypes for <code>lstat()</code> and <code>stat()</code> .	
12975	The <code>lstat()</code> function is made mandatory.	
12976	IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the	
12977	<code>st_blocks</code> member of the stat structure to the RATIONALE.	
12978	IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/25 is applied, adding to the	
12979	DESCRIPTION that the timespec structure may be defined as described in the < time.h > header.	
12980	Issue 7	
12981	SD5-XSH-ERN-161 is applied, updating the DESCRIPTION to clarify that the descriptions of the	+
12982	interfaces should be consulted in order to determine which structure members have meaningful	+
12983	values.	+
12984	The <code>fchmodat()</code> , <code>fstatat()</code> , <code>mkdirat()</code> , <code>mkfifoat()</code> , <code>mknodat()</code> , and <code>utimensat()</code> functions are added	
12985	from The Open Group Technical Standard, 2006, Extended API Set Part 2.	
12986	The <code>futimens()</code> function is added.	
12987	This reference page is clarified with respect to macros and symbolic constants.	
12988	Changes are made related to support for finegrained timestamps and the <code>UTIME_NOW</code> and	
12989	<code>UTIME_OMIT</code> symbolic constants are added.	

12990 **NAME**
 12991 `sys/statvfs.h` — VFS File System information structure

12992 **SYNOPSIS**
 12993 `#include <sys/statvfs.h>`

12994 **DESCRIPTION**
 12995 The `<sys/statvfs.h>` header shall define the `statvfs` structure that includes at least the following
 12996 members:

12997	<code>unsigned long</code>	<code>f_bsize</code>	File system block size.
12998	<code>unsigned long</code>	<code>f_frsize</code>	Fundamental file system block size.
12999	<code>fsblkcnt_t</code>	<code>f_blocks</code>	Total number of blocks on file system in units of <i>f_frsize</i> .
13000	<code>fsblkcnt_t</code>	<code>f_bfree</code>	Total number of free blocks.
13001	<code>fsblkcnt_t</code>	<code>f_bavail</code>	Number of free blocks available to non-privileged process.
13002			
13003	<code>fsfilcnt_t</code>	<code>f_files</code>	Total number of file serial numbers.
13004	<code>fsfilcnt_t</code>	<code>f_ffree</code>	Total number of free file serial numbers.
13005	<code>fsfilcnt_t</code>	<code>f_favail</code>	Number of file serial numbers available to non-privileged process.
13006			
13007	<code>unsigned long</code>	<code>f_fsid</code>	File system ID.
13008	<code>unsigned long</code>	<code>f_flag</code>	Bit mask of <i>f_flag</i> values.
13009	<code>unsigned long</code>	<code>f_namemax</code>	Maximum filename length.

13010 The `fsblkcnt_t` and `fsfilcnt_t` types shall be defined as described in `<sys/types.h>`.

13011 The `<sys/statvfs.h>` header shall define the following symbolic constants for the *f_flag* member:

13012	<code>ST_RDONLY</code>	Read-only file system.
13013	<code>ST_NOSUID</code>	Does not support the semantics of the <code>ST_ISUID</code> and <code>ST_ISGID</code> file mode bits.

13014 The following shall be declared as functions and may also be defined as macros. Function
 13015 prototypes shall be provided.

```
13016 int fstatvfs(int, struct statvfs *); -
13017 int statvfs(const char *restrict, struct statvfs *restrict); +
```

13018 **APPLICATION USAGE**
 13019 None.

13020 **RATIONALE**
 13021 None.

13022 **FUTURE DIRECTIONS**
 13023 None.

13024 **SEE ALSO**
 13025 [<sys/types.h>](#)
 13026 XSH [fstatvfs\(\)](#)

13027 **CHANGE HISTORY**
 13028 First released in Issue 4, Version 2.

13029 **Issue 5**
 13030 The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type of
 13031 *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

- 13032 **Issue 6**
- 13033 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt_t**
- 13034 and **fsfilcnt_t** have been described.
- 13035 The **restrict** keyword is added to the prototype for *statvfs()*.
- 13036 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of
- 13037 ST_NOSUID from “Does not support *setuid()/setgid()* semantics” to “Does not support the
- 13038 semantics of the ST_ISUID and ST_ISGID file mode bits”.
- 13039 **Issue 7**
- 13040 The **<sys/statvfs.h>** header is moved from the XSI option to the Base.
- 13041 This reference page is clarified with respect to macros and symbolic constants. +

13042 **NAME**

13043 sys/time.h — time types

13044 **SYNOPSIS**13045 XSI `#include <sys/time.h>`13046 **DESCRIPTION**13047 The <sys/time.h> header shall define the **timeval** structure that includes at least the following
13048 members:

13049	time_t	tv_sec	Seconds.
13050	suseconds_t	tv_usec	Microseconds.

13051 OB The <sys/time.h> header shall define the **itimerval** structure that includes at least the following
13052 members:

13053	struct timeval	it_interval	Timer interval.
13054	struct timeval	it_value	Current value.

13055 The **time_t** and **suseconds_t** types shall be defined as described in <sys/types.h>.13056 The **fd_set** type shall be defined as described in <sys/select.h>.13057 OB The <sys/time.h> header shall define the following symbolic constants for the *which* argument of
13058 *getitimer()* and *setitimer()*:

13059	ITIMER_REAL	Decrements in real time.
13060	ITIMER_VIRTUAL	Decrements in process virtual time.
13061	ITIMER_PROF	Decrements both in process virtual time and when the system is running 13062 on behalf of the process.

13063 The following shall be defined as described in <sys/select.h>:

```
13064 FD_CLR()
13065 FD_ISSET()
13066 FD_SET()
13067 FD_ZERO()
13068 FD_SETSIZE
```

13069 The following shall be declared as functions and may also be defined as macros. Function
13070 prototypes shall be provided.

```
13071 OB int getitimer(int, struct itimerval *);
13072 int gettimeofday(struct timeval *restrict, void *restrict);
13073 int setitimer(int, const struct itimerval *restrict,
13074             struct itimerval *restrict);
13075 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
13076           struct timeval *restrict);
13077 int utimes(const char *, const struct timeval [2]);
```

13078 Inclusion of the <sys/time.h> header may make visible all symbols from the <sys/select.h>
13079 header.

13100 **NAME**
 13101 `sys/times.h` — file access and modification times structure

13102 **SYNOPSIS**
 13103 `#include <sys/times.h>`

13104 **DESCRIPTION**
 13105 The **<sys/times.h>** header shall define the structure **tms**, which is returned by `times()` and
 13106 includes at least the following members:

13107 `clock_t tms_utime` User CPU time.
 13108 `clock_t tms_stime` System CPU time.
 13109 `clock_t tms_cutime` User CPU time of terminated child processes.
 13110 `clock_t tms_cstime` System CPU time of terminated child processes.

13111 The **clock_t** type shall be defined as described in **<sys/types.h>**.

13112 The following shall be declared as a function and may also be defined as a macro. A function
 13113 prototype shall be provided.

13114 `clock_t times(struct tms *);`

13124 **CHANGE HISTORY**
 13125 First released in Issue 1. Derived from Issue 1 of the SVID.

13126		NAME	
13127			sys/types.h — data types
13128		SYNOPSIS	
13129			#include <sys/types.h>
13130		DESCRIPTION	
13131			The <sys/types.h> header shall include definitions for at least the following types:
13132		blkcnt_t	Used for file block counts.
13133		blksize_t	Used for block sizes.
13134		clock_t	Used for system times in clock ticks or CLOCKS_PER_SEC; see <time.h>.
13135			
13136		clockid_t	Used for clock ID type in the clock and timer functions.
13137		dev_t	Used for device IDs.
13138	XSI	fsblkcnt_t	Used for file system block counts.
13139	XSI	fsfilcnt_t	Used for file system file counts.
13140		gid_t	Used for group IDs.
13141		id_t	Used as a general identifier; can be used to contain at least a pid_t , uid_t , or gid_t .
13142			
13143		ino_t	Used for file serial numbers.
13144	XSI	key_t	Used for XSI interprocess communication.
13145		mode_t	Used for some file attributes.
13146		nlink_t	Used for link counts.
13147		off_t	Used for file sizes.
13148		pid_t	Used for process IDs and process group IDs.
13149		pthread_attr_t	Used to identify a thread attribute object.
13150		pthread_barrier_t	Used to identify a barrier.
13151		pthread_barrierattr_t	Used to define a barrier attributes object.
13152		pthread_cond_t	Used for condition variables.
13153		pthread_condattr_t	Used to identify a condition attribute object.
13154		pthread_key_t	Used for thread-specific data keys.
13155		pthread_mutex_t	Used for mutexes.
13156		pthread_mutexattr_t	Used to identify a mutex attribute object.
13157		pthread_once_t	Used for dynamic package initialization.
13158		pthread_rwlock_t	Used for read-write locks.
13159		pthread_rwlockattr_t	Used for read-write lock attributes.
13160		pthread_spinlock_t	Used to identify a spin lock.

13161		pthread_t	Used to identify a thread.
13162		size_t	Used for sizes of objects.
13163		ssize_t	Used for a count of bytes or an error indication.
13164	XSI	suseconds_t	Used for time in microseconds.
13165		time_t	Used for time in seconds.
13166		timer_t	Used for timer ID returned by <i>timer_create()</i> .
13167	OB TRC		Also used to identify a trace stream attributes object.
13168	OB TRC	trace_event_id_t	Used to identify a trace event type.
13169	OB TEF	trace_event_set_t	Used to identify a trace event type set.
13170	OB TRC	trace_id_t	Used to identify a trace stream.
13171		uid_t	Used for user IDs.
13172		All of the types shall be defined as arithmetic types of an appropriate length, with the following exceptions:	
13173			
13174		pthread_attr_t	
13175		pthread_barrier_t	
13176		pthread_barrierattr_t	
13177		pthread_cond_t	
13178		pthread_condattr_t	
13179		pthread_key_t	
13180		pthread_mutex_t	
13181		pthread_mutexattr_t	
13182		pthread_once_t	
13183		pthread_rwlock_t	
13184		pthread_rwlockattr_t	
13185		pthread_spinlock_t	
13186		pthread_t	
13187	OB TRC	trace_attr_t	
13188		trace_event_id_t	
13189	OB TEF	trace_event_set_t	
13190	OB TRC	trace_id_t	
13191		Additionally:	
13192		• mode_t shall be an integer type.	
13193		• nlink_t , uid_t , gid_t , and id_t shall be integer types.	
13194		• blkcnt_t and off_t shall be signed integer types.	
13195	XSI	• fsblkcnt_t , fsfilcnt_t , and ino_t shall be defined as unsigned integer types.	
13196		• size_t shall be an unsigned integer type.	
13197		• blksize_t , pid_t , and ssize_t shall be signed integer types.	
13198		• time_t and clock_t shall be integer or real-floating types.	
13199	XSI	The type ssize_t shall be capable of storing values at least in the range $[-1, \{SSIZE_MAX\}]$. The	
13200		type suseconds_t shall be a signed integer type capable of storing values at least in the range	
13201		$[-1, 1\,000\,000]$.	
13202		The implementation shall support one or more programming environments in which the widths	

13203 of **blksize_t**, **pid_t**, **size_t**, **ssize_t**, and **suseconds_t** are no greater than the width of type **long**.
 13204 The names of these programming environments can be obtained using the *confstr()* function or
 13205 the *getconf* utility.

13206 There are no defined comparison or assignment operators for the following types:

13207 **pthread_attr_t**
 13208 **pthread_barrier_t**
 13209 **pthread_barrierattr_t**
 13210 **pthread_cond_t**
 13211 **pthread_condattr_t**
 13212 **pthread_mutex_t**
 13213 **pthread_mutexattr_t**
 13214 **pthread_rwlock_t**
 13215 **pthread_rwlockattr_t**
 13216 **pthread_spinlock_t**
 13217 OB TRC **trace_attr_t**

13228 CHANGE HISTORY

13229 First released in Issue 1. Derived from Issue 1 of the SVID.

13230 Issue 5

13231 The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

13232 The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

13233 Large File System extensions are added.

13234 Updated for alignment with the POSIX Threads Extension.

13235 Issue 6

13236 The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for
 13237 alignment with IEEE Std 1003.1j-2000.

13238 The margin code is changed from XSI to THR for the **pthread_rwlock_t** and
 13239 **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads
 13240 option. The threads types are marked THR.

13241 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/26 is applied, adding **pthread_t** to the list
 13242 of types that are not required to be arithmetic types, thus allowing **pthread_t** to be defined as a
 13243 structure.

13244
13245
13246
13247
13248
13249
13250
13251

Issue 7

Austin Group Interpretation 1003.1-2001 #033 is applied.

The Trace option types are marked obsolescent.

The **clock_t** and **id_t** types are moved from the XSI option to the Base.

The **pthread_barrier_t** and **pthread_barrierattr_t** types are moved from the Barriers option to the Base.

The **pthread_spinlock_t** type is moved from the Spin Locks option to the Base.

Functionality relating to the Timers and Threads options is moved to the Base.

13252 **NAME**
 13253 sys/uio.h — definitions for vector I/O operations

13254 **SYNOPSIS**
 13255 XSI `#include <sys/uio.h>`

13256 **DESCRIPTION**
 13257 The <sys/uio.h> header shall define the **iovec** structure that includes at least the following
 13258 members:

13259 `void *iov_base` Base address of a memory region for input or output.
 13260 `size_t iov_len` The size of the memory pointed to by `iov_base`.

13261 The <sys/uio.h> header uses the **iovec** structure for scatter/gather I/O.

13262 The **ssize_t** and **size_t** types shall be defined as described in <sys/types.h>.

13263 The following shall be declared as functions and may also be defined as macros. Function
 13264 prototypes shall be provided.

13265 `ssize_t readv(int, const struct iovec *, int);`
 13266 `ssize_t writev(int, const struct iovec *, int);`

13267 **APPLICATION USAGE**
 13268 The implementation can put a limit on the number of scatter/gather elements which can be
 13269 processed in one call. The symbol {IOV_MAX} defined in <limits.h> should always be used to
 13270 learn about the limits instead of assuming a fixed value.

13271 **RATIONALE**
 13272 Traditionally, the maximum number of scatter/gather elements the system can process in one
 13273 call were described by the symbolic value {UIO_MAXIOV}. In IEEE Std 1003.1-2001 this value is
 13274 replaced by the constant {IOV_MAX} which can be found in <limits.h>.

13275 **FUTURE DIRECTIONS**
 13276 None.

13277 **SEE ALSO**
 13278 [<limits.h>](#), [<sys/types.h>](#)

13279 XSH *read*, *write*

13280 **CHANGE HISTORY**
 13281 First released in Issue 4, Version 2.

13282 **Issue 6**
 13283 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13284 **NAME**
 13285 sys/un.h — definitions for UNIX domain sockets

13286 **SYNOPSIS**
 13287 #include <sys/un.h>

13288 **DESCRIPTION**
 13289 The <sys/un.h> header shall define the **sockaddr_un** structure that includes at least the
 13290 following members:

13291 sa_family_t sun_family Address family.
 13292 char sun_path[] Socket pathname.

13293 The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Values of this
 13294 type shall be cast by applications to **struct sockaddr** for use with socket functions.

13295 The **sa_family_t** type shall be defined as described in <sys/socket.h>.

13296 **APPLICATION USAGE**
 13297 The size of *sun_path* has intentionally been left undefined. This is because different
 13298 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a
 13299 size of 104. Since most implementations originate from BSD versions, the size is typically in the
 13300 range 92 to 108.

13301 Applications should not assume a particular length for *sun_path* or assume that it can hold
 13302 {_POSIX_PATH_MAX} characters (255).

13303 **RATIONALE**
 13304 None.

13305 **FUTURE DIRECTIONS**
 13306 None.

13307 **SEE ALSO**
 13308 <sys/socket.h>
 13309 XSH *bind()*, *socket()*, *socketpair()*

13310 **CHANGE HISTORY**
 13311 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13312 **NAME**
 13313 sys/utsname.h — system name structure

13314 **SYNOPSIS**
 13315 #include <sys/utsname.h>

13316 **DESCRIPTION**
 13317 The <sys/utsname.h> header shall define the structure **utsname** which shall include at least the
 13318 following members:

13319 char sysname[] Name of this implementation of the operating system.
 13320 char nodename[] Name of this node within the communications
 13321 network to which this node is attached, if any.
 13322 char release[] Current release level of this implementation.
 13323 char version[] Current version level of this release.
 13324 char machine[] Name of the hardware type on which the system is running.

13325 The character arrays are of unspecified size, but the data stored in them shall be terminated by a
 13326 null byte.

13327 The following shall be declared as a function and may also be defined as a macro:

13328 int uname(struct utsname *);

13329 **APPLICATION USAGE**
 13330 None.

13331 **RATIONALE**
 13332 None.

13333 **FUTURE DIRECTIONS**
 13334 None.

13335 **SEE ALSO**
 13336 XSH *uname*

13337 **CHANGE HISTORY**
 13338 First released in Issue 1. Derived from Issue 1 of the SVID.

13339 **Issue 6**
 13340 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/27 is applied, changing the description of
 13341 *nodename* within the **utsname** structure from “an implementation-defined communications
 13342 network” to “the communications network to which this node is attached, if any”.

13343 **NAME**
 13344 `sys/wait.h` — declarations for waiting

13345 **SYNOPSIS**
 13346 `#include <sys/wait.h>`

13347 **DESCRIPTION**
 13348 The **<sys/wait.h>** header shall define the following symbolic constants for use with `waitpid()`:

13349 `WNOHANG` Do not hang if no status is available; return immediately.
 13350 `WUNTRACED` Report status of stopped child process.

13351 The **<sys/wait.h>** header shall define the following macros for analysis of process status values:

13352 `WEXITSTATUS` Return exit status.

13353 XSI `WIFCONTINUED` True if child has been continued.
 13354 `WIFEXITED` True if child exited normally.
 13355 `WIFSIGNALED` True if child exited due to uncaught signal.
 13356 `WIFSTOPPED` True if child is currently stopped.
 13357 `WSTOPSIG` Return signal number that caused process to stop.
 13358 `WTERMSIG` Return signal number that caused process to terminate.

13359 The following symbolic constants shall be defined as possible values for the *options* argument to
 13360 `waitid()`:

13361 `WEXITED` Wait for processes that have exited.
 13362 `WSTOPPED` Status is returned for any child that has stopped upon receipt of a signal.
 13363 XSI `WCONTINUED` Status is returned for any child that was stopped and has been continued.

13364 `WNOHANG` Return immediately if there are no children to wait for.
 13365 `WNOWAIT` Keep the process whose status is returned in *infop* in a waitable state.

13366 The type **idtype_t** shall be defined as an enumeration type whose possible values shall include
 13367 at least the following:
 13368 `P_ALL`
 13369 `P_PID`
 13370 `P_PGID`

13371 The **id_t** and **pid_t** types shall be defined as described in **<sys/types.h>**.
 13372 The **siginfo_t** type shall be defined as described in **<signal.h>**.
 13373 Inclusion of the **<sys/wait.h>** header may also make visible all symbols from **<signal.h>**.
 13374 The following shall be declared as functions and may also be defined as macros. Function
 13375 prototypes shall be provided.
 13376 `pid_t wait(int *);`
 13377 `int waitid(idtype_t, id_t, siginfo_t *, int);`
 13378 `pid_t waitpid(pid_t, int *, int);`

13379 **APPLICATION USAGE**

13380 None.

13381 **RATIONALE**

13382 None.

13383 **FUTURE DIRECTIONS**

13384 None.

13385 **SEE ALSO**13386 [<signal.h>](#), [<sys/types.h>](#)13387 XSH *wait*, *waitid()*13388 **CHANGE HISTORY**

13389 First released in Issue 3.

13390 Included for alignment with the POSIX.1-1988 standard.

13391 **Issue 6**13392 The *wait3()* function is removed.13393 **Issue 7**13394 The *waitid()* function and symbolic constants for its options argument are moved to the Base.

DRAFT

13395 **NAME**
 13396 syslog.h — definitions for system error logging

13397 **SYNOPSIS**

13398 XSI `#include <syslog.h>`

13399 **DESCRIPTION**

13400 The <syslog.h> header shall define the following symbolic constants, zero or more of which
 13401 may be OR'ed together to form the *logopt* option of *openlog()*:

13402 LOG_PID Log the process ID with each message.

13403 LOG_CONS Log to the system console on error.

13404 LOG_NDELAY Connect to syslog daemon immediately.

13405 LOG_ODELAY Delay open until *syslog()* is called.

13406 LOG_NOWAIT Do not wait for child processes.

13407 The <syslog.h> header shall define the following symbolic constants for use as the *facility* |
 13408 argument to *openlog()*:

13409 LOG_KERN Reserved for message generated by the system.

13410 LOG_USER Message generated by a process.

13411 LOG_MAIL Reserved for message generated by mail system.

13412 LOG_NEWS Reserved for message generated by news system.

13413 LOG_UUCP Reserved for message generated by UUCP system.

13414 LOG_DAEMON Reserved for message generated by system daemon.

13415 LOG_AUTH Reserved for message generated by authorization daemon.

13416 LOG_CRON Reserved for message generated by clock daemon.

13417 LOG_LPR Reserved for message generated by printer system.

13418 LOG_LOCAL0 Reserved for local use.

13419 LOG_LOCAL1 Reserved for local use.

13420 LOG_LOCAL2 Reserved for local use.

13421 LOG_LOCAL3 Reserved for local use.

13422 LOG_LOCAL4 Reserved for local use.

13423 LOG_LOCAL5 Reserved for local use.

13424 LOG_LOCAL6 Reserved for local use.

13425 LOG_LOCAL7 Reserved for local use.

13426 The <syslog.h> header shall define the following macros for constructing the *maskpri* argument |
 13427 to *setlogmask()*. The following macros expand to an expression of type **int** when the argument
 13428 *pri* is an expression of type **int**:

13429 LOG_MASK(*pri*) A mask for priority *pri*.

13430 The <syslog.h> header shall define the following symbolic constants for use as the *priority* |
 13431 argument of *syslog()*:

13432	LOG_EMERG	A panic condition was reported to all processes.	
13433	LOG_ALERT	A condition that should be corrected immediately.	
13434	LOG_CRIT	A critical condition.	
13435	LOG_ERR	An error message.	
13436	LOG_WARNING	A warning message.	
13437	LOG_NOTICE	A condition requiring special handling.	
13438	LOG_INFO	A general information message.	
13439	LOG_DEBUG	A message useful for debugging programs.	
13440		The following shall be declared as functions and may also be defined as macros. Function	
13441		prototypes shall be provided.	
13442		<code>void closelog(void);</code>	
13443		<code>void openlog(const char *, int, int);</code>	
13444		<code>int setlogmask(int);</code>	
13445		<code>void syslog(int, const char *, ...);</code>

13460 **NAME**
 13461 tar.h — extended tar definitions

13462 **SYNOPSIS**
 13463 #include <tar.h>

13464 **DESCRIPTION**
 13465 The <tar.h> header shall define the following symbolic constants with the indicated values.

13466 General definitions:

Name	Value	Description
TMAGIC	"ustar"	ustar plus null byte.
TMAGLEN	6	Length of the above.
TVERSION	"00"	00 without a null byte.
TVERSLN	2	Length of the above.

13472 *Typeflag* field definitions:

Name	Value	Description
REGTYPE	'0'	Regular file.
AREGTYPE	'\0'	Regular file.
LNKTYPE	'1'	Link.
SYMTYPE	'2'	Symbolic link.
CHRTYPE	'3'	Character special.
BLKTYPE	'4'	Block special.
DIRTYPE	'5'	Directory.
FIFOTYPE	'6'	FIFO special.
CONTTYPE	'7'	Reserved.

13483 *Mode* field bit definitions (octal):

Name	Value	Description
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

DRAFT

13511 **NAME**
 13512 `termios.h` — define values for `termios`

13513 **SYNOPSIS**
 13514 `#include <termios.h>`

13515 **DESCRIPTION**
 13516 The **<termios.h>** header shall contain the definitions used by the terminal I/O interfaces (see
 13517 [Chapter 11](#) (on page 185) for the structures and names defined).

13518 **The `termios` Structure**

13519 The following data types shall be defined through **typedef**:

13520 **cc_t** Used for terminal special characters.

13521 **speed_t** Used for terminal baud rates.

13522 **tcflag_t** Used for terminal modes.

13523 The above types shall be all unsigned integer types.

13524 The implementation shall support one or more programming environments in which the widths
 13525 of **cc_t**, **speed_t**, and **tcflag_t** are no greater than the width of type **long**. The names of these
 13526 programming environments can be obtained using the `confstr()` function or the `getconf` utility.

13527 The **termios** structure shall be defined, and shall include at least the following members:

13528 `tcflag_t c_iflag` Input modes.
 13529 `tcflag_t c_oflag` Output modes.
 13530 `tcflag_t c_cflag` Control modes.
 13531 `tcflag_t c_lflag` Local modes.
 13532 `cc_t c_cc[NCCS]` Control characters.

13533 The **<termios.h>** header shall define the following symbolic constant:

13534 **NCCS** Size of the array `c_cc` for control characters.

13535 The **<termios.h>** header shall define the following symbolic constants for use as subscripts for
 13536 the array `c_cc`:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF		EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR	VINTR	INTR character.
VKILL		KILL character.
	VMIN	MIN value.
VQUIT	VQUIT	QUIT character.
VSTART	VSTART	START character.
VSTOP	VSTOP	STOP character.
VSUSP	VSUSP	SUSP character.
	VTIME	TIME value.

13550 The subscript values shall be suitable for use in **#if** preprocessing directives and shall be distinct,
 13551 except that the **VMIN** and **VTIME** subscripts may have the same values as the **VEOF** and **VEOL**
 13552 subscripts, respectively.

13553 **Input Modes**

13554 The <termios.h> header shall define the following symbolic constants for use as flags in the +
 13555 *c_iflag* field. The *c_iflag* field describes the basic terminal input control. |

13556		BRKINT	Signal interrupt on break.
13557		ICRNL	Map CR to NL on input.
13558		IGNBRK	Ignore break condition.
13559		IGNCR	Ignore CR.
13560		IGNPAR	Ignore characters with parity errors.
13561		INLCR	Map NL to CR on input.
13562		INPCK	Enable input parity check.
13563		ISTRIP	Strip character.
13564	XSI	IXANY	Enable any character to restart output.
13565		IXOFF	Enable start/stop input control.
13566		IXON	Enable start/stop output control.
13567		PARMRK	Mark parity errors.

13568 **Output Modes**

13569 The <termios.h> header shall define the following symbolic constants for use as flags in the +
 13570 *c_oflag* field. The *c_oflag* field specifies the system treatment of output. |

13571		OPOST	Post-process output.
13572	XSI	ONLCR	Map NL to CR-NL on output.
13573	XSI	OCRNL	Map CR to NL on output.
13574	XSI	ONOCR	No CR output at column 0.
13575	XSI	ONLRET	NL performs CR function.
13576	XSI	OFDEL	Fill is DEL.
13577	XSI	OFILL	Use fill characters for delay.
13578	XSI	NLDLY	Select newline delays:
13579		NL0	Newline type 0.
13580		NL1	Newline type 1.
13581	XSI	CRDLY	Select carriage-return delays:
13582		CR0	Carriage-return delay type 0.
13583		CR1	Carriage-return delay type 1.
13584		CR2	Carriage-return delay type 2.
13585		CR3	Carriage-return delay type 3.
13586	XSI	TABDLY	Select horizontal-tab delays:

13587		TAB0	Horizontal-tab delay type 0.
13588		TAB1	Horizontal-tab delay type 1.
13589		TAB2	Horizontal-tab delay type 2.
13590		TAB3	Expand tabs to spaces.
13591	XSI	BSDLY	Select backspace delays:
13592		BS0	Backspace-delay type 0.
13593		BS1	Backspace-delay type 1.
13594	XSI	VTDLY	Select vertical-tab delays:
13595		VT0	Vertical-tab delay type 0.
13596		VT1	Vertical-tab delay type 1.
13597	XSI	FFDLY	Select form-feed delays:
13598		FF0	Form-feed delay type 0.
13599		FF1	Form-feed delay type 1.

13600 Baud Rate Selection

13601 The <termios.h> header shall define the following symbolic constants for use as values of
 13602 objects of type **speed_t**.

13603 The input and output baud rates are stored in the **termios** structure. These are the valid values
 13604 for objects of type **speed_t**. Not all baud rates need be supported by the underlying hardware.

13605	B0	Hang up
13606	B50	50 baud
13607	B75	75 baud
13608	B110	110 baud
13609	B134	134.5 baud
13610	B150	150 baud
13611	B200	200 baud
13612	B300	300 baud
13613	B600	600 baud
13614	B1200	1 200 baud
13615	B1800	1 800 baud
13616	B2400	2 400 baud
13617	B4800	4 800 baud
13618	B9600	9 600 baud
13619	B19200	19 200 baud

13620	B38400	38 400 baud	
13621	Control Modes		-
13622	The <termios.h> header shall define the following symbolic constants for use as flags in the		
13623	<i>c_cflag</i> field. The <i>c_cflag</i> field describes the hardware control of the terminal; not all values		
13624	specified are required to be supported by the underlying hardware.		
13625	CSIZE	Character size:	
13626		CS5 5 bits	
13627		CS6 6 bits	
13628		CS7 7 bits	
13629		CS8 8 bits	
13630	CSTOPB	Send two stop bits, else one.	
13631	CREAD	Enable receiver.	
13632	PARENB	Parity enable.	
13633	PARODD	Odd parity, else even.	
13634	HUPCL	Hang up on last close.	
13635	CLOCAL	Ignore modem status lines.	
13636	The implementation shall support the functionality associated with the symbols CS7, CS8,		
13637	CSTOPB, PARODD, and PARENB.		
13638	Local Modes		-
13639	The <termios.h> header shall define the following symbolic constants for use as flags in the		
13640	<i>c_lflag</i> field. The <i>c_lflag</i> field of the argument structure is used to control various terminal		
13641	functions.		
13642	ECHO	Enable echo.	
13643	ECHOE	Echo erase character as error-correcting backspace.	
13644	ECHOK	Echo KILL.	
13645	ECHONL	Echo NL.	
13646	ICANON	Canonical input (erase and kill processing).	
13647	IEXTEN	Enable extended input character processing.	
13648	ISIG	Enable signals.	
13649	NOFLSH	Disable flush after interrupt or quit.	
13650	TOSTOP	Send SIGTTOU for background output.	
13651	Attribute Selection		-
13652	The <termios.h> header shall define the following symbolic constants for use with <i>tcsetattr()</i> :		
13653	TCSANOW	Change attributes immediately.	
13654	TCSADRAIN	Change attributes when output has drained.	
13655	TCSAFLUSH	Change attributes when output has drained; also flush pending input.	

13656 **Line Control** -13657 The <termios.h> header shall define the following symbolic constants for use with *tcflush()*: |

13658 TCIFLUSH Flush pending input.

13659 TCIOFLUSH Flush both pending input and untransmitted output.

13660 TCOFLUSH Flush untransmitted output.

13661 The <termios.h> header shall define the following symbolic constants for use with *tcflow()*: |

13662 TCIOFF Transmit a STOP character, intended to suspend input data.

13663 TCION Transmit a START character, intended to restart input data.

13664 TCOOFF Suspend output.

13665 TCOON Restart output.

13666 The following shall be declared as functions and may also be defined as macros. Function
13667 prototypes shall be provided.13668 `speed_t cfgetispeed(const struct termios *);`13669 `speed_t cfgetospeed(const struct termios *);`13670 `int cfsetispeed(struct termios *, speed_t);`13671 `int cfsetospeed(struct termios *, speed_t);`13672 `int tcdrain(int);`13673 `int tcflow(int, int);`13674 `int tcflush(int, int);`13675 `int tcgetattr(int, struct termios *);`13676 `pid_t tcgetsid(int);`13677 `int tcsendbreak(int, int);`13678 `int tcsetattr(int, int, const struct termios *);`13679 **APPLICATION USAGE**13680 The following names are reserved for XSI-conformant systems to use as an extension to the
13681 above; therefore strictly conforming applications shall not use them:

13682 CBAUD	EXTB	VDSUSP
13683 DEFCHO	FLUSHO	VLNEXT
13684 ECHOCTL	LOBLK	VREPRINT
13685 ECHOK	PENDIN	VSTATUS
13686 ECHOPRT	SWTCH	VWERASE
13687 EXTA	VDISCARD

13697 First released in Issue 3.

13698 Included for alignment with the ISO POSIX-1 standard.

- 13699 **Issue 6**
- 13700 The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.
- 13701 FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are
- 13702 reaffirmed.
- 13703 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to
- 13704 ECHOK in the APPLICATION USAGE section.
- 13705 **Issue 7**
- 13706 SD5-XBD-ERN-35 is applied, adding the OFDEL output mode.
- 13707 This reference page is clarified with respect to macros and symbolic constants. +

13708 **NAME**
 13709 `tgmath.h` — type-generic macros

13710 **SYNOPSIS**
 13711 `#include <tgmath.h>`

13712 **DESCRIPTION**

13713 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13714 conflict between the requirements described here and the ISO C standard is unintentional. This
 13715 volume of POSIX.1-200x defers to the ISO C standard.

13716 The <tgmath.h> header shall include the headers <math.h> and <complex.h> and shall define
 13717 several type-generic macros.

13718 Of the functions contained within the <math.h> and <complex.h> headers without an *f* (**float**)
 13719 or *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is
 13720 **double**. For each such function, except *modf()*, there shall be a corresponding type-generic
 13721 macro. The parameters whose corresponding real type is **double** in the function synopsis are
 13722 generic parameters. Use of the macro invokes a function whose corresponding real type and
 13723 type domain are determined by the arguments for the generic parameters.

13724 Use of the macro invokes a function whose generic parameters have the corresponding real type
 13725 determined as follows:

- 13726 • First, if any argument for generic parameters has type **long double**, the type determined is
 13727 **long double**.
- 13728 • Otherwise, if any argument for generic parameters has type **double** or is of integer type,
 13729 the type determined is **double**.
- 13730 • Otherwise, the type determined is **float**.

13731 For each unsuffixed function in the <math.h> header for which there is a function in the
 13732 <complex.h> header with the same name except for a *c* prefix, the corresponding type-generic
 13733 macro (for both functions) has the same name as the function in the <math.h> header. The
 13734 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

13735	<math.h> Function	<complex.h> Function	Type-Generic Macro
13736	<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
13737	<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
13738	<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
13739	<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
13740	<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
13741	<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
13742	<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
13743	<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
13744	<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
13745	<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
13746	<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
13747	<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
13748	<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
13749	<i>log()</i>	<i>clog()</i>	<i>log()</i>
13750	<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
13751	<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
13752	<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>
13753			

13754 If at least one argument for a generic parameter is complex, then use of the macro invokes a
13755 complex function; otherwise, use of the macro invokes a real function.

13756 For each unsuffixed function in the <math.h> header without a *c*-prefixed counterpart in the
13757 <complex.h> header, the corresponding type-generic macro has the same name as the function.
13758 These type-generic macros are:

13759	<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
13760	<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
13761	<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
13762	<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
13763	<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbn()</i>
13764	<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbln()</i>
13765	<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
13766	<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
13767	<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
13768	<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

13769 If all arguments for generic parameters are real, then use of the macro invokes a real function;
13770 otherwise, use of the macro results in undefined behavior.

13771 For each unsuffixed function in the <complex.h> header that is not a *c*-prefixed counterpart to a
13772 function in the <math.h> header, the corresponding type-generic macro has the same name as
13773 the function. These type-generic macros are:

13774	<i>carg()</i>
13775	<i>cimag()</i>
13776	<i>conj()</i>
13777	<i>cproj()</i>
13778	<i>creal()</i>

13779 Use of the macro with any real or complex argument invokes a complex function.

13780 APPLICATION USAGE

13781 With the declarations:

```
13782 #include <tgmath.h>
13783 int n;
13784 float f;
13785 double d;
13786 long double ld;
13787 float complex fc;
13788 double complex dc;
13789 long double complex ldc;
```

13790 functions invoked by use of type-generic macros are shown in the following table:

13791 Macro	Use Invokes
13792 <i>exp(n)</i>	<i>exp(n)</i> , the function
13793 <i>acosh(f)</i>	<i>acoshf(f)</i>
13794 <i>sin(d)</i>	<i>sin(d)</i> , the function
13795 <i>atan(ld)</i>	<i>atanl(ld)</i>
13796 <i>log(fc)</i>	<i>clogf(fc)</i>
13797 <i>sqrt(dc)</i>	<i>csqrt(dc)</i>
13798 <i>pow(ldc,f)</i>	<i>cpowl(ldc, f)</i>
13799 <i>remainder(n,n)</i>	<i>remainder(n, n)</i> , the function
13800 <i>nextafter(d,f)</i>	<i>nextafter(d, f)</i> , the function

13814

RATIONALE13815
13816
13817
13818
13819

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as '+' and '*'. For example, with a type-generic *cos()* macro, the expression *cos((float)x)* will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

13820
13821
13822
13823

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to *nexttoward()*, whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

13824
13825
13826

The term "type-generic" was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran's generic functions than to C++ overloading.

13827
13828

The macros are placed in their own header in order not to silently break old programs that include the <math.h> header; for example, with:

13829

```
printf ("%e", sin(x))
```

13830
13831

*modf(double, double *)* is excluded because no way was seen to make it safe without complicating the type resolution.

13832
13833

The implementation might, as an extension, endow appropriate ones of the macros that POSIX.1-200x specifies only for real arguments with the ability to invoke the complex functions.

13834
13835
13836

POSIX.1-200x does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for *sqrt()*, for example, could be implemented with:

13837

```
#undef sqrt
```

13838

```
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

13839
13840

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

13841
13842
13843
13844

The great majority of existing C programs are expected to be unaffected when the <tgmath.h> header is included instead of the <math.h> or <complex.h> headers. Generic macros are similar to the ISO/IEC 9899:1999 standard library masking macros, though the semantic types of return values differ.

13845
13846
13847
13848

The ability to overload on integer as well as floating types would have been useful for some functions; for example, *copysign()*. Overloading with different numbers of arguments would have allowed reusing names; for example, *remainder()* for *remquo()*. However, these facilities would have complicated the specification; and their natural consistent use, such as for a floating

13849 *abs()* or a two-argument *atan()*, would have introduced further inconsistencies with the
13850 ISO/IEC 9899:1999 standard for insufficient benefit.

13851 The ISO C standard in no way limits the implementation's options for efficiency, including
13852 inlining library functions.

13853 **FUTURE DIRECTIONS**

13854 None.

13855 **SEE ALSO**

13857 XSH *cabs()*, *fabs()*, *modf()*

13858 **CHANGE HISTORY**

13859 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

13860 **NAME**

13861 time.h — time types

13862 **SYNOPSIS**

13863 #include <time.h>

13864 **DESCRIPTION**

13865 CX Some of the functionality described on this reference page extends the ISO C standard.
 13866 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 13867 enable the visibility of these symbols in this header.

13868 The <time.h> header shall declare the structure **tm**, which shall include at least the following
 13869 members:

13870 int tm_sec Seconds [0,60].
 13871 int tm_min Minutes [0,59].
 13872 int tm_hour Hour [0,23].
 13873 int tm_mday Day of month [1,31].
 13874 int tm_mon Month of year [0,11].
 13875 int tm_year Years since 1900.
 13876 int tm_wday Day of week [0,6] (Sunday =0).
 13877 int tm_yday Day of year [0,365].
 13878 int tm_isdst Daylight Savings flag.

13879 The value of *tm_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings
 13880 Time is not in effect, and negative if the information is not available.

13881 The <time.h> header shall define the following macros:

13882 NULL As described in <stddef.h>.

13883 CLOCKS_PER_SEC A number used to convert the value returned by the *clock()* function into
 13884 XSI seconds. The value shall be an expression with type **clock_t**. The value of
 13885 CLOCKS_PER_SEC shall be 1 million on XSI-conformant systems.
 13886 However, it may be variable on other systems, and it should not be
 13887 assumed that CLOCKS_PER_SEC is a compile-time constant.

13888 CX The <time.h> header shall define the following symbolic constants. The values shall have a type
 13889 that is assignment-compatible with **clockid_t**.

13890 MON **CLOCK_MONOTONIC**

13891 The identifier for the system-wide monotonic clock, which is defined as a
 13892 realtime clock whose value cannot be set via *clock_settime()* and which
 13893 cannot have backward clock jumps. The maximum possible clock jump
 13894 shall be implementation-defined.

13895 CPT **CLOCK_PROCESS_CPUTIME_ID**

13896 The identifier of the CPU-time clock associated with the process making a
 13897 *clock()* or *timer*()* function call.

13898 CX **CLOCK_REALTIME** The identifier of the system-wide realtime clock.

13899 TCT **CLOCK_THREAD_CPUTIME_ID**

13900 The identifier of the CPU-time clock associated with the thread making a
 13901 *clock()* or *timer*()* function call.

<time.h>

Headers

13902	CX	The <time.h> header shall declare the structure timespec , which has at least the following members:
13903		
13904		time_t tv_sec Seconds.
13905		long tv_nsec Nanoseconds.
13906		The <time.h> header shall also declare the itimerspec structure, which has at least the following members:
13907		
13908		struct timespec it_interval Timer period.
13909		struct timespec it_value Timer expiration.
13910		The <time.h> header shall define the following symbolic constant:
13911		TIMER_ABSTIME Flag indicating time is absolute. For functions taking timer objects, this
13912		refers to the clock associated with the timer.
13913	CX	The clock_t , size_t , time_t , clockid_t , and timer_t types shall be defined as described in <sys/types.h> .
13914		
13915	XSI	The <time.h> header shall provide a declaration for <i>getdate_err</i> .
13916		The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.
13917		
13918	OB	char *asctime(const struct tm *);
13919	OB CX	char *asctime_r(const struct tm *restrict, char *restrict);
13920		clock_t clock(void);
13921	CPT	int clock_getcpuclockid(pid_t, clockid_t *);
13922	CX	int clock_getres(clockid_t, struct timespec *);
13923		int clock_gettime(clockid_t, struct timespec *);
13924		int clock_nanosleep(clockid_t, int, const struct timespec *,
13925		struct timespec *);
13926		int clock_settime(clockid_t, const struct timespec *);
13927	OB	char *ctime(const time_t *);
13928	OB CX	char *ctime_r(const time_t *, char *);
13929		double difftime(time_t, time_t);
13930	XSI	struct tm *getdate(const char *);
13931		struct tm *gmtime(const time_t *);
13932	CX	struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
13933		struct tm *localtime(const time_t *);
13934	CX	struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
13935		time_t mktime(struct tm *);
13936	CX	int nanosleep(const struct timespec *, struct timespec *);
13937		size_t strftime(char *restrict, size_t, const char *restrict,
13938		const struct tm *restrict);
13939	CX	size_t strftime_l(char *restrict, size_t, const char *restrict,
13940		const struct tm *restrict, locale_t);
13941	XSI	char *strptime(const char *restrict, const char *restrict,
13942		struct tm *restrict);
13943		time_t time(time_t *);
13944	CX	int timer_create(clockid_t, struct sigevent *restrict,
13945		timer_t *restrict);
13946		int timer_delete(timer_t);
13947		int timer_getoverrun(timer_t);
13948		int timer_gettime(timer_t, struct itimerspec *);
13949		int timer_settime(timer_t, int, const struct itimerspec *restrict,
13950		struct itimerspec *restrict);

13951 `void tzset(void);`

13952 The following shall be declared as variables:

13953 XSI `extern int daylight;`
 13954 `extern long timezone;`
 13955 CX `extern char *tzname[];`

13956 CX Inclusion of the <time.h> header may make visible all symbols from the <signal.h> header.

13957 APPLICATION USAGE

13958 The range [0,60] for *tm_sec* allows for the occasional leap second.

13959 *tm_year* is a signed value; therefore, years before 1900 may be represented.

13960 To obtain the number of clock ticks per second returned by the *times()* function, applications
 13961 should call *sysconf(_SC_CLK_TCK)*.

13962 RATIONALE

13963 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of
 13964 UTC does not permit double leap seconds, so all mention of double leap seconds has been
 13965 removed, and the range shortened from the former [0,61] seconds seen in earlier versions of this
 13966 standard.

13967 FUTURE DIRECTIONS

13968 None.

13976 CHANGE HISTORY

13977 First released in Issue 1. Derived from Issue 1 of the SVID.

13978 Issue 5

13979 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 13980 Threads Extension.

13981 Issue 6

13982 The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid_t**
 13983 and **timer_t** have been described.

13984 The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- 13985 • The POSIX timer-related functions are marked as part of the Timers option.

13986 The symbolic name CLK_TCK is removed. Application usage is added describing how its
 13987 equivalent functionality can be obtained using *sysconf()*.

13988 The *clock_getcpuclockid()* function and manifest constants CLOCK_PROCESS_CPUTIME_ID and
 13989 CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std 1003.1d-1999.

13990 The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep()* function are added for
 13991 alignment with IEEE Std 1003.1j-2000.

13992 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

13993

- The range for seconds is changed from [0,61] to [0,60].

13994

13995

- The **restrict** keyword is added to the prototypes for *asctime_r()*, *gmtime_r()*, *localtime_r()*, *strftime()*, *strptime()*, *timer_create()*, and *timer_settime()*.

13996

13997

IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the <signal.h> header may be made visible when the <time.h> header is included.

13998

Extensions beyond the ISO C standard are marked.

13999

Issue 7

14000

Austin Group Interpretation 1003.1-2001 #111 is applied. +

14001

SD5-XBD-ERN-74 is applied. +

14002

14003

The *strftime_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

14004

Functionality relating to the Timers option is moved to the Base.

14005

This reference page is clarified with respect to macros and symbolic constants. |

14006 **NAME**

14007 trace.h — tracing

14008 **SYNOPSIS**

14009 OB TRC #include <trace.h>

14010 **DESCRIPTION**14011 The <trace.h> header shall define the **posix_trace_event_info** structure that includes at least the
14012 following members:

```

14013     trace_event_id_t  posix_event_id
14014     pid_t             posix_pid
14015     void              *posix_prog_address
14016     pthread_t         posix_thread_id
14017     struct timespec   posix_timestamp
14018     int               posix_truncation_status

```

14019 The <trace.h> header shall define the **posix_trace_status_info** structure that includes at least the
14020 following members:

```

14021     int      posix_stream_full_status
14022     int      posix_stream_overrun_status
14023     int      posix_stream_status
14024     OB TRL  int      posix_log_full_status
14025     int      posix_log_overrun_status
14026     int      posix_stream_flush_error
14027     int      posix_stream_flush_status

```

14028 The <trace.h> header shall define the following symbolic constants: |

```

14029     POSIX_TRACE_ALL_EVENTS
14030     OB TRL  POSIX_TRACE_APPEND
14031     OB TRI  POSIX_TRACE_CLOSE_FOR_CHILD
14032     OB TEF  POSIX_TRACE_FILTER
14033     OB TRL  POSIX_TRACE_FLUSH
14034     POSIX_TRACE_FLUSH_START
14035     POSIX_TRACE_FLUSH_STOP
14036     POSIX_TRACE_FLUSHING
14037     POSIX_TRACE_FULL
14038     POSIX_TRACE_LOOP
14039     POSIX_TRACE_NO_OVERRUN
14040     OB TRL  POSIX_TRACE_NOT_FLUSHING
14041     POSIX_TRACE_NOT_FULL
14042     OB TRI  POSIX_TRACE_INHERITED
14043     POSIX_TRACE_NOT_TRUNCATED
14044     POSIX_TRACE_OVERFLOW
14045     POSIX_TRACE_OVERRUN
14046     POSIX_TRACE_RESUME
14047     POSIX_TRACE_RUNNING
14048     POSIX_TRACE_START
14049     POSIX_TRACE_STOP
14050     POSIX_TRACE_SUSPENDED
14051     POSIX_TRACE_SYSTEM_EVENTS

```

```

14052     POSIX_TRACE_TRUNCATED_READ
14053     POSIX_TRACE_TRUNCATED_RECORD
14054     POSIX_TRACE_UNNAMED_USER_EVENT
14055     POSIX_TRACE_UNTIL_FULL
14056     POSIX_TRACE_WOPID_EVENTS

```

14057 The following types shall be defined as described in <sys/types.h>:

```

14058     size_t
14059     trace_attr_t
14060     trace_event_id_t
14061     OB TEF trace_event_set_t
14062     trace_id_t

```

14063 The following shall be declared as functions and may also be defined as macros. Function
14064 prototypes shall be provided.

```

14065     int  posix_trace_attr_destroy(trace_attr_t *);
14066     int  posix_trace_attr_getclockres(const trace_attr_t *,
14067         struct timespec *);

14178 **FUTURE DIRECTIONS**

14179 None.

14180 **SEE ALSO**14181 XSH *ulimit*14182 **CHANGE HISTORY**

14183 First released in Issue 3.

14184 **Issue 7**

14185 The <ulimit.h> header is marked obsolescent.

14186 **NAME**
 14187 unistd.h — standard symbolic constants and types

14188 **SYNOPSIS**
 14189 #include <unistd.h>

14190 **DESCRIPTION**
 14191 The <unistd.h> header defines miscellaneous symbolic constants and types, and declares
 14192 miscellaneous functions. The actual values of the constants are unspecified except as shown. The
 14193 contents of this header are shown below.

14194 **Version Test Macros**

14195 The <unistd.h> header shall define the following symbolic constants. The values shall be
 14196 suitable for use in #if preprocessing directives.

14197 **_POSIX_VERSION**
 14198 Integer value indicating version of this standard (C-language binding) to which the
 14199 implementation conforms. For implementations conforming to POSIX.1-200x, the value
 14200 shall be 200xxxL.

14201 **_POSIX2_VERSION**
 14202 Integer value indicating version of the Shell and Utilities volume of POSIX.1 to which the
 14203 implementation conforms. For implementations conforming to POSIX.1-200x, the value
 14204 shall be 200xxxL.

14205 The <unistd.h> header shall define the following symbolic constant only if the implementation
 14206 supports the XSI option; see [Section 2.1.4](#) (on page 19). If defined, its value shall be suitable for
 14207 use in #if preprocessing directives.

14208 XSI **_XOPEN_VERSION**
 14209 Integer value indicating version of the X/Open Portability Guide to which the
 14210 implementation conforms. The value shall be 700.

14211 **Constants for Options and Option Groups**

14212 The following symbolic constants, if defined in <unistd.h>, shall have a value of -1, 0, or
 14213 greater, unless otherwise specified below. The values shall be suitable for use in #if
 14214 preprocessing directives.

14215 If a symbolic constant is not defined or is defined with the value -1, the option is not supported
 14216 for compilation. If it is defined with a value greater than zero, the option shall always be
 14217 supported when the application is executed. If it is defined with the value zero, the option shall
 14218 be supported for compilation and might or might not be supported at runtime. See [Section 2.1.6](#)
 14219 (on page 25) for further information about the conformance requirements of these three
 14220 categories of support.

14221 ADV **_POSIX_ADVISORY_INFO**
 14222 The implementation supports the Advisory Information option. If this symbol is defined in
 14223 <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
 14224 *sysconf()* shall either be -1 or 200xxxL.

14225 **_POSIX_ASYNCHRONOUS_IO**
 14226 The implementation supports asynchronous input and output. This symbol shall always be
 14227 set to the value 200xxxL.

14228		<code>_POSIX_BARRIERS</code>	
14229			The implementation supports barriers. This symbol shall always be set to the value
14230			200xxxL.
14231		<code>_POSIX_CHOWN_RESTRICTED</code>	
14232			The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
14233			to changing the group ID of a file only to the effective group ID of the process or to one of
14234			its supplementary group IDs. This symbol shall be defined with a value other than -1.
14235		<code>_POSIX_CLOCK_SELECTION</code>	
14236			The implementation supports clock selection. This symbol shall always be set to the value
14237			200xxxL.
14238	CPT	<code>_POSIX_CPUTIME</code>	
14239			The implementation supports the Process CPU-Time Clocks option. If this symbol is
14240			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14241			reported by <i>sysconf()</i> shall either be -1 or 200xxxL.
14242	FSC	<code>_POSIX_FSYNC</code>	
14243			The implementation supports the File Synchronization option. If this symbol is defined in
14244			<unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
14245			<i>sysconf()</i> shall either be -1 or 200xxxL.
14246		<code>_POSIX_IPV6</code>	
14247			The implementation supports the IPv6 option. If this symbol is defined in <unistd.h>, it
14248			shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by <i>sysconf()</i> shall
14249			either be -1 or 200xxxL.
14250		<code>_POSIX_JOB_CONTROL</code>	
14251			The implementation supports job control. This symbol shall always be set to a value greater
14252			than zero.
14253		<code>_POSIX_MAPPED_FILES</code>	
14254			The implementation supports memory mapped Files. This symbol shall always be set to the
14255			value 200xxxL.
14256	ML	<code>_POSIX_MEMLOCK</code>	
14257			The implementation supports the Process Memory Locking option. If this symbol is defined
14258			in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14259			by <i>sysconf()</i> shall either be -1 or 200xxxL.
14260	MLR	<code>_POSIX_MEMLOCK_RANGE</code>	
14261			The implementation supports the Range Memory Locking option. If this symbol is defined
14262			in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14263			by <i>sysconf()</i> shall either be -1 or 200xxxL.
14264		<code>_POSIX_MEMORY_PROTECTION</code>	
14265			The implementation supports memory protection. This symbol shall always be set to the
14266			value 200xxxL.
14267	MSG	<code>_POSIX_MESSAGE_PASSING</code>	
14268			The implementation supports the Message Passing option. If this symbol is defined in
14269			<unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
14270			<i>sysconf()</i> shall either be -1 or 200xxxL.
14271	MON	<code>_POSIX_MONOTONIC_CLOCK</code>	
14272			The implementation supports the Monotonic Clock option. If this symbol is defined in
14273			<unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
14274			<i>sysconf()</i> shall either be -1 or 200xxxL.

14275		<code>_POSIX_NO_TRUNC</code>	
14276			Pathname components longer than <code>{NAME_MAX}</code> generate an error. This symbol shall be
14277			defined with a value other than <code>-1</code> .
14278	PIO	<code>_POSIX_PRIORITIZED_IO</code>	
14279			The implementation supports the Prioritized Input and Output option. If this symbol is
14280			defined in <code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol
14281			reported by <code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14282	PS	<code>_POSIX_PRIORITY_SCHEDULING</code>	
14283			The implementation supports the Process Scheduling option. If this symbol is defined in
14284			<code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by
14285			<code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14286	RS	<code>_POSIX_RAW_SOCKETS</code>	
14287			The implementation supports the Raw Sockets option. If this symbol is defined in
14288			<code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by
14289			<code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14290		<code>_POSIX_READER_WRITER_LOCKS</code>	
14291			The implementation supports read-write locks. This symbol shall always be set to the value
14292			<code>200xxxL</code> .
14293		<code>_POSIX_REALTIME_SIGNALS</code>	
14294			The implementation supports realtime signals. This symbol shall always be set to the value
14295			<code>200xxxL</code> .
14296		<code>_POSIX_REGEX</code>	
14297			The implementation supports the Regular Expression Handling option. This symbol shall
14298			always be set to a value greater than zero.
14299		<code>_POSIX_SAVED_IDS</code>	
14300			Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always be
14301			set to a value greater than zero.
14302		<code>_POSIX_SEMAPHORES</code>	
14303			The implementation supports semaphores. This symbol shall always be set to the value
14304			<code>200xxxL</code> .
14305	SHM	<code>_POSIX_SHARED_MEMORY_OBJECTS</code>	
14306			The implementation supports the Shared Memory Objects option. If this symbol is defined
14307			in <code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported
14308			by <code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14309		<code>_POSIX_SHELL</code>	
14310			The implementation supports the POSIX shell. This symbol shall always be set to a value
14311			greater than zero.
14312	SPN	<code>_POSIX_SPAWN</code>	
14313			The implementation supports the Spawn option. If this symbol is defined in <code><unistd.h></code> , it
14314			shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by <code>sysconf()</code> shall
14315			either be <code>-1</code> or <code>200xxxL</code> .
14316		<code>_POSIX_SPIN_LOCKS</code>	
14317			The implementation supports spin locks. This symbol shall always be set to the value
14318			<code>200xxxL</code> .
14319	SS	<code>_POSIX_SPORADIC_SERVER</code>	
14320			The implementation supports the Process Sporadic Server option. If this symbol is defined
14321			in <code><unistd.h></code> , it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported
14322			by <code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .

14323	SIO	<u>POSIX_SYNCHRONIZED_IO</u>
14324		The implementation supports the Synchronized Input and Output option. If this symbol is
14325		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14326		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14327	TSA	<u>POSIX_THREAD_ATTR_STACKADDR</u>
14328		The implementation supports the Thread Stack Address Attribute option. If this symbol is
14329		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14330		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14331	TSS	<u>POSIX_THREAD_ATTR_STACKSIZE</u>
14332		The implementation supports the Thread Stack Size Attribute option. If this symbol is
14333		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14334		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14335	TCT	<u>POSIX_THREAD_CPU_TIME</u>
14336		The implementation supports the Thread CPU-Time Clocks option. If this symbol is
14337		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14338		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14339	TPI	<u>POSIX_THREAD_PRIO_INHERIT</u>
14340		The implementation supports the Non-Robust Mutex Priority Inheritance option. If this
14341		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this
14342		symbol reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14343	TPP	<u>POSIX_THREAD_PRIO_PROTECT</u>
14344		The implementation supports the Non-Robust Mutex Priority Protection option. If this
14345		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this
14346		symbol reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14347	TPS	<u>POSIX_THREAD_PRIORITY_SCHEDULING</u>
14348		The implementation supports the Thread Execution Scheduling option. If this symbol is
14349		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14350		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14351	TSH	<u>POSIX_THREAD_PROCESS_SHARED</u>
14352		The implementation supports the Thread Process-Shared Synchronization option. If this
14353		symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this
14354		symbol reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14355	RPI	<u>POSIX_THREAD_ROBUST_PRIO_INHERIT</u>
14356		The implementation supports the Robust Mutex Priority Inheritance option. If this symbol
14357		is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14358		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14359	RPP	<u>POSIX_THREAD_ROBUST_PRIO_PROTECT</u>
14360		The implementation supports the Robust Mutex Priority Protection option. If this symbol is
14361		defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14362		reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14363		<u>POSIX_THREAD_SAFE_FUNCTIONS</u>
14364		The implementation supports thread-safe functions. This symbol shall always be set to the
14365		value 200xxxL.
14366	TSP	<u>POSIX_THREAD_SPORADIC_SERVER</u>
14367		The implementation supports the Thread Sporadic Server option. If this symbol is defined
14368		in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14369		by <i>sysconf</i> () shall either be -1 or 200xxxL.

14370		<code>_POSIX_THREADS</code>
14371		The implementation supports threads. This symbol shall always be set to the value
14372		<code>200xxxL</code> .
14373		<code>_POSIX_TIMEOUTS</code>
14374		The implementation supports timeouts. This symbol shall always be set to the value
14375		<code>200xxxL</code> .
14376		<code>_POSIX_TIMERS</code>
14377		The implementation supports timers. This symbol shall always be set to the value <code>200xxxL</code> .
14378	OB TRC	<code>_POSIX_TRACE</code>
14379		The implementation supports the Trace option. If this symbol is defined in <unistd.h>, it
14380		shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by <code>sysconf()</code> shall
14381		either be <code>-1</code> or <code>200xxxL</code> .
14382	OB TEF	<code>_POSIX_TRACE_EVENT_FILTER</code>
14383		The implementation supports the Trace Event Filter option. If this symbol is defined in
14384		<unistd.h>, it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by
14385		<code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14386	OB TRI	<code>_POSIX_TRACE_INHERIT</code>
14387		The implementation supports the Trace Inherit option. If this symbol is defined in
14388		<unistd.h>, it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by
14389		<code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14390	OB TRL	<code>_POSIX_TRACE_LOG</code>
14391		The implementation supports the Trace Log option. If this symbol is defined in <unistd.h>,
14392		it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported by <code>sysconf()</code>
14393		shall either be <code>-1</code> or <code>200xxxL</code> .
14394	TYM	<code>_POSIX_TYPED_MEMORY_OBJECTS</code>
14395		The implementation supports the Typed Memory Objects option. If this symbol is defined
14396		in <unistd.h>, it shall be defined to be <code>-1</code> , <code>0</code> , or <code>200xxxL</code> . The value of this symbol reported
14397		by <code>sysconf()</code> shall either be <code>-1</code> or <code>200xxxL</code> .
14398	OB	<code>_POSIX_V6_ILP32_OFF32</code>
14399		The implementation provides a C-language compilation environment with 32-bit int , long ,
14400		pointer , and off_t types.
14401	OB	<code>_POSIX_V6_ILP32_OFFBIG</code>
14402		The implementation provides a C-language compilation environment with 32-bit int , long ,
14403		and pointer types and an off_t type using at least 64 bits.
14404	OB	<code>_POSIX_V6_LP64_OFF64</code>
14405		The implementation provides a C-language compilation environment with 32-bit int and
14406		64-bit long , pointer , and off_t types.
14407	OB	<code>_POSIX_V6_LP64_OFFBIG</code>
14408		The implementation provides a C-language compilation environment with an int type
14409		using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14410		<code>_POSIX_V7_ILP32_OFF32</code>
14411		The implementation provides a C-language compilation environment with 32-bit int , long ,
14412		pointer , and off_t types.
14413		<code>_POSIX_V7_ILP32_OFFBIG</code>
14414		The implementation provides a C-language compilation environment with 32-bit int , long ,
14415		and pointer types and an off_t type using at least 64 bits.

14416		<code>_POSIX_V7_LP64_OFF64</code>	
14417			The implementation provides a C-language compilation environment with 32-bit int and
14418			64-bit long , pointer , and off_t types.
14419		<code>_POSIX_V7_LPBIG_OFFBIG</code>	
14420			The implementation provides a C-language compilation environment with an int type
14421			using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14422		<code>_POSIX2_C_BIND</code>	
14423			The implementation supports the C-Language Binding option. This symbol shall always
14424			have the value 200xxxL.
14425	CD	<code>_POSIX2_C_DEV</code>	
14426			The implementation supports the C-Language Development Utilities option. If this symbol
14427			is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14428			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14429		<code>_POSIX2_CHAR_TERM</code>	
14430			The implementation supports at least one terminal type.
14431	FD	<code>_POSIX2_FORT_DEV</code>	
14432			The implementation supports the FORTRAN Development Utilities option. If this symbol
14433			is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14434			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14435	FR	<code>_POSIX2_FORT_RUN</code>	
14436			The implementation supports the FORTRAN Runtime Utilities option. If this symbol is
14437			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14438			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14439		<code>_POSIX2_LOCALEDEF</code>	
14440			The implementation supports the creation of locales by the <i>localedef</i> utility. If this symbol is
14441			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14442			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14443	OB BE	<code>_POSIX2_PBS</code>	
14444			The implementation supports the Batch Environment Services and Utilities option. If this
14445			symbol is defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this
14446			symbol reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14447	OB BE	<code>_POSIX2_PBS_ACCOUNTING</code>	
14448			The implementation supports the Batch Accounting option. If this symbol is defined in
14449			<unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
14450			<i>sysconf</i> () shall either be -1 or 200xxxL.
14451	OB BE	<code>_POSIX2_PBS_CHECKPOINT</code>	
14452			The implementation supports the Batch Checkpoint/Restart option. If this symbol is
14453			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14454			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.
14455	OB BE	<code>_POSIX2_PBS_LOCATE</code>	
14456			The implementation supports the Locate Batch Job Request option. If this symbol is defined
14457			in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14458			by <i>sysconf</i> () shall either be -1 or 200xxxL.
14459	OB BE	<code>_POSIX2_PBS_MESSAGE</code>	
14460			The implementation supports the Batch Job Message Request option. If this symbol is
14461			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14462			reported by <i>sysconf</i> () shall either be -1 or 200xxxL.

14463	OB BE	<u>POSIX2_PBS_TRACK</u>	
14464			The implementation supports the Track Batch Job Request option. If this symbol is defined
14465			in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14466			by <i>sysconf()</i> shall either be -1 or 200xxxL.
14467	SD	<u>POSIX2_SW_DEV</u>	
14468			The implementation supports the Software Development Utilities option. If this symbol is
14469			defined in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol
14470			reported by <i>sysconf()</i> shall either be -1 or 200xxxL.
14471	UP	<u>POSIX2_UPE</u>	
14472			The implementation supports the User Portability Utilities option. If this symbol is defined
14473			in <unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported
14474			by <i>sysconf()</i> shall either be -1 or 200xxxL.
14475	XSI	<u>XOPEN_CRYPT</u>	
14476			The implementation supports the X/Open Encryption Option Group.
14477		<u>XOPEN_ENH_I18N</u>	
14478			The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option
14479			Group. This symbol shall always be set to a value other than -1.
14480		<u>XOPEN_REALTIME</u>	
14481			The implementation supports the X/Open Realtime Option Group.
14482		<u>XOPEN_REALTIME_THREADS</u>	
14483			The implementation supports the X/Open Realtime Threads Option Group.
14484		<u>XOPEN_SHM</u>	
14485			The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This
14486			symbol shall always be set to a value other than -1.
14487	OB XSR	<u>XOPEN_STREAMS</u>	
14488			The implementation supports the XSI STREAMS Option Group.
14489	XSI	<u>XOPEN_UNIX</u>	
14490			The implementation supports the XSI option.
14491	UU	<u>XOPEN_UUCP</u>	
14492			The implementation supports the UUCP Utilities option. If this symbol is defined in
14493			<unistd.h>, it shall be defined to be -1, 0, or 200xxxL. The value of this symbol reported by
14494			<i>sysconf()</i> shall be either -1 or 200xxxL.

14495 Execution-Time Symbolic Constants

14496 If any of the following symbolic constants are not defined in the <unistd.h> header, the value
 14497 shall vary depending on the file to which it is applied. If defined, they shall have values suitable
 14498 for use in #if preprocessing directives.

14499 If any of the following symbolic constants are defined to have value -1 in the <unistd.h> header,
 14500 the implementation shall not provide the option on any file; if any are defined to have a value
 14501 other than -1 in the <unistd.h> header, the implementation shall provide the option on all
 14502 applicable files.

14503 All of the following values, whether defined as symbolic constants in <unistd.h> or not, may be
 14504 queried with respect to a specific file using the *pathconf()* or *fpathconf()* functions:

14505 _POSIX_ASYNC_IO
 14506 Asynchronous input or output operations may be performed for the associated file.

14507 _POSIX_PRIO_IO
 14508 Prioritized input or output operations may be performed for the associated file.

14509 _POSIX_SYNC_IO
 14510 Synchronized input or output operations may be performed for the associated file.

14511 If the following symbolic constants are defined in the <unistd.h> header, they apply to files and |
 14512 all paths in all file systems on the implementation:

14513 _POSIX_TIMESTAMP_RESOLUTION
 14514 The resolution in nanoseconds for all file timestamps. |

14515 _POSIX2_SYMLINKS
 14516 Symbolic links can be created. +

14517 **Constants for Functions**

14518 The <unistd.h> header shall define NULL as described in <stddef.h>. |

14519 The <unistd.h> header shall define the following symbolic constants for use with the *access()* |
 14520 function. The values shall be suitable for use in **#if** preprocessing directives.

14521 F_OK Test for existence of file.

14522 R_OK Test for read permission.

14523 W_OK Test for write permission.

14524 X_OK Test for execute (search) permission.

14525 The constants F_OK, R_OK, W_OK, and X_OK and the expressions R_OK|W_OK, R_OK|X_OK,
 14526 and R_OK|W_OK|X_OK shall all have distinct values.

14527 The <unistd.h> header shall define the following symbolic constants for the *confstr()* function: |

14528 _CS_PATH
 14529 This is the value for the *PATH* environment variable that finds all standard utilities.

14530 _CS_POSIX_V7_ILP32_OFF32_CFLAGS
 14531 If *sysconf(SC_V7_ILP32_OFF32)* returns -1 , the meaning of this value is unspecified.
 14532 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
 14533 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14534 _CS_POSIX_V7_ILP32_OFF32_LDFLAGS
 14535 If *sysconf(SC_V7_ILP32_OFF32)* returns -1 , the meaning of this value is unspecified.
 14536 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
 14537 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14538 _CS_POSIX_V7_ILP32_OFF32_LIBS
 14539 If *sysconf(SC_V7_ILP32_OFF32)* returns -1 , the meaning of this value is unspecified.
 14540 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
 14541 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14542 _CS_POSIX_V7_ILP32_OFFBIG_CFLAGS
 14543 If *sysconf(SC_V7_ILP32_OFFBIG)* returns -1 , the meaning of this value is unspecified.
 14544 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
 14545 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14546 **off_t** type using at least 64 bits.

14547 _CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS
 14548 If *sysconf(SC_V7_ILP32_OFFBIG)* returns -1 , the meaning of this value is unspecified.
 14549 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
 14550 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an

14551 **off_t** type using at least 64 bits.

14552 **_CS_POSIX_V7_ILP32_OFFBIG_LIBS**
 14553 If *sysconf*(**_SC_V7_ILP32_OFFBIG**) returns -1 , the meaning of this value is unspecified.
 14554 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
 14555 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14556 **off_t** type using at least 64 bits.

14557 **_CS_POSIX_V7_LP64_OFF64_CFLAGS**
 14558 If *sysconf*(**_SC_V7_LP64_OFF64**) returns -1 , the meaning of this value is unspecified.
 14559 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
 14560 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14561 types.

14562 **_CS_POSIX_V7_LP64_OFF64_LDFLAGS**
 14563 If *sysconf*(**_SC_V7_LP64_OFF64**) returns -1 , the meaning of this value is unspecified.
 14564 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
 14565 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14566 types.

14567 **_CS_POSIX_V7_LP64_OFF64_LIBS**
 14568 If *sysconf*(**_SC_V7_LP64_OFF64**) returns -1 , the meaning of this value is unspecified.
 14569 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
 14570 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14571 types.

14572 **_CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS**
 14573 If *sysconf*(**_SC_V7_LPBIG_OFFBIG**) returns -1 , the meaning of this value is unspecified.
 14574 Otherwise, this value is the set of initial options to be given to the *c99* utility to build an
 14575 application using a programming model with an **int** type using at least 32 bits and **long**,
 14576 **pointer**, and **off_t** types using at least 64 bits.

14577 **_CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS**
 14578 If *sysconf*(**_SC_V7_LPBIG_OFFBIG**) returns -1 , the meaning of this value is unspecified.
 14579 Otherwise, this value is the set of final options to be given to the *c99* utility to build an
 14580 application using a programming model with an **int** type using at least 32 bits and **long**,
 14581 **pointer**, and **off_t** types using at least 64 bits.

14582 **_CS_POSIX_V7_LPBIG_OFFBIG_LIBS**
 14583 If *sysconf*(**_SC_V7_LPBIG_OFFBIG**) returns -1 , the meaning of this value is unspecified.
 14584 Otherwise, this value is the set of libraries to be given to the *c99* utility to build an
 14585 application using a programming model with an **int** type using at least 32 bits and **long**,
 14586 **pointer**, and **off_t** types using at least 64 bits.

14587 **_CS_POSIX_V7_WIDTH_RESTRICTED_ENVS**
 14588 This value is a <newline>-separated list of names of programming environments supported
 14589 by the implementation in which the widths of the **blksize_t**, **cc_t**, **mode_t**, **nfds_t**, **pid_t**,
 14590 **ptrdiff_t**, **size_t**, **speed_t**, **ssize_t**, **suseconds_t**, **tcflag_t**, **wchar_t**, and **wint_t** types are no
 14591 greater than the width of type **long**. The format of each name shall be suitable for use with
 14592 the *getconf* $-v$ option.

14593 **_CS_V7_ENV**
 14594 This is the value that provides the environment variable information (other than that
 14595 provided by **_CS_PATH**) that is required by the implementation to create a conforming
 14596 environment, as described in the implementation's conformance documentation.

14597	OB	The following symbolic constants are reserved for compatibility with Issue 6:

14863     int          unlink(const char *);
14864     int          unlinkat(int, const char *, int);
14865     ssize_t      write(int, const void *, size_t);

```

14866 Implementations may also include the *pthread_atfork()* prototype as defined in <pthread.h>.

14867 The following external variables shall be declared:

```

14868     extern char  *optarg;
14869     extern int   opterr, optind, optopt;

```

14870 APPLICATION USAGE

14871 POSIX.1-200x only describes the behavior of systems that claim conformance to it. However,
 14872 application developers who want to write applications that adapt to other versions of this
 14873 standard (or to systems that do not conform to any POSIX standard) may find it useful to code
 14874 them so as to conditionally compile different code depending on the value of
 14875 `_POSIX_VERSION`, for example:

```

14876     #if _POSIX_VERSION >= 200112L
14877     /* Use the newer function that copes with large files. */
14878     off_t pos=ftello(fp);
14879     #else
14880     /* Either this is an old version of POSIX, or _POSIX_VERSION is
14881        not even defined, so use the traditional function. */
14882     long pos=ftell(fp);
14883     #endif

```

14884 Earlier versions of POSIX.1-200x and of the Single UNIX Specification can be identified by the
 14885 following macros:

```

14886     POSIX.1-1988 standard
14887         _POSIX_VERSION == 198808L
14888     POSIX.1-1990 standard
14889         _POSIX_VERSION == 199009L
14890     ISO POSIX-1:1996 standard
14891         _POSIX_VERSION == 199506L
14892     Single UNIX Specification, Version 1
14893         _XOPEN_UNIX and _XOPEN_VERSION == 4

```

14894 Single UNIX Specification, Version 2
 14895 `_XOPEN_UNIX` and `_XOPEN_VERSION == 500` |

14896 ISO POSIX-1:2001 and Single UNIX Specification, Version 3
 14897 `_POSIX_VERSION == 200112L`, plus (if the XSI option is supported) `_XOPEN_UNIX` and |
 14898 `_XOPEN_VERSION == 600`

14899 POSIX.1-200x does not make any attempt to define application binary interaction with the
 14900 underlying operating system. However, application developers may find it useful to query
 14901 `_SC_VERSION` at runtime via `sysconf()` to determine whether the current version of the
 14902 operating system supports the necessary functionality as in the following program fragment:

```
14903 if (sysconf(_SC_VERSION) < 200xxxL) {
14904     fprintf(stderr, "POSIX.1-200x system required, terminating \n");
14905     exit(1);
14906 }
```

14907 New applications should not use `_XOPEN_SHM` or `_XOPEN_ENH_I18N`.

14908 RATIONALE

14909 As POSIX.1-200x evolved, certain options became sufficiently standardized that it was
 14910 concluded that simply requiring one of the option choices was simpler than retaining the option.
 14911 However, for backwards-compatibility, the option flags (with required constant values) are
 14912 retained.

14913 Version Test Macros

14914 The standard developers considered altering the definition of `_POSIX_VERSION` and removing
 14915 `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed
 14916 by some to be minimal, and since the implementation of the functionality is potentially
 14917 problematic. However, they recognized that support for existing application binaries is a
 14918 concern to manufacturers, application developers, and the users of implementations conforming
 14919 to POSIX.1-200x.

14920 While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide
 14921 the greatest degree of imaginable utility to the application developer or user, it is arguably better
 14922 than a **core** file or some other equally obscure result. (It is also possible for implementations to
 14923 encode and recognize application binaries compiled in various POSIX.1-conforming
 14924 environments, and modify the semantics of the underlying system to conform to the
 14925 expectations of the application.) For the reasons outlined in the preceding paragraphs and in the
 14926 APPLICATION USAGE section, the standard developers elected to retain the `_POSIX_VERSION`
 14927 and `_SC_VERSION` functionality.

14928 Compile-Time Symbolic Constants for System-Wide Options

14929 POSIX.1-200x includes support in certain areas for the newly adopted policy governing options
 14930 and stubs.

14931 This policy provides flexibility for implementations in how they support options. It also
 14932 specifies how conforming applications can adapt to different implementations that support
 14933 different sets of options. It allows the following:

- 14934 1. If an implementation has no interest in supporting an option, it does not have to provide
 14935 anything associated with that option beyond the announcement that it does not support
 14936 it.
- 14937 2. An implementation can support a partial or incompatible version of an option (as a non-
 14938 standard extension) as long as it does not claim to support the option.

- 14939 3. An application can determine whether the option is supported. A strictly conforming
 14940 application must check this announcement mechanism before first using anything
 14941 associated with the option.

14942 There is an important implication of this policy. POSIX.1-200x cannot dictate the behavior of
 14943 interfaces associated with an option when the implementation does not claim to support the
 14944 option. In particular, it cannot require that a function associated with an unsupported option
 14945 will fail if it does not perform as specified. However, this policy does not prevent a standard
 14946 from requiring certain functions to always be present, but that they shall always fail on some
 14947 implementations. The *setpgid()* function in the POSIX.1-1990 standard, for example, is
 14948 considered appropriate.

14949 The POSIX standards include various options, and the C-language binding support for an
 14950 option implies that the implementation must supply data types and function interfaces. An
 14951 application must be able to discover whether the implementation supports each option.

14952 Any application must consider the following three cases for each option:

- 14953 1. Option never supported.

14954 The implementation advertises at compile time that the option will never be supported.
 14955 In this case, it is not necessary for the implementation to supply any of the data types or
 14956 function interfaces that are provided only as part of the option. The implementation
 14957 might provide data types and functions that are similar to those defined by POSIX.1-200x,
 14958 but there is no guarantee for any particular behavior.

- 14959 2. Option always supported.

14960 The implementation advertises at compile time that the option will always be supported.
 14961 In this case, all data types and function interfaces shall be available and shall operate as
 14962 specified.

- 14963 3. Option might or might not be supported.

14964 Some implementations might not provide a mechanism to specify support of options at
 14965 compile time. In addition, the implementation might be unable or unwilling to specify
 14966 support or non-support at compile time. In either case, any application that might use the
 14967 option at runtime must be able to compile and execute. The implementation must
 14968 provide, at compile time, all data types and function interfaces that are necessary to allow
 14969 this. In this situation, there must be a mechanism that allows the application to query, at
 14970 runtime, whether the option is supported. If the application attempts to use the option
 14971 when it is not supported, the result is unspecified unless explicitly specified otherwise in
 14972 POSIX.1-200x.

14973 FUTURE DIRECTIONS

14974 None.

CHANGE HISTORY14984
14985

First released in Issue 1. Derived from Issue 1 of the SVID.

14986
14987
14988**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

14989
14990
14991

The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added. `_POSIX2_C_BIND`, `_XOPEN_ENH_I18N`, and `_XOPEN_SHM` must now be set to a value other than `-1` by a conforming implementation.

14992

Large File System extensions are added.

14993

The type of the argument to `sbrk()` is changed from `int` to `intptr_t`.

14994
14995
14996

`_XBS_` constants are added to the list of constants for Options and Option Groups, to the list of constants for the `confstr()` function, and to the list of constants to the `sysconf()` function. These are all marked EX.

14997

Issue 6

14998

`_POSIX2_C_VERSION` is removed.

14999

The Open Group Corrigendum U026/4 is applied, adding the prototype for `fdatasync()`.

15000
15001

The Open Group Corrigendum U026/1 is applied, adding the symbols `_SC_XOPEN_LEGACY`, `_SC_XOPEN_REALTIME`, and `_SC_XOPEN_REALTIME_THREADS`.

15002
15003

The symbols `_XOPEN_STREAMS` and `_SC_XOPEN_STREAMS` are added to support the XSI STREAMS Option Group.

15004
15005

Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in IEEE Std 1003.1-2001.

15006

The LEGACY symbol `_SC_PASS_MAX` is removed.

15007
15008

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

15009

- The `_CS_POSIX_*` and `_CS_XBS5_*` constants are added for the `confstr()` function.

15010

- The `_SC_XBS5_*` constants are added for the `sysconf()` function.

15011

- The symbolic constants `F_ULOCK`, `F_LOCK`, `F_TLOCK`, and `F_TEST` are added.

15012

- The `uid_t`, `gid_t`, `off_t`, `pid_t`, and `useconds_t` types are mandated.

15013

The `gethostname()` prototype is added for sockets.

15014

A new section is added for System-Wide Options.

15015

Function prototypes for `setegid()` and `seteuid()` are added.

15016

Option symbolic constants are added for `_POSIX_ADVISORY_INFO`, `_POSIX_CPUTIME`, `_POSIX_SPAWN`, `_POSIX_SPORADIC_SERVER`, `_POSIX_THREAD_CPUTIME`, `_POSIX_THREAD_SPORADIC_SERVER`, and `_POSIX_TIMEOUTS`, and `pathconf()` variables are added for `_PC_ALLOC_SIZE_MIN`, `_PC_REC_INCR_XFER_SIZE`, `_PC_REC_MAX_XFER_SIZE`, `_PC_REC_MIN_XFER_SIZE`, and `_PC_REC_XFER_ALIGN` for alignment with IEEE Std 1003.1d-1999.

15022

The following are added for alignment with IEEE Std 1003.1j-2000:

15023

- Option symbolic constants `_POSIX_BARRIERS`, `_POSIX_CLOCK_SELECTION`, `_POSIX_MONOTONIC_CLOCK`, `_POSIX_READER_WRITER_LOCKS`, `_POSIX_SPIN_LOCKS`, and `_POSIX_TYPED_MEMORY_OBJECTS`

15024

15025

15026 • *sysconf()* variables `_SC_BARRIERS`, `_SC_CLOCK_SELECTION`,
15027 `_SC_MONOTONIC_CLOCK`, `_SC_READER_WRITER_LOCKS`, `_SC_SPIN_LOCKS`, and
15028 `_SC_TYPED_MEMORY_OBJECTS`

15029 The `_SC_XBS5` macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY,
15030 and new equivalent `_SC_V6` macros associated with the ISO/IEC 9899:1999 standard are
15031 introduced.

15032 The *getwd()* function is marked LEGACY.

15033 The **restrict** keyword is added to the prototypes for *readlink()* and *swab()*.

15034 Constants for options are now harmonized, so when supported they take the year of approval of
15035 IEEE Std 1003.1-2001 as the value.

15036 The following are added for alignment with IEEE Std 1003.1q-2000:

15037 • Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`,
15038 `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`

15039 • The *sysconf()* symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`,
15040 `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`

15041 The *brk()* and *sbrk()* LEGACY functions are removed.

15042 The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning
15043 information.

15044 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter for
15045 *gethostname()* from `socklen_t` to `size_t`.

15046 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack
15047 Address Size” to “Thread Stack Size Attribute”.

15048 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`,
15049 `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.

15050 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description
15051 in “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`,
15052 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.

15053 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for
15054 the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.

15055 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/23 is applied, adding the
15056 `_PC_SYMLINK_MAX` and `_SC_SYMLINK_MAX` constants.

15057 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/24 is applied, correcting the shading and
15058 margin code for the *fsync()* function.

15059 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/25 is applied, adding the following text to
15060 the APPLICATION USAGE section: “New applications should not use `_XOPEN_SHM` or
15061 `_XOPEN_ENH_I18N`.”.

15062 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/29 is applied, clarifying the requirements
15063 for when constants for Options and Option Groups can be defined or undefined.

15064 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/30 is applied, changing the
15065 `_V6_ILP32_OFF32`, `_V6_ILP32_OFFBIG`, `_V6_LP64_OFF64`, and `_V6_LPBIG_OFFBIG` symbols to
15066 `_POSIX_V6_ILP32_OFF32`, `_POSIX_V6_ILP32_OFFBIG`, `_POSIX_V6_LP64_OFF64`, and
15067 `_POSIX_V6_LPBIG_OFFBIG`, respectively. This is for consistency with the *sysconf()* and *c99*
15068 reference pages.

15069 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/31 is applied, adding that the format of

15070 names of programming environments can be obtained using the *getconf* -v option.

15071 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/32 is applied, deleting the
15072 *_SC_FILE_LOCKING*, *_SC_2_C_VERSION*, and *_SC_XOPEN_XCU_VERSION* constants.

15073 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/33 is applied, adding
15074 *_SC_SS_REPL_MAX*, *_SC_TRACE_EVENT_NAME_MAX*, *_SC_TRACE_NAME_MAX*,
15075 *_SC_TRACE_SYS_MAX*, and *_SC_TRACE_USER_EVENT_MAX* to the list of symbolic constants
15076 for *sysconf*().

15077 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/34 is applied, updating the prototype for
15078 the *symlink*() function to match that in the System Interfaces volume of IEEE Std 1003.1-2001.

15079 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/35 is applied, adding *_PC_2_SYMLINKS*
15080 to the symbolic constants list for *pathconf*(). This corresponds to the definition of
15081 *POSIX2_SYMLINKS* in the Shell and Utilities volume of IEEE Std 1003.1-2001.

15082 **Issue 7**

15083 Austin Group Interpretations 1003.1-2001 #026 and #047 are applied. +

15084 SD5-XBD-ERN-41 is applied, adding the *_POSIX2_SYMLINKS* constant.

15085 SD5-XBD-ERN-76 and SD5-XBD-ERN-77 are applied. |

15086 Symbols to support the UUCP Utilities option are added.

15087 The variables for the supported programming environments are updated to be V7.

15088 The LEGACY and obsolescent symbols are removed.

15089 The *faccessat*(), *fchownat*(), *fexecve*(), *linkat*(), *readlinkat*(), *symlinkat*(), and *unlinkat*() functions -
15090 are added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

15091 The *_POSIX_TRACE** constants from the Trace option are marked obsolescent.

15092 The *_POSIX2_PBS** constants from the Batch Environment Services and Utilities option are
15093 marked obsolescent.

15094 Functionality relating to the Asynchronous Input and Output, Barriers, Clock Selection, Memory
15095 Mapped Files, Memory Protection, Realtime Signals Extension, Semaphores, Spin Locks,
15096 Threads, Timeouts, and Timers options is moved to the Base.

15097 Functionality relating to the Thread Priority Protection and Thread Priority Inheritance options
15098 is changed to be Non-Robust Mutex or Robust Mutex Priority Protection and Non-Robust Mutex
15099 or Robust Mutex Priority Inheritance, respectively.

15100 This reference page is clarified with respect to macros and symbolic constants. +

15101 Changes are made related to support for finegrained timestamps and the +
15102 *_POSIX_TIMESTAMP_RESOLUTION* constant is added.

15103 **NAME**
 15104 `utime.h` — access and modification times structure

15105 **SYNOPSIS**
 15106 OB `#include <utime.h>`

15107 **DESCRIPTION**
 15108 The <**utime.h**> header shall declare the structure **utimbuf**, which shall include the following
 15109 members:

15110 `time_t` `actime` Access time.
 15111 `time_t` `modtime` Modification time.

15112 The times shall be measured in seconds since the Epoch.

15113 The type **time_t** shall be defined as described in <**sys/types.h**>.

15114 The following shall be declared as a function and may also be defined as a macro. A function
 15115 prototype shall be provided.

15116 `int utime(const char *, const struct utimbuf *);`

15117 **APPLICATION USAGE**
 15118 The `utime()` function only allows setting file timestamps to the nearest second. Applications |
 15119 should use the `utimensat()` function instead. See <**sys/stat.h**>.

15120 **RATIONALE**
 15121 None.

15122 **FUTURE DIRECTIONS**
 15123 The <**utime.h**> header may be removed in a future version. |

15124 **SEE ALSO**
 15125 [<sys/stat.h>](#), [<sys/types.h>](#)
 15126 XSH [futimens\(\)](#), [utime\(\)](#) |

15127 **CHANGE HISTORY**
 15128 First released in Issue 3.

15129 **Issue 6**
 15130 The following new requirements on POSIX implementations derive from alignment with the
 15131 Single UNIX Specification:
 15132 • The **time_t** type is defined.

15133 **Issue 7**
 15134 The <**utime.h**> header is marked obsolescent. +

15135 **NAME**
 15136 utmpx.h — user accounting database definitions

15137 **SYNOPSIS**
 15138 XSI `#include <utmpx.h>`

15139 **DESCRIPTION**
 15140 The <utmpx.h> header shall define the **utmpx** structure that shall include at least the following
 15141 members:

15142	char	ut_user[]	User login name.
15143	char	ut_id[]	Unspecified initialization process identifier.
15144	char	ut_line[]	Device name.
15145	pid_t	ut_pid	Process ID.
15146	short	ut_type	Type of entry.
15147	struct timeval	ut_tv	Time entry was made.

15148 The **pid_t** type shall be defined through **typedef** as described in <sys/types.h>.

15149 The **timeval** structure shall be defined as described in <sys/time.h>.

15150 Inclusion of the <utmpx.h> header may also make visible all symbols from <sys/time.h>.

15151 The following symbolic constants shall be defined as possible values for the *ut_type* member of
 15152 the **utmpx** structure:

15153	EMPTY	No valid user accounting information.
15154	BOOT_TIME	Identifies time of system boot.
15155	OLD_TIME	Identifies time when system clock changed.
15156	NEW_TIME	Identifies time after system clock changed.
15157	USER_PROCESS	Identifies a process.
15158	INIT_PROCESS	Identifies a process spawned by the init process.
15159	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
15160	DEAD_PROCESS	Identifies a session leader who has exited.

15161 The following shall be declared as functions and may also be defined as macros. Function
 15162 prototypes shall be provided.

```

15163 void          endutxent(void);
15164 struct utmpx *getutxent(void);
15165 struct utmpx *getutxid(const struct utmpx *);
15166 struct utmpx *getutxline(const struct utmpx *);
15167 struct utmpx *pututxline(const struct utmpx *);
15168 void          setutxent(void);

```

<utmpx.h>*Headers*

15169 **APPLICATION USAGE**
15170 None.

15171 **RATIONALE**
15172 None.

15173 **FUTURE DIRECTIONS**
15174 None.

15176 [<sys/time.h>](#), [<sys/types.h>](#)
15177 XSH *endutxent()*

15178 **CHANGE HISTORY**
15179 First released in Issue 4, Version 2.

15180 **NAME**

15181 wchar.h — wide-character handling

15182 **SYNOPSIS**

15183 #include <wchar.h>

15184 **DESCRIPTION**

15185 CX Some of the functionality described on this reference page extends the ISO C standard.
 15186 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 15187 enable the visibility of these symbols in this header.

15188 The <wchar.h> header shall define the following types:

15189 **wchar_t** As described in <stddef.h>.15190 **wint_t** An integer type capable of storing any valid value of **wchar_t** or WEOF.

15191 OB XSI **wctype_t** A scalar type of a data object that can hold values which represent locale-
 15192 specific character classification.

15193 **mbstate_t** An object type other than an array type that can hold the conversion state
 15194 information necessary to convert between sequences of (possibly multi-byte)
 15195 CX characters and wide characters. If a codeset is being used such that an
 15196 **mbstate_t** needs to preserve more than two levels of reserved state, the results
 15197 are unspecified.

15198 CX **FILE** As described in <stdio.h>.15199 **size_t** As described in <stddef.h>.15200 CX **va_list** As described in <stdarg.h>.

15201 The implementation shall support one or more programming environments in which the width
 15202 of **wint_t** is no greater than the width of type **long**. The names of these programming
 15203 environments can be obtained using the *confstr()* function or the *getconf* utility.

15204 The <wchar.h> header shall define the following macros: +

15205 WCHAR_MAX As described in <stdint.h>. +

15206 WCHAR_MIN As described in <stdint.h>. +

15207 WEOF Constant expression of type **wint_t** that is returned by several WP functions to +
 15208 indicate end-of-file. +

15209 NULL As described in <stddef.h>. +

15210 The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are +
 15211 described in the header <time.h>. +

15212 CX Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>, +
 15213 <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>. +

15214 The following shall be declared as functions and may also be defined as macros. Function
 15215 prototypes shall be provided for use with ISO C standard compilers.

15216 wint_t btowc(int);

15217 wint_t fgetwc(FILE *);

15218 wchar_t *fgetws(wchar_t *restrict, int, FILE *restrict);

15219 wint_t fputwc(wchar_t, FILE *);

15220 int fputws(const wchar_t *restrict, FILE *restrict);

15221 int fwide(FILE *, int);

```

APPLICATION USAGE

15319 The *iswblank()* function was a late addition to the ISO C standard and was introduced at the
15320 same time as the ISO C standard introduced <wctype.h>, which contains all of the *isw*()*
15321 functions. The Open Group Base Specifications had previously aligned with the MSE working
15322 draft and had introduced the rest of the *isw*()* functions into <wchar.h>. For backwards-
15323 compatibility, the original set of *isw*()* functions, without *iswblank()*, are permitted (as part of
15324 the XSI option) in <wchar.h>. For maximum portability, applications should include
15325 <wctype.h> in order to obtain declarations for the *isw*()* functions. This compatibility has been
15326 made obsolescent.

15369**RATIONALE**

In the ISO C standard, the symbols referenced as XSI extensions are in <wctype.h>. Their presence here is thus an extension.

FUTURE DIRECTIONS

None.

XCU *getconf*

CHANGE HISTORY

First released in Issue 4.

Issue 5

Aligned with the ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth()* and *wcwidth()* are marked as extensions.

The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit()* function.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- Various function prototypes are updated to add the **restrict** keyword.
- The functions *vwscanf()*, *vwscanf()*, *wcstof()*, *wcstold()*, *wcstoll()*, and *wcstoull()* are added.

The type **wctype_t**, the *isw*()*, *to*()*, and *wctype()* functions are marked as XSI extensions.

IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/26 is applied, adding the APPLICATION USAGE section.

Issue 7

The *mbsnrtowcs()*, *open_wmemstream()*, *wcpcpy()*, *wcpncpy()*, *wcscasecmp()*, *wcsdup()*, *wcsncasecmp()*, *wcsnlen()*, and *wcsnrtombs()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The *wcscasecmp_l()*, *wcsncasecmp_l()*, *wscoll_l()*, and *wcsxfrm_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

The **wctype_t** type, and the *isw**, *towlower()*, and *towupper()* functions are marked obsolescent in <wchar.h> since the ISO C standard requires the declarations to be in <wctype.h>.

This reference page is clarified with respect to macros and symbolic constants.

15370 **NAME**

15371 wctype.h — wide-character classification and mapping utilities

15372 **SYNOPSIS**

15373 #include <wctype.h>

15374 **DESCRIPTION**

15375 CX Some of the functionality described on this reference page extends the ISO C standard.
 15376 Applications shall define the appropriate feature test macro (see XSH Section 2.2, on page 448) to
 15377 enable the visibility of these symbols in this header.

15378 The <wctype.h> header shall define the following types:

15379 **wint_t** As described in <wchar.h>.15380 **wctrans_t** A scalar type that can hold values which represent locale-specific character
15381 mappings.15382 **wctype_t** As described in <wchar.h>.15383 CX The <ctype.h> header shall provide a definition for a type **locale_t** as defined in <locale.h>.

15384 The <wctype.h> header shall define the following macro: +

15385 WEOF As described in <wchar.h>. +

15386 For all functions described in this header that accept an argument of type **wint_t**, the value is +
 15387 representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value, +
 15388 the behavior is undefined. +

15389 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale. +

15390 CX Inclusion of the <wctype.h> header may make visible all symbols from the headers <ctype.h>, +
 15391 <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>. +

15392 The following shall be declared as functions and may also be defined as macros. Function
 15393 prototypes shall be provided for use with ISO C standard compilers.

15394 int iswalnum(wint_t);

15395 CX int iswalnum_l(wint_t, locale_t);

15396 int iswalpha(wint_t);

15397 CX int iswalpha_l(wint_t, locale_t);

15398 int iswblank(wint_t);

15399 CX int iswblank_l(wint_t, locale_t);

15400 int iswcntrl(wint_t);

15401 CX int iswcntrl_l(wint_t, locale_t);

15402 int iswctype(wint_t, wctype_t); +

15403 CX int iswctype_l(wint_t, wctype_t, locale_t); +

15404 int iswdigit(wint_t);

15405 CX int iswdigit_l(wint_t, locale_t);

15406 int iswgraph(wint_t);

15407 CX int iswgraph_l(wint_t, locale_t);

15408 int iswlower(wint_t);

15409 CX int iswlower_l(wint_t, locale_t);

15410 int iswprint(wint_t);

15411 CX int iswprint_l(wint_t, locale_t);

15412 int iswpunct(wint_t);

15413 CX int iswpunct_l(wint_t, locale_t);

15414 int iswspace(wint_t);

<wctype.h>

15442 **CHANGE HISTORY**

15443 First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

15444 **Issue 6**15445 The [iswblank\(\)](#) function is added for alignment with the ISO/IEC 9899:1999 standard.15446 **Issue 7**

15447 SD5-XBD-ERN-6 is applied.

15448 The [*_l\(\)](#) functions are added from The Open Group Technical Standard, 2006, Extended API Set
15449 Part 4.

15450 This reference page is clarified with respect to macros and symbolic constants.

15451 **NAME**
 15452 wordexp.h — word-expansion types

15453 **SYNOPSIS**
 15454 #include <wordexp.h>

15455 **DESCRIPTION**
 15456 The <wordexp.h> header shall define the structures and symbolic constants used by the
 15457 *wordexp()* and *wordfree()* functions.

15458 The structure type **wordexp_t** shall contain at least the following members:

15459 `size_t we_wordc` Count of words matched by *words*.
 15460 `char **we_wordv` Pointer to list of expanded words.
 15461 `size_t we_offs` Slots to reserve at the beginning of *we_wordv*.

15462 The <wordexp.h> header shall define the following symbolic constants for use as flags for the
 15463 *wordexp()* function:

15464 **WRDE_APPEND** Append words to those previously generated.
 15465 **WRDE_DOOFFS** Number of null pointers to prepend to *we_wordv*.
 15466 **WRDE_NOCMD** Fail if command substitution is requested.
 15467 **WRDE_REUSE** The *pwordexp* argument was passed to a previous successful call to
 15468 *wordexp()*, and has not been passed to *wordfree()*. The result is the same
 15469 as if the application had called *wordfree()* and then called *wordexp()*
 15470 without **WRDE_REUSE**.
 15471 **WRDE_SHOWERR** Do not redirect *stderr* to **/dev/null**.
 15472 **WRDE_UNDEF** Report error on an attempt to expand an undefined shell variable.

15473 The <wordexp.h> header shall define the following symbolic constants as error return values:

15474 **WRDE_BADCHAR** One of the unquoted characters—<newline>, '|', '&', ';', '<', '>',
 15475 '(', ')', '{', '}'—appears in *words* in an inappropriate context.
 15476 **WRDE_BADVAL** Reference to undefined shell variable when **WRDE_UNDEF** is set in *flags*.
 15477 **WRDE_CMDSUB** Command substitution requested when **WRDE_NOCMD** was set in *flags*.
 15478 **WRDE_NOSPACE** Attempt to allocate memory failed.
 15479 **WRDE_SYNTAX** Shell syntax error, such as unbalanced parentheses or unterminated
 15480 string.

15481 The <wordexp.h> header shall define the following type:

15482 **size_t** As described in <stddef.h>.

15483 The following shall be declared as functions and may also be defined as macros. Function
 15484 prototypes shall be provided.

15485 `int wordexp(const char *restrict, wordexp_t *restrict, int);`
 15486 `void wordfree(wordexp_t *);`

<wordexp.h>*Headers*

Volume 2:

15506

System Interfaces, Issue 7

15507

The Open Group

15508

The Institute of Electrical and Electronics Engineers, Inc.

The System Interfaces volume of POSIX.1-200x describes the interfaces offered to application programs by POSIX-conformant systems.

1.1 Relationship to Other Formal Standards

Great care has been taken to ensure that this volume of POSIX.1-200x is fully aligned with the following standards:

ISO C (1999)

ISO/IEC 9899:1999, Programming Languages — C.

Parts of the ISO/IEC 9899:1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of POSIX.1-200x. Some functions and headers included within this volume of POSIX.1-200x have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see [Section 1.7.1](#), on page 7). Any conflict between this volume of POSIX.1-200x and the ISO C standard is unintentional.

This volume of POSIX.1-200x also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

1.2 Format of Entries

The entries in [Chapter 3](#) are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

```
#include <stdio.h>
```

DESCRIPTION

This section describes the functionality of the function or header.

RETURN VALUE

This section indicates the possible return values, if any.

If the implementation can detect errors, “successful completion” means that no error has been detected during execution of the function. If the implementation does detect an error, the error is indicated.

For functions where no errors are defined, “successful completion” means that if the

15545 implementation checks for errors, no error has been detected. If the implementation can
15546 detect errors, and an error is detected, the indicated return value is returned and *errno*
15547 may be set.

15548 **ERRORS**

15549 This section gives the symbolic names of the error values returned by a function or
15550 stored into a variable accessed through the symbol *errno* if an error occurs.

15551 “No errors are defined” means that error values returned by a function or stored into a
15552 variable accessed through the symbol *errno*, if any, depend on the implementation.

15553 **EXAMPLES**

15554 This section is informative.

15555 This section gives examples of usage, where appropriate. In the event of conflict
15556 between an example and a normative part of this volume of POSIX.1-200x, the
15557 normative material is to be taken as correct.

15558 **APPLICATION USAGE**

15559 This section is informative.

15560 This section gives warnings and advice to application developers about the entry. In the
15561 event of conflict between warnings and advice and a normative part of this volume of
15562 POSIX.1-200x, the normative material is to be taken as correct.

15563 **RATIONALE**

15564 This section is informative.

15565 This section contains historical information concerning the contents of this volume of
15566 POSIX.1-200x and why features were included or discarded by the standard
15567 developers.

15568 **FUTURE DIRECTIONS**

15569 This section is informative.

15570 This section provides comments which should be used as a guide to current thinking;
15571 there is not necessarily a commitment to adopt these future directions.

15572 **SEE ALSO**

15573 This section is informative.

15574 This section gives references to related information.

15575 **CHANGE HISTORY**

15576 This section is informative.

15577 This section shows the derivation of the entry and any significant changes that have
15578 been made to it.

15579

15580

15581

15582

This chapter covers information that is relevant to all the functions specified in [Chapter 3](#) and [XBD Chapter 13](#) (on page 205).

15583

2.1 Use and Implementation of Functions

15584

15585

Each of the following statements shall apply unless explicitly stated otherwise in the detailed descriptions that follow:

15586

15587

15588

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.

15589

15590

15591

15592

15593

15594

15595

15596

2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the left parenthesis that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language `#undef` construct to remove any such macro definition shall also ensure that an actual function is referred to.

15597

15598

15599

15600

15601

3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments. Likewise, those function-like macros described in the following sections may be invoked in an expression anywhere a function with a compatible return type could be called.

15602

15603

15604

4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function explicitly and use it without including its associated header.

15605

15606

5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

15607 2.2 The Compilation Environment

15608 2.2.1 POSIX.1 Symbols

15609 Certain symbols in this volume of POSIX.1-200x are defined in headers (see XBD [Chapter 13](#), on
15610 page 205). Some of those headers could also define symbols other than those defined by
15611 POSIX.1-200x, potentially conflicting with symbols used by the application. Also, POSIX.1-200x
15612 defines symbols that are not permitted by other standards to appear in those headers without
15613 some control on the visibility of those symbols.

15614 Symbols called “feature test macros” are used to control the visibility of symbols that might be
15615 included in a header. Implementations, future versions of this standard, and other standards
15616 may define additional feature test macros.

15617 In the compilation of an application that **#defines** a feature test macro specified by
15618 POSIX.1-200x, no header defined by POSIX.1-200x shall be included prior to the definition of the
15619 feature test macro. This restriction also applies to any implementation-provided header in
15620 which these feature test macros are used. If the definition of the macro does not precede the
15621 **#include**, the result is undefined.

15622 Feature test macros shall begin with the underscore character (‘_’).

15623 2.2.1.1 The `_POSIX_C_SOURCE` Feature Test Macro

15624 A POSIX-conforming application should ensure that the feature test macro `_POSIX_C_SOURCE`
15625 is defined before inclusion of any header.

15626 When an application includes a header described by POSIX.1-200x, and when this feature test
15627 macro is defined to have the value `200xxxL`:

- 15628 1. All symbols required by POSIX.1-200x to appear when the header is included shall be
15629 made visible.
- 15630 2. Symbols that are explicitly permitted, but not required, by POSIX.1-200x to appear in that
15631 header (including those in reserved name spaces) may be made visible.
- 15632 3. Additional symbols not required or explicitly permitted by POSIX.1-200x to be in that
15633 header shall not be made visible, except when enabled by another feature test macro.

15634 Identifiers in POSIX.1-200x may only be undefined using the **#undef** directive as described in
15635 [Section 2.1](#) (on page 447) or [Section 2.2.2](#) (on page 449). These **#undef** directives shall follow all
15636 **#include** directives of any header in POSIX.1-200x.

15637 **Note:** The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been
15638 superseded by `_POSIX_C_SOURCE`.

15639 2.2.1.2 The `_XOPEN_SOURCE` Feature Test Macro

15640 XSI An XSI-conforming application should ensure that the feature test macro `_XOPEN_SOURCE` is
15641 defined with the value `700` before inclusion of any header. This is needed to enable the
15642 functionality described in [Section 2.2.1.1](#) and to ensure that the XSI option is enabled.

15643 Since this volume of POSIX.1-200x is aligned with the ISO C standard, and since all functionality
15644 enabled by `_POSIX_C_SOURCE` set equal to `200xxxL` is enabled by `_XOPEN_SOURCE` set equal
15645 to `700`, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so
15646 defined. Therefore, if `_XOPEN_SOURCE` is set equal to `700` and `_POSIX_C_SOURCE` is set equal
15647 to `200xxxL`, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to

15648 700. However, should `_POSIX_C_SOURCE` be set to a value greater than 200xxxL, the behavior
 15649 is unspecified.

15650 If `_XOPEN_SOURCE` is defined with the value 700 and `_POSIX_C_SOURCE` is undefined before
 15651 inclusion of any header, then the header may define the `_POSIX_C_SOURCE` macro with the
 15652 value 200xxxL.

15653 2.2.2 The Name Space

15654 All identifiers in this volume of POSIX.1-200x, except *environ*, are defined in at least one of the
 15655 XSI headers, as shown in XBD Chapter 13 (on page 205). When `_XOPEN_SOURCE` or
 15656 `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially
 15657 conflicting with identifiers used by the application. The set of identifiers visible to the
 15658 application consists of precisely those identifiers from the header pages of the included headers,
 15659 as well as additional identifiers reserved for the implementation. In addition, some headers may
 15660 make visible identifiers from other headers as indicated on the relevant header pages.

15661 Implementations may also add members to a structure or union without controlling the
 15662 visibility of those members with a feature test macro, as long as a user-defined macro with the
 15663 same name cannot interfere with the correct interpretation of the program. The identifiers
 15664 reserved for use by the implementation are described below:

- 15665 1. Each identifier with external linkage described in the header section is reserved for use as
 15666 an identifier with external linkage if the header is included.
- 15667 2. Each macro described in the header section is reserved for any use if the header is
 15668 included.
- 15669 3. Each identifier with file scope described in the header section is reserved for use as an
 15670 identifier with file scope in the same name space if the header is included.

15671 The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by POSIX.1-200x and other
 15672 POSIX standards. Implementations may add symbols to the headers shown in the following
 15673 table, provided the identifiers for those symbols either:

- 15674 1. Begin with the corresponding reserved prefixes in the table, or
- 15675 2. Have one of the corresponding complete names in the table, or
- 15676 3. End in the string indicated as a reserved suffix in the table and do not use the reserved
 15677 prefixes `posix_`, `POSIX_`, or `_POSIX_`, as long as the reserved suffix is in that part of the
 15678 name considered significant by the implementation.

15679 Symbols that use the reserved prefix `_POSIX_` may be made visible by implementations in any
 15680 header defined by POSIX.1-200x.

	Header	Prefix	Suffix	Complete Name
15681	<aio.h>	aio_, lio_, AIO_, LIO_		
15682	<arpa/inet.h>	in_, inet_

15744		<wchar.h>	wcs[a-z]		
15745		<wctype.h>	is[a-z], to[a-z]		
15746		<wordexp.h>	we_, WRDE_		
15747		ANY header		_t	

Note: The notation [A-Z] indicates any uppercase letter in the portable character set. The notation [a-z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

15759 If any header in the following table is included, macros with the prefixes shown may be defined.
 15760 After the last inclusion of a given header, an application may use identifiers with the
 15761 corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the
 15762 corresponding macro.

Header	Prefix
<errno.h>	E[0-9], E[A-Z]
<fcntl.h>	F_, O_, S_, SEEK_
<fenv.h>	FE_[A-Z]
<inttypes.h>	PRI[Xa-z], SCN[Xa-z]
<locale.h>	LC_[A-Z]
<math.h>	FP_[A-Z]
<netinet/in.h>	IMPLINK_, IN_, IP_, IPPORT_, SOCK_
IP6	IN6_
<signal.h>	SIG_, SIG[A-Z],
XSI	SV_
CX	<stdio.h> SEEK_
OB XSR	<stropts.h> M_, MUXID_R[A-Z], STR
XSI	<sys/resource.h> RLIM_
XSI	<sys/socket.h> CMMSG_
	<sys/stat.h> S_
XSI	<sys/uio.h> IOV_
XSI	<sys/wait.h> BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, TRAP_
	<termios.h> I, O, V (See below.)
	<unistd.h> SEEK_

15783 The following are used to reserve complete names for the **<stdint.h>** header:

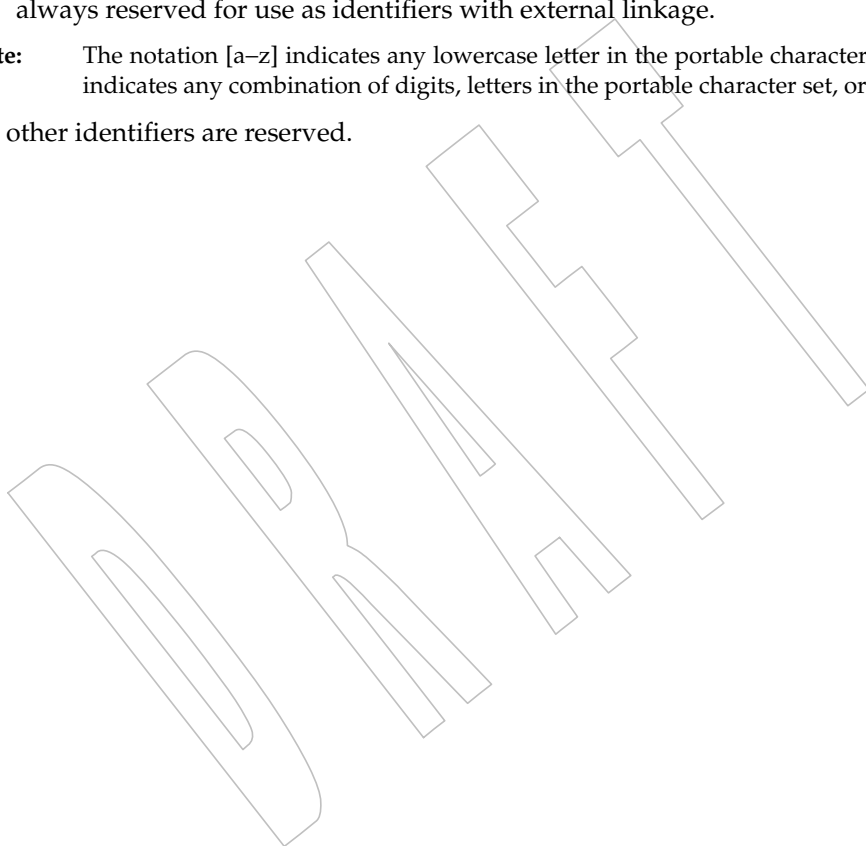

15784 INT[0-9A-Za-z_]*_MIN
 15785 INT[0-9A-Za-z_]*_MAX
 15786 INT[0-9A-Za-z_]*_C
 15787 UINT[0-9A-Za-z_]*_MIN
 15788 UINT[0-9A-Za-z_]*_MAX
 15789 UINT[0-9A-Za-z_]*_C

15790 **Note:** The notation [0–9] indicates any digit. The notation [A–Z] indicates any uppercase letter in the
 15791 portable character set. The notation [0–9a–z_] indicates any digit, any lowercase letter in the
 15792 portable character set, or underscore.

15793 XSI The following reserved names are used as exact matches for **<termios.h>**:

15794	CBAUD	EXTB	VDSUSP
15795	DEFECHO	FLUSHO	VLNEXT
15796	ECHOCTL	LOBLK	VREPRINT
15797	ECHOKE	PENDIN	VSTATUS
15798	ECHOPRT	SWTCH	VWERASE
15799	EXTA	VDISCARD	

- 15800 The following identifiers are reserved regardless of the inclusion of headers:
- 15801 1. With the exception of identifiers beginning with the prefix `_POSIX_`, all identifiers that
- 15802 begin with an underscore and either an uppercase letter or another underscore are always
- 15803 reserved for any use by the implementation.
- 15804 2. All identifiers that begin with an underscore are always reserved for use as identifiers with
- 15805 file scope in both the ordinary identifier and tag name spaces.
- 15806 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
- 15807 Some of these identifiers do not appear in this volume of POSIX.1-200x, but are reserved for
- 15808 future use by the ISO C standard.
- 15809 4. All functions and external identifiers defined in XBD [Chapter 13](#) (on page 205) are reserved +
- 15810 for use as identifiers with external linkage. +
- 15811 5. All the identifiers defined in this volume of POSIX.1-200x that have external linkage are +
- 15812 always reserved for use as identifiers with external linkage. +
- 15813 **Note:** The notation `[a-z]` indicates any lowercase letter in the portable character set. The notation `'*'` +
- 15814 indicates any combination of digits, letters in the portable character set, or underscore. +
- 15815 No other identifiers are reserved. +

15816	_Exit	casinh	clog10	erfcl	fminl
15817	abort	casinhf	clog10f	erff	fmod

15900 Applications shall not declare or define identifiers with the same name as an identifier reserved -
 15901 in the same context. Since macro names are replaced whenever found, independent of scope and
 15902 name space, macro names matching any of the reserved identifier names shall not be defined by
 15903 an application if any associated header is included.

15904 Except that the effect of each inclusion of `<assert.h>` depends on the definition of `NDEBUG`,
 15905 headers may be included in any order, and each may be included more than once in a given
 15906 scope, with no difference in effect from that of being included only once.

15907 If used, the application shall ensure that a header is included outside of any external declaration
 15908 or definition, and it shall be first included before the first reference to any type or macro it
 15909 defines, or to any function or object it declares. However, if an identifier is declared or defined in
 15910 more than one header, the second and subsequent associated headers may be included after the
 15911 initial reference to the identifier. Prior to the inclusion of a header, the application shall not
 15912 define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

15913

15914

15915

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

15916

15917

15918

15919

15920

Some functions provide the error number in a variable accessed through the symbol *errno*, defined by including the `<errno.h>` header. The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of POSIX.1-200x shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

15921

15922

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

15923

15924

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

15925

15926

15927

15928

15929

15930

15931

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring. The ERRORS section on each reference page specifies whether an error shall be returned, or whether it may be returned. Implementations shall not generate a different error number from the ones described here for error conditions described in this volume of POSIX.1-200x, but may generate additional errors unless explicitly disallowed for a particular function.

15932

15933

15934

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in POSIX.1-200x is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

15935

15936

Certain threads-related functions are not allowed to return an error code of [EINTR]. Where this applies it is stated in the ERRORS section on the individual function pages.

15937

15938

15939

15940

15941

15942

15943

The following macro names identify the possible error numbers, in the context of the functions specifically defined in this volume of POSIX.1-200x; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these macro names should be used in programs, since the actual value of the error number is unspecified. All values listed in this section shall be unique, except as noted below. The values for all these macros shall be found in the `<errno.h>` header defined in the Base Definitions volume of POSIX.1-200x. The actual values are unspecified by this volume of POSIX.1-200x.

15944

15945

15946

15947

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

15948

or:

15949

Lack of space in an output buffer.

15950

or:

15951

Argument is greater than the system-imposed maximum.

15952

15953

15954

[EACCES]

Permission denied. An attempt was made to access a file in a way forbidden by its file access permissions.

15955

15956

[EADDRINUSE]

Address in use. The specified address is in use.

15957		[EADDRNOTAVAIL]
15958		Address not available. The specified address is not available from the local system.
15959		[EAFNOSUPPORT]
15960		Address family not supported. The implementation does not support the specified address
15961		family, or the specified address is not a valid address for the address family of the specified
15962		socket.
15963		[EAGAIN]
15964		Resource temporarily unavailable. This is a temporary condition and later calls to the same
15965		routine may complete normally.
15966		[EALREADY]
15967		Connection already in progress. A connection request is already in progress for the specified
15968		socket.
15969		[EBADF]
15970		Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a
15971		read (write) request is made to a file that is only open for writing (reading).
15972		[EBADMSG]
15973	OB XSR	Bad message. During a <i>read()</i> , <i>getmsg()</i> , <i>getpmsg()</i> , or <i>ioctl()</i> I_RECVFD request to a
15974		STREAMS device, a message arrived at the head of the STREAM that is inappropriate for
15975		the function receiving the message.
15976		<i>read()</i> Message waiting to be read on a STREAM is not a data message.
15977		<i>getmsg()</i> or <i>getpmsg()</i>
15978		A file descriptor was received instead of a control message.
15979		<i>ioctl()</i> Control or data information was received instead of a file descriptor when
15980		I_RECVFD was specified.
15981		or:
15982		Bad Message. The implementation has detected a corrupted message.
15983		[EBUSY]
15984		Resource busy. An attempt was made to make use of a system resource that is not currently
15985		available, as it is being used by another process in a manner that would have conflicted
15986		with the request being made by this process.
15987		[ECANCELED]
15988		Operation canceled. The associated asynchronous operation was canceled before
15989		completion.
15990		[ECHILD]
15991		No child process. A <i>wait()</i> , <i>waitid()</i> , or <i>waitpid()</i> function was executed by a process that
15992		had no existing or unwaited-for child process.
15993		[ECONNABORTED]
15994		Connection aborted. The connection has been aborted.
15995		[ECONNREFUSED]
15996		Connection refused. An attempt to connect to a socket was refused because there was no
15997		process listening or because the queue of connection requests was full and the underlying
15998		protocol does not support retransmissions.
15999		[ECONNRESET]
16000		Connection reset. The connection was forcibly closed by the peer.

16001	[EDEADLK]
16002	Resource deadlock would occur. An attempt was made to lock a system resource that would
16003	have resulted in a deadlock situation.
16004	[EDESTADDRREQ]
16005	Destination address required. No bind address was established.
16006	[EDOM]
16007	Domain error. An input argument is outside the defined domain of the mathematical
16008	function (defined in the ISO C standard).
16009	[EDQUOT]
16010	Reserved.
16011	[EEXIST]
16012	File exists. An existing file was mentioned in an inappropriate context; for example, as a
16013	new link name in the <i>link()</i> function.
16014	[EFAULT]
16015	Bad address. The system detected an invalid address in attempting to use an argument of a
16016	call. The reliable detection of this error cannot be guaranteed, and when not detected may
16017	result in the generation of a signal, indicating an address violation, which is sent to the
16018	process.
16019	[EFBIG]
16020	File too large. The size of a file would exceed the maximum file size of an implementation
16021	or offset maximum established in the corresponding file description.
16022	[EHOSTUNREACH]
16023	Host is unreachable. The destination host cannot be reached (probably because the host is
16024	down or a remote router cannot reach it).
16025	[EIDRM]
16026	Identifier removed. Returned during XSI interprocess communication if an identifier has
16027	been removed from the system.
16028	[EILSEQ]
16029	Illegal byte sequence. A wide-character code has been detected that does not correspond to
16030	a valid character, or a byte sequence does not form a valid wide-character code (defined in
16031	the ISO C standard).
16032	[EINPROGRESS]
16033	Operation in progress. This code is used to indicate that an asynchronous operation has not
16034	yet completed.
16035	or:
16036	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
16037	immediately established.
16038	[EINTR]
16039	Interrupted function call. An asynchronous signal was caught by the process during the
16040	execution of an interruptible function. If the signal handler performs a normal return, the
16041	interrupted function call may return this condition (see the Base Definitions volume of
16042	POSIX.1-200x, <signal.h>).
16043	[EINVAL]
16044	Invalid argument. Some invalid argument was supplied; for example, specifying an
16045	undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.

16046		[EIO]
16047		Input/output error. Some physical input or output error has occurred. This error may be
16048		reported on a subsequent operation on the same file descriptor. Any other error-causing
16049		operation on the same file descriptor may cause the [EIO] error indication to be lost.
16050		[EISCONN]
16051		Socket is connected. The specified socket is already connected.
16052		[EISDIR]
16053		Is a directory. An attempt was made to open a directory with write mode specified.
16054		[ELOOP]
16055		Symbolic link loop. A loop exists in symbolic links encountered during pathname
16056		resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
16057		are encountered during pathname resolution.
16058		[EMFILE]
16059		File descriptor value too large. An attempt was made to open a file descriptor with a value
16060	XSI	greater than or equal to {OPEN_MAX}, or greater than or equal to the soft limit
16061		RLIMIT_NOFILE for the process (if smaller than {OPEN_MAX}).
16062		[EMLINK]
16063		Too many links. An attempt was made to have the link count of a single file exceed
16064		{LINK_MAX}.
16065		[EMSGSIZE]
16066		Message too large. A message sent on a transport provider was larger than an internal
16067		message buffer or some other network limit.
16068		or:
16069		Inappropriate message buffer length.
16070		[EMULTIHOP]
16071		◁Reserved.
16072		[ENAMETOOLONG]
16073		Filename too long. The length of a pathname exceeds {PATH_MAX}, or a pathname
16074		component is longer than {NAME_MAX}. This error may also occur when pathname
16075		substitution, as a result of encountering a symbolic link during pathname resolution, results
16076		in a pathname string the size of which exceeds {PATH_MAX}.
16077		[ENETDOWN]
16078		Network is down. The local network interface used to reach the destination is down.
16079		[ENETRESET]
16080		The connection was aborted by the network.
16081		[ENETUNREACH]
16082		Network unreachable. No route to the network is present.
16083		[ENFILE]
16084		Too many files open in system. Too many files are currently open in the system. The system
16085		has reached its predefined limit for simultaneously open files and temporarily cannot
16086		accept requests to open another one.
16087		[ENOBUFS]
16088		No buffer space available. Insufficient buffer resources were available in the system to
16089		perform the socket operation.

16090	OB XSR	[ENODATA]	
16091			No message available. No message is available on the STREAM head read queue.
16092		[ENODEV]	
16093			No such device. An attempt was made to apply an inappropriate function to a device; for example, trying to read a write-only device such as a printer.
16094			
16095		[ENOENT]	
16096			No such file or directory. A component of a specified pathname does not exist, or the pathname is an empty string.
16097			
16098		[ENOEXEC]	
16099			Executable file format error. A request is made to execute a file that, although it has the appropriate permissions, is not in the format required by the implementation for executable files.
16100			
16101			
16102		[ENOLCK]	
16103			No locks available. A system-imposed limit on the number of simultaneous file and record locks has been reached and no more are currently available.
16104			
16105		[ENOLINK]	
16106			Reserved.
16107		[ENOMEM]	
16108			Not enough space. The new process image requires more memory than is allowed by the hardware or system-imposed memory management constraints.
16109			
16110		[ENOMSG]	
16111			No message of the desired type. The message queue does not contain a message of the required type during XSI interprocess communication.
16112			
16113		[ENOPROTOOPT]	
16114			Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the implementation.
16115			
16116		[ENOSPC]	
16117			No space left on a device. During the <i>write()</i> function on a regular file or when extending a directory, there is no free space left on the device.
16118			
16119	OB XSR	[ENOSR]	
16120			No STREAM resources. Insufficient STREAMS memory resources are available to perform a STREAMS-related function. This is a temporary condition; it may be recovered from if other processes release resources.
16121			
16122			
16123	OB XSR	[ENOSTR]	
16124			Not a STREAM. A STREAM function was attempted on a file descriptor that was not associated with a STREAMS device.
16125			
16126		[ENOSYS]	
16127			Function not implemented. An attempt was made to use a function that is not available in this implementation.
16128			
16129		[ENOTCONN]	
16130			Socket not connected. The socket is not connected.
16131		[ENOTDIR]	
16132			Not a directory. A component of the specified pathname exists, but it is not a directory, when a directory was expected.
16133			

16134	[ENOTEMPTY]
16135	Directory not empty. A directory other than an empty directory was supplied when an
16136	empty directory was expected.
16137	[ENOTSOCK]
16138	Not a socket. The file descriptor does not refer to a socket.
16139	[ENOTSUP]
16140	Not supported. The implementation does not support this feature of the Realtime Option
16141	Group.
16142	[ENOTTY]
16143	Inappropriate I/O control operation. A control function has been attempted for a file or
16144	special file for which the operation is inappropriate.
16145	[ENXIO]
16146	No such device or address. Input or output on a special file refers to a device that does not
16147	exist, or makes a request beyond the capabilities of the device. It may also occur when, for
16148	example, a tape drive is not on-line.
16149	[EOPNOTSUPP]
16150	Operation not supported on socket. The type of socket (address family or protocol) does not
16151	support the requested operation. A conforming implementation may assign the same values
16152	for [EOPNOTSUP] and [ENOTSUP].
16153	[EOVERFLOW]
16154	Value too large to be stored in data type. An operation was attempted which would
16155	generate a value that is outside the range of values that can be represented in the relevant
16156	data type or that are allowed for a given data item.
16157	[EPERM]
16158	Operation not permitted. An attempt was made to perform an operation limited to
16159	processes with appropriate privileges or to the owner of a file or other resource.
16160	[EPIPE]
16161	Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process
16162	to read the data.
16163	[EPROTO]
16164	Protocol error. Some protocol error occurred. This error is device-specific, but is generally
16165	not related to a hardware failure.
16166	[EPROTONOSUPPORT]
16167	Protocol not supported. The protocol is not supported by the address family, or the protocol
16168	is not supported by the implementation.
16169	[EPROTOTYPE]
16170	Protocol wrong type for socket. The socket type is not supported by the protocol.
16171	[ERANGE]
16172	Result too large or too small. The result of the function is too large (overflow) or too small
16173	(underflow) to be represented in the available space (defined in the ISO C standard).
16174	[EROFS]
16175	Read-only file system. An attempt was made to modify a file or directory on a file system
16176	that is read-only.
16177	[ESPIPE]
16178	Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.

16179		[ESRCH]
16180		No such process. No process can be found corresponding to that specified by the given
16181		process ID.
16182		[ESTALE]
16183		Reserved.
16184	OB XSR	[ETIME]
16185		STREAM <i>ioctl()</i> timeout. The timer set for a STREAMS <i>ioctl()</i> call has expired. The cause of
16186		this error is device-specific and could indicate either a hardware or software failure, or a
16187		timeout value that is too short for the specific operation. The status of the <i>ioctl()</i> operation is
16188		unspecified.
16189		[ETIMEDOUT]
16190		Connection timed out. The connection to a remote machine has timed out. If the connection
16191		timed out during execution of the function that reported this error (as opposed to timing
16192		out prior to the function being called), it is unspecified whether the function has completed
16193		some or all of the documented behavior associated with a successful completion of the
16194		function.
16195		or:
16196		Operation timed out. The time limit associated with the operation was exceeded before the
16197		operation completed.
16198		[ETXTBSY]
16199		Text file busy. An attempt was made to execute a pure-procedure program that is currently
16200		open for writing, or an attempt has been made to open for writing a pure-procedure
16201		program that is being executed.
16202		[EWOULDBLOCK]
16203		Operation would block. An operation on a socket marked as non-blocking has encountered
16204		a situation such as no data available that otherwise would have caused the function to
16205		<suspend execution.
16206		A conforming implementation may assign the same values for [EWOULDBLOCK] and
16207		[EAGAIN].
16208		[EXDEV]
16209		Improper link. A link to a file on another file system was attempted.

2.3.1 Additional Error Numbers

16210 Additional implementation-defined error numbers may be defined in `<errno.h>`.

16211

16212 2.4 Signal Concepts

16213 2.4.1 Signal Generation and Delivery

16214 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes
 16215 the signal first occurs. Examples of such events include detection of hardware faults, timer
 16216 expiration, signals generated via the **sigevent** structure and terminal activity, as well as
 16217 invocations of the *kill()* and *sigqueue()* functions. In some circumstances, the same event
 16218 generates signals for multiple processes.

16219 At the time of generation, a determination shall be made whether the signal has been generated
 16220 for the process or for a specific thread within the process. Signals which are generated by some
 16221 action attributable to a particular thread, such as a hardware fault, shall be generated for the
 16222 thread that caused the signal to be generated. Signals that are generated in association with a
 16223 process ID or process group ID or an asynchronous event, such as terminal activity, shall be
 16224 generated for the process.

16225 Each process has an action to be taken in response to each signal defined by the system (see
 16226 [Section 2.4.3](#), on page 465). A signal is said to be “delivered” to a process when the appropriate
 16227 action for the process and signal is taken. A signal is said to be “accepted” by a process when the
 16228 signal is selected and returned by one of the *sigwait()* functions.

16229 During the time between the generation of a signal and its delivery or acceptance, the signal is
 16230 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a
 16231 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal
 16232 is anything other than to ignore the signal, and if that signal is generated for the thread, the
 16233 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned
 16234 by a call to the *sigwait()* function, or the action associated with it is set to ignore the signal.
 16235 Signals generated for the process shall be delivered to exactly one of those threads within the
 16236 process which is in a call to a *sigwait()* function selecting that signal or has not blocked delivery
 16237 of the signal. If there are no threads in a call to a *sigwait()* function selecting that signal, and if all
 16238 threads within the process block delivery of the signal, the signal shall remain pending on the
 16239 process until a thread calls a *sigwait()* function selecting that signal, a thread unblocks delivery
 16240 of the signal, or the action associated with the signal is set to ignore the signal. If the action
 16241 associated with a blocked signal is to ignore the signal and if that signal is generated for the
 16242 process, it is unspecified whether the signal is discarded immediately upon generation or
 16243 remains pending.

16244 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery
 16245 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,
 16246 or from the corresponding thread in the parent process if the thread was created as the result of a
 16247 call to *fork()*. The *pthread_sigmask()*, *sigaction()*, *sigprocmask()*, and *sigsuspend()* functions control
 16248 the manipulation of the signal mask.

16249 The determination of which action is taken in response to a signal is made at the time the signal
 16250 is delivered, allowing for any changes since the time of generation. This determination is
 16251 independent of the means by which the signal was originally generated. If a subsequent
 16252 occurrence of a pending signal is generated, it is implementation-defined as to whether the
 16253 signal is delivered or accepted more than once in circumstances other than those in which
 16254 queuing is required. The order in which multiple, simultaneously pending signals outside the
 16255 range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

16256 When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any
 16257 pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is

16258 generated for a process, all pending stop signals for that process shall be discarded. When
 16259 SIGCONT is generated for a process that is stopped, the process shall be continued, even if the
 16260 SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain
 16261 pending until it is either unblocked or a stop signal is generated for the process.

16262 An implementation shall document any condition not specified by this volume of POSIX.1-200x
 16263 under which the implementation generates signals.

16264 2.4.2 Realtime Signal Generation and Delivery

16265 This section describes functionality to support realtime signal generation and delivery.

16266 Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O
 16267 completion, interprocess message arrival, and the *sigqueue()* function, support the specification
 16268 of an application-defined value, either explicitly as a parameter to the function or in a **sigevent**
 16269 structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the
 16270 following members:

Member Type	Member Name	Description
int	<i>sigev_notify</i>	Notification type.
int	<i>sigev_signo</i>	Signal number.
union signal	<i>sigev_value</i>	Signal value.
void(*) (union signal)	<i>sigev_notify_function</i>	Notification function.
(pthread_attr_t*)	<i>sigev_notify_attributes</i>	Notification attributes.

16271 The *sigev_notify* member specifies the notification mechanism to use when an asynchronous
 16272 event occurs. This volume of POSIX.1-200x defines the following values for the *sigev_notify*
 16273 member:
 16274

16280 SIGEV_NONE No asynchronous notification shall be delivered when the event of
 16281 interest occurs.

16282 SIGEV_SIGNAL The signal specified in *sigev_signo* shall be generated for the process when
 16283 the event of interest occurs. If the implementation supports the Realtime
 16284 Signals Extension option and if the SA_SIGINFO flag is set for that signal
 16285 number, then the signal shall be queued to the process and the value
 16286 specified in *sigev_value* shall be the *si_value* component of the generated
 16287 signal. If SA_SIGINFO is not set for that signal number, it is unspecified
 16288 whether the signal is queued and what value, if any, is sent.

16289 SIGEV_THREAD A notification function shall be called to perform notification.

16290 An implementation may define additional notification mechanisms.

16291 The *sigev_signo* member specifies the signal to be generated. The *sigev_value* member is the
 16292 application-defined value to be passed to the signal-catching function at the time of the signal
 16293 delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

16294 The **signal** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	<i>sival_int</i>	Integer signal value.
void*	<i>sival_ptr</i>	Pointer signal value.

16298 The *sival_int* member shall be used when the application-defined value is of type **int**; the
 16299 *sival_ptr* member shall be used when the application-defined value is a pointer.

16300 When a signal is generated by the *sigqueue()* function or any signal-generating function that

16301 supports the specification of an application-defined value, the signal shall be marked pending
 16302 and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along
 16303 with the application-specified signal value. Multiple occurrences of signals so generated are
 16304 queued in FIFO order. It is unspecified whether signals so generated are queued when the
 16305 SA_SIGINFO flag is not set for that signal.

16306 Signals generated by the *kill()* function or other events that cause signals to occur, such as
 16307 detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the
 16308 implementation does not support queuing, shall have no effect on signals already queued for the
 16309 same signal number.

16310 When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the
 16311 behavior shall be as if the implementation delivers the pending unblocked signal with the
 16312 lowest signal number within that range. No other ordering of signal delivery is specified.

16313 If, when a pending signal is delivered, there are additional signals queued to that signal number,
 16314 the signal shall remain pending. Otherwise, the pending indication shall be reset.

16315 Multi-threaded programs can use an alternate event notification mechanism. When a
 16316 notification is processed, and the *sigev_notify* member of the **sigevent** structure has the value
 16317 SIGEV_THREAD, the function *sigev_notify_function* is called with parameter *sigev_value*.

16318 The function shall be executed in an environment as if it were the *start_routine* for a newly
 16319 created thread with thread attributes specified by *sigev_notify_attributes*. If *sigev_notify_attributes*
 16320 is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to
 16321 PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute
 16322 of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this
 16323 thread is implementation-defined.

16324 2.4.3 Signal Actions

16325 There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a
 16326 pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of
 16327 the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows.

16328 SIG_DFL

16329 Signal-specific default action.

16330 The default actions for the signals defined in this volume of POSIX.1-200x are specified under
 16331 **<signal.h>**. The default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX
 16332 shall be to terminate the process abnormally.

16333 If the default action is to terminate the process abnormally, the process is terminated as if by a +
 16334 call to *_exit()*, except that the status made available to *wait()*, *waitid()*, and *waitpid()* indicates +
 16335 abnormal termination by the signal. If the default action is to terminate the process abnormally +
 16336 with additional actions, implementation-defined abnormal termination actions, such as creation +
 16337 of a core file, may also occur. +

16338 If the default action is to stop the process, the execution of that process is temporarily
 16339 suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process,
 16340 unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any
 16341 additional signals that are sent to the process shall not be delivered until the process is
 16342 continued, except SIGKILL which always terminates the receiving process. A process that is a
 16343 member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP,
 16344 SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a
 16345 process, the signal shall be discarded.

16346 If the default action is to ignore the signal, delivery of the signal shall have no effect on the +
 16347 process. +

16348 Setting a signal action to SIG_DFL for a signal that is pending, and whose default action is to
 16349 ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded,
 16350 whether or not it is blocked. Any queued values pending shall be discarded and the resources
 16351 used to queue them shall be released and returned to the system for other use.

16352 The default action for SIGCONT is to resume execution at the point where the process was
 16353 stopped, after first handling any pending unblocked signals.

16354 XSI When a stopped process is continued, a SIGCHLD signal may be generated for its parent
 16355 process, unless the parent process has set the SA_NOCLDSTOP flag.

16356 SIG_IGN

16357 Ignore signal.

16358 Delivery of the signal shall have no effect on the process. The behavior of a process is undefined
 16359 after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by *kill()*,
 16360 *sigqueue()*, or *raise()*.

16361 The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG_IGN.

16362 Setting a signal action to SIG_IGN for a signal that is pending shall cause the pending signal to
 16363 be discarded, whether or not it is blocked.

16364 XSI If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is unspecified,
 16365 except as specified below.

16366 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes
 16367 shall not be transformed into zombie processes when they terminate. If the calling process
 16368 subsequently waits for its children, and the process has no unwaited-for children that were
 16369 transformed into zombie processes, it shall block until all of its children terminate, and *wait()*,
 16370 *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

16371 Any queued values pending shall be discarded and the resources used to queue them shall be
 16372 released and made available to queue other signals.

16373 Pointer to a Function

16374 Catch signal.

16375 On delivery of the signal, the receiving process is to execute the signal-catching function at the
 16376 specified address. After returning from the signal-catching function, the receiving process shall
 16377 resume execution at the point at which it was interrupted.

16378 If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as
 16379 a C-language function call as follows:

```
16380 void func(int signo);
```

16381 If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be entered as a C-
 16382 language function call as follows:

```
16383 void func(int signo, siginfo_t *info, void *context);
```

16384 where *func* is the specified signal-catching function, *signo* is the signal number of the signal
 16385 being delivered, and *info* is a pointer to a **siginfo_t** structure defined in **<signal.h>** containing at
 16386 least the following members:

16387
16388
16389
16390

Member Type	Member Name	Description
int	<i>si_signo</i>	Signal number.
int	<i>si_code</i>	Cause of the signal.
union signal	<i>si_value</i>	Signal value.

16391
16392
16393

The *si_signo* member shall contain the signal number. This shall be the same as the *signo* parameter. The *si_code* member shall contain a code identifying the cause of the signal. The following values are defined for *si_code*:

16394
16395
16396

SI_USER The signal was sent by the *kill()* function. The implementation may set *si_code* to SI_USER if the signal was sent by the *raise()* or *abort()* functions or any similar functions provided as implementation extensions.

16397

SI_QUEUE The signal was sent by the *sigqueue()* function.

16398

SI_TIMER The signal was generated by the expiration of a timer set by *timer_settime()*.

16399

SI_ASYNCIO The signal was generated by the completion of an asynchronous I/O request.

16400

MSG

SI_MESGQ The signal was generated by the arrival of a message on an empty message queue.

16401

16402

If the signal was not generated by one of the functions or events listed above, the *si_code* shall be set to an implementation-defined value that is not equal to any of the values defined above.

16403

16404

If *si_code* is one of SI_QUEUE, SI_TIMER, SI_ASYNCIO, or SI_MESGQ, then *si_value* shall contain the application-specified signal value. Otherwise, the contents of *si_value* are undefined.

16405

16406

The behavior of a process is undefined after it returns normally from a signal-catching function for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not generated by *kill()*, *sigqueue()*, or *raise()*.

16407

16408

16409

The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

16410

If a process establishes a signal-catching function for the SIGCHLD signal while it has a terminated child process for which it has not waited, it is unspecified whether a SIGCHLD signal is generated to indicate that child process.

16411

16412

16413

When signal-catching functions are invoked asynchronously with process execution, the behavior of some of the functions defined by this volume of POSIX.1-200x is unspecified if they are called from a signal-catching function.

16414

16415

16416

The following table defines a set of functions that shall be either reentrant or non-interruptible by signals and shall be async-signal-safe. Therefore, applications may invoke them, without restriction, from signal-catching functions:

16417

16418

16419	<code>_Exit()</code>	<code>fork()</code>	<code>poll()</code>	<code>sigset()</code>
16420	<code>_exit()</code>	<code>fpathconf()</code>	<code>posix_trace_event()</code>	<code>sigsuspend()</code>
16421	<code>abort()</code>	<code>fstat()</code>	<code>pselect()</code>	<code>sleep()</code>
16422	<code>accept()</code>	<code>fstatat()</code>	<code>raise()</code>	<code>socketatmark()</code>
16423	<code>access()</code>	<code>fsync()</code>	<code>read()</code>	<code>socket()</code>
16424	<code>aio_error()</code>	<code>ftruncate()</code>	<code>readlink()</code>	<code>socketpair()</code>
16425	<code>aio_return()</code>	<code>futimens()</code>	<code>readlinkat()</code>	<code>stat()</code>
16426	<code>aio_suspend()</code>	<code>getegid()</code>	<code>recv()</code>	<code>symlink()</code>
16427	<code>alarm()</code>	<code>geteuid()</code>	<code>recvfrom()</code>	<code>symlinkat()</code>
16428	<code>bind()</code>	<code>getgid()</code>	<code>recvmsg()</code>	<code>sysconf()</code>
16429	<code>cfgetispeed()</code>	<code>getgroups()</code>	<code>rename()</code>	<code>tcdrain()</code>
16430	<code>cfgetospeed()</code>	<code>getpeername()</code>	<code>renameat()</code>	<code>tcflow()</code>
16431	<code>cfsetispeed()</code>	<code>getpgrp()</code>	<code>rmdir()</code>	<code>tcflush()</code>
16432	<code>cfsetospeed()</code>	<code>getpid()</code>	<code>select()</code>	<code>tcgetattr()</code>
16433	<code>chdir()</code>	<code>getppid()</code>	<code>sem_post()</code>	<code>tcgetpgrp()</code>
16434	<code>chmod()</code>	<code>getsockname()</code>	<code>send()</code>	<code>tcsendbreak()</code>
16435	<code>chown()</code>	<code>getsockopt()</code>	<code>sendmsg()</code>	<code>tcsetattr()</code>
16436	<code>clock_gettime()</code>	<code>getuid()</code>	<code>sendto()</code>	<code>tcsetpgrp()</code>
16437	<code>close()</code>	<code>kill()</code>	<code>setgid()</code>	<code>time()</code>
16438	<code>connect()</code>	<code>link()</code>	<code>setpgid()</code>	<code>timer_getoverrun()</code>
16439	<code>creat()</code>	<code>linkat()</code>	<code>setpid()</code>	<code>timer_gettime()</code>
16440	<code>dup()</code>	<code>listen()</code>	<code>setsid()</code>	<code>timer_settime()</code>
16441	<code>dup2()</code>	<code>lseek()</code>	<code>setsockopt()</code>	<code>times()</code>
16442	<code>execl()</code>	<code>lstat()</code>	<code>setuid()</code>	<code>times()</code>
16443	<code>execle()</code>	<code>mkdir()</code>	<code>shutdown()</code>	<code>umask()</code>
16444	<code>execv()</code>	<code>mkdirat()</code>	<code>sigaction()</code>	<code>uname()</code>
16445	<code>execve()</code>	<code>mkfifo()</code>	<code>sigaddset()</code>	<code>unlink()</code>
16446	<code>faccessat()</code>	<code>mkfifoat()</code>	<code>sigdelset()</code>	<code>unlinkat()</code>
16447	<code>fchmod()</code>	<code>mkfifoat()</code>	<code>sigemptyset()</code>	<code>utime()</code>
16448	<code>fchmodat()</code>	<code>mknod()</code>	<code>sigfillset()</code>	<code>utimensat()</code>
16449	<code>fchown()</code>	<code>mknodat()</code>	<code>sigismember()</code>	<code>utimes()</code>
16450	<code>fchownat()</code>	<code>open()</code>	<code>signal()</code>	<code>wait()</code>
16451	<code>fcntl()</code>	<code>openat()</code>	<code>sigpause()</code>	<code>waitpid()</code>
16452	<code>fdatasync()</code>	<code>pathconf()</code>	<code>sigpending()</code>	<code>write()</code>
16453	<code>fexecve()</code>	<code>pause()</code>	<code>sigprocmask()</code>	
		<code>pipe()</code>	<code>sigqueue()</code>	

16454 All functions not in the above table are considered to be unsafe with respect to signals. In the
 16455 presence of signals, all functions defined by this volume of POSIX.1-200x shall behave as defined
 16456 when called from or interrupted by a signal-catching function, with a single exception: when a
 16457 signal interrupts an unsafe function and the signal-catching function calls an unsafe function,
 16458 the behavior is undefined.

16459 Operations which obtain the value of *errno* and operations which assign a value to *errno* shall be +
 16460 *async-signal-safe*. +

16461 When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or
 16462 continue, the entire process shall be terminated, stopped, or continued, respectively.

16463 2.4.4 Signal Effects on Other Functions

16464 Signals affect the behavior of certain functions defined by this volume of POSIX.1-200x if
 16465 delivered to a process while it is executing such a function. If the action of the signal is to
 16466 terminate the process, the process shall be terminated and the function shall not return. If the
 16467 action of the signal is to stop the process, the process shall stop until continued or terminated.
 16468 Generation of a SIGCONT signal for the process shall cause the process to be continued, and the
 16469 original function shall continue at the point the process was stopped. If the action of the signal is
 16470 to invoke a signal-catching function, the signal-catching function shall be invoked; in this case
 16471 the original function is said to be “interrupted” by the signal. If the signal-catching function
 16472 executes a **return** statement, the behavior of the interrupted function shall be as described
 16473 individually for that function, except as noted for unsafe functions. Signals that are ignored shall
 16474 not affect the behavior of any function; signals that are blocked shall not affect the behavior of
 16475 any function until they are unblocked and then delivered, except as specified for the *sigpending()*
 16476 and *sigwait()* functions.

16477 2.5 Standard I/O Streams

16478 CX A stream is associated with an external file (which may be a physical device) or memory buffer
 16479 CX by “opening” a file or buffer. This may involve “creating” a new file. Creating an existing file
 16480 causes its former contents to be discarded if necessary. If a file can support positioning requests
 16481 (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the
 16482 stream is positioned at the start (byte number 0) of the file, unless the file is opened with append
 16483 mode, in which case it is implementation-defined whether the file position indicator is initially
 16484 positioned at the beginning or end of the file. The file position indicator is maintained by
 16485 subsequent reads, writes, and positioning requests, to facilitate an orderly progression through
 16486 the file. All input takes place as if bytes were read by successive calls to *fgetc()*; all output takes
 16487 place as if bytes were written by successive calls to *fputc()*.

16488 When a stream is “unbuffered”, bytes are intended to appear from the source or at the
 16489 destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a
 16490 block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a
 16491 buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block
 16492 when a newline byte is encountered. Furthermore, bytes are intended to be transmitted as a
 16493 block when a buffer is filled, when input is requested on an unbuffered stream, or when input is
 16494 requested on a line-buffered stream that requires the transmission of bytes. Support for these
 16495 characteristics is implementation-defined, and may be affected via *setbuf()* and *setobuf()*.

16496 A file may be disassociated from a controlling stream by “closing” the file. Output streams are
 16497 flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from
 16498 the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed
 16499 (including the standard streams).

16500 A file may be subsequently reopened, by the same or another program execution, and its
 16501 contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function
 16502 returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all
 16503 output streams are flushed) before program termination. Other paths to program termination,
 16504 such as calling *abort()*, need not close all files properly.

16505 The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE**
 16506 object need not necessarily serve in place of the original.

16507 At program start-up, three streams are predefined and need not be opened explicitly: *standard*
 16508 *input* (for reading conventional input), *standard output* (for writing conventional output), and
 16509 *standard error* (for writing diagnostic output). When opened, the standard error stream is not

16510 fully buffered; the standard input and standard output streams are fully buffered if and only if
16511 the stream can be determined not to refer to an interactive device.

16512 CX A stream associated with a memory buffer shall have the same operations for text files that a
16513 stream associated with an external file would have. In addition, the stream orientation shall be
16514 determined in exactly the same fashion.

16515 Input and output operations on a stream associated with a memory buffer by a call to
16516 *fmemopen()* shall be constrained by the implementation to take place within the bounds of the
16517 memory buffer. In the case of a stream opened by *open_memstream()* or *open_wmemstream()*, the
16518 memory area shall grow dynamically to accommodate write operations as necessary. For output,
16519 data is moved from the buffer provided by *setvbuf()* to the memory stream during a flush or
16520 close operation.

16521 2.5.1 Interaction of File Descriptors and Standard I/O Streams

16522 CX This section describes the interaction of file descriptors and standard I/O streams. The
16523 functionality described in this section is an extension to the ISO C standard (and the rest of this
16524 section is not further CX shaded).

16525 An open file description may be accessed through a file descriptor, which is created using
16526 functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as
16527 *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file
16528 description to which it refers; an open file description may have several handles.

16529 Handles can be created or destroyed by explicit user action, without affecting the underlying
16530 open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*,
16531 and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

16532 A file descriptor that is never used in an operation that could affect the file offset (for example,
16533 *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to
16534 one (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include
16535 the file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is
16536 not used directly by the application to affect the file offset. The *read()* and *write()* functions
16537 implicitly affect the file offset; *lseek()* explicitly affects it.

16538 The result of function calls involving any one handle (the “active handle”) is defined elsewhere
16539 in this volume of POSIX.1-200x, but if two or more handles are used, and any one of them is a
16540 stream, the application shall ensure that their actions are coordinated as described below. If this
16541 is not done, the result is undefined.

16542 A handle which is a stream is considered to be closed when either an *fclose()* or *freopen()* is
16543 executed on it (the result of *freopen()* is a new stream, which cannot be a handle on the same
16544 open file description as its previous value), or when the process owning that stream terminates
16545 with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *_exit()*, or the *exec*
16546 functions when *FD_CLOEXEC* is set on that file descriptor.

16547 For a handle to become the active handle, the application shall ensure that the actions below are
16548 performed between the last use of the handle (the current active handle) and the first use of the
16549 second handle (the future active handle). The second handle then becomes the active handle. All
16550 activity by the application affecting the file offset on the first handle shall be suspended until it
16551 again becomes the active file handle. (If a stream function has as an underlying function one that
16552 affects the file offset, the stream function shall be considered to affect the file offset.)

16553 The handles need not be in the same process for these rules to apply.

16554 Note that after a *fork()*, two handles exist where one existed before. The application shall ensure
16555 that, if both handles can ever be accessed, they are both in a state where the other could become

16556 the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of
 16557 active handle. (If the only action performed by one of the processes is one of the *exec* functions or
 16558 *_exit()* (not *exit()*), the handle is never accessed in that process.)

16559 For the first handle, the first applicable condition below applies. After the actions required
 16560 below are taken, if the handle is still open, the application can close it.

- 16561 • If it is a file descriptor, no action is required.
- 16562 • If the only further action to be performed on any handle to this open file descriptor is to
 16563 close it, no action need be taken.
- 16564 • If it is a stream which is unbuffered, no action need be taken.
- 16565 • If it is a stream which is line buffered, and the last byte written to the stream was a
 16566 <newline> (that is, as if a:

16567 `putc('\n')`

16568 was the most recent operation on that stream), no action need be taken.

- 16569 • If it is a stream which is open for writing or appending (but not also open for reading), the
 16570 application shall either perform an *fflush()*, or the stream shall be closed.
- 16571 • If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need
 16572 be taken.
- 16573 • If the stream is open with a mode that allows reading and the underlying open file
 16574 description refers to a device that is capable of seeking, the application shall either perform
 16575 an *fflush()*, or the stream shall be closed.

16576 Otherwise, the result is undefined.

16577 For the second handle:

- 16578 • If any previous active handle has been used by a function that explicitly changed the file
 16579 offset, except as required above for the first handle, the application shall perform an *lseek()*
 16580 or *fseek()* (as appropriate to the type of handle) to an appropriate location.

16581 If the active handle ceases to be accessible before the requirements on the first handle, above,
 16582 have been met, the state of the open file description becomes undefined. This might occur
 16583 during functions such as a *fork()* or *_exit()*.

16584 The *exec* functions make inaccessible all streams that are open at the time they are called,
 16585 independent of which streams or file descriptors may be available to the new process image.

16586 When these rules are followed, regardless of the sequence of handles used, implementations
 16587 shall ensure that an application, even one consisting of several processes, shall yield correct
 16588 results: no data shall be lost or duplicated when writing, and all data shall be written in order,
 16589 except as requested by seeks. It is implementation-defined whether, and under what conditions,
 16590 all input is seen exactly once.

16591 If the rules above are not followed, the result is unspecified.

16592 Each function that operates on a stream is said to have zero or more “underlying functions”.
 16593 This means that the stream function shares certain traits with the underlying functions, but does
 16594 not require that there be any relation between the implementations of the stream function and its
 16595 underlying functions.

2.5.2 Stream Orientation and Encoding Rules

For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an “orientation”. After a stream is associated with an external file, but before any operations are performed on it, the stream is without orientation. Once a wide-character input/output function has been applied to a stream without orientation, the stream shall become “wide-oriented”. Similarly, once a byte input/output function has been applied to a stream without orientation, the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()* function can otherwise alter the orientation of a stream.

A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard input*, *standard output*, and *standard error* shall be unoriented at program start-up.

Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character input/output functions cannot be applied to a byte-oriented stream. The remaining stream operations shall not affect and shall not be affected by a stream’s orientation, except for the following additional restriction:

- For wide-oriented streams, after a successful call to a file-positioning function that leaves the file position indicator prior to the end-of-file, a wide-character output function can overwrite a partial character; any file contents beyond the byte(s) written are henceforth undefined.

Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state of the stream. A successful call to *fgetpos()* shall store a representation of the value of this **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos()* using the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as the position within the controlled stream.

Implementations that support multiple encoding rules associate an encoding rule with the stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the current locale at the time when the stream becomes wide-oriented. As with the stream’s orientation, the encoding rule associated with a stream cannot be changed once it has been set, except by a successful call to *freopen()* which clears the encoding rule and resets the orientation to unoriented.

Although wide-oriented streams are conceptually sequences of wide characters, the external file associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters generalized as follows:

- Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte encodings valid for use internal to the program).
- A file need not begin nor end in the initial shift state.

Moreover, the encodings used for characters may differ among files. Both the nature and choice of such encodings are implementation-defined.

The wide-character input functions read characters from the stream and convert them to wide characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream’s own **mbstate_t** object, **except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current locale.**

The wide-character output functions convert wide characters to (possibly multi-byte) characters and write them to the stream as if they were written by successive calls to the *fputwc()* function. Each conversion shall occur as if by a call to the *wcrtomb()* function, with the conversion state described by the stream’s own **mbstate_t** object, **except the encoding rule associated with the stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current**

16643

locale.

16644

16645

16646

16647

16648

An “encoding error” shall occur if the character sequence presented to the underlying `mbrtowc()` function does not form a valid (generalized) character, or if the code value passed to the underlying `wcrtomb()` function does not correspond to a valid (generalized) character. The wide-character input/output functions and the byte input/output functions store the value of the macro `[EILSEQ]` in `errno` if and only if an encoding error occurs.

16649

2.6 STREAMS

16650

OB XSR

16651

16652

STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. The functionality described in this section is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

16653

16654

16655

16656

16657

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in POSIX.1-200x. Creation of STREAMS modules is outside the scope of POSIX.1-200x.

16658

16659

16660

16661

16662

16663

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

16664

STREAMS I/O is based on messages. There are three types of message:

16665

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

16666

16667

16668

16669

16670

16671

16672

16673

16674

16675

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls `write()`, `writew()`, `putmsg()`, `putpmsg()`, or `ioctl()`, messages are sent down the STREAM, and `read()`, `readv()`, `getmsg()`, or `getpmsg()` accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

16676

16677

16678

16679

16680

16681

When a STREAMS-based device is opened, a STREAM shall be created that contains the STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using `ioctl()`. New modules are “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

16682

Priority

16683

16684

16685

16686

16687

16688

16689

16690

16691

16692

16693

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

16694

Message Parts

16695

16696

16697

16698

16699

16700

16701

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writv()*. Messages containing a control part with or without a data part are accessible via calls to *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

16702

2.6.1 Accessing STREAMS

16703

16704

16705

A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*, *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable function definitions for general properties and errors.

16706

16707

16708

Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor *fdes*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

16709

16710

16711

16712

16713

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

16714

2.7 XSI Interprocess Communication

16715

16716

16717

XSI

This section describes extensions to support interprocess communication. The functionality described in this section shall be provided on implementations that support the XSI option (and the rest of this section is not further shaded).

16718

16719

16720

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are defined as follows.

16721
16722
16723
16724
16725

IPC Functions		
<i>msgctl()</i>	<i>semctl()</i>	<i>shmctl()</i>
<i>msgget()</i>	<i>semget()</i>	<i>shmdt()</i>
<i>msgrcv()</i>	<i>semop()</i>	<i>shmget()</i>
<i>msgsnd()</i>	<i>shmat()</i>	

16726
16727

Another interprocess communication facility is provided by functions in the Realtime Option Group; see [Section 2.8](#) (on page 476).

16728

2.7.1 IPC General Description

16729
16730
16731
16732

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shm_{id}*, a semaphore identifier, *sem_{id}*, and a message queue identifier, *msg_{id}*. The identifiers shall be returned by calls to *shmget()*, *semget()*, and *msgget()*, respectively.

16733
16734
16735

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of POSIX.1-200x, [<sys/shm.h>](#), [<sys/sem.h>](#), and [<sys/msg.h>](#) for their descriptions.

16736
16737
16738
16739
16740

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of POSIX.1-200x, [<sys/ipc.h>](#)) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

16741

The values of the bits are given below in octal notation.

16742
16743
16744
16745
16746
16747
16748

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

16749
16750
16751
16752

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

16753
16754
16755
16756

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.

16757
16758
16759
16760

- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.

16761
16762
16763
16764

- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

16765

Otherwise, the permission shall be denied.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of some of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in XBD [Chapter 3](#) (on page 33).

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of POSIX.1-200x are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

See [Section 2.4.2](#) (on page 464).

2.8.2 Asynchronous I/O

An asynchronous I/O control block structure `aiocb` is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of POSIX.1-200x, `<aio.h>` and has at least the following members:

Member Type	Member Name	Description
<code>int</code>	<code>aio_fildes</code>	File descriptor.
<code>off_t</code>	<code>aio_offset</code>	File offset.
<code>volatile void*</code>	<code>aio_buf</code>	Location of buffer.
<code>size_t</code>	<code>aio_nbytes</code>	Length of transfer.
<code>int</code>	<code>aio_repprio</code>	Request priority offset.
<code>struct sigevent</code>	<code>aio_sigevent</code>	Signal number and value.
<code>int</code>	<code>aio_lio_opcode</code>	Operation to be performed.

The `aio_fildes` element is the file descriptor on which the asynchronous operation is performed.

If `O_APPEND` is not set for the file descriptor `aio_fildes` and if `aio_fildes` is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by `aio_offset`, as if `lseek()` were called immediately prior to the operation with an `offset` argument equal to `aio_offset` and a `whence` argument equal to `SEEK_SET`. If `O_APPEND` is set for the file descriptor, or if `aio_fildes` is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming

16807 application to determine whether this relaxation applies, all strictly conforming applications
 16808 which rely on ordering of output shall be written in such a way that they will operate correctly if
 16809 the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the
 16810 value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same
 16811 as the *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

16812 If `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, then
 16813 asynchronous I/O is queued in priority order, with the priority of each asynchronous operation
 16814 based on the current scheduling priority of the calling process. The *aio_reqprio* member can be
 16815 used to lower (but not raise) the asynchronous I/O operation priority and is within the range
 16816 zero through `{AIO_PRIO_DELTA_MAX}`, inclusive. Unless both `_POSIX_PRIORITIZED_IO` and
 16817 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing asynchronous I/O
 16818 requests is unspecified. When both `_POSIX_PRIORITIZED_IO` and
 16819 `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing of requests submitted
 16820 by processes whose schedulers are not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is
 16821 unspecified. The priority of an asynchronous request is computed as (process scheduling
 16822 priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an
 16823 indication of the desired order of execution of the request relative to other asynchronous I/O
 16824 requests for this file. If `_POSIX_PRIORITIZED_IO` is defined, requests issued with the same
 16825 priority to a character special file are processed by the underlying device in FIFO order; the
 16826 order of processing of requests of the same priority issued to files that are not character special
 16827 files is unspecified. Numerically higher priority values indicate requests of higher priority. The
 16828 value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous
 16829 I/O requests to the same file are blocked waiting for a resource required for that I/O operation,
 16830 the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests
 16831 are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is
 16832 implementation-defined. If `_POSIX_PRIORITIZED_IO` is defined, the implementation shall
 16833 define for which files I/O prioritization is supported.

16834 The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as
 16835 specified in [Section 2.4.1](#) (on page 463). If *aio_sigevent.sigev_notify* is `SIGEV_NONE`, then no
 16836 signal shall be posted upon I/O completion, but the error status for the operation and the return
 16837 status for the operation shall be set appropriately.

16838 The *aio_lio_opcode* field is used only by the *lio_listio()* call. The *lio_listio()* call allows multiple
 16839 asynchronous I/O operations to be submitted at a single time. The function takes as an
 16840 argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to
 16841 be performed (read or write) via the *aio_lio_opcode* field.

16842 The address of the **aiocb** structure is used as a handle for retrieving the error status and return
 16843 status of the asynchronous operation while it is in progress.

16844 The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are
 16845 being used by the system for asynchronous I/O while, and only while, the error status of the
 16846 asynchronous operation is equal to `[EINPROGRESS]`. Applications shall not modify the **aiocb**
 16847 structure while the structure is being used by the system for asynchronous I/O.

16848 The return status of the asynchronous operation is the number of bytes transferred by the I/O
 16849 operation. If the error status is set to indicate an error completion, then the return status is set to
 16850 the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned.
 16851 When the error status is not equal to `[EINPROGRESS]`, the return status shall reflect the return
 16852 status of the corresponding synchronous operation.

16853 **2.8.3 Memory Management**16854 **2.8.3.1 Memory Locking**

16855 MLR Range memory locking operations are defined in terms of pages. Implementations may restrict
 16856 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,
 16857 is the value of the configurable system variable {PAGESIZE}. If an implementation has no
 16858 restrictions on size or alignment, it may specify a 1-byte page size.

16859 ML | MLR Memory locking guarantees the residence of portions of the address space. It is implementation-
 16860 defined whether locking memory guarantees fixed translation between virtual addresses (as
 16861 seen by the process) and physical addresses. Per-process memory locks are not inherited across a
 16862 *fork()*, and all memory locks owned by a process are unlocked upon *exec* or process termination.
 16863 Unmapping of an address range removes any memory locks established on that address range
 16864 by this process.

16865 **2.8.3.2 Memory Mapped Files**

16866 Range memory mapping operations are defined in terms of pages. Implementations may
 16867 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,
 16868 in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has
 16869 no restrictions on size or alignment, it may specify a 1-byte page size.

16870 Memory mapped files provide a mechanism that allows a process to access files by directly
 16871 incorporating file data into its address space. Once a file is mapped into a process address space,
 16872 the data can be manipulated as memory. If more than one process maps a file, its contents are
 16873 shared among them. If the mappings allow shared write access, then data written into the
 16874 memory object through the address space of one process appears in the address spaces of all
 16875 processes that similarly map the same portion of the memory object.

16876 SHM Shared memory objects are named regions of storage that may be independent of the file system
 16877 and can be mapped into the address space of one or more processes to allow them to share the
 16878 associated memory.

16879 SHM An *unlink()* of a file or *shm_unlink()* of a shared memory object, while causing the removal of
 16880 the name, does not unmap any mappings established for the object. Once the name has been
 16881 removed, the contents of the memory object are preserved as long as it is referenced. The
 16882 memory object remains referenced as long as a process has the memory object open or has some
 16883 area of the memory object mapped.

16884 **2.8.3.3 Memory Protection**

16885 When an object is mapped, various application accesses to the mapped region may result in
 16886 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and
 16887 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 16888 • A mapping may be restricted to disallow some types of access.
- 16889 • Write attempts to memory that was mapped without write access, or any access to
 16890 memory mapped PROT_NONE, shall result in a SIGSEGV signal.
- 16891 • References to unmapped addresses shall result in a SIGSEGV signal.
- 16892 • Reference to whole pages within the mapping, but beyond the current length of the object,
 16893 shall result in a SIGBUS signal.

- 16894 • The size of the object is unaffected by access beyond the end of the object (even if a
16895 SIGBUS is not generated).

16896 2.8.3.4 Typed Memory Objects

16897 TYM The functionality described in this section shall be provided on implementations that support
16898 the Typed Memory Objects option (and the rest of this section is not further shaded for this
16899 option).

16900 Implementations may support the Typed Memory Objects option independently of support for
16901 memory mapped files or shared memory objects. Typed memory objects are implementation-
16902 configurable named storage pools accessible from one or more processors in a system, each via
16903 one or more ports, such as backplane buses, LANs, I/O channels, and so on. Each valid
16904 combination of a storage pool and a port is identified through a name that is defined at system
16905 configuration time, in an implementation-defined manner; the name may be independent of the
16906 file system. Using this name, a typed memory object can be opened and mapped into process
16907 address space. For a given storage pool and port, it is necessary to support both dynamic
16908 allocation from the pool as well as mapping at an application-supplied offset within the pool;
16909 when dynamic allocation has been performed, subsequent deallocation must be supported.
16910 Lastly, accessing typed memory objects from different ports requires a method for obtaining the
16911 offset and length of contiguous storage of a region of typed memory (dynamically allocated or
16912 not); this allows typed memory to be shared among processes and/or processors while being
16913 accessed from the desired port.

16914 2.8.4 Process Scheduling

16915 PS The functionality described in this section shall be provided on implementations that support
16916 the Process Scheduling option (and the rest of this section is not further shaded for this option).

16917 Scheduling Policies

16918 The scheduling semantics described in this volume of POSIX.1-200x are defined in terms of a
16919 conceptual model that contains a set of thread lists. No implementation structures are
16920 necessarily implied by the use of this conceptual model. It is assumed that no time elapses
16921 during operations described using this model, and therefore no simultaneous operations are
16922 possible. This model discusses only processor scheduling for runnable threads, but it should be
16923 noted that greatly enhanced predictability of realtime applications results if the sequencing of
16924 other resources takes processor scheduling policy into account.

16925 There is, conceptually, one thread list for each priority. A runnable thread will be on the thread
16926 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty
16927 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose
16928 of a scheduling policy is to define the allowable operations on this set of lists (for example,
16929 moving threads between and within lists).

16930 The POSIX model treats a "process" as an aggregation of system resources, including one or
16931 more threads that may be scheduled by the operating system on the processor(s) it controls.
16932 Although a process has its own set of scheduling attributes, these have an indirect effect (if any)
16933 on the scheduling behavior of individual threads as described below.

16934 Each thread shall be controlled by an associated scheduling policy and priority. These
16935 parameters may be specified by explicit application execution of the *pthread_setschedparam()*
16936 function. Additionally, the scheduling parameters of a thread (but not its scheduling policy) may
16937 be changed by application execution of the *pthread_setschedprio()* function.

16938 Each process shall be controlled by an associated scheduling policy and priority. These
16939 parameters may be specified by explicit application execution of the *sched_setscheduler()* or

16940 *sched_setparam()* functions.

16941 The effect of the process scheduling attributes on individual threads in the process is dependent
16942 on the scheduling contention scope of the threads (see [Section 2.9.4](#), on page 488):

- 16943 • For threads with system scheduling contention scope, the process scheduling attributes
16944 shall have no effect on the scheduling attributes or behavior either of the thread or an
16945 underlying kernel scheduling entity dedicated to that thread.
- 16946 • For threads with process scheduling contention scope, the process scheduling attributes
16947 shall have no effect on the scheduling attributes of the thread. However, any underlying
16948 kernel scheduling entity used by these threads shall at all times behave as specified by the
16949 scheduling attributes of the containing process, and this behavior may affect the
16950 scheduling behavior of the process contention scope threads. For example, a process
16951 contention scope thread with scheduling policy `SCHED_FIFO` and the system maximum
16952 priority *H* (the value returned by *sched_get_priority_max(SCHED_FIFO)*) in a process with
16953 scheduling policy `SCHED_RR` and system minimum priority *L* (the value returned by
16954 *sched_get_priority_min(SCHED_RR)*) shall be subject to timeslicing and to preemption by
16955 any thread with an effective priority higher than *L*.

16956 Associated with each policy is a priority range. Each policy definition shall specify the minimum
16957 priority range for that policy. The priority ranges for each policy may but need not overlap the
16958 priority ranges of other policies.

16959 A conforming implementation shall select the thread that is defined as being at the head of the
16960 highest priority non-empty thread list to become a running thread, regardless of its associated
16961 policy. This thread is then removed from its thread list.

16962 Four scheduling policies are specifically required. Other implementation-defined scheduling
16963 policies may be defined. The following symbols are defined in the Base Definitions volume of
16964 POSIX.1-200x, `<sched.h>`:

16965 `SCHED_FIFO` First in, first out (FIFO) scheduling policy.

16966 `SCHED_RR` Round robin scheduling policy.

16967 SS `SCHED_SPORADIC` Sporadic server scheduling policy.

16968 `SCHED_OTHER` Another scheduling policy.

16969 The values of these symbols shall be distinct.

16970 **SCHED_FIFO**

16971 Conforming implementations shall include a scheduling policy called the FIFO scheduling
16972 policy.

16973 Threads scheduled under this policy are chosen from a thread list that is ordered by the time its
16974 threads have been on the list without being executed; generally, the head of the list is the thread
16975 that has been on the list the longest time, and the tail is the thread that has been on the list the
16976 shortest time.

16977 Under the `SCHED_FIFO` policy, the modification of the definitional thread lists is as follows:

- 16978 1. When a running thread becomes a preempted thread, it becomes the head of the thread
16979 list for its priority.
- 16980 2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list
16981 for its priority.

- 16982 3. When a running thread calls the *sched_setscheduler()* function, the process specified in the
 16983 function call is modified to the specified policy and the priority specified by the *param*
 16984 argument.
- 16985 4. When a running thread calls the *sched_setparam()* function, the priority of the process
 16986 specified in the function call is modified to the priority specified by the *param* argument.
- 16987 5. When a running thread calls the *pthread_setschedparam()* function, the thread specified in
 16988 the function call is modified to the specified policy and the priority specified by the *param*
 16989 argument.
- 16990 6. When a running thread calls the *pthread_setschedprio()* function, the thread specified in the
 16991 function call is modified to the priority specified by the *prio* argument.
- 16992 7. If a thread whose policy or priority has been modified other than by *pthread_setschedprio()*
 16993 is a running thread or is runnable, it then becomes the tail of the thread list for its new
 16994 priority.
- 16995 8. If a thread whose priority has been modified by *pthread_setschedprio()* is a running thread
 16996 or is runnable, the effect on its position in the thread list depends on the direction of the
 16997 modification, as follows:
- 16998 a. If the priority is raised, the thread becomes the tail of the thread list.
- 16999 b. If the priority is unchanged, the thread does not change position in the thread list.
- 17000 c. If the priority is lowered, the thread becomes the head of the thread list.
- 17001 9. When a running thread issues the *sched_yield()* function, the thread becomes the tail of
 17002 the thread list for its priority.
- 17003 10. At no other time is the position of a thread with this scheduling policy within the thread
 17004 lists affected.

17005 For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()*
 17006 and *sched_get_priority_min()* functions when SCHED_FIFO is provided as the parameter.
 17007 Conforming implementations shall provide a priority range of at least 32 priorities for this
 17008 policy.

17009 SCHED_RR

17010 Conforming implementations shall include a scheduling policy called the “round robin”
 17011 scheduling policy. This policy shall be identical to the SCHED_FIFO policy with the additional
 17012 condition that when the implementation detects that a running thread has been executing as a
 17013 running thread for a time period of the length returned by the *sched_rr_get_interval()* function or
 17014 longer, the thread shall become the tail of its thread list and the head of that thread list shall be
 17015 removed and made a running thread.

17016 The effect of this policy is to ensure that if there are multiple SCHED_RR threads at the same
 17017 priority, one of them does not monopolize the processor. An application should not rely only on
 17018 the use of SCHED_RR to ensure application progress among multiple threads if the application
 17019 includes threads using the SCHED_FIFO policy at the same or higher priority levels or
 17020 SCHED_RR threads at a higher priority level.

17021 A thread under this policy that is preempted and subsequently resumes execution as a running
 17022 thread completes the unexpired portion of its round robin interval time period.

17023 For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()*
 17024 and *sched_get_priority_min()* functions when SCHED_RR is provided as the parameter.
 17025 Conforming implementations shall provide a priority range of at least 32 priorities for this

17026 policy.

17027 SCHED_SPORADIC

17028 SS|TSP The functionality described in this section shall be provided on implementations that support
17029 the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not
17030 further shaded for these options).

17031 If `_POSIX_SPORADIC_SERVER` or `_POSIX_THREAD_SPORADIC_SERVER` is defined, the
17032 implementation shall include a scheduling policy identified by the value `SCHED_SPORADIC`.

17033 The sporadic server policy is based primarily on two time parameters: the replenishment period
17034 and the available execution capacity. The replenishment period is given by the
17035 `sched_ss_repl_period` member of the `sched_param` structure. The available execution capacity is
17036 initialized to the value given by the `sched_ss_init_budget` member of the same parameter. The
17037 sporadic server policy is identical to the `SCHED_FIFO` policy with some additional conditions
17038 that cause the thread's assigned priority to be switched between the values specified by the
17039 `sched_priority` and `sched_ss_low_priority` members of the `sched_param` structure.

17040 The priority assigned to a thread using the sporadic server scheduling policy is determined in
17041 the following manner: if the available execution capacity is greater than zero and the number of
17042 pending replenishment operations is strictly less than `sched_ss_max_repl`, the thread is assigned
17043 the priority specified by `sched_priority`; otherwise, the assigned priority shall be
17044 `sched_ss_low_priority`. If the value of `sched_priority` is less than or equal to the value of
17045 `sched_ss_low_priority`, the results are undefined. When active, the thread shall belong to the
17046 thread list corresponding to its assigned priority level, according to the mentioned priority
17047 assignment. The modification of the available execution capacity and, consequently of the
17048 assigned priority, is done as follows:

- 17049 1. When the thread at the head of the `sched_priority` list becomes a running thread, its
17050 execution time shall be limited to at most its available execution capacity, plus the
17051 resolution of the execution time clock used for this scheduling policy. This resolution shall
17052 be implementation-defined.
- 17053 2. Each time the thread is inserted at the tail of the list associated with `sched_priority`—
17054 because as a blocked thread it became runnable with priority `sched_priority` or because a
17055 replenishment operation was performed—the time at which this operation is done is
17056 posted as the `activation_time`.
- 17057 3. When the running thread with assigned priority equal to `sched_priority` becomes a
17058 preempted thread, it becomes the head of the thread list for its priority, and the execution
17059 time consumed is subtracted from the available execution capacity. If the available
17060 execution capacity would become negative by this operation, it shall be set to zero.
- 17061 4. When the running thread with assigned priority equal to `sched_priority` becomes a blocked
17062 thread, the execution time consumed is subtracted from the available execution capacity,
17063 and a replenishment operation is scheduled, as described in 6 and 7. If the available
17064 execution capacity would become negative by this operation, it shall be set to zero.
- 17065 5. When the running thread with assigned priority equal to `sched_priority` reaches the limit
17066 imposed on its execution time, it becomes the tail of the thread list for
17067 `sched_ss_low_priority`, the execution time consumed is subtracted from the available
17068 execution capacity (which becomes zero), and a replenishment operation is scheduled, as
17069 described in 6 and 7.
- 17070 6. Each time a replenishment operation is scheduled, the amount of execution capacity to be
17071 replenished, `replenish_amount`, is set equal to the execution time consumed by the thread
17072 since the `activation_time`. The replenishment is scheduled to occur at `activation_time` plus

17073 *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the
 17074 replenishment operation is carried out immediately. Several replenishment operations
 17075 may be pending at the same time, each of which will be serviced at its respective
 17076 scheduled time. With the above rules, the number of replenishment operations
 17077 simultaneously pending for a given thread that is scheduled under the sporadic server
 17078 policy shall not be greater than *sched_ss_max_repl*.

17079 7. A replenishment operation consists of adding the corresponding *replenish_amount* to the
 17080 available execution capacity at the scheduled time. If, as a consequence of this operation,
 17081 the execution capacity would become larger than *sched_ss_initial_budget*, it shall be
 17082 rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was
 17083 runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it
 17084 becomes the tail of the thread list for *sched_priority*.

17085 Execution time is defined in XBD [Section 3.117](#) (on page 49). |

17086 For this policy, changing the value of a CPU-time clock via *clock_settime()* shall have no effect on
 17087 its behavior.

17088 For this policy, valid priorities shall be within the range returned by the *sched_get_priority_min()*
 17089 and *sched_get_priority_max()* functions when SCHED_SPORADIC is provided as the parameter.
 17090 Conforming implementations shall provide a priority range of at least 32 distinct priorities for
 17091 this policy.

17092 If the scheduling policy of the target process is either SCHED_FIFO or SCHED_RR, the
 17093 *sched_ss_low_priority*, *sched_ss_repl_period*, and *sched_ss_init* budget members of the *param*
 17094 argument shall have no effect on the scheduling behavior. If the scheduling policy of this process
 17095 is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the effects of these members are
 17096 implementation-defined; this case includes the SCHED_OTHER policy.

17097 **SCHED_OTHER**

17098 Conforming implementations shall include one scheduling policy identified as SCHED_OTHER
 17099 (which may execute identically with either the FIFO or round robin scheduling policy). The
 17100 effect of scheduling threads with the SCHED_OTHER policy in a system in which other threads
 17101 are executing under SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC is implementation-
 17102 defined.

17103 This policy is defined to allow strictly conforming applications to be able to indicate in a
 17104 portable manner that they no longer need a realtime scheduling policy.

17105 For threads executing under this policy, the implementation shall use only priorities within the
 17106 range returned by the *sched_get_priority_max()* and *sched_get_priority_min()* functions when
 17107 SCHED_OTHER is provided as the parameter.

2.8.5 Clocks and Timers

The `<time.h>` header defines the types and manifest constants used by the timing facility.

Time Value Specification Structures

Many of the timing facility functions accept or return time value specifications. A time value structure `timespec` specifies a single time value and includes at least the following members:

Member Type	Member Name	Description
<code>time_t</code>	<code>tv_sec</code>	Seconds.
<code>long</code>	<code>tv_nsec</code>	Nanoseconds.

The `tv_nsec` member is only valid if greater than or equal to zero, and less than the number of nanoseconds in a second (1 000 million). The time interval described by this structure is $(tv_sec * 10^9 + tv_nsec)$ nanoseconds.

A time value structure `itimerspec` specifies an initial timer value and a repetition interval for use by the per-process timer functions. This structure includes at least the following members:

Member Type	Member Name	Description
<code>struct timespec</code>	<code>it_interval</code>	Timer period.
<code>struct timespec</code>	<code>it_value</code>	Timer expiration.

If the value described by `it_value` is non-zero, it indicates the time to or time of the next timer expiration (for relative and absolute timer values, respectively). If the value described by `it_value` is zero, the timer shall be disarmed.

If the value described by `it_interval` is non-zero, it specifies an interval which shall be used in reloading the timer when it expires; that is, a periodic timer is specified. If the value described by `it_interval` is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is specified.

Timer Event Notification Control Block

Per-process timers may be created that notify the process of timer expirations by queuing a realtime extended signal. The `sigevent` structure, defined in the Base Definitions volume of POSIX.1-200x, `<signal.h>`, is used in creating such a timer. The `sigevent` structure contains the signal number and an application-specific data value which shall be used when notifying the calling process of timer expiration events.

Manifest Constants

The following constants are defined in the Base Definitions volume of POSIX.1-200x, `<time.h>`:

<code>CLOCK_REALTIME</code>	The identifier for the system-wide realtime clock.
<code>TIMER_ABSTIME</code>	Flag indicating time is absolute with respect to the clock associated with a timer.
<code>CLOCK_MONOTONIC</code>	The identifier for the system-wide monotonic clock, which is defined as a clock whose value cannot be set via <code>clock_settime()</code> and which cannot have backward clock jumps. The maximum possible clock jump is implementation-defined.

The maximum allowable resolution for `CLOCK_REALTIME` and `CLOCK_MONOTONIC` clocks and all time services based on these clocks is represented by `{_POSIX_CLOCKRES_MIN}` and shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of

17149 resolution for these clocks to provide finer granularity time bases. The actual resolution
 17150 supported by an implementation for a specific clock is obtained using the `clock_getres()`
 17151 function. If the actual resolution supported for a time service based on one of these clocks differs from the
 17152 resolution supported for that clock, the implementation shall document this difference.

17153 MON The minimum allowable maximum value for `CLOCK_REALTIME` and `CLOCK_MONOTONIC`
 17154 clocks and all absolute time services based on them is the same as that defined by the ISO C
 17155 standard for the `time_t` type. If the maximum value supported by a time service based on one of
 17156 these clocks differs from the maximum value supported by that clock, the implementation shall
 17157 document this difference.

17158 Execution Time Monitoring

17159 CPT If `_POSIX_CPUTIME` is defined, process CPU-time clocks shall be supported in addition to the
 17160 clocks described in [Manifest Constants](#) (on page 484).

17161 TCT If `_POSIX_THREAD_CPUTIME` is defined, thread CPU-time clocks shall be supported.

17162 CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in XBD [Section 3.117](#) (on
 17163 page 49). The mechanism used to measure execution time is described in XBD [Section 4.10](#) (on
 17164 page 98).

17165 CPT If `_POSIX_CPUTIME` is defined, the following constant of the type `clockid_t` is defined in
 17166 `<time.h>`:

17167 `CLOCK_PROCESS_CPUTIME_ID`

17168 When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is
 17169 interpreted as the identifier of the CPU-time clock associated with the process making the
 17170 function call.

17171 TCT If `_POSIX_THREAD_CPUTIME` is defined, the following constant of the type `clockid_t` is
 17172 defined in `<time.h>`:

17173 `CLOCK_THREAD_CPUTIME_ID`

17174 When this value of the type `clockid_t` is used in a `clock()` or `timer*()` function call, it is
 17175 interpreted as the identifier of the CPU-time clock associated with the thread making the
 17176 function call.

17177 2.9 Threads

17178 This section defines functionality to support multiple flows of control, called “threads”, within a
 17179 process. For the definition of threads, see XBD [Section 3.396](#) (on page 88).

17180 The specific functional areas covered by threads and their scope include:

- 17181 • Thread management: the creation, control, and termination of multiple flows of control in
 17182 the same process under the assumption of a common shared address space
- 17183 • Synchronization primitives optimized for tightly coupled operation of multiple control
 17184 flows in a common, shared address space

17185 **2.9.1 Thread-Safety**

17186 All functions defined by this volume of POSIX.1-200x shall be thread-safe, except that the
17187 following functions⁶ need not be thread-safe.

17188	<i>asctime()</i>	<i>ftw()</i>	<i>getserbyport()</i>	<i>putc_unlocked()</i>
17189	<i>basename()</i>	<i>getc_unlocked()</i>	<i>getservent()</i>	<i>putchar_unlocked()</i>
17190	<i>catgets()</i>	<i>getchar_unlocked()</i>	<i>getutxent()</i>	<i>putenv()</i>
17191	<i>crypt()</i>	<i>getdate()</i>	<i>getutxid()</i>	<i>pututxline()</i>
17192	<i>ctime()</i>	<i>getenv()</i>	<i>getutxline()</i>	<i>rand()</i>
17193	<i>dbm_clearerr()</i>	<i>getgrent()</i>	<i>gmtime()</i>	<i>readdir()</i>
17194	<i>dbm_close()</i>	<i>getgrgid()</i>	<i>hcreate()</i>	<i>setenv()</i>
17195	<i>dbm_delete()</i>	<i>getgrnam()</i>	<i>hdestroy()</i>	<i>setgrent()</i>
17196	<i>dbm_error()</i>	<i>gethostent()</i>	<i>hsearch()</i>	<i>setkey()</i>
17197	<i>dbm_fetch()</i>	<i>getlogin()</i>	<i>inet_ntoa()</i>	<i>setpwent()</i>
17198	<i>dbm_firstkey()</i>	<i>getnetbyaddr()</i>	<i>l64a()</i>	<i>setutxent()</i>
17199	<i>dbm_nextkey()</i>	<i>getnetbyname()</i>	<i>lgamma()</i>	<i>strerror()</i>
17200	<i>dbm_open()</i>	<i>getnetent()</i>	<i>lgammaf()</i>	<i>strsignal()</i>
17201	<i>dbm_store()</i>	<i>getopt()</i>	<i>lgammal()</i>	<i>strtok()</i>
17202	<i>dirname()</i>	<i>getprotobyname()</i>	<i>localeconv()</i>	<i>system()</i>
17203	<i>dllerror()</i>	<i>getprotobynumber()</i>	<i>localtime()</i>	<i>ttyname()</i>
17204	<i>drand48()</i>	<i>getprotoent()</i>	<i>lrand48()</i>	<i>unsetenv()</i>
17205	<i>encrypt()</i>	<i>getpwent()</i>	<i>mrand48()</i>	<i>wcstombs()</i>
17206	<i>endgrent()</i>	<i>getpwnam()</i>	<i>nftw()</i>	<i>wctomb()</i>
17207	<i>endpwent()</i>	<i>getpwuid()</i>	<i>nl_langinfo()</i>	
17208	<i>endutxent()</i>	<i>getserbyname()</i>	<i>ptsname()</i>	

17209 The *ctermid()* and *tmpnam()* functions need not be thread-safe if passed a NULL argument. The
17210 *wctomb()* and *wcsrtombs()* functions need not be thread-safe if passed a NULL *ps* argument.

17211 Implementations shall provide internal synchronization as necessary in order to satisfy this
17212 requirement.

17213 **2.9.2 Thread IDs**

17214 Although implementations may have thread IDs that are unique in a system, applications
17215 should only assume that thread IDs are usable and unique within a single process. The effect of
17216 calling any of the functions defined in this volume of POSIX.1-200x and passing as an argument
17217 the thread ID of a thread from another process is unspecified. A conforming implementation is
17218 free to reuse a thread ID after the thread terminates if it was created with the *detachstate* attribute
17219 set to *PTHREAD_CREATE_DETACHED* or if *pthread_detach()* or *pthread_join()* has been called
17220 for that thread. If a thread is detached, its thread ID is invalid for use as an argument in a call to
17221 *pthread_detach()* or *pthread_join()*.

17222 ⁶ The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

17223 **2.9.3 Thread Mutexes**

17224 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same
 17225 processing resources from eventually making forward progress in its execution. Eligibility for
 17226 processing resources is determined by the scheduling policy.

17227 A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- 17228 • It returns successfully from *pthread_mutex_lock()* with *m* as the *mutex* argument.
- 17229 • It returns successfully from *pthread_mutex_trylock()* with *m* as the *mutex* argument.
- 17230 • It returns successfully from *pthread_mutex_timedlock()* with *m* as the *mutex* argument.
- 17231 • It returns (successfully or not) from *pthread_cond_wait()* with *m* as the *mutex* argument
 17232 (except as explicitly indicated otherwise for certain errors).
- 17233 • It returns (successfully or not) from *pthread_cond_timedwait()* with *m* as the *mutex*
 17234 argument (except as explicitly indicated otherwise for certain errors).

17235 The thread shall remain the owner of *m* until one of the following occurs:

- 17236 • It executes *pthread_mutex_unlock()* with *m* as the *mutex* argument
- 17237 • It blocks in a call to *pthread_cond_wait()* with *m* as the *mutex* argument.
- 17238 • It blocks in a call to *pthread_cond_timedwait()* with *m* as the *mutex* argument.

17239 The implementation shall behave as if at all times there is at most one owner of any mutex.

17240 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex
 17241 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have
 17242 “released” the mutex and the mutex is said to have become “unlocked”.

17243 A problem can occur if a process terminates while one of its threads holds a mutex lock.
 17244 Depending on the mutex type, it might be possible for another thread to unlock the mutex and
 17245 recover the state of the mutex. However, it is difficult to perform this recovery reliably.

17246 Robust mutexes provide a means to enable the implementation to notify other threads in the
 17247 event of a process terminating while one of its threads holds a mutex lock. The next thread that
 17248 acquires the mutex is notified about the termination by the return value [EOWNERDEAD] from
 17249 the locking function. The notified thread can then attempt to recover the state protected by the
 17250 mutex, and if successful mark the state protected by the mutex as consistent by a call to
 17251 *pthread_mutex_consistent()*. If the notified thread is unable to recover the state, it can declare the
 17252 state as not recoverable by a call to *pthread_mutex_unlock()* without a prior call to
 17253 *pthread_mutex_consistent()*.

17254 Whether or not the state protected by a mutex can be recovered is dependent solely on the
 17255 application using robust mutexes. The robust mutex support provided in the implementation
 17256 provides notification only that a mutex owner has terminated while holding a lock, or that the
 17257 state of the mutex is not recoverable.

2.9.4 Thread Scheduling

TPS The functionality described in this section shall be provided on implementations that support the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the `pthread_attr_t` thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either `PTHREAD_SCOPE_PROCESS` or `PTHREAD_SCOPE_SYSTEM`.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the `pthread_attr_t` object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

TSP If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under [Section 2.8.4](#) (on page 479).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the policy and attributes of the process. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, affects threads as follows:

- A thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes

- 17303 with which the thread was created.
- 17304 • Threads created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope contend
- 17305 directly with other threads within their process that were created with
- 17306 `PTHREAD_SCOPE_PROCESS` scheduling contention scope. The contention is resolved
- 17307 based on the threads' scheduling attributes and policies. It is unspecified how such threads
- 17308 are scheduled relative to threads in other processes or threads with
- 17309 `PTHREAD_SCOPE_SYSTEM` scheduling contention scope.
- 17310 • Conforming implementations shall support the `PTHREAD_SCOPE_PROCESS` scheduling
- 17311 contention scope, the `PTHREAD_SCOPE_SYSTEM` scheduling contention scope, or both.

17312 Scheduling Allocation Domain

17313 Implementations shall support scheduling allocation domains containing one or more

17314 processors. It should be noted that the presence of multiple processors does not automatically

17315 indicate a scheduling allocation domain size greater than one. Conforming implementations on

17316 multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation

17317 domains, and could define these scheduling allocation domains on a per-thread, per-process, or

17318 per-system basis, depending on the types of applications intended to be supported by the

17319 implementation. The scheduling allocation domain is independent of scheduling contention

17320 scope, as the scheduling contention scope merely defines the set of threads with which a thread

17321 contends for processor resources, while scheduling allocation domain defines the set of

17322 processors for which it contends. The semantics of how this contention is resolved among

17323 threads for processors is determined by the scheduling policies of the threads.

17324 The choice of scheduling allocation domain size and the level of application control over

17325 scheduling allocation domains is implementation-defined. Conforming implementations may

17326 change the size of scheduling allocation domains and the binding of threads to scheduling

17327 allocation domains at any time.

17328 For application threads with scheduling allocation domains of size equal to one, the scheduling

17329 rules defined for `SCHED_FIFO` and `SCHED_RR` shall be used; see [Scheduling Policies](#) (on page

17330 479). All threads with system scheduling contention scope, regardless of the processes in which

17331 they reside, compete for the processor according to their priorities. Threads with process

17332 scheduling contention scope compete only with other threads with process scheduling

17333 contention scope within their process.

17334 For application threads with scheduling allocation domains of size greater than one, the rules

17335 TSP defined for `SCHED_FIFO`, `SCHED_RR`, and `SCHED_SPORADIC` shall be used in an

17336 implementation-defined manner. Each thread with system scheduling contention scope

17337 competes for the processors in its scheduling allocation domain in an implementation-defined

17338 manner according to its priority. Threads with process scheduling contention scope are

17339 scheduled relative to other threads within the same scheduling contention scope in the process.

17340 TSP If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the rules defined for `SCHED_SPORADIC`

17341 in [Scheduling Policies](#) (on page 479) shall be used in an implementation-defined manner for

17342 application threads whose scheduling allocation domain size is greater than one.

17343 **Scheduling Documentation**

17344 If `_POSIX_PRIORITY_SCHEDULING` is defined, then any scheduling policies beyond
 17345 TSP `SCHED_OTHER`, `SCHED_FIFO`, `SCHED_RR`, and `SCHED_SPORADIC`, as well as the effects of
 17346 the scheduling policies indicated by these other values, and the attributes required in order to
 17347 support such a policy, are implementation-defined. Furthermore, the implementation shall
 17348 document the effect of all processor scheduling allocation domain values supported for these
 17349 policies.

17350 **2.9.5 Thread Cancellation**

17351 The thread cancellation mechanism allows a thread to terminate the execution of any other
 17352 thread in the process in a controlled manner. The target thread (that is, the one that is being
 17353 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform
 17354 application-specific cleanup processing when the notice of cancellation is acted upon.

17355 Cancellation is controlled by the cancellation control functions. Each thread maintains its own
 17356 cancelability state. Cancellation may only occur at cancellation points or when the thread is
 17357 asynchronously cancelable.

17358 The thread cancellation mechanism described in this section depends upon programs having set
 17359 *deferred* cancelability state, which is specified as the default. Applications shall also carefully
 17360 follow static lexical scoping rules in their execution behavior. For example, use of `setjmp()`,
 17361 `return`, `goto`, and so on, to leave user-defined cancellation scopes without doing the necessary
 17362 scope pop operation results in undefined behavior.

17363 Use of asynchronous cancelability while holding resources which potentially need to be released
 17364 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated
 17365 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

17366 **2.9.5.1 Cancelability States**

17367 The cancelability state of a thread determines the action taken upon receipt of a cancellation
 17368 request. The thread may control cancellation in a number of ways.

17369 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 17370 1. Cancelability-Enable: When cancelability is `PTHREAD_CANCEL_DISABLE` (as defined
 17371 in the Base Definitions volume of POSIX.1-200x, `<pthread.h>`), cancellation requests
 17372 against the target thread are held pending. By default, cancelability is set to
 17373 `PTHREAD_CANCEL_ENABLE` (as defined in `<pthread.h>`).
- 17374 2. Cancelability Type: When cancelability is enabled and the cancelability type is
 17375 `PTHREAD_CANCEL_ASYNCHRONOUS` (as defined in `<pthread.h>`), new or pending
 17376 cancellation requests may be acted upon at any time. When cancelability is enabled and
 17377 the cancelability type is `PTHREAD_CANCEL_DEFERRED` (as defined in `<pthread.h>`),
 17378 cancellation requests are held pending until a cancellation point (see below) is reached. If
 17379 cancelability is disabled, the setting of the cancelability type has no immediate effect as all
 17380 cancellation requests are held pending; however, once cancelability is enabled again the
 17381 new type is in effect. The cancelability type is `PTHREAD_CANCEL_DEFERRED` in all
 17382 newly created threads including the thread in which `main()` was first invoked.

17383 2.9.5.2 Cancellation Points

17384 Cancellation points shall occur when a thread is executing the following functions:

17385	<i>accept()</i>	<i>nanosleep()</i>	<i>select()</i>
17386	<i>aio_suspend()</i>	<i>open()</i>	<i>sem_timedwait()</i>
17387	<i>clock_nanosleep()</i>	<i>openat()</i>	<i>sem_wait()</i>
17388	<i>close()</i>	<i>pause()</i>	<i>send()</i>
17389	<i>connect()</i>	<i>poll()</i>	<i>sendmsg()</i>
17390	<i>creat()</i>	<i>pread()</i>	<i>sendto()</i>
17391	<i>fcntl()</i> †	<i>pselect()</i>	<i>sigsuspend()</i>
17392	<i>fdatasync()</i>	<i>pthread_cond_timedwait()</i>	<i>sigtimedwait()</i>
17393	<i>fsync()</i>	<i>pthread_cond_wait()</i>	<i>sigwait()</i>
17394	<i>getmsg()</i>	<i>pthread_join()</i>	<i>sigwaitinfo()</i>
17395	<i>getpmsg()</i>	<i>pthread_testcancel()</i>	<i>sleep()</i>
17396	<i>lockf()</i>	<i>putmsg()</i>	<i>system()</i>
17397	<i>mq_receive()</i>	<i>putpmsg()</i>	<i>tcdrain()</i>
17398	<i>mq_send()</i>	<i>pwrite()</i>	<i>wait()</i>
17399	<i>mq_timedreceive()</i>	<i>read()</i>	<i>waitid()</i>
17400	<i>mq_timedsend()</i>	<i>readv()</i>	<i>waitpid()</i>
17401	<i>msgrcv()</i>	<i>recv()</i>	<i>write()</i>
17402	<i>msgsnd()</i>	<i>recvfrom()</i>	<i>writew()</i>
17403	<i>msync()</i>	<i>recvmsg()</i>	

17404 † When the *cmd* argument is F_SETLKW.

17405 A cancellation point may also occur when a thread is executing the following functions:

17406	<i>access()</i>	<i>fprintf()</i>	<i>getprotobynumber()</i>
17407	<i>asctime()</i>	<i>fputc()</i>	<i>getprotoent()</i>
17408	<i>asctime_r()</i>	<i>fputs()</i>	<i>getpwent()</i>
17409	<i>catclose()</i>	<i>fputwc()</i>	<i>getpwnam()</i>
17410	<i>catgets()</i>	<i>fputws()</i>	<i>getpwnam_r()</i>
17411	<i>catopen()</i>	<i>fread()</i>	<i>getpwuid()</i>
17412	<i>chmod()</i>	<i>freopen()</i>	<i>getpwuid_r()</i>
17413	<i>chown()</i>	<i>fscanf()</i>	<i>gets()</i>
17414	<i>closedir()</i>	<i>fseek()</i>	<i>getserbyname()</i>
17415	<i>closelog()</i>	<i>fseeko()</i>	<i>getserbyport()</i>
17416	<i>ctermid()</i>	<i>fsetpos()</i>	<i>getservent()</i>
17417	<i>ctime()</i>	<i>fstat()</i>	<i>getutxent()</i>
17418	<i>ctime_r()</i>	<i>fstatat()</i>	<i>getutxid()</i>
17419	<i>dbm_close()</i>	<i>ftell()</i>	<i>getutxline()</i>
17420	<i>dbm_delete()</i>	<i>ftello()</i>	<i>getwc()</i>
17421	<i>dbm_fetch()</i>	<i>ftw()</i>	<i>getwchar()</i>
17422	<i>dbm_nextkey()</i>	<i>futimens()</i>	<i>glob()</i>
17423	<i>dbm_open()</i>	<i>fwprintf()</i>	<i>iconv_close()</i>
17424	<i>dbm_store()</i>	<i>fwrite()</i>	<i>iconv_open()</i>
17425	<i>dlclose()</i>	<i>fwscanf()</i>	<i>ioctl()</i>
17426	<i>dlopen()</i>	<i>getaddrinfo()</i>	<i>link()</i>
17427	<i>dprintf()</i>	<i>getc()</i>	<i>linkat()</i>
17428	<i>endgrent()</i>	<i>getc_unlocked()</i>	<i>lio_listio()</i>
17429	<i>endhostent()</i>	<i>getchar()</i>	<i>localtime()</i>
17430	<i>endnetent()</i>	<i>getchar_unlocked()</i>	<i>localtime_r()</i>
17431	<i>endprotoent()</i>	<i>getcwd()</i>	<i>lseek()</i>
17432	<i>endpwent()</i>	<i>getdate()</i>	<i>lstat()</i>
17433	<i>endservent()</i>	<i>getdelim()</i>	<i>mkdir()</i>
17434	<i>endutxent()</i>	<i>getgrent()</i>	<i>mkdirat()</i>
17435	<i>faccessat()</i>	<i>getgrgid()</i>	<i>mkdtemp()</i>
17436	<i>fchmod()</i>	<i>getgrgid_r()</i>	<i>mkfifo()</i>
17437	<i>fchmodat()</i>	<i>getgrnam()</i>	<i>mkfifoat()</i>
17438	<i>fchown()</i>	<i>getgrnam_r()</i>	<i>mknod()</i>
17439	<i>fchownat()</i>	<i>gethostent()</i>	<i>mknodat()</i>
17440	<i>fclose()</i>	<i>gethostid()</i>	<i>mkstemp()</i>
17441	<i>fcntl()</i> †	<i>gethostname()</i>	<i>mktime()</i>
17442	<i>fflush()</i>	<i>getline()</i>	<i>nftw()</i>
17443	<i>fgetc()</i>	<i>getlogin()</i>	<i>opendir()</i>
17444	<i>fgetpos()</i>	<i>getlogin_r()</i>	<i>openlog()</i>
17445	<i>fgets()</i>	<i>getnameinfo()</i>	<i>pathconf()</i>
17446	<i>fgetwc()</i>	<i>getnetbyaddr()</i>	<i>pclose()</i>
17447	<i>fgetws()</i>	<i>getnetbyname()</i>	<i>perror()</i>
17448	<i>fntmsg()</i>	<i>getnetent()</i>	<i>popen()</i>
17449	<i>fork()</i>	<i>getopt()</i> ††	<i>posix_fadvise()</i>
17450	<i>fpathconf()</i>	<i>getprotobyname()</i>	<i>posix_fallocate()</i>

17451	<i>posix_madvise()</i>	<i>putc_unlocked()</i>	<i>strerror()</i>
17452	<i>posix_openpt()</i>	<i>putchar()</i>	<i>strerror_r()</i>
17453	<i>posix_spawn()</i>	<i>putchar_unlocked()</i>	<i>strftime()</i>
17454	<i>posix_spawnnp()</i>	<i>puts()</i>	<i>symlink()</i>
17455	<i>posix_trace_clear()</i>	<i>pututxline()</i>	<i>symlinkat()</i>
17456	<i>posix_trace_close()</i>	<i>putwc()</i>	<i>sync()</i>
17457	<i>posix_trace_create()</i>	<i>putwchar()</i>	<i>syslog()</i>
17458	<i>posix_trace_create_withlog()</i>	<i>readdir()</i>	<i>tmpfile()</i>
17459	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>readdir_r()</i>	<i>tmpnam()</i>
17460	<i>posix_trace_eventtypelist_rewind()</i>	<i>readlink()</i>	<i>ttyname()</i>
17461	<i>posix_trace_flush()</i>	<i>readlinkat()</i>	<i>ttyname_r()</i>
17462	<i>posix_trace_get_attr()</i>	<i>remove()</i>	<i>tzset()</i>
17463	<i>posix_trace_get_filter()</i>	<i>rename()</i>	<i>ungetc()</i>
17464	<i>posix_trace_get_status()</i>	<i>renameat()</i>	<i>ungetwc()</i>
17465	<i>posix_trace_getnext_event()</i>	<i>rewind()</i>	<i>unlink()</i>
17466	<i>posix_trace_open()</i>	<i>rewinddir()</i>	<i>unlinkat()</i>
17467	<i>posix_trace_rewind()</i>	<i>scandir()</i>	<i>utime()</i>
17468	<i>posix_trace_set_filter()</i>	<i>scanf()</i>	<i>utimensat()</i>
17469	<i>posix_trace_shutdown()</i>	<i>seekdir()</i>	<i>utimes()</i>
17470	<i>posix_trace_timedgetnext_event()</i>	<i>semop()</i>	<i>vfprintf()</i>
17471	<i>posix_typed_mem_open()</i>	<i>setgrent()</i>	<i>vfwprintf()</i>
17472	<i>printf()</i>	<i>sethostent()</i>	<i>vprintf()</i>
17473	<i>psiginfo()</i>	<i>setnetent()</i>	<i>vwprintf()</i>
17474	<i>psignal()</i>	<i>setprotoent()</i>	<i>wcsftime()</i>
17475	<i>pthread_rwlock_rdlock()</i>	<i>setpwent()</i>	<i>wordexp()</i>
17476	<i>pthread_rwlock_timedrdlock()</i>	<i>setservent()</i>	<i>wprintf()</i>
17477	<i>pthread_rwlock_timedwrlock()</i>	<i>setutxent()</i>	<i>wscanf()</i>
17478	<i>pthread_rwlock_wrlock()</i>	<i>sigpause()</i>	
17479	<i>putc()</i>	<i>stat()</i>	

17480 An implementation shall not introduce cancellation points into any other functions specified in
17481 this volume of POSIX.1-200x.

17482 The side effects of acting upon a cancellation request while suspended during a call of a function
17483 are the same as the side effects that may be seen in a single-threaded program when a call to a
17484 function is interrupted by a signal and the given function returns [EINTR]. Any such side
17485 effects occur before any cancellation cleanup handlers are called.

17486 Whenever a thread has cancelability enabled and a cancellation request has been made with that
17487 thread as the target, and the thread then calls any function that is a cancellation point (such as
17488 *pthread_testcancel()* or *read()*), the cancellation request shall be acted upon before the function
17489 returns. If a thread has cancelability enabled and a cancellation request is made with the thread
17490 as a target while the thread is suspended at a cancellation point, the thread shall be awakened
17491 and the cancellation request shall be acted upon. It is unspecified whether the cancellation
17492 request is acted upon or whether the cancellation request remains pending and the thread
17493 resumes normal execution if:

- 17494 • The thread is suspended at a cancellation point and the event for which it is waiting occurs
 - 17495 • A specified timeout expired
- 17496 before the cancellation request is acted upon.

17497 † For any value of the *cmd* argument.

17498 †† If *opterr* is non-zero.

17499 2.9.5.3 *Thread Cancellation Cleanup Handlers*

17500 Each thread maintains a list of cancellation cleanup handlers. The programmer uses the
 17501 *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions to place routines on and remove
 17502 routines from this list.

17503 When a cancellation request is acted upon, or when a thread calls *pthread_exit()*, the thread first
 17504 disables cancellation by setting its cancelability state to `PTHREAD_CANCEL_DISABLE` and its
 17505 cancelability type to `PTHREAD_CANCEL_DEFERRED`. The cancelability state shall remain set
 17506 to `PTHREAD_CANCEL_DISABLE` until the thread has terminated. The behavior is undefined if
 17507 a cancellation cleanup handler or thread-specific data destructor routine changes the
 17508 cancelability state to `PTHREAD_CANCEL_ENABLE`.

17509 The routines in the thread's list of cancellation cleanup handlers are invoked one by one in LIFO
 17510 sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked (First
 17511 Out). When the cancellation cleanup handler for a scope is invoked, the storage for that scope
 17512 remains valid. If the last cancellation cleanup handler returns, thread-specific data destructors (if
 17513 any) associated with thread-specific data keys for which the thread has non-NULL values will
 17514 be run, in unspecified order, as described for *pthread_key_create()*.

17515 After all cancellation cleanup handlers and thread-specific data destructors have returned,
 17516 thread execution is terminated. If the thread has terminated because of a call to *pthread_exit()*,
 17517 the *value_ptr* argument is made available to any threads joining with the target. If the thread has
 17518 terminated by acting on a cancellation request, a status of `PTHREAD_CANCELED` is made
 17519 available to any threads joining with the target. The symbolic constant `PTHREAD_CANCELED`
 17520 expands to a constant expression of type `(void *)` whose value matches no pointer to an object in
 17521 memory nor the value `NULL`.

17522 A side effect of acting upon a cancellation request while in a condition variable wait is that the
 17523 mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread
 17524 is no longer considered to be waiting for the condition and the thread shall not have consumed
 17525 any pending condition signals on the condition.

17526 A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

17527 2.9.5.4 *Async-Cancel Safety*

17528 The *pthread_cancel()*, *pthread_setcancelstate()*, and *pthread_setcanceltype()* functions are defined to
 17529 be async-cancel safe.

17530 No other functions in this volume of POSIX.1-200x are required to be async-cancel-safe.

17531 2.9.6 **Thread Read-Write Locks**

17532 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous
 17533 read-only access to data while allowing only one thread to have exclusive write access at any
 17534 given time. They are typically used to protect data that is read more frequently than it is
 17535 changed.

17536 One or more readers acquire read access to the resource by performing a read lock operation on
 17537 the associated read-write lock. A writer acquires exclusive write access by performing a write
 17538 lock operation. Basically, all readers exclude any writers and a writer excludes all readers and
 17539 any other writers.

17540 A thread that has blocked on a read-write lock (for example, has not yet returned from a
 17541 *pthread_rwlock_rdlock()* or *pthread_rwlock_wrlock()* call) shall not prevent any unblocked thread
 17542 that is eligible to use the same processing resources from eventually making forward progress in
 17543 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

17544 Read-write locks can be used to synchronize threads in the current process and other processes if
 17545 they are allocated in memory that is writable and shared among the cooperating processes and
 17546 have been initialized for this behavior.

17547 2.9.7 Thread Interactions with Regular File Operations

17548 All of the following functions shall be atomic with respect to each other in the effects specified in
 17549 POSIX.1-200x when they operate on regular files or symbolic links:

17550	<i>chmod()</i>	<i>fchownat()</i>	<i>lseek()</i>	<i>readv()</i>	<i>unlink()</i>
17551	<i>chown()</i>	<i>fcntl()</i>	<i>lstat()</i>	<i>pwrite()</i>	<i>unlinkat()</i>
17552	<i>close()</i>	<i>fstat()</i>	<i>open()</i>	<i>rename()</i>	<i>utime()</i>
17553	<i>creat()</i>	<i>fstatat()</i>	<i>openat()</i>	<i>renameat()</i>	<i>utimensat()</i>
17554	<i>dup2()</i>	<i>ftruncate()</i>	<i>pread()</i>	<i>stat()</i>	<i>utimes()</i>
17555	<i>fchmod()</i>	<i>lchown()</i>	<i>read()</i>	<i>symlink()</i>	<i>write()</i>
17556	<i>fchmodat()</i>	<i>link()</i>	<i>readlink()</i>	<i>symlinkat()</i>	<i>writev()</i>
17557	<i>fchown()</i>	<i>linkat()</i>	<i>readlinkat()</i>	<i>truncate()</i>	

17558 If two threads each call one of these functions, each call shall either see all of the specified effects
 17559 of the other call, or none of them.

17560 2.9.8 Use of Application-Managed Thread Stacks

17561 An “application-managed thread stack” is a region of memory allocated by the application—for
 17562 example, memory returned by the *malloc()* or *mmmap()* functions—and designated as a stack
 17563 through the act of passing the address and size of the stack, respectively, as the *stackaddr* and
 17564 *stacksize* arguments to *pthread_attr_setstack()*. Application-managed stacks allow the application
 17565 to precisely control the placement and size of a stack.

17566 The application grants to the implementation permanent ownership of and control over the
 17567 application-managed stack when the attributes object in which the *stack* or *stackaddr* attribute has
 17568 been set is used, either by presenting that attribute’s object as the *attr* argument in a call to
 17569 *pthread_create()* that completes successfully, or by storing a pointer to the attributes object in the
 17570 *sigev_notify_attributes* member of a **struct sigevent** and passing that **struct sigevent** to a function
 17571 accepting such argument that completes successfully. The application may thereafter utilize the
 17572 memory within the stack only within the normal context of stack usage within or properly
 17573 synchronized with a thread that has been scheduled by the implementation with stack pointer
 17574 value(s) that are within the range of that stack. In particular, the region of memory cannot be
 17575 freed, nor can it be later specified as the stack for another thread.

17576 When specifying an attributes object with an application-managed stack through the
 17577 *sigev_notify_attributes* member of a **struct sigevent**, the results are undefined if the requested
 17578 signal is generated multiple times (as for a repeating timer).

17579 Until an attributes object in which the *stack* or *stackaddr* attribute has been set is used, the
 17580 application retains ownership of and control over the memory allocated to the stack. It may free
 17581 or reuse the memory as long as it either deletes the attributes object, or before using the
 17582 attributes object replaces the stack by making an additional call to *pthread_attr_setstack()*, that
 17583 was used originally to designate the stack. There is no mechanism to retract the reference to an
 17584 application-managed stack by an existing attributes object.

17585 Once an attributes object with an application-managed stack has been used, that attributes object
 17586 cannot be used again by a subsequent call to *pthread_create()* or any function accepting a **struct**
 17587 **sigevent** with *sigev_notify_attributes* containing a pointer to the attributes object, without
 17588 designating an unused application-managed stack by making an additional call to
 17589 *pthread_attr_setstack()*.

17590 2.10 Sockets

17591 A socket is an endpoint for communication using the facilities described in this section. A socket
 17592 is created with a specific socket type, described in [Section 2.10.6](#) (on page 497), and is associated
 17593 with a specific protocol, detailed in [Section 2.10.3](#). A socket is accessed via a file descriptor
 17594 obtained when the socket is created.

17595 2.10.1 Address Families

17596 All network protocols are associated with a specific address family. An address family provides
 17597 basic services to the protocol implementation to allow it to function within a specific network
 17598 environment. These services may include packet fragmentation and reassembly, routing,
 17599 addressing, and basic transport. An address family is normally comprised of a number of
 17600 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not
 17601 required that an address family support all socket types. An address family may contain
 17602 multiple protocols supporting the same socket abstraction.

17603 [Section 2.10.17](#) (on page 503), [Section 2.10.19](#) (on page 504), and [Section 2.10.20](#) (on page 504),
 17604 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based
 17605 on IPv4, and for Internet protocols based on IPv6.

17606 2.10.2 Addressing

17607 An address family defines the format of a socket address. All network addresses are described
 17608 using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of
 17609 POSIX.1-200x, `<sys/socket.h>`. However, each address family imposes finer and more specific
 17610 structure, generally defining a structure with fields specific to the address family. The field
 17611 *sa_family* in the **sockaddr** structure contains the address family identifier, specifying the format
 17612 of the *sa_data* area. The size of the *sa_data* area is unspecified.

17613 2.10.3 Protocols

17614 A protocol supports one of the socket abstractions detailed in [Section 2.10.6](#) (on page 497).
 17615 Selecting a protocol involves specifying the address family, socket type, and protocol number to
 17616 the *socket()* function. Certain semantics of the basic socket abstractions are protocol-specific. All
 17617 protocols are expected to support the basic model for their particular socket type, but may, in
 17618 addition, provide non-standard facilities or extensions to a mechanism.

17619 2.10.4 Routing

17620 Sockets provides packet routing facilities. A routing information database is maintained, which
 17621 is used in selecting the appropriate network interface when transmitting packets.

17622 2.10.5 Interfaces

17623 Each network interface in a system corresponds to a path through which messages can be sent
 17624 and received. A network interface usually has a hardware device associated with it, though
 17625 certain interfaces such as the loopback interface, do not.

2.10.6 Socket Types

17626

17627

17628

17629

17630

RS

A socket is created with a specific type, which defines the communication semantics and which allows the selection of an appropriate communication protocol. Four types are defined: `SOCK_RAW`, `SOCK_STREAM`, `SOCK_SEQPACKET`, and `SOCK_DGRAM`. Implementations may specify additional socket types.

17631

17632

17633

17634

17635

17636

17637

17638

17639

17640

The `SOCK_STREAM` socket type provides reliable, sequenced, full-duplex octet streams between the socket and a peer to which the socket is connected. A socket of type `SOCK_STREAM` must be in a connected state before any data may be sent or received. Record boundaries are not maintained; data sent on a stream socket using output operations of one size may be received using input operations of smaller or larger sizes without loss of data. Data may be buffered; successful return from an output function does not imply that the data has been delivered to the peer or even transmitted from the local system. If data cannot be successfully transmitted within a given time then the connection is considered broken, and subsequent operations shall fail. A `SIGPIPE` signal is raised if a thread sends on a broken stream (one that is no longer connected). Support for an out-of-band data transmission facility is protocol-specific.

17641

17642

17643

17644

17645

17646

17647

The `SOCK_SEQPACKET` socket type is similar to the `SOCK_STREAM` type, and is also connection-oriented. The only difference between these types is that record boundaries are maintained using the `SOCK_SEQPACKET` type. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers parts of more than one record. Record boundaries are visible to the receiver via the `MSG_EOR` flag in the received message flags returned by the `recvmsg()` function. It is protocol-specific whether a maximum record size is imposed.

17648

17649

17650

17651

17652

17653

17654

17655

17656

17657

17658

17659

17660

The `SOCK_DGRAM` socket type supports connectionless data transfer which is not necessarily acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or broadcast) in each output operation, and incoming datagrams may be received from multiple sources. The source address of each datagram is available when receiving the datagram. An application may also pre-specify a peer address, in which case calls to output functions that do not specify a peer address shall send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall be received. A datagram must be sent in a single output operation, and must be received in a single input operation. The maximum size of a datagram is protocol-specific; with some protocols, the limit is implementation-defined. Output datagrams may be buffered within the system; thus, a successful return from an output function does not guarantee that a datagram is actually sent or received. However, implementations should attempt to detect any errors possible before the return of an output function, reporting any error by an unsuccessful return value.

17661

17662

17663

17664

17665

RS

The `SOCK_RAW` socket type is similar to the `SOCK_DGRAM` type. It differs in that it is normally used with communication providers that underlie those used for the other socket types. For this reason, the creation of a socket with type `SOCK_RAW` shall require appropriate privilege. The format of datagrams sent and received with this socket type generally include specific protocol headers, and the formats are protocol-specific and implementation-defined.

17666 2.10.7 Socket I/O Mode

17667 The I/O mode of a socket is described by the `O_NONBLOCK` file status flag which pertains to
 17668 the open file description for the socket. This flag is initially off when a socket is created, but may
 17669 be set and cleared by the use of the `F_SETFL` command of the `fcntl()` function.

17670 When the `O_NONBLOCK` flag is set, functions that would normally block until they are
 17671 complete shall either return immediately with an error, or shall complete asynchronously to the
 17672 execution of the calling process. Data transfer operations (the `read()`, `write()`, `send()`, and `recv()`
 17673 functions) shall complete immediately, transfer only as much as is available, and then return
 17674 without blocking, or return an error indicating that no transfer could be made without blocking.
 17675 The `connect()` function initiates a connection and shall return without blocking when
 17676 `O_NONBLOCK` is set; it shall return the error `[EINPROGRESS]` to indicate that the connection
 17677 was initiated successfully, but that it has not yet completed.

17678 2.10.8 Socket Owner

17679 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or
 17680 process group ID using the `F_SETOWN` command of the `fcntl()` function.

17681 2.10.9 Socket Queue Limits

17682 The transmit and receive queue sizes for a socket are set when the socket is created. The default
 17683 sizes used are both protocol-specific and implementation-defined. The sizes may be changed
 17684 using the `setsockopt()` function.

17685 2.10.10 Pending Error

17686 Errors may occur asynchronously, and be reported to the socket in response to input from the
 17687 network protocol. The socket stores the pending error to be reported to a user of the socket at the
 17688 next opportunity. The error is returned in response to a subsequent `send()`, `recv()`, or `getsockopt()`
 17689 operation on the socket, and the pending error is then cleared.

17690 2.10.11 Socket Receive Queue

17691 A socket has a receive queue that buffers data when it is received by the system until it is
 17692 removed by a receive call. Depending on the type of the socket and the communication provider,
 17693 the receive queue may also contain ancillary data such as the addressing and other protocol data
 17694 associated with the normal data in the queue, and may contain out-of-band or expedited data.
 17695 The limit on the queue size includes any normal, out-of-band data, datagram source addresses,
 17696 and ancillary data in the queue. The description in this section applies to all sockets, even
 17697 though some elements cannot be present in some instances.

17698 The contents of a receive buffer are logically structured as a series of data segments with
 17699 associated ancillary data and other information. A data segment may contain normal data or
 17700 out-of-band data, but never both. A data segment may complete a record if the protocol
 17701 supports records (always true for types `SOCK_SEQPACKET` and `SOCK_DGRAM`). A record
 17702 may be stored as more than one segment; the complete record might never be present in the
 17703 receive buffer at one time, as a portion might already have been returned to the application, and
 17704 another portion might not yet have been received from the communications provider. A data
 17705 segment may contain ancillary protocol data, which is logically associated with the segment.
 17706 Ancillary data is received as if it were queued along with the first normal data octet in the
 17707 segment (if any). A segment may contain ancillary data only, with no normal or out-of-band
 17708 data. For the purposes of this section, a datagram is considered to be a data segment that
 17709 terminates a record, and that includes a source address as a special type of ancillary data. Data

17710 segments are placed into the queue as data is delivered to the socket by the protocol. Normal
 17711 data segments are placed at the end of the queue as they are delivered. If a new segment
 17712 contains the same type of data as the preceding segment and includes no ancillary data, and if
 17713 the preceding segment does not terminate a record, the segments are logically merged into a
 17714 single segment.

17715 The receive queue is logically terminated if an end-of-file indication has been received or a
 17716 connection has been terminated. A segment shall be considered to be terminated if another
 17717 segment follows it in the queue, if the segment completes a record, or if an end-of-file or other
 17718 connection termination has been reported. The last segment in the receive queue shall also be
 17719 considered to be terminated while the socket has a pending error to be reported.

17720 A receive operation shall never return data or ancillary data from more than one segment.

17721 2.10.12 Socket Out-of-Band Data State

17722 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed
 17723 in the socket receive queue, either at the end of the queue or before all normal data in the queue.
 17724 In this case, out-of-band data is returned to an application program by a normal receive call.
 17725 Out-of-band data may also be queued separately rather than being placed in the socket receive
 17726 queue, in which case it shall be returned only in response to a receive call that requests out-of-
 17727 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive
 17728 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An
 17729 out-of-band data mark is logically an empty data segment that cannot be merged with other
 17730 segments in the queue. An out-of-band data mark is never returned in response to an input
 17731 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the
 17732 first element in the queue. If an out-of-band data mark is the first element in the queue when an
 17733 input function is called without the MSG_PEEK option, the mark is removed from the queue
 17734 and the following data (if any) is processed as if the mark had not been present.

17735 2.10.13 Connection Indication Queue

17736 Sockets that are used to accept incoming connections maintain a queue of outstanding
 17737 connection indications. This queue is a list of connections that are awaiting acceptance by the
 17738 application; see *listen()*.

17739 2.10.14 Signals

17740 One category of event at the socket interface is the generation of signals. These signals report
 17741 protocol events or process errors relating to the state of the socket. The generation or delivery of
 17742 a signal does not change the state of the socket, although the generation of the signal may have
 17743 been caused by a state change.

17744 The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no
 17745 longer able to send. In addition, the send operation fails with the error [EPIPE].

17746 If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified
 17747 of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the
 17748 status of the socket is specified in [Section 2.10.17](#) (on page 503), [Section 2.10.19](#) (on page 504),
 17749 and [Section 2.10.20](#) (on page 504). Depending on the protocol, the expedited data may or may
 17750 not have arrived at the time of signal generation.

17751 **2.10.15 Asynchronous Errors**

17752 If any of the following conditions occur asynchronously for a socket, the corresponding value
17753 listed below shall become the pending error for the socket:

17754 [ECONNABORTED]

17755 The connection was aborted locally.

17756 [ECONNREFUSED]

17757 For a connection-mode socket attempting a non-blocking connection, the attempt to connect
17758 was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram
17759 was forcefully rejected.

17760 [ECONNRESET]

17761 The peer has aborted the connection.

17762 [EHOSTDOWN]

17763 The destination host has been determined to be down or disconnected.

17764 [EHOSTUNREACH]

17765 The destination host is not reachable.

17766 [EMSGSIZE]

17767 For a connectionless-mode socket, the size of a previously sent datagram prevented
17768 delivery.

17769 [ENETDOWN]

17770 The local network connection is not operational.

17771 [ENETRESET]

17772 The connection was aborted by the network.

17773 [ENETUNREACH]

17774 The destination network is not reachable.

17775 **2.10.16 Use of Options**

17776 There are a number of socket options which either specialize the behavior of a socket or provide
17777 useful information. These options may be set at different protocol levels and are always present
17778 at the uppermost "socket" level.

17779 Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions
17780 allow an application program to customize the behavior and characteristics of a socket to
17781 provide the desired effect.

17782 All of the options have default values. The type and meaning of these values is defined by the
17783 protocol level to which they apply. Instead of using the default values, an application program
17784 may choose to customize one or more of the options. However, in the bulk of cases, the default
17785 values are sufficient for the application.

17786 Some of the options are used to enable or disable certain behavior within the protocol modules
17787 (for example, turn on debugging) while others may be used to set protocol-specific information
17788 (for example, IP time-to-live on all the application's outgoing packets). As each of the options is
17789 introduced, its effect on the underlying protocol modules is described.

17790 [Table 2-1](#) (on page 501) shows the value for the socket level.

17791

Table 2-1 Value of Level for Socket Options

17792

17793

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

17794

17795

17796

17797

17798

Table 2-2 lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt()* or *setsockopt()* function is SOL_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with *setsockopt()* on all types of socket.

17825

17826

17827

Option	Parameter Type	Parameter Meaning
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket (<i>getsockopt()</i> only).
SO_KEEPALIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type (<i>getsockopt()</i> only).

17828

17829

17830

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

17831

17832

17833

17834

The SO_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

17835

The SO_DONTROUTE option requests that outgoing messages bypass the standard routing

17836 facilities. The destination must be on a directly-connected network, and messages are directed to
 17837 the appropriate network interface according to the destination address. It is protocol-specific
 17838 whether this option has any effect and how the outgoing network interface is chosen. Support
 17839 for this option with each protocol is implementation-defined.

17840 The `SO_ERROR` option is used only on `getsockopt()`. When this option is specified, `getsockopt()`
 17841 shall return any pending error on the socket and clear the error status. It shall return a value of 0
 17842 if there is no pending error. `SO_ERROR` may be used to check for asynchronous errors on
 17843 connected connectionless-mode sockets or for other types of asynchronous errors. `SO_ERROR`
 17844 has no default value.

17845 The `SO_KEEPALIVE` option enables the periodic transmission of messages on a connected
 17846 socket. The behavior of this option is protocol-specific. The default value for `SO_KEEPALIVE` is
 17847 zero, specifying that this capability is turned off.

17848 The `SO_LINGER` option controls the action of the interface when unsent messages are queued
 17849 on a socket and a `close()` is performed. The details of this option are protocol-specific. The
 17850 default value for `SO_LINGER` is zero, or off, for the `l_onoff` element of the option value and zero
 17851 seconds for the linger time specified by the `l_linger` element.

17852 The `SO_OOBINLINE` option is valid only on protocols that support out-of-band data. The
 17853 `SO_OOBINLINE` option requests that out-of-band data be placed in the normal data input
 17854 queue as received; it is then accessible using the `read()` or `recv()` functions without the
 17855 `MSG_OOB` flag set. The default for `SO_OOBINLINE` is off; that is, for out-of-band data not to be
 17856 placed in the normal data input queue.

17857 The `SO_RCVBUF` option requests that the buffer space allocated for receive operations on this
 17858 socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer
 17859 size for high volume connections, or may decrease buffer size to limit the possible backlog of
 17860 incoming data. The default value for the `SO_RCVBUF` option value is implementation-defined,
 17861 and may vary by protocol.

17862 The `SO_RCVLOWAT` option sets the minimum number of bytes to process for socket input
 17863 operations. In general, receive calls block until any (non-zero) amount of data is received, then
 17864 return the smaller of the amount available or the amount requested. The default value for
 17865 `SO_RCVLOWAT` is 1, and does not affect the general case. If `SO_RCVLOWAT` is set to a larger
 17866 value, blocking receive calls normally wait until they have received the smaller of the low water
 17867 mark value or the requested amount. Receive calls may still return less than the low water mark
 17868 if an error occurs, a signal is caught, or the type of data next in the receive queue is different
 17869 from that returned (for example, out-of-band data). As mentioned previously, the default value
 17870 for `SO_RCVLOWAT` is 1 byte. It is implementation-defined whether the `SO_RCVLOWAT` option
 17871 can be set.

17872 The `SO_RCVTIMEO` option is an option to set a timeout value for input operations. It accepts a
 17873 `timeval` structure with the number of seconds and microseconds specifying the limit on how
 17874 long to wait for an input operation to complete. If a receive operation has blocked for this much
 17875 time without receiving additional data, it shall return with a partial count or `errno` shall be set to
 17876 `[EWOULDBLOCK]` if no data were received. The default for this option is the value zero, which
 17877 indicates that a receive operation will not time out. It is implementation-defined whether the
 17878 `SO_RCVTIMEO` option can be set.

17879 The `SO_REUSEADDR` option indicates that the rules used in validating addresses supplied in a
 17880 `bind()` should allow reuse of local addresses. Operation of this option is protocol-specific. The
 17881 default value for `SO_REUSEADDR` is off; that is, reuse of local addresses is not permitted.

17882 The `SO_SNDBUF` option requests that the buffer space allocated for send operations on this
 17883 socket be set to the value, in bytes, of the option value. The default value for the `SO_SNDBUF`

17884 option value is implementation-defined, and may vary by protocol.

17885 The SO_SNDBLOWAT option sets the minimum number of bytes to process for socket output
 17886 operations. Most output operations process all of the data supplied by the call, delivering data to
 17887 the protocol for transmission and blocking as necessary for flow control. Non-blocking output
 17888 operations process as much data as permitted subject to flow control without blocking, but
 17889 process no data if flow control does not allow the smaller of the send low water mark value or
 17890 the entire request to be processed. A *select()* operation testing the ability to write to a socket shall
 17891 return true only if the send low water mark could be processed. The default value for
 17892 SO_SNDBLOWAT is implementation-defined and protocol-specific. It is implementation-defined
 17893 whether the SO_SNDBLOWAT option can be set.

17894 The SO_SNDTIMEO option is an option to set a timeout value for the amount of time that an
 17895 output function shall block because flow control prevents data from being sent. As noted in
 17896 Table 2-2 (on page 501), the option value is a **timeval** structure with the number of seconds and
 17897 microseconds specifying the limit on how long to wait for an output operation to complete. If a
 17898 send operation has blocked for this much time, it shall return with a partial count or *errno* set to
 17899 [EWOULDBLOCK] if no data were sent. The default for this option is the value zero, which
 17900 indicates that a send operation will not time out. It is implementation-defined whether the
 17901 SO_SNDTIMEO option can be set.

17902 The SO_TYPE option is used only on *getsockopt()*. When this option is specified, *getsockopt()*
 17903 shall return the type of the socket (for example, SOCK_STREAM). This option is useful to
 17904 servers that inherit sockets on start-up. SO_TYPE has no default value.

17905 2.10.17 Use of Sockets for Local UNIX Connections

17906 Support for UNIX domain sockets is mandatory.

17907 UNIX domain sockets provide process-to-process communication in a single system.

17908 2.10.17.1 Headers

17909 The symbolic constant AF_UNIX defined in the `<sys/socket.h>` header is used to identify the
 17910 UNIX domain address family. The `<sys/un.h>` header contains other definitions used in
 17911 connection with UNIX domain sockets. See XBD Chapter 13 (on page 205).

17912 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to
 17913 accommodate a `sockaddr_un` structure (see the `<sys/un.h>` header defined in XBD Chapter 13,
 17914 on page 205) and shall be aligned at an appropriate boundary so that pointers to it can be cast as
 17915 pointers to `sockaddr_un` structures and used to access the fields of those structures without
 17916 alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_un` structure, the
 17917 `ss_family` field maps onto the `sun_family` field.

17918 2.10.18 Use of Sockets over Internet Protocols

17919 When a socket is created in the Internet family with a protocol value of zero, the implementation
 17920 shall use the protocol listed below for the type of socket created.

17921 SOCK_STREAM IPPROTO_TCP.

17922 SOCK_DGRAM IPPROTO_UDP.

17923 RS SOCK_RAW IPPROTO_RAW.

17924 SOCK_SEQPACKET Unspecified.

17925 RS A raw interface to IP is available by creating an Internet socket of type SOCK_RAW. The default
 17926 protocol for type SOCK_RAW shall be identified in the IP header with the value

17927 IPPROTO_RAW. Applications should not use the default protocol when creating a socket with
 17928 type SOCK_RAW, but should identify a specific protocol by value. The ICMP control protocol is
 17929 accessible from a raw socket by specifying a value of IPPROTO_ICMP for protocol.

17930 2.10.19 Use of Sockets over Internet Protocols Based on IPv4

17931 Support for sockets over Internet protocols based on IPv4 is mandatory.

17932 2.10.19.1 Headers

17933 The symbolic constant AF_INET defined in the `<sys/socket.h>` header is used to identify the
 17934 IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in
 17935 connection with IPv4 Internet sockets. See XBD Chapter 13 (on page 205).

17936 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to
 17937 accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in XBD Chapter
 17938 13, on page 205) and shall be aligned at an appropriate boundary so that pointers to it can be
 17939 cast as pointers to `sockaddr_in` structures and used to access the fields of those structures
 17940 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in`
 17941 structure, the `ss_family` field maps onto the `sin_family` field.

17942 2.10.20 Use of Sockets over Internet Protocols Based on IPv6

17943 IP6 This section describes extensions to support sockets over Internet protocols based on IPv6. The
 17944 functionality described in this section shall be provided on implementations that support the
 17945 IPV6 option (and the rest of this section is not further shaded for this option).

17946 To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain
 17947 circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 505).

17948 2.10.20.1 Addressing

17949 IPv6 overcomes the addressing limitations of earlier versions by using 128-bit addresses instead
 17950 of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

17951 There are three kinds of IPv6 address:

17952 Unicast

17953 Identifies a single interface.

17954 A unicast address can be global, link-local (designed for use on a single link), or site-local
 17955 (designed for systems not connected to the Internet). Link-local and site-local addresses
 17956 need not be globally unique.

17957 Anycast

17958 Identifies a set of interfaces such that a packet sent to the address can be delivered to any
 17959 member of the set.

17960 An anycast address is similar to a unicast address; the nodes to which an anycast address is
 17961 assigned must be explicitly configured to know that it is an anycast address.

17962 Multicast

17963 Identifies a set of interfaces such that a packet sent to the address should be delivered to
 17964 every member of the set.

17965 An application can send multicast datagrams by simply specifying an IPv6 multicast
 17966 address in the `address` argument of `sendto()`. To receive multicast datagrams, an application
 17967 must join the multicast group (using `setsockopt()` with `IPV6_JOIN_GROUP`) and must bind
 17968 to the socket the UDP port on which datagrams will be received. Some applications should

17969 also bind the multicast group address to the socket, to prevent other datagrams destined to
17970 that port from being delivered to the socket.

17971 A multicast address can be global, node-local, link-local, site-local, or organization-local.

17972 The following special IPv6 addresses are defined:

17973 Unspecified

17974 An address that is not assigned to any interface and is used to indicate the absence of an
17975 address.

17976 Loopback

17977 A unicast address that is not assigned to any interface and can be used by a node to send
17978 packets to itself.

17979 Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

17980 IPv4-compatible addresses

17981 These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled”
17982 through IPv4.

17983 IPv4-mapped addresses

17984 These are used to represent IPv4 addresses in IPv6 address format; see [Section 2.10.20.2](#).

17985 Note that the unspecified address and the loopback address must not be treated as
17986 IPv4-compatible addresses.

17987 2.10.20.2 Compatibility with IPv4

17988 The API provides the ability for IPv6 applications to interoperate with applications using IPv4,
17989 by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the
17990 `getaddrinfo()` function when the specified host has only IPv4 addresses.

17991 Applications can use `AF_INET6` sockets to open TCP connections to IPv4 nodes, or send UDP
17992 packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped
17993 IPv6 address, and passing that address, within a `sockaddr_in6` structure, in the `connect()`,
17994 `sendto()`, or `sendmsg()` function. When applications use `AF_INET6` sockets to accept TCP
17995 connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return
17996 the peer’s address to the application in the `accept()`, `recvfrom()`, `recvmsg()`, or `getpeername()`
17997 function using a `sockaddr_in6` structure encoded this way. If a node has an IPv4 address, then
17998 the implementation shall allow applications to communicate using that address via an
17999 `AF_INET6` socket. In such a case, the address will be represented at the API by the
18000 corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an `AF_INET6`
18001 socket bound to `in6addr_any` to receive inbound connections and packets destined to one of the
18002 node’s IPv4 addresses.

18003 An application can use `AF_INET6` sockets to bind to a node’s IPv4 address by specifying the
18004 address as an IPv4-mapped IPv6 address in a `sockaddr_in6` structure in the `bind()` function. For
18005 an `AF_INET6` socket bound to a node’s IPv4 address, the system shall return the address in the
18006 `getsockname()` function as an IPv4-mapped IPv6 address in a `sockaddr_in6` structure.

18007 2.10.20.3 Interface Identification

18008 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;
18009 zero is not used. There may be gaps so that there is no current interface for a particular positive
18010 index. Each interface also has a unique implementation-defined name.

18011 2.10.20.4 Options

18012 The following options apply at the IPPROTO_IPV6 level:

18013 IPV6_JOIN_GROUP

18014 When set via *setsockopt()*, it joins the application to a multicast group on an interface
 18015 (identified by its index) and addressed by a given multicast address, enabling packets sent
 18016 to that address to be read via the socket. If the interface index is specified as zero, the
 18017 system selects the interface (for example, by looking up the address in a routing table and
 18018 using the resulting interface).

18019 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

18020 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

18021 IPV6_LEAVE_GROUP

18022 When set via *setsockopt()*, it removes the application from the multicast group on an
 18023 interface (identified by its index) and addressed by a given multicast address.

18024 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

18025 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

18026 IPV6_MULTICAST_HOPS

18027 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the
 18028 socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the
 18029 IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set
 18030 via *setsockopt()* and read via *getsockopt()*.

18031 The parameter type of this option is a pointer to an **int**. (Default value: 1)

18032 IPV6_MULTICAST_IF

18033 The index of the interface to be used for outgoing multicast packets. It can be set via
 18034 *setsockopt()* and read via *getsockopt()*. If the interface index is specified as zero, the system
 18035 selects the interface (for example, by looking up the address in a routing table and using the
 18036 resulting interface).

18037 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

18038 IPV6_MULTICAST_LOOP

18039 This option controls whether outgoing multicast packets should be delivered back to the
 18040 local application when the sending interface is itself a member of the destination multicast
 18041 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an
 18042 [EINVAL] error. This option can be set via *setsockopt()* and read via *getsockopt()*.

18043 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean
 18044 value. (Default value: 1)

18045 IPV6_UNICAST_HOPS

18046 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the
 18047 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to
 18048 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can
 18049 be set via *setsockopt()* and read via *getsockopt()*.

18050 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

18051 IPV6_V6ONLY

18052 This socket option restricts AF_INET6 sockets to IPv6 communications only. AF_INET6
 18053 sockets may be used for both IPv4 and IPv6 communications. Some applications may want
 18054 to restrict their use of an AF_INET6 socket to IPv6 communications only. For these
 18055 applications, the IPV6_V6ONLY socket option is defined. When this option is turned on, the

18056 socket can be used to send and receive IPv6 packets only. This is an IPPROTO_IPV6-level
18057 option.

18058 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.
18059 (Default value: 0)

18060 An [EOPNOTSUPP] error shall result if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used
18061 with *getsockopt()*.

18062 2.10.20.5 Headers

18063 The symbolic constant AF_INET6 is defined in the `<sys/socket.h>` header to identify the IPv6
18064 Internet address family. See XBD Chapter 13 (on page 205).

18065 The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to
18066 accommodate a `sockaddr_in6` structure (see the `<netinet/in.h>` header defined in XBD Chapter
18067 13, on page 205) and shall be aligned at an appropriate boundary so that pointers to it can be
18068 cast as pointers to `sockaddr_in6` structures and used to access the fields of those structures
18069 without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in6`
18070 structure, the `ss_family` field maps onto the `sin6_family` field.

18071 The `<netinet/in.h>`, `<arpa/inet.h>`, and `<netdb.h>` headers contain other definitions used in
18072 connection with IPv6 Internet sockets; see XBD Chapter 13 (on page 205).

18073 2.11 Tracing

18074 OB TRC This section describes extensions to support tracing of user applications. The functionality
18075 described in this section is dependent on support of the Trace option (and the rest of this section
18076 is not further shaded for this option).

18077 The tracing facilities defined in POSIX.1-200x allow a process to select a set of trace event types,
18078 to activate a trace stream of the selected trace events as they occur in the flow of execution, and
18079 to retrieve the recorded trace events.

18080 The tracing operation relies on three logically different components: the traced process, the
18081 controller process, and the analyzer process. During the execution of the traced process, when a
18082 trace point is reached, a trace event is recorded into the trace streams created for that process in
18083 which the associated trace event type identifier is not being filtered out. The controller process
18084 controls the operation of recording the trace events into the trace stream. It shall be able to:

- 18085 • Initialize the attributes of a trace stream
- 18086 • Create the trace stream (for a specified traced process) using those attributes
- 18087 • Start and stop tracing for the trace stream
- 18088 • Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- 18089 • Shut a trace stream down

18090 These operations can be done for an active trace stream. The analyzer process retrieves the
18091 traced events either at runtime, when the trace stream has not yet been shut down, but is still
18092 recording trace events; or after opening a trace log that had been previously recorded and shut
18093 down. These three logically different operations can be performed by the same process, or can
18094 be distributed into different processes.

18095 A trace stream identifier can be created by a call to *posix_trace_create()*,
18096 *posix_trace_create_withlog()*, or *posix_trace_open()*. The *posix_trace_create()* and
18097 *posix_trace_create_withlog()* functions should be used by a controller process. The

18098 *posix_trace_open()* should be used by an analyzer process.

18099 The tracing functions can serve different purposes. One purpose is debugging the possibly pre-
 18100 instrumented code, while another is post-mortem fault analysis. These two potential uses differ
 18101 in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and
 18102 permits focusing on expected information; while the second needs comprehensive trace
 18103 capabilities in order to be able to record all types of information.

18104 The events to be traced belong to two classes:

- 18105 1. User trace events (generated by the application instrumentation)
- 18106 2. System trace events (generated by the operating system)

18107 The trace interface defines several system trace event types associated with control of and
 18108 operation of the trace stream. This small set of system trace events includes the minimum
 18109 required to interpret correctly the trace event information present in the stream. Other desirable
 18110 system trace events for some particular application profile may be implemented and are
 18111 encouraged; for example, process and thread scheduling, signal occurrence, and so on.

18112 Each traced process shall have a mapping of the trace event names to trace event type identifiers
 18113 that have been defined for that process. Each active trace stream shall have a mapping that
 18114 incorporates all the trace event type identifiers predefined by the trace system plus all the
 18115 mappings of trace event names to trace event type identifiers of the processes that are being
 18116 traced into that trace stream. These mappings are defined from the instrumented application by
 18117 calling the *posix_trace_eventid_open()* function and from the controller process by calling the
 18118 *posix_trace_trid_eventid_open()* function. For a pre-recorded trace stream, the list of trace event
 18119 types is obtained from the pre-recorded trace log.

18120 The last data modification and file status change timestamps of a file associated with an active |
 18121 trace stream shall be marked for update every time any of the tracing operations modifies that |
 18122 file. |

18123 The last data access timestamp of a file associated with a trace stream shall be marked for |
 18124 update every time any of the tracing operations causes data to be read from that file. |

18125 Results are undefined if the application performs any operation on a file descriptor associated
 18126 with an active or pre-recorded trace stream until *posix_trace_shutdown()* or *posix_trace_close()* is
 18127 called for that trace stream. Results are also undefined if the analyzer process and the traced
 18128 process do not share the same programming environment (see *c99*, Programming Environments
 18129 in the Shell and Utilities volume of POSIX.1-200x.

18130 The main purpose of this option is to define a complete set of functions and concepts that allow
 18131 a conforming application to be traced from creation to termination, whatever its realtime
 18132 constraints and properties.

18133 **2.11.1 Tracing Data Definitions**18134 **2.11.1.1 Structures**

18135 The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures
 18136 described below. Implementations may add extensions to these structures.

18137 **posix_trace_status_info Structure**

18138 To facilitate control of a trace stream, information about the current state of an active trace
 18139 stream can be obtained dynamically. This structure is returned by a call to the
 18140 *posix_trace_get_status()* function.

18141 The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following
 18142 members:

Member Type	Member Name	Description
int	<i>posix_stream_status</i>	The operating mode of the trace stream.
int	<i>posix_stream_full_status</i>	The full status of the trace stream.
int	<i>posix_stream_overrun_status</i>	Indicates whether trace events were lost in the trace stream.

18148 If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info**
 18149 structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	<i>posix_stream_flush_status</i>	Indicates whether a flush is in progress.
int	<i>posix_stream_flush_error</i>	Indicates whether any error occurred during the last flush operation.
int	<i>posix_log_overrun_status</i>	Indicates whether trace events were lost in the trace log.
int	<i>posix_log_full_status</i>	The full status of the trace log.

18157 The *posix_stream_status* member indicates the operating mode of the trace stream and shall have
 18158 one of the following values defined by manifest constants in the **<trace.h>** header:

18159 **POSIX_TRACE_RUNNING**

18160 Tracing is in progress; that is, the trace stream is accepting trace events.

18161 **POSIX_TRACE_SUSPENDED**

18162 The trace stream is not accepting trace events. The tracing operation has not yet started or
 18163 has stopped, either following a *posix_trace_stop()* function call or because the trace resources
 18164 are exhausted.

18165 The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have
 18166 one of the following values defined by manifest constants in the **<trace.h>** header:

18167 **POSIX_TRACE_FULL**

18168 The space in the trace stream for trace events is exhausted.

18169 **POSIX_TRACE_NOT_FULL**

18170 There is still space available in the trace stream.

18171 The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates
 18172 the actual status of the stream. The status shall be interpreted as follows:

- 18173 POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL
 18174 This status combination indicates that tracing is in progress, and there is space available for
 18175 recording more trace events.
- 18176 POSIX_TRACE_RUNNING and POSIX_TRACE_FULL
 18177 This status combination indicates that tracing is in progress and that the trace stream is full
 18178 of trace events. This status combination cannot occur unless the *stream-full-policy* is set to
 18179 POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving
 18180 time window of prior trace events, and some older trace events may have been overwritten
 18181 and thus lost.
- 18182 POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
 18183 This status combination indicates that tracing has not yet been started, has been stopped by
 18184 the *posix_trace_stop()* function, or has been cleared by the *posix_trace_clear()* function.
- 18185 POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL
 18186 This status combination indicates that tracing has been stopped by the implementation
 18187 because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace
 18188 resources were exhausted, or that the trace stream was stopped by the function
 18189 *posix_trace_stop()* at a time when trace resources were exhausted.
- 18190 The *posix_stream_overrun_status* member indicates whether trace events were lost in the trace
 18191 stream, and shall have one of the following values defined by manifest constants in the
 18192 **<trace.h>** header:
- 18193 POSIX_TRACE_OVERRUN
 18194 At least one trace event was lost and thus was not recorded in the trace stream.
- 18195 POSIX_TRACE_NO_OVERRUN
 18196 No trace events were lost.
- 18197 When the corresponding trace stream is created, the *posix_stream_overrun_status* member shall be
 18198 set to POSIX_TRACE_NO_OVERRUN.
- 18199 Whenever an overrun occurs, the *posix_stream_overrun_status* member shall be set to
 18200 POSIX_TRACE_OVERRUN.
- 18201 An overrun occurs when:
- 18202 • The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
 - 18203 • The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event
 18204 is generated.
 - 18205 • If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one
 18206 trace event is lost while flushing the trace stream to the trace log.
- 18207 The *posix_stream_overrun_status* member is reset to zero after its value is read.
- 18208 If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*,
 18209 *posix_stream_flush_error*, *posix_log_overrun_status*, and *posix_log_full_status* members are defined
 18210 as follows; otherwise, they are undefined.
- 18211 The *posix_stream_flush_status* member indicates whether a flush operation is being performed
 18212 and shall have one of the following values defined by manifest constants in the header
 18213 **<trace.h>**:
- 18214 POSIX_TRACE_FLUSHING
 18215 The trace stream is currently being flushed to the trace log.

18216 POSIX_TRACE_NOT_FLUSHING
18217 No flush operation is in progress.

18218 The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush
18219 operation is in progress either due to a call to the *posix_trace_flush()* function (explicit or caused
18220 by a trace stream shutdown operation) or because the trace stream has become full with the
18221 *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member
18222 shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

18223 The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If
18224 an error occurred during a previous flushing operation, the *posix_stream_flush_error* member
18225 shall be set to the value of the first error that occurred. If more than one error occurs while
18226 flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is
18227 reset to zero after its value is read.

18228 The *posix_log_outrun_status* member indicates whether trace events were lost in the trace log,
18229 and shall have one of the following values defined by manifest constants in the **<trace.h>**
18230 header:

18231 POSIX_TRACE_OVERRUN
18232 At least one trace event was lost.

18233 POSIX_TRACE_NO_OVERRUN
18234 No trace events were lost.

18235 When the corresponding trace stream is created, the *posix_log_outrun_status* member shall be set
18236 to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to
18237 POSIX_TRACE_OVERRUN. The *posix_log_outrun_status* member is reset to zero after its value
18238 is read.

18239 The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of
18240 the following values defined by manifest constants in the **<trace.h>** header:

18241 POSIX_TRACE_FULL
18242 The space in the trace log is exhausted.

18243 POSIX_TRACE_NOT_FULL
18244 There is still space available in the trace log.

18245 The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either
18246 POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

18247 For an active trace stream without log, that is created by the *posix_trace_create()* function, the
18248 *posix_log_outrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the
18249 *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

18250 **posix_trace_event_info** Structure

18251 The trace event structure **posix_trace_event_info** contains the information for one recorded
18252 trace event. This structure is returned by the set of functions *posix_trace_getnext_event()*,
18253 *posix_trace_timedgetnext_event()*, and *posix_trace_trygetnext_event()*.

18254 The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following
18255 members:

Member Type	Member Name	Description
trace_event_id_t	<i>posix_event_id</i>	Trace event type identification.
pid_t	<i>posix_pid</i>	Process ID of the process that generated the trace event.
void *	<i>posix_prog_address</i>	Address at which the trace point was invoked.
int	<i>posix_truncation_status</i>	Status about the truncation of the data associated with this trace event.
struct timespec	<i>posix_timestamp</i>	Time at which the trace event was generated.

In addition, the **posix_trace_event_info** structure defined in `<trace.h>` shall contain the following additional member:

Member Type	Member Name	Description
pthread_t	<i>posix_thread_id</i>	Thread ID of the thread that generated the trace event.

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open()*, *posix_trace_eventtypelist_getnext_id()*, or *posix_trace_eventid_open()*. The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name()*.

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event()* function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event()* function). The *posix_truncation_status* member shall have one of the following values defined by manifest constants in the `<trace.h>` header:

POSIX_TRACE_NOT_TRUNCATED

All the traced data is available.

POSIX_TRACE_TRUNCATED_RECORD

Data was truncated at the time the trace event was generated.

POSIX_TRACE_TRUNCATED_READ

Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres()* function.

The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

18302 2.11.1.2 Trace Stream Attributes

18303 Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object.
 18304 This object shall contain at least the following attributes:

- 18305 • The *generation-version* attribute identifies the origin and version of the trace system.
- 18306 • The *trace-name* attribute is a character string defined by the trace controller, and that
 18307 identifies the trace stream.
- 18308 • The *creation-time* attribute represents the time of the creation of the trace stream.
- 18309 • The *clock-resolution* attribute defines the clock resolution of the clock used to generate
 18310 timestamps.
- 18311 • The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly
 18312 reserved for the trace events.
- 18313 • The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its
 18314 value is `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_FLUSH`.
- 18315 • The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

18316 In addition, if the Trace option and the Trace Inherit option are both supported, the
 18317 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
 18318 attributes:

- 18319 • The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing
 18320 in its parent's process trace stream. It is either `POSIX_TRACE_INHERITED` or
 18321 `POSIX_TRACE_CLOSE_FOR_CHILD`.

18322 In addition, if the Trace option and the Trace Log option are both supported, the
 18323 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
 18324 attribute:

- 18325 • If the file type corresponding to the trace log supports the `POSIX_TRACE_LOOP` or the
 18326 `POSIX_TRACE_UNTIL_FULL` policies, the *log-max-size* attribute defines the maximum
 18327 size in bytes of the trace log associated with an active trace stream. Other stream data—for
 18328 example, trace attribute values—shall not be included in this size.
- 18329 • The *log-full-policy* attribute defines the policy of a trace log associated with an active trace
 18330 stream to be `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or
 18331 `POSIX_TRACE_APPEND`.

18332 2.11.2 Trace Event Type Definitions

18333 2.11.2.1 System Trace Event Type Definitions

18334 The following system trace event types, defined in the **<trace.h>** header, track the invocation of
 18335 the trace operations:

- 18336 • `POSIX_TRACE_START` shall be associated with a trace start operation.
- 18337 • `POSIX_TRACE_STOP` shall be associated with a trace stop operation.
- 18338 • If the Trace Event Filter option is supported, `POSIX_TRACE_FILTER` shall be associated
 18339 with a trace event type filter change operation.

18340 The following system trace event types, defined in the **<trace.h>** header, report operational trace
 18341 events:

- 18342 • POSIX_TRACE_OVERFLOW shall mark the beginning of a trace overflow condition.
- 18343 • POSIX_TRACE_RESUME shall mark the end of a trace overflow condition.
- 18344 • If the Trace Log option is supported, POSIX_TRACE_FLUSH_START shall mark the
- 18345 beginning of a flush operation.
- 18346 • If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of
- 18347 a flush operation.
- 18348 • If an implementation-defined trace error condition is reported, it shall be marked
- 18349 POSIX_TRACE_ERROR.

18350 The interpretation of a trace stream or a trace log by a trace analyzer process relies on the
 18351 information recorded for each trace event, and also on system trace events that indicate the
 18352 invocation of trace control operations and trace system operational trace events.

18353 The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows
 18354 during which the trace stream is running.

- 18355 • The POSIX_TRACE_STOP trace event with an associated data that is equal to zero
- 18356 indicates a call of the function *posix_trace_stop()*.
- 18357 • The POSIX_TRACE_STOP trace event with an associated data that is different from zero
- 18358 indicates an automatic stop of the trace stream (see the definition of the
- 18359 *posix_trace_attr_getstreamfullpolicy()* function in *posix_trace_attr_getinherited()*).

18360 The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed
 18361 while the trace stream was running.

18362 The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-
 18363 defined internal error of the trace system occurred.

18364 The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the
 18365 timestamp of the first trace event overwritten. This is an indication that some generated trace
 18366 events have been lost.

18367 The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the
 18368 timestamp of the first valid trace event reported after the overflow condition ends and shall be
 18369 reported before this first valid trace event. This is an indication that the trace system is reliably
 18370 recording trace events after an overflow condition.

18371 Each of these trace event types shall be defined by a constant trace event name and a
 18372 **trace_event_id_t** constant; trace event data is associated with some of these trace events.

18373 If the Trace option is supported and the Trace Event Filter option and the Trace Log option are
 18374 not supported, the following predefined system trace events in [Table 2-3](#) (on page 515) shall be
 18375 defined:

18376

		int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter
		new_event_filter
		trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

18403

18404

18405

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in [Table 2-5](#) (on page 516) shall be defined:

Table 2-5 Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-6 shall be defined:

Table 2-6 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	event_filter trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

2.11.2.2 User Trace Event Type Definitions

The user trace event `POSIX_TRACE_UNNAMED_USEREVENT` is defined in the `<trace.h>` header. If the limit of per-process user trace event names represented by `{TRACE_USER_EVENT_MAX}` has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in Table 2-7 (on page 517) shall be defined:

18443 **Table 2-7** Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

18446 **2.11.3 Trace Functions**

18447 The trace interface is built and structured to improve portability through use of trace data of
 18448 opaque type. The object-oriented approach for the manipulation of trace attributes and trace
 18449 event type identifiers requires definition of many constructor and selector functions which
 18450 operate on these opaque types. Also, the trace interface must support several different tracing
 18451 roles. To facilitate reading the trace interface, the trace functions are grouped into small
 18452 functional sets supporting the three different roles:

- 18453 • A trace controller process requires functions to set up and customize all the resources
 18454 needed to run a trace stream, including:
 - 18455 — Attribute initialization and destruction (*posix_trace_attr_init()*)
 - 18456 — Identification information manipulation (*posix_trace_attr_getgenversion()*)
 - 18457 — Trace system behavior modification (*posix_trace_attr_getinherited()*)
 - 18458 — Trace stream and trace log size set (*posix_trace_attr_getmaxusereventsize()*)
 - 18459 — Trace stream creation, flush, and shutdown (*posix_trace_create()*)
 - 18460 — Trace stream and trace log clear (*posix_trace_clear()*)
 - 18461 — Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
 - 18462 — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
 - 18463 — Trace event type set manipulation (*posix_trace_eventset_empty()*)
 - 18464 — Trace event type filter set (*posix_trace_set_filter()*)
 - 18465 — Trace stream start and stop (*posix_trace_start()*)
 - 18466 — Trace stream information and status read (*posix_trace_get_attr()*)
- 18467 • A traced process requires functions to instrument trace points:
 - 18468 — Trace event type identifiers definition and trace points insertion (*posix_trace_event()*)
- 18469 • A trace analyzer process requires functions to retrieve information from a trace stream and
 18470 trace log:
 - 18471 — Identification information read (*posix_trace_attr_getgenversion()*)
 - 18472 — Trace system behavior information read (*posix_trace_attr_getinherited()*)
 - 18473 — Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsize()*)
 - 18474 — Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
 - 18475 — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
 - 18476 — Trace log open, rewind, and close (*posix_trace_open()*)
 - 18477 — Trace stream information and status read (*posix_trace_get_attr()*)

18478 — Trace event read (*posix_trace_getnext_event()*)

18479 2.12 Data Types

18480 2.12.1 Defined Types

18481 All of the data types used by various functions are defined by the implementation. The
 18482 following table describes some of these types. Other types referenced in the description of a
 18483 function, not mentioned here, can be found in the appropriate header for that function.

18484	Defined Type	Description
18485	cc_t	Type used for terminal special characters.
18486	clock_t	Integer or real-floating type used for processor times, as defined in 18487 the ISO C standard.
18488	clockid_t	Used for clock ID type in some timer functions.
18489	dev_t	Arithmetic type used for device numbers.
18490	DIR	Type representing a directory stream.
18491	div_t	Structure type returned by the <i>div()</i> function.
18492	FILE	Structure containing information about a file.
18493	glob_t	Structure type used in pathname pattern matching.
18494	fpos_t	Type containing all information needed to specify uniquely every 18495 position within a file.
18496	gid_t	Integer type used for group IDs.
18497	iconv_t	Type used for conversion descriptors.
18498	id_t	Integer type used as a general identifier; can be used to contain 18499 at least the largest of a pid_t , uid_t , or gid_t .
18500	ino_t	Unsigned integer type used for file serial numbers.
18501	key_t	Arithmetic type used for XSI interprocess communication.
18502	ldiv_t	Structure type returned by the <i>ldiv()</i> function.
18503	mode_t	Integer type used for file attributes.
18504	mqd_t	Used for message queue descriptors.
18505	nfds_t	Integer type used for the number of file descriptors.
18506	nlink_t	Integer type used for link counts.
18507	off_t	Signed integer type used for file sizes.
18508	pid_t	Signed integer type used for process and process group IDs.
18509	pthread_attr_t	Used to identify a thread attribute object.
18510	pthread_cond_t	Used for condition variables.
18511	pthread_condattr_t	Used to identify a condition attribute object.
18512	pthread_key_t	Used for thread-specific data keys.
18513	pthread_mutex_t	Used for mutexes.
18514	pthread_mutexattr_t	Used to identify a mutex attribute object.
18515	pthread_once_t	Used for dynamic package initialization.
18516	pthread_rwlock_t	Used for read-write locks.
18517	pthread_rwlockattr_t	Used for read-write lock attributes.
18518	pthread_t	Used to identify a thread.
18519	ptrdiff_t	Signed integer type of the result of subtracting two pointers.
18520	regex_t	Structure type used in regular expression matching.
18521	regmatch_t	Structure type used in regular expression matching.
18522	rlim_t	Unsigned integer type used for limit values, to which objects of

Defined Type	Description
18523	
18524	type int and off_t can be cast without loss of value.
18525	sem_t Type used in performing semaphore operations.
18526	sig_atomic_t Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
18527	
18528	sigset_t Integer or structure type of an object used to represent sets of signals.
18529	
18530	size_t Unsigned integer type used for size of objects.
18531	speed_t Type used for terminal baud rates.
18532	ssize_t Signed integer type used for a count of bytes or an error indication.
18533	
18534	suseconds_t Signed integer type used for time in microseconds.
18535	tflag_t Type used for terminal modes.
18536	time_t Integer or real-floating type used for time in seconds, as defined in the ISO C standard.
18537	
18538	timer_t Used for timer ID returned by the <i>timer_create()</i> function.
18539	uid_t Integer type used for user IDs.
18540	va_list Type used for traversing variable argument lists.
18541	wchar_t Integer type whose range of values can represent distinct codes for all members of the largest extended character set specified by the supported locales.
18542	
18543	
18544	wctype_t Scalar type which represents a character class descriptor.
18545	wint_t Integer type capable of storing any valid value of wchar_t or WEOF.
18546	
18547	wordexp_t Structure type used in word expansion.

2.12.2 The char Type

The type **char** is defined as a single byte; see XBD [Chapter 3](#) (on page 33) (Byte and Character).

2.12.3 Pointer Types

All function pointer types shall have the same representation as the type pointer to **void**. Conversion of a function pointer to **void *** shall not alter the representation. A **void *** value resulting from such a conversion can be converted back to the original function pointer type, using an explicit cast, without loss of information.

Note: The ISO C standard does not require this, but it is required for POSIX conformance.

18556

Chapter 3

18557

System Interfaces

18558

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

18559

18560 **NAME**
18561 FD_CLR — macros for synchronous I/O multiplexing

18562 **SYNOPSIS**
18563 #include <sys/select.h>
18564 void FD_CLR(int *fd*, fd_set **fdset*);
18565 int FD_ISSET(int *fd*, fd_set **fdset*);
18566 void FD_SET(int *fd*, fd_set **fdset*);
18567 void FD_ZERO(fd_set **fdset*);

18568 **DESCRIPTION**
18569 Refer to *pselect()*.

18570 **NAME**18571 `_Exit, _exit` — terminate a process18572 **SYNOPSIS**18573 `#include <stdlib.h>`18574 `void _Exit(int status);`18575 `#include <unistd.h>`18576 `void _exit(int status);`18577 **DESCRIPTION**18578 CX For `_Exit()`: The functionality described on this reference page is aligned with the ISO C
18579 standard. Any conflict between the requirements described here and the ISO C standard is
18580 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.18581 CX The value of *status* may be 0, `EXIT_SUCCESS`, `EXIT_FAILURE`, or any other value, though only
18582 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.18583 CX The `_Exit()` and `_exit()` functions shall be functionally equivalent.18584 CX The `_Exit()` and `_exit()` functions shall not call functions registered with `atexit()` nor any
18585 CX registered signal handlers. Open streams shall not be flushed. Whether open streams are
18586 closed (without flushing) is implementation-defined. Finally, the calling process is terminated
18587 with the consequences described below.18588 **Consequences of Process Termination**

18589 CX These functions shall terminate the calling process with the following consequences:

18590 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.
18591 However, functionality relating to the XSI option is shaded.18592 • All of the file descriptors, directory streams, conversion descriptors, and message catalog
18593 descriptors open in the calling process shall be closed.18594 XSI • If the parent process of the calling process is executing a `wait()`, `waitid()`, or `waitpid()`, and
18595 has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, it shall be notified
18596 of termination of the calling process and the low-order eight bits (that is, bits 0377) of *status*
18597 shall be made available to it. If the parent is not waiting, the child's status shall be made
18598 available to it when the parent subsequently executes `wait()`, `waitid()`, or `waitpid()`.18599 The semantics of the `waitid()` function shall be equivalent to `wait()`.18600 XSI • If the parent process of the calling process is not executing a `wait()`, `waitid()`, or `waitpid()`,
18601 and has neither set its `SA_NOCLDWAIT` flag nor set `SIGCHLD` to `SIG_IGN`, the calling
18602 process shall be transformed into a *zombie process*. A *zombie process* is an inactive process
18603 and it shall be deleted at some later time when its parent process executes `wait()`, `waitid()`,
18604 or `waitpid()`.18605 XSI The semantics of the `waitid()` function shall be equivalent to `wait()`.18606 • Termination of a process does not directly terminate its children. The sending of a `SIGHUP`
18607 signal as described below indirectly terminates children in some circumstances.

18608 • Either:

18609 If the implementation supports the `SIGCHLD` signal, a `SIGCHLD` shall be sent to the
18610 parent process.

18611 Or:

_Exit()*System Interfaces*

- 18612 XSI If the parent process has set its SA_NOCLDWAIT flag, or set SIGCHLD to SIG_IGN, the
 18613 status shall be discarded, and the lifetime of the calling process shall end immediately. If
 18614 SA_NOCLDWAIT is set, it is implementation-defined whether a SIGCHLD signal is sent to
 18615 the parent process.
- The parent process ID of all of the existing child processes and zombie processes of the
 18616 calling process shall be set to the process ID of an implementation-defined system process.
 18617 That is, these processes shall be inherited by a special system process.
 18618
- 18619 XSI • Each attached shared-memory segment is detached and the value of *shm_nattch* (see
 18620 *shmget()*) in the data structure associated with its shared memory ID shall be decremented
 18621 by 1.
- 18622 XSI • For each semaphore for which the calling process has set a *semadj* value (see *semop()*), that
 18623 value shall be added to the *semval* of the specified semaphore.
- If the process is a controlling process, the SIGHUP signal shall be sent to each process in
 18624 the foreground process group of the controlling terminal belonging to the calling process.
 18625
 - If the process is a controlling process, the controlling terminal associated with the session
 18626 shall be disassociated from the session, allowing it to be acquired by a new controlling
 18627 process.
 18628
 - If the exit of the process causes a process group to become orphaned, and if any member of
 18629 the newly-orphaned process group is stopped, then a SIGHUP signal followed by a
 18630 SIGCONT signal shall be sent to each process in the newly-orphaned process group.
 18631
- All open named semaphores in the calling process shall be closed as if by appropriate calls
 18632 to *sem_close()*.
 18633
- 18634 ML • Any memory locks established by the process via calls to *mlockall()* or *mlock()* shall be
 18635 removed. If locked pages in the address space of the calling process are also mapped into
 18636 the address spaces of other processes and are locked by those processes, the locks
 18637 established by the other processes shall be unaffected by the call by this process to *_Exit()*
 18638 or *_exit()*.
- Memory mappings that were created in the process shall be unmapped before the process
 18639 is destroyed.
 18640
- 18641 TYM • Any blocks of typed memory that were mapped in the calling process shall be unmapped,
 18642 as if *munmap()* was implicitly called to unmap them.
- 18643 MSG • All open message queue descriptors in the calling process shall be closed as if by
 18644 appropriate calls to *mq_close()*.
- Any outstanding cancelable asynchronous I/O operations may be canceled. Those
 18645 asynchronous I/O operations that are not canceled shall complete as if the *_Exit()* or
 18646 *_exit()* operation had not yet occurred, but any associated signal notifications shall be
 18647 suppressed. The *_Exit()* or *_exit()* operation may block awaiting such I/O completion.
 18648 Whether any I/O is canceled, and which I/O may be canceled upon *_Exit()* or *_exit()*, is
 18649 implementation-defined.
 18650
- Threads terminated by a call to *_Exit()* or *_exit()* shall not invoke their cancellation
 18651 cleanup handlers or per-thread data destructors.
 18652
- 18653 OB TRC • If the calling process is a trace controller process, any trace streams that were created by
 18654 the calling process shall be shut down as described by the *posix_trace_shutdown()* function,
 18655 and mapping of trace event names to trace event type identifiers of any process built for
 18656 these trace streams may be deallocated.

18657 **RETURN VALUE**

18658 These functions do not return.

18659 **ERRORS**

18660 No errors are defined.

18661 **EXAMPLES**

18662 None.

18663 **APPLICATION USAGE**18664 Normally applications should use *exit()* rather than *_Exit()* or *_exit()*.18665 **RATIONALE**18666 **Process Termination**

18667 Early proposals drew a distinction between normal and abnormal process termination.
 18668 Abnormal termination was caused only by certain signals and resulted in implementation-
 18669 defined “actions”, as discussed below. Subsequent proposals distinguished three types of
 18670 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and
 18671 *abnormal termination with actions*. Again the distinction between the two types of abnormal
 18672 termination was that they were caused by different signals and that implementation-defined
 18673 actions would result in the latter case. Given that these actions were completely implementation-
 18674 defined, the early proposals were only saying when the actions could occur and how their
 18675 occurrence could be detected, but not what they were. This was of little or no use to conforming
 18676 applications, and thus the distinction is not made in this volume of POSIX.1-200x.

18677 The implementation-defined actions usually include, in most historical implementations, the
 18678 creation of a file named **core** in the current working directory of the process. This file contains an
 18679 image of the memory of the process, together with descriptive information about the process,
 18680 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

18681 There is a potential security problem in creating a **core** file if the process was set-user-ID and the
 18682 current user is not the owner of the program, if the process was set-group-ID and none of the
 18683 user’s groups match the group of the program, or if the user does not have permission to write
 18684 in the current directory. In this situation, an implementation either should not create a **core** file
 18685 or should make it unreadable by the user.

18686 Despite the silence of this volume of POSIX.1-200x on this feature, applications are advised not
 18687 to create files named **core** because of potential conflicts in many implementations. Some
 18688 implementations use a name other than **core** for the file; for example, by appending the process
 18689 ID to the filename.

18690 **Terminating a Process**

18691 It is important that the consequences of process termination as described occur regardless of
 18692 whether the process called *_exit()* (perhaps indirectly through *exit()*) or instead was terminated
 18693 due to a signal or for some other reason. Note that in the specific case of *exit()* this means that
 18694 the *status* argument to *exit()* is treated in the same way as the *status* argument to *_exit()*.

18695 A language other than C may have other termination primitives than the C-language *exit()*
 18696 function, and programs written in such a language should use its native termination primitives,
 18697 but those should have as part of their function the behavior of *_exit()* as described.
 18698 Implementations in languages other than C are outside the scope of this version of this volume
 18699 of POSIX.1-200x, however.

18700 As required by the ISO C standard, using **return** from *main()* has the same behavior (other than
 18701 with respect to language scope issues) as calling *exit()* with the returned value. Reaching the end
 18702 of the *main()* function has the same behavior as calling *exit(0)*.

18703 A value of zero (or `EXIT_SUCCESS`, which is required to be zero) for the argument *status*
18704 conventionally indicates successful termination. This corresponds to the specification for *exit()*
18705 in the ISO C standard. The convention is followed by utilities such as *make* and various shells,
18706 which interpret a zero status from a child process as success. For this reason, applications should
18707 not call *exit(0)* or *_exit(0)* when they terminate unsuccessfully; for example, in signal-catching
18708 functions.

18709 Historically, the implementation-defined process that inherits children whose parents have
18710 terminated without waiting on them is called *init* and has a process ID of 1.

18711 The sending of a `SIGHUP` to the foreground process group when a controlling process
18712 terminates corresponds to somewhat different historical implementations. In System V, the
18713 kernel sends a `SIGHUP` on termination of (essentially) a controlling process. In 4.2 BSD, the
18714 kernel does not send `SIGHUP` in a case like this, but the termination of a controlling process is
18715 usually noticed by a system daemon, which arranges to send a `SIGHUP` to the foreground
18716 process group with the *vhangup()* function. However, in 4.2 BSD, due to the behavior of the
18717 shells that support job control, the controlling process is usually a shell with no other processes
18718 in its process group. Thus, a change to make *_exit()* behave this way in such systems should not
18719 cause problems with existing applications.

18720 The termination of a process may cause a process group to become orphaned in either of two
18721 ways. The connection of a process group to its parent(s) outside of the group depends on both
18722 the parents and their children. Thus, a process group may be orphaned by the termination of the
18723 last connecting parent process outside of the group or by the termination of the last direct
18724 descendant of the parent process(es). In either case, if the termination of a process causes a
18725 process group to become orphaned, processes within the group are disconnected from their job
18726 control shell, which no longer has any information on the existence of the process group.
18727 Stopped processes within the group would languish forever. In order to avoid this problem,
18728 newly orphaned process groups that contain stopped processes are sent a `SIGHUP` signal and a
18729 `SIGCONT` signal to indicate that they have been disconnected from their session. The `SIGHUP`
18730 signal causes the process group members to terminate unless they are catching or ignoring
18731 `SIGHUP`. Under most circumstances, all of the members of the process group are stopped if any
18732 of them are stopped.

18733 The action of sending a `SIGHUP` and a `SIGCONT` signal to members of a newly orphaned
18734 process group is similar to the action of 4.2 BSD, which sends `SIGHUP` and `SIGCONT` to each
18735 stopped child of an exiting process. If such children exit in response to the `SIGHUP`, any
18736 additional descendants receive similar treatment at that time. In this volume of POSIX.1-200x,
18737 the signals are sent to the entire process group at the same time. Also, in this volume of
18738 POSIX.1-200x, but not in 4.2 BSD, stopped processes may be orphaned, but may be members of a
18739 process group that is not orphaned; therefore, the action taken at *_exit()* must consider processes
18740 other than child processes.

18741 It is possible for a process group to be orphaned by a call to *setpgid()* or *setsid()*, as well as by
18742 process termination. This volume of POSIX.1-200x does not require sending `SIGHUP` and
18743 `SIGCONT` in those cases, because, unlike process termination, those cases are not caused
18744 accidentally by applications that are unaware of job control. An implementation can choose to
18745 send `SIGHUP` and `SIGCONT` in those cases as an extension; such an extension must be
18746 documented as required in **<signal.h>**.

18747 The ISO/IEC 9899:1999 standard adds the *_Exit()* function that results in immediate program
18748 termination without triggering signals or *atexit()*-registered functions. In POSIX.1-200x, this is
18749 equivalent to the *_exit()* function.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Interactions with the SA_NOCLDWAIT flag and SIGCHLD signal are further clarified.

The values of *status* from *exit()* are better described.

Issue 6

Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for typed memory.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *_Exit()* function is included.
- The DESCRIPTION is updated.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

References to the *wait3()* function are removed.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the DESCRIPTION.

Issue 7

Austin Group Interpretation 1003.1-2001 #031 is applied, separating these functions from the *exit()* function.

Austin Group Interpretation 1003.1-2001 #085 is applied, clarifying the text regarding flushing of streams and closing of temporary files.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, and Semaphores options is moved to the Base.

18781 **NAME**

18782 _longjmp, _setjmp — non-local goto

18783 **SYNOPSIS**

```
18784 OB XSI #include <setjmp.h>
18785 void _longjmp(jmp_buf env, int val);
18786 int _setjmp(jmp_buf env);
```

18787 **DESCRIPTION**

18788 The *_longjmp()* and *_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,
 18789 respectively, with the additional restriction that *_longjmp()* and *_setjmp()* shall not manipulate
 18790 the signal mask.

18791 If *_longjmp()* is called even though *env* was never initialized by a call to *_setjmp()*, or when the
 18792 last such call was in a function that has since returned, the results are undefined.

18793 **RETURN VALUE**18794 Refer to *longjmp()* and *setjmp()*.18795 **ERRORS**

18796 No errors are defined.

18797 **EXAMPLES**

18798 None.

18799 **APPLICATION USAGE**

18800 If *_longjmp()* is executed and the environment in which *_setjmp()* was executed no longer exists,
 18801 errors can occur. The conditions under which the environment of the *_setjmp()* no longer exists
 18802 include exiting the function that contains the *_setjmp()* call, and exiting an inner block with
 18803 temporary storage. This condition might not be detectable, in which case the *_longjmp()* occurs
 18804 and, if the environment no longer exists, the contents of the temporary storage of an inner block
 18805 are unpredictable. This condition might also cause unexpected process termination. If the
 18806 function has returned, the results are undefined.

18807 Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *_longjmp()* a pointer to a
 18808 buffer not created by *_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by
 18809 *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user
 18810 can cause all the problems listed above, and more.

18811 The *_longjmp()* and *_setjmp()* functions are included to support programs written to historical
 18812 system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

18813 **RATIONALE**

18814 None.

18815 **FUTURE DIRECTIONS**18816 The *_longjmp()* and *_setjmp()* functions may be removed in a future version.18817 **SEE ALSO**18818 *longjmp()*, *setjmp()*, *siglongjmp()*, *sigsetjmp()*

18826 **NAME**
 18827 _toupper — transliterate uppercase characters to lowercase

18828 **SYNOPSIS**

18829 OB XSI `#include <ctype.h>`
 18830 `int _tolower(int c);`

18831 **DESCRIPTION**

18832 The *_tolower()* macro shall be equivalent to *tolower(c)* except that the application shall ensure
 18833 that the argument *c* is an uppercase letter.

18834 **RETURN VALUE**

18835 Upon successful completion, *_tolower()* shall return the lowercase letter corresponding to the
 18836 argument passed.

18837 **ERRORS**

18838 No errors are defined.

18839 **EXAMPLES**

18840 None.

18841 **APPLICATION USAGE**

18842 Applications should use the *tolower()* function instead of the obsolescent *_tolower()* function.

18843 **RATIONALE**

18844 None.

18845 **FUTURE DIRECTIONS**

18846 The *_tolower()* function may be removed in a future version.

18847 **SEE ALSO**

18884 **Issue 7**18885 The `_toupper()` function is marked obsolescent.

18886 **NAME**
 18887 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

18888 **SYNOPSIS**

```
18889 XSI #include <stdlib.h>
18890 long a64l(const char *s);
18891 char *l64a(long value);
```

18892 **DESCRIPTION**

18893 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by
 18894 which 32-bit integers can be represented by up to six characters; each character represents a digit
 18895 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall
 18896 be used for these operations.

18897 The characters used to represent digits are '.' (dot) for 0, '/' for 1, '0' through '9' for [2,11],
 18898 'A' through 'Z' for [12,37], and 'a' through 'z' for [38,63].

18899 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the
 18900 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains
 18901 more than six characters, *a64l()* shall use the first six. If the first six characters of the string
 18902 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The
 18903 *a64l()* function shall scan the character string from left to right with the least significant digit on
 18904 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than
 18905 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null
 18906 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

18907 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding
 18908 radix-64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

18909 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may
 18910 overwrite the buffer.

18911 The *l64a()* function need not be thread-safe. A function that is not required to be thread-safe is
 18912 not required to be reentrant.

18913 **RETURN VALUE**

18914 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the
 18915 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

18916 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall
 18917 return a pointer to an empty string.

18918 **ERRORS**

18919 No errors are defined.

18920 **EXAMPLES**

18921 None.

18922 **APPLICATION USAGE**

18923 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.

18924 **RATIONALE**

18925 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

18926 **FUTURE DIRECTIONS**

18927 None.

18928 **SEE ALSO**18929 *strtoul()*

18930 XBD <stdlib.h>

18931 XCU *uuencode*18932 **CHANGE HISTORY**

18933 First released in Issue 4, Version 2.

18934 **Issue 5**

18935 Moved from X/OPEN UNIX extension to BASE.

18936 Normative text previously in the APPLICATION USAGE section is moved to the
18937 DESCRIPTION.18938 A note indicating that the *l64a()* function need not be reentrant is added to the DESCRIPTION.

18939 **NAME**

18940 abort — generate an abnormal process abort

18941 **SYNOPSIS**

18942 #include <stdlib.h>

18943 void abort(void);

18944 **DESCRIPTION**

18945 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 18946 conflict between the requirements described here and the ISO C standard is unintentional. This
 18947 volume of POSIX.1-200x defers to the ISO C standard.

18948 The *abort()* function shall cause abnormal process termination to occur, unless the signal
 18949 SIGABRT is being caught and the signal handler does not return.

18950 CX The abnormal termination processing shall include the default actions defined for SIGABRT and
 18951 may include an attempt to effect *fclose()* on all open streams.

18952 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the
 18953 argument SIGABRT.

18954 CX The status made available to *wait()*, *waitid()*, or *waitpid()* by *abort()* shall be that of a process
 18955 terminated by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the
 18956 SIGABRT signal.

18957 **RETURN VALUE**18958 The *abort()* function shall not return.18959 **ERRORS**

18960 No errors are defined.

18961 **EXAMPLES**

18962 None.

18963 **APPLICATION USAGE**

18964 Catching the signal is intended to provide the application developer with a portable means to
 18965 abort processing, free from possible interference from any implementation-supplied functions.

18966 **RATIONALE**

18967 The ISO/IEC 9899:1999 standard requires the *abort()* function to be async-signal-safe. Since
 18968 POSIX.1-200x defers to the ISO C standard, this required a change to the DESCRIPTION from
 18969 “shall include the effect of *fclose()*” to “may include an attempt to effect *fclose()*.”

18970 The revised wording permits some backwards-compatibility and avoids a potential deadlock
 18971 situation.

18972 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded
 18973 paragraph from the DESCRIPTION:

18974 “On XSI-conformant systems, in addition the abnormal termination processing shall include the
 18975 effect of *fclose()* on message catalog descriptors.”

18976 There were several reasons to remove this paragraph:

- 18977 • No special processing of open message catalogs needs to be performed prior to abnormal
 18978 process termination.
- 18979 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open
 18980 streams is to flush output queued on the stream. Message catalogs in this context are read-
 18981 only and, therefore, do not need to be flushed.

18982
18983
18984
18985

18986
18987

18988
18989

18998
18999
19000
19001

- The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog descriptors are allowed, but not required to be implemented using a file descriptor, but there is no mention in POSIX.1-200x of a message catalog descriptor using a standard I/O stream FILE object as would be expected by *fclose()*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Base Resolution bwg2002-003 is applied.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/9 is applied, changing “implementation-defined functions” to “implementation-supplied functions” in the APPLICATION USAGE section.

19002 **NAME**19003 `abs` — return an integer absolute value19004 **SYNOPSIS**19005 `#include <stdlib.h>`19006 `int abs(int i);`19007 **DESCRIPTION**

19008 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19009 conflict between the requirements described here and the ISO C standard is unintentional. This
 19010 volume of POSIX.1-200x defers to the ISO C standard.

19011 The `abs()` function shall compute the absolute value of its integer operand, *i*. If the result cannot
 19012 be represented, the behavior is undefined.

19013 **RETURN VALUE**19014 The `abs()` function shall return the absolute value of its integer operand.19015 **ERRORS**

19016 No errors are defined.

19017 **EXAMPLES**

19018 None.

19019 **APPLICATION USAGE**

19020 In two's-complement representation, the absolute value of the negative integer with largest
 19021 magnitude {INT_MIN} might not be representable.

19022 **RATIONALE**

19023 None.

19024 **FUTURE DIRECTIONS**

19025 None.

19026 **SEE ALSO**19027 *[fabs\(\)](#), [labs\(\)](#)*19028 XBD [<stdlib.h>](#)19029 **CHANGE HISTORY**

19030 First released in Issue 1. Derived from Issue 1 of the SVID.

19031 **Issue 6**

19032 Extensions beyond the ISO C standard are marked.

19033 **NAME**
 19034 accept — accept a new connection on a socket

19035 **SYNOPSIS**
 19036 #include <sys/socket.h>
 19037 int accept(int *socket*, struct sockaddr *restrict *address*,
 19038 socklen_t *restrict *address_len*);

19039 **DESCRIPTION**
 19040 The *accept()* function shall extract the first connection on the queue of pending connections,
 19041 create a new socket with the same socket type protocol and address family as the specified
 19042 socket, and allocate a new file descriptor for that socket.

19043 The *accept()* function takes the following arguments:

19044 *socket* Specifies a socket that was created with *socket()*, has been bound to an address
 19045 with *bind()*, and has issued a successful call to *listen()*.

19046 *address* Either a null pointer, or a pointer to a **sockaddr** structure where the address of
 19047 the connecting socket shall be returned.

19048 *address_len* Points to a **socklen_t** structure which on input specifies the length of the
 19049 supplied **sockaddr** structure, and on output specifies the length of the stored
 19050 address.

19051 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored
 19052 in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in
 19053 the object pointed to by *address_len*.

19054 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 19055 the stored address shall be truncated.

19056 If the protocol permits connections by unbound clients, and the peer is not bound, then the
 19057 value stored in the object pointed to by *address* is unspecified.

19058 If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file
 19059 descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is
 19060 empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket,
 19061 *accept()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

19062 The accepted socket cannot itself accept more connections. The original socket remains open and
 19063 can accept more connections.

19064 **RETURN VALUE**
 19065 Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted
 19066 socket. Otherwise, -1 shall be returned and *errno* set to indicate the error.

19067 **ERRORS**
 19068 The *accept()* function shall fail if:
 19069 [EAGAIN] or [EWOULDBLOCK]
 19070 O_NONBLOCK is set for the socket file descriptor and no connections are
 19071 present to be accepted.
 19072 [EBADF] The *socket* argument is not a valid file descriptor.
 19073 [ECONNABORTED]
 19074 A connection has been aborted.

accept()

19075	[EINTR]	The <i>accept()</i> function was interrupted by a signal that was caught before a valid connection arrived.
19076		
19077	[EINVAL]	The <i>socket</i> is not accepting connections.
19078	[EMFILE]	All file descriptors available to the process are currently open.
19079	[ENFILE]	The maximum number of file descriptors in the system are already open.
19080	[ENOBUFS]	No buffer space is available.
19081	[ENOMEM]	There was insufficient memory available to complete the operation.
19082	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
19083	[EOPNOTSUPP]	The socket type of the specified socket does not support accepting connections.
19084		
19085		The <i>accept()</i> function may fail if:
19086	OB XSR [EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.
19087		

EXAMPLES

None.

APPLICATION USAGE

When a connection is available, *select()* indicates that the file descriptor for the socket is ready for reading.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO*bind()*, *connect()*, *listen()*, *socket()*

XBD <sys/socket.h>

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The **restrict** keyword is added to the *accept()* prototype for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS] and [ENOMEM] errors to become “shall fail” errors.

Functionality relating to XSI STREAMS is marked obsolescent.

19109 **NAME**

19110 access, faccessat — determine accessibility of a file relative to directory file descriptor

19111 **SYNOPSIS**

19112 #include <unistd.h>

19113 int access(const char *path, int amode);

19114 int faccessat(int fd, const char *path, int amode, int flag);

19115 **DESCRIPTION**19116 The *access()* function shall check the file named by the pathname pointed to by the *path*
19117 argument for accessibility according to the bit pattern contained in *amode*, using the real user ID
19118 in place of the effective user ID and the real group ID in place of the effective group ID.19119 The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked
19120 (R_OK, W_OK, X_OK) or the existence test (F_OK).19121 If any access permissions are checked, each shall be checked individually, as described in XBD |
19122 Section 4.4 (on page 96), except that where that description refers to execute permission for a |
19123 process with appropriate privileges, an implementation may indicate success for X_OK even if |
19124 execute permission is not granted to any user.19125 The *faccessat()* function shall be equivalent to the *access()* function, except in the case where *path*
19126 specifies a relative path. In this case the file whose accessibility is to be determined shall be
19127 located relative to the directory associated with the file descriptor *fd* instead of the current
19128 working directory. It is unspecified whether directory searches are permitted based on whether
19129 the file was opened with search permission or on the current permissions of the directory
19130 underlying the file descriptor.19131 If *faccessat()* is passed the special value AT_FDCWD in the *fd* parameter, the current working
19132 directory is used and the behavior shall be identical to a call to *access()*.19133 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
19134 in <fcntl.h>:19135 AT_EACCESS The checks for accessibility are performed using the effective user and group
19136 IDs instead of the real user and group ID as required in a call to *access()*.19137 **RETURN VALUE**19138 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
19139 return -1 and set *errno* to indicate the error.19140 **ERRORS**

19141 These functions shall fail if:

19142 [EACCES] Permission bits of the file mode do not permit the requested access, or search
19143 permission is denied on a component of the path prefix.19144 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
19145 argument.

19146 [ENAMETOOLONG]

19147 The length of the *path* argument exceeds {PATH_MAX} or a pathname
19148 component is longer than {NAME_MAX}.19149 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

19150 [ENOTDIR] A component of the path prefix is not a directory.

access()

- 19151 [EROFS] Write access is requested for a file on a read-only file system.
- 19152 The *faccessat()* function shall fail if:
- 19153 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
19154 neither AT_FDCWD nor a valid file descriptor.
- 19155 These functions may fail if:
- 19156 [EINVAL] The value of the *amode* argument is invalid.
- 19157 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
19158 resolution of the *path* argument.
- 19159 [ENAMETOOLONG]
19160 As a result of encountering a symbolic link in resolution of the *path* argument,
19161 the length of the substituted pathname string exceeded {PATH_MAX}.
- 19162 [ETXTBSY] Write access is requested for a pure procedure (shared text) file that is being
19163 executed.
- 19164 The *faccessat()* function may fail if:
- 19165 [EINVAL] The value of the *flag* argument is not valid.
- 19166 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
19167 file descriptor associated with a directory.

EXAMPLES**Testing for the Existence of a File**

The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
19171 #include <unistd.h>
19172 ...
19173 int result;
19174 const char *filename = "/tmp/myfile";
19175 result = access (filename, F_OK);
```

APPLICATION USAGE

Additional values of *amode* other than the set defined in the description may be valid; for example, if a system has extended access controls.

The use of the AT_EACCESS value for *flag* enables functionality not available in *access()*.

RATIONALE

In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()* function because:

- 19183 1. Historical implementations of *access()* do not test file access correctly when the process'
19184 real user ID is superuser. In particular, they always return zero when testing execute
19185 permissions without regard to whether the file is executable.
- 19186 2. The superuser has complete access to all files on a system. As a consequence, programs
19187 started by the superuser and switched to the effective user ID with lesser privileges
19188 cannot use *access()* to test their file access permissions.

19189 However, the historical model of *eaccess()* does not resolve problem (1), so this volume of
19190 POSIX.1-200x now allows *access()* to behave in the desired way because several implementations
19191 have corrected the problem. It was also argued that problem (2) is more easily solved by using
19192 *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the error, rather
19193 than creating a new function that would not be as reliable. Therefore, *eaccess()* is not included in

19194 this volume of POSIX.1-200x.

19195 The sentence concerning appropriate privileges and execute permission bits reflects the two
19196 possibilities implemented by historical implementations when checking superuser access for
19197 X_OK.

19198 New implementations are discouraged from returning X_OK unless at least one execution
19199 permission bit is set.

19200 The purpose of the *faccessat()* function is to enable the checking of the accessibility of files in
19201 directories other than the current working directory without exposure to race conditions. Any
19202 part of the path of a file could be changed in parallel to a call to *access()*, resulting in unspecified
19203 behavior. By opening a file descriptor for the target directory and using the *faccessat()* function it
19204 can be guaranteed that the file tested for accessibility is located relative to the desired directory.

19205 FUTURE DIRECTIONS

19206 None.

19210 CHANGE HISTORY

19211 First released in Issue 1. Derived from Issue 1 of the SVID.

19212 Issue 6

19213 The following new requirements on POSIX implementations derive from alignment with the
19214 Single UNIX Specification:

- 19215 • The [ELOOP] mandatory error condition is added.
- 19216 • A second [ENAMETOOLONG] is added as an optional error condition.
- 19217 • The [ETXTBSY] optional error condition is added.

19218 The following changes were made to align with the IEEE P1003.1a draft standard:

- 19219 • The [ELOOP] optional error condition is added.

19220 Issue 7

19221 Austin Group Interpretation 1003.1-2001 #046 is applied.

19222 The *faccessat()* function is added from The Open Group Technical Standard, 2006, Extended API
19223 Set Part 2.

19224 **NAME**

19225 acos, acosf, acosl — arc cosine functions

19226 **SYNOPSIS**

```
19227     #include <math.h>
19228
19228     double acos(double x);
19229     float  acosf(float x);
19230     long double acosl(long double x);
```

19231 **DESCRIPTION**

19232 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19233 conflict between the requirements described here and the ISO C standard is unintentional. This
 19234 volume of POSIX.1-200x defers to the ISO C standard.

19235 These functions shall compute the principal value of the arc cosine of their argument x . The
 19236 value of x should be in the range $[-1,1]$.

19237 An application wishing to check for error situations should set *errno* to zero and call
 19238 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 19239 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 19240 zero, an error has occurred.

19241 **RETURN VALUE**

19242 Upon successful completion, these functions shall return the arc cosine of x , in the range $[0,\pi]$
 19243 radians.

19244 MX For finite values of x not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 19245 supported), or an implementation-defined value shall be returned.

19246 MX If x is NaN, a NaN shall be returned.

19247 If x is $+1$, $+0$ shall be returned.

19248 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 19249 defined value shall be returned.

19250 **ERRORS**

19251 These functions shall fail if:

19252 MX Domain Error The x argument is finite and is not in the range $[-1,1]$, or is $\pm\text{Inf}$.

19253 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 19254 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 19255 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 19256 shall be raised.

19257 **EXAMPLES**

19258 None.

19259 **APPLICATION USAGE**

19260 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 19261 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19262 **RATIONALE**

19263 None.

19264 **FUTURE DIRECTIONS**

19265 None.

19266 **SEE ALSO**19267 *cos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

19268 XBD Section 4.19 (on page 104), <math.h>

19269 **CHANGE HISTORY**

19270 First released in Issue 1. Derived from Issue 1 of the SVID.

19271 **Issue 5**19272 The DESCRIPTION is updated to indicate how an application should check for an error. This
19273 text was previously published in the APPLICATION USAGE section.19274 **Issue 6**19275 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.19276 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
19277 revised to align with the ISO/IEC 9899:1999 standard.19278 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
19279 marked.

DRAFT

19280 **NAME**
 19281 `acosh`, `acoshf`, `acoshl` — inverse hyperbolic cosine functions

19282 **SYNOPSIS**
 19283 `#include <math.h>`
 19284 `double acosh(double x);`
 19285 `float acoshf(float x);`
 19286 `long double acoshl(long double x);`

19287 **DESCRIPTION**
 19288 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19289 conflict between the requirements described here and the ISO C standard is unintentional. This
 19290 volume of POSIX.1-200x defers to the ISO C standard.

19291 These functions shall compute the inverse hyperbolic cosine of their argument x .
 19292 An application wishing to check for error situations should set `errno` to zero and call
 19293 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 19294 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 19295 zero, an error has occurred.

19296 **RETURN VALUE**
 19297 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their
 19298 argument.

19299 MX For finite values of $x < 1$, a domain error shall occur, and either a NaN (if supported), or an
 19300 implementation-defined value shall be returned.

19301 MX If x is NaN, a NaN shall be returned.
 19302 If x is $+1$, $+0$ shall be returned.
 19303 If x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.
 19304 If x is $-\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 19305 defined value shall be returned.

19306 **ERRORS**
 19307 These functions shall fail if:
 19308 MX Domain Error The x argument is finite and less than $+1.0$, or is $-\text{Inf}$.
 19309 If the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,
 19310 then `errno` shall be set to `[EDOM]`. If the integer expression (`math_errhandling`
 19311 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception
 19312 shall be raised.

19313 **EXAMPLES**
 19314 None.

19315 **APPLICATION USAGE**
 19316 On error, the expressions (`math_errhandling` & `MATH_ERRNO`) and (`math_errhandling` &
 19317 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

19318 **RATIONALE**
 19319 None.

long double acosl(long double x);

19343

DESCRIPTION

19344

Refer to *acos()*.

19345 **NAME**

19346 aio_cancel — cancel an asynchronous I/O request

19347 **SYNOPSIS**

19348 #include <aio.h>

19349 int aio_cancel(int *fildev*, struct aiocb **aiocbp*);19350 **DESCRIPTION**

19351 The *aio_cancel()* function shall attempt to cancel one or more asynchronous I/O requests
 19352 currently outstanding against file descriptor *fildev*. The *aiocbp* argument points to the
 19353 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then
 19354 all outstanding cancelable asynchronous I/O requests against *fildev* shall be canceled.

19355 Normal asynchronous notification shall occur for asynchronous I/O operations that are
 19356 successfully canceled. If there are requests that cannot be canceled, then the normal
 19357 asynchronous completion process shall take place for those requests when they are completed.

19358 For requested operations that are successfully canceled, the associated error status shall be set to
 19359 [ECANCELED] and the return status shall be -1. For requested operations that are not
 19360 successfully canceled, the *aiocbp* shall not be modified by *aio_cancel()*.

19361 If *aiocbp* is not NULL, then if *fildev* does not have the same value as the file descriptor with which
 19362 the asynchronous operation was initiated, unspecified results occur.

19363 Which operations are cancelable is implementation-defined.

19364 **RETURN VALUE**

19365 The *aio_cancel()* function shall return the value AIO_CANCELED if the requested operation(s)
 19366 were canceled. The value AIO_NOTCANCELED shall be returned if at least one of the
 19367 requested operation(s) cannot be canceled because it is in progress. In this case, the state of the
 19368 other operations, if any, referenced in the call to *aio_cancel()* is not indicated by the return value
 19369 of *aio_cancel()*. The application may determine the state of affairs for these operations by using
 19370 *aio_error()*. The value AIO_ALLDONE is returned if all of the operations have already
 19371 completed. Otherwise, the function shall return -1 and set *errno* to indicate the error.

19372 **ERRORS**

19373 The *aio_cancel()* function shall fail if:

19374 [EBADF] The *fildev* argument is not a valid file descriptor.

The APPLICATION USAGE section is added.

19392

19393

19394

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/10 is applied, removing the words “to the calling process” in the RETURN VALUE section. The term was unnecessary and precluded threads.

19395

Issue 7

19396

The *aio_cancel()* function is moved from the Asynchronous Input and Output option to the Base.

19397 **NAME**

19398 aio_error — retrieve errors status for an asynchronous I/O operation

19399 **SYNOPSIS**

19400 #include <aio.h>

19401 int aio_error(const struct aiocb *aiocbp);

19402 **DESCRIPTION**

19403 The *aio_error()* function shall return the error status associated with the **aiocb** structure
 19404 referenced by the *aiocbp* argument. The error status for an asynchronous I/O operation is the
 19405 SIO *errno* value that would be set by the corresponding *read()*, *write()*, *fdatasync()*, or *fsync()*
 19406 operation. If the operation has not yet completed, then the error status shall be equal to
 19407 [EINPROGRESS].

19408 If the **aiocb** structure pointed to by *aiocbp* is not associated with an operation that has been
 19409 scheduled, the results are undefined.

19410 **RETURN VALUE**

19411 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the
 19412 asynchronous operation has completed unsuccessfully, then the error status, as described for
 19413 SIO *read()*, *write()*, *fdatasync()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has
 19414 not yet completed, then [EINPROGRESS] shall be returned.

19415 If the *aio_error()* function fails, it shall return -1 and set *errno* to indicate the error. +

19416 **ERRORS**19417 The *aio_error()* function may fail if:

19418 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
 19419 return status has not yet been retrieved.

The *aio_error()* function is moved from the Asynchronous Input and Output option to the Base.

+

19442 **NAME**

19443 aio_fsync — asynchronous file synchronization

19444 **SYNOPSIS**

19445 #include <aio.h>

19446 int aio_fsync(int op, struct aiocb *aiocbp);

19447 **DESCRIPTION**

19448 The *aio_fsync()* function shall asynchronously force all I/O operations associated with the file
 19449 indicated by the file descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp*
 19450 argument and queued at the time of the call to *aio_fsync()* to the synchronized I/O completion
 19451 state. The function call shall return when the synchronization request has been initiated or
 19452 queued to the file or device (even when the data cannot be synchronized immediately).

19453 If *op* is O_DSYNC, all currently queued I/O operations shall be completed as if by a call to
 19454 *fdatasync()*; that is, as defined for synchronized I/O data integrity completion. If *op* is O_SYNC,
 19455 all currently queued I/O operations shall be completed as if by a call to *fsync()*; that is, as
 19456 defined for synchronized I/O file integrity completion. If the *aio_fsync()* function fails, or if the
 19457 operation queued by *aio_fsync()* fails, then, as for *fsync()* and *fdatasync()*, outstanding I/O
 19458 operations are not guaranteed to have been completed.

19459 If *aio_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to
 19460 *aio_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of
 19461 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized
 19462 fashion.

19463 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used
 19464 as an argument to *aio_error()* and *aio_return()* in order to determine the error status and return
 19465 status, respectively, of the asynchronous operation while it is proceeding. When the request is
 19466 queued, the error status for the operation is [EINPROGRESS]. When all data has been
 19467 successfully transferred, the error status shall be reset to reflect the success or failure of the
 19468 operation. If the operation does not complete successfully, the error status for the operation shall
 19469 be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification
 19470 to occur as specified in Section 2.4.1 (on page 463) when all operations have achieved synchronized
 19471 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the
 19472 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O
 19473 completion, then the behavior is undefined.

19474 If the *aio_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to
 19475 have been successfully transferred.

19476 **RETURN VALUE**

19477 The *aio_fsync()* function shall return the value 0 if the I/O operation is successfully queued;
 19478 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

19479 **ERRORS**

19480 The *aio_fsync()* function shall fail if:

- | | | |
|-------|----------|--|
| 19481 | [EAGAIN] | The requested asynchronous operation was not queued due to temporary resource limitations. |
| 19482 | | |
| 19483 | [EBADF] | The <i>aio_fildes</i> member of the aiocb structure referenced by the <i>aiocbp</i> argument is not a valid file descriptor open for writing. |
| 19484 | | |
| 19485 | [EINVAL] | This implementation does not support synchronized I/O for this file. |

aio_fsync()

19486 [EINVAL] A value of *op* other than O_DSYNC or O_SYNC was specified.

19487 In the event that any of the queued I/O operations fail, *aio_fsync()* shall return the error
 19488 condition defined for *read()* and *write()*. The error is returned in the error status for the
 19489 asynchronous *fsync()* operation, which can be retrieved using *aio_error()*.

CHANGE HISTORY

19501 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
 19502

Issue 6

19503 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 19504 implementation does not support the Asynchronous Input and Output option.
 19505

19506 The APPLICATION USAGE section is added.

19507 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/11 is applied, removing the words “to the
 19508 calling process” in the RETURN VALUE section. The term was unnecessary and precluded
 19509 threads.

Issue 7

19510 The *aio_fsync()* function is moved from the Asynchronous Input and Output option to the Base.
 19511

19512 **NAME**

19513 aio_read — asynchronous read from a file

19514 **SYNOPSIS**

19515 #include <aio.h>

19516 int aio_read(struct aiocb *aiocbp);

19517 **DESCRIPTION**

19518 The *aio_read()* function shall read *aiocbp->aio_nbytes* from the file associated with
 19519 *aiocbp->aio_fildes* into the buffer pointed to by *aiocbp->aio_buf*. The function call shall return
 19520 when the read request has been initiated or queued to the file or device (even when the data
 19521 cannot be delivered immediately).

19522 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
 19523 at a priority equal to a base scheduling priority minus *aiocbp->aio_reqprio*. If Thread Execution
 19524 Scheduling is not supported, then the base scheduling priority is that of the calling process;
 19525 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.

19526 The *aiocbp* value may be used as an argument to *aio_error()* and *aio_return()* in order to
 19527 determine the error status and return status, respectively, of the asynchronous operation while it
 19528 is proceeding. If an error condition is encountered during queuing, the function call shall return
 19529 without having initiated or queued the request. The requested operation takes place at the
 19530 absolute position in the file as given by *aio_offset*, as if *lseek()* were called immediately prior to
 19531 the operation with an *offset* equal to *aio_offset* and a *whence* equal to *SEEK_SET*. After a
 19532 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file
 19533 is unspecified.

19534 The *aio_sigevent* member specifies the notification which occurs when the request is completed.

19535 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_read()*.

19536 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
 19537 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
 19538 completion, then the behavior is undefined.

19539 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

19540 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
 19541 function shall be according to the definitions of synchronized I/O data integrity completion and
 19542 synchronized I/O file integrity completion.

19543 For any system action that changes the process memory space while an asynchronous I/O is
 19544 outstanding to the address range being changed, the result of that action is undefined.

19545 For regular files, no data transfer shall occur past the offset maximum established in the open
 19546 file description associated with *aiocbp->aio_fildes*.

19547 **RETURN VALUE**

19548 The *aio_read()* function shall return the value zero if the I/O operation is successfully queued;
 19549 otherwise, the function shall return the value -1 and set *errno* to indicate the error.

19550 **ERRORS**

19551 The *aio_read()* function shall fail if:

19552 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
 19553 resource limitations.

19554 Each of the following conditions may be detected synchronously at the time of the call to
 19555 *aio_read()*, or asynchronously. If any of the conditions below are detected synchronously, the

aio_read()

19556 *aio_read()* function shall return `-1` and set *errno* to the corresponding value. If any of the
 19557 conditions below are detected asynchronously, the return status of the asynchronous operation
 19558 is set to `-1`, and the error status of the asynchronous operation is set to the corresponding value.

19559 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for reading.

19560 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid,
 19561 PIO *aiocbp*→*aio_reqprio* is not a valid value, or *aiocbp*→*aio_nbytes* is an invalid
 19562 value.

19563 In the case that the *aio_read()* successfully queues the I/O operation but the operation is
 19564 subsequently canceled or encounters an error, the return status of the asynchronous operation is
 19565 one of the values normally returned by the *read()* function call. In addition, the error status of
 19566 the asynchronous operation is set to one of the error statuses normally set by the *read()* function
 19567 call, or one of the following values:

19568 [EBADF] The *aiocbp*→*aio_fildes* argument is not a valid file descriptor open for reading.

19569 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 19570 *aio_cancel()* request.

19571 [EINVAL] The file offset value implied by *aiocbp*→*aio_offset* would be invalid.

19572 The following condition may be detected synchronously or asynchronously:

19573 [EOVERFLOW] The file is a regular file, *aiocbp*→*aio_nbytes* is greater than 0, and the starting
 19574 offset in *aiocbp*→*aio_offset* is before the end-of-file and is at or beyond the
 19575 offset maximum in the open file description associated with *aiocbp*→*aio_fildes*.

CHANGE HISTORY

19588 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
 19589

19590 Large File Summit extensions are added.

Issue 6

19591 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 19592 implementation does not support the Asynchronous Input and Output option.
 19593

19594 The APPLICATION USAGE section is added.

19595

19596

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

19597

19598

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.

19599

19600

- In the ERRORS section, the [Eoverflow] condition is added. This change is to support large files.

19601

19602

19603

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/12 is applied, rewording the DESCRIPTION when prioritized I/O is supported to account for threads, and removing the words “to the calling process” in the RETURN VALUE section.

19604

19605

19606

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/13 is applied, updating the [EINVAL] error, so that detection of an [EINVAL] error for an invalid value of *aio_cbp*→*aio_reqprio* is only required if the Prioritized Input and Output option is supported.

19607

Issue 7

19608

Austin Group Interpretation 1003.1-2001 #082 is applied.

19609

The *aio_read()* function is moved from the Asynchronous Input and Output option to the Base.

19610 **NAME**19611 `aioreturn` — retrieve return status of an asynchronous I/O operation19612 **SYNOPSIS**19613 `#include <aiio.h>`19614 `ssize_t aiorreturn(struct aiocb *aiocbp);`19615 **DESCRIPTION**

19616 The `aioreturn()` function shall return the return status associated with the `aiocb` structure
 19617 referenced by the `aiocbp` argument. The return status for an asynchronous I/O operation is the
 19618 value that would be returned by the corresponding `read()`, `write()`, or `fsync()` function call. If the
 19619 error status for the operation is equal to [EINPROGRESS], then the return status for the
 19620 operation is undefined. The `aioreturn()` function may be called exactly once to retrieve the
 19621 return status of a given asynchronous operation; thereafter, if the same `aiocb` structure is used in
 19622 a call to `aioreturn()` or `aiorerror()`, an error may be returned. When the `aiocb` structure referred
 19623 to by `aiocbp` is used to submit another asynchronous operation, then `aioreturn()` may be
 19624 successfully used to retrieve the return status of that operation.

19625 **RETURN VALUE**

19626 If the asynchronous I/O operation has completed, then the return status, as described for `read()`,
 19627 `write()`, and `fsync()`, shall be returned. If the asynchronous I/O operation has not yet completed,
 19628 the results of `aioreturn()` are undefined.

19629 If the `aioreturn()` function fails, it shall return `-1` and set `errno` to indicate the error. +

19630 **ERRORS**19631 The `aioreturn()` function may fail if:

19632 [EINVAL] The `aiocbp` argument does not refer to an asynchronous operation whose
 19633 return status has not yet been retrieved.

19634 **EXAMPLES**

19635 None.

19636 **APPLICATION USAGE**

19637 None.

19647 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19648 **Issue 6**

19649 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 19650 implementation does not support the Asynchronous Input and Output option.

19651 The APPLICATION USAGE section is added.

19652 The [EINVAL] error condition is made optional. This is for consistency with the DESCRIPTION.

19653

Issue 7

19654

SD5-XSH-ERN-148 is applied.

+

19655

The *aio_return()* function is moved from the Asynchronous Input and Output option to the Base.

19656 **NAME**
 19657 aio_suspend — wait for an asynchronous I/O request

19658 **SYNOPSIS**
 19659 #include <aio.h>
 19660 int aio_suspend(const struct aiocb *const list[], int nent,
 19661 const struct timespec *timeout);

19662 **DESCRIPTION**
 19663 The *aio_suspend()* function shall suspend the calling thread until at least one of the asynchronous
 19664 I/O operations referenced by the *list* argument has completed, until a signal interrupts the
 19665 function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any
 19666 of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is,
 19667 the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the
 19668 function shall return without suspending the calling thread. The *list* argument is an array of
 19669 pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of
 19670 elements in the array. Each **aiocb** structure pointed to has been used in initiating an
 19671 asynchronous I/O request via *aio_read()*, *aio_write()*, or *lio_listio()*. This array may contain
 19672 NULL pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures
 19673 that have not been used in submitting asynchronous I/O, the effect is undefined.

19674 If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of
 19675 the I/O operations referenced by *list* are completed, then *aio_suspend()* shall return with an error.

19676 MON If the Monotonic Clock option is supported, the clock that shall be used to measure this time
 19677 interval shall be the CLOCK_MONOTONIC clock.

19678 **RETURN VALUE**
 19679 If the *aio_suspend()* function returns after one or more asynchronous I/O operations have
 19680 completed, the function shall return zero. Otherwise, the function shall return a value of -1 and
 19681 set *errno* to indicate the error.

19682 The application may determine which asynchronous I/O completed by scanning the associated
 19683 error and return status using *aio_error()* and *aio_return()*, respectively.

19684 **ERRORS**
 19685 The *aio_suspend()* function shall fail if:

19686 [EAGAIN] No asynchronous I/O indicated in the list referenced by *list* completed in the
 19687 time interval indicated by *timeout*.

19688 [EINTR] A signal interrupted the *aio_suspend()* function. Note that, since each
 19689 asynchronous I/O operation may possibly provoke a signal when it
 19690 completes, this error return may be caused by the completion of one (or more)
 19691 of the very I/O operations being awaited.

19692 **EXAMPLES**
 19693 None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used.

Issue 7

The *aio_suspend()* function is moved from the Asynchronous Input and Output option to the Base.

DRAFT

19714 **NAME**

19715 aio_write — asynchronous write to a file

19716 **SYNOPSIS**

19717 #include <aio.h>

19718 int aio_write(struct aiocb *aiocbp);

19719 **DESCRIPTION**19720 The *aio_write()* function shall write *aiocbp->aio_nbytes* to the file associated with
19721 *aiocbp->aio_fildes* from the buffer pointed to by *aiocbp->aio_buf*. The function shall return when
19722 the write request has been initiated or, at a minimum, queued to the file or device.19723 **PIO** If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
19724 at a priority equal to a base scheduling priority minus *aiocbp->aio_reqprio*. If Thread Execution
19725 Scheduling is not supported, then the base scheduling priority is that of the calling process;
19726 **PIO TPS** otherwise, the base scheduling priority is that of the calling thread.19727 The *aiocbp* argument may be used as an argument to *aio_error()* and *aio_return()* in order to
19728 determine the error status and return status, respectively, of the asynchronous operation while it
19729 is proceeding.19730 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
19731 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
19732 completion, then the behavior is undefined.19733 If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation shall take
19734 place at the absolute position in the file as given by *aio_offset*, as if *lseek()* were called
19735 immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to
19736 SEEK_SET. If O_APPEND is set for the file descriptor, write operations append to the file in the
19737 same order as the calls were made. After a successful call to enqueue an asynchronous I/O
19738 operation, the value of the file offset for the file is unspecified.19739 The *aio_sigevent* member specifies the notification which occurs when the request is completed.19740 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_write()*.19741 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.19742 **SIO** If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
19743 function shall be according to the definitions of synchronized I/O data integrity completion, and
19744 synchronized I/O file integrity completion.19745 For any system action that changes the process memory space while an asynchronous I/O is
19746 outstanding to the address range being changed, the result of that action is undefined.19747 For regular files, no data transfer shall occur past the offset maximum established in the open
19748 file description associated with *aiocbp->aio_fildes*.19749 **RETURN VALUE**19750 The *aio_write()* function shall return the value zero if the I/O operation is successfully queued;
19751 otherwise, the function shall return the value -1 and set *errno* to indicate the error.19752 **ERRORS**19753 The *aio_write()* function shall fail if:19754 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
19755 resource limitations.

19756 Each of the following conditions may be detected synchronously at the time of the call to

19757 *aio_write()*, or asynchronously. If any of the conditions below are detected synchronously, the
 19758 *aio_write()* function shall return `-1` and set *errno* to the corresponding value. If any of the
 19759 conditions below are detected asynchronously, the return status of the asynchronous operation
 19760 shall be set to `-1`, and the error status of the asynchronous operation is set to the corresponding
 19761 value.

19762 [EBADF] The *aioctx->aio_fildes* argument is not a valid file descriptor open for writing.

19763 [EINVAL] The file offset value implied by *aioctx->aio_offset* would be invalid,
 19764 PIO *aioctx->aio_reqprio* is not a valid value, or *aioctx->aio_nbytes* is an invalid
 19765 value.

19766 In the case that the *aio_write()* successfully queues the I/O operation, the return status of the
 19767 asynchronous operation shall be one of the values normally returned by the *write()* function call.
 19768 If the operation is successfully queued but is subsequently canceled or encounters an error, the
 19769 error status for the asynchronous operation contains one of the values normally set by the
 19770 *write()* function call, or one of the following:

19771 [EBADF] The *aioctx->aio_fildes* argument is not a valid file descriptor open for writing.

19772 [EINVAL] The file offset value implied by *aioctx->aio_offset* would be invalid.

19773 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 19774 *aio_cancel()* request.

19775 The following condition may be detected synchronously or asynchronously:

19776 [EFBIG] The file is a regular file, *aioctx->aio_nbytes* is greater than 0, and the starting
 19777 offset in *aioctx->aio_offset* is at or beyond the offset maximum in the open file
 19778 description associated with *aioctx->aio_fildes*.

19779 EXAMPLES

19780 None.

19791 CHANGE HISTORY

19792 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

19793 Large File Summit extensions are added.

19794 Issue 6

19795 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 19796 implementation does not support the Asynchronous Input and Output option.

19797 The APPLICATION USAGE section is added.

19798 The following new requirements on POSIX implementations derive from alignment with the
 19799 Single UNIX Specification:

19800
19801
19802
19803
19804
19805
19806
19807
19808
19809
19810
19811
19812

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with *aiocbp*→*aio_fildes*.
- The [EFBIG] error is added as part of the large file support extensions.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/14 is applied, rewording the DESCRIPTION when prioritized I/O is supported to account for threads, and removing the words “to the calling process” in the RETURN VALUE section.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/15 is applied, updating the [EINVAL] error, so that detection of an [EINVAL] error for an invalid value of *aiocbp*→*aio_reqprio* is only required if the Prioritized Input and Output option is supported.

Issue 7

Austin Group Interpretation 1003.1-2001 #082 is applied.

The *aio_write()* function is moved from the Asynchronous Input and Output option to the Base.

19813 **NAME**

19814 alarm — schedule an alarm signal

19815 **SYNOPSIS**

19816 #include <unistd.h>

19817 unsigned alarm(unsigned *seconds*);19818 **DESCRIPTION**

19819 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after
 19820 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays
 19821 may prevent the process from handling the signal as soon as it is generated.

19822 If *seconds* is 0, a pending alarm request, if any, is canceled.

19823 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.
 19824 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time
 19825 at which the SIGALRM signal is generated.

19826 XSI Interactions between *alarm()* and *setitimer()* are unspecified.

19827 **RETURN VALUE**

19828 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value
 19829 that is the number of seconds until the previous request would have generated a SIGALRM
 19830 signal. Otherwise, *alarm()* shall return 0.

19831 **ERRORS**

19832 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

19833 **EXAMPLES**

19834 None.

19835 **APPLICATION USAGE**

19836 The *fork()* function clears pending alarms in the child process. A new process image created by
 19837 one of the *exec* functions inherits the time left to an alarm signal in the image of the old process.

19838 Application developers should note that the type of the argument *seconds* and the return value of
 19839 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces
 19840 Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX},
 19841 which the ISO C standard sets as 65 535, and any application passing a larger value is restricting
 19842 its portability. A different type was considered, but historical implementations, including those
 19843 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

19844 Application developers should be aware of possible interactions when the same process uses
 19845 both the *alarm()* and *sleep()* functions.

19846 **RATIONALE**

19847 Many historical implementations (including Version 7 and System V) allow an alarm to occur up
 19848 to a second early. Other implementations allow alarms up to half a second or one clock tick
 19849 early or do not allow them to occur early at all. The latter is considered most appropriate, since it
 19850 gives the most predictable behavior, especially since the signal can always be delayed for an
 19851 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument
 19852 as the minimum amount of time they wish to have elapse before the signal.

19853 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time
 19854 as common English usage, and has nothing to do with “realtime operating systems”. It is in
 19855 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

19856 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are

19857 silently rounded down to an implementation-specific maximum value. This maximum is large
 19858 enough (to the order of several months) that the effect is not noticeable.

19859 There were two possible choices for alarm generation in multi-threaded applications: generation
 19860 for the calling thread or generation for the process. The first option would not have been
 19861 particularly useful since the alarm state is maintained on a per-process basis and the alarm that
 19862 is established by the last invocation of *alarm()* is the only one that would be active.

19863 Furthermore, allowing generation of an asynchronous signal for a thread would have
 19864 introduced an exception to the overall signal model. This requires a compelling reason in order
 19865 to be justified.

19866 **FUTURE DIRECTIONS**

19867 None.

19868 **SEE ALSO**

19869 *alarm()*, *exec*, *fork()*, *getitimer()*, *pause()*, *sigaction()*, *sleep*

19870 XBD `<signal.h>`, `<unistd.h>`

19871 **CHANGE HISTORY**

19872 First released in Issue 1. Derived from Issue 1 of the SVID.

19873 **Issue 6**

19874 The following new requirements on POSIX implementations derive from alignment with the
 19875 Single UNIX Specification:

- 19876 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*,
 19877 and *usleep()* functions are unspecified.

19878 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/16 is applied, replacing “an
 19879 implementation-defined maximum value” with “an implementation-specific maximum value”
 19880 in the RATIONALE.

19881 **NAME**
 19882 alphasort, scandir — scan a directory

19883 **SYNOPSIS**

```
19884 #include <dirent.h>
19885
19885 int alphasort(const struct dirent **d1, const struct dirent **d2);
19886 int scandir(const char *dir, struct dirent ***namelist,
19887             int (*sel)(const struct dirent *),
19888             int (*compar)(const struct dirent **, const struct dirent **));
```

19889 **DESCRIPTION**

19890 The *alphasort()* function can be used as the comparison function for the *scandir()* function to sort
 19891 the directory entries into alphabetical order. Sorting happens as if by calling the *strcoll()*
 19892 function on the *d_name* element of the **dirent** structures passed as the two parameters. Its
 19893 parameters are the two directory entries, *d1* and *d2*, to compare.

19894 The *scandir()* function shall scan the directory *dir*, calling the function referenced by *sel* on each
 19895 directory entry. Entries for which the function referenced by *sel* returns non-zero shall be stored
 19896 in strings allocated as if by a call to *malloc()*, and sorted using *qsort()* with the comparison
 19897 function *compar*, and collected in array *namelist* which shall be allocated as if by a call to *malloc()*.
 19898 If *sel* is a null pointer, all entries shall be selected.

19899 **RETURN VALUE**

19900 Upon successful completion, the *alphasort()* function shall return an integer greater than, equal
 19901 to, or less than 0, according to whether the name of the directory entry pointed to by *d1* is
 19902 lexically greater than, equal to, or less than the directory pointed to by *d2* when both are
 19903 interpreted as appropriate to the current locale. There is no return value reserved to indicate an
 19904 error.

19905 Upon successful completion, the *scandir()* function shall return the number of entries in the
 19906 array and a pointer to the array through the parameter *namelist*. Otherwise, the *scandir()*
 19907 function shall return -1.

19908 **ERRORS**

19909 The *scandir()* function shall fail if:

19910 [EACCES] Search permission is denied for the component of the path prefix of *dir* or read
 19911 permission is denied for *dir*.

19912 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dir*
 19913 argument.

19914 [ENAMETOOLONG] The length of the *dir* argument exceeds {PATH_MAX} or a pathname
 19915 component is longer than {NAME_MAX}.

19917 [ENOENT] A component of *dir* does not name an existing directory or *dir* is an empty
 19918 string.

19919 [ENOMEM] Insufficient storage space is available.

19920 [ENOTDIR] A component of *dir* is not a directory.

19921 The *scandir()* function may fail if:

19922 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 19923 resolution of the *dir* argument.

alphasort()

- 19924 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.
- 19925 [ENAMETOOLONG]
 19926 As a result of encountering a symbolic link in resolution of the *dir* argument,
 19927 the length of the substituted pathname string exceeded {PATH_MAX}.
- 19928 [ENFILE] Too many files are currently open in the system.

EXAMPLES

19929 An example to print the files in the current directory:

```

19931 #include <dirent.h>
19932 #include <stdio.h>
19933 #include <stdlib.h>
19934 ...
19935 struct dirent **namelist;
19936 int i,n;
19937
19938     n = scandir(".", &namelist, 0, alphasort);
19939     if (n < 0)
19940         perror("scandir");
19941     else {
19942         for (i = 0; i < n; i++) {
19943             printf("%s\n", namelist[i]->d_name);
19944             free(namelist[i]);
19945         }
19946         free(namelist);
19947     }

```

APPLICATION USAGE

19948 None.

RATIONALE

19949 None.

FUTURE DIRECTIONS

19950 None.

19952 XBD [<dirent.h>](#)

CHANGE HISTORY

19953 First released in Issue 7.

19959 **NAME**
 19960 asctime, asctime_r — convert date and time to a string

19961 **SYNOPSIS**

```
19962 OB #include <time.h>
19963 char *asctime(const struct tm *timeptr);
19964 OB CX char *asctime_r(const struct tm *restrict tm, char *restrict buf);
```

19965 **DESCRIPTION**

19966 CX For *asctime()*: The functionality described on this reference page is aligned with the ISO C |
 19967 standard. Any conflict between the requirements described here and the ISO C standard is |
 19968 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

19969 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*
 19970 into a string in the form:

```
19971 Sun Sep 16 01:03:52 1973\n\0
```

19972 using the equivalent of the following algorithm:

```
19973 char *asctime(const struct tm *timeptr)
19974 {
19975     static char wday_name[7][3] = {
19976         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
19977     };
19978     static char mon_name[12][3] = {
19979         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
19980         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
19981     };
19982     static char result[26];
19983     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
19984         wday_name[timeptr->tm_wday],
19985         mon_name[timeptr->tm_mon],
19986         timeptr->tm_mday, timeptr->tm_hour,
19987         timeptr->tm_min, timeptr->tm_sec,
19988         1900 + timeptr->tm_year);
19989     return result;
19990 }
```

19991 However, the behavior is undefined if *timeptr->tm_wday* or *timeptr->tm_mon* are not within the
 19992 normal ranges as defined in **<time.h>**, or if *timeptr->tm_year* exceeds {INT_MAX}-1990, or if the
 19993 above algorithm would attempt to generate more than 26 bytes of output (including the
 19994 terminating null).

19995 The **tm** structure is defined in the **<time.h>** header.

19996 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 19997 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 19998 functions may overwrite the information returned in either of these objects by any of the other
 19999 functions.

20000 The *asctime()* function need not be thread-safe. A function that is not required to be thread-safe
 20001 is not required to be reentrant.

20002 The *asctime_r()* function shall convert the broken-down time in the structure pointed to by *tm*

asctime()

System Interfaces

20003 into a string (of the same form as that returned by *asctime()*, and with the same undefined
 20004 behavior when input or output is out of range) that is placed in the user-supplied buffer pointed
 20005 to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

RETURN VALUE

20006
 20007 CX Upon successful completion, *asctime()* shall return a pointer to the string. If the function is
 20008 unsuccessful, it shall return NULL.

20009 Upon successful completion, *asctime_r()* shall return a pointer to a character string containing
 20010 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,
 20011 it shall return NULL.

ERRORS

20012 No errors are defined.
 20013

EXAMPLES

20014 None.
 20015

APPLICATION USAGE

20016 These functions are included only for compatibility with older implementations. They have
 20017 undefined behavior if the resulting string would be too long, so the use of these functions
 20018 should be discouraged. On implementations that do not detect output string length overflow, it
 20019 is possible to overflow the output buffers in such a way as to cause applications to fail, or
 20020 possible system security violations. Also, these functions do not support localized date and time
 20021 formats. To avoid these problems, applications should use *strftime()* to generate strings from
 20022 broken-down times.
 20023

20024 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

20025 The *asctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead
 20026 of possibly using a static data area that may be overwritten by each call.

RATIONALE

20027 The standard developers decided to mark the *asctime()* and *asctime_r()* functions obsolescent
 20028 even though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C
 20029 standard also provides the *strftime()* function which can be used to avoid these problems.
 20030

FUTURE DIRECTIONS

20031 These functions may be removed in a future version.
 20032

SEE ALSO

20033 *clock()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time*, *utime()*

 20035

CHANGE HISTORY

20036 First released in Issue 1. Derived from Issue 1 of the SVID.
 20037

Issue 5

20038 Normative text previously in the APPLICATION USAGE section is moved to the
 20039 DESCRIPTION.
 20040

20041 The *asctime_r()* function is included for alignment with the POSIX Threads Extension.

20042 A note indicating that the *asctime()* function need not be reentrant is added to the
 20043 DESCRIPTION.

Issue 6

20044 The *asctime_r()* function is marked as part of the Thread-Safe Functions option.
 20045

20046 Extensions beyond the ISO C standard are marked.
 20047

20047 The APPLICATION USAGE section is updated to include a note on the thread-safe function and

20048

its avoidance of possibly using a static data area.

20049

The DESCRIPTION of *asctime_r()* is updated to describe the format of the string returned.

20050

20051

The **restrict** keyword is added to the *asctime_r()* prototype for alignment with the ISO/IEC 9899:1999 standard.

20052

20053

20054

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/17 is applied, adding the CX extension in the RETURN VALUE section requiring that if the *asctime()* function is unsuccessful it returns NULL.

20055

Issue 7

20056

Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

20057

The *asctime_r()* function is moved from the Thread-Safe Functions option to the Base.

20058 **NAME**
 20059 asin, asinf, asinl — arc sine function

20060 **SYNOPSIS**
 20061 #include <math.h>
 20062 double asin(double x);
 20063 float asinf(float x);
 20064 long double asinl(long double x);

20065 **DESCRIPTION**
 20066 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20067 conflict between the requirements described here and the ISO C standard is unintentional. This
 20068 volume of POSIX.1-200x defers to the ISO C standard.

20069 These functions shall compute the principal value of the arc sine of their argument x . The value
 20070 of x should be in the range $[-1,1]$.

20071 An application wishing to check for error situations should set *errno* to zero and call
 20072 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20073 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20074 zero, an error has occurred.

20075 **RETURN VALUE**
 20076 Upon successful completion, these functions shall return the arc sine of x , in the range
 20077 $[-\pi/2, \pi/2]$ radians.

20078 MX For finite values of x not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 20079 supported), or an implementation-defined value shall be returned.

20080 MX If x is NaN, a NaN shall be returned.

20081 If x is ± 0 , x shall be returned.

20082 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 20083 defined value shall be returned.

20084 If x is subnormal, a range error may occur and x should be returned.

20085 **ERRORS**
 20086 These functions shall fail if:

20087 MX Domain Error The x argument is finite and is not in the range $[-1,1]$, or is $\pm\text{Inf}$.
 20088 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20089 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 20090 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 20091 shall be raised.

20092 These functions may fail if:

20093 MX Range Error The value of x is subnormal.
 20094 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20095 then *errno* shall be set to [ERANGE]. If the integer expression
 20096 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20097 floating-point exception shall be raised.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20121 **NAME**

20122 asinh, asinhf, asinhl — inverse hyperbolic sine functions

20123 **SYNOPSIS**

```
20124 #include <math.h>
20125
20125 double asinh(double x);
20126 float asinhf(float x);
20127 long double asinhl(long double x);
```

20128 **DESCRIPTION**

20129 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20130 conflict between the requirements described here and the ISO C standard is unintentional. This
 20131 volume of POSIX.1-200x defers to the ISO C standard.

20132 These functions shall compute the inverse hyperbolic sine of their argument x .

20133 An application wishing to check for error situations should set *errno* to zero and call
 20134 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20135 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20136 zero, an error has occurred.

20137 **RETURN VALUE**

20138 Upon successful completion, these functions shall return the inverse hyperbolic sine of their
 20139 argument.

20140 MX If x is NaN, a NaN shall be returned.

20141 If x is ± 0 , or $\pm\text{Inf}$, x shall be returned.

20142 If x is subnormal, a range error may occur and x should be returned.

20143 **ERRORS**

20144 These functions may fail if:

20145 MX **Range Error** The value of x is subnormal.

20146 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20147 then *errno* shall be set to [ERANGE]. If the integer expression
 20148 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20149 floating-point exception shall be raised.

20150 **EXAMPLES**

20151 None.

20152 **APPLICATION USAGE**

20153 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 20154 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The *asinh()* function is no longer marked as an extension.

The *asinhf()* and *asinhll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20174

NAME20175 *asinl* — arc sine function
20176**SYNOPSIS**20177 `#include <math.h>`20178 `long double asinl(long double x);`
20179**DESCRIPTION**20180 Refer to *asin()*.
20181

20182 **NAME**

20183 assert — insert program diagnostics

20184 **SYNOPSIS**

20185 #include <assert.h>

20186 void assert(*scalar expression*);20187 **DESCRIPTION**

20188 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20189 conflict between the requirements described here and the ISO C standard is unintentional. This
 20190 volume of POSIX.1-200x defers to the ISO C standard.

20191 The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.
 20192 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal
 20193 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call
 20194 *abort()*.

20195 The information written about the call that failed shall include the text of the argument, the
 20196 name of the source file, the source file line number, and the name of the enclosing function; the
 20197 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of
 20198 the identifier `__func__`.

20199 Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the
 20200 preprocessor control statement `#define NDEBUG` ahead of the `#include <assert.h>` statement,
 20201 shall stop assertions from being compiled into the program.

20202 **RETURN VALUE**20203 The *assert()* macro shall not return a value.20204 **ERRORS**

20205 No errors are defined.

20206 **EXAMPLES**

20207 None.

20208 **APPLICATION USAGE**

20209 None.

20210 **RATIONALE**

20216 XBD <assert.h>

20217 **CHANGE HISTORY**

20218 First released in Issue 1. Derived from Issue 1 of the SVID.

20219 **Issue 6**20220 The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment
 20221 with the ISO/IEC 9899:1999 standard.20222 The DESCRIPTION of *assert()* is updated for alignment with the ISO/IEC 9899:1999 standard.

20223 **NAME**

20224 atan, atanf, atanl — arc tangent function

20225 **SYNOPSIS**

```
20226 #include <math.h>
20227
20227 double atan(double x);
20228 float atanf(float x);
20229 long double atanl(long double x);
```

20230 **DESCRIPTION**

20231 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20232 conflict between the requirements described here and the ISO C standard is unintentional. This
 20233 volume of POSIX.1-200x defers to the ISO C standard.

20234 These functions shall compute the principal value of the arc tangent of their argument x .

20235 An application wishing to check for error situations should set *errno* to zero and call
 20236 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20237 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20238 zero, an error has occurred.

20239 **RETURN VALUE**

20240 Upon successful completion, these functions shall return the arc tangent of x in the range
 20241 $[-\pi/2, \pi/2]$ radians.

20242 MX If x is NaN, a NaN shall be returned.

20243 If x is ± 0 , x shall be returned.

20244 If x is $\pm\text{Inf}$, $\pm\pi/2$ shall be returned.

20245 If x is subnormal, a range error may occur and x should be returned.

20246 **ERRORS**

20247 These functions may fail if:

20248 MX **Range Error** The value of x is subnormal.

20249 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20250 then *errno* shall be set to [ERANGE]. If the integer expression
 20251 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 20252 floating-point exception shall be raised.

20253 **EXAMPLES**

20254 None.

20255 **APPLICATION USAGE**

20256 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 20257 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *atanf()* and *atanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20276 **NAME**

20277 atan2, atan2f, atan2l — arc tangent functions

20278 **SYNOPSIS**

20279 #include <math.h>

20280 double atan2(double y, double x);

20281 float atan2f(float y, float x);

20282 long double atan2l(long double y, long double x);

20283 **DESCRIPTION**

20284 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20285 conflict between the requirements described here and the ISO C standard is unintentional. This
 20286 volume of POSIX.1-200x defers to the ISO C standard.

20287 These functions shall compute the principal value of the arc tangent of y/x , using the signs of
 20288 both arguments to determine the quadrant of the return value.

20289 An application wishing to check for error situations should set *errno* to zero and call
 20290 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20291 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20292 zero, an error has occurred.

20293 **RETURN VALUE**

20294 Upon successful completion, these functions shall return the arc tangent of y/x in the range
 20295 $[-\pi, \pi]$ radians.

20296 If y is ± 0 and x is < 0 , $\pm\pi$ shall be returned.20297 If y is ± 0 and x is > 0 , ± 0 shall be returned.20298 If y is < 0 and x is ± 0 , $-\pi/2$ shall be returned.20299 If y is > 0 and x is ± 0 , $\pi/2$ shall be returned.20300 If x is 0, a pole error shall not occur.20301 MX If either x or y is NaN, a NaN shall be returned.20302 If the result underflows, a range error may occur and y/x should be returned.20303 If y is ± 0 and x is -0 , $\pm\pi$ shall be returned.20304 If y is ± 0 and x is $+0$, ± 0 shall be returned.20305 For finite values of $\pm y > 0$, if x is $-\text{Inf}$, $\pm\pi$ shall be returned.20306 For finite values of $\pm y > 0$, if x is $+\text{Inf}$, ± 0 shall be returned.20307 For finite values of x , if y is $\pm\text{Inf}$, $\pm\pi/2$ shall be returned.20308 If y is $\pm\text{Inf}$ and x is $-\text{Inf}$, $\pm 3\pi/4$ shall be returned.20309 If y is $\pm\text{Inf}$ and x is $+\text{Inf}$, $\pm\pi/4$ shall be returned.

20310 If both arguments are 0, a domain error shall not occur.

20311 **ERRORS**

20312 These functions may fail if:

20313 MX **Range Error** The result underflows.

20314 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20315 then *errno* shall be set to [ERANGE]. If the integer expression

20316
20317

`(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow floating-point exception shall be raised.

20318

EXAMPLES

20319

Converting Cartesian to Polar Coordinates System20320
20321
20322

The function below uses `atan2()` to convert a 2d vector expressed in cartesian coordinates (x,y) to the polar coordinates $(rho,theta)$. There are other ways to compute the angle $theta$, using `asin()` or `atan()`. However, `atan2()` presents here two advantages:

20323

- The angle's quadrant is automatically determined.

20324

- The singular cases $(0,y)$ are taken into account.

20325
20326

Finally, this example uses `hypot()` rather than `sqrt()` since it is better for special cases; see `hypot()` for more information.

20327

```
#include <math.h>
```

20328

```
void
```

20329

```
cartesian_to_polar(const double x, const double y,
```

20330

```
double *rho, double *theta
```

20331

```
)
```

20332

```
{
```

20333

```
*rho = hypot (x,y); /* better than sqrt(x*x+y*y) */
```

20334

```
*theta = atan2 (y,x);
```

20335

```
}
```

20336

APPLICATION USAGE20337
20338

On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling & MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

20339

20359

NAME20361 `atanf` — arc tangent function**SYNOPSIS**20363 `#include <math.h>`20364 `float atanf(float x);`**DESCRIPTION**20366 Refer to *atan()*.

20367 **NAME**

20368 atanh, atanhf, atanh1 — inverse hyperbolic tangent functions

20369 **SYNOPSIS**

```
20370 #include <math.h>
20371
20371 double atanh(double x);
20372 float atanhf(float x);
20373 long double atanh1(long double x);
```

20374 **DESCRIPTION**

20375 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20376 conflict between the requirements described here and the ISO C standard is unintentional. This
 20377 volume of POSIX.1-200x defers to the ISO C standard.

20378 These functions shall compute the inverse hyperbolic tangent of their argument x .

20379 An application wishing to check for error situations should set *errno* to zero and call
 20380 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 20381 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 20382 zero, an error has occurred.

20383 **RETURN VALUE**

20384 Upon successful completion, these functions shall return the inverse hyperbolic tangent of their
 20385 argument.

20386 If x is ± 1 , a pole error shall occur, and *atanh()*, *atanhf()*, and *atanh1()* shall return the value of the
 20387 macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively, with the same sign as the
 20388 correct value of the function.

20389 MX For finite $|x| > 1$, a domain error shall occur, and either a NaN (if supported), or an
 20390 implementation-defined value shall be returned.

20391 MX If x is NaN, a NaN shall be returned.

20392 If x is ± 0 , x shall be returned.

20393 If x is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 20394 defined value shall be returned.

20395 If x is subnormal, a range error may occur and x should be returned.

20396 **ERRORS**

20397 These functions shall fail if:

20398 MX Domain Error The x argument is finite and not in the range $[-1, 1]$, or is $\pm \text{Inf}$.
 20399 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20400 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 20401 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 20402 shall be raised.

20403 Pole Error The x argument is ± 1 .

20404 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 20405 then *errno* shall be set to [ERANGE]. If the integer expression
 20406 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 20407 floating-point exception shall be raised.

20408

These functions may fail if:

20409

MX

Range Error The value of x is subnormal.

20410

20411

20412

20413

If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

20414

EXAMPLES

20415

None.

20416

APPLICATION USAGE

20417

20418

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

The *atanh()* function is no longer marked as an extension.

20432

20433

The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

20434

20435

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

20436

20437

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

20438 **NAME**
20439 atanl — arc tangent function

20440 **SYNOPSIS**
20441 #include <math.h>
20442 long double atanl(long double x);

20443 **DESCRIPTION**
20444 Refer to *atan()*.

20445 **NAME**
 20446 `atexit` — register a function to run at process termination

20447 **SYNOPSIS**
 20448 `#include <stdlib.h>`
 20449 `int atexit(void (*func)(void));`

20450 **DESCRIPTION**

20451 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20452 conflict between the requirements described here and the ISO C standard is unintentional. This
 20453 volume of POSIX.1-200x defers to the ISO C standard.

20454 The `atexit()` function shall register the function pointed to by `func`, to be called without
 20455 arguments at normal program termination. At normal program termination, all functions
 20456 registered by the `atexit()` function shall be called, in the reverse order of their registration, except
 20457 that a function is called after any previously registered functions that had already been called at
 20458 the time it was registered. Normal termination occurs either by a call to `exit()` or a return from
 20459 `main()`.

20460 At least 32 functions can be registered with `atexit()`.

20461 CX After a successful call to any of the `exec` functions, any functions previously registered by `atexit()`
 20462 shall no longer be registered.

20463 **RETURN VALUE**

20464 Upon successful completion, `atexit()` shall return 0; otherwise, it shall return a non-zero value.

20465 **ERRORS**

20466 No errors are defined.

20467 **EXAMPLES**

20468 None.

20469 **APPLICATION USAGE**

20470 The functions registered by a call to `atexit()` must return to ensure that all registered functions
 20471 are called.

20472 The application should call `sysconf()` to obtain the value of {ATEXIT_MAX}, the number of
 20473 functions that can be registered. There is no way for an application to tell how many functions
 20474 have already been registered with `atexit()`.

20475 Since the behavior is undefined if the `exit()` function is called more than once, portable
 20476 applications calling `atexit()` must ensure that the `exit()` function is not called at normal process
 20477 termination when all functions registered by the `atexit()` function are called.

20478 All functions registered by the `atexit()` function are called at normal process termination, which
 20479 occurs by a call to the `exit()` function or a return from `main()` or on the last thread termination,
 20480 when the behavior is as if the implementation called `exit()` with a zero argument at thread
 20481 termination time.

20482 If, at normal process termination, a function registered by the `atexit()` function is called and a
 20483 portable application needs to stop further `exit()` processing, it must call the `_exit()` function or
 20484 the `_Exit()` function or one of the functions which cause abnormal process termination.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/19 is applied, adding further clarification to the APPLICATION USAGE section.

20499 **NAME**
 20500 `atof` — convert a string to a double-precision number

20501 **SYNOPSIS**
 20502 `#include <stdlib.h>`

20503 `double atof(const char *str);`

20504 **DESCRIPTION**

20505 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20506 conflict between the requirements described here and the ISO C standard is unintentional. This
 20507 volume of POSIX.1-200x defers to the ISO C standard.

20508 The call `atof(str)` shall be equivalent to:

20509 `strtod(str, (char **)NULL),`

20510 except that the handling of errors may differ. If the value cannot be represented, the behavior is
 20511 undefined.

20512 **RETURN VALUE**

20513 The `atof()` function shall return the converted value if the value can be represented.

20514 **ERRORS**

20515 No errors are defined.

20516 **EXAMPLES**

20517 None.

20518 **APPLICATION USAGE**

20519 The `atof()` function is subsumed by `strtod()` but is retained because it is used extensively in
 20520 existing code. If the number is not known to be in range, `strtod()` should be used because `atof()`
 20521 is not required to perform any error checking.

20522 **RATIONALE**

20523 None.

20524 **FUTURE DIRECTIONS**

20525 None.

20526 **SEE ALSO**

20527 [*strtod\(\)*](#)

20528 XBD [*<stdlib.h>*](#)

20529 **CHANGE HISTORY**

20530 First released in Issue 1. Derived from Issue 1 of the SVID.

20531 **NAME**
 20532 `atoi` — convert a string to an integer

20533 **SYNOPSIS**
 20534 `#include <stdlib.h>`
 20535 `int atoi(const char *str);`

20536 **DESCRIPTION**
 20537 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20538 conflict between the requirements described here and the ISO C standard is unintentional. This
 20539 volume of POSIX.1-200x defers to the ISO C standard.

20540 The call `atoi(str)` shall be equivalent to:
 20541 `(int) strtol(str, (char **)NULL, 10)`
 20542 except that the handling of errors may differ. If the value cannot be represented, the behavior is
 20543 undefined.

20544 **RETURN VALUE**
 20545 The `atoi()` function shall return the converted value if the value can be represented.

20546 **ERRORS**
 20547 No errors are defined.

20548 **EXAMPLES**

20549 **Converting an Argument**

20550 The following example checks for proper usage of the program. If there is an argument and the
 20551 decimal conversion of this argument (obtained using `atoi()`) is greater than 0, then the program
 20552 has a valid number of minutes to wait for an event.

```
20553 #include <stdlib.h>
20554 #include <stdio.h>
20555 ...
20556 int minutes_to_event;
20557 ...
20558 if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
20559     fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
20560 }
20561 ...
```

20562 **APPLICATION USAGE**
 20563 The `atoi()` function is subsumed by `strtol()` but is retained because it is used extensively in
 20564 existing code. If the number is not known to be in range, `strtol()` should be used because `atoi()` is
 20565 not required to perform any error checking.

20566 **RATIONALE**
 20567 None.

20568 **FUTURE DIRECTIONS**
 20569 None.

CHANGE HISTORY

20574

First released in Issue 1. Derived from Issue 1 of the SVID.

20575 **NAME**
 20576 `atol, atoll` — convert a string to a long integer

20577 **SYNOPSIS**
 20578 `#include <stdlib.h>`
 20579 `long atol(const char *str);`
 20580 `long long atoll(const char *nptr);`

20581 **DESCRIPTION**
 20582 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20583 conflict between the requirements described here and the ISO C standard is unintentional. This
 20584 volume of POSIX.1-200x defers to the ISO C standard.

20585 The call `atol(str)` shall be equivalent to:
 20586 `strtol(str, (char **)NULL, 10)`

20587 The call `atoll(nptr)` shall be equivalent to:
 20588 `strtoll(nptr, (char **)NULL, 10)`

20589 except that the handling of errors may differ. If the value cannot be represented, the behavior is
 20590 undefined.

20591 **RETURN VALUE**
 20592 These functions shall return the converted value if the value can be represented.

20593 **ERRORS**
 20594 No errors are defined.

20595 **EXAMPLES**
 20596 None.

20597 **APPLICATION USAGE**
 20598 The `atol()` function is subsumed by `strtol()` but is retained because it is used extensively in
 20599 existing code. If the number is not known to be in range, `strtol()` should be used because `atol()` is
 20600 not required to perform any error checking.

20601 **RATIONALE**
 20602 None.

20603 **FUTURE DIRECTIONS**
 20604 None.

20605 **SEE ALSO**
 20606 [strtol\(\)](#)
 20607 XBD [<stdlib.h>](#)

20608 **CHANGE HISTORY**
 20609 First released in Issue 1. Derived from Issue 1 of the SVID.

20610 **Issue 6**
 20611 The `atoll()` function is added for alignment with the ISO/IEC 9899:1999 standard.

20612 **Issue 7**
 20613 SD5-XSH-ERN-61 is applied, correcting the DESCRIPTION of `atoll()`.

20614 **NAME**20615 `basename` — return the last component of a pathname20616 **SYNOPSIS**

```
20617 XSI #include <libgen.h>
20618 char *basename(char *path);
```

20619 **DESCRIPTION**

20620 The `basename()` function shall take the pathname pointed to by `path` and return a pointer to the
 20621 final component of the pathname, deleting any trailing `'/'` characters.

20622 If the string pointed to by `path` consists entirely of the `'/'` character, `basename()` shall return a
 20623 pointer to the string `"/"`. If the string pointed to by `path` is exactly `"/"`, it is implementation-
 20624 defined whether `'/'` or `"/"` is returned.

20625 If `path` is a null pointer or points to an empty string, `basename()` shall return a pointer to the
 20626 string `"."`.

20627 The `basename()` function may modify the string pointed to by `path`, and may return a pointer to
 20628 static storage that may then be overwritten by a subsequent call to `basename()`.

20629 The `basename()` function need not be thread-safe. A function that is not required to be thread-safe
 20630 is not required to be reentrant.

20631 **RETURN VALUE**

20632 The `basename()` function shall return a pointer to the final component of `path`.

20633 **ERRORS**

20634 No errors are defined.

20635 **EXAMPLES**20636 **Using basename()**

20637 The following program fragment returns a pointer to the value `lib`, which is the base name of
 20638 `/usr/lib`.

```
20639 #include <libgen.h>
20640 ...
20641 char *name = "/usr/lib";
20642 char *base;
20643
20644 base = basename(name);
20645 ...
```

20645 **Sample Input and Output Strings for basename()**

20646 In the following table, the input string is the value pointed to by `path`, and the output string is
 20647 the return value of the `basename()` function.

Input String	Output String
<code>"/usr/lib"</code>	<code>"lib"</code>
<code>"/usr/"</code>	<code>"usr"</code>
<code>"/"</code>	<code>"/"</code>
<code>"/" / " /" / " /"</code>	<code>"/"</code>
<code>"/usr//lib//"</code>	<code>"lib"</code>

20654 **APPLICATION USAGE**

20655 None.

20656 **RATIONALE**

20657 None.

20659 None.

20660 **SEE ALSO**20661 *dirname*

20662 XBD <libgen.h>

20663 XCU *basename*20664 **CHANGE HISTORY**

20665 First released in Issue 4, Version 2.

20666 **Issue 5**

20667 Moved from X/OPEN UNIX extension to BASE.

20668 Normative text previously in the APPLICATION USAGE section is moved to the
20669 DESCRIPTION.

20670 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

20671 **Issue 6**

20672 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

20673 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/20 is applied, changing the
20674 DESCRIPTION to make it clear that the string referenced is the string pointed to by *path*.

bind()20675 **NAME**20676 `bind` — bind a name to a socket20677 **SYNOPSIS**

```
20678 #include <sys/socket.h>
20679
20679 int bind(int socket, const struct sockaddr *address,
20680         socklen_t address_len);
```

20681 **DESCRIPTION**

20682 The `bind()` function shall assign a local socket address *address* to a socket identified by descriptor
 20683 *socket* that has no local socket address assigned. Sockets created with the `socket()` function are
 20684 initially unnamed; they are identified only by their address family.

20685 The `bind()` function takes the following arguments:

20686 <i>socket</i>	Specifies the file descriptor of the socket to be bound.
20687 <i>address</i>	Points to a sockaddr structure containing the address to be bound to the 20688 socket. The length and format of the address depend on the address family of 20689 the socket.
20690 <i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> 20691 argument.

20692 The socket specified by *socket* may require the process to have appropriate privileges to use the
 20693 `bind()` function.

20694 If the socket address cannot be assigned immediately and `O_NONBLOCK` is set for the file +
 20695 descriptor for the socket, `bind()` shall fail and set *errno* to `[EINPROGRESS]`, but the assignment +
 20696 request shall not be aborted, and the assignment shall be completed asynchronously. +
 20697 Subsequent calls to `bind()` for the same socket, before the assignment is completed, shall fail and +
 20698 set *errno* to `[EALREADY]`. +

20699 When the assignment has been performed asynchronously, `pselect()`, `select()`, and `poll()` shall +
 20700 indicate that the file descriptor for the socket is ready for reading and writing.

20701 **RETURN VALUE**

20702 Upon successful completion, `bind()` shall return 0; otherwise, `-1` shall be returned and *errno* set
 20703 to indicate the error.

20704 **ERRORS**

20705 The `bind()` function shall fail if:

20706 <code>[EADDRINUSE]</code>	The specified address is already in use.
20707 <code>[EADDRNOTAVAIL]</code>	The specified address is not available from the local machine.
20708 <code>[EAFNOSUPPORT]</code>	The specified address is not a valid address for the address family of the 20709 specified socket.
20710 <code>[EBADF]</code>	The <i>socket</i> argument is not a valid file descriptor.
20711 <code>[EINVAL]</code>	The socket is already bound to an address, and the protocol does not support 20712 binding to a new address; or the socket has been shut down.
20713 <code>[ENOBUFS]</code>	Insufficient resources were available to complete the call.

- 20716 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 20717 [EOPNOTSUPP] The socket type of the specified socket does not support binding to an address.
- 20718 If the address family of the socket is AF_UNIX, then *bind()* shall fail if:
- 20719 [EACCES] A component of the path prefix denies search permission, or the requested
20720 name requires writing in a directory with a mode that denies write
20721 permission.
- 20722 [EDESTADDRREQ] or [EISDIR]
20723 The *address* argument is a null pointer.
- 20724 [EIO] An I/O error occurred.
- 20725 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
20726 in *address*.
- 20727 [ENAMETOOLONG]
20728 A component of a pathname exceeded {NAME_MAX} characters, or an entire
20729 pathname exceeded {PATH_MAX} characters.
- 20730 [ENOENT] A component of the pathname does not name an existing file or the pathname
20731 is an empty string.
- 20732 [ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory.
- 20733 [EROFS] The name would reside on a read-only file system.
- 20734 The *bind()* function may fail if:
- 20735 [EACCES] The specified address is protected and the current user does not have
20736 permission to bind to it.
- 20737 [EALREADY] An assignment request is already in progress for the specified socket. +
- 20738 [EINVAL] The *address_len* argument is not a valid length for the address family.
- 20739 [EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the assignment +
20740 cannot be immediately performed; the assignment shall be performed +
20741 asynchronously.
- 20742 [EISCONN] The socket is already connected.
- 20743 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
20744 resolution of the pathname in *address*.
- 20745 [ENAMETOOLONG]
20746 Pathname resolution of a symbolic link produced an intermediate result
20747 whose length exceeds {PATH_MAX}.

EXAMPLES

None.

APPLICATION USAGEAn application program can retrieve the assigned socket name with the *getsockname()* function.**RATIONALE**

CHANGE HISTORY

20760

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

20761

Issue 7

20762

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOBUFS] error to become a “shall fail” error.

20763

20764

SD5-XSH-ERN-185 is applied.

20765 **NAME**20766 `bsearch` — binary search a sorted table20767 **SYNOPSIS**20768 `#include <stdlib.h>`20769 `void *bsearch(const void *key, const void *base, size_t nel,`
20770 `size_t width, int (*compar)(const void *, const void *));`20771 **DESCRIPTION**20772 CX The functionality described on this reference page is aligned with the ISO C standard. Any
20773 conflict between the requirements described here and the ISO C standard is unintentional. This
20774 volume of POSIX.1-200x defers to the ISO C standard.20775 The `bsearch()` function shall search an array of `nel` objects, the initial element of which is pointed
20776 to by `base`, for an element that matches the object pointed to by `key`. The size of each element in
20777 the array is specified by `width`. If the `nel` argument has the value zero, the comparison function
20778 pointed to by `compar` shall not be called and no match shall be found.20779 The comparison function pointed to by `compar` shall be called with two arguments that point to
20780 the `key` object and to an array element, in that order.20781 The application shall ensure that the comparison function pointed to by `compar` does not alter the
20782 contents of the array. The implementation may reorder elements of the array between calls to the
20783 comparison function, but shall not alter the contents of any individual element.

20784 The implementation shall ensure that the first argument is always a pointer to the key.

20785 When the same objects (consisting of `width` bytes, irrespective of their current positions in the
20786 array) are passed more than once to the comparison function, the results shall be consistent with
20787 one another. That is, the same object shall always compare the same way with the key.20788 The application shall ensure that the function returns an integer less than, equal to, or greater
20789 than 0 if the `key` object is considered, respectively, to be less than, to match, or to be greater than
20790 the array element. The application shall ensure that the array consists of all the elements that
20791 compare less than, all the elements that compare equal to, and all the elements that compare
20792 greater than the `key` object, in that order.20793 **RETURN VALUE**20794 The `bsearch()` function shall return a pointer to a matching member of the array, or a null pointer
20795 if no match is found. If two or more members compare equal, which member is returned is
20796 unspecified.20797 **ERRORS**

20798 No errors are defined.

20799 **EXAMPLES**20800 The example below searches a table containing pointers to nodes consisting of a string and its
20801 length. The table is ordered alphabetically on the string in the node pointed to by each entry.20802 The code fragment below reads in strings and either finds the corresponding node and prints
20803 out the string and its length, or prints an error message.20804 `#include <stdio.h>`
20805 `#include <stdlib.h>`
20806 `#include <string.h>`
20807 `#define TABSIZE 1000`
20808 `struct node { /* These are stored in the table. */`

```

20809     char *string;
20810     int length;
20811 };
20812 struct node table[TABSIZE];    /* Table to be searched. */
20813     .
20814     .
20815     .
20816 {
20817     struct node *node_ptr, node;
20818     /* Routine to compare 2 nodes. */
20819     int node_compare(const void *, const void *);
20820     .
20821     .
20822     .
20823     while (scanf("%Ms", &node.string) != EOF) {
20824         node_ptr = (struct node *)bsearch((void *)&node,
20825             (void *)table, TABSIZE,
20826             sizeof(struct node), node_compare);
20827         if (node_ptr != NULL) {
20828             (void)printf("string = %20s, length = %d\n",
20829                 node_ptr->string, node_ptr->length);
20830         } else {
20831             (void)printf("not found: %s\n", node.string);
20832         }
20833         free(node.string);
20834     }
20835 }
20836 /*
20837     This routine compares two nodes based on an
20838     alphabetical ordering of the string field.
20839 */
20840 int
20841 node_compare(const void *node1, const void *node2)
20842 {
20843     return strcoll(((const struct node *)node1)->string,
20844         ((const struct node *)node2)->string);
20845 }

```

APPLICATION USAGE

The pointers to the key and the element at the base of the table should be of type pointer-to-element.

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

In practice, the array is usually sorted according to the comparison function.

RATIONALE

The requirement that the second argument (hereafter referred to as *p*) to the comparison function is a pointer to an element of the array implies that for every call all of the following expressions are non-zero:

```

20856 ((char *)p - (char *(base) % width == 0
20857 (char *)p >= (char *)base
20858 (char *)p < (char *)base + nel * width

```

20859

FUTURE DIRECTIONS

20860

None.

20869

20870

20871

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three paragraphs. The RATIONALE section is also updated. These changes are for alignment with the ISO C standard.

20872

Issue 7

20873

The EXAMPLES section is revised.

20874 **NAME**
 20875 `btowc` — single byte to wide character conversion

20876 **SYNOPSIS**
 20877 `#include <stdio.h>`
 20878 `#include <wchar.h>`
 20879 `wint_t btowc(int c);`

20880 **DESCRIPTION**
 20881 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20882 conflict between the requirements described here and the ISO C standard is unintentional. This
 20883 volume of POSIX.1-200x defers to the ISO C standard.

20884 The `btowc()` function shall determine whether `c` constitutes a valid (one-byte) character in the
 20885 initial shift state.

20886 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.

20887 **RETURN VALUE**
 20888 The `btowc()` function shall return `WEOF` if `c` has the value `EOF` or if (**unsigned char**) `c` does not
 20889 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the
 20890 wide-character representation of that character.

20891 **ERRORS**
 20892 No errors are defined.

20893 **EXAMPLES**
 20894 None.

20967 **NAME**
 20968 cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

20969 **SYNOPSIS**
 20970 #include <complex.h>
 20971 double complex cacosh(double complex z);
 20972 float complex cacoshf(float complex z);
 20973 long double complex cacoshl(long double complex z);

20974 **DESCRIPTION**
 20975 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 20976 conflict between the requirements described here and the ISO C standard is unintentional. This
 20977 volume of POSIX.1-200x defers to the ISO C standard.

20978 These functions shall compute the complex arc hyperbolic cosine of z , with a branch cut at
 20979 values less than 1 along the real axis.

20980 **RETURN VALUE**
 20981 These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip
 20982 of non-negative values along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary axis.

20983 **ERRORS**
 20984 No errors are defined.

20985 **EXAMPLES**
 20986 None.

20987 **APPLICATION USAGE**
 20988 None.

20989 **RATIONALE**
 20990 None.

20991 **FUTURE DIRECTIONS**
 20992 None.

20996 **CHANGE HISTORY**
 20997 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20998 **NAME**
20999 `cacosl` — complex arc cosine functions

21000 **SYNOPSIS**
21001 `#include <complex.h>`
21002 `long double complex cacosl(long double complex z);`

21003 **DESCRIPTION**
21004 Refer to *cacos()*.

21005 **NAME**

21006 calloc — a memory allocator

21007 **SYNOPSIS**

21008 #include <stdlib.h>

21009 void *calloc(size_t *nelem*, size_t *elsize*);21010 **DESCRIPTION**21011 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21012 conflict between the requirements described here and the ISO C standard is unintentional. This
21013 volume of POSIX.1-200x defers to the ISO C standard.21014 The *calloc()* function shall allocate unused space for an array of *nelem* elements each of whose
21015 size in bytes is *elsize*. The space shall be initialized to all bits 0.21016 The order and contiguity of storage allocated by successive calls to *calloc()* is unspecified. The
21017 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
21018 a pointer to any type of object and then used to access such an object or an array of such objects
21019 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall
21020 yield a pointer to an object disjoint from any other object. The pointer returned shall point to the
21021 start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer
21022 shall be returned. If the size of the space requested is 0, the behavior is implementation-defined:
21023 the value returned shall be either a null pointer or a unique pointer.21024 **RETURN VALUE**21025 Upon successful completion with both *nelem* and *elsize* non-zero, *calloc()* shall return a pointer to
21026 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer
21027 value that can be successfully passed to *free()* shall be returned. Otherwise, it shall return a null
21028 pointer and set *errno* to indicate the error.21029 **ERRORS**21030 The *calloc()* function shall fail if:

21031 CX [ENOMEM] Insufficient memory is available.

21032 **EXAMPLES**

21033 None.

21034 **APPLICATION USAGE**

21035 There is now no requirement for the implementation to support the inclusion of <malloc.h>.

21036 **RATIONALE**

21037 None.

21038 **FUTURE DIRECTIONS**

21039 None.

21040 **SEE ALSO**21041 *free()*, *malloc()*, *realloc()*

 21214 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

21215 **NAME**
21216 catanl — complex arc tangent functions

21217 **SYNOPSIS**
21218 #include <complex.h>
21219 long double complex catanl(long double complex z);

21220 **DESCRIPTION**
21221 Refer to *catan()*.

21222 **NAME**21223 `catclose` — close a message catalog descriptor21224 **SYNOPSIS**21225 `#include <nl_types.h>`21226 `int catclose(nl_catd catd);`21227 **DESCRIPTION**21228 The `catclose()` function shall close the message catalog identified by `catd`. If a file descriptor is
21229 used to implement the type **nl_catd**, that file descriptor shall be closed.21230 **RETURN VALUE**21231 Upon successful completion, `catclose()` shall return 0; otherwise, -1 shall be returned, and `errno`
21232 set to indicate the error.21233 **ERRORS**21234 The `catclose()` function may fail if:

21235 [EBADF] The catalog descriptor is not valid.

21236 [EINTR] The `catclose()` function was interrupted by a signal.21237 **EXAMPLES**

21238 None.

21239 **APPLICATION USAGE**

21240 None.

21241 **RATIONALE**

21242 None.

21243 **FUTURE DIRECTIONS**

21244 None.

21245 **SEE ALSO**21246 [catgets\(\)](#), [catopen\(\)](#)21247 XBD [<nl_types.h>](#)21248 **CHANGE HISTORY**

21249 First released in Issue 2.

21250 **Issue 7**21251 The `catclose()` function is moved from the XSI option to the Base.

21252 **NAME**21253 `catgets` — read a program message21254 **SYNOPSIS**21255 `#include <nl_types.h>`21256 `char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);`21257 **DESCRIPTION**

21258 The `catgets()` function shall attempt to read message `msg_id`, in set `set_id`, from the message
 21259 catalog identified by `catd`. The `catd` argument is a message catalog descriptor returned from an
 21260 earlier call to `catopen()`. The results are undefined if `catd` is not a value returned by `catopen()` for
 21261 a message catalog still open in the process. The `s` argument points to a default message string
 21262 which shall be returned by `catgets()` if it cannot retrieve the identified message.

21263 The `catgets()` function need not be thread-safe. A function that is not required to be thread-safe is
 21264 not required to be reentrant.

21265 **RETURN VALUE**

21266 If the identified message is retrieved successfully, `catgets()` shall return a pointer to an internal
 21267 buffer area containing the null-terminated message string. If the call is unsuccessful for any
 21268 reason, `s` shall be returned and `errno` shall be set to indicate the error.

21269 **ERRORS**21270 The `catgets()` function shall fail if:

21271 [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 21272 was transferred.

21273 [ENOMSG] The message identified by `set_id` and `msg_id` is not in the message catalog.

21274 The `catgets()` function may fail if:

21275 [EBADF] The `catd` argument is not a valid message catalog descriptor open for reading.

21276 [EBADMSG] The message identified by `set_id` and `msg_id` in the specified message catalog
 21277 did not satisfy implementation-defined security criteria.

21278 [EINVAL] The message catalog identified by `catd` is corrupted.

21279 **EXAMPLES**

21280 None.

21281 **APPLICATION USAGE**

21282 None.

21301**CHANGE HISTORY**

First released in Issue 2.

Issue 5

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [EINTR] and [ENOMSG] errors to become “shall fail” errors, updating the RETURN VALUE section, and updating the DESCRIPTION to note that: “The results are undefined if *catd* is not a value returned by *catopen()* for a message catalog still open in the process.

The *catgets()* function is moved from the XSI option to the Base.

21302 **NAME**

21303 catopen — open a message catalog

21304 **SYNOPSIS**

21305 #include <nl_types.h>

21306 nl_catd catopen(const char *name, int oflag);

21307 **DESCRIPTION**

21308 The *catopen()* function shall open a message catalog and return a message catalog descriptor.
 21309 The *name* argument specifies the name of the message catalog to be opened. If *name* contains a
 21310 ' / ', then *name* specifies a complete name for the message catalog. Otherwise, the environment
 21311 variable *NLSPATH* is used with *name* substituted for the %N conversion specification (see XBD
 21312 Chapter 8, on page 159). If *NLSPATH* exists in the environment when the process starts, then if
 21313 the process has appropriate privileges, the behavior of *catopen()* is undefined. If *NLSPATH* does
 21314 not exist in the environment, or if a message catalog cannot be found in any of the components
 21315 specified by *NLSPATH*, then an implementation-defined default path shall be used. This default
 21316 may be affected by the setting of *LC_MESSAGES* if the value of *oflag* is *NL_CAT_LOCALE*, or
 21317 the *LANG* environment variable if *oflag* is 0.

21318 A message catalog descriptor shall remain valid in a process until that process closes it, or a
 21319 successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES*
 21320 category may invalidate existing open catalogs.

21321 If a file descriptor is used to implement message catalog descriptors, the *FD_CLOEXEC* flag
 21322 shall be set; see <fcntl.h>.

21323 If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the
 21324 catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is
 21325 *NL_CAT_LOCALE*, the *LC_MESSAGES* category is used to locate the message catalog (see XBD
 21326 Section 8.2, on page 160).

21327 **RETURN VALUE**

21328 Upon successful completion, *catopen()* shall return a message catalog descriptor for use on
 21329 subsequent calls to *catgets()* and *catclose()*. Otherwise, *catopen()* shall return (*nl_catd*) -1 and set
 21330 *errno* to indicate the error.

21331 **ERRORS**21332 The *catopen()* function may fail if:

21333 [EACCES] Search permission is denied for the component of the path prefix of the
 21334 message catalog or read permission is denied for the message catalog.

21335 [EMFILE] All file descriptors available to the process are currently open.

21336 [ENAMETOOLONG]

21337 The length of a pathname of the message catalog exceeds {PATH_MAX} or a
 21338 pathname component is longer than {NAME_MAX}.

21339 [ENAMETOOLONG]

21340 Pathname resolution of a symbolic link produced an intermediate result
 21341 whose length exceeds {PATH_MAX}.

21342 [ENFILE] Too many files are currently open in the system.

21343 [ENOENT] The message catalog does not exist or the *name* argument points to an empty
 21344 string.

catopen()

21345 [ENOMEM] Insufficient storage space is available.

21346 [ENOTDIR] A component of the path prefix of the message catalog is not a directory.

EXAMPLES

21347 None.

21348

APPLICATION USAGE

21349 Some implementations of *catopen()* use *malloc()* to allocate space for internal buffer areas. The
21350 *catopen()* function may fail if there is insufficient storage space available to accommodate these
21351 buffers.
21352

21353 Conforming applications must assume that message catalog descriptors are not valid after a call
21354 to one of the *exec* functions.

21355 Application developers should be aware that guidelines for the location of message catalogs
21356 have not yet been developed. Therefore they should take care to avoid conflicting with catalogs
21357 used by other applications and the standard utilities.

RATIONALE

21358 None.

21359

FUTURE DIRECTIONS

21360 None.

21361

21368

21369 The *catopen()* function is moved from the XSI option to the Base.

21370 **NAME**
 21371 `cbrt`, `cbrtf`, `cbrtl` — cube root functions

21372 **SYNOPSIS**
 21373 `#include <math.h>`
 21374 `double cbrt(double x);`
 21375 `float cbrtf(float x);`
 21376 `long double cbrtl(long double x);`

21377 **DESCRIPTION**
 21378 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 21379 conflict between the requirements described here and the ISO C standard is unintentional. This
 21380 volume of POSIX.1-200x defers to the ISO C standard.

21381 These functions shall compute the real cube root of their argument x .

21382 **RETURN VALUE**
 21383 Upon successful completion, these functions shall return the cube root of x .

21384 MX If x is NaN, a NaN shall be returned.
 21385 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

21386 **ERRORS**
 21387 No errors are defined.

21388 **EXAMPLES**
 21389 None.

21390 **APPLICATION USAGE**
 21391 None.

21392 **RATIONALE**
 21393 For some applications, a true cube root function, which returns negative results for negative
 21394 arguments, is more appropriate than $\text{pow}(x, 1.0/3.0)$, which returns a NaN for x less than 0.

21395 **FUTURE DIRECTIONS**
 21396 None.

21397 **SEE ALSO**
 21398 XBD [<math.h>](#)

21399 **CHANGE HISTORY**
 21400 First released in Issue 4, Version 2.

21401 **Issue 5**
 21402 Moved from X/OPEN UNIX extension to BASE.

21403 **Issue 6**
 21404 The `cbrt()` function is no longer marked as an extension.
 21405 The `cbrtf()` and `cbrtl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.
 21406 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 21407 revised to align with the ISO/IEC 9899:1999 standard.
 21408 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 21409 marked.

21410 **NAME**

21411 `ccos, ccosf, ccosl` — complex cosine functions

21412 **SYNOPSIS**

21413 `#include <complex.h>`

21414 `double complex ccos(double complex z);`

21415 `float complex ccosf(float complex z);`

21416 `long double complex ccosl(long double complex z);`

21417 **DESCRIPTION**

21418 CX The functionality described on this reference page is aligned with the ISO C standard. Any

21419 conflict between the requirements described here and the ISO C standard is unintentional. This

21420 volume of POSIX.1-200x defers to the ISO C standard.

21421 These functions shall compute the complex cosine of *z*.

21422 **RETURN VALUE**

21423 These functions shall return the complex cosine value.

21424 **ERRORS**

21425 No errors are defined.

21426 **EXAMPLES**

21427 None.

21428 **APPLICATION USAGE**

21429 None.

21430 **RATIONALE**

21431 None.

21432 **FUTURE DIRECTIONS**

21433 None.

21458 None.

21459 **RATIONALE**

21460 None.

21461 **FUTURE DIRECTIONS**

21462 None.

21463 **SEE ALSO**

21464 *cacosh()*

21465 XBD <complex.h>

21466 **CHANGE HISTORY**

21467 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21468 **NAME**
21469 ccosl — complex cosine functions

21470 **SYNOPSIS**
21471 #include <complex.h>
21472 long double complex ccosl(long double complex z);

21473 **DESCRIPTION**
21474 Refer to *ccos()*.

21475 **NAME**

21476 ceil, ceilf, ceill — ceiling value function

21477 **SYNOPSIS**

```
21478       #include <math.h>
21479
21479       double ceil(double x);
21480       float ceilf(float x);
21481       long double ceill(long double x);
```

21482 **DESCRIPTION**

21483 CX The functionality described on this reference page is aligned with the ISO C standard. Any
21484 conflict between the requirements described here and the ISO C standard is unintentional. This
21485 volume of POSIX.1-200x defers to the ISO C standard.

21486 These functions shall compute the smallest integral value not less than x .

21487 An application wishing to check for error situations should set *errno* to zero and call
21488 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
21489 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
21490 zero, an error has occurred.

21491 **RETURN VALUE**

21492 Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not
21493 less than x , expressed as a type **double**, **float**, or **long double**, respectively.

21494 MX If x is NaN, a NaN shall be returned.

21495 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

21496 XSI If the correct value would cause overflow, a range error shall occur and *ceil()*, *ceilf()*, and *ceill()*
21497 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

21498 **ERRORS**

21499 These functions shall fail if:

21500 XSI **Range Error** The result overflows.

21501 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
21502 then *errno* shall be set to [ERANGE]. If the integer expression
21503 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
21504 floating-point exception shall be raised.

21505 **EXAMPLES**

21506 None.

21507 **APPLICATION USAGE**

21508 The integral value returned by these functions need not be expressible as an **int** or **long**. The
21509 return value should be tested before assigning it to an integer type to avoid the undefined
21510 results of an integer overflow.

21511 The *ceil()* function can only overflow when the floating-point representation has
21512 DBL_MANT_DIG > DBL_MAX_EXP.

21513 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
21514 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *ceilf()* and *ceilll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

CHANGE HISTORY

21561

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21562 **NAME**

21563 cfgetispeed — get input baud rate

21564 **SYNOPSIS**

21565 #include <termios.h>

21566 speed_t cfgetispeed(const struct termios *termios_p);

21567 **DESCRIPTION**21568 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which
21569 the *termios_p* argument points.21570 This function shall return exactly the value in the **termios** data structure, without interpretation.21571 **RETURN VALUE**21572 Upon successful completion, *cfgetispeed()* shall return a value of type **speed_t** representing the
21573 input baud rate.21574 **ERRORS**

21575 No errors are defined.

21576 **EXAMPLES**

21577 None.

21578 **APPLICATION USAGE**

21579 None.

21580 **RATIONALE**21581 The term “baud” is used historically here, but is not technically correct. This is properly “bits per
21582 second”, which may not be the same as baud. However, the term is used because of the
21583 historical usage and understanding.21584 The *cfgetospeed()*, *cfgetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as
21585 numbers, but rather as symbolic names. There are two reasons for this:

- 21586 1. Historically, numbers were not used because of the way the rate was stored in the data
-
- 21587 structure. This is retained even though a function is now used.
-
- 21588 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
-
- 21589 the application to that set.

21590 There is nothing to prevent an implementation accepting as an extension a number (such as 126),
21591 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid
21592 introducing ambiguity.21593 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications
21594 in this volume of POSIX.1-200x have made it possible to determine whether split rates are
21595 supported and to support them without having to treat zero as a special case. Since this
21596 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is
21597 the literal constant 0, not the symbolic constant B0. This volume of POSIX.1-200x does not
21598 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit
21599 from the two being equivalent. This volume of POSIX.1-200x does not fully specify whether the
21600 previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as zero. Therefore,
21601 conforming applications should always set both the input speed and output speed when setting
21602 either.21603 In historical implementations, the baud rate information is traditionally kept in **c_cflag**.
21604 Applications should be written to presume that this might be the case (and thus not blindly copy
21605 **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag**

21606 field absolutely after setting a baud rate is a non-portable action because of this. In general, the
21607 unused parts of the flag fields might be used by the implementation and should not be blindly
21608 copied from the descriptions of one terminal device to another.

FUTURE DIRECTIONS

21609 None.

21712 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

21713 **Issue 6**21714 The following new requirements on POSIX implementations derive from alignment with the
21715 Single UNIX Specification:

- 21716
- The optional setting of *errno* and the [EINVAL] error conditions are added.

21717 **NAME**

21718 chdir — change working directory

21719 **SYNOPSIS**

21720 #include <unistd.h>

21721 int chdir(const char *path);

21722 **DESCRIPTION**

21723 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*
 21724 argument to become the current working directory; that is, the starting point for path searches
 21725 for pathnames not beginning with '/ '.

21726 **RETURN VALUE**

21727 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current
 21728 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

21729 **ERRORS**21730 The *chdir()* function shall fail if:

21731 [EACCES] Search permission is denied for any component of the pathname.

21732 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 21733 argument.

21734 [ENAMETOOLONG]

21735 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 21736 component is longer than {NAME_MAX}.

21737 [ENOENT]

21738 A component of *path* does not name an existing directory or *path* is an empty
 string.

21739 [ENOTDIR]

A component of the pathname is not a directory.

21740 The *chdir()* function may fail if:

21741 [ELOOP]

21742 More than {SYMLOOP_MAX} symbolic links were encountered during
 resolution of the *path* argument.

21743 [ENAMETOOLONG]

21744 As a result of encountering a symbolic link in resolution of the *path* argument,
 21745 the length of the substituted pathname string exceeded {PATH_MAX}.

21746 **EXAMPLES**21747 **Changing the Current Working Directory**

21748 The following example makes the value pointed to by **directory**, */tmp*, the current working
 21749 directory.

21750 #include <unistd.h>

21751 ...

21752 char *directory = "/tmp";

21753 int ret;

21754 ret = chdir (directory);

21755 **APPLICATION USAGE**

21756 None.

21757 **RATIONALE**21758 The *chdir()* function only affects the working directory of the current process.21759 **FUTURE DIRECTIONS**

21760 None.

21761 **SEE ALSO**21762 *getcwd()*21763 XBD <[unistd.h](#)>21764 **CHANGE HISTORY**

21765 First released in Issue 1. Derived from Issue 1 of the SVID.

21766 **Issue 6**

21767 The APPLICATION USAGE section is added.

21768 The following new requirements on POSIX implementations derive from alignment with the
21769 Single UNIX Specification:

- 21770
- The [ELOOP] mandatory error condition is added.
 - A second [ENAMETOOLONG] is added as an optional error condition.
- 21771

21772 The following changes were made to align with the IEEE P1003.1a draft standard:

- 21773
- The [ELOOP] optional error condition is added.

21774 **NAME**
 21775 `chmod, fchmodat` — change mode of a file relative to directory file descriptor

21776 **SYNOPSIS**
 21777 `#include <sys/stat.h>`
 21778 `int chmod(const char *path, mode_t mode);`
 21779 `int fchmodat(int fd, const char *path, mode_t mode, int flag);`

21780 DESCRIPTION

21781 XSI The `chmod()` function shall change `S_ISUID`, `S_ISGID`, `S_ISVTX`, and the file permission bits of
 21782 the file named by the pathname pointed to by the `path` argument to the corresponding bits in the
 21783 `mode` argument. The application shall ensure that the effective user ID of the process matches the
 21784 owner of the file or the process has appropriate privileges in order to do this.

21785 XSI `S_ISUID`, `S_ISGID`, `S_ISVTX`, and the file permission bits are described in `<sys/stat.h>`.

21786 If the calling process does not have appropriate privileges, and if the group ID of the file does
 21787 not match the effective group ID or one of the supplementary group IDs and if the file is a
 21788 regular file, bit `S_ISGID` (set-group-ID on execution) in the file's mode shall be cleared upon
 21789 successful return from `chmod()`.

21790 Additional implementation-defined restrictions may cause the `S_ISUID` and `S_ISGID` bits in
 21791 `mode` to be ignored.

21792 The effect on file descriptors for files open at the time of a call to `chmod()` is implementation-
 21793 defined.

21794 Upon successful completion, `chmod()` shall mark for update the last file status change timestamp
 21795 of the file.

21796 The `fchmodat()` function shall be equivalent to the `chmod()` function except in the case where `path`
 21797 specifies a relative path. In this case the file to be changed is determined relative to the directory
 21798 associated with the file descriptor `fd` instead of the current working directory. It is unspecified
 21799 whether directory searches are permitted based on whether the file was opened with search
 21800 permission or on the current permissions of the directory underlying the file descriptor.

21801 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined
 21802 in `<fcntl.h>`:

21803 `AT_SYMLINK_NOFOLLOW`

21804 If `path` names a symbolic link, then the mode of the symbolic link is changed.

21805 If `fchmodat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working
 21806 directory is used. If also `flag` is zero, the behavior shall be identical to a call to `chmod()`.

21807 RETURN VALUE

21808 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 21809 return `-1` and set `errno` to indicate the error. If `-1` is returned, no change to the file mode occurs.

21810 ERRORS

21811 These functions shall fail if:

21812 [EACCES] Search permission is denied on a component of the path prefix.

21813 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`
 21814 argument.

21815	[ENAMETOOLONG]	
21816		The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
21817		
21818	[ENOTDIR]	A component of the path prefix is not a directory.
21819	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
21820	[EPERM]	The effective user ID does not match the owner of the file and the process does not have appropriate privileges.
21821		
21822	[EROFS]	The named file resides on a read-only file system.
21823		The <i>fchmodat()</i> function shall fail if:
21824	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading.
21825		
21826		These functions may fail if:
21827	[EINTR]	A signal was caught during execution of the function.
21828	[EINVAL]	The value of the <i>mode</i> argument is invalid.
21829	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
21830		
21831	[ENAMETOOLONG]	
21832		As a result of encountering a symbolic link in resolution of the <i>path</i> argument, the length of the substituted pathname strings exceeded {PATH_MAX}.
21833		
21834		The <i>fchmodat()</i> function may fail if:
21835	[EINVAL]	The value of the <i>flag</i> argument is invalid.
21836	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.
21837		
21838	[EOPNOTSUPP]	The AT_SYMLINK_NOFOLLOW bit is set in the <i>flag</i> argument, <i>path</i> names a symbolic link, and the system does not support changing the mode of a symbolic link.
21839		
21840		

EXAMPLES**Setting Read Permissions for User, Group, and Others**

The following example sets read permissions for the owner, group, and others.

```
#include <sys/stat.h>
const char *path;
...
chmod(path, S_IRUSR | S_IRGRP | S_IROTH);
```

Setting Read, Write, and Execute Permissions for the Owner Only

The following example sets read, write, and execute permissions for the owner, and no permissions for group and others.

```
#include <sys/stat.h>
const char *path;
...
chmod(path, S_IRWXU);
```

21855 **Setting Different Permissions for Owner, Group, and Other**

21856 The following example sets owner permissions for CHANGEFILE to read, write, and execute,
21857 group permissions to read and execute, and other permissions to read.

```
21858 #include <sys/stat.h>
21859 #define CHANGEFILE "/etc/myfile"
21860 ...
21861 chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

21862 **Setting and Checking File Permissions**

21863 The following example sets the file permission bits for a file named `/home/cnd/mod1`, then calls
21864 the `stat()` function to verify the permissions.

```
21865 #include <sys/types.h>
21866 #include <sys/stat.h>
21867 int status;
21868 struct stat buffer
21869 ...
21870 chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
21871 status = stat("home/cnd/mod1", &buffer);
```

21872 **APPLICATION USAGE**

21873 In order to ensure that the `S_ISUID` and `S_ISGID` bits are set, an application requiring this
21874 should use `stat()` after a successful `chmod()` to verify this.

21875 Any file descriptors currently open by any process on the file could possibly become invalid if
21876 the mode of the file is changed to a value which would deny access to that process. One
21877 situation where this could occur is on a stateless file system. This behavior will not occur in a
21878 conforming environment.

21879 **RATIONALE**

21880 This volume of POSIX.1-200x specifies that the `S_ISGID` bit is cleared by `chmod()` on a regular file
21881 under certain conditions. This is specified on the assumption that regular files may be executed,
21882 and the system should prevent users from making executable `setgid()` files perform with
21883 privileges that the caller does not have. On implementations that support execution of other file
21884 types, the `S_ISGID` bit should be cleared for those file types under the same circumstances.

21885 Implementations that use the `S_ISUID` bit to indicate some other function (for example,
21886 mandatory record locking) on non-executable files need not clear this bit on writing. They
21887 should clear the bit for executable files and any other cases where the bit grants special powers
21888 to processes that change the file contents. Similar comments apply to the `S_ISGID` bit.

21889 The purpose of the `fchmodat()` function is to enable changing the mode of files in directories
21890 other than the current working directory without exposure to race conditions. Any part of the
21891 path of a file could be changed in parallel to a call to `chmod()`, resulting in unspecified behavior.
21892 By opening a file descriptor for the target directory and using the `fchmodat()` function it can be
21893 guaranteed that the changed file is located relative to the desired directory. Some
21894 implementations might allow changing the mode of symbolic links. This is not supported by the
21895 interfaces in the POSIX specification. Systems with such support provide an interface named
21896 `lchmod()`. To support such implementations `fchmodat()` has a `flag` parameter.

21897 **FUTURE DIRECTIONS**

21898 None.

chmod()

21899 **SEE ALSO**

CHANGE HISTORY

21902 First released in Issue 1. Derived from Issue 1 of the SVID.
 21903

Issue 6

21904 The following new requirements on POSIX implementations derive from alignment with the
 21905 Single UNIX Specification:
 21906

- 21907 • The requirement to include *<sys/types.h>* has been removed. Although *<sys/types.h>* was
 21908 required for conforming implementations of previous POSIX specifications, it was not
 21909 required for UNIX applications.
- 21910 • The [EINVAL] and [EINTR] optional error conditions are added.
- 21911 • A second [ENAMETOOLONG] is added as an optional error condition.

21912 The following changes were made to align with the IEEE P1003.1a draft standard:

- 21913 • The [ELOOP] optional error condition is added.

21914 The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

21915 The *fchmodat()* function is added from The Open Group Technical Standard, 2006, Extended API
 21916 Set Part 2.
 21917

21918 Changes are made related to support for finegrained timestamps. +

21919 **NAME**

21920 chown, fchownat — change owner and group of a file relative to directory file descriptor

21921 **SYNOPSIS**

```
21922 #include <unistd.h>
21923
21924 int chown(const char *path, uid_t owner, gid_t group);
21925 int fchownat(int fd, const char *path, uid_t owner, gid_t group,
21926             int flag);
```

21926 **DESCRIPTION**21927 The *chown()* function shall change the user and group ownership of a file.21928 The *path* argument points to a pathname naming a file. The user ID and group ID of the named
21929 file shall be set to the numeric values contained in *owner* and *group*, respectively.21930 Only processes with an effective user ID equal to the user ID of the file or with appropriate
21931 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for
21932 *path*:

- 21933 • Changing the user ID is restricted to processes with appropriate privileges.
- 21934 • Changing the group ID is permitted to a process with an effective user ID equal to the user
21935 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's
21936 user ID or `(uid_t)-1` and *group* is equal either to the calling process' effective group ID or to
21937 one of its supplementary group IDs.

21938 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of
21939 the file mode are set, and the process does not have appropriate privileges, the set-user-ID
21940 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful
21941 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,
21942 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is
21943 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*
21944 function is successfully invoked on a file that is not a regular file and one or more of the
21945 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID
21946 bits may be cleared.

21947 If *owner* or *group* is specified as `(uid_t)-1` or `(gid_t)-1`, respectively, the corresponding ID of the
21948 file shall not be changed. If both *owner* and *group* are `-1`, the times need not be updated.21949 Upon successful completion, *chown()* shall mark for update the last file status change timestamp
21950 of the file.

21951 The *fchownat()* function shall be equivalent to the *chown()* and *lchown()* functions except in the
21952 case where *path* specifies a relative path. In this case the file to be changed is determined relative
21953 to the directory associated with the file descriptor *fd* instead of the current working directory. It
21954 is unspecified whether directory searches are permitted based on whether the file was opened
21955 with search permission or on the current permissions of the directory underlying the file
21956 descriptor.

21957 Values for *flag* are constructed by a bitwise-inclusive OR of flags from the following list, defined
21958 in `<fcntl.h>`:21959 `AT_SYMLINK_NOFOLLOW`21960 If *path* names a symbolic link, ownership of the symbolic link is changed.

21961 If *fchownat()* is passed the special value `AT_FDCWD` in the *fd* parameter, the current working
21962 directory is used and the behavior shall be identical to a call to *chown()* or *lchown()* respectively,
21963 depending on whether or not the `AT_SYMLINK_NOFOLLOW` bit is set in the *flag* argument.

chown()21964 **RETURN VALUE**

21965 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 21966 return -1 and set *errno* to indicate the error. If -1 is returned, no changes are made in the user ID
 21967 and group ID of the file.

21968 **ERRORS**

21969 These functions shall fail if:

21970 [EACCES] Search permission is denied on a component of the path prefix.

21971 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 21972 argument.

21973 [ENAMETOOLONG]

21974 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 21975 component is longer than {NAME_MAX}.

21976 [ENOTDIR] A component of the path prefix is not a directory.

21977 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

21978 [EPERM] The effective user ID does not match the owner of the file, or the calling
 21979 process does not have appropriate privileges and
 21980 _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

21981 [EROFS] The named file resides on a read-only file system.

21982 The *fchownat()* function shall fail if:

21983 [EBADF] The *path* argument does not specify an absolute path and the *fd* argument is
 21984 neither AT_FDCWD nor a valid file descriptor open for reading.

21985 These functions may fail if:

21986 [EIO] An I/O error occurred while reading or writing to the file system.

21987 [EINTR] The *chown()* function was interrupted by a signal which was caught.

21988 [EINVAL] The owner or group ID supplied is not a value supported by the
 21989 implementation.

21990 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 21991 resolution of the *path* argument.

21992 [ENAMETOOLONG]

21993 As a result of encountering a symbolic link in resolution of the *path* argument,
 21994 the length of the substituted pathname string exceeded {PATH_MAX}.

21995 The *fchownat()* function may fail if:

21996 [EINVAL] The value of the *flag* argument is not valid.

21997 [ENOTDIR] The *path* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
 21998 file descriptor associated with a directory.

21999 [EOPNOTSUPP] The *path* argument names a symbolic link and the implementation does not
 22000 support setting the owner or group of a symbolic link.

22001
22002**EXAMPLES**

None.

22003
22004
22005
22006**APPLICATION USAGE**

Although *chown()* can be used on some implementations by the file owner to change the owner and group to any desired values, the only portable use of this function is to change the group of a file to the effective GID of the calling process or to a member of its group set.

22007
22008
22009
22010
22011
22012
22013**RATIONALE**

System III and System V allow a user to give away files; that is, the owner of a file may change its user ID to anything. This is a serious problem for implementations that are intended to meet government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the user ID of a file. Some government agencies (usually not ones concerned directly with security) find this limitation too confining. This volume of POSIX.1-200x uses *may* to permit secure implementations while not disallowing System V.

22014
22015
22016
22017

System III and System V allow the owner of a file to change the group ID to anything. Version 7 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to change the group ID of a file to its effective group ID or to any of the groups in the list of supplementary group IDs, but to no others.

22018
22019
22020
22021
22022
22023
22024

The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate privileged process clear the *S_ISGID* and the *S_ISUID* bits for regular files, and permits them to be cleared for other types of files. This is so that changes in accessibility do not accidentally cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-executable data files also clears the mandatory file locking bit (shared with *S_ISGID*), which is an extension on many implementations (it first appeared in System V). These bits should only be required to be cleared on regular files that have one or more of their execute bits set.

22025
22026
22027
22028
22029
22030

The purpose of the *fchownat()* function is to enable changing ownership of files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *chown()* or *lchown()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *fchownat()* function it can be guaranteed that the changed file is located relative to the desired directory.

22031
22032**FUTURE DIRECTIONS**

None.

22033
22034**SEE ALSO***chmod*, *fpathconf()*, *lchown()*

22035

XBD [<fcntl.h>](#), [<sys/types.h>](#), [<unistd.h>](#)22036
22037**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

22038
22039**Issue 6**

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

22040
22041
22042
22043
22044
22045

- The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is restored.
- The `[EPERM]` error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`. This is since its operand is a pathname and applications should be aware that the error may not occur for that pathname if the file system does not support `_POSIX_CHOWN_RESTRICTED`.

22046
22047

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

22048
22049
22050
22051
22052
22053
22054
22055
22056
22057
22058
22059
22060
22061
22062
22063

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the group ID only. A corresponding change is made for group.
- The [ELOOP] mandatory error condition is added.
- The [EIO] and [EINTR] optional error conditions are added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

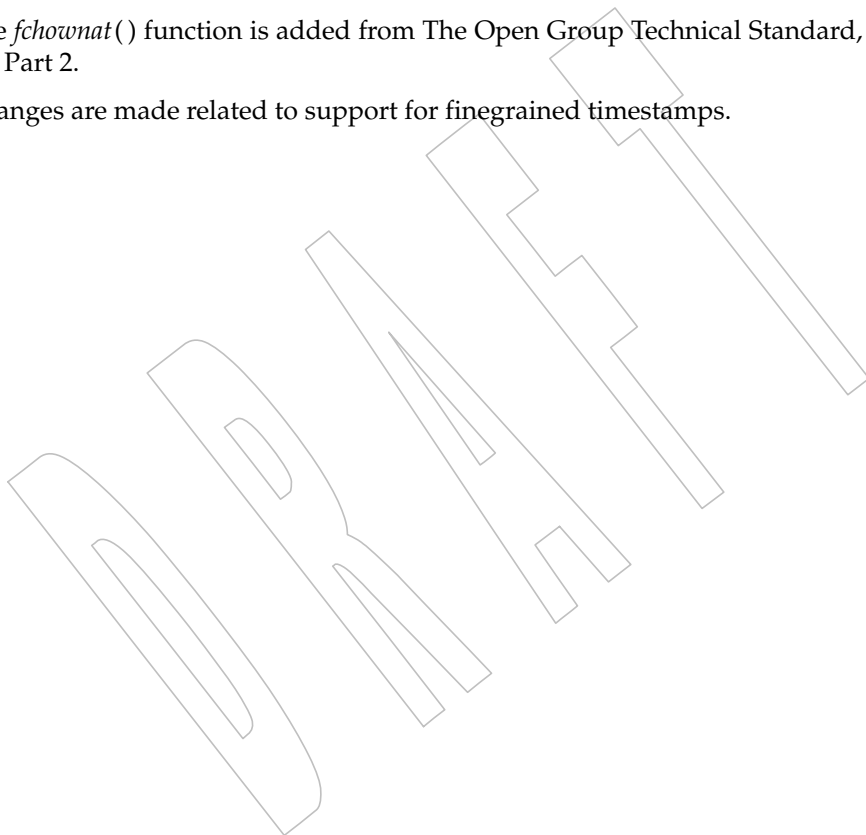

- Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when the process has appropriate privileges.
- The [ELOOP] optional error condition is added.

Issue 7

The `fchownat()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

Changes are made related to support for finegrained timestamps.

+

22064 **NAME**

22065 `cimag, cimagf, cimagl` — complex imaginary functions

22066 **SYNOPSIS**

22067 `#include <complex.h>`

22068 `double cimag(double complex z);`

22069 `float cimagf(float complex z);`

22070 `long double cimagl(long double complex z);`

22071 **DESCRIPTION**

22072 CX The functionality described on this reference page is aligned with the ISO C standard. Any

22073 conflict between the requirements described here and the ISO C standard is unintentional. This

22074 volume of POSIX.1-200x defers to the ISO C standard.

22075 These functions shall compute the imaginary part of `z`.

22076 **RETURN VALUE**

22077 These functions shall return the imaginary part value (as a real).

22078 **ERRORS**

22079 No errors are defined.

22080 **EXAMPLES**

22081 None.

22082 **APPLICATION USAGE**

22083 For a variable `z` of complex type:

22084 `z == creal(z) + cimag(z)*I`

CHANGE HISTORY

22119 First released in Issue 1. Derived from Issue 1 of the SVID.
 22120

22121 **NAME**

22122 clock — report CPU time used

22123 **SYNOPSIS**

22124 #include <time.h>

22125 clock_t clock(void);

22126 **DESCRIPTION**

22127 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22128 conflict between the requirements described here and the ISO C standard is unintentional. This
 22129 volume of POSIX.1-200x defers to the ISO C standard.

22130 The *clock()* function shall return the implementation's best approximation to the processor time
 22131 used by the process since the beginning of an implementation-defined era related only to the
 22132 process invocation.

22133 **RETURN VALUE**

22134 To determine the time in seconds, the value returned by *clock()* should be divided by the value
 22135 XSI of the macro `CLOCKS_PER_SEC`. `CLOCKS_PER_SEC` is defined to be one million in `<time.h>`.
 22136 If the processor time used is not available or its value cannot be represented, the function shall
 22137 return the value `(clock_t)-1`.

22138 **ERRORS**

22139 No errors are defined.

22140 **EXAMPLES**

22141 None.

22142 **APPLICATION USAGE**

22143 In order to measure the time spent in a program, *clock()* should be called at the start of the
 22144 program and its return value subtracted from the value returned by subsequent calls. The value
 22145 returned by *clock()* is defined for compatibility across systems that have clocks with different
 22146 resolutions. The resolution on any particular system need not be to microsecond accuracy.

22147 The value returned by *clock()* may wrap around on some implementations. For example, on a
 22148 machine with 32-bit values for `clock_t`, it wraps after 2 147 seconds or 36 minutes.

22149 **RATIONALE**

22150 None.

22151 **FUTURE DIRECTIONS**

22152 None.

22153 **SEE ALSO**22154 *asctime()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strptime()*, *strptime()*, *time*, *utime()*22155 XBD `<time.h>`22156 **CHANGE HISTORY**

22157 First released in Issue 1. Derived from Issue 1 of the SVID.

22158 **NAME**22159 clock_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)22160 **SYNOPSIS**

```
22161 CPT #include <time.h>
22162 int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);
```

22163 **DESCRIPTION**

22164 The *clock_getcpuclockid()* function shall return the clock ID of the CPU-time clock of the process
 22165 specified by *pid*. If the process described by *pid* exists and the calling process has permission, the
 22166 clock ID of this clock shall be returned in *clock_id*.

22167 If *pid* is zero, the *clock_getcpuclockid()* function shall return the clock ID of the CPU-time clock of
 22168 the process making the call, in *clock_id*.

22169 The conditions under which one process has permission to obtain the CPU-time clock ID of
 22170 other processes are implementation-defined.

22171 **RETURN VALUE**

22172 Upon successful completion, *clock_getcpuclockid()* shall return zero; otherwise, an error number
 22173 shall be returned to indicate the error.

22174 **ERRORS**

22175 The *clock_getcpuclockid()* function shall fail if:

22176 [EPERM] The requesting process does not have permission to access the CPU-time clock
 22177 for the process.

22178 The *clock_getcpuclockid()* function may fail if:

22179 [ESRCH] No process can be found corresponding to the process specified by *pid*.

22180 **EXAMPLES**

22181 None.

22182 **APPLICATION USAGE**

22183 The *clock_getcpuclockid()* function is part of the Process CPU-Time Clocks option and need not be
 22184 provided on all implementations.

22185 **RATIONALE**

22186 None.

22187 **FUTURE DIRECTIONS**

22197 **SYNOPSIS**

```

22198 CX      #include <time.h>
22199
22199      int clock_getres(clockid_t clock_id, struct timespec *res);
22200      int clock_gettime(clockid_t clock_id, struct timespec *tp);
22201      int clock_settime(clockid_t clock_id, const struct timespec *tp);

```

22202 **DESCRIPTION**

22203 The *clock_getres()* function shall return the resolution of any clock. Clock resolutions are
 22204 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the
 22205 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,
 22206 the clock resolution is not returned. If the *time* argument of *clock_settime()* is not a multiple of *res*,
 22207 then the value is truncated to a multiple of *res*.

22208 The *clock_gettime()* function shall return the current value *tp* for the specified clock, *clock_id*.

22209 The *clock_settime()* function shall set the specified clock, *clock_id*, to the value specified by *tp*.
 22210 Time values that are between two consecutive non-negative integer multiples of the resolution of
 22211 the specified clock shall be truncated down to the smaller multiple of the resolution.

22212 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that
 22213 is meaningful only within a process). All implementations shall support a *clock_id* of
 22214 CLOCK_REALTIME as defined in **<time.h>**. This clock represents the realtime clock for the
 22215 system. For this clock, the values returned by *clock_gettime()* and specified by *clock_settime()*
 22216 represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation
 22217 may also support additional clocks. The interpretation of time values for these clocks is
 22218 unspecified.

22219 If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock
 22220 shall be used to determine the time of expiration for absolute time services based upon the
 22221 CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the
 22222 absolute time requested at the invocation of such a time service is before the new value of the
 22223 clock, the time service shall expire immediately as if the clock had reached the requested time
 22224 normally.

22225 Setting the value of the CLOCK_REALTIME clock via *clock_settime()* shall have no effect on
 22226 threads that are blocked waiting for a relative time service based upon this clock, including the
 22227 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.
 22228 Consequently, these time services shall expire when the requested relative interval elapses,
 22229 independently of the new or old value of the clock.

22230 MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of
 22231 CLOCK_MONOTONIC defined in **<time.h>**. This clock represents the monotonic clock for the
 22232 system. For this clock, the value returned by *clock_gettime()* represents the amount of time (in
 22233 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up
 22234 time, or the Epoch). This point does not change after system start-up time. The value of the
 22235 CLOCK_MONOTONIC clock cannot be set via *clock_settime()*. This function shall fail if it is
 22236 invoked with a *clock_id* argument of CLOCK_MONOTONIC.

22237 The effect of setting a clock via *clock_settime()* on armed per-process timers associated with a
 22238 clock other than CLOCK_REALTIME is implementation-defined.

22239 If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock

clock_getres()

22240 shall be used to determine the time at which the system shall awaken a thread blocked on an
 22241 absolute *clock_nanosleep()* call based upon the CLOCK_REALTIME clock. If the absolute time
 22242 requested at the invocation of such a time service is before the new value of the clock, the call
 22243 shall return immediately as if the clock had reached the requested time normally.

22244 Setting the value of the CLOCK_REALTIME clock via *clock_settime()* shall have no effect on any
 22245 thread that is blocked on a relative *clock_nanosleep()* call. Consequently, the call shall return
 22246 when the requested relative interval elapses, independently of the new or old value of the clock.

22247 The appropriate privilege to set a particular clock is implementation-defined.

22248 CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by
 22249 invoking *clock_getcpuclockid()*, which represent the CPU-time clock of a given process.
 22250 Implementations shall also support the special `clockid_t` value
 22251 `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process
 22252 when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values
 22253 returned by *clock_gettime()* and specified by *clock_settime()* represent the amount of execution
 22254 time of the process associated with the clock. Changing the value of a CPU-time clock via
 22255 *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see
 22256 [Scheduling Policies](#), on page 479).

22257 TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values
 22258 obtained by invoking *pthread_getcpuclockid()*, which represent the CPU-time clock of a given
 22259 thread. Implementations shall also support the special `clockid_t` value
 22260 `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread
 22261 when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values
 22262 returned by *clock_gettime()* and specified by *clock_settime()* shall represent the amount of
 22263 execution time of the thread associated with the clock. Changing the value of a CPU-time clock
 22264 via *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy
 22265 (see [Scheduling Policies](#), on page 479).

RETURN VALUE

22266 A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that
 22267 an error occurred, and *errno* shall be set to indicate the error.

ERRORS

22269 The *clock_getres()*, *clock_gettime()*, and *clock_settime()* functions shall fail if:

22270 [EINVAL] The *clock_id* argument does not specify a known clock.

22271 The *clock_settime()* function shall fail if:

22272 [EINVAL] The *tp* argument to *clock_settime()* is outside the range for the given clock ID.

22273 [EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or
 22274 equal to 1 000 million.

22275 [EINVAL] The value of the *clock_id* argument is `CLOCK_MONOTONIC`.

22276 The *clock_settime()* function may fail if:

22277 [EPERM] The requesting process does not have the appropriate privilege to set the
 22278 specified clock.

EXAMPLES

22280
22281 None.

APPLICATION USAGE

22282 Note that the absolute value of the monotonic clock is meaningless (because its origin is
22283 arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the
22284 fact that the value of this clock is never set and, therefore, that time intervals measured with this
22285 clock will not be affected by calls to *clock_settime()*.
22286

RATIONALE

22287

CHANGE HISTORY

22295 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
22296

Issue 6

22297 The [ENOSYS] error condition has been removed as stubs need not be provided if an
22298 implementation does not support the Timers option.
22299

22300 The APPLICATION USAGE section is added.

22301 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22302 • Clarification is added of the effect of resetting the clock resolution.

22303 CPU-time clocks and the *clock_getcpuclockid()* function are added for alignment with IEEE Std
22304 1003.1d-1999.

22305 The following changes are added for alignment with IEEE Std 1003.1j-2000:

- 22306 • The DESCRIPTION is updated as follows:
 - 22307 — The value returned by *clock_gettime()* for CLOCK_MONOTONIC is specified.
 - 22308 — The *clock_settime()* function failing for CLOCK_MONOTONIC is specified.
 - 22309 — The effects of *clock_settime()* on the *clock_nanosleep()* function with respect to
22310 CLOCK_REALTIME are specified.
- 22311 • An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime()* fails for
22312 CLOCK_MONOTONIC.
- 22313 • The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not
22314 and shall not be set by *clock_settime()* since the absolute value of the
22315 CLOCK_MONOTONIC clock is meaningless.
- 22316 • The *clock_nanosleep()*, *mq_timedreceive()*, *mq_timedsend()*, *pthread_mutex_timedlock()*,
22317 *sem_timedwait()*, *timer_create()*, and *timer_settime()* functions are added to the SEE ALSO
22318 section.

Issue 7

22319 Functionality relating to the Clock Selection option is moved to the Base.
22320

22321 The *clock_getres()*, *clock_gettime()*, and *clock_settime()* functions are moved from the Timers
22322 option to the Base.

22323 **NAME**

22324 clock_nanosleep — high resolution sleep with specifiable clock

22325 **SYNOPSIS**

```
22326 CX #include <time.h>
22327
22327 int clock_nanosleep(clockid_t clock_id, int flags,
22328 const struct timespec *rqtp, struct timespec *rmtp);
```

22329 **DESCRIPTION**

22330 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the `clock_nanosleep()` function shall
 22331 cause the current thread to be suspended from execution until either the time interval specified
 22332 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to
 22333 invoke a signal-catching function, or the process is terminated. The clock used to measure the
 22334 time shall be the clock specified by *clock_id*.

22335 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the `clock_nanosleep()` function shall
 22336 cause the current thread to be suspended from execution until either the time value of the clock
 22337 specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is
 22338 delivered to the calling thread and its action is to invoke a signal-catching function, or the
 22339 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or
 22340 equal to the time value of the specified clock, then `clock_nanosleep()` shall return immediately
 22341 and the calling process shall not be suspended.

22342 The suspension time caused by this function may be longer than requested because the
 22343 argument value is rounded up to an integer multiple of the sleep resolution, or because of the
 22344 scheduling of other activity by the system. But, except for the case of being interrupted by a
 22345 signal, the suspension time for the relative `clock_nanosleep()` function (that is, with the
 22346 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as
 22347 measured by the corresponding clock. The suspension for the absolute `clock_nanosleep()` function
 22348 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the
 22349 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being
 22350 interrupted by a signal.

22351 The use of the `clock_nanosleep()` function shall have no effect on the action or blockage of any
 22352 signal.

22353 The `clock_nanosleep()` function shall fail if the *clock_id* argument refers to the CPU-time clock of
 22354 the calling thread. It is unspecified whether *clock_id* values of other CPU-time clocks are allowed.

22355 **RETURN VALUE**

22356 If the `clock_nanosleep()` function returns because the requested time has elapsed, its return value
 22357 shall be zero.

22358 If the `clock_nanosleep()` function returns because it has been interrupted by a signal, it shall
 22359 return the corresponding error value. For the relative `clock_nanosleep()` function, if the *rmtp*
 22360 argument is non-NULL, the **timespec** structure referenced by it shall be updated to contain the
 22361 amount of time remaining in the interval (the requested time minus the time actually slept). If
 22362 the *rmtp* argument is NULL, the remaining time is not returned. The absolute `clock_nanosleep()`
 22363 function has no effect on the structure referenced by *rmtp*.

22364 If `clock_nanosleep()` fails, it shall return the corresponding error value.

ERRORS

- 22365
22366 The *clock_nanosleep()* function shall fail if:
- 22367 [EINTR] The *clock_nanosleep()* function was interrupted by a signal.
- 22368 [EINVAL] The *rqtpt* argument specified a nanosecond value less than zero or greater than
22369 or equal to 1 000 million; or the *TIMER_ABSTIME* flag was specified in *flags*
22370 and the *rqtpt* argument is outside the range for the clock specified by *clock_id*;
22371 or the *clock_id* argument does not specify a known clock, or specifies the CPU-
22372 time clock of the calling thread.
- 22373 [ENOTSUP] The *clock_id* argument specifies a clock for which *clock_nanosleep()* is not
22374 supported, such as a CPU-time clock.

EXAMPLES

- 22375
22376 None.

APPLICATION USAGE

- 22377
22378 Calling *clock_nanosleep()* with the value *TIMER_ABSTIME* not set in the *flags* argument and with
22379 a *clock_id* of *CLOCK_REALTIME* is equivalent to calling *nanosleep()* with the same *rqtpt* and *rmtpt*
22380 arguments.

RATIONALE

- 22381
22382 The *nanosleep()* function specifies that the system-wide clock *CLOCK_REALTIME* is used to
22383 measure the elapsed time for this time service. However, with the introduction of the monotonic
22384 clock *CLOCK_MONOTONIC* a new relative sleep function is needed to allow an application to
22385 take advantage of the special characteristics of this clock.

- 22386
22387 There are many applications in which a process needs to be suspended and then activated
22388 multiple times in a periodic way; for example, to poll the status of a non-interrupting device or
22389 to refresh a display device. For these cases, it is known that precise periodic activation cannot be
22390 achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic
22391 process that is activated at time *T0*, executes for a while, and then wants to suspend itself until
22392 time *T0+T*, the period being *T*. If this process wants to use the *nanosleep()* function, it must first
22393 call *clock_gettime()* to get the current time, then calculate the difference between the current time
22394 and *T0+T* and, finally, call *nanosleep()* using the computed interval. However, the process could
22395 be preempted by a different process between the two function calls, and in this case the interval
22396 computed would be wrong; the process would wake up later than desired. This problem would
22397 not occur with the absolute *clock_nanosleep()* function, since only one function call would be
22398 necessary to suspend the process until the desired time. In other cases, however, a relative sleep
is needed, and that is why both functionalities are required.

- 22399
22400 Although it is possible to implement periodic processes using the timers interface, this
22401 implementation would require the use of signals, and the reservation of some signal numbers. In
22402 this regard, the reasons for including an absolute version of the *clock_nanosleep()* function in
POSIX.1-200x are the same as for the inclusion of the relative *nanosleep()*.

- 22403
22404 It is also possible to implement precise periodic processes using *pthread_cond_timedwait()*, in
22405 which an absolute timeout is specified that takes effect if the condition variable involved is never
22406 signaled. However, the use of this interface is unnatural, and involves performing other
22407 operations on mutexes and condition variables that imply an unnecessary overhead.
22408 Furthermore, *pthread_cond_timedwait()* is not available in implementations that do not support
threads.

- 22409
22410 Although the interface of the relative and absolute versions of the new high resolution sleep
22411 service is the same *clock_nanosleep()* function, the *rmtpt* argument is only used in the relative
22412 sleep. This argument is needed in the relative *clock_nanosleep()* function to reissue the function
22413 call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep()* function
call; if the call is interrupted by a signal, the absolute *clock_nanosleep()* function can be invoked

clock_nanosleep()

22414 again with the same *rqtp* argument used in the interrupted call.

FUTURE DIRECTIONS

22415 None.

CHANGE HISTORY

22420 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

Issue 7

22422 The *clock_nanosleep()* function is moved from the Clock Selection option to the Base.

22424 **NAME**
22425 `clock_settime` — clock and timer functions

22426 **SYNOPSIS**

```
22427 CX #include <time.h>  
22428 int clock_settime(clockid_t clock_id, const struct timespec *tp);
```

22429 **DESCRIPTION**

22430 Refer to [clock_getres\(\)](#).

22431 **NAME**
 22432 `clog, clogf, clogl` — complex natural logarithm functions

22433 **SYNOPSIS**
 22434 `#include <complex.h>`
 22435 `double complex clog(double complex z);`
 22436 `float complex clogf(float complex z);`
 22437 `long double complex clogl(long double complex z);`

22438 **DESCRIPTION**
 22439 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22440 conflict between the requirements described here and the ISO C standard is unintentional. This
 22441 volume of POSIX.1-200x defers to the ISO C standard.

22442 These functions shall compute the complex natural (base e) logarithm of z , with a branch cut
 22443 along the negative real axis.

22444 **RETURN VALUE**
 22445 These functions shall return the complex natural logarithm value, in the range of a strip
 22446 mathematically unbounded along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary
 22447 axis.

22448 **ERRORS**
 22449 No errors are defined.

22450 **EXAMPLES**
 22451 None.

22452 **APPLICATION USAGE**
 22453 None.

22454 **RATIONALE**
 22455 None.

22461 **CHANGE HISTORY**
 22462 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

22463 **NAME**

22464 close — close a file descriptor

22465 **SYNOPSIS**

```
22466 #include <unistd.h>
22467 int close(int fdes);
```

22468 **DESCRIPTION**

22469 The *close()* function shall deallocate the file descriptor indicated by *fdes*. To deallocate means to
 22470 make the file descriptor available for return by subsequent calls to *open()* or other functions that
 22471 allocate file descriptors. All outstanding record locks owned by the process on the file associated
 22472 with the file descriptor shall be removed (that is, unlocked).

22473 If *close()* is interrupted by a signal that is to be caught, it shall return -1 with *errno* set to [EINTR]
 22474 and the state of *fdes* is unspecified. If an I/O error occurred while reading from or writing to
 22475 the file system during *close()*, it may return -1 with *errno* set to [EIO]; if this error is returned, the
 22476 state of *fdes* is unspecified.

22477 When all file descriptors associated with a pipe or FIFO special file are closed, any data
 22478 remaining in the pipe or FIFO shall be discarded.

22479 When all file descriptors associated with an open file description have been closed, the open file
 22480 description shall be freed.

22481 If the link count of the file is 0, when all file descriptors associated with the file are closed, the
 22482 space occupied by the file shall be freed and the file shall no longer be accessible.

22483 OB XSR If a STREAMS-based *fdes* is closed and the calling process was previously registered to receive
 22484 a SIGPOLL signal for events associated with that STREAM, the calling process shall be
 22485 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause
 22486 the STREAM associated with *fdes* to be dismantled. If O_NONBLOCK is not set and there have
 22487 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*
 22488 shall wait for an unspecified time (for each module and driver) for any output to drain before
 22489 dismantling the STREAM. The time delay can be changed via an L_SETCLTIME *ioctl()* request. If
 22490 the O_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for
 22491 output to drain, and shall dismantle the STREAM immediately.

22492 If the implementation supports STREAMS-based pipes, and *fdes* is associated with one end of a
 22493 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the
 22494 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end
 22495 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and
 22496 gets detached, the STREAM associated with that end shall also be dismantled.

22497 XSI If *fdes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal
 22498 shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is
 22499 the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal
 22500 flushes all queued input and output.

22501 OB XSR If *fdes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message
 22502 may be sent to the master.

22503 When there is an outstanding cancelable asynchronous I/O operation against *fdes* when *close()*
 22504 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes
 22505 as if the *close()* operation had not yet occurred. All operations that are not canceled shall
 22506 complete as if the *close()* blocked until the operations completed. The *close()* operation itself
 22507 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and
 22508 which I/O operation may be canceled upon *close()*, is implementation-defined.

close()

22509 SHM If a memory mapped file or a shared memory object remains referenced at the last close (that is,
 22510 a process has it mapped), then the entire contents of the memory object shall persist until the
 22511 SHM memory object becomes unreferenced. If this is the last close of a memory mapped file or a
 22512 shared memory object and the close results in the memory object becoming unreferenced, and
 22513 the memory object has been unlinked, then the memory object shall be removed.

22514 If *fdes* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in
 22515 connection-mode, and the `SO_LINGER` option is set for the socket with non-zero linger time,
 22516 and the socket has untransmitted data, then *close()* shall block for up to the current linger
 22517 interval until all data is transmitted.

RETURN VALUE

22518 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 22519 indicate the error.
 22520

ERRORS

22521 The *close()* function shall fail if:

22522 [EBADF] The *fdes* argument is not a valid file descriptor.

22523 [EINTR] The *close()* function was interrupted by a signal.

22524 The *close()* function may fail if:

22525 [EIO] An I/O error occurred while reading from or writing to the file system.
 22526

EXAMPLES**Reassigning a File Descriptor**

22527
 22528 The following example closes the file descriptor associated with standard output for the current
 22529 process, re-assigns standard output to a new file descriptor, and closes the original file descriptor
 22530 to clean up. This example assumes that the file descriptor 0 (which is the descriptor for standard
 22531 input) is not closed.
 22532

```
22533 #include <unistd.h>
22534 ...
22535 int pfd;
22536 ...
22537 close(1);
22538 dup(pfd);
22539 close(pfd);
22540 ...
```

22541 Incidentally, this is exactly what could be achieved using:

```
22542 dup2(pfd, 1);
22543 close(pfd);
```

Closing a File Descriptor

22544 In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is
 22545 made to associate that file descriptor with a stream.
 22546

```
22547 #include <stdio.h>
22548 #include <unistd.h>
22549 #include <stdlib.h>
22550 #define LOCKFILE "/etc/ptmp"
22551 ...
22552 int pfd;
```

```

22553     FILE *fpfd;
22554     ...
22555     if ((fpfd = fdopen (pfd, "w")) == NULL) {
22556         close(pfd);
22557         unlink(LOCKFILE);
22558         exit(1);
22559     }
22560     ...

```

APPLICATION USAGE

An application that had used the *stdio* routine *fopen()* to open a file should use the corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no longer exists, since the integer corresponding to it no longer refers to a file.

RATIONALE

The use of interruptible device close routines should be discouraged to avoid problems with the implicit closes of file descriptors by *exec* and *exit()*. This volume of POSIX.1-200x only intends to permit such behavior by specifying the [EINTR] error condition.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Issue 6

The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] error condition is added as an optional error.
- The DESCRIPTION is updated to describe the state of the *fildev* file descriptor as unspecified if an I/O error occurs and an [EIO] error condition is returned.

Text referring to sockets is added to the DESCRIPTION.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that shared memory objects and memory mapped files (and not typed memory objects) are the types of memory objects to which the paragraph on last closes applies.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/12 is applied, correcting the XSH shaded text relating to the master side of a pseudo-terminal. The reason for the change is that the behavior of pseudo-terminals and regular terminals should be as much alike as possible in this case; the change achieves that and matches historical behavior.

Issue 7

Functionality relating to the XSI STREAMS option is marked obsolescent.

Functionality relating to the Asynchronous Input and Output and Memory Mapped Files options is moved to the Base.

22598 **NAME**
 22599 `closedir` — close a directory stream

22600 **SYNOPSIS**
 22601 `#include <dirent.h>`
 22602 `int closedir(DIR *dirp);`

22603 **DESCRIPTION**
 22604 The `closedir()` function shall close the directory stream referred to by the argument `dirp`. Upon
 22605 return, the value of `dirp` may no longer point to an accessible object of the type **DIR**. If a file
 22606 descriptor is used to implement type **DIR**, that file descriptor shall be closed.

22607 **RETURN VALUE**
 22608 Upon successful completion, `closedir()` shall return 0; otherwise, `-1` shall be returned and `errno`
 22609 set to indicate the error.

22610 **ERRORS**
 22611 The `closedir()` function may fail if:
 22612 [EBADF] The `dirp` argument does not refer to an open directory stream.
 22613 [EINTR] The `closedir()` function was interrupted by a signal.

22614 **EXAMPLES**
 22615 **Closing a Directory Stream**
 22616 The following program fragment demonstrates how the `closedir()` function is used.

```
22617 ...
22618     DIR *dir;
22619     struct dirent *dp;
22620 ...
22621     if ((dir = opendir(".")) == NULL) {
22622     ...
22623     }
22624     while ((dp = readdir(dir)) != NULL) {
22625     ...
22626     }
22627     closedir(dir);
22628     ...
```

22629 **APPLICATION USAGE**
 22630 None.

22631 **RATIONALE**
 22632 None.

22633 **FUTURE DIRECTIONS**
 22634 None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [EINTR] error condition is added as an optional error condition.

22648 **NAME**

22649 closelog, openlog, setlogmask, syslog — control system log

22650 **SYNOPSIS**

```

22651 XSI #include <syslog.h>
22652
22652 void closelog(void);
22653 void openlog(const char *ident, int logopt, int facility);
22654 int setlogmask(int maskpri);
22655 void syslog(int priority, const char *message, ... /* arguments */);

```

22656 **DESCRIPTION**

22657 The *syslog()* function shall send a message to an implementation-defined logging facility, which
 22658 may log it in an implementation-defined system log, write it to the system console, forward it to
 22659 a list of users, or forward it to the logging facility on another host over the network. The logged
 22660 message shall include a message header and a message body. The message header contains at
 22661 least a timestamp and a tag string.

22662 The message body is generated from the *message* and following arguments in the same manner
 22663 as if these were arguments to *printf()*, except that the additional conversion specification *%m*
 22664 shall be recognized; it shall convert no arguments, shall cause the output of the error message
 22665 string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument
 22666 specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion
 22667 specifier character is not just *%m*, the behavior is undefined. A trailing <newline> may be added
 22668 if needed.

22669 Values of the *priority* argument are formed by OR'ing together a severity-level value and an
 22670 optional facility value. If no facility value is specified, the current default facility value is used.

22671 Possible values of severity level include:

22672	LOG_EMERG	A panic condition.
22673	LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system 22674 database.
22675	LOG_CRIT	Critical conditions, such as hard device errors.
22676	LOG_ERR	Errors.
22677	LOG_WARNING	Warning messages. 22678
22679	LOG_NOTICE	Conditions that are not error conditions, but that may require special 22680 handling.
22681	LOG_INFO	Informational messages.
22682	LOG_DEBUG	Messages that contain information normally of use only when debugging a 22683 program.

22684 The facility indicates the application or system component generating the message. Possible
 22685 facility values include:

22686	LOG_USER	Messages generated by arbitrary processes. This is the default facility 22687 identifier if none is specified.
-------	----------	---

22688	LOG_LOCAL0	Reserved for local use.
22689	LOG_LOCAL1	Reserved for local use.
22690	LOG_LOCAL2	Reserved for local use.
22691	LOG_LOCAL3	Reserved for local use.
22692	LOG_LOCAL4	Reserved for local use.
22693	LOG_LOCAL5	Reserved for local use.
22694	LOG_LOCAL6	Reserved for local use.
22695	LOG_LOCAL7	Reserved for local use.

22696 The *openlog()* function shall set process attributes that affect subsequent calls to *syslog()*. The
 22697 *ident* argument is a string that is prepended to every message. The *logopt* argument indicates
 22698 logging options. Values for *logopt* are constructed by a bitwise-inclusive OR of zero or more of
 22699 the following:

22700	LOG_PID	Log the process ID with each message. This is useful for identifying specific 22701 processes.
22702	LOG_CONS	Write messages to the system console if they cannot be sent to the logging 22703 facility. The <i>syslog()</i> function ensures that the process does not acquire the 22704 console as a controlling terminal in the process of writing the message.
22705	LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is 22706 delayed until the first message is logged. This is useful for programs that need 22707 to manage the order in which file descriptors are allocated.
22708	LOG_ODELAY	Delay open until <i>syslog()</i> is called.
22709	LOG_NOWAIT	Do not wait for child processes that may have been created during the course 22710 of logging the message. This option should be used by processes that enable 22711 notification of child termination using SIGCHLD, since <i>syslog()</i> may 22712 otherwise block waiting for a child whose exit status has already been 22713 collected.

22714 The *facility* argument encodes a default facility to be assigned to all messages that do not have an
 22715 explicit facility already encoded. The initial default facility is LOG_USER.

22716 The *openlog()* and *syslog()* functions may allocate a file descriptor. It is not necessary to call
 22717 *openlog()* prior to calling *syslog()*.

22718 The *closelog()* function shall close any open file descriptors allocated by previous calls to
 22719 *openlog()* or *syslog()*.

22720 The *setlogmask()* function shall set the log priority mask for the current process to *maskpri* and
 22721 return the previous mask. If the *maskpri* argument is 0, the current log mask is not modified.
 22722 Calls by the current process to *syslog()* with a priority not set in *maskpri* shall be rejected. The
 22723 default log mask allows all priorities to be logged. A call to *openlog()* is not required prior to
 22724 calling *setlogmask()*.

22725 Symbolic constants for use as values of the *logopt*, *facility*, *priority*, and *maskpri* arguments are
 22726 defined in the **<syslog.h>** header.

22727 RETURN VALUE

22728 The *setlogmask()* function shall return the previous log priority mask. The *closelog()*, *openlog()*,
 22729 and *syslog()* functions shall not return a value.

closelog()22730 **ERRORS**

22731 No errors are defined.

22732 **EXAMPLES**22733 **Using openlog()**

22734 The following example causes subsequent calls to *syslog()* to log the process ID with each
 22735 message, and to write messages to the system console if they cannot be sent to the logging
 22736 facility.

```
22737 #include <syslog.h>
22738 char *ident = "Process demo";
22739 int logopt = LOG_PID | LOG_CONS;
22740 int facility = LOG_USER;
22741 ...
22742 openlog(ident, logopt, facility);
```

22743 **Using setlogmask()**

22744 The following example causes subsequent calls to *syslog()* to accept error messages, and to reject
 22745 all other messages.

```
22746 #include <syslog.h>
22747 int result;
22748 int mask = LOG_MASK (LOG_ERR);
22749 ...
22750 result = setlogmask(mask);
```

22751 **Using syslog**

22752 The following example sends the message "This is a message" to the default logging
 22753 facility, marking the message as an error message generated by random processes.

```
22754 #include <syslog.h>
22755 char *message = "This is a message";
22756 int priority = LOG_ERR | LOG_USER;
22757 ...
22758 syslog(priority, message);
```

22759 **APPLICATION USAGE**

22760 None.

22761 **RATIONALE**

22762 None.

22763 **FUTURE DIRECTIONS**

CHANGE HISTORY

22769

First released in Issue 4, Version 2.

22770

Issue 5

22771

Moved from X/OPEN UNIX extension to BASE.

22772

Issue 6

22773

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/13 is applied, correcting the EXAMPLES section.

22774

22775 **NAME**
 22776 confstr — get configurable variables

22777 **SYNOPSIS**
 22778 #include <unistd.h>

22779 size_t confstr(int name, char *buf, size_t len);

22780 **DESCRIPTION**

22781 The *confstr()* function shall return configuration-defined string values. Its use and purpose are
 22782 similar to *sysconf()*, but it is used where string values rather than numeric values are returned.

22783 The *name* argument represents the system variable to be queried. The implementation shall
 22784 support the following name values, defined in <unistd.h>. It may support others:

22785 _CS_PATH
 22786 _CS_POSIX_V7_ILP32_OFF32_CFLAGS
 22787 _CS_POSIX_V7_ILP32_OFF32_LDFLAGS
 22788 _CS_POSIX_V7_ILP32_OFF32_LIBS
 22789 _CS_POSIX_V7_ILP32_OFFBIG_CFLAGS
 22790 _CS_POSIX_V7_ILP32_OFFBIG_LDFLAGS
 22791 _CS_POSIX_V7_ILP32_OFFBIG_LIBS
 22792 _CS_POSIX_V7_LP64_OFF64_CFLAGS
 22793 _CS_POSIX_V7_LP64_OFF64_LDFLAGS
 22794 _CS_POSIX_V7_LP64_OFF64_LIBS
 22795 _CS_POSIX_V7_LPBIG_OFFBIG_CFLAGS
 22796 _CS_POSIX_V7_LPBIG_OFFBIG_LDFLAGS
 22797 _CS_POSIX_V7_LPBIG_OFFBIG_LIBS
 22798 _CS_POSIX_V7_WIDTH_RESTRICTED_ENVS
 22799 _CS_V7_ENV

22800 OB _CS_POSIX_V6_ILP32_OFF32_CFLAGS
 22801 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
 22802 _CS_POSIX_V6_ILP32_OFF32_LIBS
 22803 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
 22804 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
 22805 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
 22806 _CS_POSIX_V6_LP64_OFF64_CFLAGS
 22807 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
 22808 _CS_POSIX_V6_LP64_OFF64_LIBS
 22809 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
 22810 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
 22811 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
 22812 _CS_POSIX_V6_WIDTH_RESTRICTED_ENVS
 22813 _CS_V6_ENV

22814 If *len* is not 0, and if *name* has a configuration-defined value, *confstr()* shall copy that value into
 22815 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,
 22816 including the terminating null, then *confstr()* shall truncate the string to *len*–1 bytes and null-
 22817 terminate the result. The application can detect that the string was truncated by comparing the
 22818 value returned by *confstr()* with *len*.

22819 If *len* is 0 and *buf* is a null pointer, then *confstr()* shall still return the integer value as defined
 22820 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is
 22821 unspecified.

22822 After a call to:

22823 `confstr(_CS_V7_ENV, buf, sizeof(buf))`

22824 the string stored in *buf* will contain the space-separated list of variable=value environment
22825 variable pairs required by the implementation to create a conforming environment, as described
22826 in the implementations' conformance documentation.

22827 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

22828 `confstr(_CS_PATH, buf, sizeof(buf))`

22829 can be used as a value of the *PATH* environment variable that accesses all of the standard
22830 utilities of POSIX.1-200x, if the return value is less than or equal to *sizeof(buf)*.

22831 RETURN VALUE

22832 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be
22833 needed to hold the entire configuration-defined value including the terminating null. If this
22834 return value is greater than *len*, the string returned in *buf* is truncated.

22835 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

22836 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*
22837 unchanged.

22838 ERRORS

22839 The *confstr()* function shall fail if:

22840 [EINVAL] The value of the *name* argument is invalid.

22841 EXAMPLES

22842 None.

22843 APPLICATION USAGE

22844 An application can distinguish between an invalid *name* parameter value and one that
22845 corresponds to a configurable variable that has no configuration-defined value by checking if
22846 *errno* is modified. This mirrors the behavior of *sysconf()*.

22847 The original need for this function was to provide a way of finding the configuration-defined
22848 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to
22849 include directories that could contain utilities replacing the standard utilities in the Shell and
22850 Utilities volume of POSIX.1-200x, applications need a way to determine the system-supplied
22851 *PATH* environment variable value that contains the correct search path for the standard utilities.

22852 An application could use:

22853 `confstr(name, (char *)NULL, (size_t)0)`

22854 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to
22855 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,
22856 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use
22857 *malloc()* to allocate a larger buffer if it finds that this is too small.

22858 RATIONALE

22859 Application developers can normally determine any configuration variable by means of reading
22860 from the stream opened by a call to:

22861 `popen("command -p getconf variable", "r");`

22862 The *confstr()* function with a *name* argument of *_CS_PATH* returns a string that can be used as a
22863 *PATH* environment variable setting that will reference the standard shell and utilities as
22864 described in the Shell and Utilities volume of POSIX.1-200x.

22865 The *confstr()* function copies the returned string into a buffer supplied by the application instead

22866 of returning a pointer to a string. This allows a cleaner function in some implementations (such
 22867 as those with lightweight threads) and resolves questions about when the application must copy
 22868 the string returned.

22869 FUTURE DIRECTIONS

22870 None.

22871 SEE ALSO

22872 *exec*, *fpathconf()*, *sysconf()*

22873 XBD <*unistd.h*>

22874 XCU *c99*

22875 CHANGE HISTORY

22876 First released in Issue 4. Derived from the ISO POSIX-2 standard.

22877 Issue 5

22878 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those
 22879 marked EX are new in this version.

22880 Issue 6

22881 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the
 22882 size of the buffer now explicitly states that this includes the terminating null.

22883 The following new requirements on POSIX implementations derive from alignment with the
 22884 Single UNIX Specification:

- 22885 • The DESCRIPTION is updated with new arguments which can be used to determine
 22886 configuration strings for C compiler flags, linker/loader flags, and libraries for each
 22887 different supported programming environment. This is a change to support data size
 22888 neutrality.

22889 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22890 • The DESCRIPTION is updated to include text describing how *_CS_PATH* can be used to
 22891 obtain a *PATH* to access the standard utilities.

22892 The macros associated with the *c89* programming models are marked LEGACY and new
 22893 equivalent macros associated with *c99* are introduced.

22894 Issue 7

22895 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the *_CS_V7_ENV* variable.

22896 The V6 variables for the supported programming environments are marked obsolescent.

22897 The variables for the supported programming environments are updated to be V7.

22898 The LEGACY variables and obsolescent values are removed.

22899 **NAME**
 22900 conj, conjf, conjl — complex conjugate functions

22901 **SYNOPSIS**
 22902 #include <complex.h>
 22903 double complex conj(double complex z);
 22904 float complex conjf(float complex z);
 22905 long double complex conjl(long double complex z);

22906 **DESCRIPTION**
 22907 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22908 conflict between the requirements described here and the ISO C standard is unintentional. This
 22909 volume of POSIX.1-200x defers to the ISO C standard.

22910 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary
 22911 part.

22912 **RETURN VALUE**
 22913 These functions return the complex conjugate value.

22914 **ERRORS**
 22915 No errors are defined.

22916 **EXAMPLES**
 22917 None.

22918 **APPLICATION USAGE**
 22919 None.

22920 **RATIONALE**
 22921 None.

22922 **FUTURE DIRECTIONS**
 22923 None.

22924 **SEE ALSO**

22927 **CHANGE HISTORY**
 22928 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

22929 **NAME**

22930 connect — connect a socket

22931 **SYNOPSIS**

22932 #include <sys/socket.h>

22933 int connect(int *socket*, const struct sockaddr **address*,
22934 socklen_t *address_len*);22935 **DESCRIPTION**22936 The *connect()* function shall attempt to make a connection on a connection-mode socket or to set
22937 or reset the peer address of a connectionless-mode socket. The function takes the following
22938 arguments:

22939	<i>socket</i>	Specifies the file descriptor associated with the socket.
22940	<i>address</i>	Points to a sockaddr structure containing the peer address. The length and 22941 format of the address depend on the address family of the socket.
22942	<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> 22943 argument.

22944 If the socket has not already been bound to a local address, *connect()* shall bind it to an address
22945 which, unless the socket's address family is AF_UNIX, is an unused local address.22946 If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address,
22947 and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all
22948 datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent
22949 *recv()* functions. If *address* is a null address for the protocol, the socket's peer address shall be
22950 reset. Note that despite no connection being made, the term "connected" is used to describe a
22951 connectionless-mode socket for which a peer address has been set.22952 If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection
22953 to the address specified by the *address* argument. If the connection cannot be established
22954 immediately and O_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall
22955 block for up to an unspecified timeout interval until the connection is established. If the timeout
22956 interval expires before the connection is established, *connect()* shall fail and the connection
22957 attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked
22958 waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection
22959 request shall not be aborted, and the connection shall be established asynchronously.22960 If the connection cannot be established immediately and O_NONBLOCK is set for the file
22961 descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection
22962 request shall not be aborted, and the connection shall be established asynchronously. Subsequent
22963 calls to *connect()* for the same socket, before the connection is established, shall fail and set *errno*
22964 to [EALREADY].22965 When the connection has been established asynchronously, *pselect()*, *select()*, and *poll()* shall
22966 indicate that the file descriptor for the socket is ready for writing.22967 The socket in use may require the process to have appropriate privileges to use the *connect()*
22968 function.22969 **RETURN VALUE**22970 Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno*
22971 set to indicate the error.

ERRORS

- 22972
22973 The *connect()* function shall fail if:
- 22974 [EADDRNOTAVAIL]
22975 The specified address is not available from the local machine.
- 22976 [EAFNOSUPPORT]
22977 The specified address is not a valid address for the address family of the
22978 specified socket.
- 22979 [EALREADY] A connection request is already in progress for the specified socket.
- 22980 [EBADF] The *socket* argument is not a valid file descriptor.
- 22981 [ECONNREFUSED]
22982 The target address was not listening for connections or refused the connection
22983 request.
- 22984 [EINPROGRESS] O_NONBLOCK is set for the file descriptor for the socket and the connection
22985 cannot be immediately established; the connection shall be established
22986 asynchronously.
- 22987 [EINTR] The attempt to establish a connection was interrupted by delivery of a signal
22988 that was caught; the connection shall be established asynchronously.
- 22989 [EISCONN] The specified socket is connection-mode and is already connected.
- 22990 [ENETUNREACH]
22991 No route to the network is present.
- 22992 [ENOTSOCK] The *socket* argument does not refer to a socket.
- 22993 [EPROTOTYPE] The specified address has a different type than the socket bound to the
22994 specified peer address.
- 22995 [ETIMEDOUT] The attempt to connect timed out before a connection was made.
- 22996 If the address family of the socket is AF_UNIX, then *connect()* shall fail if:
- 22997 [EIO] An I/O error occurred while reading from or writing to the file system.
- 22998 [ELOOP] A loop exists in symbolic links encountered during resolution of the pathname
22999 in *address*.
- 23000 [ENAMETOOLONG]
23001 A component of a pathname exceeded {NAME_MAX} characters, or an entire
23002 pathname exceeded {PATH_MAX} characters.
- 23003 [ENOENT] A component of the pathname does not name an existing file or the pathname
23004 is an empty string.
- 23005 [ENOTDIR] A component of the path prefix of the pathname in *address* is not a directory.
- 23006 The *connect()* function may fail if:
- 23007 [EACCES] Search permission is denied for a component of the path prefix; or write access
23008 to the named socket is denied.
- 23009 [EADDRINUSE] Attempt to establish a connection that uses addresses that are already in use.
- 23010 [ECONNRESET] Remote host reset the connection request.
- 23011 [EHOSTUNREACH]
23012 The destination host cannot be reached (probably because the host is down or
23013 a remote router cannot reach it).

connect()*System Interfaces*

- 23014 [EINVAL] The *address_len* argument is not a valid length for the address family; or
23015 invalid address family in the **sockaddr** structure.
- 23016 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
23017 resolution of the pathname in *address*.
- 23018 [ENAMETOOLONG]
23019 Pathname resolution of a symbolic link produced an intermediate result
23020 whose length exceeds {PATH_MAX}.
- 23021 [ENETDOWN] The local network interface used to reach the destination is down.
- 23022 [ENOBUFS] No buffer space is available.
- 23023 [EOPNOTSUPP] The socket is listening and cannot be connected.

EXAMPLES

None.

APPLICATION USAGE

If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the file descriptor and create a new socket before attempting to reconnect.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

Issue 7

Austin Group Interpretation 1003.1-2001 #035 is applied, clarifying the description of connected sockets.

SD5-XSH-ERN-185 is applied.

23044 **NAME**
 23045 copysign, copysignf, copysignl — number manipulation function

23046 **SYNOPSIS**
 23047 #include <math.h>
 23048 double copysign(double x, double y);
 23049 float copysignf(float x, float y);
 23050 long double copysignl(long double x, long double y);

23051 **DESCRIPTION**
 23052 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23053 conflict between the requirements described here and the ISO C standard is unintentional. This
 23054 volume of POSIX.1-200x defers to the ISO C standard.

23055 These functions shall produce a value with the magnitude of x and the sign of y . On
 23056 implementations that represent a signed zero but do not treat negative zero consistently in
 23057 arithmetic operations, these functions regard the sign of zero as positive.

23058 **RETURN VALUE**
 23059 Upon successful completion, these functions shall return a value with the magnitude of x and
 23060 the sign of y .

23061 **ERRORS**
 23062 No errors are defined.

23063 **EXAMPLES**
 23064 None.

23065 **APPLICATION USAGE**
 23066 None.

23067 **RATIONALE**
 23068 None.

23069 **FUTURE DIRECTIONS**
 23070 None.

23074 **CHANGE HISTORY**
 23075 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23076 **NAME**

23077 cos, cosf, cosl — cosine function

23078 **SYNOPSIS**

```
23079 #include <math.h>
23080
23080 double cos(double x);
23081 float cosf(float x);
23082 long double cosl(long double x);
```

23083 **DESCRIPTION**

23084 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23085 conflict between the requirements described here and the ISO C standard is unintentional. This
 23086 volume of POSIX.1-200x defers to the ISO C standard.

23087 These functions shall compute the cosine of their argument x , measured in radians.

23088 An application wishing to check for error situations should set *errno* to zero and call
 23089 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23090 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23091 zero, an error has occurred.

23092 **RETURN VALUE**

23093 Upon successful completion, these functions shall return the cosine of x .

23094 MX If x is NaN, a NaN shall be returned.

23095 If x is ± 0 , the value 1.0 shall be returned.

23096 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 23097 defined value shall be returned.

23098 **ERRORS**

23099 These functions shall fail if:

23100 MX **Domain Error** The x argument is $\pm\text{Inf}$.

23101 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 23102 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 23103 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23104 shall be raised.

23105 **EXAMPLES**23106 **Taking the Cosine of a 45-Degree Angle**

```
23107 #include <math.h>
23108 ...
23109 double radians = 45 * M_PI / 180;
23110 double result;
23111 ...
23112 result = cos(radians);
```

23113 **APPLICATION USAGE**

23114 These functions may lose accuracy when their argument is near an odd multiple of $\pi/2$ or is far
 23115 from 0.

23116 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 23117 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

23136 **NAME**
 23137 cosh, coshf, coshl — hyperbolic cosine functions

23138 **SYNOPSIS**
 23139 #include <math.h>
 23140 double cosh(double x);
 23141 float coshf(float x);
 23142 long double coshl(long double x);

23143 **DESCRIPTION**
 23144 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23145 conflict between the requirements described here and the ISO C standard is unintentional. This
 23146 volume of POSIX.1-200x defers to the ISO C standard.

23147 These functions shall compute the hyperbolic cosine of their argument x .

23148 An application wishing to check for error situations should set *errno* to zero and call
 23149 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23150 *fetetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23151 zero, an error has occurred.

23152 **RETURN VALUE**
 23153 Upon successful completion, these functions shall return the hyperbolic cosine of x .
 23154 If the correct value would cause overflow, a range error shall occur and *cosh*(x), *coshf*(x), and
 23155 *coshl*(x) shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 23156 respectively.

23157 MX If x is NaN, a NaN shall be returned.
 23158 If x is ± 0 , the value 1.0 shall be returned.
 23159 If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.

23160 **ERRORS**
 23161 These functions shall fail if:
 23162 Range Error The result would cause an overflow.
 23163 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 23164 then *errno* shall be set to [ERANGE]. If the integer expression
 23165 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 23166 floating-point exception shall be raised.

23167 **EXAMPLES**
 23168 None.

23169 **APPLICATION USAGE**
 23170 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 23171 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23172 For IEEE Std 754-1985 **double**, $710.5 < |x|$ implies that *cosh*(x) has overflowed.

23173 **RATIONALE**
 23174 None.

23228 **CHANGE HISTORY**

23229 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23230 **NAME**
 23231 cproj, cprojf, cprojl — complex projection functions

23232 **SYNOPSIS**
 23233 #include <complex.h>
 23234 double complex cproj(double complex z);
 23235 float complex cprojf(float complex z);
 23236 long double complex cprojl(long double complex z);

23237 **DESCRIPTION**
 23238 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23239 conflict between the requirements described here and the ISO C standard is unintentional. This
 23240 volume of POSIX.1-200x defers to the ISO C standard.

23241 These functions shall compute a projection of z onto the Riemann sphere: z projects to z , except
 23242 that all complex infinities (even those with one infinite part and one NaN part) project to
 23243 positive infinity on the real axis. If z has an infinite part, then $cproj(z)$ shall be equivalent to:

23244 $\text{INFINITY} + \text{I} * \text{copysign}(0.0, \text{cimag}(z))$

23245 **RETURN VALUE**
 23246 These functions shall return the value of the projection onto the Riemann sphere.

23247 **ERRORS**
 23248 No errors are defined.

23249 **EXAMPLES**
 23250 None.

23251 **APPLICATION USAGE**
 23252 None.

23253 **RATIONALE**
 23254 Two topologies are commonly used in complex mathematics: the complex plane with its
 23255 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is
 23256 better suited for transcendental functions, the Riemann sphere for algebraic functions. The
 23257 complex types with their multiplicity of infinities provide a useful (though imperfect) model for
 23258 the complex plane. The $cproj()$ function helps model the Riemann sphere by mapping all
 23259 infinities to one, and should be used just before any operation, especially comparisons, that
 23260 might give spurious results for any of the other infinities. Note that a complex value with one
 23261 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is
 23262 infinite, the complex value is infinite independent of the value of the other part. For the same
 23263 reason, $cabs()$ returns an infinity if its argument has an infinite part and a NaN part.

23264 **FUTURE DIRECTIONS**
 23265 None.

NAME

creal, crealf, creall — complex real functions

SYNOPSIS

```
#include <complex.h>

double creal(double complex z);
float crealf(float complex z);
long double creall(long double complex z);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

These functions shall compute the real part of *z*.

RETURN VALUE

These functions shall return the real part value.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

For a variable *z* of type **complex**:

```
z == creal(z) + cimag(z)*I
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

carg(), *cimag()*, *conj()*, *cproj()*

XBD **<complex.h>**

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

creat()

23301 **NAME**
 23302 `creat` — create a new file or rewrite an existing one

23303 **SYNOPSIS**

23304 OH `#include <sys/stat.h>`
 23305 `#include <fcntl.h>`
 23306 `int creat(const char *path, mode_t mode);`

23307 **DESCRIPTION**

23308 The `creat()` function shall behave as if it is implemented as follows:

```
23309 int creat(const char *path, mode_t mode)
23310 {
23311     return open(path, O_WRONLY|O_CREAT|O_TRUNC, mode);
23312 }
```

23313 **RETURN VALUE**

23314 Refer to `open()`.

23315 **ERRORS**

23316 Refer to `open()`.

23317 **EXAMPLES**23318 **Creating a File**

23319 The following example creates the file `/tmp/file` with read and write permissions for the file
 23320 owner and read permission for group and others. The resulting file descriptor is assigned to the
 23321 `fd` variable.

```
23322 #include <fcntl.h>
23323 ...
23324 int fd;
23325 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
23326 char *filename = "/tmp/file";
23327 ...
23328 fd = creat(filename, mode);
23329 ...
```

23330 **APPLICATION USAGE**

23331 None.

23332 **RATIONALE**

23333 The `creat()` function is redundant. Its services are also provided by the `open()` function. It has
 23334 been included primarily for historical purposes since many existing applications depend on it. It
 23335 is best considered a part of the C binding rather than a function that should be provided in other
 23336 languages.

23337 **FUTURE DIRECTIONS**

23338 None.

23339 **SEE ALSO**

23340 `mknod()`, `open()`

CHANGE HISTORY

23343

First released in Issue 1. Derived from Issue 1 of the SVID.

23344

Issue 6

23345

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

23346

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

23347

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

23348

23349

23350

23351

Issue 7

23352

SD5-XSH-ERN-186 is applied.

+

23353 **NAME**23354 `crypt` — string encoding function (**CRYPT**)23355 **SYNOPSIS**

```
23356 XSI #include <unistd.h>
23357 char *crypt(const char *key, const char *salt);
```

23358 **DESCRIPTION**23359 The `crypt()` function is a string encoding function. The algorithm is implementation-defined.

23360 The `key` argument points to a string to be encoded. The `salt` argument shall be a string of at least
 23361 two bytes in length not including the null character chosen from the set:

```
23362 a b c d e f g h i j k l m n o p q r s t u v w x y z
23363 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
23364 0 1 2 3 4 5 6 7 8 9 . /
```

23365 The first two bytes of this string may be used to perturb the encoding algorithm.

23366 The return value of `crypt()` points to static data that is overwritten by each call.

23367 The `crypt()` function need not be thread-safe. A function that is not required to be thread-safe is
 23368 not required to be reentrant.

23369 **RETURN VALUE**

23370 Upon successful completion, `crypt()` shall return a pointer to the encoded string. The first two
 23371 bytes of the returned value shall be those of the `salt` argument. Otherwise, it shall return a null
 23372 pointer and set `errno` to indicate the error.

23373 **ERRORS**23374 The `crypt()` function shall fail if:

23375 [ENOSYS] The functionality is not supported on this implementation.

23376 **EXAMPLES**23377 **Encoding Passwords**

23378 The following example finds a user database entry matching a particular user name and changes
 23379 the current password to a new password. The `crypt()` function generates an encoded version of
 23380 each password. The first call to `crypt()` produces an encoded version of the old password; that
 23381 encoded password is then compared to the password stored in the user database. The second
 23382 call to `crypt()` encodes the new password before it is stored.

23383 The `putpwent()` function, used in the following example, is not part of POSIX.1-200x.

```
23384 #include <unistd.h>
23385 #include <pwd.h>
23386 #include <string.h>
23387 #include <stdio.h>
23388 ...
23389 int valid_change;

 23583 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23584 **NAME**
23585 ctanl — complex tangent functions

23586 **SYNOPSIS**
23587 #include <complex.h>
23588 long double complex ctanl(long double complex z);

23589 **DESCRIPTION**
23590 Refer to *ctan()*.

23591 **NAME**
 23592 `ctermid` — generate a pathname for the controlling terminal

23593 **SYNOPSIS**

23594 CX

```
#include <stdio.h>
```

 23595

```
char *ctermid(char *s);
```

23596 **DESCRIPTION**

23597 The `ctermid()` function shall generate a string that, when used as a pathname, refers to the
 23598 current controlling terminal for the current process. If `ctermid()` returns a pathname, access to the
 23599 file is not guaranteed.

23600 If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`
 23601 functions, it shall ensure that the `ctermid()` function is called with a non-NULL parameter.

23602 **RETURN VALUE**

23603 If `s` is a null pointer, the string shall be generated in an area that may be static (and therefore may
 23604 be overwritten by each call), the address of which shall be returned. Otherwise, `s` is assumed to
 23605 point to a character array of at least `L_ctermid` bytes; the string is placed in this array and the
 23606 value of `s` shall be returned. The symbolic constant `L_ctermid` is defined in `<stdio.h>`, and shall
 23607 have a value greater than 0.

23608 The `ctermid()` function shall return an empty string if the pathname that would refer to the
 23609 controlling terminal cannot be determined, or if the function is unsuccessful.

23610 **ERRORS**

23611 No errors are defined.

23612 **EXAMPLES**

23613 **Determining the Controlling Terminal for the Current Process**

23614 The following example returns a pointer to a string that identifies the controlling terminal for the
 23615 current process. The pathname for the terminal is stored in the array pointed to by the `ptr`
 23616 argument, which has a size of `L_ctermid` bytes, as indicated by the `term` argument.

23617

```
#include <stdio.h>
```

 23618

```
...
```

 23619

```
char term[L_ctermid];
```

 23620

```
char *ptr;
```

 23621

```
ptr = ctermid(term);
```

23622 **APPLICATION USAGE**

23623 The difference between `ctermid()` and `ttyname()` is that `ttyname()` must be handed a file
 23624 descriptor and return a path of the terminal associated with that file descriptor, while `ctermid()`
 23625 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a
 23626 pathname.

23627 **RATIONALE**

23628 `L_ctermid` must be defined appropriately for a given implementation and must be greater than
 23629 zero so that array declarations using it are accepted by the compiler. The value includes the
 23630 terminating null byte.

23631 Conforming applications that use threads cannot call `ctermid()` with NULL as the parameter if
 23632 either `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS` is defined. If `s` is not
 23633 NULL, the `ctermid()` function generates a string that, when used as a pathname, refers to the

23634 current controlling terminal for the current process. If *s* is NULL, the return value of *ctermid()* is
23635 undefined.

23636 There is no additional burden on the programmer—changing to use a hypothetical thread-safe
23637 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a
23638 buffer. Application code should not assume that the returned string is short, as some
23639 implementations have more than two pathname components before reaching a logical device
23640 name.

23641 **FUTURE DIRECTIONS**

23642 None.

23643 **SEE ALSO**

23644 *ttyname()*

23645 XBD <stdio.h>

23646 **CHANGE HISTORY**

23647 First released in Issue 1. Derived from Issue 1 of the SVID.

23648 **Issue 5**

23649 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

23650 **Issue 6**

23651 The normative text is updated to avoid use of the term “must” for application requirements.

23652 **NAME**

23653 ctime, ctime_r — convert a time value to a date and time string

23654 **SYNOPSIS**

```
23655 OB #include <time.h>
23656 char *ctime(const time_t *clock);
23657 OB CX char *ctime_r(const time_t *clock, char *buf);
```

23658 **DESCRIPTION**

23659 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C
 23660 standard. Any conflict between the requirements described here and the ISO C standard is
 23661 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

23662 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds
 23663 since the Epoch, to local time in the form of a string. It shall be equivalent to:

```
23664 asctime(localtime(clock))
```

23665 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 23666 objects: a broken-down time structure and an array of **char**. Execution of any of the functions
 23667 may overwrite the information returned in either of these objects by any of the other functions.

23668 The *ctime()* function need not be thread-safe. A function that is not required to be thread-safe is
 23669 not required to be reentrant.

23670 The *ctime_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly
 23671 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at
 23672 least 26 bytes in size) and return *buf*.

23673 Unlike *ctime()*, the thread-safe version *ctime_r()* is not required to set *tzname*.

23674 **RETURN VALUE**

23675 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time
 23676 as an argument.

23677 CX Upon successful completion, *ctime_r()* shall return a pointer to the string pointed to by *buf*.
 23678 When an error is encountered, a null pointer shall be returned.

23679 **ERRORS**

23680 No errors are defined.

23681 **EXAMPLES**

23682 None.

23683 **APPLICATION USAGE**

23684 These functions are included only for compatibility with older implementations. They have
 23685 undefined behavior if the resulting string would be too long, so the use of these functions
 23686 should be discouraged. On implementations that do not detect output string length overflow, it
 23687 is possible to overflow the output buffers in such a way as to cause applications to fail, or
 23688 possible system security violations. Also, these functions do not support localized date and time
 23689 formats. To avoid these problems, applications should use *strftime()* to generate strings from
 23690 broken-down times.

23691 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.

23692 The *ctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead of
 23693 possibly using a static data area that may be overwritten by each call.

23694 Attempts to use *ctime()* or *ctime_r()* for times before the Epoch or for times beyond the year 9999
 23695 produce undefined results. Refer to *asctime()* (on page 567).

RATIONALE

23696 The standard developers decided to mark the *ctime()* and *ctime_r()* functions obsolescent even
 23697 though they are in the ISO C standard due to the possibility of buffer overflow. The ISO C
 23698 standard also provides the *strptime()* function which can be used to avoid these problems.
 23699

FUTURE DIRECTIONS

23700 These functions may be removed in a future version.
 23701

SEE ALSO

CHANGE HISTORY

23705 First released in Issue 1. Derived from Issue 1 of the SVID.
 23706

Issue 5

23707 Normative text previously in the APPLICATION USAGE section is moved to the
 23708 DESCRIPTION.
 23709

23710 The *ctime_r()* function is included for alignment with the POSIX Threads Extension.

23711 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.

Issue 6

23712 Extensions beyond the ISO C standard are marked.
 23713

23714 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

23715 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 23716 its avoidance of possibly using a static data area.

Issue 7

23717 SD5-XSH-ERN-25 is applied, updating the APPLICATION USAGE.

23718 Austin Group Interpretation 1003.1-2001 #053 is applied, marking these functions obsolescent.

23719 The *ctime_r()* function is moved from the Thread-Safe Functions option to the Base.
 23720

23721 **NAME**

23728 NAME

23729 dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey,
23730 dbm_open, dbm_store — database functions

23731 SYNOPSIS

```
23732 XSI #include <ndbm.h>
23733
23734 int dbm_clearerr(DBM *db);
23735 void dbm_close(DBM *db);
23736 int dbm_delete(DBM *db, datum key);
23737 int dbm_error(DBM *db);
23738 datum dbm_fetch(DBM *db, datum key);
23739 datum dbm_firstkey(DBM *db);
23740 datum dbm_nextkey(DBM *db);
23741 DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
23742 int dbm_store(DBM *db, datum key, datum content, int store_mode);
```

23742 DESCRIPTION

23743 These functions create, access, and modify a database.

23744 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object
23745 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in
23746 the object pointed to by *dptr*.

23747 A database shall be stored in one or two files. When one file is used, the name of the database
23748 file shall be formed by appending the suffix **.db** to the *file* argument given to *dbm_open()*. When
23749 two files are used, the names of the database files shall be formed by appending the suffixes **.dir**
23750 and **.pag** respectively to the *file* argument.

23751 The *dbm_open()* function shall open a database. The *file* argument to the function is the
23752 pathname of the database. The *open_flags* argument has the same meaning as the *flags* argument
23753 of *open()* except that a database opened for write-only access opens the files for read and write
23754 access and the behavior of the **O_APPEND** flag is unspecified. The *file_mode* argument has the
23755 same meaning as the third argument of *open()*.

23756 The *dbm_open()* function need not accept pathnames longer than **{PATH_MAX}-4** bytes
23757 (including the terminating null), or pathnames with a last component longer than
23758 **{NAME_MAX}-4** bytes (excluding the terminating null).

23759 The *dbm_close()* function shall close a database. The application shall ensure that argument *db* is
23760 a pointer to a **dbm** structure that has been returned from a call to *dbm_open()*.

23761 These database functions shall support an internal block size large enough to support
23762 key/content pairs of at least 1 023 bytes.

23763 The *dbm_fetch()* function shall read a record from a database. The argument *db* is a pointer to a
23764 database structure that has been returned from a call to *dbm_open()*. The argument *key* is a
23765 **datum** that has been initialized by the application to the value of the key that matches the key of
23766 the record the program is fetching.

23767 The *dbm_store()* function shall write a record to a database. The argument *db* is a pointer to a
23768 database structure that has been returned from a call to *dbm_open()*. The argument *key* is a
23769 **datum** that has been initialized by the application to the value of the key that identifies (for
23770 subsequent reading, writing, or deleting) the record the application is writing. The argument
23771 *content* is a **datum** that has been initialized by the application to the value of the record the
23772 program is writing. The argument *store_mode* controls whether *dbm_store()* replaces any pre-

23773 existing record that has the same key that is specified by the *key* argument. The application shall
 23774 set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that
 23775 matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record shall be
 23776 replaced with the new record. If the database contains a record that matches the *key* argument
 23777 and *store_mode* is DBM_INSERT, the existing record shall be left unchanged and the new record
 23778 ignored. If the database does not contain a record that matches the *key* argument and *store_mode*
 23779 is either DBM_INSERT or DBM_REPLACE, the new record shall be inserted in the database.

23780 If the sum of a key/content pair exceeds the internal block size, the result is unspecified.
 23781 Moreover, the application shall ensure that all key/content pairs that hash together fit on a
 23782 single block. The *dbm_store()* function shall return an error in the event that a disk block fills
 23783 with inseparable data.

23784 The *dbm_delete()* function shall delete a record and its key from the database. The argument *db* is
 23785 a pointer to a database structure that has been returned from a call to *dbm_open()*. The argument
 23786 *key* is a **datum** that has been initialized by the application to the value of the key that identifies
 23787 the record the program is deleting.

23788 The *dbm_firstkey()* function shall return the first key in the database. The argument *db* is a
 23789 pointer to a database structure that has been returned from a call to *dbm_open()*.

23790 The *dbm_nextkey()* function shall return the next key in the database. The argument *db* is a
 23791 pointer to a database structure that has been returned from a call to *dbm_open()*. The application
 23792 shall ensure that the *dbm_firstkey()* function is called before calling *dbm_nextkey()*. Subsequent
 23793 calls to *dbm_nextkey()* return the next key until all of the keys in the database have been
 23794 returned.

23795 The *dbm_error()* function shall return the error condition of the database. The argument *db* is a
 23796 pointer to a database structure that has been returned from a call to *dbm_open()*.

23797 The *dbm_clearerr()* function shall clear the error condition of the database. The argument *db* is a
 23798 pointer to a database structure that has been returned from a call to *dbm_open()*.

23799 The *dptr* pointers returned by these functions may point into static storage that may be changed
 23800 by subsequent calls.

23801 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 23802 required to be reentrant.

23803 RETURN VALUE

23804 The *dbm_store()* and *dbm_delete()* functions shall return 0 when they succeed and a negative
 23805 value when they fail.

23806 The *dbm_store()* function shall return 1 if it is called with a *flags* value of DBM_INSERT and the
 23807 function finds an existing record with the same key.

23808 The *dbm_error()* function shall return 0 if the error condition is not set and return a non-zero
 23809 value if the error condition is set.

23810 The return value of *dbm_clearerr()* is unspecified.

23811 The *dbm_firstkey()* and *dbm_nextkey()* functions shall return a key **datum**. When the end of the
 23812 database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr*
 23813 member of the key shall be a null pointer and the error condition of the database shall be set.

23814 The *dbm_fetch()* function shall return a content **datum**. If no record in the database matches the
 23815 key or if an error condition has been detected in the database, the *dptr* member of the content
 23816 shall be a null pointer.

23817 The *dbm_open()* function shall return a pointer to a database structure. If an error is detected
 23818 during the operation, *dbm_open()* shall return a (DBM *)0.

23819 **ERRORS**

23820 No errors are defined.

23821 **EXAMPLES**

23822 None.

23823 **APPLICATION USAGE**

23824 The following code can be used to traverse the database:

23825

```
for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))
```

23826 The *dbm_** functions provided in this library should not be confused in any way with those of a
 23827 general-purpose database management system. These functions do not provide for multiple
 23828 search keys per entry, they do not protect against multi-user access (in other words they do not
 23829 lock records or files), and they do not provide the many other useful database functions that are
 23830 found in more robust database management systems. Creating and updating databases by use of
 23831 these functions is relatively slow because of data copies that occur upon hash collisions. These
 23832 functions are useful for applications requiring fast lookup of relatively static information that is
 23833 to be indexed by a single key.

23834 Note that a strictly conforming application is extremely limited by these functions: since there is
 23835 no way to determine that the keys in use do not all hash to the same value (although that would
 23836 be rare), a strictly conforming application cannot be guaranteed that it can store more than one
 23837 block's worth of data in the database. As long as a key collision does not occur, additional data
 23838 may be stored, but because there is no way to determine whether an error is due to a key
 23839 collision or some other error condition (*dbm_error()* being effectively a Boolean), once an error is
 23840 detected, the application is effectively limited to guessing what the error might be if it wishes to
 23841 continue using these functions.

23842 The *dbm_delete()* function need not physically reclaim file space, although it does make it
 23843 available for reuse by the database.

23844 After calling *dbm_store()* or *dbm_delete()* during a pass through the keys by *dbm_firstkey()* and
 23845 *dbm_nextkey()*, the application should reset the database by calling *dbm_firstkey()* before again
 23846 calling *dbm_nextkey()*. The contents of these files are unspecified and may not be portable.

23847 Applications should take care that database pathname arguments specified to *dbm_open()* are
 23848 not prefixes of unrelated files. This might be done, for example, by placing databases in a
 23849 separate directory.

23850 Since some implementations use three characters for a suffix and others use four characters for a
 23851 suffix, applications should ensure that the maximum portable pathname length passed to
 23852 *dbm_open()* is no greater than {PATH_MAX}-4 bytes, with the last component of the pathname
 23853 no greater than {NAME_MAX}-4 bytes.

23854 **RATIONALE**

23855 Previously the standard required the database to be stored in two files, one file being a directory
 23856 containing a bitmap of keys and having **.dir** as its suffix. The second file containing all data and
 23857 having **.pag** as its suffix. This has been changed not to specify the use of the files and to allow
 23858 newer implementations of the Berkeley DB interface using a single file that have evolved while
 23859 remaining compatible with the application programming interface. The standard developers
 23860 considered removing the specific suffixes altogether but decided to retain them so as not to
 23861 pollute the application file name space more than necessary and to allow for portable backups of
 23862 the database.

23863 **FUTURE DIRECTIONS**

23864 None.

23907 First released in Issue 4. Derived from the ISO C standard.

23908 **NAME**
 23909 dirfd — extract the file descriptor used by a DIR stream

23910 **SYNOPSIS**
 23911 #include <dirent.h>
 23912 int dirfd(DIR *dirp);

23913 **DESCRIPTION**
 23914 The *dirfd()* function shall return a file descriptor referring to the same directory as the *dirp*
 23915 argument. This file descriptor shall be closed by a call to *closedir()*. The behavior of future calls
 23916 to *readdir()* and *readdir_r()* is undefined if the application attempts to alter the file position
 23917 indicator using the returned file descriptor. The behavior of future calls to *closedir()*, *readdir()*,
 23918 and *readdir_r()* is undefined if the application attempts to close the file descriptor.

23919 **RETURN VALUE**
 23920 Upon successful completion, the *dirfd()* function shall return an integer which contains a file
 23921 descriptor for the stream pointed to by *dirp*. Otherwise, it shall return -1 and may set *errno* to
 23922 indicate the error.

23923 **ERRORS**
 23924 The *dirfd()* function may fail if:
 23925 [EINVAL] The *dirp* argument does not refer to a valid directory stream.
 23926 [ENOTSUP] The implementation does not support the association of a file descriptor with
 23927 a directory.

23928 **EXAMPLES**
 23929 None.

23930 **APPLICATION USAGE**
 23931 The *dirfd()* function is intended to be a mechanism by which an application may obtain a file
 23932 descriptor to use for the *fchdir()* function.

23933 **RATIONALE**
 23934 This interface was introduced because the Base Definitions volume of POSIX.1-200x does not
 23935 make public the **DIR** data structure. Applications tend to use the *fchdir()* function on the file
 23936 descriptor returned by this interface, and this has proven useful for security reasons; in
 23937 particular, it is a better technique than others where directory names might change.

23938 The description uses the term “a file descriptor” rather than “the file descriptor”. The
 23939 implication intended is that an implementation that does not use an *fd* for *diropen()* could still
 23940 *open()* the directory to implement the *dirfd()* function. Such a descriptor must be closed later
 23941 during a call to *closedir()*.

23942 An implementation that does not support file descriptors referring to directories may fail with
 23943 [ENOTSUP].

23944 If it is necessary to allocate an *fd* to be returned by *dirfd()*, it should be done at the time of a call
 23945 to *opendir()*.

23946 **FUTURE DIRECTIONS**
 23947 None.

CHANGE HISTORY

23952

First released in Issue 7.

23953 **NAME**23954 `dirname` — report the parent directory name of a file pathname23955 **SYNOPSIS**

```
23956 XSI #include <libgen.h>
23957 char *dirname(char *path);
```

23958 **DESCRIPTION**

23959 The `dirname()` function shall take a pointer to a character string that contains a pathname, and
 23960 return a pointer to a string that is a pathname of the parent directory of that file. Trailing '/'
 23961 characters in the path are not counted as part of the path.

23962 If *path* does not contain a '/', then `dirname()` shall return a pointer to the string ".". If *path* is a
 23963 null pointer or points to an empty string, `dirname()` shall return a pointer to the string ".".

23964 The `dirname()` function need not be thread-safe. A function that is not required to be thread-safe
 23965 is not required to be reentrant.

23966 **RETURN VALUE**

23967 The `dirname()` function shall return a pointer to a string that is the parent directory of *path*. If
 23968 *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

23969 The `dirname()` function may modify the string pointed to by *path*, and may return a pointer to
 23970 static storage that may then be overwritten by subsequent calls to `dirname()`.

23971 **ERRORS**

23972 No errors are defined.

23973 **EXAMPLES**

23974 The following code fragment reads a pathname, changes the current working directory to the
 23975 parent directory, and opens the file.

```
23976 char *path = NULL, *pathcopy;
23977 size_t buflen = 0;
23978 ssize_t linelen = 0;
23979 int fd;
23980
23981 linelen = getline(&path, &buflen, stdin);
23982
23983 path[linelen-1] = 0;
23984 pathcopy = strdup(path);
23985 if (chdir(dirname(pathcopy)) < 0) {
23986     ...
23987 }
23988 if ((fd = open(basename(path), O_RDONLY)) >= 0) {
23989     ...
23990     close (fd);
23991 }
23992 ...
23993 free (pathcopy);
23994 free (path);
```

23993

Sample Input and Output Strings for dirname()

23994

23995

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *dirname()* function.

23996

23997

23998

23999

24000

24001

24002

Input String	Output String
"/usr/lib"	"/usr"
"/usr/"	"/"
"usr"	."
"/"	"/"
."	."
".."	."

24003

APPLICATION USAGE

24004

24005

The *dirname()* and *basename()* functions together yield a complete pathname. The expression *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

24006

24007

Since the meaning of the leading *"/"* is implementation-defined, *dirname("/foo)* may return either *"/"* or *'/'* (but nothing else).

24022

Issue 7

24023

The EXAMPLES section is revised.

24024 **NAME**
 24025 `div` — compute the quotient and remainder of an integer division

24026 **SYNOPSIS**
 24027 `#include <stdlib.h>`
 24028 `div_t div(int numer, int denom);`

24029 **DESCRIPTION**
 24030 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 24031 conflict between the requirements described here and the ISO C standard is unintentional. This
 24032 volume of POSIX.1-200x defers to the ISO C standard.

24033 The `div()` function shall compute the quotient and remainder of the division of the numerator
 24034 `numer` by the denominator `denom`. If the division is inexact, the resulting quotient is the integer
 24035 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be
 24036 represented, the behavior is undefined; otherwise, $quot * denom + rem$ shall equal `numer`.

24037 **RETURN VALUE**
 24038 The `div()` function shall return a structure of type `div_t`, comprising both the quotient and the
 24039 remainder. The structure includes the following members, in any order:

24040 `int quot; /* quotient */`
 24041 `int rem; /* remainder */`

24042 **ERRORS**
 24043 No errors are defined.

24044 **EXAMPLES**
 24045 None.

24046 **APPLICATION USAGE**
 24047 None.

24048 **RATIONALE**
 24049 None.

24055 **CHANGE HISTORY**
 24056 First released in Issue 4. Derived from the ISO C standard.

24057 **NAME**24058 `dlclose` — close a `dlopen()` object24059 **SYNOPSIS**24060 `#include <dlfcn.h>`24061 `int dlclose(void *handle);`24062 **DESCRIPTION**24063 The `dlclose()` function shall inform the system that the object referenced by a `handle` returned
24064 from a previous `dlopen()` invocation is no longer needed by the application.24065 The use of `dlclose()` reflects a statement of intent on the part of the process, but does not create
24066 any requirement upon the implementation, such as removal of the code or symbols referenced
24067 by `handle`. Once an object has been closed using `dlclose()` an application should assume that its
24068 symbols are no longer available to `dlsym()`. All objects loaded automatically as a result of
24069 invoking `dlopen()` on the referenced object shall also be closed if this is the last reference to it.24070 Although a `dlclose()` operation is not required to remove structures from an address space,
24071 neither is an implementation prohibited from doing so. The only restriction on such a removal is
24072 that no object shall be removed to which references have been relocated, until or unless all such
24073 references are removed. For instance, an object that had been loaded with a `dlopen()` operation
24074 specifying the `RTLD_GLOBAL` flag might provide a target for dynamic relocations performed in
24075 the processing of other objects—in such environments, an application may assume that no
24076 relocation, once made, shall be undone or remade unless the object requiring the relocation has
24077 itself been removed.24078 **RETURN VALUE**24079 If the referenced object was successfully closed, `dlclose()` shall return 0. If the object could not be
24080 closed, or if `handle` does not refer to an open object, `dlclose()` shall return a non-zero value. More
24081 detailed diagnostic information shall be available through `dLError()`.24082 **ERRORS**

24083 No errors are defined.

24084 **EXAMPLES**24085 The following example illustrates use of `dlopen()` and `dlclose()`:24086

```
...
```

24087

```
/* Open a dynamic library and then close it ... */
```

24088

```
#include <dlfcn.h>
```

24089

```
void *mylib;
```

24090

```
int eret;
```

24091

```
mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
```

24092

```
...
```

24093

```
eret = dlclosure(mylib);
```

24094

```
...
```

24095 **APPLICATION USAGE**24096 A conforming application should employ a `handle` returned from a `dlopen()` invocation only
24097 within a given scope bracketed by the `dlopen()` and `dlclose()` operations. Implementations are
24098 free to use reference counting or other techniques such that multiple calls to `dlopen()` referencing
24099 the same object may return the same object for `handle`. Implementations are also free to reuse a
24100 `handle`. For these reasons, the value of a `handle` must be treated as an opaque object by the
24101 application, used only in calls to `dlsym()` and `dlclose()`.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The DESCRIPTION is updated to say that the referenced object is closed “if this is the last reference to it”.

Issue 7

The *dlopen()* function is moved from the XSI option to Base.

DRAFT

dlderror()24116 **NAME**24117 `dlderror` — get diagnostic information24118 **SYNOPSIS**24119 `#include <dldfcn.h>`24120 `char *dlderror(void);`24121 **DESCRIPTION**

24122 The `dlderror()` function shall return a null-terminated character string (with no trailing
 24123 <newline>) that describes the last error that occurred during dynamic linking processing. If no
 24124 dynamic linking errors have occurred since the last invocation of `dlderror()`, `dlderror()` shall return
 24125 NULL. Thus, invoking `dlderror()` a second time, immediately following a prior invocation, shall
 24126 result in NULL being returned.

24127 The `dlderror()` function need not be thread-safe. A function that is not required to be thread-safe is
 24128 not required to be reentrant.

24129 **RETURN VALUE**

24130 If successful, `dlderror()` shall return a null-terminated character string; otherwise, NULL shall be
 24131 returned.

24132 **ERRORS**

24133 No errors are defined.

24134 **EXAMPLES**

24135 The following example prints out the last dynamic linking error:

```
24136 ...
24137 #include <dldfcn.h>
24138 char *errstr;
24139 errstr = dlderror();
24140 if (errstr != NULL)
24141     printf ("A dynamic linking error occurred: (%s)\n", errstr);
24142 ...
```

24143 **APPLICATION USAGE**

24144 The messages returned by `dlderror()` may reside in a static buffer that is overwritten on each call
 24145 to `dlderror()`. Application code should not write to this buffer. Programs wishing to preserve an
 24146 error message should make their own copies of that message. Depending on the application
 24147 environment with respect to asynchronous execution events, such as signals or other
 24148 asynchronous computation sharing the address space, conforming applications should use a
 24149 critical section to retrieve the error pointer and buffer.

24150 **RATIONALE**

24151 None.

24152 **FUTURE DIRECTIONS**

24153 None.

24154 **SEE ALSO**24155 [*dlclose\(\)*](#), [*dlopen\(\)*](#), [*dlsym\(\)*](#)24156 XBD [*<dldfcn.h>*](#)

24157	CHANGE HISTORY
24158	First released in Issue 5.
24159	Issue 6
24160	In the DESCRIPTION the note about reentrancy and thread-safety is added.
24161	Issue 7
24162	The <i>dlerror()</i> function is moved from the XSI option to the Base.

24163 **NAME**24164 `dlopen` — gain access to an executable object file24165 **SYNOPSIS**24166 `#include <dlfcn.h>`24167 `void *dlopen(const char *file, int mode);`24168 **DESCRIPTION**

24169 The `dlopen()` function shall make an executable object file specified by `file` available to the calling
 24170 program. The class of files eligible for this operation and the manner of their construction are
 24171 implementation-defined, though typically such files are executable objects such as shared
 24172 libraries, relocatable files, or programs. Note that some implementations permit the construction
 24173 of dependencies between such objects that are embedded within files. In such cases, a `dlopen()`
 24174 operation shall load such dependencies in addition to the object referenced by `file`.
 24175 Implementations may also impose specific constraints on the construction of programs that can
 24176 employ `dlopen()` and its related services.

24177 A successful `dlopen()` shall return a *handle* which the caller may use on subsequent calls to
 24178 `dlsym()` and `dlclose()`. The value of this *handle* should not be interpreted in any way by the caller.

24179 The `file` argument is used to construct a pathname to the object file. If `file` contains a slash
 24180 character, the `file` argument is used as the pathname for the file. Otherwise, `file` is used in an
 24181 implementation-defined manner to yield a pathname.

24182 If the value of `file` is 0, `dlopen()` shall provide a *handle* on a global symbol object. This object shall
 24183 provide access to the symbols from an ordered set of objects consisting of the original program
 24184 image file, together with any objects loaded at program start-up as specified by that process
 24185 image file (for example, shared libraries), and the set of objects loaded using a `dlopen()` operation
 24186 together with the `RTLD_GLOBAL` flag. As the latter set of objects can change during execution,
 24187 the set identified by *handle* can also change dynamically.

24188 Only a single copy of an object file is brought into the address space, even if `dlopen()` is invoked
 24189 multiple times in reference to the file, and even if different pathnames are used to reference the
 24190 file.

24191 The `mode` parameter describes how `dlopen()` shall operate upon `file` with respect to the processing
 24192 of relocations and the scope of visibility of the symbols provided within `file`. When an object is
 24193 brought into the address space of a process, it may contain references to symbols whose
 24194 addresses are not known until the object is loaded. These references shall be relocated before the
 24195 symbols can be accessed. The `mode` parameter governs when these relocations take place and
 24196 may have the following values:

24197 **RTLD_LAZY** Relocations shall be performed at an implementation-defined time,
 24198 ranging from the time of the `dlopen()` call until the first reference to a
 24199 given symbol occurs. Specifying `RTLD_LAZY` should improve
 24200 performance on implementations supporting dynamic symbol binding as
 24201 a process may not reference all of the functions in any given object. And,
 24202 for systems supporting dynamic symbol resolution for normal process
 24203 execution, this behavior mimics the normal handling of process
 24204 execution.

24205 **RTLD_NOW** All necessary relocations shall be performed when the object is first
 24206 loaded. This may waste some processing if relocations are performed for
 24207 functions that are never referenced. This behavior may be useful for
 24208 applications that need to know as soon as an object is loaded that all
 24209 symbols referenced during execution are available.

24210 Any object loaded by *dlopen()* that requires relocations against global symbols can reference the
 24211 symbols in the original process image file, any objects loaded at program start-up, from the
 24212 object itself as well as any other object included in the same *dlopen()* invocation, and any objects
 24213 that were loaded in any *dlopen()* invocation and which specified the RTLD_GLOBAL flag. To
 24214 determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode*
 24215 parameter should be a bitwise-inclusive OR with one of the following values:

24216 RTLD_GLOBAL The object's symbols shall be made available for the relocation processing
 24217 of any other object. In addition, symbol lookup using *dlopen(0, mode)* and
 24218 an associated *dlsym()* allows objects loaded with this *mode* to be searched.

24219 RTLD_LOCAL The object's symbols shall not be made available for the relocation
 24220 processing of any other object.

24221 If neither RTLD_GLOBAL nor RTLD_LOCAL are specified, then the default behavior is
 24222 unspecified.

24223 If a *file* is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation. Note,
 24224 however, that once RTLD_NOW has been specified all relocations shall have been completed
 24225 rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations
 24226 irrelevant. Similarly, note that once RTLD_GLOBAL has been specified the object shall maintain
 24227 the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL,
 24228 as long as the object remains in the address space (see *dlclose()*).

24229 Symbols introduced into a program through calls to *dlopen()* may be used in relocation activities.
 24230 Symbols so introduced may duplicate symbols already defined by the program or previous
 24231 *dlopen()* operations. To resolve the ambiguities such a situation might present, the resolution of a
 24232 symbol reference to symbol definition is based on a symbol resolution order. Two such
 24233 resolution orders are defined: *load* or *dependency* ordering. Load order establishes an ordering
 24234 among symbol definitions, such that the definition first loaded (including definitions from the
 24235 image file and any dependent objects loaded with it) has priority over objects added later (via
 24236 *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a breadth-
 24237 first order starting with a given object, then all of its dependencies, then any dependents of
 24238 those, iterating until all dependencies are satisfied. With the exception of the global symbol
 24239 object obtained via a *dlopen()* operation on a *file* of 0, dependency ordering is used by the
 24240 *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol object.

24241 When an object is first made accessible via *dlopen()* it and its dependent objects are added in
 24242 dependency order. Once all the objects are added, relocations are performed using load order.
 24243 Note that if an object or its dependencies had been previously loaded, the load and dependency
 24244 orders may yield different resolutions.

24245 The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum
 24246 those which are exported as symbols of global scope by the object. Typically such symbols shall
 24247 be those that were specified in (for example) C source code as having *extern* linkage. The precise
 24248 manner in which an implementation constructs the set of exported symbols for a *dlopen()* object
 24249 is specified by that implementation.

24250 RETURN VALUE

24251 If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for
 24252 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its
 24253 symbolic references, *dlopen()* shall return NULL. More detailed diagnostic information shall be
 24254 available through *dlerror()*.

24255 ERRORS

24256 No errors are defined.

CHANGE HISTORY

24269

First released in Issue 5.

24270

Issue 6

24271

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/21 is applied, changing the default behavior in the DESCRIPTION when neither RTLD_GLOBAL nor RTLD_LOCAL are specified from implementation-defined to unspecified.

24272

24273

24274

Issue 7

24275

The *dlopen()* function is moved from the XSI option to the Base.

24276

The EXAMPLES section is updated to refer to *dlsym()*.

24277 **NAME**24278 dlsym — obtain the address of a symbol from a *dlopen()* object24279 **SYNOPSIS**

24280 #include <dlfcn.h>

24281 void *dlsym(void *restrict *handle*, const char *restrict *name*);24282 **DESCRIPTION**

24283 The *dlsym()* function shall obtain the address of a symbol defined within an object made
 24284 accessible through a *dlopen()* call. The *handle* argument is the value returned from a call to
 24285 *dlopen()* (and which has not since been released via a call to *dlclose()*), and *name* is the symbol's
 24286 name as a character string.

24287 The *dlsym()* function shall search for the named symbol in all objects loaded automatically as a
 24288 result of loading the object referenced by *handle* (see *dlopen()*). Load ordering is used in *dlsym()*
 24289 operations upon the global symbol object. The symbol resolution algorithm used shall be
 24290 dependency order as described in *dlopen()*.

24291 The RTLD_DEFAULT and RTLD_NEXT flags are reserved for future use.

24292 **RETURN VALUE**

24293 If *handle* does not refer to a valid object opened by *dlopen()*, or if the named symbol cannot be
 24294 found within any of the objects associated with *handle*, *dlsym()* shall return NULL. More
 24295 detailed diagnostic information shall be available through *dLError()*.

24296 **ERRORS**

24297 No errors are defined.

24298 **EXAMPLES**

24299 The following example shows how *dlopen()* and *dlsym()* can be used to access either function or
 24300 data objects. For simplicity, error checking has been omitted.

```
24301 void    *handle;
24302 int     *iptr, (*fptr)(int);

24303 /* open the needed object */
24304 handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

24305 /* find the address of function and data objects */
24306 *(void **)(&fptr) = dlsym(handle, "my_function");
24307 iptr = (int *)dlsym(handle, "my_object");

24308 /* invoke function, passing value of integer as a parameter */
24309 (*fptr)(*iptr);
```

24310 **APPLICATION USAGE**

24311 Special purpose values for *handle* are reserved for future use. These values and their meanings
 24312 are:

24313 RTLD_DEFAULT The symbol lookup happens in the normal global scope; that is, a search for a
 24314 symbol using this handle would find the same definition as a direct use of this
 24315 symbol in the program code.

24316 RTLD_NEXT Specifies the next object after this one that defines *name*. *This one* refers to the
 24317 object containing the invocation of *dlsym()*. The *next* object is the one found
 24318 upon the application of a load order symbol resolution algorithm (see
 24319 *dlopen()*). The next object is either one of global scope (because it was
 24320 introduced as part of the original process image or because it was added with

24321
24322

24326
24327
24328

a *dlopen()* operation including the `RTLD_GLOBAL` flag), or is an object that was included in the same *dlopen()* operation that loaded this one.

The `RTLD_NEXT` flag is useful to navigate an intentionally created hierarchy of multiply-defined symbols created through *interposition*. For example, if a program wished to create an implementation of *malloc()* that embedded some statistics gathering about memory allocations, such an implementation could use the real *malloc()* definition to perform the memory allocation—and itself only embed the necessary logic to implement the statistics gathering function.

24329
24330
24331
24332
24333**RATIONALE**

The ISO C standard does not require that pointers to functions can be cast back and forth to pointers to data. However, POSIX-conforming implementations are required to support this, as noted in [Section 2.12.3](#) (on page 519). The result of converting a pointer to a function into a pointer to another data type (except `void *`) is still undefined, however.

24334
24335

Note that compilers conforming to the ISO C standard are required to generate a warning if a conversion from a `void *` pointer to a function pointer is attempted as in:

24336

```
fptr = (int (*)(int))dlsym(handle, "my_function");
```

24337
24338**FUTURE DIRECTIONS**

None.

The *dlsym()* function is moved from the XSI option to the Base.

24353 **NAME**
24354 `dprintf` — print formatted output

24355 **SYNOPSIS**

24356 CX `#include <stdio.h>`
24357 `int dprintf(int files, const char *format, ...);`

24358 **DESCRIPTION**

24359 Refer to *fprintf()*.

24360 **NAME**

24361 `drand48`, `erand48`, `rand48`, `lcong48`, `rand48`, `mrnd48`, `nrnd48`, `seed48`, `srand48` — generate
 24362 uniformly distributed pseudo-random numbers

24363 **SYNOPSIS**

```
24364 XSI #include <stdlib.h>
24365
24365 double drand48(void);
24366 double erand48(unsigned short xsubi[3]);
24367 long jrand48(unsigned short xsubi[3]);
24368 void lcong48(unsigned short param[7]);
24369 long rand48(void);
24370 long mrnd48(void);
24371 long nrnd48(unsigned short xsubi[3]);
24372 unsigned short *seed48(unsigned short seed16v[3]);
24373 void srand48(long seedval);
```

24374 **DESCRIPTION**

24375 This family of functions shall generate pseudo-random numbers using a linear congruential
 24376 algorithm and 48-bit integer arithmetic.

24377 The `drand48()` and `erand48()` functions shall return non-negative, double-precision, floating-
 24378 point values, uniformly distributed over the interval [0.0,1.0).

24379 The `rand48()` and `nrnd48()` functions shall return non-negative, long integers, uniformly
 24380 distributed over the interval $[0,2^{31})$.

24381 The `mrnd48()` and `jrand48()` functions shall return signed long integers uniformly distributed
 24382 over the interval $[-2^{31},2^{31})$.

24383 The `srand48()`, `seed48()`, and `lcong48()` functions are initialization entry points, one of which
 24384 should be invoked before either `drand48()`, `rand48()`, or `mrnd48()` is called. (Although it is not
 24385 recommended practice, constant default initializer values shall be supplied automatically if
 24386 `drand48()`, `rand48()`, or `mrnd48()` is called without a prior call to an initialization entry point.)
 24387 The `erand48()`, `nrnd48()`, and `jrand48()` functions do not require an initialization entry point to
 24388 be called first.

24389 All the routines work by generating a sequence of 48-bit integer values, X_i , according to the
 24390 linear congruential formula:

$$24391 X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

24392 The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless `lcong48()` is invoked,
 24393 the multiplier value a and the addend value c are given by:

$$24394 a = 5DEECE66D_{16} = 273673163155_8$$

$$24395 c = B_{16} = 13_8$$

24396 The value returned by any of the `drand48()`, `erand48()`, `jrand48()`, `rand48()`, `mrnd48()`, or
 24397 `nrnd48()` functions is computed by first generating the next 48-bit X_i in the sequence. Then the
 24398 appropriate number of bits, according to the type of data item to be returned, are copied from
 24399 the high-order (leftmost) bits of X_i and transformed into the returned value.

24400 The `drand48()`, `rand48()`, and `mrnd48()` functions store the last 48-bit X_i generated in an
 24401 internal buffer; that is why the application shall ensure that these are initialized prior to being
 24402 invoked. The `erand48()`, `nrnd48()`, and `jrand48()` functions require the calling program to

24403 provide storage for the successive X_i values in the array specified as an argument when the
 24404 functions are invoked. That is why these routines do not have to be initialized; the calling
 24405 program merely has to place the desired initial value of X_i into the array and pass it as an
 24406 argument. By using different arguments, *erand48()*, *nrnd48()*, and *jrnd48()* allow separate
 24407 modules of a large program to generate several *independent* streams of pseudo-random numbers;
 24408 that is, the sequence of numbers in each stream shall *not* depend upon how many times the
 24409 routines are called to generate numbers for the other streams.

24410 The initializer function *srand48()* sets the high-order 32 bits of X_i to the low-order 32 bits
 24411 contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

24412 The initializer function *seed48()* sets the value of X_i to the 48-bit value specified in the argument
 24413 array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16
 24414 bits of X_i are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of X_i are set to the
 24415 low-order 16 bits of *seed16v*[2]. In addition, the previous value of X_i is copied into a 48-bit
 24416 internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by
 24417 *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is
 24418 to be restarted from a given point at some future time—use the pointer to get at and store the
 24419 last X_i value, and then use this value to reinitialize via *seed48()* when the program is restarted.

24420 The initializer function *lcong48()* allows the user to specify the initial X_i , the multiplier value a ,
 24421 and the addend value c . Argument array elements *param*[0-2] specify X_i , *param*[3-5] specify the
 24422 multiplier a , and *param*[6] specifies the 16-bit addend c . After *lcong48()* is called, a subsequent
 24423 call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values, a and
 24424 c , specified above.

24425 The *drand48()*, *lrnd48()*, and *mrnd48()* function need not be thread-safe. A function that is not
 24426 required to be thread-safe is not required to be reentrant.

24427 RETURN VALUE

24428 As described in the DESCRIPTION above.

24442 CHANGE HISTORY

24443 First released in Issue 1. Derived from Issue 1 of the SVID.

24444 Issue 5

24445 A note indicating that the *drand48()*, *lrnd48()*, and *mrnd48()* functions need not be reentrant is
 24446 added to the DESCRIPTION.

24447

24448

Issue 6

The normative text is updated to avoid use of the term “must” for application requirements.

24449 **NAME**

24450 dup, dup2 — duplicate an open file descriptor

24451 **SYNOPSIS**

24452 #include <unistd.h>

24453 int dup(int *fil-des*);24454 int dup2(int *fil-des*, int *fil-des2*);24455 **DESCRIPTION**24456 The *dup()* function provides an alternative interface to the service provided by *fcntl()* using the
24457 F_DUPFD command. The call *dup(fil-des)* shall be equivalent to:24458 *fcntl(fil-des, F_DUPFD, 0);*24459 The *dup2()* function shall cause the file descriptor *fil-des2* to refer to the same open file
24460 description as the file descriptor *fil-des* and to share any locks, and shall return *fil-des2*. If *fil-des2* is
24461 already a valid open file descriptor, it shall be closed first, unless *fil-des* is equal to *fil-des2* in which
24462 case *dup2()* shall return *fil-des2* without closing it. If the close operation fails to close *fil-des2*,
24463 *dup2()* shall return -1 without changing the open file description to which *fil-des2* refers. If *fil-des*
24464 is not a valid file descriptor, *dup2()* shall return -1 and shall not close *fil-des2*. If *fil-des2* is less than
24465 0 or greater than or equal to {OPEN_MAX}, *dup2()* shall return -1 with *errno* set to [EBADF].24466 On successful completion, if *fil-des* is not equal to *fil-des2*, the FD_CLOEXEC flag associated with
24467 *fil-des2* shall be cleared. If *fil-des* is equal to *fil-des2*, the FD_CLOEXEC flag associated with *fil-des2*
24468 shall not be changed.24469 TYM If *fil-des* refers to a typed memory object, the result of the *dup2()* function is unspecified.24470 **RETURN VALUE**24471 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;
24472 otherwise, -1 shall be returned and *errno* set to indicate the error.24473 **ERRORS**24474 The *dup()* function shall fail if:24475 [EBADF] The *fil-des* argument is not a valid open file descriptor.

24476 [EMFILE] All file descriptors available to the process are currently open.

24477 The *dup2()* function shall fail if:24478 [EBADF] The *fil-des* argument is not a valid open file descriptor or the argument *fil-des2* is
24479 negative or greater than or equal to {OPEN_MAX}.24480 [EINTR] The *dup2()* function was interrupted by a signal.24481 The *dup2()* function may fail if: +24482 [EIO] An I/O error occurred while attempting to close *fil-des2*. +

24483 **EXAMPLES**24484 **Redirecting Standard Output to a File**

24485 The following example closes standard output for the current processes, re-assigns standard
 24486 output to go to the file referenced by *pfid*, and closes the original file descriptor to clean up.

```
24487 #include <unistd.h>
24488 ...
24489 int pfid;
24490 ...
24491 close(1);
24492 dup(pfid);
24493 close(pfid);
24494 ...
```

24495 **Redirecting Error Messages**

24496 The following example redirects messages from *stderr* to *stdout*.

```
24497 #include <unistd.h>
24498 ...
24499 dup2(1, 2);
24500 ...
```

24501 **APPLICATION USAGE**

24502 None.

24503 **RATIONALE**

24504 The *dup()* and *dup2()* functions are redundant. Their services are also provided by the *fcntl()*
 24505 function. They have been included in this volume of POSIX.1-200x primarily for historical
 24506 reasons, since many existing applications use them.

24507 The *dup2()* function is not marked obsolescent because it presents a type-safe version of -
 24508 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

24509 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

24510 In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of
 24511 *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of
 24512 invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter
 24513 whether *fildes2* refers to an open file when the *dup2()* call is made.

24514 **FUTURE DIRECTIONS**

24515 None.

24516 **SEE ALSO**

24517 *close()*, *fcntl()*, *open()*

24518 XBD [<unistd.h>](#) |

24519 **CHANGE HISTORY**

24520 First released in Issue 1. Derived from Issue 1 of the SVID.

24521 **Issue 7**

24522 SD5-XSH-ERN-187 is applied. +

24523 **NAME**

24524 duplocale — duplicate a locale object

24525 **SYNOPSIS**

```
24526 CX #include <locale.h>
24527 locale_t duplocale(locale_t locobj);
```

24528 **DESCRIPTION**

24529 The *duplocale()* function shall create a duplicate copy of the locale object referenced by the *locobj*
 24530 argument.

24531 **RETURN VALUE**

24532 Upon successful completion, the *duplocale()* function shall return a handle for a new locale
 24533 object. Otherwise, *duplocale()* shall return **(locale_t)0** and set *errno* to indicate the error.

24534 **ERRORS**

24535 The *duplocale()* function shall fail if:

24536 [ENOMEM] There is not enough memory available to create the locale object or load the
 24537 locale data.

24538 The *duplocale()* function may fail if:

24539 [EINVAL] *locobj* is not a handle for a locale object.

24540 **EXAMPLES**24541 **Constructing an Altered Version of an Existing Locale Object**

24542 The following example shows a code fragment to create a slightly altered version of an existing
 24543 locale object. The function takes a locale object and a locale name and it replaces the *LC_TIME*
 24544 category data in the locale object with that from the named locale.

```
24545 #include <locale.h>
24546 ...
24547 locale_t
24548 with_changed_lc_time (locale_t obj, const char *name)
24549 {
24550     locale_t retval = duplocale (obj);
24551     if (retval != (locale_t) 0)
24552     {
24553         locale_t changed = newlocale (LC_TIME_MASK, name, retval);
24554         if (changed == (locale_t) 0)
24555             /* An error occurred. Free all allocated resources. */
24556             freelocale (retval);
24557         retval = changed;
24558     }
24559     return retval; }
24560 }
```

24561 **APPLICATION USAGE**

24562 The use of the *duplocale()* function is recommended for situations where a locale object is being
 24563 used in multiple places, and it is possible that the lifetime of the locale object might end before
 24564 all uses are finished. Another reason to duplicate a locale object is if a slightly modified form is
 24565 needed. This can be achieved by a call to *newlocale()* following the *duplocale()* call.

duplocale()

24566 As with the *newlocale()* function, handles for locale objects created by the *duplocale()* function
24567 should be released by a corresponding call to *freelocale()*.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

freelocale(), *newlocale()*, *uselocale()*

CHANGE HISTORY

First released in Issue 7.

24577 **NAME**24578 encrypt — encoding function (**CRYPT**)24579 **SYNOPSIS**

```
24580 XSI #include <unistd.h>
24581 void encrypt(char block[64], int edflag);
```

24582 **DESCRIPTION**

24583 The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.
 24584 The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

24585 The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes
 24586 with values of 0 and 1. The array is modified in place to a similar array using the key set by
 24587 *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see
 24588 the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to
 24589 [ENOSYS].

24590 The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing
 24591 to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on
 24592 return, an error has occurred.

24593 The *encrypt()* function need not be thread-safe. A function that is not required to be thread-safe
 24594 is not required to be reentrant.

24595 **RETURN VALUE**24596 The *encrypt()* function shall not return a value.24597 **ERRORS**24598 The *encrypt()* function shall fail if:

24599 [ENOSYS] The functionality is not supported on this implementation.

24600 **EXAMPLES**

24601 None.

24602 **APPLICATION USAGE**24603 Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.

24604 In some environments, decoding might not be implemented. This is related to some Government
 24605 restrictions on encryption and decryption routines. Historical practice has been to ship a
 24606 different version of the encryption library without the decryption feature in the routines
 24607 supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

24608 **RATIONALE**

24609 None.

24610 **FUTURE DIRECTIONS**

24611 None.

24615

CHANGE HISTORY

24616

First released in Issue 1. Derived from Issue 1 of the SVID.

24617

Issue 5

24618

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

24619

Issue 6

24620

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24621 **NAME**
 24622 endgrent, getgrent, setgrent — group database entry functions

24623 **SYNOPSIS**

```
24624 XSI #include <grp.h>
24625 void endgrent(void);
24626 struct group *getgrent(void);
24627 void setgrent(void);
```

24628 **DESCRIPTION**

24629 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an
 24630 entry in the group database. When first called, *getgrent()* shall return a pointer to a **group**
 24631 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a
 24632 **group** structure containing the next group structure in the group database, so successive calls
 24633 may be used to search the entire database.

24634 An implementation that provides extended security controls may impose further
 24635 implementation-defined restrictions on accessing the group database. In particular, the system
 24636 may deny the existence of some or all of the group database entries associated with groups other
 24637 than those groups associated with the caller and may omit users other than the caller from the
 24638 list of members of groups in database entries that are returned.

24639 The *setgrent()* function shall rewind the group database to allow repeated searches.

24640 The *endgrent()* function may be called to close the group database when processing is complete.

24641 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 24642 required to be reentrant.

24643 **RETURN VALUE**

24644 When first called, *getgrent()* shall return a pointer to the first group structure in the group
 24645 database. Upon subsequent calls it shall return the next group structure in the group database.
 24646 The *getgrent()* function shall return a null pointer on end-of-file or an error and *errno* may be set
 24647 to indicate the error.

24648 The return value may point to a static area which is overwritten by a subsequent call to
 24649 *getgrgid()*, *getgrnam()*, or *getgrent()*.

24650 **ERRORS**

24651 The *getgrent()* function may fail if:

- | | | |
|-------|----------|--|
| 24652 | [EINTR] | A signal was caught during the operation. |
| 24653 | [EIO] | An I/O error has occurred. |
| 24654 | [EMFILE] | All file descriptors available to the process are currently open. |
| 24655 | [ENFILE] | The maximum allowable number of files is currently open in the system. |

endgrent()

24656

EXAMPLES

24657

None.

24658

APPLICATION USAGE

24659

These functions are provided due to their historical usage. Applications should avoid dependencies on fields in the group database, whether the database is a single file, or where in the file system name space the database resides. Applications should use *getgrnam()* and *getgrgid()* whenever possible because it avoids these dependencies.

First released in Issue 4, Version 2.

24672

Issue 5

24673

Moved from X/OPEN UNIX extension to BASE.

24674

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

24675

24676

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

24677

Issue 6

24678

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24679

Issue 7

24680

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

24681 **NAME**
 24682 `endhostent`, `gethostent`, `sethostent` — network host database functions

24683 **SYNOPSIS**
 24684 `#include <netdb.h>`
 24685 `void endhostent(void);`
 24686 `struct hostent *gethostent(void);`
 24687 `void sethostent(int stayopen);`

24688 **DESCRIPTION**
 24689 These functions shall retrieve information about hosts. This information is considered to be
 24690 stored in a database that can be accessed sequentially or randomly. The implementation of this
 24691 database is unspecified.

24692 **Note:** In many cases this database is implemented by the Domain Name System, as documented in
 24693 RFC 1034, RFC 1035, and RFC 1886.

24694 The `sethostent()` function shall open a connection to the database and set the next entry for
 24695 retrieval to the first entry in the database. If the `stayopen` argument is non-zero, the connection
 24696 shall not be closed by a call to `gethostent()`, and the implementation may maintain an open file
 24697 descriptor.

24698 The `gethostent()` function shall read the next entry in the database, opening and closing a
 24699 connection to the database as necessary.

24700 Entries shall be returned in **hostent** structures.

24701 The `endhostent()` function shall close the connection to the database, releasing any open file
 24702 descriptor.

24703 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 24704 required to be reentrant.

24705 **RETURN VALUE**
 24706 Upon successful completion, the `gethostent()` function shall return a pointer to a **hostent**
 24707 structure if the requested entry was found, and a null pointer if the end of the database was
 24708 reached or the requested entry was not found.

24709 **ERRORS**
 24710 No errors are defined for `endhostent()`, `gethostent()`, and `sethostent()`.

24711 **EXAMPLES**
 24712 None.

24713 **APPLICATION USAGE**
 24714 The `gethostent()` function may return pointers to static data, which may be overwritten by
 24715 subsequent calls to any of these functions.

24716 **RATIONALE**
 24717 None.

24718 **FUTURE DIRECTIONS**
 24719 None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

24725 **NAME**
 24726 endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

24727 **SYNOPSIS**

24728 #include <netdb.h>

24729 void endnetent(void);
 24730 struct netent *getnetbyaddr(uint32_t net, int type);
 24731 struct netent *getnetbyname(const char *name);
 24732 struct netent *getnetent(void);
 24733 void setnetent(int stayopen);

24734 **DESCRIPTION**

24735 These functions shall retrieve information about networks. This information is considered to be
 24736 stored in a database that can be accessed sequentially or randomly. The implementation of this
 24737 database is unspecified.

24738 The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-
 24739 zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either
 24740 directly, or indirectly through one of the other *getnet**() functions), and the implementation may
 24741 maintain an open file descriptor to the database.

24742 The *getnetent()* function shall read the next entry of the database, opening and closing a
 24743 connection to the database as necessary.

24744 The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry
 24745 for which the address family specified by *type* matches the *n_addrtype* member and the network
 24746 number *net* matches the *n_net* member, opening and closing a connection to the database as
 24747 necessary. The *net* argument shall be the network number in host byte order.

24748 The *getnetbyname()* function shall search the database from the beginning and find the first entry
 24749 for which the network name specified by *name* matches the *n_name* member, opening and
 24750 closing a connection to the database as necessary.

24751 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a
 24752 **netent** structure, the members of which shall contain the fields of an entry in the network
 24753 database.

24754 The *endnetent()* function shall close the database, releasing any open file descriptor.

24755 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 24756 required to be reentrant.

24757 **RETURN VALUE**

24758 Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a
 24759 pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the
 24760 database was reached or the requested entry was not found. Otherwise, a null pointer shall be
 24761 returned.

24762 **ERRORS**

24763 No errors are defined.

endnetent()

24764

EXAMPLES

24765

None.

24766

APPLICATION USAGE

24767

CHANGE HISTORY

24776

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

24777 **NAME**

24778 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol
24779 database functions

24780 **SYNOPSIS**

```
24781 #include <netdb.h>

24782 void endprotoent(void);
24783 struct protoent *getprotobyname(const char *name);
24784 struct protoent *getprotobynumber(int proto);
24785 struct protoent *getprotoent(void);
24786 void setprotoent(int stayopen);
```

24787 **DESCRIPTION**

24788 These functions shall retrieve information about protocols. This information is considered to be
24789 stored in a database that can be accessed sequentially or randomly. The implementation of this
24790 database is unspecified.

24791 The *setprotoent()* function shall open a connection to the database, and set the next entry to the
24792 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database
24793 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the
24794 other *getproto**(*)* functions), and the implementation may maintain an open file descriptor for
24795 the database.

24796 The *getprotobyname()* function shall search the database from the beginning and find the first
24797 entry for which the protocol name specified by *name* matches the *p_name* member, opening and
24798 closing a connection to the database as necessary.

24799 The *getprotobynumber()* function shall search the database from the beginning and find the first
24800 entry for which the protocol number specified by *proto* matches the *p_proto* member, opening
24801 and closing a connection to the database as necessary.

24802 The *getprotoent()* function shall read the next entry of the database, opening and closing a
24803 connection to the database as necessary.

24804 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer
24805 to a **protoent** structure, the members of which shall contain the fields of an entry in the network
24806 protocol database.

24807 The *endprotoent()* function shall close the connection to the database, releasing any open file
24808 descriptor.

24809 These functions need not be thread-safe. A function that is not required to be thread-safe is not
24810 required to be reentrant.

24811 **RETURN VALUE**

24812 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a
24813 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of
24814 the database was reached or the requested entry was not found. Otherwise, a null pointer is
24815 returned.

24816 **ERRORS**

24817 No errors are defined.

endprotoent()

24818

EXAMPLES

24819

None.

24820

APPLICATION USAGE

24821

The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions may return pointers to static data, which may be overwritten by subsequent calls to any of these functions.

24829

CHANGE HISTORY

24830

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

24831 **NAME**
 24832 endpwent, getpwent, setpwent — user database functions

24833 **SYNOPSIS**

```
24834 XSI #include <pwd.h>
24835 void endpwent(void);
24836 struct passwd *getpwent(void);
24837 void setpwent(void);
```

24838 **DESCRIPTION**

24839 These functions shall retrieve information about users.

24840 The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of
 24841 an entry in the user database. Each entry in the user database contains a **passwd** structure. When
 24842 first called, *getpwent()* shall return a pointer to a **passwd** structure containing the first entry in
 24843 the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next
 24844 entry in the user database. Successive calls can be used to search the entire user database.

24845 If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

24846 An implementation that provides extended security controls may impose further
 24847 implementation-defined restrictions on accessing the user database. In particular, the system
 24848 may deny the existence of some or all of the user database entries associated with users other
 24849 than the caller.

24850 The *setpwent()* function effectively rewinds the user database to allow repeated searches.

24851 The *endpwent()* function may be called to close the user database when processing is complete.

24852 These functions need not be thread-safe. A function that is not required to be thread-safe is not
 24853 required to be reentrant.

24854 **RETURN VALUE**

24855 The *getpwent()* function shall return a null pointer on end-of-file or error.

24856 **ERRORS**

24857 The *getpwent()*, *setpwent()*, and *endpwent()* functions may fail if:

24858 [EIO] An I/O error has occurred.

24859 In addition, *getpwent()* and *setpwent()* may fail if:

24860 [EMFILE] All file descriptors available to the process are currently open.

24861 [ENFILE] The maximum allowable number of files is currently open in the system.

24862 The return value may point to a static area which is overwritten by a subsequent call to
 24863 *getpwuid()*, *getpwnam()*, or *getpwent()*.

24864 **EXAMPLES**24865 **Searching the User Database**

24866 The following example uses the *getpwent()* function to get successive entries in the user
 24867 database, returning a pointer to a **passwd** structure that contains information about each user.
 24868 The call to *endpwent()* closes the user database and cleans up.

```

24869 #include <pwd.h>
24870 #include <stdio.h>

24871 void printname(uid_t uid)
24872 {
24873     struct passwd *pwd;

24874     setpwent();
24875     while((pwd = getpwent()) != NULL) {
24876         if (pwd->pw_uid == uid) {
24877             printf("name=%s\n", pwd->pw_name);
24878             break;
24879         }
24880     }
24881     endpwent();
24882 }

```

24883 **APPLICATION USAGE**

24884 These functions are provided due to their historical usage. Applications should avoid
 24885 dependencies on fields in the password database, whether the database is a single file, or where
 24886 in the file system name space the database resides. Applications should use *getpwuid()*
 24887 whenever possible because it avoids these dependencies.

24888 **RATIONALE**

24889 None.

24890 **FUTURE DIRECTIONS**

24891 None.

24892 **SEE ALSO**

24899 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 24900 VALUE section.

24901 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

24902 **Issue 6**

24903 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

24904 **Issue 7**

24905 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

24906 The EXAMPLES section is revised. +

24907 **NAME**

24908 endservent, getservbyname, getservbyport, getservent, setservent — network services database
24909 functions

24910 **SYNOPSIS**

```
24911 #include <netdb.h>

24912 void endservent(void);
24913 struct servent *getservbyname(const char *name, const char *proto);
24914 struct servent *getservbyport(int port, const char *proto);
24915 struct servent *getservent(void);
24916 void setservent(int stayopen);
```

24917 **DESCRIPTION**

24918 These functions shall retrieve information about network services. This information is
24919 considered to be stored in a database that can be accessed sequentially or randomly. The
24920 implementation of this database is unspecified.

24921 The *setservent()* function shall open a connection to the database, and set the next entry to the
24922 first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each
24923 call to the *getservent()* function (either directly, or indirectly through one of the other *getserv*()*
24924 functions), and the implementation may maintain an open file descriptor for the database.

24925 The *getservent()* function shall read the next entry of the database, opening and closing a
24926 connection to the database as necessary.

24927 The *getservbyname()* function shall search the database from the beginning and find the first
24928 entry for which the service name specified by *name* matches the *s_name* member and the protocol
24929 name specified by *proto* matches the *s_proto* member, opening and closing a connection to the
24930 database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be
24931 matched.

24932 The *getservbyport()* function shall search the database from the beginning and find the first entry
24933 for which the port specified by *port* matches the *s_port* member and the protocol name specified
24934 by *proto* matches the *s_proto* member, opening and closing a connection to the database as
24935 necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port*
24936 argument shall be a value obtained by converting a *uint16_t* in network byte order to *int*.

24937 The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a
24938 **servent** structure, the members of which shall contain the fields of an entry in the network
24939 services database.

24940 The *endservent()* function shall close the database, releasing any open file descriptor.

24941 These functions need not be thread-safe. A function that is not required to be thread-safe is not
24942 required to be reentrant.

24943 **RETURN VALUE**

24944 Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to
24945 a **servent** structure if the requested entry was found, and a null pointer if the end of the database
24946 was reached or the requested entry was not found. Otherwise, a null pointer is returned.

24947 **ERRORS**

24948 No errors are defined.

SD5-XBD-ERN-14 is applied.

DRAFT

24967 **NAME**
 24968 endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database
 24969 functions

24970 SYNOPSIS

```
24971 XSI #include <utmpx.h>
24972
24973 void endutxent(void);
24974 struct utmpx *getutxent(void);
24975 struct utmpx *getutxid(const struct utmpx *id);
24976 struct utmpx *getutxline(const struct utmpx *line);
24977 struct utmpx *pututxline(const struct utmpx *utmpx);
24978 void setutxent(void);
```

24978 DESCRIPTION

24979 These functions shall provide access to the user accounting database.

24980 The *getutxent()* function shall read the next entry from the user accounting database. If the
 24981 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

24982 The *getutxid()* function shall search forward from the current point in the database. If the
 24983 *ut_type* value of the **utmpx** structure pointed to by *id* is *BOOT_TIME*, *OLD_TIME*, or
 24984 *NEW_TIME*, then it shall stop when it finds an entry with a matching *ut_type* value. If the
 24985 *ut_type* value is *INIT_PROCESS*, *LOGIN_PROCESS*, *USER_PROCESS*, or *DEAD_PROCESS*,
 24986 then it shall stop when it finds an entry whose type is one of these four and whose *ut_id* member
 24987 matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is
 24988 reached without a match, *getutxid()* shall fail.

24989 The *getutxline()* function shall search forward from the current point in the database until it
 24990 finds an entry of the type *LOGIN_PROCESS* or *USER_PROCESS* which also has a *ut_line* value
 24991 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached
 24992 without a match, *getutxline()* shall fail.

24993 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to
 24994 search for multiple occurrences, the application shall zero out the static data after each success,
 24995 or *getutxline()* may return a pointer to the same **utmpx** structure.

24996 There is one exception to the rule about clearing the structure before further reads are done. The
 24997 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user
 24998 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or
 24999 *getutxline()*, if the application has modified this structure and passed the pointer back to
 25000 *pututxline()*.

25001 For all entries that match a request, the *ut_type* member indicates the type of the entry. Other
 25002 members of the entry shall contain meaningful data based on the value of the *ut_type* member as
 25003 follows:

25004
25005
25006
25007
25008
25009
25010
25011
25012
25013

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	<i>ut_tv</i>
OLD_TIME	<i>ut_tv</i>
NEW_TIME	<i>ut_tv</i>
USER_PROCESS	<i>ut_id, ut_user</i> (login name of the user), <i>ut_line, ut_pid, ut_tv</i>
INIT_PROCESS	<i>ut_id, ut_pid, ut_tv</i>
LOGIN_PROCESS	<i>ut_id, ut_user</i> (implementation-defined name of the login process), <i>ut_pid, ut_tv</i>
DEAD_PROCESS	<i>ut_id, ut_pid, ut_tv</i>

25014
25015
25016
25017

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

25018
25019
25020
25021

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall use *getutxid()* to search for a record that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

25022

The *endutxent()* function shall close the user accounting database.

25023
25024

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

25025
25026

These functions need not be thread-safe. A function that is not required to be thread-safe is not required to be reentrant.

25027

RETURN VALUE

25028
25029
25030

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

25031
25032

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

25033
25034
25035

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

25036

The *endutxent()* and *setutxent()* functions shall not return a value.

25037

ERRORS

25038
25039

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

25040

The *pututxline()* function may fail if:

25041

[EPERM] The process does not have appropriate privileges.

25042
25043
25044

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

Issue 6

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

DRAFT

25061 **NAME**
25062 `environ` — array of character pointers to the environment strings

25063 **SYNOPSIS**
25064 `extern char **environ;`

25065 **DESCRIPTION**
25066 Refer to XBD [Chapter 8](#) (on page 159) and *exec*.

25067 **NAME**
25068 erand48 — generate uniformly distributed pseudo-random numbers

25069 **SYNOPSIS**

```
25070 XSI       #include <stdlib.h>  
25071       double erand48(unsigned short xsubi[3]);
```

25072 **DESCRIPTION**

25073 Refer to *drand48()*.

25074 **NAME**
 25075 erf, erff, erfl — error functions

25076 **SYNOPSIS**
 25077 #include <math.h>
 25078 double erf(double x);
 25079 float erff(float x);
 25080 long double erfl(long double x);

25081 DESCRIPTION

25082 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25083 conflict between the requirements described here and the ISO C standard is unintentional. This
 25084 volume of POSIX.1-200x defers to the ISO C standard.

25085 These functions shall compute the error function of their argument x , defined as:

25086
 25087
$$\frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

25088 An application wishing to check for error situations should set *errno* to zero and call
 25089 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25090 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25091 zero, an error has occurred.

25092 RETURN VALUE

25093 Upon successful completion, these functions shall return the value of the error function.

25094 MX If x is NaN, a NaN shall be returned.
 25095 If x is ± 0 , ± 0 shall be returned.
 25096 If x is $\pm \text{Inf}$, ± 1 shall be returned.
 25097 If x is subnormal, a range error may occur, and $2 * x / \text{sqrt}(\pi)$ should be returned.

25098 ERRORS

25099 These functions may fail if:

25100 MX **Range Error** The result underflows.
 25101 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25102 then *errno* shall be set to [ERANGE]. If the integer expression
 25103 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25104 floating-point exception shall be raised.

25105 EXAMPLES

25106 Computing the Probability for a Normal Variate

25107 This example shows how to use *erf()* to compute the probability that a normal variate assumes a
 25108 value in the range $[x1, x2]$ with $x1 \leq x2$. This example uses the constant M_SQRT1_2 which is part
 25109 of the XSI option.

```
25110 #include <math.h>
25111 double
25112 Phi(const double x1, const double x2)
25113 {
25114     return ( erf(x2*M_SQRT1_2) - erf(x1*M_SQRT1_2) ) / 2;
```

25115 }

25116 APPLICATION USAGE

25117 Underflow occurs when $|x| < \text{DBL_MIN} * (\text{sqrt}(\pi)/2)$.

25118 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
25119 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

25120 RATIONALE

25121 None.

25122 FUTURE DIRECTIONS

25123 None.

25124 SEE ALSO

25125 *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*

25126 XBD Section 4.19 (on page 104), `<math.h>`

25127 CHANGE HISTORY

25128 First released in Issue 1. Derived from Issue 1 of the SVID.

25129 Issue 5

25130 The DESCRIPTION is updated to indicate how an application should check for an error. This
25131 text was previously published in the APPLICATION USAGE section.

25132 Issue 6

25133 The *erf()* function is no longer marked as an extension.

25134 The *erfc()* function is split out onto its own reference page.

25135 The *erff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

25136 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
25137 revised to align with the ISO/IEC 9899:1999 standard.

25138 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
25139 marked.

25140 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/22 is applied, adding the example to the
25141 EXAMPLES section.

25142 **NAME**25143 `erfc`, `erfcf`, `erfcl` — complementary error functions25144 **SYNOPSIS**

```
25145 #include <math.h>
25146
25146 double erfc(double x);
25147 float erfcf(float x);
25148 long double erfcl(long double x);
```

25149 **DESCRIPTION**

25150 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25151 conflict between the requirements described here and the ISO C standard is unintentional. This
 25152 volume of POSIX.1-200x defers to the ISO C standard.

25153 These functions shall compute the complementary error function $1.0 - \text{erf}(x)$.

25154 An application wishing to check for error situations should set *errno* to zero and call
 25155 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25156 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25157 zero, an error has occurred.

25158 **RETURN VALUE**

25159 Upon successful completion, these functions shall return the value of the complementary error
 25160 function.

25161 If the correct value would cause underflow and is not representable, a range error may occur
 25162 MX and either 0.0 (if representable), or an implementation-defined value shall be returned.

25163 MX If *x* is NaN, a NaN shall be returned.

25164 If *x* is ± 0 , +1 shall be returned.

25165 If *x* is $-\text{Inf}$, +2 shall be returned.

25166 If *x* is $+\text{Inf}$, +0 shall be returned.

25167 If the correct value would cause underflow and is representable, a range error may occur and
 25168 the correct value shall be returned.

25169 **ERRORS**

25170 These functions may fail if:

25171 Range Error The result underflows.

25172 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25173 then *errno* shall be set to [ERANGE]. If the integer expression
 25174 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25175 floating-point exception shall be raised.

25176 **EXAMPLES**

25177 None.

25178 **APPLICATION USAGE**

25179 The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called
 25180 for large *x* and the result subtracted from 1.0.

25181 Note for IEEE Std 754-1985 **double**, $26.55 < x$ implies *erfc(x)* has underflowed.

25182 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 25183 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *erfc()* function is no longer marked as an extension.

These functions are split out from the *erf()* reference page.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

DRAFT

25203 **NAME**
25204 `erff, erfl` — error functions

25205 **SYNOPSIS**
25206 `#include <math.h>`
25207 `float erff(float x);`
25208 `long double erfl(long double x);`

25209 **DESCRIPTION**
25210 Refer to *erf()*.

25211 **NAME**

25212 errno — error return value

25213 **SYNOPSIS**

25214 #include <errno.h>

25215 **DESCRIPTION**25216 The lvalue *errno* is used by many functions to return error values.

25217 Many functions provide an error number in *errno*, which has type **int** and is defined in
 25218 <**errno.h**>. The value of *errno* shall be defined only after a call to a function for which it is
 25219 explicitly stated to be set and until it is changed by the next function call or if the application
 25220 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by
 25221 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of
 25222 <**errno.h**>. No function in this volume of POSIX.1-200x shall set *errno* to 0. The setting of *errno*
 25223 after a successful call to a function is unspecified unless the description of that function specifies
 25224 that *errno* shall not be modified.

25225 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a
 25226 macro definition is suppressed in order to access an actual object, or a program defines an
 25227 identifier with the name *errno*, the behavior is undefined.

25228 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant
 25229 pages.

25230 **RETURN VALUE**

25231 None.

25232 **ERRORS**

25233 None.

25234 **EXAMPLES**

25235 None.

25236 **APPLICATION USAGE**

25237 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard
 25238 in that they required *errno* to be defined as an external variable, whereas the ISO C standard
 25239 required only that *errno* be defined as a modifiable lvalue with type **int**.

25240 An application that needs to examine the value of *errno* to determine the error should set it to 0
 25241 before a function call, then inspect it before a subsequent function call.

25242 **RATIONALE**

25243 None.

25244 **FUTURE DIRECTIONS**

25245 None.

25246 **SEE ALSO**25247 [Section 2.3](#)25248 XBD <**errno.h**>25249 **CHANGE HISTORY**

25250 First released in Issue 1. Derived from Issue 1 of the SVID.

25251

Issue 5

25252

25253

25254

The following sentence is deleted from the DESCRIPTION: “The value of *errno* is 0 at program start-up, but is never set to 0 by any XSI function”. The DESCRIPTION also no longer states that conforming implementations may support the declaration:

25255

```
extern int errno;
```

25256

Issue 6

25257

Obsolescent text regarding defining *errno* as:

25258

```
extern int errno
```

25259

is removed.

25260

Text regarding no function setting *errno* to zero to indicate an error is changed to no function shall set *errno* to zero. This is for alignment with the ISO/IEC 9899:1999 standard.

25261

25262

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/23 is applied, adding text to the DESCRIPTION stating that the setting of *errno* after a successful call to a function is unspecified unless the description of the function requires that it will not be modified.

25263

25264

25265 **NAME**

25266 environ, execl, execv, execl, execve, execlp, execvp, fexecve — execute a file

25267 **SYNOPSIS**

```

25268 #include <unistd.h>
25269
25269 extern char **environ;
25270 int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
25271 int execl(const char *path, const char *arg0, ... /*,
25272          (char *)0, char *const envp[]*/);
25273 int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
25274 int execv(const char *path, char *const argv[]);
25275 int execve(const char *path, char *const argv[], char *const envp[]);
25276 int execvp(const char *file, char *const argv[]);
25277 int fexecve(int fd, char *const argv[], char *const envp[]);

```

25278 **DESCRIPTION**

25279 The *exec* family of functions shall replace the current process image with a new process image.
 25280 The new image shall be constructed from a regular, executable file called the *new process image*
 25281 *file*. There shall be no return from a successful *exec*, because the calling process image is overlaid
 25282 by the new process image.

25283 The *fexecve()* function shall be equivalent to the *execve()* function except that the file to be
 25284 executed is determined by the file descriptor *fd* instead of a pathname. The file offset of *fd* is
 25285 ignored.

25286 When a C-language program is executed as a result of a call to one of the *exec* family of
 25287 functions, it shall be entered as a C-language function call as follows:

```
25288 int main (int argc, char *argv[]);
```

25289 where *argc* is the argument count and *argv* is an array of character pointers to the arguments
 25290 themselves. In addition, the following variable:

```
25291 extern char **environ;
```

25292 is initialized as a pointer to an array of character pointers to the environment strings. The *argv*
 25293 and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv*
 25294 array is not counted in *argc*.

25295 Conforming multi-threaded applications shall not use the *environ* variable to access or modify
 25296 any environment variable while any other thread is concurrently modifying any environment
 25297 variable. A call to any function dependent on any environment variable shall be considered a
 25298 use of the *environ* variable to access that environment variable.

25299 The arguments specified by a program with one of the *exec* functions shall be passed on to the
 25300 new process image in the corresponding *main()* arguments.

25301 The argument *path* points to a pathname that identifies the new process image file.

25302 The argument *file* is used to construct a pathname that identifies the new process image file. If
 25303 the *file* argument contains a slash character, the *file* argument shall be used as the pathname for
 25304 this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed
 25305 as the environment variable *PATH* (see XBD Chapter 8, on page 159). If this environment
 25306 variable is not present, the results of the search are implementation-defined.

25307 There are two distinct ways in which the contents of the process image file may cause the
 25308 execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the
 25309 ERRORS section). In the cases where the other members of the *exec* family of functions would

25310 fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command
 25311 interpreter and the environment of the executed command shall be as if the process invoked the
 25312 *sh* utility using *execl()* as follows:

```
25313 execl(<shell path>, arg0, file, arg1, ..., (char *)0);
```

25314 where *<shell path>* is an unspecified pathname for the *sh* utility, *file* is the process image file, and
 25315 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv*[0],
 25316 *argv*[1], and so on.

25317 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These
 25318 strings shall constitute the argument list available to the new process image. The list is
 25319 terminated by a null pointer. The argument *arg0* should point to a filename that is associated
 25320 with the process being started by one of the *exec* functions.

25321 The argument *argv* is an array of character pointers to null-terminated strings. The application
 25322 shall ensure that the last member of this array is a null pointer. These strings shall constitute the
 25323 argument list available to the new process image. The value in *argv*[0] should point to a filename
 25324 that is associated with the process being started by one of the *exec* functions.

25325 The argument *envp* is an array of character pointers to null-terminated strings. These strings
 25326 shall constitute the environment for the new process image. The *envp* array is terminated by a
 25327 null pointer.

25328 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the
 25329 environment for the new process image shall be taken from the external variable *environ* in the
 25330 calling process.

25331 The number of bytes available for the new process' combined argument and environment lists is
 25332 {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any
 25333 alignment bytes are included in this total.

25334 File descriptors open in the calling process image shall remain open in the new process image,
 25335 except for those whose close-on-exec flag FD_CLOEXEC is set. For those file descriptors that
 25336 remain open, all attributes of the open file description remain unchanged. For any file descriptor
 25337 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.
 25338 Locks that are not removed by closing of file descriptors remain unchanged.

25339 If file descriptors 0, 1, and 2 would otherwise be closed after a successful call to one of the *exec*
 25340 family of functions, and the new process image file has the set-user-ID or set-group-ID file mode
 25341 XSI bits set, and the ST_NOSUID bit is not set for the file system containing the new process image
 25342 file, implementations may open an unspecified file for each of these file descriptors in the new
 25343 process image.

25344 Directory streams open in the calling process image shall be closed in the new process image.

25345 The state of the floating-point environment in the initial thread of the new process image shall
 25346 be set to the default.

25347 The state of conversion descriptors and message catalog descriptors in the new process image is
 25348 undefined.

25349 For the new process image, the equivalent of:

```
25350 setlocale(LC_ALL, "C")
```

25351 shall be executed at start-up.

25352 Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default
 25353 action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by
 25354 the calling process image shall be set to be ignored by the new process image. Signals set to be
 25355 caught by the calling process image shall be set to the default action in the new process image

- 25356 (see <signal.h>).
- 25357 If the SIGCHLD signal is set to be ignored by the calling process image, it is unspecified whether
25358 the SIGCHLD signal is set to be ignored or to the default action in the new process image.
- 25359 XSI After a successful call to any of the *exec* functions, alternate signal stacks are not preserved and
25360 the SA_ONSTACK flag shall be cleared for all signals.
- 25361 After a successful call to any of the *exec* functions, any functions previously registered by the
25362 *atexit()* or *pthread_atfork()* functions are no longer registered.
- 25363 XSI If the ST_NOSUID bit is set for the file system containing the new process image file, then the
25364 effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged
25365 in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is
25366 set, the effective user ID of the new process image shall be set to the user ID of the new process
25367 image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the
25368 effective group ID of the new process image shall be set to the group ID of the new process
25369 image file. The real user ID, real group ID, and supplementary group IDs of the new process
25370 image shall remain the same as those of the calling process image. The effective user ID and
25371 effective group ID of the new process image shall be saved (as the saved set-user-ID and the
25372 saved set-group-ID) for use by *setuid()*.
- 25373 XSI Any shared memory segments attached to the calling process image shall not be attached to the
25374 new process image.
- 25375 Any named semaphores open in the calling process shall be closed as if by appropriate calls to
25376 *sem_close()*.
- 25377 TYM Any blocks of typed memory that were mapped in the calling process are unmapped, as if
25378 *munmap()* was implicitly called to unmap them.
- 25379 ML Memory locks established by the calling process via calls to *mlockall()* or *mlock()* shall be
25380 removed. If locked pages in the address space of the calling process are also mapped into the
25381 address spaces of other processes and are locked by those processes, the locks established by the
25382 other processes shall be unaffected by the call by this process to the *exec* function. If the *exec*
25383 function fails, the effect on memory locks is unspecified.
- 25384 Memory mappings created in the process are unmapped before the address space is rebuilt for
25385 the new process image.
- 25386 SS When the calling process image does not use the SCHED_FIFO, SCHED_RR, or
25387 SCHED_SPORADIC scheduling policies, the scheduling policy and parameters of the new
25388 process image and the initial thread in that new process image are implementation-defined.
- 25389 PS When the calling process image uses the SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC
25390 scheduling policies, the process policy and scheduling parameter settings shall not be changed
25391 by a call to an *exec* function. The initial thread in the new process image shall inherit the process
25392 scheduling policy and parameters. It shall have the default system contention scope, but shall
25393 inherit its allocation domain from the calling process image.
- 25394 Per-process timers created by the calling process shall be deleted before replacing the current
25395 process image with the new process image.
- 25396 MSG All open message queue descriptors in the calling process shall be closed, as described in
25397 *mq_close()*.
- 25398 Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O
25399 operations that are not canceled shall complete as if the *exec* function had not yet occurred, but
25400 any associated signal notifications shall be suppressed. It is unspecified whether the *exec*
25401 function itself blocks awaiting such I/O completion. In no event, however, shall the new process
25402 image created by the *exec* function be affected by the presence of outstanding asynchronous I/O

25403		operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O
25404		may be canceled upon <i>exec</i> , is implementation-defined.
25405	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This
25406		inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be
25407		reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the
25408		process executing the <i>exec</i> function itself.
25409	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set
25410		to zero.
25411	OB TRC	If the calling process is being traced, the new process image shall continue to be traced into the
25412		same trace stream as the original process image, but the new process image shall not inherit the
25413		mapping of trace event names to trace event type identifiers that was defined by calls to the
25414		<i>posix_trace_eventid_open()</i> or the <i>posix_trace_trid_eventid_open()</i> functions in the calling process
25415		image.
25416		If the calling process is a trace controller process, any trace streams that were created by the
25417		calling process shall be shut down as described in the <i>posix_trace_shutdown()</i> function.
25418		The thread ID of the initial thread in the new process image is unspecified.
25419		The size and location of the stack on which the initial thread in the new process image runs is
25420		unspecified.
25421		The initial thread in the new process image shall have its cancellation type set to
25422		PTHREAD_CANCEL_DEFERRED and its cancellation state set to
25423		PTHREAD_CANCEL_ENABLED.
25424		The initial thread in the new process image shall have all thread-specific data values set to
25425		NULL and all thread-specific data keys shall be removed by the call to <i>exec</i> without running
25426		destructors.
25427		The initial thread in the new process image shall be joinable, as if created with the <i>detachstate</i>
25428		attribute set to PTHREAD_CREATE_JOINABLE.
25429		The new process shall inherit at least the following attributes from the calling process image:
25430	XSI	• Nice value (see <i>nice()</i>)
25431	XSI	• <i>semadj</i> values (see <i>semop()</i>)
25432		• Process ID
25433		• Parent process ID
25434		• Process group ID
25435		• Session membership
25436		• Real user ID
25437		• Real group ID
25438		• Supplementary group IDs
25439		• Time left until an alarm clock signal (see <i>alarm()</i>)
25440		• Current working directory
25441		• Root directory
25442		• File mode creation mask (see <i>umask()</i>)

- 25443 XSI • File size limit (see `getrlimit()` and `setrlimit()`)
- 25444 • Process signal mask (see `pthread_sigmask()`)
- 25445 • Pending signal (see `sigpending()`)
- 25446 • `tms_utime`, `tms_stime`, `tms_cutime`, and `tms_cstime` (see `times()`)
- 25447 XSI • Resource limits
- 25448 • Controlling terminal
- 25449 XSI • Interval timers
- 25450 The initial thread of the new process shall inherit at least the following attributes from the
- 25451 calling thread:
- 25452 • Signal mask (see `sigprocmask()` and `pthread_sigmask()`)
- 25453 • Pending signals (see `sigpending()`)
- 25454 All other process attributes defined in this volume of POSIX.1-200x shall be inherited in the new
- 25455 process image from the old process image. All other thread attributes defined in this volume of
- 25456 POSIX.1-200x shall be inherited in the initial thread in the new process image from the calling
- 25457 thread in the old process image. The inheritance of process or thread attributes not defined by
- 25458 this volume of POSIX.1-200x is implementation-defined.
- 25459 A call to any *exec* function from a process with more than one thread shall result in all threads
- 25460 being terminated and the new executable image being loaded and executed. No destructor
- 25461 functions or cleanup handlers shall be called.
- 25462 Upon successful completion, the *exec* functions shall mark for update the last data access
- 25463 timestamp of the file. If an *exec* function failed but was able to locate the process image file,
- 25464 whether the last data access timestamp is marked for update is unspecified. Should the *exec*
- 25465 function succeed, the process image file shall be considered to have been opened with `open()`.
- 25466 The corresponding `close()` shall be considered to occur at a time after this open, but before
- 25467 process termination or successful completion of a subsequent call to one of the *exec* functions,
- 25468 `posix_spawn()`, or `posix_spawnnp()`. The `argv[]` and `envp[]` arrays of pointers and the strings to
- 25469 which those arrays point shall not be modified by a call to one of the *exec* functions, except as a
- 25470 consequence of replacing the process image.
- 25471 XSI The saved resource limits in the new process image are set to be a copy of the process'
- 25472 corresponding hard and soft limits.

RETURN VALUE

- 25473 If one of the *exec* functions returns to the calling process image, an error has occurred; the return
- 25474 value shall be `-1`, and `errno` shall be set to indicate the error.

ERRORS

- 25476 The *exec* functions shall fail if:
- 25477
- 25478 [E2BIG] The number of bytes used by the new process image's argument list and
- 25479 environment list is greater than the system-imposed limit of `{ARG_MAX}`
- 25480 bytes.
- 25481 [EACCES] Search permission is denied for a directory listed in the new process image
- 25482 file's path prefix, or the new process image file denies execution permission,
- 25483 or the new process image file is not a regular file and the implementation does
- 25484 not support execution of files of its type.
- 25485 [EINVAL] The new process image file has the appropriate permission and has a
- 25486 recognized executable binary format, but the system does not support
- 25487 execution of a file with this format.

- 25488 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*
25489 argument.
- 25490 [ENAMETOOLONG]
25491 The length of the *path* or *file* arguments exceeds {PATH_MAX} or a pathname
25492 component is longer than {NAME_MAX}.
- 25493 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an
25494 empty string.
- 25495 [ENOTDIR] A component of the new process image file's path prefix is not a directory.
25496 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:
- 25497 [ENOEXEC] The new process image file has the appropriate access permission but has an
25498 unrecognized format.
- 25499 The *fexecve()* function shall fail if:
- 25500 [EBADF] The *fd* argument is not a valid file descriptor open for executing.
25501 The *exec* functions may fail if:
- 25502 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
25503 resolution of the *path* or *file* argument.
- 25504 [ENAMETOOLONG]
25505 As a result of encountering a symbolic link in resolution of the *path* argument,
25506 the length of the substituted pathname string exceeded {PATH_MAX}.
- 25507 [ENOMEM] The new process image requires more memory than is allowed by the
25508 hardware or system-imposed memory management constraints.
- 25509 [ETXTBSY] The new process image file is a pure procedure (shared text) file that is
25510 currently open for writing by some process.

EXAMPLES

Using *execl()*

The following example executes the *ls* command, specifying the pathname of the executable (*/bin/ls*) and using arguments supplied directly to the command to produce single-column output.

```
#include <unistd.h>
int ret;
...
ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

Using *execle()*

The following example is similar to [Using *execl\(\)*](#). In addition, it specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>
int ret;
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

25528

Using execlp()

25529

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable.

25530

25531

```
#include <unistd.h>
```

25532

```
int ret;
```

25533

```
...
```

25534

```
ret = execlp ("ls", "ls", "-l", (char *)0);
```

25535

Using execv()

25536

The following example passes arguments to the *ls* command in the *cmd* array.

25537

```
#include <unistd.h>
```

25538

```
int ret;
```

25539

```
char *cmd[] = { "ls", "-l", (char *)0 };
```

25540

```
...
```

25541

```
ret = execv ("/bin/ls", cmd);
```

25542

Using execve()

25543

The following example passes arguments to the *ls* command in the *cmd* array, and specifies the environment for the new process image using the *env* argument.

25544

25545

```
#include <unistd.h>
```

25546

```
int ret;
```

25547

```
char *cmd[] = { "ls", "-l", (char *)0 };
```

25548

```
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
```

25549

```
...
```

25550

```
ret = execve ("/bin/ls", cmd, env);
```

25551

Using execvp()

25552

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable, and passes arguments to the *ls* command in the *cmd* array.

25553

25554

25555

```
#include <unistd.h>
```

25556

```
int ret;
```

25557

```
char *cmd[] = { "ls", "-l", (char *)0 };
```

25558

```
...
```

25559

```
ret = execvp ("ls", cmd);
```

25560

APPLICATION USAGE

25561

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, conforming applications should not rely on their use and should close them prior to calling one of the *exec* functions.

25562

25563

25564

Applications that require other than the default POSIX locale should call *setlocale()* with the appropriate parameters to establish the locale of the new process.

25565

25566

The *environ* array should not be accessed directly by the application.

25567

The new process might be invoked in a non-conforming environment if the *envp* array does not contain implementation-defined variables required by the implementation to provide a conforming environment. See the *_CS_V7_ENV* entry in **<unistd.h>** and *confstr()* for details.

25568

25569

25570 Applications should not depend on file descriptors 0, 1, and 2 being closed after an *exec*. A
25571 future version may allow these file descriptors to be automatically opened for any process.

25572 If an application wants to perform a checksum test of the file being executed before executing it,
25573 the file will need to be opened with read permission to perform the checksum test.

25574 Since execute permission is checked by *fexecve()*, the file description *fd* need not have been
25575 opened with the O_EXEC flag. However, if the file to be executed denies read and write
25576 permission for the process preparing to do the *exec*, the only way to provide the *fd* to *fexecve()*
25577 will be to use the O_EXEC flag when opening *fd*. In this case, the application will not be able to
25578 perform a checksum test since it will not be able to read the contents of the file.

25579 Note that when a file descriptor is opened with O_RDONLY, O_RDWR, or O_WRONLY mode,
25580 the file descriptor can be used to read, read and write, or write the file, respectively, even if the
25581 mode of the file changes after the file was opened. Using the O_EXEC open mode is different;
25582 *fexecve()* will ignore the mode that was used when the file descriptor was opened and the *exec*
25583 will fail if the mode of the file associated with *fd* does not grant execute permission to the calling
25584 process at the time *fexecve()* is called.

25585 RATIONALE

25586 Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was
25587 driven by the same requirement in drafts of the ISO C standard. In fact, historical
25588 implementations have passed a value of zero when no arguments are supplied to the caller of
25589 the *exec* functions. This requirement was removed from the ISO C standard and subsequently
25590 removed from this volume of POSIX.1-200x as well. The wording, in particular the use of the
25591 word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to
25592 the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an
25593 application. In fact, this is good practice, since many existing applications reference *argv*[0]
25594 without first checking the value of *argc*.

25595 The requirement on a Strictly Conforming POSIX Application also states that the value passed as
25596 the first argument be a filename associated with the process being started. Although some
25597 existing applications pass a pathname rather than a filename in some circumstances, a filename
25598 is more generally useful, since the common usage of *argv*[0] is in printing diagnostics. In some
25599 cases the filename passed is not the actual filename of the file; for example, many
25600 implementations of the *login* utility use a convention of prefixing a hyphen ('-') to the actual
25601 filename, which indicates to the command interpreter being invoked that it is a “login shell”.

25602 Historically there have been two ways that implementations can *exec* shell scripts.

25603 One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()*
25604 functions return an [ENOEXEC] error for any file not recognizable as executable, including a
25605 shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file
25606 to be a shell script and invoke a known command interpreter to interpret such files. This is now
25607 required by POSIX.1-200x. These implementations of *execvp()* and *execlp()* only give the
25608 [ENOEXEC] error in the rare case of a problem with the command interpreter’s executable file.
25609 Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp()* or
25610 *execvp()*, although implementations can still give it.

25611 Another way that some historical implementations handle shell scripts is by recognizing the first
25612 two bytes of the file as the character string “#!” and using the remainder of the first line of the
25613 file as the name of the command interpreter to execute.

25614 One potential source of confusion noted by the standard developers is over how the contents of
25615 a process image file affect the behavior of the *exec* family of functions. The following is a
25616 description of the actions taken:

1. If the process image file is a valid executable (in a format that is executable and valid and having appropriate permission) for this system, then the system executes the file.
2. If the process image file has appropriate permission and is in a format that is executable but not valid for this system (such as a recognized binary for another architecture), then this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
3. If the process image file has appropriate permission but is not otherwise recognized:
 - a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter assuming that the process image file is a shell script.
 - b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to [ENOEXEC].

Applications that do not require to access their arguments may use the form:

```
main(void)
```

as specified in the ISO C standard. However, the implementation will always provide the two arguments *argc* and *argv*, even if they are not used.

Some implementations provide a third argument to *main()* called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments, so implementations must support applications written this way. Since this volume of POSIX.1-200x defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv()* function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of POSIX.1-200x specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the new process image inherits the signal mask of the thread that called *exec* in the old process image. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without explicit reason to do so, and especially not to block signals across *execs* of arbitrary (not closely co-operating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv[]* and *envp[]* being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src* derived from the ISO C standard summarizes the compatibility:

25661
25662
25663
25664
25665
25666

<i>dst:</i>	char *[]	const char *[]	char *const[]	const char *const[]
<i>src:</i>				
char *[]	VALID	—	VALID	—
const char *[]	—	VALID	—	VALID
char * const []	—	—	VALID	—
const char *const[]	—	—	—	VALID

25667
25668
25669
25670
25671

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

25672
25673
25674
25675
25676
25677
25678

The ISO C standard and this volume of POSIX.1-200x do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of POSIX.1-200x is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

25679
25680

[E2BIG] The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

25681
25682

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

25683
25684
25685
25686
25687
25688
25689
25690
25691
25692
25693

[EINVAL] This error condition was added to POSIX.1-200x to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp()*, and *execlp()* that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

25694
25695
25696
25697

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

25698
25699
25700
25701

[ENAMETOOLONG]

Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

25702
25703
25704

[ETXTBSY]

System V returns this error when the executable file is currently open for writing by some process. This volume of POSIX.1-200x neither requires nor prohibits this behavior.

25705
25706
25707

Other systems (such as System V) may return [INTR] from *exec*. This is not addressed by this volume of POSIX.1-200x, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [INTR].

25708

An explicit statement regarding the floating-point environment (as defined in the **<fenv.h>**

header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

25713	<i>posix_spawn()</i>	Set to default.
25714	<i>fork()</i>	Inherit.
25715	<i>pthread_create()</i>	Inherit.

The purpose of the *fexecve()* function is to enable executing a file which has been verified to be the intended file. It is possible to actively check the file by reading from the file descriptor and be sure that the file is not exchanged for another between the reading and the execution. Alternatively, an function like *openat()* can be used to open a file which has been found by reading the content of a directory using *readdir()*.

25721 FUTURE DIRECTIONS

25722 None.

25729 CHANGE HISTORY

25730 First released in Issue 1. Derived from Issue 1 of the SVID.

25731 Issue 5

25732 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 25733 Threads Extension.

25734 Large File Summit extensions are added.

25735 Issue 6

25736 The following new requirements on POSIX implementations derive from alignment with the
 25737 Single UNIX Specification:

- 25738 • In the DESCRIPTION, behavior is defined for when the process image file is not a valid
 25739 executable.
- 25740 • In this version, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective
 25741 group ID of the new process image shall be saved (as the saved set-user-ID and the saved
 25742 set-group-ID) for use by the *setuid()* function.
- 25743 • The [ELOOP] mandatory error condition is added.
- 25744 • A second [ENAMETOOLONG] is added as an optional error condition.
- 25745 • The [ETXTBSY] optional error condition is added.

25746 The following changes were made to align with the IEEE P1003.1a draft standard:

- 25747 • The [EINVAL] mandatory error condition is added.
- 25748 • The [ELOOP] optional error condition is added.

25749 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

25750 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics
 25751 for typed memory.

- 25752 The normative text is updated to avoid use of the term “must” for application requirements.
- 25753 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.
- 25754 IEEE PASC Interpretation 1003.1 #132 is applied.
- 25755 The DESCRIPTION is updated to make it explicit that the floating-point environment in the new
25756 process image is set to the default.
- 25757 The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents
25758 of a process image file affect the behavior of the *exec* functions.
- 25759 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/15 is applied, adding a new paragraph to
25760 the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change
25761 addresses a security concern, where implementations may want to reopen file descriptors 0, 1,
25762 and 2 for programs with the set-user-id or set-group-id file mode bits calling the *exec* family of
25763 functions.
- 25764 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/24 is applied, applying changes to the
25765 DESCRIPTION, addressing which attributes are inherited by threads, and behavioral
25766 requirements for threads attributes.
- 25767 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/25 is applied, updating text in the
25768 RATIONALE from “the process signal mask be unchanged across an *exec*” to “the new process
25769 image inherits the signal mask of the thread that called *exec* in the old process image”.
- 25770 **Issue 7**
- 25771 Austin Group Interpretation 1003.1-2001 #047 is applied, adding the description of `_CS_V7_ENV`
25772 to the APPLICATION USAGE.
- 25773 The *fexecve()* function is added from The Open Group Technical Standard, 2006, Extended API
25774 Set Part 2.
- 25775 Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Threads,
25776 and Timers options is moved to the Base.
- 25777 Changes are made related to support for finegrained timestamps. +

25778 **NAME**

25779 exit — terminate a process

25780 **SYNOPSIS**

25781 #include <stdlib.h>

25782 void exit(int status);

25783 **DESCRIPTION**

25784 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25785 conflict between the requirements described here and the ISO C standard is unintentional. This
 25786 volume of POSIX.1-200x defers to the ISO C standard.

25787 CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only
 25788 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

25789 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their
 25790 registration, except that a function is called after any previously registered functions that had
 25791 already been called at the time it was registered. Each function is called as many times as it was
 25792 registered. If, during the call to any such function, a call to the *longjmp()* function is made that
 25793 would terminate the call to the registered function, the behavior is undefined.

25794 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall
 25795 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more
 25796 than once, the behavior is undefined.

25797 CX The *exit()* function shall then flush all open streams with unwritten buffered data and close all
 25798 open streams. Finally, the process shall be terminated with the same consequences as described
 25799 in [Consequences of Process Termination](#) (on page 523).

25800 **RETURN VALUE**25801 The *exit()* function does not return.25802 **ERRORS**

25803 No errors are defined.

25804 **EXAMPLES**

25805 None.

25806 **APPLICATION USAGE**

25807 None.

25808 **RATIONALE**25809 See *_Exit()*.25810 **FUTURE DIRECTIONS**

25811 None.

25812 **SEE ALSO**25813 [_Exit\(\)](#), [atexit\(\)](#), [exec](#), [longjmp\(\)](#), [tmpfile\(\)](#)25814 XBD [<stdlib.h>](#)25815 **CHANGE HISTORY**25816 **Issue 7**25817 Austin Group Interpretation 1003.1-2001 #031 is applied, separating the *_Exit()* and *_exit()*
 25818 functions from the *exit()* function.

25819 Austin Group Interpretation 1003.1-2001 #085 is applied.

25820 **NAME**
 25821 `exp, expf, expl` — exponential function

25822 **SYNOPSIS**
 25823 `#include <math.h>`
 25824 `double exp(double x);`
 25825 `float expf(float x);`
 25826 `long double expl(long double x);`

25827 **DESCRIPTION**

25828 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25829 conflict between the requirements described here and the ISO C standard is unintentional. This
 25830 volume of POSIX.1-200x defers to the ISO C standard.

25831 These functions shall compute the base-*e* exponential of *x*.

25832 An application wishing to check for error situations should set *errno* to zero and call
 25833 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25834 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25835 zero, an error has occurred.

25836 **RETURN VALUE**

25837 Upon successful completion, these functions shall return the exponential value of *x*.

25838 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*
 25839 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

25840 If the correct value would cause underflow, and is not representable, a range error may occur,
 25841 and either 0.0 (if supported), or an implementation-defined value shall be returned.

25842 MX If *x* is NaN, a NaN shall be returned.

25843 If *x* is ± 0 , 1 shall be returned.

25844 If *x* is $-\text{Inf}$, +0 shall be returned.

25845 If *x* is $+\text{Inf}$, *x* shall be returned.

25846 If the correct value would cause underflow, and is representable, a range error may occur and
 25847 the correct value shall be returned.

25848 **ERRORS**

25849 These functions shall fail if:

25850 Range Error The result overflows.

25851 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25852 then *errno* shall be set to [ERANGE]. If the integer expression
 25853 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 25854 floating-point exception shall be raised.

25855 These functions may fail if:

25856 Range Error The result underflows.

25857 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25858 then *errno* shall be set to [ERANGE]. If the integer expression
 25859 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25860 floating-point exception shall be raised.

25861 **EXAMPLES**25862 **Computing the Density of the Standard Normal Distribution**

25863 This function shows an implementation for the density of the standard normal distribution
 25864 using `exp()`. This example uses the constant `M_PI` which is part of the XSI option.

```
25865 #include <math.h>
25866
25867 double
25868 normal_density (double x)
25869 {
25870     return exp(-x*x/2) / sqrt (2*M_PI);
25871 }
```

25871 **APPLICATION USAGE**

25872 Note that for IEEE Std 754-1985 **double**, $709.8 < x$ implies `exp(x)` has overflowed. The value
 25873 $x < -708.4$ implies `exp(x)` has underflowed.

25874 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
 25875 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

25876 **RATIONALE**

25877 None.

25878 **FUTURE DIRECTIONS**

25879 None.

25880 **SEE ALSO**

25881 [feclearexcept\(\)](#), [fetestexcept\(\)](#), [isnan\(\)](#), [log\(\)](#)

25882 XBD [Section 4.19](#) (on page 104), [<math.h>](#)

25883 **CHANGE HISTORY**

25884 First released in Issue 1. Derived from Issue 1 of the SVID.

25885 **Issue 5**

25886 The DESCRIPTION is updated to indicate how an application should check for an error. This
 25887 text was previously published in the APPLICATION USAGE section.

25888 **Issue 6**

25889 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

25890 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 25891 revised to align with the ISO/IEC 9899:1999 standard.

25892 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 25893 marked.

25894 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/26 is applied, adding the example to the
 25895 EXAMPLES section.

25896 **NAME**
 25897 exp2, exp2f, exp2l — exponential base 2 functions

25898 **SYNOPSIS**
 25899 #include <math.h>
 25900 double exp2(double x);
 25901 float exp2f(float x);
 25902 long double exp2l(long double x);

25903 **DESCRIPTION**

25904 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25905 conflict between the requirements described here and the ISO C standard is unintentional. This
 25906 volume of POSIX.1-200x defers to the ISO C standard.

25907 These functions shall compute the base-2 exponential of x .

25908 An application wishing to check for error situations should set *errno* to zero and call
 25909 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25910 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25911 zero, an error has occurred.

25912 **RETURN VALUE**

25913 Upon successful completion, these functions shall return 2^x .

25914 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and
 25915 *exp2l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 25916 respectively.

25917 If the correct value would cause underflow, and is not representable, a range error may occur,
 25918 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

25919 MX If x is NaN, a NaN shall be returned.

25920 If x is ± 0 , 1 shall be returned.

25921 If x is $-\text{Inf}$, $+\text{0}$ shall be returned.

25922 If x is $+\text{Inf}$, x shall be returned.

25923 If the correct value would cause underflow, and is representable, a range error may occur and
 25924 the correct value shall be returned.

25925 **ERRORS**

25926 These functions shall fail if:

25927 Range Error The result overflows.

25928 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25929 then *errno* shall be set to [ERANGE]. If the integer expression
 25930 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 25931 floating-point exception shall be raised.

25932 These functions may fail if:

25933 Range Error The result underflows.

25934 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25935 then *errno* shall be set to [ERANGE]. If the integer expression
 25936 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25937 floating-point exception shall be raised.

DRAFT

25954 **NAME**
 25955 expm1, expm1f, expm1l — compute exponential functions

25956 **SYNOPSIS**
 25957 #include <math.h>
 25958 double expm1(double x);
 25959 float expm1f(float x);
 25960 long double expm1l(long double x);

25961 **DESCRIPTION**
 25962 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25963 conflict between the requirements described here and the ISO C standard is unintentional. This
 25964 volume of POSIX.1-200x defers to the ISO C standard.

25965 These functions shall compute $e^x-1.0$.

25966 An application wishing to check for error situations should set *errno* to zero and call
 25967 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 25968 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 25969 zero, an error has occurred.

25970 **RETURN VALUE**
 25971 Upon successful completion, these functions return $e^x-1.0$.
 25972 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and
 25973 *expm1l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 25974 respectively.

25975 MX If *x* is NaN, a NaN shall be returned.
 25976 If *x* is ± 0 , ± 0 shall be returned.
 25977 If *x* is $-\text{Inf}$, -1 shall be returned.
 25978 If *x* is $+\text{Inf}$, *x* shall be returned.
 25979 If *x* is subnormal, a range error may occur and *x* should be returned.

25980 **ERRORS**
 25981 These functions shall fail if:
 25982 Range Error The result overflows.
 25983 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25984 then *errno* shall be set to [ERANGE]. If the integer expression
 25985 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 25986 floating-point exception shall be raised.

25987 These functions may fail if:
 25988 MX Range Error The value of *x* is subnormal.
 25989 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 25990 then *errno* shall be set to [ERANGE]. If the integer expression
 25991 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 25992 floating-point exception shall be raised.

APPLICATION USAGE

The value of $\text{expm1}(x)$ may be more accurate than $\text{exp}(x)-1.0$ for small values of x .

The $\text{expm1}()$ and $\text{log1p}()$ functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:

$\text{expm1}(n * \text{log1p}(x)) / x$

when x is very small (for example, when calculating small daily interest rates). These functions also simplify writing accurate inverse hyperbolic functions.

For IEEE Std 754-1985 **double**, $709.8 < x$ implies $\text{expm1}(x)$ has overflowed.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The $\text{expm1f}()$ and $\text{expm1l}()$ functions are added for alignment with the ISO/IEC 9899:1999 standard.

The $\text{expm1}()$ function is no longer marked as an extension.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

26023 **NAME**
 26024 `fabs, fabsf, fabsl` — absolute value function

26025 **SYNOPSIS**
 26026 `#include <math.h>`
 26027 `double fabs(double x);`
 26028 `float fabsf(float x);`
 26029 `long double fabsl(long double x);`

26030 **DESCRIPTION**
 26031 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26032 conflict between the requirements described here and the ISO C standard is unintentional. This
 26033 volume of POSIX.1-200x defers to the ISO C standard.

26034 These functions shall compute the absolute value of their argument x , $|x|$.

26035 **RETURN VALUE**
 26036 Upon successful completion, these functions shall return the absolute value of x .

26037 MX If x is NaN, a NaN shall be returned.
 26038 If x is ± 0 , $+0$ shall be returned.
 26039 If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.

26040 **ERRORS**
 26041 No errors are defined.

26042 EXAMPLES

Computing the 1-Norm of a Floating-Point Vector

26043 This example shows the use of `fabs()` to compute the 1-norm of a vector defined as follows:

26044 $\text{norm1}(v) = |v[0]| + |v[1]| + \dots + |v[n-1]|$

26045 where $|x|$ denotes the absolute value of x , n denotes the vector's dimension $v[i]$ denotes the i -th
 26046 component of v ($0 \leq i < n$).

```
26047 #include <math.h>
26048
26049 double
26050 norm1(const double v[], const int n)
26051 {
26052     int    i;
26053     double n1_v; /* 1-norm of v */
26054
26055     n1_v = 0;
26056     for (i=0; i<n; i++) {
26057         n1_v += fabs (v[i]);
26058     }
26059     return n1_v;
26060 }
```

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

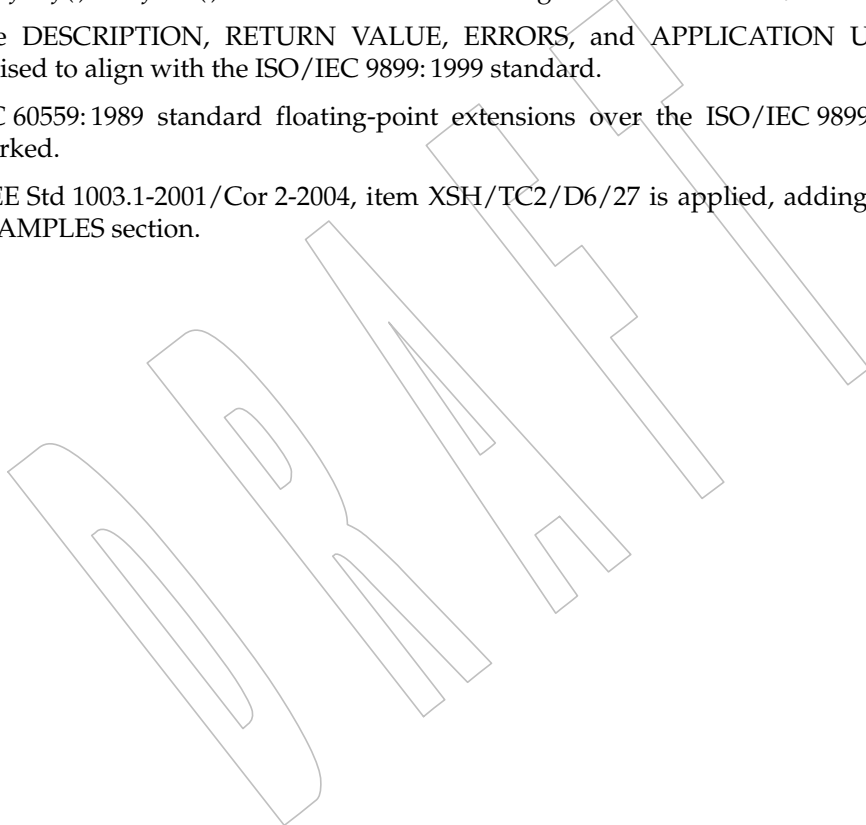

Issue 6

The *fabsf()* and *fabsl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/27 is applied, adding the example to the EXAMPLES section.

26082 **NAME**
26083 `faccessat` — determine accessibility of a file relative to directory file descriptor

26084 **SYNOPSIS**
26085 `#include <unistd.h>`
26086 `int faccessat(int fd, const char *path, int amode, int flag);`

26087 **DESCRIPTION**
26088 Refer to [access\(\)](#).

26089 **NAME**

26090 **fattach** — attach a STREAMS-based file descriptor to a file in the file system name space
 26091 **(STREAMS)**

26092 **SYNOPSIS**

```
26093 OB XSR #include <stropts.h>
26094 int fattach(int fildes, const char *path);
```

26095 **DESCRIPTION**

26096 The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively
 26097 associating a pathname with *fildes*. The application shall ensure that the *fildes* argument is a
 26098 valid open file descriptor associated with a STREAMS file. The *path* argument points to a
 26099 pathname of an existing file. The application shall have the appropriate privileges or be the
 26100 owner of the file named by *path* and have write permission. A successful call to *fattach()* shall
 26101 cause all pathnames that name the file named by *path* to name the STREAMS file associated with
 26102 *fildes*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more
 26103 than one file and can have several pathnames associated with it.

26104 The attributes of the named STREAMS file shall be initialized as follows: the permissions, user
 26105 ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1,
 26106 and the size and device identifier are set to those of the STREAMS file associated with *fildes*. If
 26107 any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*),
 26108 neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildes*
 26109 refers shall be affected.

26110 File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to
 26111 refer to the underlying file.

26112 **RETURN VALUE**

26113 Upon successful completion, *fattach()* shall return 0. Otherwise, -1 shall be returned and *errno*
 26114 set to indicate the error.

26115 **ERRORS**

26116 The *fattach()* function shall fail if:

- | | | |
|-------|----------------|---|
| 26117 | [EACCES] | Search permission is denied for a component of the path prefix, or the process is the owner of <i>path</i> but does not have write permissions on the file named by <i>path</i> . |
| 26118 | | |
| 26119 | | |
| 26120 | [EBADF] | The <i>fildes</i> argument is not a valid open file descriptor. |
| 26121 | [EBUSY] | The file named by <i>path</i> is currently a mount point or has a STREAMS file attached to it. |
| 26122 | | |
| 26123 | [ELOOP] | A loop exists in symbolic links encountered during resolution of the <i>path</i> argument. |
| 26124 | | |
| 26125 | [ENAMETOOLONG] | The size of <i>path</i> exceeds {PATH_MAX} or a component of <i>path</i> is longer than {NAME_MAX}. |
| 26126 | | |
| 26127 | | |
| 26128 | [ENOENT] | A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string. |
| 26129 | [ENOTDIR] | A component of the path prefix is not a directory. |

fattach()

- 26130 [EPERM] The effective user ID of the process is not the owner of the file named by *path*
26131 and the process does not have appropriate privilege.
- 26132 The *fattach()* function may fail if:
- 26133 [EINVAL] The *fd* argument does not refer to a STREAMS file.
- 26134 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
26135 resolution of the *path* argument.
- 26136 [ENAMETOOLONG]
26137 Pathname resolution of a symbolic link produced an intermediate result
26138 whose length exceeds {PATH_MAX}.
- 26139 [EXDEV] A link to a file on another file system was attempted.

EXAMPLES**Attaching a File Descriptor to a File**

26142 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this
26143 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**
26144 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file
26145 handle referring to the STREAMS file associated with *fd*.

```
26146 #include <stropts.h>
26147 ...
26148     int fd;
26149     char *filename = "/tmp/named-STREAM";
26150     int ret;
26151
26152     ret = fattach(fd, filename);
```

APPLICATION USAGE

26153 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is
26154 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the
26155 replaced file need not be a directory and the replacing file is a STREAMS file.

RATIONALE

26156 The file attributes of a file which has been the subject of an *fattach()* call are specifically set
26157 because of an artefact of the original implementation. The internal mechanism was the same as
26158 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when
26159 applied to a regular file are a little surprising, especially as regards the link count which rigidly
26160 remains one, even if there were several links originally and despite the fact that all original links
26161 refer to the STREAM as long as the *fattach()* remains in effect.

FUTURE DIRECTIONS

26163 The *fattach()* function may be removed in a future version.

CHANGE HISTORY

26168 First released in Issue 4, Version 2.

Issue 5

26170 Moved from X/OPEN UNIX extension to BASE.

26172 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

- 26173 **Issue 6**
- 26174 This function is marked as part of the XSI STREAMS Option Group.
- 26175 The normative text is updated to avoid use of the term “must” for application requirements.
- 26176 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
- 26177 [ELOOP] error condition is added.
- 26178 **Issue 7**
- 26179 The *fattach()* function is marked obsolescent.

26180 NAME

26181 `fchdir` — change working directory

26182 SYNOPSIS

26183 `#include <unistd.h>`

26184 `int fchdir(int fildev);`

26185 DESCRIPTION

26186 The `fchdir()` function shall be equivalent to `chdir()` except that the directory that is to be the new
26187 current working directory is specified by the file descriptor *fildev*.

26188 A conforming application can obtain a file descriptor for a file of type directory using `open()`,
26189 provided that the file status flags and access modes do not contain `O_WRONLY` or `O_RDWR`.

26190 RETURN VALUE

26191 Upon successful completion, `fchdir()` shall return 0. Otherwise, it shall return `-1` and set `errno` to
26192 indicate the error. On failure the current working directory shall remain unchanged.

26193 ERRORS

26194 The `fchdir()` function shall fail if:

26195 `[EACCES]` Search permission is denied for the directory referenced by *fildev*.

26196 `[EBADF]` The *fildev* argument is not an open file descriptor.

26197 `[ENOTDIR]` The open file descriptor *fildev* does not refer to a directory.

26198 The `fchdir()` may fail if:

26199 `[EINTR]` A signal was caught during the execution of `fchdir()`.

26200 `[EIO]` An I/O error occurred while reading from or writing to the file system.

26201 EXAMPLES

26202 None.

26203 APPLICATION USAGE

26204 None.

26212 CHANGE HISTORY

26213 First released in Issue 4, Version 2.

26214 Issue 5

26215 Moved from X/OPEN UNIX extension to BASE.

26216 Issue 7

26217 The `fchdir()` function is moved from the XSI option to the Base.

26218 **NAME**

26219 fchmod — change mode of a file

26220 **SYNOPSIS**

26221 #include <sys/stat.h>

26222 int fchmod(int *fildes*, mode_t *mode*);26223 **DESCRIPTION**26224 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are
26225 changed is specified by the file descriptor *fildes*.26226 SHM If *fildes* references a shared memory object, the *fchmod()* function need only affect the S_IRUSR,
26227 S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.26228 TYM If *fildes* references a typed memory object, the behavior of *fchmod()* is unspecified.26229 If *fildes* refers to a socket, the behavior of *fchmod()* is unspecified.26230 OB XSR If *fildes* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call
26231 returns successfully, doing nothing.26232 **RETURN VALUE**26233 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to
26234 indicate the error.26235 **ERRORS**26236 The *fchmod()* function shall fail if:26237 [EBADF] The *fildes* argument is not an open file descriptor.26238 [EPERM] The effective user ID does not match the owner of the file and the process does
26239 not have appropriate privilege.26240 [EROFS] The file referred to by *fildes* resides on a read-only file system.26241 The *fchmod()* function may fail if:26242 XSI [EINTR] The *fchmod()* function was interrupted by a signal.26243 XSI [EINVAL] The value of the *mode* argument is invalid.26244 [EINVAL] The *fildes* argument refers to a pipe and the implementation disallows
26245 execution of *fchmod()* on a pipe.26246 **EXAMPLES**26247 **Changing the Current Permissions for a File**26248 The following example shows how to change the permissions for a file named **/home/cnd/mod1**
26249 so that the owner and group have read/write/execute permissions, but the world only has
26250 read/write permissions.

26251 #include <sys/stat.h>

26252 #include <fcntl.h>

26253 mode_t mode;

26254 int fildes;

26255 ...

26256 fildes = open("/home/cnd/mod1", O_RDWR);

26257 fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);

fchmod()26258 **APPLICATION USAGE**

26259 None.

26260 **RATIONALE**

26261 None.

26262 **FUTURE DIRECTIONS**

26263 None.

26264 **SEE ALSO**26265 *chmod, chown, creat(), fcntl(), fstatat(), fstatvfs(), mknod(), open(), read, write*

26266 XBD <sys/stat.h>

26267 **CHANGE HISTORY**

26268 First released in Issue 4, Version 2.

26269 **Issue 5**26270 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX
26271 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a
26272 second instance of [EINVAL] is defined in the list of optional errors.26273 **Issue 6**26274 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*
26275 behavior is unspecified for typed memory objects.

26276 **NAME**
26277 fchmodat — change mode of a file relative to directory file descriptor

26278 **SYNOPSIS**
26279 #include <sys/stat.h>
26280 int fchmodat(int *fd*, const char **path*, mode_t *mode*, int *flag*);

26281 **DESCRIPTION**
26282 Refer to *chmod*.

26283 **NAME**26284 `fchown` — change owner and group of a file26285 **SYNOPSIS**26286 `#include <unistd.h>`26287 `int fchown(int fildev, uid_t owner, gid_t group);`26288 **DESCRIPTION**26289 The `fchown()` function shall be equivalent to `chown()` except that the file whose owner and group
26290 are changed is specified by the file descriptor *fildev*.26291 **RETURN VALUE**26292 Upon successful completion, `fchown()` shall return 0. Otherwise, it shall return `-1` and set *errno* to
26293 indicate the error.26294 **ERRORS**26295 The `fchown()` function shall fail if:26296 [EBADF] The *fildev* argument is not an open file descriptor.26297 [EPERM] The effective user ID does not match the owner of the file or the process does
26298 not have appropriate privilege and `_POSIX_CHOWN_RESTRICTED` indicates
26299 that such privilege is required.26300 [EROFS] The file referred to by *fildev* resides on a read-only file system.26301 The `fchown()` function may fail if:26302 [EINVAL] The owner or group ID is not a value supported by the implementation. The
26303 OB XSR *fildev* argument refers to a pipe or socket or an `fattach()`-ed `STREAM` and the
26304 implementation disallows execution of `fchown()` on a pipe.

26305 [EIO] A physical I/O error has occurred.

26306 [EINTR] The `fchown()` function was interrupted by a signal which was caught.26307 **EXAMPLES**26308 **Changing the Current Owner of a File**26309 The following example shows how to change the owner of a file named `/home/cnd/mod1` to
26310 “jones” and the group to “cnd”.26311 The numeric value for the user ID is obtained by extracting the user ID from the user database
26312 entry associated with “jones”. Similarly, the numeric value for the group ID is obtained by
26313 extracting the group ID from the group database entry associated with “cnd”. This example
26314 assumes the calling program has appropriate privileges.26315 `#include <sys/types.h>`
26316 `#include <unistd.h>`
26317 `#include <fcntl.h>`
26318 `#include <pwd.h>`
26319 `#include <grp.h>`

26320 `struct passwd *pwd;`
26321 `struct group *grp;`
26322 `int fildev;`
26323 `...`
26324 `fildev = open("/home/cnd/mod1", O_RDWR);`

```

26325     pwd = getpwnam("jones");
26326     grp = getgrnam("cnd");
26327     fchown(fildes, pwd->pw_uid, grp->gr_gid);

```

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The following changes were made to align with the IEEE P1003.1a draft standard:

- Clarification is added that a call to *fchown()* may not be allowed on a pipe.

The *fchown()* function is defined as mandatory.

Issue 7

Functionality relating to XSI STREAMS is marked obsolescent.

26347 **NAME**
26348 fchownat — change owner and group of a file relative to directory file descriptor

26349 **SYNOPSIS**
26350 #include <unistd.h>
26351 int fchownat(int *fd*, const char **path*, uid_t *owner*, gid_t *group*,
26352 int *flag*);

26353 **DESCRIPTION**
26354 Refer to *chown*.

26355 **NAME**26356 `fclose` — close a stream26357 **SYNOPSIS**26358 `#include <stdio.h>`26359 `int fclose(FILE *stream);`26360 **DESCRIPTION**

26361 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26362 conflict between the requirements described here and the ISO C standard is unintentional. This
 26363 volume of POSIX.1-200x defers to the ISO C standard.

26364 The `fclose()` function shall cause the stream pointed to by `stream` to be flushed and the associated
 26365 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any
 26366 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be
 26367 disassociated from the file and any buffer set by the `setbuf()` or `setvbuf()` function shall be
 26368 disassociated from the stream. If the associated buffer was automatically allocated, it shall be
 26369 deallocated.

26370 CX If the file is not already at EOF, and the file is one capable of seeking, the file offset of the
 26371 underlying open file description shall be adjusted so that the next operation on the open file
 26372 description deals with the byte after the last one read from or written to the stream being closed.

26373 The `fclose()` function shall mark for update the last data modification and last file status change
 26374 timestamps of the underlying file, if the stream was writable, and if buffered data remains that
 26375 has not yet been written to the file. The `fclose()` function shall perform the equivalent of a `close()`
 26376 on the file descriptor that is associated with the stream pointed to by `stream`.

26377 After the call to `fclose()`, any use of `stream` results in undefined behavior.

26378 **RETURN VALUE**

26379 CX Upon successful completion, `fclose()` shall return 0; otherwise, it shall return EOF and set `errno`
 26380 to indicate the error.

26381 **ERRORS**

26382 The `fclose()` function shall fail if:

26383 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying `stream` and
 26384 the thread would be delayed in the write operation.

26385 CX [EBADF] The file descriptor underlying stream is not valid.

26386 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

26387 XSI [EFBIG] An attempt was made to write a file that exceeds the file size limit of the
 26388 process.

26389 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 26390 offset maximum associated with the corresponding stream.

26391 CX [EINTR] The `fclose()` function was interrupted by a signal.

26392 CX [EIO] The process is a member of a background process group attempting to write to
 26393 its controlling terminal, TOSTOP is set, the process is neither ignoring nor
 26394 blocking SIGTTOU, and the process group of the process is orphaned. This
 26395 error may also be returned under implementation-defined conditions.

fclose()

System Interfaces

26396 CX [ENOMEM] The underlying stream was created by *open_memstream()* or
26397 *open_wmemstream()* and insufficient memory is available.

26398 CX [ENOSPC] There was no free space remaining on the device containing the file or in the
26399 buffer used by the *fmemopen()* function.

26400 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
26401 any process. A SIGPIPE signal shall also be sent to the thread.

26402 The *fclose()* function may fail if:

26403 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
26404 capabilities of the device.

CHANGE HISTORY

26416 First released in Issue 1. Derived from Issue 1 of the SVID.
26417

Issue 5

26418 Large File Summit extensions are added.
26419

Issue 6

26420 Extensions beyond the ISO C standard are marked.
26421

26422 The following new requirements on POSIX implementations derive from alignment with the
26423 Single UNIX Specification:

- 26424 • The [EFBIG] error is added as part of the large file support extensions.
- 26425 • The [ENXIO] optional error condition is added.

26426 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether
26427 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

26428 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/28 is applied, updating the [EAGAIN]
26429 error in the ERRORS section from “the process would be delayed” to “the thread would be
26430 delayed”.

Issue 7

26431 Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file
26432 descriptors and streams.
26433

26434 The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open
26435 Group Technical Standard, 2006, Extended API Set Part 1.

26436 Changes are made related to support for finegrained timestamps. +

26437 **NAME**

26438 fcntl — file control

26439 **SYNOPSIS**

26440 #include <fcntl.h>

26441 int fcntl(int *fil-des*, int *cmd*, ...);26442 **DESCRIPTION**26443 The *fcntl()* function shall perform the operations described below on open files. The *fil-des*
26444 argument is a file descriptor.26445 The available values for *cmd* are defined in <fcntl.h> and are as follows:

26446 **F_DUPFD** Return a new file descriptor which shall be the lowest numbered available
26447 (that is, not already open) file descriptor greater than or equal to the third
26448 argument, *arg*, taken as an integer of type **int**. The new file descriptor shall
26449 refer to the same open file description as the original file descriptor, and shall
26450 share any locks. The FD_CLOEXEC flag associated with the new file
26451 descriptor shall be cleared to keep the file open across calls to one of the *exec*
26452 functions.

26453 **F_GETFD** Get the file descriptor flags defined in <fcntl.h> that are associated with the
26454 file descriptor *fil-des*. File descriptor flags are associated with a single file
26455 descriptor and do not affect other file descriptors that refer to the same file.

26456 **F_SETFD** Set the file descriptor flags defined in <fcntl.h>, that are associated with *fil-des*,
26457 to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC flag in the
26458 third argument is 0, the file shall remain open across the *exec* functions;
26459 otherwise, the file shall be closed upon successful execution of one of the *exec*
26460 functions.

26461 **F_GETFL** Get the file status flags and file access modes, defined in <fcntl.h>, for the file
26462 description associated with *fil-des*. The file access modes can be extracted from
26463 the return value using the mask O_ACCMODE, which is defined in <fcntl.h>.
26464 File status flags and file access modes are associated with the file description
26465 and do not affect other file descriptors that refer to the same file with different
26466 open file descriptions.

26467 **F_SETFL** Set the file status flags, defined in <fcntl.h>, for the file description associated
26468 with *fil-des* from the corresponding bits in the third argument, *arg*, taken as
26469 type **int**. Bits corresponding to the file access mode and the file creation flags,
26470 as defined in <fcntl.h>, that are set in *arg* shall be ignored. If any bits in *arg*
26471 other than those mentioned here are changed by the application, the result is
26472 unspecified.

26473 **F_GETOWN** If *fil-des* refers to a socket, get the process or process group ID specified to
26474 receive SIGURG signals when out-of-band data is available. Positive values
26475 indicate a process ID; negative values, other than -1, indicate a process group
26476 ID. If *fil-des* does not refer to a socket, the results are unspecified.

26477 **F_SETOWN** If *fil-des* refers to a socket, set the process or process group ID specified to
26478 receive SIGURG signals when out-of-band data is available, using the value of
26479 the third argument, *arg*, taken as type **int**. Positive values indicate a process
26480 ID; negative values, other than -1, indicate a process group ID. If *fil-des* does
26481 not refer to a socket, the results are unspecified.

26482 The following values for *cmd* are available for advisory record locking. Record locking shall be

26483		supported for regular files, and may be supported for other files.
26484	F_GETLK	Get the first lock which blocks the lock description pointed to by the third argument, <i>arg</i> , taken as a pointer to type struct flock , defined in <fcntl.h> . The information retrieved shall overwrite the information passed to <i>fcntl()</i> in the structure flock . If no lock is found that would prevent this lock from being created, then the structure shall be left unchanged except for the lock type which shall be set to F_UNLCK.
26485		
26486		
26487		
26488		
26489		
26490	F_SETLK	Set or clear a file segment lock according to the lock description pointed to by the third argument, <i>arg</i> , taken as a pointer to type struct flock , defined in <fcntl.h> . F_SETLK can establish shared (or read) locks (F_RDLCK) or exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock (F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in <fcntl.h> . If a shared or exclusive lock cannot be set, <i>fcntl()</i> shall return immediately with a return value of -1 .
26491		
26492		
26493		
26494		
26495		
26496		
26497	F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or exclusive lock is blocked by other locks, the thread shall wait until the request can be satisfied. If a signal that is to be caught is received while <i>fcntl()</i> is waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return from the signal handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to [EINTR], and the lock operation shall not be done.
26498		
26499		
26500		
26501		
26502		
26503		Additional implementation-defined values for <i>cmd</i> may be defined in <fcntl.h> . Their names shall start with F_.
26504		
26505		When a shared lock is set on a segment of a file, other processes shall be able to set shared locks on that segment or a portion of it. A shared lock prevents any other process from setting an exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the file descriptor was not opened with read access.
26506		
26507		
26508		
26509		An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock on any portion of the protected area. A request for an exclusive lock shall fail if the file descriptor was not opened with write access.
26510		
26511		
26512		The structure flock describes the type (<i>l_type</i>), starting offset (<i>l_whence</i>), relative offset (<i>l_start</i>), size (<i>l_len</i>), and process ID (<i>l_pid</i>) of the segment of the file to be affected.
26513		
26514		The value of <i>l_whence</i> is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative offset <i>l_start</i> bytes shall be measured from the start of the file, current position, or end of the file, respectively. The value of <i>l_len</i> is the number of consecutive bytes to be locked. The value of <i>l_len</i> may be negative (where the definition of off_t permits negative values of <i>l_len</i>). The <i>l_pid</i> field is only used with F_GETLK to return the process ID of the process holding a blocking lock. After a successful F_GETLK request, when a blocking lock is found, the values returned in the flock structure shall be as follows:
26515		
26516		
26517		
26518		
26519		
26520		
26521	<i>l_type</i>	Type of blocking lock found.
26522	<i>l_whence</i>	SEEK_SET.
26523	<i>l_start</i>	Start of the blocking lock.
26524	<i>l_len</i>	Length of the blocking lock.
26525	<i>l_pid</i>	Process ID of the process that holds the blocking lock.
26526		If the command is F_SETLKW and the process must wait for another process to release a lock, then the range of bytes to be locked shall be determined before the <i>fcntl()</i> function blocks. If the file size or file descriptor seek offset change while <i>fcntl()</i> is blocked, this shall not affect the range of bytes locked.
26527		
26528		
26529		

26530 If *l_len* is positive, the area affected shall start at *l_start* and end at *l_start+l_len-1*. If *l_len* is
 26531 negative, the area affected shall start at *l_start+l_len* and end at *l_start-1*. Locks may start and
 26532 extend beyond the current end of a file, but shall not extend before the beginning of the file. A
 26533 lock shall be set to extend to the largest possible value of the file offset for that file by setting
 26534 *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to *SEEK_SET*, the whole file
 26535 shall be locked.

26536 There shall be at most one type of lock set for each byte in the file. Before a successful return
 26537 from an *F_SETLK* or an *F_SETLKW* request when the calling process has previously existing
 26538 locks on bytes in the region specified by the request, the previous lock type for each byte in the
 26539 specified region shall be replaced by the new lock type. As specified above under the
 26540 descriptions of shared locks and exclusive locks, an *F_SETLK* or an *F_SETLKW* request
 26541 (respectively) shall fail or block when another process has existing locks on bytes in the specified
 26542 region and the type of any of those locks conflicts with the type specified in the request.

26543 All locks associated with a file for a given process shall be removed when a file descriptor for
 26544 that file is closed by that process or the process holding that file descriptor terminates. Locks are
 26545 not inherited by a child process.

26546 A potential for deadlock occurs if a process controlling a locked region is put to sleep by
 26547 attempting to lock the locked region of another process. If the system detects that sleeping until
 26548 a locked region is unlocked would cause a deadlock, *fcntl()* shall fail with an *[EDEADLK]* error.

26549 An unlock (*F_UNLCK*) request in which *l_len* is non-zero and the offset of the last byte of the
 26550 requested segment is the maximum value for an object of type *off_t*, when the process has an
 26551 existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall
 26552 be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0.
 26553 Otherwise, an unlock (*F_UNLCK*) request shall attempt to unlock only the requested segment.

26554 SHM When the file descriptor *fildev* refers to a shared memory object, the behavior of *fcntl()* shall be
 26555 the same as for a regular file except the effect of the following values for the argument *cmd* shall
 26556 be unspecified: *F_SETFL*, *F_GETLK*, *F_SETLK*, and *F_SETLKW*.

26557 TYM If *fildev* refers to a typed memory object, the result of the *fcntl()* function is unspecified.

26558 RETURN VALUE

26559 Upon successful completion, the value returned shall depend on *cmd* as follows:

26560	<i>F_DUPFD</i>	A new file descriptor.
26561	<i>F_GETFD</i>	Value of flags defined in <i><fcntl.h></i> . The return value shall not be negative.
26562	<i>F_SETFD</i>	Value other than <i>-1</i> .
26563	<i>F_GETFL</i>	Value of file status flags and access modes. The return value is not negative.
26564	<i>F_SETFL</i>	Value other than <i>-1</i> .
26565	<i>F_GETLK</i>	Value other than <i>-1</i> .
26566	<i>F_SETLK</i>	Value other than <i>-1</i> .
26567	<i>F_SETLKW</i>	Value other than <i>-1</i> .
26568	<i>F_GETOWN</i>	Value of the socket owner process or process group; this will not be <i>-1</i> .
26569	<i>F_SETOWN</i>	Value other than <i>-1</i> .
26570		Otherwise, <i>-1</i> shall be returned and <i>errno</i> set to indicate the error.

26571 **ERRORS**26572 The *fcntl()* function shall fail if:

26573 [EACCES] or [EAGAIN]

26574 The *cmd* argument is F_SETLK; the type of lock (*l_type*) is a shared (F_RDLCK)
26575 or exclusive (F_WRLCK) lock and the segment of a file to be locked is already
26576 exclusive-locked by another process, or the type is an exclusive lock and some
26577 portion of the segment of a file to be locked is already shared-locked or
26578 exclusive-locked by another process.

26579 [EBADF]

26580 The *fildev* argument is not a valid open file descriptor, or the argument *cmd* is
26581 F_SETLK or F_SETLKW, the type of lock, *l_type*, is a shared lock (F_RDLCK),
26582 and *fildev* is not a valid file descriptor open for reading, or the type of lock,
26583 *l_type*, is an exclusive lock (F_WRLCK), and *fildev* is not a valid file descriptor
open for writing.

26584 [EINTR]

The *cmd* argument is F_SETLKW and the function was interrupted by a signal.

26585 [EINVAL]

26586 The *cmd* argument is invalid, or the *cmd* argument is F_DUPFD and *arg* is
26587 negative or greater than or equal to {OPEN_MAX}, or the *cmd* argument is
26588 F_GETLK, F_SETLK, or F_SETLKW and the data pointed to by *arg* is not
valid, or *fildev* refers to a file that does not support locking.

26589 [EMFILE]

26590 The argument *cmd* is F_DUPFD and all file descriptors available to the process
26591 are currently open, or no file descriptors greater than or equal to *arg* are
available.

26592 [ENOLCK]

26593 The argument *cmd* is F_SETLK or F_SETLKW and satisfying the lock or unlock
26594 request would result in the number of locked regions in the system exceeding
a system-imposed limit.

26595 [EOVERFLOW]

One of the values to be returned cannot be represented correctly.

26596 [EOVERFLOW]

26597 The *cmd* argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or,
26598 if *l_len* is non-zero, the largest offset of any byte in the requested segment
cannot be represented correctly in an object of type *off_t*.26599 The *fcntl()* function may fail if:

26600 [EDEADLK]

26601 The *cmd* argument is F_SETLKW, the lock is blocked by a lock from another
26602 process, and putting the calling process to sleep to wait for that lock to become
free would cause a deadlock.26603 **EXAMPLES**26604 **Locking and Unlocking a File**26605 The following example demonstrates how to place a lock on bytes 100 to 109 of a file and then
26606 later remove it. F_SETLK is used to perform a non-blocking lock request so that the process does
26607 not have to wait if an incompatible lock is held by another process; instead the process can take
26608 some other action.26609 #include <stdlib.h>
26610 #include <unistd.h>
26611 #include <fcntl.h>
26612 #include <errno.h>
26613 #include <stdio.h>26614 int
26615 main(int argc, char *argv[])
26616 {

```

26617         int fd;
26618         struct flock fl;

26619         fd = open("testfile", O_RDWR);
26620         if (fd == -1)
26621             /* Handle error */;

26622         /* Make a non-blocking request to place a write lock
26623            on bytes 100-109 of testfile */

26624         fl.l_type = F_WRLCK;
26625         fl.l_whence = SEEK_SET;
26626         fl.l_start = 100;
26627         fl.l_len = 10;

26628         if (fcntl(fd, F_SETLK, &fl) == -1) {
26629             if (errno == EACCES || errno == EAGAIN) {
26630                 printf("Already locked by another process\n");
26631                 /* We can't get the lock at the moment */
26632             } else {
26633                 /* Handle unexpected error */;
26634             }
26635         } else { /* Lock was granted... */
26636             /* Perform I/O on bytes 100 to 109 of file */
26637             /* Unlock the locked bytes */

26638             fl.l_type = F_UNLCK;
26639             fl.l_whence = SEEK_SET;
26640             fl.l_start = 100;
26641             fl.l_len = 10;
26642             if (fcntl(fd, F_SETLK, &fl) == -1)
26643                 /* Handle error */;
26644         }
26645         exit(EXIT_SUCCESS);
26646     } /* main */

```

Setting the Close-on-Exec Flag

The following example demonstrates how to set the close-on-exec flag for the file descriptor *fd*.

```

26649 #include <unistd.h>
26650 #include <fcntl.h>
26651 ...
26652     int flags;

26653     flags = fcntl(fd, F_GETFD);
26654     if (flags == -1)
26655         /* Handle error */;
26656     flags |= FD_CLOEXEC;
26657     if (fcntl(fd, F_SETFD, flags) == -1)
26658         /* Handle error */;

```

APPLICATION USAGE

None.

RATIONALE

The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

The *arg* values to `F_GETFD`, `F_SETFD`, `F_GETFL`, and `F_SETFL` all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation on them, rather than assuming that only the values defined by this volume of POSIX.1-200x are valid. It is a common error to forget this, particularly in the case of `F_SETFD`.

This volume of POSIX.1-200x permits concurrent read and write access to file data using the `fcntl()` function; this is a change from the 1984 `/usr/group` standard and early proposals. Without concurrency controls, this feature may not be fully utilized without occasional loss of data.

Data losses occur in several ways. One case occurs when several processes try to update the same record, without sequencing controls; several updates may occur in parallel and the last writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing reorganization. Without exclusive use to the tree segment by the updating process, other reading processes chance getting lost in the database when the index blocks are split, condensed, inserted, or deleted. While `fcntl()` is useful for many applications, it is not intended to be overly general and does not handle the bit-tree example well.

This facility is only required for regular files because it is not appropriate for many devices such as terminals and network connections.

Since `fcntl()` works with “any file descriptor associated with that file, however it is obtained”, the file descriptor may have been inherited through a `fork()` or `exec` operation and thus may affect a file that another process also has open.

The use of the open file description to identify what to lock requires extra calls and presents problems if several processes are sharing an open file description, but there are too many implementations of the existing mechanism for this volume of POSIX.1-200x to use different specifications.

Another consequence of this model is that closing any file descriptor for a given file (whether or not it is the same open file description that created the lock) causes the locks on that file to be relinquished for that process. Equivalently, any close for any file/process pair relinquishes the locks owned on that file for that process. But note that while an open file description may be shared through `fork()`, locks are not inherited through `fork()`. Yet locks may be inherited through one of the `exec` functions.

The identification of a machine in a network environment is outside the scope of this volume of POSIX.1-200x. Thus, an `l_sysid` member, such as found in System V, is not included in the locking structure.

Changing of lock types can result in a previously locked region being split into smaller regions.

Mandatory locking was a major feature of the 1984 `/usr/group` standard.

For advisory file record locking to be effective, all processes that have access to a file must cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode record locking is important when it cannot be assumed that all processes are cooperating. For example, if one user uses an editor to update a file at the same time that a second user executes another process that updates the same file and if only one of the two processes is using advisory locking, the processes are not cooperating. Enforcement-mode record locking would protect against accidental collisions.

26707 Secondly, advisory record locking requires a process using locking to bracket each I/O operation
 26708 with lock (or test) and unlock operations. With enforcement-mode file and record locking, a
 26709 process can lock the file once and unlock when all I/O operations have been completed.
 26710 Enforcement-mode record locking provides a base that can be enhanced; for example, with
 26711 sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so
 26712 other processes could read it, but none of them could write it.

26713 Mandatory locks were omitted for several reasons:

- 26714 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most
 26715 implementations; this was confusing, at best.
- 26716 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
- 26717 3. Any publicly readable file could be locked by anyone. Many historical implementations
 26718 keep the password database in a publicly readable file. A malicious user could thus
 26719 prohibit logins. Another possibility would be to hold open a long-distance telephone line.
- 26720 4. Some demand-paged historical implementations offer memory mapped files, and
 26721 enforcement cannot be done on that type of file.

26722 Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a
 26723 timeout facility in applications requiring it. This is useful in deadlock detection. Since
 26724 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was
 26725 made optional.

26726 FUTURE DIRECTIONS

26727 None.

26728 SEE ALSO

26731 CHANGE HISTORY

26732 First released in Issue 1. Derived from Issue 1 of the SVID.

26733 Issue 5

26734 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 26735 Threads Extension.

26736 Large File Summit extensions are added.

26737 Issue 6

26738 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.

26739 The following new requirements on POSIX implementations derive from alignment with the
 26740 Single UNIX Specification:

- 26741 • The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
 26742 required for conforming implementations of previous POSIX specifications, it was not
 26743 required for UNIX applications.
- 26744 • In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now
 26745 mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is
 26746 mandated.
- 26747 • In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd*
 26748 is invalid, and two [EOVERFLOW] error conditions are added.

26749 The F_GETOWN and F_SETOWN values are added for sockets.

26750 The following changes were made to align with the IEEE P1003.1a draft standard:

26751

- Clarification is added that the extent of the bytes locked is determined prior to the blocking action.

26752

26753

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *fcntl()* results are unspecified for typed memory objects.

26754

26755

The normative text is updated to avoid use of the term “must” for application requirements.

26756

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/29 is applied, adding the example to the EXAMPLES section.

26757

26758

Issue 7

26759

The optional `<unistd.h>` header is removed from this function, since `<fcntl.h>` now defines SEEK_SET, SEEK_CUR, and SEEK_END as part of the Base.

26760

26761 **NAME**
 26762 `fdatasync` — synchronize the data of a file (**REALTIME**)

26763 **SYNOPSIS**

26764 SIO `#include <unistd.h>`
 26765 `int fdatasync(int fildes);`

26766 **DESCRIPTION**

26767 The `fdatasync()` function shall force all currently queued I/O operations associated with the file
 26768 indicated by file descriptor `fil`des to the synchronized I/O completion state.

26769 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`
 26770 defined, with the exception that all I/O operations shall be completed as defined for
 26771 synchronized I/O data integrity completion.

26772 **RETURN VALUE**

26773 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return
 26774 the value `-1` and set `errno` to indicate the error. If the `fdatasync()` function fails, outstanding I/O
 26775 operations are not guaranteed to have been completed.

26776 **ERRORS**

26777 The `fdatasync()` function shall fail if:

26778 [EBADF] The `fil`des argument is not a valid file descriptor open for writing.

26779 [EINVAL] This implementation does not support synchronized I/O for this file.

26780 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error
 26781 conditions defined for `read()` and `write()`.

26782 **EXAMPLES**

26783 None.

26784 **APPLICATION USAGE**

26785 None.

26786 **RATIONALE**

26787 None.

26788 **FUTURE DIRECTIONS**

26789 None.

26790 **SEE ALSO**

26791 [aio_fsync\(\)](#), [fcntl\(\)](#), [fsync\(\)](#), [open\(\)](#), [read\(\)](#), [write\(\)](#)

26792 XBD [<unistd.h>](#)

26793 **CHANGE HISTORY**

26794 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26795 **Issue 6**

26796 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 26797 implementation does not support the Synchronized Input and Output option.

26798 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

26799 **NAME**26800 `fdetach` — detach a name from a STREAMS-based file descriptor (**STREAMS**)26801 **SYNOPSIS**

```
26802 OB XSR #include <stropts.h>
26803 int fdetach(const char *path);
```

26804 **DESCRIPTION**

26805 The `fdetach()` function shall detach a STREAMS-based file from the file to which it was attached
 26806 by a previous call to `fattach()`. The `path` argument points to the pathname of the attached
 26807 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A
 26808 successful call to `fdetach()` shall cause all pathnames that named the attached STREAMS file to
 26809 again name the file to which the STREAMS file was attached. All subsequent operations on `path`
 26810 shall operate on the underlying file and not on the STREAMS file.

26811 All open file descriptions established while the STREAMS file was attached to the file referenced
 26812 by `path` shall still refer to the STREAMS file after the `fdetach()` has taken effect.

26813 If there are no open file descriptors or other references to the STREAMS file, then a successful
 26814 call to `fdetach()` shall be equivalent to performing the last `close()` on the attached file.

26815 **RETURN VALUE**

26816 Upon successful completion, `fdetach()` shall return 0; otherwise, it shall return `-1` and set `errno` to
 26817 indicate the error.

26818 **ERRORS**

26819 The `fdetach()` function shall fail if:

- 26820 [EACCES] Search permission is denied on a component of the path prefix.
- 26821 [EINVAL] The `path` argument names a file that is not currently attached.
- 26822 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`
 26823 argument.
- 26824 [ENAMETOOLONG]
 26825 The size of a pathname exceeds {PATH_MAX} or a pathname component is
 26826 longer than {NAME_MAX}.
- 26827 [ENOENT] A component of `path` does not name an existing file or `path` is an empty string.
- 26828 [ENOTDIR] A component of the path prefix is not a directory.
- 26829 [EPERM] The effective user ID is not the owner of `path` and the process does not have
 26830 appropriate privileges.

26831 The `fdetach()` function may fail if:

- 26832 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 26833 resolution of the `path` argument.
- 26834 [ENAMETOOLONG]
 26835 Pathname resolution of a symbolic link produced an intermediate result
 26836 whose length exceeds {PATH_MAX}.

26837 **EXAMPLES**26838 **Detaching a File**

26839 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to
 26840 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this
 26841 file refer to the underlying file, not to the STREAMS file.

```
26842 #include <stropts.h>
26843 ...
26844     char *filename = "/tmp/named-STREAM";
26845     int ret;
26846
26847     ret = fdetach(filename);
```

26847 **APPLICATION USAGE**

26848 None.

26849 **RATIONALE**

26850 None.

26851 **FUTURE DIRECTIONS**

26852 The *fdetach()* function may be removed in a future version.

26853 **SEE ALSO**

26854 *fattach()*

26855 XBD [<stropts.h>](#)

26856 **CHANGE HISTORY**

26857 First released in Issue 4, Version 2.

26858 **Issue 5**

26859 Moved from X/OPEN UNIX extension to BASE.

26860 **Issue 6**

26861 The normative text is updated to avoid use of the term “must” for application requirements.

26862 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 26863 [ELOOP] error condition is added.

26864 **Issue 7**

26865 The *fdetach()* function is marked obsolescent.

26866 **NAME**26867 `fdim`, `fdimf`, `fdiml` — compute positive difference between two floating-point numbers26868 **SYNOPSIS**26869 `#include <math.h>`26870 `double fdim(double x, double y);`26871 `float fdimf(float x, float y);`26872 `long double fdiml(long double x, long double y);`26873 **DESCRIPTION**26874 CX The functionality described on this reference page is aligned with the ISO C standard. Any
26875 conflict between the requirements described here and the ISO C standard is unintentional. This
26876 volume of POSIX.1-200x defers to the ISO C standard.26877 These functions shall determine the positive difference between their arguments. If x is greater
26878 than y , $x-y$ is returned. If x is less than or equal to y , $+0$ is returned.26879 An application wishing to check for error situations should set *errno* to zero and call
26880 *feclearexcept*(`FE_ALL_EXCEPT`) before calling these functions. On return, if *errno* is non-zero or
26881 *fetestexcept*(`FE_INVALID` | `FE_DIVBYZERO` | `FE_OVERFLOW` | `FE_UNDERFLOW`) is non-
26882 zero, an error has occurred.26883 **RETURN VALUE**

26884 Upon successful completion, these functions shall return the positive difference value.

26885 If $x-y$ is positive and overflows, a range error shall occur and *fdim*(), *fdimf*(), and *fdiml*() shall
26886 return the value of the macro `HUGE_VAL`, `HUGE_VALF`, and `HUGE_VALL`, respectively.26887 XSI If $x-y$ is positive and underflows, a range error may occur, and either $(x-y)$ (if representable), or
26888 0.0 (if supported), or an implementation-defined value shall be returned.26889 MX If x or y is NaN, a NaN shall be returned.26890 **ERRORS**26891 The *fdim*() function shall fail if:

26892 Range Error The result overflows.

26893 If the integer expression (*math_errhandling* & `MATH_ERRNO`) is non-zero,
26894 then *errno* shall be set to `[ERANGE]`. If the integer expression
26895 (*math_errhandling* & `MATH_ERREXCEPT`) is non-zero, then the overflow
26896 floating-point exception shall be raised.26897 The *fdim*() function may fail if:

26898 Range Error The result underflows.

26899 If the integer expression (*math_errhandling* & `MATH_ERRNO`) is non-zero,
26900 then *errno* shall be set to `[ERANGE]`. If the integer expression
26901 (*math_errhandling* & `MATH_ERREXCEPT`) is non-zero, then the underflow
26902 floating-point exception shall be raised.

26919

EXAMPLES

None.

APPLICATION USAGE

On implementations supporting IEEE Std 754-1985, $x-y$ cannot underflow, and hence the 0.0 return value is shaded as an extension for implementations supporting the XSI option rather than an MX extension.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26920 **NAME**26921 `fdopen` — associate a stream with a file descriptor26922 **SYNOPSIS**

```
26923 CX #include <stdio.h>
26924 FILE *fdopen(int fil-des, const char *mode);
```

26925 **DESCRIPTION**26926 The `fdopen()` function shall associate a stream with a file descriptor.26927 The *mode* argument is a character string having one of the following values:

26928	<i>r</i> or <i>rb</i>	Open a file for reading.
26929	<i>w</i> or <i>wb</i>	Open a file for writing.
26930	<i>a</i> or <i>ab</i>	Open a file for writing at end-of-file.
26931	<i>r+</i> or <i>rb+</i> or <i>r+b</i>	Open a file for update (reading and writing).
26932	<i>w+</i> or <i>wb+</i> or <i>w+b</i>	Open a file for update (reading and writing).
26933	<i>a+</i> or <i>ab+</i> or <i>a+b</i>	Open a file for update (reading and writing) at end-of-file.

26934 The meaning of these flags is exactly as specified in `open()`, except that modes beginning with *w*
26935 shall not cause truncation of the file.26936 Additional values for the *mode* argument may be supported by an implementation.26937 The application shall ensure that the mode of the stream as expressed by the *mode* argument is
26938 allowed by the file access mode of the open file description to which *fil-des* refers. The file
26939 position indicator associated with the new stream is set to the position indicated by the file offset
26940 associated with the file descriptor.26941 The error and end-of-file indicators for the stream shall be cleared. The `fdopen()` function may
26942 cause the last data access timestamp of the underlying file to be marked for update.26943 SHM If *fil-des* refers to a shared memory object, the result of the `fdopen()` function is unspecified.26944 TYM If *fil-des* refers to a typed memory object, the result of the `fdopen()` function is unspecified.26945 The `fdopen()` function shall preserve the offset maximum previously set for the open file
26946 description corresponding to *fil-des*.26947 **RETURN VALUE**26948 Upon successful completion, `fdopen()` shall return a pointer to a stream; otherwise, a null pointer
26949 shall be returned and *errno* set to indicate the error.26950 **ERRORS**

26951	The <code>fdopen()</code> function shall fail if:		+
26952	[EMFILE]	{STREAM_MAX} streams are currently open in the calling process.	+
26953	The <code>fdopen()</code> function may fail if:		
26954	[EBADF]	The <i>fil-des</i> argument is not a valid file descriptor.	
26955	[EINVAL]	The <i>mode</i> argument is not a valid mode.	
26956	[EMFILE]	{FOPEN_MAX} streams are currently open in the calling process.	-

26957 [ENOMEM] Insufficient space to allocate a buffer.

26958 EXAMPLES

26959 None.

26960 APPLICATION USAGE

26961 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but
26962 do not return streams.

26963 RATIONALE

26964 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, *fcntl()*, or *socket()*;
26965 inherited through *fork()*, *posix_spawn()*, or *exec*; or perhaps obtained by other means.

26966 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write
26967 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument
26968 formats that include *a b* are allowed for consistency with the ISO C standard function *fopen()*.
26969 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of
26970 POSIX.1-200x, a good implementation of append (*a*) mode would cause the *O_APPEND* flag to
26971 be set.

26972 FUTURE DIRECTIONS

26973 None.

26974 SEE ALSO

26977 XBD <stdio.h>

26978 CHANGE HISTORY

26979 First released in Issue 1. Derived from Issue 1 of the SVID.

26980 Issue 5

26981 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

26982 Large File Summit extensions are added.

26983 Issue 6

26984 The following new requirements on POSIX implementations derive from alignment with the
26985 Single UNIX Specification:

- 26986 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include
26987 binary streams.
- 26988 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset
26989 maximum in the open file description.
- 26990 • All errors identified in the ERRORS section are added.
- 26991 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st_atime* to be
26992 updated.

26993 The following changes were made to align with the IEEE P1003.1a draft standard:

- 26994 • Clarification is added that it is the responsibility of the application to ensure that the mode
26995 is compatible with the open file descriptor.

26996 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
26997 *fdopen()* results are unspecified for typed memory objects.

26998 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/30 is applied, making corrections to the
26999 RATIONALE.

fdopen()27000
27001
27002**Issue 7**

SD5-XSH-ERN-149 is applied, adding the {STREAM_MAX} [EMFILE] error condition. +

Changes are made related to support for finegrained timestamps.

27003 **NAME**

27004 fdopendir, opendir — open directory associated with file descriptor

27005 **SYNOPSIS**

```
27006 #include <dirent.h>
27007 DIR *fdopendir(int fd);
27008 DIR *opendir(const char *dirname);
```

27009 **DESCRIPTION**

27010 The *fdopendir()* function shall be equivalent to the *opendir()* function except that the directory is
 27011 specified by a file descriptor rather than by a name. The file offset associated with the file
 27012 descriptor at the time of the call determines which entries are returned.

27013 Upon successful return from *fdopendir()*, the file descriptor is under the control of the system,
 27014 and if any attempt is made to close the file descriptor, or to modify the state of the associated
 27015 description other than by means of *closedir()*, *readdir()*, *readdir_r()*, or *rewinddir()*, the behavior is
 27016 implementation-defined. Upon calling *closedir()* the file descriptor shall be closed.

27017 It is unspecified whether the FD_CLOEXEC flag will be set on the file descriptor by a successful
 27018 call to *fdopendir()*.

27019 The *opendir()* function shall open a directory stream corresponding to the directory named by
 27020 the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is
 27021 implemented using a file descriptor, applications shall only be able to open up to a total of
 27022 {OPEN_MAX} files and directories.

27023 If the type **DIR** is implemented using a file descriptor, the descriptor shall be obtained as if the
 27024 O_DIRECTORY flag was passed to *open()*.

27025 **RETURN VALUE**

27026 Upon successful completion, these functions shall return a pointer to an object of type **DIR**.
 27027 Otherwise, these functions shall return a null pointer and set *errno* to indicate the error.

27028 **ERRORS**

27029 The *fdopendir()* function shall fail if:

27030 [EBADF] The *fd* argument is not a valid file descriptor open for reading.

27031 [ENOTDIR] The descriptor *fd* is not associated with a directory.

27032 The *opendir()* function shall fail if:

27033 [EACCES] Search permission is denied for the component of the path prefix of *dirname* or
 27034 read permission is denied for *dirname*.

27035 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname*
 27036 argument.

27037 [ENAMETOOLONG]

27038 The length of the *dirname* argument exceeds {PATH_MAX} or a pathname
 27039 component is longer than {NAME_MAX}.

27040 [ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an
 27041 empty string.

27042 [ENOTDIR] A component of *dirname* is not a directory.

- 27043 The *opendir()* function may fail if:
- 27044 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
27045 resolution of the *dirname* argument.
- 27046 [EMFILE] All file descriptors available to the process are currently open.
- 27047 [ENAMETOOLONG]
27048 As a result of encountering a symbolic link in resolution of the *dirname*
27049 argument, the length of the substituted pathname string exceeded
27050 {PATH_MAX}.
- 27051 [ENFILE] Too many files are currently open in the system.

EXAMPLES**Open a Directory Stream**

The following program fragment demonstrates how the *opendir()* function is used.

```
27055 #include <dirent.h>
27056 ...
27057     DIR *dir;
27058     struct dirent *dp;
27059 ...
27060     if ((dir = opendir(".")) == NULL) {
27061         perror("Cannot open .");
27062         exit(1);
27063     }
27064     while ((dp = readdir(dir)) != NULL) {
27065         ...
```

Find And Open a File

The following program fragment searches through a given directory looking for files larger than 1 MB.

```
27069 #include <stdio.h>
27070 #include <dirent.h>
27071 #include <fcntl.h>
27072 #include <sys/stat.h>
27073 #include <stdlib.h>
27074 #include <unistd.h>
27075
27076 int
27077 main(int argc, char *argv[])
27078 {
27079     struct stat statbuf;
27080     DIR *d;
27081     struct dirent *dp;
27082     int dfd, ffd;
27083
27084     if ((d = fdopendir((dfd = open("./tmp", O_RDONLY)))) == NULL) {
27085         fprintf(stderr, "Cannot open ./tmp directory\n");
27086         exit(1);
27087     }
27088     while ((dp = readdir(d)) != NULL) {
27089         if (dp->d_name[0] == '.')
27090             continue;
```

```

27089         /* there is a possible race condition here as the file           +
27090         * could be renamed between the readdir and the open */         +
27091         if ((ffd = openat(dfd, dp->d_name, O_RDONLY)) == -1) {         +
27092             perror(dp->d_name);                                         +
27093             continue;                                                  +
27094         }                                                               +
27095         if (fstat(ffd, &statbuf) == 0 && statbuf.st_size > (1024*1024)) {+
27096             /* found it ... */                                         +
27097             printf("%s: %dk\n", dp->d_name, statbuf.st_size / 1024);    +
27098         }                                                               +
27099         close(ffd);                                                    +
27100     }                                                                    +
27101     closedir(d);                                                       +
27102     close(dfd);                                                        +
27103     return 0;                                                          +
27104 }                                                                       +

```

APPLICATION USAGE

The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is recommended for portability.

RATIONALE

The purpose of the *fdopendir()* function is to enable opening files in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *opendir()*, resulting in unspecified behavior.

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of POSIX.1-200x does not mandate that the directory stream be implemented using file descriptors. The description of *closedir()* clarifies that if a file descriptor is used for the directory stream, it is mandatory that *closedir()* deallocate the file descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the `FD_CLOEXEC` had been set for the file descriptor.

The directory entries for dot and dot-dot are optional. This volume of POSIX.1-200x does not provide a way to test *a priori* for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a "normal" entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of POSIX.1-200x imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed or after a *fork()* or one of the *exec* function calls.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

Issue 7

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

The `fdopendir()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

An additional example is added.

+

27155 **NAME**27156 `feclearexcept` — clear floating-point exception27157 **SYNOPSIS**27158 `#include <fenv.h>`27159 `int feclearexcept(int excepts);`27160 **DESCRIPTION**27161 CX The functionality described on this reference page is aligned with the ISO C standard. Any

 27193 conflict between the requirements described here and the ISO C standard is unintentional. This
 27194 volume of POSIX.1-200x defers to the ISO C standard.

27195 The `fegetenv()` function shall attempt to store the current floating-point environment in the object
 27196 pointed to by `envp`.

27197 The `fesetenv()` function shall attempt to establish the floating-point environment represented by
 27198 the object pointed to by `envp`. The argument `envp` shall point to an object set by a call to
 27199 `fegetenv()` or `feholdexcept()`, or equal a floating-point environment macro. The `fesetenv()` function
 27200 does not raise floating-point exceptions, but only installs the state of the floating-point status
 27201 flags represented through its argument.

27202 **RETURN VALUE**
 27203 If the representation was successfully stored, `fegetenv()` shall return zero. Otherwise, it shall
 27204 return a non-zero value. If the environment was successfully established, `fesetenv()` shall return
 27205 zero. Otherwise, it shall return a non-zero value.

27206 **ERRORS**
 27207 No errors are defined.

27208 **EXAMPLES**
 27209 None.

27210 **APPLICATION USAGE**
 27211 None.

27212 **RATIONALE**
 27213 None.

27214 **FUTURE DIRECTIONS**
 27215 None.

27218 XBD [<fenv.h>](#)

27219 **CHANGE HISTORY**
 27220 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.
 27221 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

27222 **NAME**

27223 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

27224 **SYNOPSIS**

27225 #include <fenv.h>

27226 int fegetexceptflag(fexcept_t *flagp, int excepts);

27227 int fesetexceptflag(const fexcept_t *flagp, int excepts);

27228 **DESCRIPTION**

27229 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27230 conflict between the requirements described here and the ISO C standard is unintentional. This
 27231 volume of POSIX.1-200x defers to the ISO C standard.

27232 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of
 27233 the states of the floating-point status flags indicated by the argument *excepts* in the object
 27234 pointed to by the argument *flagp*.

27235 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the
 27236 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by
 27237 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument
 27238 represented at least those floating-point exceptions represented by the argument *excepts*. This
 27239 function does not raise floating-point exceptions, but only sets the state of the flags.

27240 **RETURN VALUE**

27241 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it
 27242 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions
 27243 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero
 27244 value.

27245 **ERRORS**

27246 No errors are defined.

27247 **EXAMPLES**

27248 None.

27249 **APPLICATION USAGE**

27250 None.

27251 **RATIONALE**

27252 None.

27253 **FUTURE DIRECTIONS**

27254 None.

27255 **SEE ALSO**27256 *feclearexcept()*, *feraiseexcept()*, *fetestexcept()*

27257 XBD <fenv.h>

27258 **CHANGE HISTORY**

27259 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

27260 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

27261 **NAME**
 27262 fegetround, fesetround — get and set current rounding direction

27263 **SYNOPSIS**
 27264 #include <fenv.h>
 27265 int fegetround(void);
 27266 int fesetround(int round);

27267 **DESCRIPTION**
 27268 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27269 conflict between the requirements described here and the ISO C standard is unintentional. This
 27270 volume of POSIX.1-200x defers to the ISO C standard.

27271 The *fegetround()* function shall get the current rounding direction.

27272 The *fesetround()* function shall establish the rounding direction represented by its argument
 27273 *round*. If the argument is not equal to the value of a rounding direction macro, the rounding
 27274 direction is not changed.

27275 **RETURN VALUE**
 27276 The *fegetround()* function shall return the value of the rounding direction macro representing the
 27277 current rounding direction or a negative value if there is no such rounding direction macro or
 27278 the current rounding direction is not determinable.

27279 The *fesetround()* function shall return a zero value if and only if the requested rounding direction
 27280 was established.

27281 **ERRORS**
 27282 No errors are defined.

27283 **EXAMPLES**
 27284 The following example saves, sets, and restores the rounding direction, reporting an error and
 27285 aborting if setting the rounding direction fails:

```
27286 #include <fenv.h>
27287 #include <assert.h>
27288 void f(int round_dir)
27289 {
27290     #pragma STDC FENV_ACCESS ON
27291     int save_round;
27292     int setround_ok;
27293     save_round = fegetround();
27294     setround_ok = fesetround(round_dir);
27295     assert(setround_ok == 0);
27296     /* ... */
27297     fesetround(save_round);
27298     /* ... */
27299 }
```

27300 **APPLICATION USAGE**
 27301 None.

27302 **RATIONALE**
 27303 None.

- 27304 **FUTURE DIRECTIONS**
- 27305 None.
- 27306 **SEE ALSO**
- 27307 XBD <[fenv.h](#)>
- 27308 **CHANGE HISTORY**
- 27309 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.
- 27310 ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

feholdexcept()27311 **NAME**

27312 feholdexcept — save current floating-point environment

27313 **SYNOPSIS**

27314 #include <fenv.h>

27315 int feholdexcept(fenv_t *envp);

27316 **DESCRIPTION**27317 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27318 conflict between the requirements described here and the ISO C standard is unintentional. This
27319 volume of POSIX.1-200x defers to the ISO C standard.27320 The *feholdexcept()* function shall save the current floating-point environment in the object
27321 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on
27322 floating-point exceptions) mode, if available, for all floating-point exceptions.27323 **RETURN VALUE**27324 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception
27325 handling was successfully installed.27326 **ERRORS**

27327 No errors are defined.

27328 **EXAMPLES**

27329 None.

27330 **APPLICATION USAGE**

27331 None.

27332 **RATIONALE**27333 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard
27334 implementations which have the default non-stop mode and at least one other mode for trap
27335 handling or aborting. If the implementation provides only the non-stop mode, then installing the
27336 non-stop mode is trivial.27337 **FUTURE DIRECTIONS**

27338 None.

27339 **SEE ALSO**27340 *fegetenv()*, *feupdateenv()*

27341 XBD <fenv.h>

27342 **CHANGE HISTORY**

27343 First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

27344 **NAME**
 27345 feof — test end-of-file indicator on a stream

27346 **SYNOPSIS**
 27347 #include <stdio.h>
 27348 int feof(FILE *stream);

27349 **DESCRIPTION**
 27350 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27351 conflict between the requirements described here and the ISO C standard is unintentional. This
 27352 volume of POSIX.1-200x defers to the ISO C standard.

27353 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.

27354 **RETURN VALUE**
 27355 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.

27356 **ERRORS**
 27357 No errors are defined.

27358 **EXAMPLES**
 27359 None.

27360 **APPLICATION USAGE**
 27361 None.

27362 **RATIONALE**
 27363 None.

27364 **FUTURE DIRECTIONS**
 27365 None.

27366 **SEE ALSO**
 27367 *clearerr()*, *ferror()*, *fopen()*

27368 XBD <stdio.h>

27369 **CHANGE HISTORY**
 27370 First released in Issue 1. Derived from Issue 1 of the SVID.

27371 **NAME**
 27372 `feraiseexcept` — raise floating-point exception

27373 **SYNOPSIS**
 27374 `#include <fenv.h>`
 27375 `int feraiseexcept(int excepts);`

27376 **DESCRIPTION**
 27377 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27378 conflict between the requirements described here and the ISO C standard is unintentional. This
 27379 volume of POSIX.1-200x defers to the ISO C standard.

27380 The `feraiseexcept()` function shall attempt to raise the supported floating-point exceptions
 27381 represented by the argument `excepts`. The order in which these floating-point exceptions are
 27382 raised is unspecified. Whether the `feraiseexcept()` function additionally raises the inexact floating-
 27383 point exception whenever it raises the overflow or underflow floating-point exception is
 27384 implementation-defined.

27385 **RETURN VALUE**
 27386 If the argument is zero or if all the specified exceptions were successfully raised, `feraiseexcept()`
 27387 shall return zero. Otherwise, it shall return a non-zero value.

27388 **ERRORS**
 27389 No errors are defined.

27390 **EXAMPLES**
 27391 None.

27392 **APPLICATION USAGE**
 27393 The effect is intended to be similar to that of floating-point exceptions raised by arithmetic
 27394 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

27395 **RATIONALE**
 27396 Raising overflow or underflow is allowed to also raise inexact because on some architectures the
 27397 only practical way to raise an exception is to execute an instruction that has the exception as a
 27398 side effect. The function is not restricted to accept only valid coincident expressions for atomic
 27399 operations, so the function can be used to raise exceptions accrued over several operations.

27400 **FUTURE DIRECTIONS**
 27401 None.

27402 **SEE ALSO**
 27403 [`feclearexcept\(\)`](#), [`fetestexceptflag\(\)`](#), [`fetestexcept\(\)`](#)

 27406 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.
 27407 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

27408 **NAME**
 27409 `ferror` — test error indicator on a stream

27410 **SYNOPSIS**
 27411 `#include <stdio.h>`
 27412 `int ferror(FILE *stream);`

27413 **DESCRIPTION**
 27414 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27415 conflict between the requirements described here and the ISO C standard is unintentional. This
 27416 volume of POSIX.1-200x defers to the ISO C standard.

27417 The `ferror()` function shall test the error indicator for the stream pointed to by `stream`.

27418 **RETURN VALUE**
 27419 The `ferror()` function shall return non-zero if and only if the error indicator is set for `stream`.

27420 **ERRORS**
 27421 No errors are defined.

27422 **EXAMPLES**
 27423 None.

27424 **APPLICATION USAGE**
 27425 None.

27426 **RATIONALE**
 27427 None.

27428 **FUTURE DIRECTIONS**
 27429 None.

27430 **SEE ALSO**
 27431 `clearerr()`, `feof()`, `fopen()`

27432 XBD `<stdio.h>`

27433 **CHANGE HISTORY**
 27434 First released in Issue 1. Derived from Issue 1 of the SVID.

27435 **NAME**
27436 fesetenv — set current floating-point environment

27437 **SYNOPSIS**
27438 #include <fenv.h>
27439 int fesetenv(const fenv_t *envp);

27440 **DESCRIPTION**
27441 Refer to *fegetenv()*.

27442 **NAME**
27443 fesetexceptflag — set floating-point status flags

27444 **SYNOPSIS**
27445 #include <fenv.h>
27446 int fesetexceptflag(const fexcept_t *flagp, int excepts);

27447 **DESCRIPTION**
27448 Refer to *fegetexceptflag()*.

27449 **NAME**
27450 fesetround — set current rounding direction

27451 **SYNOPSIS**
27452 #include <fenv.h>
27453 int fesetround(int round);

27454 **DESCRIPTION**
27455 Refer to *fegetround()*.

27456 **NAME**

27457 fetestexcept — test floating-point exception flags

27458 **SYNOPSIS**

27459 #include <fenv.h>

27460 int fetestexcept(int *excepts*);27461 **DESCRIPTION**

27462 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27463 conflict between the requirements described here and the ISO C standard is unintentional. This
 27464 volume of POSIX.1-200x defers to the ISO C standard.

27465 The *fetestexcept()* function shall determine which of a specified subset of the floating-point
 27466 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to
 27467 be queried.

27468 **RETURN VALUE**

27469 The *fetestexcept()* function shall return the value of the bitwise-inclusive OR of the floating-point
 27470 exception macros corresponding to the currently set floating-point exceptions included in
 27471 *excepts*.

27472 **ERRORS**

27473 No errors are defined.

27474 **EXAMPLES**

27475 The following example calls function *f()* if an invalid exception is set, and then function *g()* if an
 27476 overflow exception is set:

```
27477 #include <fenv.h>
27478 /* ... */
27479 {
27480     #pragma STDC FENV_ACCESS ON
27481     int set_excepts;
27482     feclearexcept(FE_INVALID | FE_OVERFLOW);
27483     // maybe raise exceptions
27484     set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
27485     if (set_excepts & FE_INVALID) f();
27486     if (set_excepts & FE_OVERFLOW) g();
27487     /* ... */
27488 }
```

27489 **APPLICATION USAGE**

27490 None.

27491 **RATIONALE**

27492 None.

27493 **FUTURE DIRECTIONS**

27494 None.

27495 **SEE ALSO**27496 [feclearexcept\(\)](#), [fetestexceptflag\(\)](#), [feraiseexcept\(\)](#)27497 XBD [<fenv.h>](#)

27498
27499**CHANGE HISTORY**

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

27500 **NAME**
 27501 feupdateenv — update floating-point environment

27502 **SYNOPSIS**
 27503 #include <fenv.h>
 27504 int feupdateenv(const fenv_t *envp);

27505 **DESCRIPTION**
 27506 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27507 conflict between the requirements described here and the ISO C standard is unintentional. This
 27508 volume of POSIX.1-200x defers to the ISO C standard.

27509 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in
 27510 its automatic storage, attempt to install the floating-point environment represented by the object
 27511 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument
 27512 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point
 27513 environment macro.

27514 **RETURN VALUE**
 27515 The *feupdateenv()* function shall return a zero value if and only if all the required actions were
 27516 successfully carried out.

27517 **ERRORS**
 27518 No errors are defined.

27519 **EXAMPLES**
 27520 The following example shows sample code to hide spurious underflow floating-point
 27521 exceptions:

```
27522 #include <fenv.h>
27523 double f(double x)
27524 {
27525     #pragma STDC FENV_ACCESS ON
27526     double result;
27527     fenv_t save_env;
27528     feholdexcept(&save_env);
27529     // compute result
27530     if (/* test spurious underflow */)
27531         feclearexcept(FE_UNDERFLOW);
27532     feupdateenv(&save_env);
27533     return result;
27534 }
```

27535 **APPLICATION USAGE**
 27536 None.

27537 **RATIONALE**
 27538 None.

27539 **FUTURE DIRECTIONS**
 27540 None.

27541 **SEE ALSO**
 27542 *fegetenv()*, *feholdexcept()*
 27543 XBD <fenv.h>

27544

27545

27546

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

ISO/IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

27547 **NAME**
27548 fexecve — execute a file

27549 **SYNOPSIS**
27550 #include <unistd.h>
27551 int fexecve(int *fd*, char *const *argv*[], char *const *envp*[]);

27552 **DESCRIPTION**
27553 Refer to *exec*.

27554 **NAME**27555 `fflush` — flush a stream27556 **SYNOPSIS**27557 `#include <stdio.h>`27558 `int fflush(FILE *stream);`27559 **DESCRIPTION**27560 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27561 conflict between the requirements described here and the ISO C standard is unintentional. This
27562 volume of POSIX.1-200x defers to the ISO C standard.27563 If *stream* points to an output stream or an update stream in which the most recent operation was
27564 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the
27565 last data modification and last file status change timestamps of the underlying file shall be
27566 marked for update.27567 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the
27568 behavior is defined above.27569 CX For a stream open for reading, if the file is not already at EOF, and the file is one capable of
27570 seeking, the file offset of the underlying open file description shall be adjusted so that the next
27571 operation on the open file description deals with the byte after the last one read from or written
27572 to the stream being flushed.27573 **RETURN VALUE**27574 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for
27575 CX the stream, return EOF, and set *errno* to indicate the error.27576 **ERRORS**27577 The *fflush()* function shall fail if:27578 CX **[EAGAIN]** The O_NONBLOCK flag is set for the file descriptor underlying *stream* and
27579 the thread would be delayed in the write operation.27580 CX **[EBADF]** The file descriptor underlying *stream* is not valid.27581 CX **[EFBIG]** An attempt was made to write a file that exceeds the maximum file size.27582 XSI **[EFBIG]** An attempt was made to write a file that exceeds the file size limit of the
27583 process.27584 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the
27585 offset maximum associated with the corresponding stream.27586 CX **[EINTR]** The *fflush()* function was interrupted by a signal.27587 CX **[EIO]** The process is a member of a background process group attempting to write to
27588 its controlling terminal, TOSTOP is set, the process is neither ignoring nor
27589 blocking SIGTTOU, and the process group of the process is orphaned. This
27590 error may also be returned under implementation-defined conditions.27591 CX **[ENOMEM]** The underlying stream was created by *open_memstream()* or
27592 *open_wmemstream()* and insufficient memory is available.27593 CX **[ENOSPC]** There was no free space remaining on the device containing the file or in the
27594 buffer used by the *fmemopen()* function.

27595 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
27596 any process. A SIGPIPE signal shall also be sent to the thread.

27597 The *fflush()* function may fail if:

27598 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
27599 capabilities of the device.

27600 EXAMPLES

27601 Sending Prompts to Standard Output

27602 The following example uses *printf()* calls to print a series of prompts for information the user
27603 must enter from standard input. The *fflush()* calls force the output to standard output. The
27604 *fflush()* function is used because standard output is usually buffered and the prompt may not
27605 immediately be printed on the output or terminal. The *getline()* function calls read strings from
27606 standard input and place the results in variables, for use later in the program.

```
27607 char *user;
27608 char *oldpasswd;
27609 char *newpasswd;
27610 ssize_t llen;
27611 size_t blen;
27612 struct termios term;
27613 tcflag_t saveflag;

27614 printf("User name: ");
27615 fflush(stdout);
27616 blen = 0;
27617 llen = getline(&user, &blen, stdin);
27618 user[llen-1] = 0;
27619 tcgetattr(fileno(stdin), &term);
27620 saveflag = term.c_lflag;
27621 term.c_lflag &= ~ECHO;
27622 tcsetattr(fileno(stdin), TCSANOW, &term);
27623 printf("Old password: ");
27624 fflush(stdout);
27625 blen = 0;
27626 llen = getline(&oldpasswd, &blen, stdin);
27627 oldpasswd[llen-1] = 0;

27628 printf("\nNew password: ");
27629 fflush(stdout);
27630 blen = 0;
27631 llen = getline(&newpasswd, &blen, stdin);
27632 newpasswd[llen-1] = 0;
27633 term.c_lflag = saveflag;
27634 tcsetattr(fileno(stdin), TCSANOW, &term);
27635 free(user);
27636 free(oldpasswd);
27637 free(newpasswd);
```

27638 APPLICATION USAGE

27639 None.

27640
27641
27642
27643**RATIONALE**

Data buffered by the system may make determining the validity of the position of the current file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()* on streams open for *read()* is not mandated by POSIX.1-200x.

27644
27645**FUTURE DIRECTIONS**

None.

27646
27647**SEE ALSO**

27649
27650**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

27651
27652**Issue 5**

Large File Summit extensions are added.

27653
27654**Issue 6**

Extensions beyond the ISO C standard are marked.

27655
27656

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

27657
27658

- The [EFBIG] error is added as part of the large file support extensions.
- The [ENXIO] optional error condition is added.

27659
27660

The RETURN VALUE section is updated to note that the error indicator shall be set for the stream. This is for alignment with the ISO/IEC 9899:1999 standard.

27661
27662
27663

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/31 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

27664
27665
27666**Issue 7**

Austin Group Interpretation 1003.1-2001 #002 is applied, clarifying the interaction of file descriptors and streams.

27667
27668

The [ENOSPC] error condition is updated and the [ENOMEM] error is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

27669

The EXAMPLES section is revised.

27670

Changes are made related to support for finegrained timestamps.

27671 **NAME**
 27672 ffs — find first set bit

27673 **SYNOPSIS**
 27674 XSI `#include <strings.h>`
 27675 `int ffs(int i);`

27676 **DESCRIPTION**
 27677 The `ffs()` function shall find the first bit set (beginning with the least significant bit) in *i*, and
 27678 return the index of that bit. Bits are numbered starting at one (the least significant bit).

27679 **RETURN VALUE**
 27680 The `ffs()` function shall return the index of the first bit set. If *i* is 0, then `ffs()` shall return 0.

27681 **ERRORS**
 27682 No errors are defined.

27683 **EXAMPLES**
 27684 None.

27685 **APPLICATION USAGE**
 27686 None.

27687 **RATIONALE**
 27688 None.

27689 **FUTURE DIRECTIONS**
 27690 None.

27691 **SEE ALSO**
 27692 XBD [<strings.h>](#)

27693 **CHANGE HISTORY**
 27694 First released in Issue 4, Version 2.

27695 **Issue 5**
 27696 Moved from X/OPEN UNIX extension to BASE.

27697 **NAME**27698 `fgetc` — get a byte from a stream27699 **SYNOPSIS**27700 `#include <stdio.h>`27701 `int fgetc(FILE *stream);`27702 **DESCRIPTION**

27703 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27704 conflict between the requirements described here and the ISO C standard is unintentional. This
 27705 volume of POSIX.1-200x defers to the ISO C standard.

27706 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is
 27707 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,
 27708 from the input stream pointed to by *stream*, and advance the associated file position indicator for
 27709 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple
 27710 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

27711 CX The *fgetc()* function may mark the last data access timestamp of the file associated with *stream*
 27712 for update. The last data access timestamp shall be marked for update by the first successful
 27713 execution of *fgetc()*, *fgets()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that
 27714 returns data not supplied by a prior call to *ungetc()*.

27715 **RETURN VALUE**

27716 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to
 27717 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the
 27718 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,
 27719 CX the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to
 27720 indicate the error.

27721 **ERRORS**27722 The *fgetc()* function shall fail if data needs to be read and:

27723 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying *stream* and
 27724 the thread would be delayed in the *fgetc()* operation.

27725 CX **[EBADF]** The file descriptor underlying *stream* is not a valid file descriptor open for
 27726 reading.

27727 CX **[EINTR]** The read operation was terminated due to the receipt of a signal, and no data
 27728 was transferred.

27729 CX **[EIO]** A physical I/O error has occurred, or the process is in a background process
 27730 group attempting to read from its controlling terminal, and either the process
 27731 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
 27732 This error may also be generated for implementation-defined reasons.

27733 CX **[EOVERFLOW]** The file is a regular file and an attempt was made to read at or beyond the
 27734 offset maximum associated with the corresponding stream.

27735 The *fgetc()* function may fail if:

27736 CX **[ENOMEM]** Insufficient storage space is available.

27737 CX **[ENXIO]** A request was made of a nonexistent device, or the request was outside the
 27738 capabilities of the device.

27739

EXAMPLES

27740

None.

27741

APPLICATION USAGE

27742

If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared against the integer constant EOF, the comparison may never succeed, because sign-extension of a variable of type **char** on widening to integer is implementation-defined.

27743

27744

27745

The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an end-of-file condition.

27746

27747

RATIONALE

27748

None.

27749

FUTURE DIRECTIONS

27750

None.

27751

CHANGE HISTORY

27755

First released in Issue 1. Derived from Issue 1 of the SVID.

27756

Issue 5

27757

Large File Summit extensions are added.

27758

Issue 6

27759

Extensions beyond the ISO C standard are marked.

27760

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

27761

27762

- The [EIO] and [Eoverflow] mandatory error conditions are added.

27763

- The [ENOMEM] and [ENXIO] optional error conditions are added.

27764

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

27765

- The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the input stream is not set.

27766

27767

- The RETURN VALUE section is updated to note that the error indicator shall be set for the stream.

27768

27769

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/32 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

27772

Issue 7

27773

Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark the last data access timestamp for update.

27774

27775 **NAME**27776 `fgetpos` — get current file position information27777 **SYNOPSIS**27778 `#include <stdio.h>`27779 `int fgetpos(FILE *restrict stream, fpos_t *restrict pos);`27780 **DESCRIPTION**27781 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27782 conflict between the requirements described here and the ISO C standard is unintentional. This
27783 volume of POSIX.1-200x defers to the ISO C standard.27784 The `fgetpos()` function shall store the current values of the parse state (if any) and file position
27785 indicator for the stream pointed to by `stream` in the object pointed to by `pos`. The value stored
27786 contains unspecified information usable by `fsetpos()` for repositioning the stream to its position
27787 at the time of the call to `fgetpos()`.27788 **RETURN VALUE**27789 Upon successful completion, `fgetpos()` shall return 0; otherwise, it shall return a non-zero value
27790 and set `errno` to indicate the error.27791 **ERRORS**27792 The `fgetpos()` function shall fail if:27793 CX **[EOVERFLOW]** The current value of the file position cannot be represented correctly in an
27794 object of type `fpos_t`.27795 The `fgetpos()` function may fail if:27796 CX **[EBADF]** The file descriptor underlying `stream` is not valid.27797 CX **[ESPIPE]** The file descriptor underlying `stream` is associated with a pipe, FIFO, or socket.27798 **EXAMPLES**

27799 None.

27800 **APPLICATION USAGE**

27801 None.

27802 **RATIONALE**

27803 None.

27818
27819

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EBADF] and [ESPIPE] optional error conditions are added.

An additional [ESPIPE] error condition is added for sockets.

The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

27820 **NAME**27821 `fgets` — get a string from a stream27822 **SYNOPSIS**27823 `#include <stdio.h>`27824 `char *fgets(char *restrict s, int n, FILE *restrict stream);`27825 **DESCRIPTION**

27826 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27827 conflict between the requirements described here and the ISO C standard is unintentional. This
 27828 volume of POSIX.1-200x defers to the ISO C standard.

27829 The `fgets()` function shall read bytes from *stream* into the array pointed to by *s*, until *n*−1 bytes
 27830 are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered.
 27831 The string is then terminated with a null byte.

27832 CX The `fgets()` function may mark the last data access timestamp of the file associated with *stream*
 27833 for update. The last data access timestamp shall be marked for update by the first successful
 27834 execution of `fgetc()`, `fgets()`, `fread()`, `fscanf()`, `getc()`, `getchar()`, `gets()`, or `scanf()` using *stream* that
 27835 returns data not supplied by a prior call to `ungetc()`.

27836 **RETURN VALUE**

27837 Upon successful completion, `fgets()` shall return *s*. If the stream is at end-of-file, the end-of-file
 27838 indicator for the stream shall be set and `fgets()` shall return a null pointer. If a read error occurs,
 27839 CX the error indicator for the stream shall be set, `fgets()` shall return a null pointer, and shall set
 27840 `errno` to indicate the error.

27841 **ERRORS**27842 Refer to `fgetc()`.27843 **EXAMPLES**27844 **Reading Input**

27845 The following example uses `fgets()` to read each line of input. {LINE_MAX}, which defines the
 27846 maximum size of the input line, is defined in the <limits.h> header.

```
27847 #include <stdio.h>
27848 ...
27849 char line[LINE_MAX];
27850 ...
27851 while (fgets(line, LINE_MAX, fp) != NULL) {
27852     ...
27853 }
27854 ...
```

27855 **APPLICATION USAGE**

27856 None.

27857 **RATIONALE**

27858 None.

27869

Issue 7

27870

Austin Group Interpretation 1003.1-2001 #051 is applied, updating the list of functions that mark

27871

the last data access timestamp for update.

27872 **NAME**27873 `fgetwc` — get a wide-character code from a stream27874 **SYNOPSIS**27875 `#include <stdio.h>`27876 `#include <wchar.h>`27877 `wint_t fgetwc(FILE *stream);`27878 **DESCRIPTION**27879 CX The functionality described on this reference page is aligned with the ISO C standard. Any
27880 conflict between the requirements described here and the ISO C standard is unintentional. This
27881 volume of POSIX.1-200x defers to the ISO C standard.27882 The `fgetwc()` function shall obtain the next character (if present) from the input stream pointed to
27883 by `stream`, convert that to the corresponding wide-character code, and advance the associated file
27884 position indicator for the stream (if defined).

27885 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

27886 CX The `fgetwc()` function may mark the last data access timestamp of the file associated with `stream` |
27887 for update. The last data access timestamp shall be marked for update by the first successful |
27888 execution of `fgetc()`, `fgets()`, `fgetwc()`, `fgetws()`, `fread()`, `fscanf()`, `getc()`, `getchar()`, `gets()`, or `scanf()`
27889 using `stream` that returns data not supplied by a prior call to `ungetc()` or `ungetwc()`.27890 **RETURN VALUE**27891 Upon successful completion, the `fgetwc()` function shall return the wide-character code of the
27892 character read from the input stream pointed to by `stream` converted to a type `wint_t`. If the end-
27893 of-file indicator for the stream is set, or if the stream is at end-of-file, the end-of-file indicator for
27894 the stream shall be set and `fgetwc()` shall return WEOF. If a read error occurs, the error indicator
27895 CX for the stream shall be set, `fgetwc()` shall return WEOF, and shall set `errno` to indicate the error. If
27896 an encoding error occurs, the error indicator for the stream shall be set, `fgetwc()` shall return
27897 WEOF, and shall set `errno` to indicate the error.27898 **ERRORS**27899 The `fgetwc()` function shall fail if data needs to be read and:27900 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying `stream` and
27901 the thread would be delayed in the `fgetwc()` operation.27902 CX **[EBADF]** The file descriptor underlying `stream` is not a valid file descriptor open for
27903 reading.27904 **[EILSEQ]** The data obtained from the input stream does not form a valid character.27905 CX **[EINTR]** The read operation was terminated due to the receipt of a signal, and no data
27906 was transferred.27907 CX **[EIO]** A physical I/O error has occurred, or the process is in a background process
27908 group attempting to read from its controlling terminal, and either the process
27909 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
27910 This error may also be generated for implementation-defined reasons.27911 CX **[EOVERFLOW]** The file is a regular file and an attempt was made to read at or beyond the
27912 offset maximum associated with the corresponding stream.

27913 The *fgetwc()* function may fail if:

27914 CX [ENOMEM] Insufficient storage space is available.

27915 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
27916 capabilities of the device.

27917 EXAMPLES

27918 None.

27919 APPLICATION USAGE

27920 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an
27921 end-of-file condition.

27929 CHANGE HISTORY

27930 First released in Issue 4. Derived from the MSE working draft.

27931 Issue 5

27932 The Optional Header (OH) marking is removed from <stdio.h>.

27933 Large File Summit extensions are added.

27934 Issue 6

27935 Extensions beyond the ISO C standard are marked.

27936 The following new requirements on POSIX implementations derive from alignment with the
27937 Single UNIX Specification:

- 27938 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 27939 • The [ENOMEM] and [ENXIO] optional error conditions are added.

27940 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/33 is applied, updating the [EAGAIN]
27941 error in the ERRORS section from “the process would be delayed” to “the thread would be
27942 delayed”.

27943 Issue 7

27944 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.

27945 Changes are made related to support for finegrained timestamps.

27946 **NAME**
 27947 `fgetws` — get a wide-character string from a stream

27948 **SYNOPSIS**
 27949 `#include <stdio.h>`
 27950 `#include <wchar.h>`

27951 `wchar_t *fgetws(wchar_t *restrict ws, int n,`
 27952 `FILE *restrict stream);`

27953 DESCRIPTION

27954 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27955 conflict between the requirements described here and the ISO C standard is unintentional. This
 27956 volume of POSIX.1-200x defers to the ISO C standard.

27957 The `fgetws()` function shall read characters from the *stream*, convert these to the corresponding
 27958 wide-character codes, place them in the `wchar_t` array pointed to by *ws*, until *n*−1 characters are
 27959 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is
 27960 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character
 27961 code.

27962 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

27963 CX The `fgetws()` function may mark the last data access timestamp of the file associated with *stream*
 27964 for update. The last data access timestamp shall be marked for update by the first successful
 27965 execution of `fgetc()`, `fgets()`, `fgetwc()`, `fgetws()`, `fread()`, `fscanf()`, `getc()`, `getchar()`, `gets()`, or `scanf()`
 27966 using *stream* that returns data not supplied by a prior call to `ungetc()` or `ungetwc()`.

27967 RETURN VALUE

27968 Upon successful completion, `fgetws()` shall return *ws*. If the end-of-file indicator for the stream is
 27969 set, or if the stream is at end-of-file, the end-of-file indicator for the stream shall be set and
 27970 `fgetws()` shall return a null pointer. If a read error occurs, the error indicator for the stream shall
 27971 CX be set, `fgetws()` shall return a null pointer, and shall set `errno` to indicate the error.

27972 ERRORS

27973 Refer to `fgetwc()`.

27974 EXAMPLES

27975 None.

27976 APPLICATION USAGE

27977 None.

27978 RATIONALE

27979 None.

27980 FUTURE DIRECTIONS

27981 None.

27993 Austin Group Interpretation 1003.1-2001 #051 is applied, clarifying the RETURN VALUE section.
27994 Changes are made related to support for finegrained timestamps. +

27995 **NAME**
 27996 `fileno` — map a stream pointer to a file descriptor

27997 **SYNOPSIS**

27998 CX

```
#include <stdio.h>
```

 27999

```
int fileno(FILE *stream);
```

28000 **DESCRIPTION**

28001 The `fileno()` function shall return the integer file descriptor associated with the stream pointed to
 28002 by `stream`.

28003 **RETURN VALUE**

28004 Upon successful completion, `fileno()` shall return the integer value of the file descriptor
 28005 associated with `stream`. Otherwise, the value `-1` shall be returned and `errno` set to indicate the
 28006 error.

28007 **ERRORS**

28008 The `fileno()` function may fail if:
 28009 [EBADF] The `stream` argument is not a valid stream.

28010 **EXAMPLES**

28011 None.

28012 **APPLICATION USAGE**

28013 None.

28014 **RATIONALE**

28015 Without some specification of which file descriptors are associated with these streams, it is
 28016 impossible for an application to set up the streams for another application it starts with `fork()`
 28017 and `exec`. In particular, it would not be possible to write a portable version of the `sh` command
 28018 interpreter (although there may be other constraints that would prevent that portability).

28019 **FUTURE DIRECTIONS**

28020 None.

28021 **SEE ALSO**

28023 XBD [<stdio.h>](#)

28024 **CHANGE HISTORY**

28025 First released in Issue 1. Derived from Issue 1 of the SVID.

28026 **Issue 6**

28027 The following new requirements on POSIX implementations derive from alignment with the
 28028 Single UNIX Specification:

- 28029 • The [EBADF] optional error condition is added.

28030 **NAME**

28031 flockfile, ftrylockfile, funlockfile — stdio locking functions

28032 **SYNOPSIS**

```
28033 CX      #include <stdio.h>
28034
28034 void flockfile(FILE *file);
28035 int ftrylockfile(FILE *file);
28036 void funlockfile(FILE *file);
```

28037 **DESCRIPTION**

28038 These functions shall provide for explicit application-level locking of stdio (**FILE ***) objects.
 28039 These functions can be used by a thread to delineate a sequence of I/O statements that are
 28040 executed as a unit.

28041 The *flockfile()* function shall acquire for a thread ownership of a (**FILE ***) object.

28042 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE ***) object if the object is
 28043 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

28044 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is
 28045 undefined if a thread other than the current owner calls the *funlockfile()* function.

28046 The functions shall behave as if there is a lock count associated with each (**FILE ***) object. This
 28047 count is implicitly initialized to zero when the (**FILE ***) object is created. The (**FILE ***) object is
 28048 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE ***)
 28049 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and
 28050 the caller owns the (**FILE ***) object, the count shall be incremented. Otherwise, the calling thread
 28051 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall
 28052 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)
 28053 and *funlockfile()* to be nested.

28054 All functions that reference (**FILE ***) objects shall behave as if they use *flockfile()* and *funlockfile()*
 28055 internally to obtain ownership of these (**FILE ***) objects.

28056 **RETURN VALUE**

28057 None for *flockfile()* and *funlockfile()*.

28058 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock
 28059 cannot be acquired.

28060 **ERRORS**

28061 No errors are defined.

28062 **EXAMPLES**

28063 None.

28064 **APPLICATION USAGE**

28065 Applications using these functions may be subject to priority inversion, as discussed in XBD |
 28066 [Section 3.284](#) (on page 72).

28067 **RATIONALE**

28068 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each
 28069 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock,
 28070 analogous to *pthread_mutex_trylock()*.

28071 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.
 28072 This both provides thread-safety of these functions without requiring a second level of internal

28073 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

28074 Application developers and implementors should be aware that there are potential deadlock
 28075 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested
 28076 via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of
 28077 implementation-defined line-buffered output streams to be flushed. If two threads each hold the
 28078 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring
 28079 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can
 28080 typically be avoided by acquiring locks on input streams before locks on output streams if a
 28081 thread would be acquiring both.

28082 In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()*
 28083 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where
 28084 the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the
 28085 `*_unlocked` functions/macros. This moves the cost/performance tradeoff to the optimal point.

28086 **FUTURE DIRECTIONS**

28087 None.

28088 **SEE ALSO**

28089 [*getc_unlocked\(\)*](#)

28091 **CHANGE HISTORY**

28092 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

28093 **Issue 6**

28094 These functions are marked as part of the Thread-Safe Functions option.

28095 **Issue 7**

28096 The *flockfile()*, *ftrylockfile()*, and *funlockfile()* functions are moved from the Thread-Safe Functions
 28097 option to the Base.

28098 **NAME**
 28099 floor, floorf, floorl — floor function

28100 **SYNOPSIS**
 28101 #include <math.h>
 28102 double floor(double x);
 28103 float floorf(float x);
 28104 long double floorl(long double x);

28105 **DESCRIPTION**
 28106 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28107 conflict between the requirements described here and the ISO C standard is unintentional. This
 28108 volume of POSIX.1-200x defers to the ISO C standard.

28109 These functions shall compute the largest integral value not greater than x .

28110 An application wishing to check for error situations should set *errno* to zero and call
 28111 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 28112 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 28113 zero, an error has occurred.

28114 **RETURN VALUE**
 28115 Upon successful completion, these functions shall return the largest integral value not greater
 28116 than x , expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the
 28117 function.

28118 MX If x is NaN, a NaN shall be returned.

28119 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

28120 XSI If the correct value would cause overflow, a range error shall occur and *floor()*, *floorf()*, and
 28121 *floorl()* shall return the value of the macro `-HUGE_VAL`, `-HUGE_VALF`, and `-HUGE_VALL`,
 28122 respectively.

28123 **ERRORS**
 28124 These functions shall fail if:

28125 XSI **Range Error** The result would cause an overflow.

28126 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 28127 then *errno* shall be set to [ERANGE]. If the integer expression
 28128 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 28129 floating-point exception shall be raised.

28130 **EXAMPLES**
 28131 None.

28132 **APPLICATION USAGE**
 28133 The integral value returned by these functions might not be expressible as an **int** or **long**. The
 28134 return value should be tested before assigning it to an integer type to avoid the undefined
 28135 results of an integer overflow.

28136 The *floor()* function can only overflow when the floating-point representation has
 28137 `DBL_MANT_DIG > DBL_MAX_EXP`.

28138 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 28139 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

28158 **NAME**

28159 fma, fmaf, fmal — floating-point multiply-add

28160 **SYNOPSIS**

```
28161 #include <math.h>
28162
28162 double fma(double x, double y, double z);
28163 float fmaf(float x, float y, float z);
28164 long double fmal(long double x, long double y, long double z);
```

28165 **DESCRIPTION**

28166 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28167 conflict between the requirements described here and the ISO C standard is unintentional. This
 28168 volume of POSIX.1-200x defers to the ISO C standard.

28169 These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute
 28170 the value (as if) to infinite precision and round once to the result format, according to the
 28171 rounding mode characterized by the value of FLT_ROUNDS.

28172 An application wishing to check for error situations should set *errno* to zero and call
 28173 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 28174 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 28175 zero, an error has occurred.

28176 **RETURN VALUE**

28177 Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary
 28178 operation.

28179 MX If the result overflows or underflows, a range error may occur. On systems that support the IEC
 28180 60559 Floating-Point option, if the result overflows a range error shall occur.

28181 If *x* or *y* are NaN, a NaN shall be returned.

28182 If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a
 28183 domain error shall occur, and either a NaN (if supported), or an implementation-defined value
 28184 shall be returned.

28185 If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and
 28186 either a NaN (if supported), or an implementation-defined value shall be returned.

28187 If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a
 28188 domain error may occur.

28189 If $x*y$ is not $0*Inf$ nor $Inf*0$ and *z* is a NaN, a NaN shall be returned.

28190 **ERRORS**

28191 These functions shall fail if:

28192 MX **Domain Error** The value of $x*y+z$ is invalid, or the value $x*y$ is invalid and *z* is not a NaN.

28193 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 28194 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 28195 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 28196 shall be raised.

28197 MX **Range Error** The result overflows.

28198 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 28199 then *errno* shall be set to [ERANGE]. If the integer expression
 28200 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow

28201 floating-point exception shall be raised.

28202 These functions may fail if:

28203 MX **Domain Error** The value $x*y$ is invalid and z is a NaN.

28204 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
28205 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
28206 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
28207 shall be raised.

28208 **Range Error** The result underflows.

28209 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
28210 then *errno* shall be set to [ERANGE]. If the integer expression
28211 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
28212 floating-point exception shall be raised.

28213 **Range Error** The result overflows.

28214 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
28215 then *errno* shall be set to [ERANGE]. If the integer expression
28216 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
28217 floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

28221 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
28222 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

28224 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its
28225 unexpected use by the compiler can undermine carefully written code. The FP_CONTRACT
28226 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees
28227 its use where desired. Many current machines provide hardware floating multiply-add
28228 instructions; software implementation can be used for others.

FUTURE DIRECTIONS

None.

28271 **CHANGE HISTORY**

28272 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

28273 **Issue 7**

28274 Austin Group Interpretation 1003.1-2001 #007 is applied.

28275 **NAME**28276 `fmemopen` — open a memory buffer stream28277 **SYNOPSIS**

```
28278 CX #include <stdio.h>
28279 FILE *fmemopen(void *restrict buf, size_t size,
28280 const char *restrict mode);
```

28281 **DESCRIPTION**

28282 The `fmemopen()` function shall associate the buffer given by the `buf` and `size` arguments with a
 28283 stream. The `buf` argument shall be either a null pointer or point to a buffer that is at least `size`
 28284 bytes long.

28285 The `mode` argument is a character string having one of the following values:

28286	<code>r</code> or <code>rb</code>	Open the stream for reading.
28287	<code>w</code> or <code>wb</code>	Open the stream for writing.
28288	<code>a</code> or <code>ab</code>	Append; open the stream for writing at the first null byte.
28289	<code>r+</code> or <code>rb+</code> or <code>r+b</code>	Open the stream for update (reading and writing).
28290	<code>w+</code> or <code>wb+</code> or <code>w+b</code>	Open the stream for update (reading and writing). Truncate the buffer 28291 contents.
28292	<code>a+</code> or <code>ab+</code> or <code>a+b</code>	Append; open the stream for update (reading and writing); the initial 28293 position is at the first null byte.

28294 The character '`b`' shall have no effect.

28295 If a null pointer is specified as the `buf` argument, `fmemopen()` shall allocate `size` bytes of memory
 28296 as if by a call to `malloc()`. This buffer shall be automatically freed when the stream is closed.
 28297 Because this feature is only useful when the stream is opened for updating (because there is no
 28298 way to get a pointer to the buffer) the `fmemopen()` call may fail if the `mode` argument does not
 28299 include a '+'.

28300 The stream maintains a current position in the buffer. This position is initially set to either the
 28301 beginning of the buffer (for `r` and `w` modes) or to the first null byte in the buffer (for `a` modes). If
 28302 no null byte is found in append mode, the initial position is set to one byte after the end of the
 28303 buffer.

28304 If `buf` is a null pointer, the initial position shall always be set to the beginning of the buffer.

28305 The stream also maintains the size of the current buffer contents. For modes `r` and `r+` the size is
 28306 set to the value given by the `size` argument. For modes `w` and `w+` the initial size is zero and for
 28307 modes `a` and `a+` the initial size is either the position of the first null byte in the buffer or the value
 28308 of the `size` argument if no null byte is found.

28309 A read operation on the stream cannot advance the current buffer position behind the current
 28310 buffer size. Reaching the buffer size in a read operation counts as "end-of-file". Null bytes in the
 28311 buffer have no special meaning for reads. The read operation starts at the current buffer position
 28312 of the stream.

28313 A write operation starts either at the current position of the stream (if mode has not specified
 28314 '`a`' as the first character) or at the current size of the stream (if mode had '`a`' as the first
 28315 character). If the current position at the end of the write is larger than the current buffer size, the
 28316 current buffer size is set to the current position. A write operation on the stream cannot advance

28317 the current buffer size behind the size given in the *size* argument.

28318 When a stream open for writing is flushed or closed, a null byte is written at the current position
 28319 or at the end of the buffer, depending on the size of the contents. If a stream open for update is
 28320 flushed or closed and the last write has advanced the current buffer size, a null byte is written at
 28321 the end of the buffer if it fits.

28322 An attempt to seek a memory buffer stream to a negative position or to a position larger than the
 28323 buffer size given in the *size* argument shall fail.

28324 RETURN VALUE

28325 Upon successful completion, *fmemopen()* shall return a pointer to the object controlling the
 28326 stream. Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

28327 ERRORS

28328 The *fmemopen()* function shall fail if:

28329 [EINVAL] The *size* argument specifies a buffer size of zero.

28330 The *fmemopen()* function may fail if:

28331 [EINVAL] The value of the *mode* argument is not valid.

28332 [EINVAL] The *buf* argument is a null pointer and the *mode* argument does not include a
 28333 '+' character.

28334 [ENOMEM] The *buf* argument is a null pointer and the allocation of a buffer of length *size*
 28335 has failed.

28336 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

28337 EXAMPLES

```
28338 #include <stdio.h>
28339 static char buffer[] = "foobar";
28340 int
28341 main (void)
28342 {
28343     int ch;
28344     FILE *stream;
28345     stream = fmemopen(buffer, strlen (buffer), "r");
28346     if (stream == NULL)
28347         /* handle error */;
28348     while ((ch = fgetc(stream)) != EOF)
28349         printf("Got %c\n", ch);
28350     fclose(stream);
28351     return (0);
28352 }
```

28353 This program produces the following output:

```
28354 Got f
28355 Got o
28356 Got o
28357 Got b
28358 Got a
28359 Got r
```

28406 **Issue 7**

28407 Austin Group Interpretation 1003.1-2001 #008 is applied.

28408 **NAME**
 28409 `fmod, fmodf, fmodl` — floating-point remainder value function

28410 **SYNOPSIS**
 28411 `#include <math.h>`
 28412 `double fmod(double x, double y);`
 28413 `float fmodf(float x, float y);`
 28414 `long double fmodl(long double x, long double y);`

28415 **DESCRIPTION**
 28416 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28417 conflict between the requirements described here and the ISO C standard is unintentional. This
 28418 volume of POSIX.1-200x defers to the ISO C standard.

28419 These functions shall return the floating-point remainder of the division of x by y .
 28420 An application wishing to check for error situations should set `errno` to zero and call
 28421 `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or
 28422 `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-
 28423 zero, an error has occurred.

28424 **RETURN VALUE**
 28425 These functions shall return the value $x - i * y$, for some integer i such that, if y is non-zero, the
 28426 result has the same sign as x and magnitude less than the magnitude of y .

28427 If the correct value would cause underflow, and is not representable, a range error may occur,
 28428 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

28429 MX If x or y is NaN, a NaN shall be returned.
 28430 If y is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-
 28431 defined value shall be returned.

28432 If x is infinite, a domain error shall occur, and either a NaN (if supported), or an
 28433 implementation-defined value shall be returned.

28434 If x is ± 0 and y is not zero, ± 0 shall be returned.

28435 If x is not infinite and y is $\pm \text{Inf}$, x shall be returned.

28436 If the correct value would cause underflow, and is representable, a range error may occur and
 28437 the correct value shall be returned.

28438 **ERRORS**
 28439 These functions shall fail if:

28440 MX **Domain Error** The x argument is infinite or y is zero.
 28441 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 28442 then `errno` shall be set to [EDOM]. If the integer expression `(math_errhandling`
 28443 `& MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception
 28444 shall be raised.

28445 These functions may fail if:

28446 **Range Error** The result underflows.
 28447 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 28448 then `errno` shall be set to [ERANGE]. If the integer expression
 28449 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow

28450 floating-point exception shall be raised.

28451 **EXAMPLES**

28452 None.

28453 **APPLICATION USAGE**

28454 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
28455 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

28456 **RATIONALE**

28457 None.

28458 **FUTURE DIRECTIONS**

28459 None.

28462 Section 4.19 (on page 104), <math.h>

28463 **CHANGE HISTORY**

28464 First released in Issue 1. Derived from Issue 1 of the SVID.

28465 **Issue 5**

28466 The DESCRIPTION is updated to indicate how an application should check for an error. This
28467 text was previously published in the APPLICATION USAGE section.

28468 **Issue 6**

28469 The behavior for when the *y* argument is zero is now defined.

28470 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999
28471 standard.

28472 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
28473 revised to align with the ISO/IEC 9899:1999 standard.

28474 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
28475 marked.

28476 **NAME**28477 `fmtmsg` — display a message in the specified format on standard error and/or a system console28478 **SYNOPSIS**

```
28479 XSI #include <fmtmsg.h>
28480 int fmtmsg(long classification, const char *label, int severity,
28481           const char *text, const char *action, const char *tag);
```

28482 **DESCRIPTION**28483 The `fmtmsg()` function shall display messages in a specified format instead of the traditional
28484 `printf()` function.28485 Based on a message's classification component, `fmtmsg()` shall write a formatted message either
28486 to standard error, to the console, or to both.28487 A formatted message consists of up to five components as defined below. The component
28488 *classification* is not part of a message displayed to the user, but defines the source of the message
28489 and directs the display of the formatted message.

28490 *classification* Contains the sum of identifying values constructed from the constants defined
28491 below. Any one identifier from a subclass may be used in combination with a
28492 single identifier from a different subclass. Two or more identifiers from the
28493 same subclass should not be used together, with the exception of identifiers
28494 from the display subclass. (Both display subclass identifiers may be used so
28495 that messages can be displayed to both standard error and the system
28496 console.)

28497 **Major Classifications**28498 Identifies the source of the condition. Identifiers are: MM_HARD
28499 (hardware), MM_SOFT (software), and MM_FIRM (firmware).28500 **Message Source Subclassifications**28501 Identifies the type of software in which the problem is detected.
28502 Identifiers are: MM_APPL (application), MM_UTIL (utility), and
28503 MM OPSYS (operating system).28504 **Display Subclassifications**28505 Indicates where the message is to be displayed. Identifiers are:
28506 MM_PRINT to display the message on the standard error stream,
28507 MM_CONSOLE to display the message on the system console. One or
28508 both identifiers may be used.28509 **Status Subclassifications**28510 Indicates whether the application can recover from the condition.
28511 Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-
28512 recoverable).28513 An additional identifier, MM_NULLMC, indicates that no classification
28514 component is supplied for the message.28515 *label* Identifies the source of the message. The format is two fields separated by a
28516 colon. The first field is up to 10 bytes, the second is up to 14 bytes.28517 *severity* Indicates the seriousness of the condition. Identifiers for the levels of *severity*
28518 are:

28519		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
28520			
28521		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
28522			
28523		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
28524			
28525			
28526		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
28527			
28528		MM_NOSEV	Indicates that no severity level is supplied for the message.
28529	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
28530			
28531			
28532	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
28533			
28534			
28535	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
28536			
28537			

28538 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*
 28539 which message components it is to select when writing messages to standard error. The value of
 28540 *MSGVERB* shall be a colon-separated list of optional keywords. Valid keywords are: *label*,
 28541 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the
 28542 component's value is not the component's null value, *fmtmsg()* shall include that component in
 28543 the message when writing the message to standard error. If *MSGVERB* does not include a
 28544 keyword for a message component, that component shall not be included in the display of the
 28545 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the
 28546 null string, if its value is not of the correct format, or if it contains keywords other than the valid
 28547 ones listed above, *fmtmsg()* shall select all components.

28548 *MSGVERB* shall determine which components are selected for display to standard error. All
 28549 message components shall be included in console messages.

28550 RETURN VALUE

28551 The *fmtmsg()* function shall return one of the following values:

28552	MM_OK	The function succeeded.
28553	MM_NOTOK	The function failed completely.
28554	MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
28555		
28556	MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.
28557		

28558 ERRORS

28559 None.

EXAMPLES

28560

28561 1. The following example of *fmtmsg()*:

28562 `fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",`
 28563 `"refer to cat in user's reference manual", "XSI:cat:001")`

28564 produces a complete message in the specified message format:

28565 `XSI:cat: ERROR: illegal option`
 28566 `TO FIX: refer to cat in user's reference manual XSI:cat:001`

28567 2. When the environment variable *MSGVERB* is set as follows:

28568 `MSGVERB=severity:text:action`

28569 and Example 1 is used, *fmtmsg()* produces:

28570 `ERROR: illegal option`
 28571 `TO FIX: refer to cat in user's reference manual`

APPLICATION USAGE

28572 One or more message components may be systematically omitted from messages generated by
 28573 an application by using the null value of the argument for that component.
 28574

RATIONALE

28575 None.
 28576

FUTURE DIRECTIONS

28577 None.

CHANGE HISTORY

28582 First released in Issue 4, Version 2.

Issue 5

28584 Moved from X/OPEN UNIX extension to BASE.
 28585

28586 **NAME**28587 `fnmatch` — match a filename or a pathname28588 **SYNOPSIS**28589 `#include <fnmatch.h>`28590 `int fnmatch(const char *pattern, const char *string, int flags);`28591 **DESCRIPTION**

28592 The `fnmatch()` function shall match patterns as described in XCU [Section 2.13.1](#) (on page 2278) and [Section 2.13.2](#) (on page 2279). It checks the string specified by the `string` argument to see if it matches the pattern specified by the `pattern` argument.

28595 The `flags` argument shall modify the interpretation of `pattern` and `string`. It is the bitwise-inclusive OR of zero or more of the flags defined in `<fnmatch.h>`. If the `FNM_PATHNAME` flag is set in `flags`, then a slash character (`'/'`) in `string` shall be explicitly matched by a slash in `pattern`; it shall not be matched by either the asterisk or question-mark special characters, nor by a bracket expression. If the `FNM_PATHNAME` flag is not set, the slash character shall be treated as an ordinary character.

28601 If `FNM_NOESCAPE` is not set in `flags`, a backslash character (`'\'`) in `pattern` followed by any other character shall match that second character in `string`. In particular, `"\\\"` shall match a backslash in `string`. If `FNM_NOESCAPE` is set, a backslash character shall be treated as an ordinary character.

28605 If `FNM_PERIOD` is set in `flags`, then a leading period (`'.'`) in `string` shall match a period in `pattern`; as described by rule 2 in XCU [Section 2.13.3](#) (on page 2279) where the location of “leading” is indicated by the value of `FNM_PATHNAME`:

- 28608 • If `FNM_PATHNAME` is set, a period is “leading” if it is the first character in `string` or if it immediately follows a slash.
- 28610 • If `FNM_PATHNAME` is not set, a period is “leading” only if it is the first character of `string`.

28612 If `FNM_PERIOD` is not set, then no special restrictions are placed on matching a period.

28613 **RETURN VALUE**

28614 If `string` matches the pattern specified by `pattern`, then `fnmatch()` shall return 0. If there is no match, `fnmatch()` shall return `FNM_NOMATCH`, which is defined in `<fnmatch.h>`. If an error occurs, `fnmatch()` shall return another non-zero value.

28617 **ERRORS**

28618 No errors are defined.

28619 **EXAMPLES**

28620 None.

28621 **APPLICATION USAGE**

28622 The `fnmatch()` function has two major uses. It could be used by an application or utility that needs to read a directory and apply a pattern against each entry. The `find` utility is an example of this. It can also be used by the `pax` utility to process its `pattern` operands, or by applications that need to match strings in a similar manner.

28626 The name `fnmatch()` is intended to imply *filename* match, rather than *pathname* match. The default action of this function is to match filenames, rather than pathnames, since it gives no special significance to the slash character. With the `FNM_PATHNAME` flag, `fnmatch()` does match pathnames, but without tilde expansion, parameter expansion, or special treatment for a period at the beginning of a filename.

fnmatch()28631
28632
28633
28634
28635
28636**RATIONALE**

This function replaced the REG_FILENAME flag of *regcomp()* in early proposals of this volume of POSIX.1-200x. It provides virtually the same functionality as the *regcomp()* and *regexexec()* functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag was proposed for *regcomp()*, and would have had the opposite effect from FNM_PATHNAME), but with a simpler function and less system overhead.

28637
28638**FUTURE DIRECTIONS**

None.

28641

XBD <[fnmatch.h](#)>

28642
28643**CHANGE HISTORY**

First released in Issue 4. Derived from the ISO POSIX-2 standard.

28644
28645**Issue 5**

Moved from POSIX2 C-language Binding to BASE.

28646 **NAME**

28647 fopen — open a stream

28648 **SYNOPSIS**

28649 #include <stdio.h>

28650 FILE *fopen(const char *restrict filename, const char *restrict mode);

28651 **DESCRIPTION**

28652 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 28653 conflict between the requirements described here and the ISO C standard is unintentional. This
 28654 volume of POSIX.1-200x defers to the ISO C standard.

28655 The *fopen()* function shall open the file whose pathname is the string pointed to by *filename*, and
 28656 associates a stream with it.

28657 The *mode* argument points to a string. If the string is one of the following, the file shall be opened
 28658 in the indicated mode. Otherwise, the behavior is undefined.

28659 *r* or *rb* Open file for reading.

28660 *w* or *wb* Truncate to zero length or create file for writing.

28661 *a* or *ab* Append; open or create file for writing at end-of-file.

28662 *r+* or *rb+* or *r+b* Open file for update (reading and writing).

28663 *w+* or *wb+* or *w+b* Truncate to zero length or create file for update.

28664 *a+* or *ab+* or *a+b* Append; open or create file for update, writing at end-of-file.

28665 CX The character 'b' shall have no effect, but is allowed for ISO C standard conformance. Opening
 28666 a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not
 28667 exist or cannot be read.

28668 Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all
 28669 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening
 28670 calls to *fseek()*.

28671 When a file is opened with update mode ('+' as the second or third character in the *mode*
 28672 argument), both input and output may be performed on the associated stream. However, the
 28673 application shall ensure that output is not directly followed by input without an intervening call
 28674 to *fflush()* or to a file positioning function (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly
 28675 followed by output without an intervening call to a file positioning function, unless the input
 28676 operation encounters end-of-file.

28677 When opened, a stream is fully buffered if and only if it can be determined not to refer to an
 28678 interactive device. The error and end-of-file indicators for the stream shall be cleared.

28679 CX If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon
 28680 successful completion, *fopen()* shall mark for update the last data access, last data modification,
 28681 and last file status change timestamps of the file and the last file status change and last data
 28682 modification timestamps of the parent directory.

28683 If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, the
 28684 *fopen()* function shall create a file as if it called the *creat()* function with a value appropriate for
 28685 the *path* argument interpreted from *filename* and a value of S_IRUSR | S_IWUSR | S_IRGRP |
 28686 S_IWGRP | S_IROTH | S_IWOTH for the *mode* argument.

28687 If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion,
 28688 *fopen()* shall mark for update the last data modification and last file status change timestamps of

fopen()

28689 the file. The *fopen()* function shall allocate a file descriptor as *open()* does.

28690 XSI After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the

28691 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an

28692 initial conversion state.

28693 CX The largest value that can be represented correctly in an object of type **off_t** shall be established

28694 as the offset maximum in the open file description.

RETURN VALUE

28695 Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream.

28696 CX Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

ERRORS

28698 The *fopen()* function shall fail if:

28700 CX [EACCES] Search permission is denied on a component of the path prefix, or the file

28701 exists and the permissions specified by *mode* are denied, or the file does not

28702 exist and write permission is denied for the parent directory of the file to be

28703 created.

28704 CX [EINTR] A signal was caught during *fopen()*.

28705 CX [EISDIR] The named file is a directory and *mode* requires write access.

28706 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*

28707 argument.

28708 CX [EMFILE] All file descriptors available to the process are currently open.

28709 CX [EMFILE] {STREAM_MAX} streams are currently open in the calling process. +

28710 CX [ENAMETOOLONG]

28711 The length of the *filename* argument exceeds {PATH_MAX} or a pathname

28712 component is longer than {NAME_MAX}.

28713 CX [ENFILE] The maximum allowable number of files is currently open in the system.

28714 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty

28715 string.

28716 CX [ENOSPC] The directory or file system that would contain the new file cannot be

28717 expanded, the file does not exist, and the file was to be created.

28718 CX [ENOTDIR] A component of the path prefix is not a directory.

28719 CX [ENXIO] The named file is a character special or block special file, and the device

28720 associated with this special file does not exist.

28721 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented

28722 correctly in an object of type **off_t**.

28723 CX [EROFS] The named file resides on a read-only file system and *mode* requires write

28724 access.

28725 The *fopen()* function may fail if:

28726 CX [EINVAL] The value of the *mode* argument is not valid.

28727 CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during

28728 resolution of the *path* argument.

28729 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process. -

28730	CX	[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
28731			
28732			
28733	CX	[ENOMEM]	Insufficient storage space is available.
28734	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.
28735			

EXAMPLES**Opening a File**

The following example tries to open the file named **file** for reading. The *fopen()* function returns a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the file, it just ignores it.

```
#include <stdio.h>
...
FILE *fp;
...
void rgrep(const char *file)
{
...
    if ((fp = fopen(file, "r")) == NULL)
        return;
...
}
```

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD **<stdio.h>**

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

Large File Summit extensions are added.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.

28773

- The [ELOOP] mandatory error condition is added.

28774

28775

- The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error conditions are added.

28776

The normative text is updated to avoid use of the term “must” for application requirements.

28777

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

28778

- The prototype for *fopen()* is updated.

28779

28780

- The DESCRIPTION is updated to note that if the argument *mode* points to a string other than those listed, then the behavior is undefined.

28781

28782

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

28783

Issue 7

28784

Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying the file creation mode. +

28785

SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error. |

28786

28787

SD5-XSH-ERN-149 is applied, changing the {STREAM_MAX} [EMFILE] error condition from a “may fail” to a “shall fail”. |

28788

Changes are made related to support for finegrained timestamps.

28789 **NAME**

28790 fork — create a new process

28791 **SYNOPSIS**

28792 #include <unistd.h>

28793 pid_t fork(void);

28794 **DESCRIPTION**28795 The *fork()* function shall create a new process. The new process (child process) shall be an exact
28796 copy of the calling process (parent process) except as detailed below:

- 28797 • The child process shall have a unique process ID.
- 28798 • The child process ID also shall not match any active process group ID.
- 28799 • The child process shall have a different parent process ID, which shall be the process ID of
28800 the calling process.
- 28801 • The child process shall have its own copy of the parent's file descriptors. Each of the
28802 child's file descriptors shall refer to the same open file description with the corresponding
28803 file descriptor of the parent.
- 28804 • The child process shall have its own copy of the parent's open directory streams. Each
28805 open directory stream in the child process may share directory stream positioning with the
28806 corresponding directory stream of the parent.
- 28807 • The child process shall have its own copy of the parent's message catalog descriptors.
- 28808 • The child process values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* shall be set to
28809 0.
- 28810 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be
28811 canceled; see *alarm()*.
- 28812 XSI • All *semadj* values shall be cleared.
- 28813 • File locks set by the parent process shall not be inherited by the child process.
- 28814 • The set of signals pending for the child process shall be initialized to the empty set.
- 28815 XSI • Interval timers shall be reset in the child process.
- 28816 • Any semaphores that are open in the parent process shall also be open in the child process.
- 28817 ML • The child process shall not inherit any address space memory locks established by the
28818 parent process via calls to *mlockall()* or *mlock()*.
- 28819 • Memory mappings created in the parent shall be retained in the child process.
28820 MAP_PRIVATE mappings inherited from the parent shall also be MAP_PRIVATE
28821 mappings in the child, and any modifications to the data in these mappings made by the
28822 parent prior to calling *fork()* shall be visible to the child. Any modifications to the data in
28823 MAP_PRIVATE mappings made by the parent after *fork()* returns shall be visible only to
28824 the parent. Modifications to the data in MAP_PRIVATE mappings made by the child shall
28825 be visible only to the child.
- 28826 PS • For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit
28827 the policy and priority settings of the parent process during a *fork()* function. For other
28828 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.

fork()

- 28829
- Per-process timers created by the parent shall not be inherited by the child process.
- 28830 MSG
- The child process shall have its own copy of the message queue descriptors of the parent. Each of the message descriptors of the child shall refer to the same open message queue description as the corresponding message descriptor of the parent.
- 28831
- 28832
- 28833
- No asynchronous input or asynchronous output operations shall be inherited by the child process. Any use of asynchronous control blocks created by the parent produces undefined behavior.
- 28834
- 28835
- 28836
- A process shall be created with a single thread. If a multi-threaded process calls *fork()*, the new process shall contain a replica of the calling thread and its entire address space, possibly including the states of mutexes and other resources. Consequently, to avoid errors, the child process may only execute async-signal-safe operations until such time as one of the *exec* functions is called. Fork handlers may be established by means of the *pthread_atfork()* function in order to maintain application invariants across *fork()* calls.
- 28837
- 28838
- 28839
- 28840
- 28841
- 28842
- 28843
- 28844
- When the application calls *fork()* from a signal handler and any of the fork handlers registered by *pthread_atfork()* calls a function that is not asynch-signal-safe, the behavior is undefined.
- 28845 OB TRC TRI
- If the Trace option and the Trace Inherit option are both supported:
- 28846
- 28847
- 28848
- 28849
- 28850
- 28851
- 28852
- If the calling process was being traced in a trace stream that had its inheritance policy set to `POSIX_TRACE_INHERITED`, the child process shall be traced into that trace stream, and the child process shall inherit the parent's mapping of trace event names to trace event type identifiers. If the trace stream in which the calling process was being traced had its inheritance policy set to `POSIX_TRACE_CLOSE_FOR_CHILD`, the child process shall not be traced into that trace stream. The inheritance policy is set by a call to the *posix_trace_attr_setinherited()* function.
- 28853 OB TRC
- If the Trace option is supported, but the Trace Inherit option is not supported:
- 28854
- The child process shall not be traced into any of the trace streams of its parent process.
- 28855 OB TRC
- If the Trace option is supported, the child process of a trace controller process shall not
- 28856
- < control the trace streams controlled by its parent process.
- 28857 CPT
- The initial value of the CPU-time clock of the child process shall be set to zero.
- 28858 TCT
- The initial value of the CPU-time clock of the single thread of the child process shall be set
- 28859
- to zero.

28860 All other process characteristics defined by POSIX.1-200x shall be the same in the parent and

28861 child processes. The inheritance of process characteristics not defined by POSIX.1-200x is

28862 unspecified by POSIX.1-200x.

28863 After *fork()*, both the parent and the child processes shall be capable of executing independently

28864 before either one terminates.

RETURN VALUE

28865

28866 Upon successful completion, *fork()* shall return 0 to the child process and shall return the

28867 process ID of the child process to the parent process. Both processes shall continue to execute

28868 from the *fork()* function. Otherwise, `-1` shall be returned to the parent process, no child process

28869 shall be created, and *errno* shall be set to indicate the error.

ERRORS

28870 The *fork()* function shall fail if:

- 28871
- 28872 [EAGAIN] The system lacked the necessary resources to create another process, or the
- 28873 system-imposed limit on the total number of processes under execution
- 28874 system-wide or by a single user {CHILD_MAX} would be exceeded.

28875 The *fork()* function may fail if:

28876 [ENOMEM] Insufficient storage space is available.

28877 EXAMPLES

28878 None.

28879 APPLICATION USAGE

28880 None.

28881 RATIONALE

28882 Many historical implementations have timing windows where a signal sent to a process group
 28883 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the
 28884 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of
 28885 pending signals. This volume of POSIX.1-200x does not require, or even permit, this behavior.
 28886 However, it is pragmatic to expect that problems of this nature may continue to exist in
 28887 implementations that appear to conform to this volume of POSIX.1-200x and pass available
 28888 verification suites. This behavior is only a consequence of the implementation failing to make
 28889 the interval between signal generation and delivery totally invisible. From the application's
 28890 perspective, a *fork()* call should appear atomic. A signal that is generated prior to the *fork()*
 28891 should be delivered prior to the *fork()*. A signal sent to the process group after the *fork()* should
 28892 be delivered to both parent and child. The implementation may actually initialize internal data
 28893 structures corresponding to the child's set of pending signals to include signals sent to the
 28894 process group during the *fork()*. Since the *fork()* call can be considered as atomic from the
 28895 application's perspective, the set would be initialized as empty and such signals would have
 28896 arrived after the *fork()*; see also `<signal.h>`.

28897 One approach that has been suggested to address the problem of signal inheritance across *fork()*
 28898 is to add an [EINTR] error, which would be returned when a signal is detected during the call.
 28899 While this is preferable to losing signals, it was not considered an optimal solution. Although it
 28900 is not recommended for this purpose, such an error would be an allowable extension for an
 28901 implementation.

28902 The [ENOMEM] error value is reserved for those implementations that detect and distinguish
 28903 such a condition. This condition occurs when an implementation detects that there is not enough
 28904 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate
 28905 because there can never be enough memory (either primary or secondary storage) to perform
 28906 the operation. Since *fork()* duplicates an existing process, this must be a condition where there is
 28907 sufficient memory for one such process, but not for two. Many historical implementations
 28908 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally
 28909 distinct from [EAGAIN] from the perspective of a conforming application.

28910 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it
 28911 and it should be reserved for the error condition specified there. The condition is not applicable
 28912 on many implementations.

28913 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.
 28914 A system that single-threads processes was clearly not intended and is considered an
 28915 unacceptable "toy implementation" of this volume of POSIX.1-200x. The only objection
 28916 anticipated to the phrase "executing independently" is testability, but this assertion should be
 28917 testable. Such tests require that both the parent and child can block on a detectable action of the
 28918 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be
 28919 possible for the system to conform to the intent of this volume of POSIX.1-200x.

28920 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it
 28921 occurs or not is not in any practical sense under the control of the application because the
 28922 condition is usually a consequence of the user's use of the system, not of the application's code.
 28923 Thus, no application can or should rely upon its occurrence under any circumstances, nor
 28924 should the exact semantics of what concept of "user" is used be of concern to the application

28925 developer. Validation writers should be cognizant of this limitation.

28926 There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread
28927 of control within the same program (which was originally only possible in POSIX by creating a
28928 new process); the other is to create a new process running a different program. In the latter case,
28929 the call to *fork()* is soon followed by a call to one of the *exec* functions.

28930 The general problem with making *fork()* work in a multi-threaded world is what to do with all
28931 of the threads. There are two alternatives. One is to copy all of the threads into the new process.
28932 This causes the programmer or implementation to deal with threads that are suspended on
28933 system calls or that might be about to execute system calls that should not be executed in the
28934 new process. The other alternative is to copy only the thread that calls *fork()*. This creates the
28935 difficulty that the state of process-local resources is usually held in process memory. If a thread
28936 that is not calling *fork()* holds a resource, that resource is never released in the child process
28937 because the thread whose job it is to release the resource does not exist in the child process.

28938 When a programmer is writing a multi-threaded program, the first described use of *fork()*,
28939 creating new threads in the same program, is provided by the *pthread_create()* function. The
28940 *fork()* function is thus used only to run new programs, and the effects of calling functions that
28941 require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

28942 The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()*
28943 function lets all the threads in the parent be duplicated in the child. This essentially duplicates
28944 the state of the parent in the child. This allows threads in the child to continue processing and
28945 allows locks and the state to be preserved without explicit *pthread_atfork()* code. The calling
28946 process has to ensure that the threads processing state that is shared between the parent and
28947 child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall()*. For
28948 example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two
28949 threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*.
28950 If this is not desired behavior, the parent process has to synchronize with such threads before
28951 calling *forkall()*.

28952 While the *fork()* function is async-signal-safe, there is no way for an implementation to
28953 determine whether the fork handlers established by *pthread_atfork()* are async-signal-safe. The
28954 fork handlers may attempt to execute portions of the implementation that are not async-signal-
28955 safe, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore
28956 undefined for the fork handlers to execute functions that are not async-signal-safe when *fork()*
28957 is called from a signal handler.

28958 When *forkall()* is called, threads, other than the calling thread, that are in functions that can
28959 return with an [EINTR] error may have those functions return [EINTR] if the implementation
28960 cannot ensure that the function behaves correctly in the parent and child. In particular,
28961 *pthread_cond_wait()* and *pthread_cond_timedwait()* need to return in order to ensure that the
28962 condition has not changed. These functions can be awakened by a spurious condition wakeup
28963 rather than returning [EINTR].

28964 FUTURE DIRECTIONS

28965 None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of `fork()` on a pending alarm call in the child process is clarified.

The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the DESCRIPTION and RATIONALE relating to fork handlers registered by the `pthread_atfork()` function and async-signal safety.

Issue 7

Austin Group Interpretation 1003.1-2001 #080 is applied, clarifying the status of asynchronous input and asynchronous output operations and asynchronous control lists in the DESCRIPTION.

Functionality relating to the Asynchronous Input and Output, Memory Mapped Files, Timers, and Threads options is moved to the Base.

Functionality relating to message catalog descriptors is moved from the XSI option to the Base.

28994 **NAME**
 28995 fpathconf, pathconf — get configurable pathname variables

28996 **SYNOPSIS**
 28997 #include <unistd.h>
 28998 long fpathconf(int *fildes*, int *name*);
 28999 long pathconf(const char **path*, int *name*);

29000 **DESCRIPTION**
 29001 The *fpathconf()* and *pathconf()* functions shall determine the current value of a configurable limit
 29002 or option (*variable*) that is associated with a file or directory.

29003 For *pathconf()*, the *path* argument points to the pathname of a file or directory.

29004 For *fpathconf()*, the *fildes* argument is an open file descriptor.

29005 The *name* argument represents the variable to be queried relative to that file or directory.
 29006 Implementations shall support all of the variables listed in the following table and may support
 29007 others. The variables in the following table come from <limits.h> or <unistd.h> and the
 29008 symbolic constants, defined in <unistd.h>, are the corresponding values used for *name*.

Variable	Value of <i>name</i>	Requirements
{FILESIZEBITS}	_PC_FILESIZEBITS	3,4
{LINK_MAX}	_PC_LINK_MAX	1
{MAX_CANON}	_PC_MAX_CANON	2
{MAX_INPUT}	_PC_MAX_INPUT	2
{NAME_MAX}	_PC_NAME_MAX	3,4
{PATH_MAX}	_PC_PATH_MAX	4,5
{PIPE_BUF}	_PC_PIPE_BUF	6
{POSIX2_SYMLINKS}	_PC_2_SYMLINKS	4
{POSIX_ALLOC_SIZE_MIN}	_PC_ALLOC_SIZE_MIN	10
{POSIX_REC_INCR_XFER_SIZE}	_PC_REC_INCR_XFER_SIZE	10
{POSIX_REC_MAX_XFER_SIZE}	_PC_REC_MAX_XFER_SIZE	10
{POSIX_REC_MIN_XFER_SIZE}	_PC_REC_MIN_XFER_SIZE	10
{POSIX_REC_XFER_ALIGN}	_PC_REC_XFER_ALIGN	10
{SYMLINK_MAX}	_PC_SYMLINK_MAX	4,9
_POSIX_CHOWN_RESTRICTED	_PC_CHOWN_RESTRICTED	7
_POSIX_NO_TRUNC	_PC_NO_TRUNC	3,4
_POSIX_VDISABLE	_PC_VDISABLE	2
_POSIX_ASYNC_IO	_PC_ASYNC_IO	8
_POSIX_PRIO_IO	_PC_PRIO_IO	8
_POSIX_SYNC_IO	_PC_SYNC_IO	8
_POSIX_TIMESTAMP_RESOLUTION	_PC_TIMESTAMP_RESOLUTION	1

29031 Requirements

- 29032 1. If *path* or *fildes* refers to a directory, the value returned shall apply to the directory itself.
- 29033 2. If *path* or *fildes* does not refer to a terminal file, it is unspecified whether an
 29034 implementation supports an association of the variable name with the specified file.
- 29035 3. If *path* or *fildes* refers to a directory, the value returned shall apply to filenames within the
 29036 directory.

- 29037 4. If *path* or *filde*s does not refer to a directory, it is unspecified whether an implementation
29038 supports an association of the variable name with the specified file.
- 29039 5. If *path* or *filde*s refers to a directory, the value returned shall be the maximum length of a
29040 relative pathname when the specified directory is the working directory.
- 29041 6. If *path* refers to a FIFO, or *filde*s refers to a pipe or FIFO, the value returned shall apply to
29042 the referenced object. If *path* or *filde*s refers to a directory, the value returned shall apply to
29043 any FIFO that exists or can be created within the directory. If *path* or *filde*s refers to any
29044 other type of file, it is unspecified whether an implementation supports an association of
29045 the variable name with the specified file.
- 29046 7. If *path* or *filde*s refers to a directory, the value returned shall apply to any files, other than
29047 directories, that exist or can be created within the directory.
- 29048 8. If *path* or *filde*s refers to a directory, it is unspecified whether an implementation supports
29049 an association of the variable name with the specified file.
- 29050 9. If *path* or *filde*s refers to a directory, the value returned shall be the maximum length of the
29051 string that a symbolic link in that directory can contain.
- 29052 10. If *path* or *filde*s does not refer to a regular file, it is unspecified whether an
29053 implementation supports an association of the variable name with the specified file. If an
29054 implementation supports such an association for other than a regular file, the value
29055 returned is unspecified.

RETURN VALUE

29056 If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return -1 and set *errno* to
29057 indicate the error.
29058

29059 If the variable corresponding to *name* has no limit for the *path* or file descriptor, both *pathconf()*
29060 and *fpathconf()* shall return -1 without changing *errno*. If the implementation needs to use *path*
29061 to determine the value of *name* and the implementation does not support the association of *name*
29062 with the file specified by *path*, or if the process did not have appropriate privileges to query the
29063 file specified by *path*, or *path* does not exist, *pathconf()* shall return -1 and set *errno* to indicate the
29064 error.

29065 If the implementation needs to use *filde*s to determine the value of *name* and the implementation
29066 does not support the association of *name* with the file specified by *filde*s, or if *filde*s is an invalid
29067 file descriptor, *fpathconf()* shall return -1 and set *errno* to indicate the error.

29068 Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or
29069 directory without changing *errno*. The value returned shall not be more restrictive than the
29070 corresponding value available to the application when it was compiled with the
29071 implementation's `<limits.h>` or `<unistd.h>`.

29072 If the variable corresponding to *name* is dependent on an unsupported option, the results are
29073 unspecified.

ERRORS

29074 The *pathconf()* function shall fail if:
29075

29076 [EINVAL] The value of *name* is not valid.

29077 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
29078 argument.

29079 [E_OVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is +
29080 larger than `{LONG_MAX}`.

29081 The *pathconf()* function may fail if:

- 29082 [EACCES] Search permission is denied for a component of the path prefix.
- 29083 [EINVAL] The implementation does not support an association of the variable *name* with
29084 the specified file.
- 29085 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
29086 resolution of the *path* argument.
- 29087 [ENAMETOOLONG]
29088 The length of the *path* argument exceeds {PATH_MAX} or a pathname
29089 component is longer than {NAME_MAX}.
- 29090 [ENAMETOOLONG]
29091 As a result of encountering a symbolic link in resolution of the *path* argument,
29092 the length of the substituted pathname string exceeded {PATH_MAX}.
- 29093 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.
- 29094 [ENOTDIR] A component of the path prefix is not a directory.
- 29095 The *fpathconf()* function shall fail if:
- 29096 [EINVAL] The value of *name* is not valid.
- 29097 [EOVERFLOW] The value of *name* is `_PC_TIMESTAMP_RESOLUTION` and the resolution is +
29098 larger than {LONG_MAX}.
- 29099 The *fpathconf()* function may fail if:
- 29100 [EBADF] The *fildev* argument is not a valid file descriptor.
- 29101 [EINVAL] The implementation does not support an association of the variable *name* with
29102 the specified file.

EXAMPLES

29103 None.
29104

APPLICATION USAGE

29105 Application developers should check whether an option, such as `_POSIX_ADVISORY_INFO`, is
29106 supported prior to obtaining and using values for related variables such as
29107 {`POSIX_ALLOC_SIZE_MIN`}.
29108

RATIONALE

29109 The *pathconf()* function was proposed immediately after the *sysconf()* function when it was
29110 realized that some configurable values may differ across file system, directory, or device
29111 boundaries.
29112

29113 For example, {`NAME_MAX`} frequently changes between System V and BSD-based file systems;
29114 System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file
29115 systems, an application would be forced to limit all pathname components to 14 bytes, as this
29116 would be the value specified in `<limits.h>` on such a system.

29117 Therefore, various useful values can be queried on any pathname or file descriptor, assuming
29118 that the appropriate permissions are in place.

29119 The value returned for the variable {`PATH_MAX`} indicates the longest relative pathname that
29120 could be given if the specified directory is the current working directory of the process. A
29121 process may not always be able to generate a name that long and use it if a subdirectory in the
29122 pathname crosses into a more restrictive file system.

29123 The value returned for the variable `_POSIX_CHOWN_RESTRICTED` also applies to directories
29124 that do not have file systems mounted on them. The value may change when crossing a mount
29125 point, so applications that need to know should check for each directory. (An even easier check
29126 is to try the *chown()* function and look for an error in case it happens.)

29127 Unlike the values returned by *sysconf()*, the pathname-oriented variables are potentially more
 29128 volatile and are not guaranteed to remain constant throughout the lifetime of the process. For
 29129 example, in between two calls to *pathconf()*, the file system in question may have been
 29130 unmounted and remounted with different characteristics.

29131 Also note that most of the errors are optional. If one of the variables always has the same value
 29132 on an implementation, the implementation need not look at *path* or *fildev* to return that value and
 29133 is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that
 29134 indicates that the value of *name* is not valid for that variable.

29135 If the value of any of the limits is unspecified (logically infinite), they will not be defined in
 29136 <limits.h> and the *pathconf()* and *fpathconf()* functions return -1 without changing *errno*. This
 29137 can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set
 29138 to [EINVAL] in this case.

29139 Since -1 is a valid return value for the *pathconf()* and *fpathconf()* functions, applications should
 29140 set *errno* to zero before calling them and check *errno* only if the return value is -1.

29141 For the case of {SYMLINK_MAX}, since both *pathconf()* and *open()* follow symbolic links, there
 29142 is no way that *path* or *fildev* could refer to a symbolic link.

29143 It was the intention of IEEE Std 1003.1d-1999 that the following variables:

```
29144     {POSIX_ALLOC_SIZE_MIN}
29145     {POSIX_REC_INCR_XFER_SIZE}
29146     {POSIX_REC_MAX_XFER_SIZE}
29147     {POSIX_REC_MIN_XFER_SIZE}
29148     {POSIX_REC_XFER_ALIGN}
```

29149 only applied to regular files, but Note 10 also permits implementation of the advisory semantics
 29150 on other file types unique to an implementation (for example, a character special device).

29151 The [EOVERFLOW] error for _PC_TIMESTAMP_RESOLUTION cannot occur on POSIX- +
 29152 compliant file systems because POSIX requires a timestamp resolution no larger than one +
 29153 second. Even on 32-bit systems, this can be represented without overflow.

29154 FUTURE DIRECTIONS

29155 None.

29160 CHANGE HISTORY

29161 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

29162 Issue 5

29163 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

29164 Large File Summit extensions are added.

29165 Issue 6

29166 The following new requirements on POSIX implementations derive from alignment with the
 29167 Single UNIX Specification:

- 29168 • The DESCRIPTION is updated to include {FILESIZEBITS}.
- 29169 • The [ELOOP] mandatory error condition is added.

29170

- A second [ENAMETOOLONG] is added as an optional error condition.

29171

The following changes were made to align with the IEEE P1003.1a draft standard:

29172

- The `_PC_SYMLINK_MAX` entry is added to the table in the DESCRIPTION.

29173

The following `fpathconf()` variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

29174

29175

```
{POSIX_ALLOC_SIZE_MIN}
```

29176

```
{POSIX_REC_INCR_XFER_SIZE}

29180

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth paragraph of the DESCRIPTION and removing shading and margin markers from the table. This change is needed since implementations are required to support all of these symbols.

29181

29182

29183

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/34 is applied, adding the table entry for `POSIX2_SYMLINKS` in the DESCRIPTION.

29184

29185

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/35 is applied, updating the DESCRIPTION and RATIONALE sections to clarify behavior for the following variables:

29186

29187

```
{POSIX_ALLOC_SIZE_MIN}
```

29188

```
{POSIX_REC_INCR_XFER_SIZE}
```

29189

```
{POSIX_REC_MAX_XFER_SIZE}
```

29190

```
{POSIX_REC_MIN_XFER_SIZE}
```

29191

```
{POSIX_REC_XFER_ALIGN}
```

29192

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/36 is applied, updating the RETURN VALUE and APPLICATION USAGE sections to state that the results are unspecified if a variable is dependent on an unsupported option, and advising application developers to check for supported options prior to obtaining and using such values.

29196

Issue 7

29197

Changes are made related to support for finegrained timestamps.

29198 **NAME**
 29199 fpclassify — classify real floating type

29200 **SYNOPSIS**
 29201 #include <math.h>
 29202 int fpclassify(real-floating x);

29203 **DESCRIPTION**
 29204 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 29205 conflict between the requirements described here and the ISO C standard is unintentional. This
 29206 volume of POSIX.1-200x defers to the ISO C standard.

29207 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,
 29208 zero, or into another implementation-defined category. First, an argument represented in a
 29209 format wider than its semantic type is converted to its semantic type. Then classification is based
 29210 on the type of the argument.

29211 **RETURN VALUE**
 29212 The *fpclassify()* macro shall return the value of the number classification macro appropriate to
 29213 the value of its argument.

29214 **ERRORS**
 29215 No errors are defined.

29216 **EXAMPLES**
 29217 None.

29218 **APPLICATION USAGE**
 29219 None.

29220 **RATIONALE**
 29221 None.

29222 **FUTURE DIRECTIONS**
 29223 None.

29224 **SEE ALSO**
 29225 *isfinite()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*

29226 XBD <math.h>

29227 **CHANGE HISTORY**
 29228 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

29229 **NAME**29230 `dprintf, fprintf, printf, snprintf, sprintf` — print formatted output29231 **SYNOPSIS**29232 `#include <stdio.h>`

```

29233 CX int dprintf(int fildes, const char *format, ...);
29234 int fprintf(FILE *restrict stream, const char *restrict format, ...);
29235 int printf(const char *restrict format, ...);
29236 int snprintf(char *restrict s, size_t n,
29237 const char *restrict format, ...);
29238 int sprintf(char *restrict s, const char *restrict format, ...);

```

29239 **DESCRIPTION**

29240 CX Excluding `dprintf()`: The functionality described on this reference page is aligned with the ISO C
 29241 standard. Any conflict between the requirements described here and the ISO C standard is
 29242 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

29243 The `fprintf()` function shall place output on the named output *stream*. The `printf()` function shall
 29244 place output on the standard output stream *stdout*. The `sprintf()` function shall place output
 29245 followed by the null byte, `'\0'`, in consecutive bytes starting at **s*; it is the user's responsibility
 29246 to ensure that enough space is available.

29247 CX The `dprintf()` function shall be equivalent to the `fprintf()` function, except that `dprintf()` shall
 29248 write output to the file associated with the file descriptor specified by the *fildes* argument rather
 29249 than place output on a stream.

29250 The `snprintf()` function shall be equivalent to `sprintf()`, with the addition of the *n* argument
 29251 which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s*
 29252 may be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of
 29253 being written to the array, and a null byte is written at the end of the bytes actually written into
 29254 the array.

29255 If copying takes place between objects that overlap as a result of a call to `sprintf()` or `snprintf()`,
 29256 the results are undefined.

29257 Each of these functions converts, formats, and prints its arguments under control of the *format*.
 29258 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is
 29259 composed of zero or more directives: *ordinary characters*, which are simply copied to the output
 29260 stream, and *conversion specifications*, each of which shall result in the fetching of zero or more
 29261 arguments. The results are undefined if there are insufficient arguments for the *format*. If the
 29262 *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are
 29263 otherwise ignored.

29264 CX Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 29265 to the next unused argument. In this case, the conversion specifier character `%` (see below) is
 29266 replaced by the sequence `"%n$"`, where *n* is a decimal integer in the range `[1,{NL_ARGMAX}]`,
 29267 giving the position of the argument in the argument list. This feature provides for the definition
 29268 of format strings that select arguments in an order appropriate to specific languages (see the
 29269 EXAMPLES section).

29270 The *format* can contain either numbered argument conversion specifications (that is, `"%n$"` and
 29271 `"*m$"`), or unnumbered argument conversion specifications (that is, `%` and `*`), but not both. The
 29272 only exception to this is that `%%` can be mixed with the `"%n$"` form. The results of mixing
 29273 numbered and unnumbered argument specifications in a *format* string are undefined. When
 29274 numbered argument specifications are used, specifying the *N*th argument requires that all the
 29275 leading arguments, from the first to the $(N-1)$ th, are specified in the format string.

- 29276 In format strings containing the "%n\$" form of conversion specification, numbered arguments
29277 in the argument list can be referenced from the format string as many times as required.
- 29278 In format strings containing the % form of conversion specification, each conversion specification
29279 uses the first unused argument in the argument list.
- 29280 CX All forms of the *fprintf()* functions allow for the insertion of a language-dependent radix
29281 character in the output string. The radix character is defined in the process' locale (category
29282 *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix character is not defined, the
29283 radix character shall default to a period ('.').
- 29284 CX Each conversion specification is introduced by the '%' character or by the character sequence
29285 "%n\$", after which the following appear in sequence:
- 29286 • Zero or more *flags* (in any order), which modify the meaning of the conversion
29287 specification.
 - 29288 • An optional minimum *field width*. If the converted value has fewer bytes than the field
29289 width, it shall be padded with spaces by default on the left; it shall be padded on the right
29290 if the left-adjustment flag ('-'), described below, is given to the field width. The field
29291 width takes the form of an asterisk ('*'), described below, or a decimal integer.
 - 29292 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u,
29293 x, and X conversion specifiers; the number of digits to appear after the radix character for
29294 the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for
29295 the g and G conversion specifiers; or the maximum number of bytes to be printed from a
29296 XSI string in the s and S conversion specifiers. The precision takes the form of a period ('.')
29297 followed either by an asterisk ('*'), described below, or an optional decimal digit string,
29298 where a null digit string is treated as zero. If a precision appears with any other conversion
29299 specifier, the behavior is undefined.
 - 29300 • An optional length modifier that specifies the size of the argument.
 - 29301 • A *conversion specifier* character that indicates the type of conversion to be applied.
- 29302 A field width, or precision, or both, may be indicated by an asterisk ('*'). In this case an
29303 argument of type **int** supplies the field width or precision. Applications shall ensure that
29304 arguments specifying field width, or precision, or both appear in that order before the argument,
29305 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field
29306 CX width. A negative precision is taken as if the precision were omitted. In *format* strings
29307 containing the "%n\$" form of a conversion specification, a field width or precision may be
29308 indicated by the sequence "*m\$", where *m* is a decimal integer in the range [1,{NL_ARGMAX}]
29309 giving the position in the argument list (after the *format* argument) of an integer argument
29310 containing the field width or precision, for example:
- ```
29311 printf("%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);
```
- 29312 The flag characters and their meanings are:
- 29313 CX ' The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G)  
29314 shall be formatted with thousands' grouping characters. For other conversions the  
29315 behavior is undefined. The non-monetary grouping character is used.
- 29316 - The result of the conversion shall be left-justified within the field. The conversion is  
29317 right-justified if this flag is not specified.
- 29318 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The  
29319 conversion shall begin with a sign only when a negative value is converted if this flag is  
29320 not specified.

|       |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------|----|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29321 |    | <space>      | If the first character of a signed conversion is not a sign or if a signed conversion results in no characters, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 29322 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29323 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29324 |    | #            | Specifies that the value is to be converted to an alternative form. For o conversion, it increases the precision (if necessary) to force the first digit of the result to be zero. For x or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. Without this flag, a radix character appears in the result of these conversions only if a digit follows it. For g and G conversion specifiers, trailing zeros shall <i>not</i> be removed from the result as they normally are. For other conversion specifiers, the behavior is undefined. |
| 29325 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29326 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| 29331 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29332 |    | 0            | For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros (following any indication of sign or base) are used to pad to the field width; no space padding is performed. If the '0' and '-' flags both appear, the '0' flag is ignored. For d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag shall be ignored. If the '0' and ' ' flags both appear, the grouping characters are inserted before zero padding. For other conversions, the behavior is undefined.                                                                                                                                                                                                |

| 29364 |    | t            | Specifies that a following d, i, o, u, x, or X conversion specifier applies to a <b>ptrdiff_t</b> or the corresponding <b>unsigned</b> type argument; or that a following n conversion specifier applies to a pointer to a <b>ptrdiff_t</b> argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 29365 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29366 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 29367 |    | L            | Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a <b>long double</b> argument.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 29368 |    |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

- 29369 If a length modifier appears with any conversion specifier other than as specified above, the  
29370 behavior is undefined.
- 29371 The conversion specifiers and their meanings are:
- 29372 **d, i** The **int** argument shall be converted to a signed decimal in the style "`[-]dddd`". The  
29373 precision specifies the minimum number of digits to appear; if the value being  
29374 converted can be represented in fewer digits, it shall be expanded with leading zeros.  
29375 The default precision is 1. The result of converting zero with an explicit precision of  
29376 zero shall be no characters.
- 29377 **o** The **unsigned** argument shall be converted to unsigned octal format in the style  
29378 "`dddd`". The precision specifies the minimum number of digits to appear; if the value  
29379 being converted can be represented in fewer digits, it shall be expanded with leading  
29380 zeros. The default precision is 1. The result of converting zero with an explicit precision  
29381 of zero shall be no characters.
- 29382 **u** The **unsigned** argument shall be converted to unsigned decimal format in the style  
29383 "`dddd`". The precision specifies the minimum number of digits to appear; if the value  
29384 being converted can be represented in fewer digits, it shall be expanded with leading  
29385 zeros. The default precision is 1. The result of converting zero with an explicit precision  
29386 of zero shall be no characters.
- 29387 **x** The **unsigned** argument shall be converted to unsigned hexadecimal format in the style  
29388 "`dddd`"; the letters "abcdef" are used. The precision specifies the minimum number  
29389 of digits to appear; if the value being converted can be represented in fewer digits, it  
29390 shall be expanded with leading zeros. The default precision is 1. The result of  
29391 converting zero with an explicit precision of zero shall be no characters.
- 29392 **X** Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead  
29393 of "abcdef".
- 29394 **f, F** The **double** argument shall be converted to decimal notation in the style  
29395 "`[-]ddd.ddd`", where the number of digits after the radix character is equal to the  
29396 precision specification. If the precision is missing, it shall be taken as 6; if the precision  
29397 is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix  
29398 character appears, at least one digit appears before it. The low-order digit shall be  
29399 rounded in an implementation-defined manner.
- 29400 A **double** argument representing an infinity shall be converted in one of the styles  
29401 "`[-]inf`" or "`[-]infinity`"; which style is implementation-defined. A **double**  
29402 argument representing a NaN shall be converted in one of the styles "`[-]nan(n-char-sequence)`" or "`[-]nan`"; which style, and the meaning of any *n-char-sequence*,  
29403 is implementation-defined. The **F** conversion specifier produces "INF", "INFINITY",  
29404 or "NAN" instead of "inf", "infinity", or "nan", respectively.
- 29406 **e, E** The **double** argument shall be converted in the style "`[-]d.ddde±dd`", where there is  
29407 one digit before the radix character (which is non-zero if the argument is non-zero) and  
29408 the number of digits after it is equal to the precision; if the precision is missing, it shall  
29409 be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall  
29410 appear. The low-order digit shall be rounded in an implementation-defined manner.  
29411 The **E** conversion specifier shall produce a number with 'E' instead of 'e'  
29412 introducing the exponent. The exponent shall always contain at least two digits. If the  
29413 value is zero, the exponent shall be zero.
- 29414 A **double** argument representing an infinity or NaN shall be converted in the style of  
29415 an **f** or **F** conversion specifier.

29416 g, G The **double** argument representing a floating-point number shall be converted in the  
 29417 style `f` or `e` (or in the style `F` or `E` in the case of a `G` conversion specifier), depending on  
 29418 the value converted and the precision. Let `P` equal the precision if non-zero, 6 if the  
 29419 precision is omitted, or 1 if the precision is zero. Then, if a conversion with style `E`  
 29420 would have an exponent of `X`:

- 29421 — If  $P > X \geq -4$ , the conversion shall be with style `f` (or `F`) and precision  $P - (X + 1)$ .
- 29422 — Otherwise, the conversion shall be with style `e` (or `E`) and precision  $P - 1$ .

29423 Finally, unless the `'#'` flag is used, any trailing zeros shall be removed from the  
 29424 fractional portion of the result and the decimal-point character shall be removed if there  
 29425 is no fractional portion remaining.

29426 A **double** argument representing an infinity or NaN shall be converted in the style of  
 29427 an `f` or `F` conversion specifier.

29428 a, A A **double** argument representing a floating-point number shall be converted in the  
 29429 style `"[-]0xh.hhhhp±d"`, where there is one hexadecimal digit (which shall be non-  
 29430 zero if the argument is a normalized floating-point number and is otherwise  
 29431 unspecified) before the decimal-point character and the number of hexadecimal digits  
 29432 after it is equal to the precision; if the precision is missing and `FLT_RADIX` is a power  
 29433 of 2, then the precision shall be sufficient for an exact representation of the value; if the  
 29434 precision is missing and `FLT_RADIX` is not a power of 2, then the precision shall be  
 29435 sufficient to distinguish values of type **double**, except that trailing zeros may be  
 29436 omitted; if the precision is zero and the `'#'` flag is not specified, no decimal-point  
 29437 character shall appear. The letters `"abcdef"` shall be used for a conversion and the  
 29438 letters `"ABCDEF"` for a conversion. The `A` conversion specifier produces a number with  
 29439 `'X'` and `'P'` instead of `'x'` and `'p'`. The exponent shall always contain at least one  
 29440 digit, and only as many more digits as necessary to represent the decimal exponent of  
 29441 2. If the value is zero, the exponent shall be zero.

29442 A **double** argument representing an infinity or NaN shall be converted in the style of  
 29443 an `f` or `F` conversion specifier.

29444 c The **int** argument shall be converted to an **unsigned char**, and the resulting byte shall  
 29445 be written.

29446 If an `l` (ell) qualifier is present, the **wint\_t** argument shall be converted as if by an `ls`  
 29447 conversion specification with no precision and an argument that points to a two-  
 29448 element array of type **wchar\_t**, the first element of which contains the **wint\_t** argument  
 29449 to the `ls` conversion specification and the second element contains a null wide  
 29450 character.

29451 s The argument shall be a pointer to an array of **char**. Bytes from the array shall be  
 29452 written up to (but not including) any terminating null byte. If the precision is specified,  
 29453 no more than that many bytes shall be written. If the precision is not specified or is  
 29454 greater than the size of the array, the application shall ensure that the array contains a  
 29455 null byte.

29456 If an `l` (ell) qualifier is present, the argument shall be a pointer to an array of type  
 29457 **wchar\_t**. Wide characters from the array shall be converted to characters (each as if by  
 29458 a call to the `wcrtomb()` function, with the conversion state described by an **mbstate\_t**  
 29459 object initialized to zero before the first wide character is converted) up to and  
 29460 including a terminating null wide character. The resulting characters shall be written  
 29461 up to (but not including) the terminating null character (byte). If no precision is  
 29462 specified, the application shall ensure that the array contains a null wide character. If a  
 29463 precision is specified, no more than that many characters (bytes) shall be written  
 29464 (including shift sequences, if any), and the array shall contain a null wide character if,

|       |     |   |                                                                                                    |
|-------|-----|---|----------------------------------------------------------------------------------------------------|
| 29465 |     |   | to equal the character sequence length given by the precision, the function would need             |
| 29466 |     |   | to access a wide character one past the end of the array. In no case shall a partial               |
| 29467 |     |   | character be written.                                                                              |
| 29468 | p   |   | The argument shall be a pointer to <b>void</b> . The value of the pointer is converted to a        |
| 29469 |     |   | sequence of printable characters, in an implementation-defined manner.                             |
| 29470 | n   |   | The argument shall be a pointer to an integer into which is written the number of bytes            |
| 29471 |     |   | written to the output so far by this call to one of the <i>fprintf()</i> functions. No argument is |
| 29472 |     |   | converted.                                                                                         |
| 29473 | XSI | C | Equivalent to <code>lc</code> .                                                                    |
| 29474 | XSI | S | Equivalent to <code>ls</code> .                                                                    |
| 29475 | %   |   | Print a ' % ' character; no argument is converted. The complete conversion specification           |
| 29476 |     |   | shall be <code>%%</code> .                                                                         |

29477 If a conversion specification does not match one of the above forms, the behavior is undefined. If  
 29478 any argument is not the correct type for the corresponding conversion specification, the  
 29479 behavior is undefined.

29480 In no case shall a nonexistent or small field width cause truncation of a field; if the result of a  
 29481 conversion is wider than the field width, the field shall be expanded to contain the conversion  
 29482 result. Characters generated by *fprintf()* and *printf()* are printed as if *fputc()* had been called.

29483 For the `a` and `A` conversion specifiers, if `FLT_RADIX` is a power of 2, the value shall be correctly  
 29484 rounded to a hexadecimal floating number with the given precision.

29485 For `a` and `A` conversions, if `FLT_RADIX` is not a power of 2 and the result is not exactly  
 29486 representable in the given precision, the result should be one of the two adjacent numbers in  
 29487 hexadecimal floating style with the given precision, with the extra stipulation that the error  
 29488 should have a correct sign for the current rounding direction.

29489 For the `e`, `E`, `f`, `F`, `g`, and `G` conversion specifiers, if the number of significant decimal digits is at  
 29490 most `DECIMAL_DIG`, then the result should be correctly rounded. If the number of significant  
 29491 decimal digits is more than `DECIMAL_DIG` but the source value is exactly representable with  
 29492 `DECIMAL_DIG` digits, then the result should be an exact representation with trailing zeros.  
 29493 Otherwise, the source value is bounded by two adjacent decimal strings  $L < U$ , both having  
 29494 `DECIMAL_DIG` significant digits; the value of the resultant decimal string  $D$  should satisfy  $L \leq$   
 29495  $D \leq U$ , with the extra stipulation that the error should have a correct sign for the current  
 29496 rounding direction.

29497 CX The last data modification and last file status change timestamps of the file shall be marked for  
 29498 update between the call to a successful execution of *fprintf()* or *printf()* and the next successful  
 29499 completion of a call to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

## 29500 RETURN VALUE

29501 CX Upon successful completion, the *dprintf()*, *fprintf()*, and *printf()* functions shall return the  
 29502 number of bytes transmitted.

29503 Upon successful completion, the *sprintf()* function shall return the number of bytes written to *s*,  
 29504 excluding the terminating null byte.

29505 Upon successful completion, the *snprintf()* function shall return the number of bytes that would  
 29506 be written to *s* had *n* been sufficiently large excluding the terminating null byte.

29507 CX If an output error was encountered, these functions shall return a negative value and set *errno* to  
 29508 indicate the error.

29509 If the value of *n* is zero on a call to *snprintf()*, nothing shall be written, the number of bytes that  
 29510 would have been written had *n* been sufficiently large excluding the terminating null shall be

29511 returned, and *s* may be a null pointer.

## 29512 ERRORS

29513 CX For the conditions under which *dprintf()*, *fprintf()*, and *printf()* fail and may fail, refer to *fputc()*  
29514 or *fputcw()*.

29515 In addition, all forms of *fprintf()* may fail if:

29516 CX [EILSEQ] A wide-character code that does not correspond to a valid character has been  
29517 detected.

29518 CX [EINVAL] There are insufficient arguments.

29519 The *dprintf()* function may fail if:

29520 [EBADF] The *fildev* argument is not a valid file descriptor.

29521 CX The *dprintf()*, *fprintf()*, and *printf()* functions may fail if:

29522 CX [ENOMEM] Insufficient storage space is available.

29523 The *snprintf()* function shall fail if:

29524 CX [EOVERFLOW] The value of *n* is greater than {INT\_MAX} or the number of bytes needed to  
29525 hold the output excluding the terminating null is greater than {INT\_MAX}.

## 29526 EXAMPLES

### 29527 Printing Language-Independent Date and Time

29528 The following statement can be used to print date and time using a language-independent  
29529 format:

```
29530 printf(format, weekday, month, day, hour, min);
```

29531 For American usage, *format* could be a pointer to the following string:

```
29532 "%s, %s %d, %d:%.2d\n"
```

29533 This example would produce the following message:

```
29534 Sunday, July 3, 10:02
```

29535 For German usage, *format* could be a pointer to the following string:

```
29536 "%1$s, %3$d. %2$s, %4$d:%5$.2d\n"
```

29537 This definition of *format* would produce the following message:

```
29538 Sonntag, 3. Juli, 10:02
```

### 29539 Printing File Information

29540 The following example prints information about the type, permissions, and number of links of a  
29541 specific file in a directory.

29542 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined  
29543 *strperm()* function shall return a string similar to the one at the beginning of the output for the  
29544 following command:

```
29545 ls -l
```

29546 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*  
29547 function shall return a **passwd** structure from which the name of the user is extracted. If the user  
29548 name is not found, the program instead prints out the numeric value of the user ID.

29549 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar

29550 to *getpwuid()* except that it shall return group information based on the group number. Once  
 29551 again, if the group is not found, the program prints the numeric value of the group for the entry.  
 29552 The final call to *printf()* prints the size of the file.

```

29553 #include <stdio.h>
29554 #include <sys/types.h>
29555 #include <pwd.h>
29556 #include <grp.h>

29557 char *strperm (mode_t);
29558 ...
29559 struct stat statbuf;
29560 struct passwd *pwd;
29561 struct group *grp;
29562 ...
29563 printf("%10.10s", strperm (statbuf.st_mode));
29564 printf("%4d", statbuf.st_nlink);

29565 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
29566 printf(" %-8.8s", pwd->pw_name);
29567 else
29568 printf(" %-8ld", (long) statbuf.st_uid);
29569 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
29570 printf(" %-8.8s", grp->gr_name);
29571 else
29572 printf(" %-8ld", (long) statbuf.st_gid);
29573 printf("%9jd", (intmax_t) statbuf.st_size);
29574 ...

```

#### 29575 **Printing a Localized Date String**

29576 The following example gets a localized date string. The *nl\_langinfo()* function shall return the  
 29577 localized date string, which specifies the order and layout of the date. The *strftime()* function  
 29578 takes this information and, using the **tm** structure for values, places the date and time  
 29579 information into *datestring*. The *printf()* function then outputs *datestring* and the name of the  
 29580 entry.

```

29581 #include <stdio.h>
29582 #include <time.h>
29583 #include <langinfo.h>
29584 ...
29585 struct dirent *dp;
29586 struct tm *tm;
29587 char datestring[256];
29588 ...
29589 strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
29590 printf(" %s %s\n", datestring, dp->d_name);
29591 ...

```

29592

**Printing Error Information**

29593

The following example uses *fprintf()* to write error information to standard error.

29594

29595

29596

29597

In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If the file already exists, this is an error, as indicated by the **O\_EXCL** flag on the *open()* function. If the call fails, the program assumes that someone else is updating the password file, and the program exits.

29598

29599

The next group of calls saves a new password file as the current password file by creating a link between **LOCKFILE** and the new password file **PASSWDFILE**.

29600

29601

29602

29603

29604

29605

29606

29607

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
 S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
 fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
 exit(1);
}
...
if (link(LOCKFILE, PASSWDFILE) == -1) {
 fprintf(stderr, "Link error: %s\n", strerror(errno));
 exit(1);
}
...

```

29625

**Printing Usage Information**

29626

29627

The following example checks to make sure the program has the necessary arguments, and uses *fprintf()* to print usage information if the expected number of arguments is not present.

29628

29629

29630

29631

29632

29633

29634

29635

29636

```
#include <stdio.h>
#include <stdlib.h>
...
char *Options = "hdbt1";
...
if (argc < 2) {
 fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
}
...

```

29637

**Formatting a Decimal String**

29638

The following example prints a key and data pair on *stdout*. Note use of the '\*' (asterisk) in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

29639

29640

29641

```
#include <stdio.h>
```

29642

```
...
```

29643

```
long i;
```

29644

```
char *keyst;
```

29645

```
int elementlen, len;
```

29646

```
...
```

29647

```
while (len < elementlen) {
```

29648

```
...
```

29649

```
 printf("%s Element%0*ld\n", keyst, elementlen, i);
```

29650

```
...
```

29651

```
}
```

29652

**Creating a Filename**

29653

The following example creates a filename using information from a previous *getpwnam()* function that returned the HOME directory of the user.

29654

29655

```
#include <stdio.h>
```

29656

```
#include <sys/types.h>
```

29657

```
#include <unistd.h>
```

29658

```
...
```

29659

```
char filename[PATH_MAX+1];
```

29660

```
struct passwd *pw;
```

29661

```
...
```

29662

```
sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
```

29663

```
...
```

29664

**Reporting an Event**

29665

The following example loops until an event has timed out. The *pause()* function waits forever unless it receives a signal. The *fprintf()* statement should never occur due to the possible return values of *pause()*.

29666

29667

29668

```
#include <stdio.h>
```

29669

```
#include <unistd.h>
```

29670

```
#include <string.h>
```

29671

```
#include <errno.h>
```

29672

```
...
```

29673

```
while (!event_complete) {
```

29674

```
...
```

29675

```
 if (pause() != -1 || errno != EINTR)
```

29676

```
 fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
```

29677

```
}
```

29678

```
...
```

29679

**Printing Monetary Information**

29680

The following example uses *strfmon()* to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

29681

29682

29683

```
#include <monetary.h>
```

29684

```
#include <stdio.h>
```

29685

```
...
```

29686

```
struct tblfmt {
```

29687

```
 char *format;
```

29688

```
 char *description;
```

29689

```
};
```

29690

```
struct tblfmt table[] = {
```

29691

```
 { "%n", "default formatting" },
```

29692

```
 { "%11n", "right align within an 11 character field" },
```

29693

```
 { "%#5n", "aligned columns for values up to 99999" },
```

29694

```
 { "%=#5n", "specify a fill character" },
```

29695

```
 { "%=0#5n", "fill characters do not use grouping" },
```

29696

```
 { "%^#5n", "disable the grouping separator" },
```

29697

```
 { "%^#5.0n", "round off to whole units" },
```

29698

```
 { "%^#5.4n", "increase the precision" },
```

29699

```
 { "%(#5n", "use an alternative pos/neg style" },
```

29700

```
 { "%!(#5n", "disable the currency symbol" },
```

29701

```
};
```

29702

```
...
```

29703

```
float input[3];
```

29704

```
int i, j;
```

29705

```
char convbuf[100];
```

29706

```
...
```

29707

```
strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);
```

29708

```
if (j == 0) {
```

29709

```
 printf("%s%s%s\n", table[i].format,
```

29710

```
 convbuf, table[i].description);
```

29711

```
}
```

29712

```
else {
```

29713

```
 printf("%s\n", convbuf);
```

29714

```
}
```

29715

```
...
```

29716

**Printing Wide Characters**

29717

The following example prints a series of wide characters. Suppose that "L'@'" expands to three bytes:

29718

29719

```
wchar_t wz [3] = L"@@"; // Zero-terminated
```

29720

```
wchar_t wn [3] = L"@@"; // Unterminated
```

29721

```
fprintf (stdout, "%ls", wz); // Outputs 6 bytes
```

29722

```
fprintf (stdout, "%ls", wn); // Undefined because wn has no terminator
```

29723

```
fprintf (stdout, "%4ls", wz); // Outputs 3 bytes
```

29724

```
fprintf (stdout, "%4ls", wn); // Outputs 3 bytes; no terminator needed
```

29725

```
fprintf (stdout, "%9ls", wz); // Outputs 6 bytes
```

29726

```
fprintf (stdout, "%9ls", wn); // Outputs 9 bytes; no terminator needed
```

29727

```
fprintf (stdout, "%10ls", wz); // Outputs 6 bytes
```

29728            `fprintf (stdout, "%10ls", wn); // Undefined because wn has no terminator`

29729            In the last line of the example, after processing three characters, nine bytes have been output.  
29730            The fourth character must then be examined to determine whether it converts to one byte or  
29731            more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth  
29732            character in the array, the behavior is undefined.

### 29733 APPLICATION USAGE

29734            If the application calling `fprintf()` has any objects of type `wint_t` or `wchar_t`, it must also include  
29735            the `<wchar.h>` header to have these objects defined.

### 29736 RATIONALE

29737            None.

### 29738 FUTURE DIRECTIONS

29739            None.

### 29740 SEE ALSO

29741            [fputc\(\)](#), [fscanf\(\)](#), [setlocale\(\)](#), [strfmon\(\)](#), [wctomb\(\)](#)

29742            XBD Chapter 7 (on page 121), `<stdio.h>`, `<wchar.h>` |

### 29743 CHANGE HISTORY

29744            First released in Issue 1. Derived from Issue 1 of the SVID.

#### 29745 Issue 5

29746            Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the `l` (ell) qualifier can  
29747            now be used with `c` and `s` conversion specifiers.

29748            The `snprintf()` function is new in Issue 5.

#### 29749 Issue 6

29750            Extensions beyond the ISO C standard are marked.

29751            The normative text is updated to avoid use of the term “must” for application requirements.

29752            The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 29753            • The prototypes for `fprintf()`, `printf()`, `snprintf()`, and `sprintf()` are updated, and the XSI  
29754            shading is removed from `snprintf()`.
- 29755            • The description of `snprintf()` is aligned with the ISO C standard. Note that this supersedes  
29756            the `snprintf()` description in The Open Group Base Resolution bwg98-006, which changed  
29757            the behavior from Issue 5.
- 29758            • The DESCRIPTION is updated.

29759            The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion  
29760            specification” consistently.

29761            ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

29762            An example of printing wide characters is added.

#### 29763 Issue 7

29764            ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #68 (SD5-XSH-ERN-70) is applied,  
29765            revising the description of `g` and `G`.

29766            ISO C TC2 #68 is applied. +

29767            SD5-XSH-ERN-174 is applied. +

29768            The `dprintf()` function is added from The Open Group Technical Standard, 2006, Extended API  
29769            Set Part 1.

29770            Functionality relating to the `%n$` form of conversion specification and the `'` (apostrophe) flag

- 29771 is moved from the XSI option to the Base.
- 29772 Changes are made related to support for finegrained timestamps.

+

29773 **NAME**

29774 fputc — put a byte on a stream

29775 **SYNOPSIS**

29776 #include &lt;stdio.h&gt;

29777 int fputc(int *c*, FILE \**stream*);29778 **DESCRIPTION**

29779 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29780 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29781 volume of POSIX.1-200x defers to the ISO C standard.

29782 The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the  
 29783 output stream pointed to by *stream*, at the position indicated by the associated file-position  
 29784 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file  
 29785 cannot support positioning requests, or if the stream was opened with append mode, the byte  
 29786 shall be appended to the output stream.

29787 CX The last data modification and last file status change timestamps of the file shall be marked for  
 29788 update between the successful execution of *fputc()* and the next successful completion of a call  
 29789 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

29790 **RETURN VALUE**

29791 Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall  
 29792 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the  
 29793 error.

29794 **ERRORS**

29795 The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream's* buffer needs to be  
 29796 flushed, and:

29797 CX **[EAGAIN]** The O\_NONBLOCK flag is set for the file descriptor underlying *stream* and  
 29798 the thread would be delayed in the write operation.

29799 CX **[EBADF]** The file descriptor underlying *stream* is not a valid file descriptor open for  
 29800 writing.

29801 CX **[EFBIG]** An attempt was made to write to a file that exceeds the maximum file size.

29802 XSI **[EFBIG]** An attempt was made to write to a file that exceeds the file size limit of the  
 29803 process.

29804 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the  
 29805 offset maximum.

29806 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data  
 29807 was transferred.

29808 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background  
 29809 process group attempting to write to its controlling terminal, TOSTOP is set,  
 29810 the process is neither ignoring nor blocking SIGTTOU, and the process group  
 29811 of the process is orphaned. This error may also be returned under  
 29812 implementation-defined conditions.

29813 CX **[ENOSPC]** There was no free space remaining on the device containing the file.

29814 CX **[EPIPE]** An attempt is made to write to a pipe or FIFO that is not open for reading by  
 29815 any process. A SIGPIPE signal shall also be sent to the thread.

- 29816 The *fputc()* function may fail if:
- 29817 CX [ENOMEM] Insufficient storage space is available.
- 29818 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
29819 capabilities of the device.

XBD &lt;stdio.h&gt;

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

Large File Summit extensions are added.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] and [EFBIG] mandatory error conditions are added.
- The [ENOMEM] and [ENXIO] optional error conditions are added.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/37 is applied, updating the [EAGAIN] error in the ERRORS section from “the process would be delayed” to “the thread would be delayed”.

**Issue 7**

Changes are made related to support for finegrained timestamps.

29846 **NAME**  
 29847 fputs — put a string on a stream

29848 **SYNOPSIS**  
 29849 #include <stdio.h>

29850 int fputs(const char \*restrict s, FILE \*restrict stream);

#### 29851 DESCRIPTION

29852 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29853 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29854 volume of POSIX.1-200x defers to the ISO C standard.

29855 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed  
 29856 to by *stream*. The terminating null byte shall not be written.

29857 CX The last data modification and last file status change timestamps of the file shall be marked for  
 29858 update between the successful execution of *fputs()* and the next successful completion of a call  
 29859 to *fflush()* or *fclose()* on the same stream or a call to *exit()* or *abort()*.

#### 29860 RETURN VALUE

29861 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall  
 29862 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

#### 29863 ERRORS

29864 Refer to *fputc()*.

#### 29865 EXAMPLES

##### 29866 Printing to Standard Output

29867 The following example gets the current time, converts it to a string using *localtime()* and  
 29868 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to  
 29869 an event for which it is waiting.

```
29870 #include <time.h>
29871 #include <stdio.h>
29872 ...
29873 time_t now;
29874 int minutes_to_event;
29875 ...
29876 time(&now);
29877 printf("The time is ");
29878 fputs(asctime(localtime(&now)), stdout);
29879 printf("There are still %d minutes to the event.\n",
29880 minutes_to_event);
29881 ...
```

#### 29882 APPLICATION USAGE

29883 The *puts()* function appends a <newline> while *fputs()* does not.

#### 29884 RATIONALE

29885 None.

**fputs()**

|       |                                                                                            |   |
|-------|--------------------------------------------------------------------------------------------|---|
| 29886 | <b>FUTURE DIRECTIONS</b>                                                                   |   |
| 29887 | None.                                                                                      |   |
| 29888 | <b>SEE ALSO</b>                                                                            |   |

29898 **NAME**  
 29899 `fputc` — put a wide-character code on a stream

29900 **SYNOPSIS**

29901 `#include <stdio.h>`  
 29902 `#include <wchar.h>`  
 29903 `wint_t fputc(wchar_t wc, FILE *stream);`

29904 **DESCRIPTION**

29905 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 29906 conflict between the requirements described here and the ISO C standard is unintentional. This  
 29907 volume of POSIX.1-200x defers to the ISO C standard.

29908 The `fputc()` function shall write the character corresponding to the wide-character code `wc` to  
 29909 the output stream pointed to by `stream`, at the position indicated by the associated file-position  
 29910 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot  
 29911 support positioning requests, or if the stream was opened with append mode, the character is  
 29912 appended to the output stream. If an error occurs while writing the character, the shift state of  
 29913 the output file is left in an undefined state.

29914 CX The last data modification and last file status change timestamps of the file shall be marked for  
 29915 update between the successful execution of `fputc()` and the next successful completion of a call  
 29916 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.

29917 **RETURN VALUE**

29918 Upon successful completion, `fputc()` shall return `wc`. Otherwise, it shall return WEOF, the error  
 29919 CX indicator for the stream shall be set, and `errno` shall be set to indicate the error.

29920 **ERRORS**

29921 The `fputc()` function shall fail if either the stream is unbuffered or data in the `stream`'s buffer  
 29922 needs to be written, and:

29923 CX **[EAGAIN]** The `O_NONBLOCK` flag is set for the file descriptor underlying `stream` and  
 29924 the thread would be delayed in the write operation.

29925 CX **[EBADF]** The file descriptor underlying `stream` is not a valid file descriptor open for  
 29926 writing.

29927 CX **[EFBIG]** An attempt was made to write to a file that exceeds the maximum file size or  
 29928 the file size limit of the process.

29929 CX **[EFBIG]** The file is a regular file and an attempt was made to write at or beyond the  
 29930 offset maximum associated with the corresponding stream.

29931 **[EILSEQ]** The wide-character code `wc` does not correspond to a valid character.

29932 CX **[EINTR]** The write operation was terminated due to the receipt of a signal, and no data  
 29933 was transferred.

29934 CX **[EIO]** A physical I/O error has occurred, or the process is a member of a background  
 29935 process group attempting to write to its controlling terminal, `TOSTOP` is set,  
 29936 the process is neither ignoring nor blocking `SIGTTOU`, and the process group  
 29937 of the process is orphaned. This error may also be returned under  
 29938 implementation-defined conditions.

29939 CX **[ENOSPC]** There was no free space remaining on the device containing the file.

**fputwc()**

29940 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by  
29941 any process. A SIGPIPE signal shall also be sent to the thread.

29942 The *fputwc()* function may fail if:

29943 CX [ENOMEM] Insufficient storage space is available.

29944 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the  
29945 capabilities of the device.

**EXAMPLES**

29946 None.  
29947

**APPLICATION USAGE**

29948 None.  
29949

**RATIONALE**

29950 None.  
29951

**FUTURE DIRECTIONS**

29952 None.  
29953

29956 XBD [<stdio.h>](#), [<wchar.h>](#) |

**CHANGE HISTORY**

29957 First released in Issue 4. Derived from the MSE working draft.  
29958

**Issue 5**

29959 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*  
29960 is changed from **wint\_t** to **wchar\_t**.  
29961

29962 The Optional Header (OH) marking is removed from **<stdio.h>**.

29963 Large File Summit extensions are added.

**Issue 6**

29964 Extensions beyond the ISO C standard are marked.  
29965

29966 The following new requirements on POSIX implementations derive from alignment with the  
29967 Single UNIX Specification:

- 29968 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 29969 • The [ENOMEM] and [ENXIO] optional error conditions are added.

29970 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/38 is applied, updating the [EAGAIN]  
29971 error in the ERRORS section from “the process would be delayed” to “the thread would be  
29972 delayed”.

**Issue 7**

29973 Changes are made related to support for finegrained timestamps.  
29974 +

29975 **NAME**29976 `fputws` — put a wide-character string on a stream29977 **SYNOPSIS**29978 `#include <stdio.h>`29979 `#include <wchar.h>`29980 `int fputws(const wchar_t *restrict ws, FILE *restrict stream);`29981 **DESCRIPTION**29982 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
29983 conflict between the requirements described here and the ISO C standard is unintentional. This  
29984 volume of POSIX.1-200x defers to the ISO C standard.29985 The `fputws()` function shall write a character string corresponding to the (null-terminated) wide-  
29986 character string pointed to by `ws` to the stream pointed to by `stream`. No character corresponding  
29987 to the terminating null wide-character code shall be written.29988 CX The last data modification and last file status change timestamps of the file shall be marked for  
29989 update between the successful execution of `fputws()` and the next successful completion of a call  
29990 to `fflush()` or `fclose()` on the same stream or a call to `exit()` or `abort()`.29991 **RETURN VALUE**29992 Upon successful completion, `fputws()` shall return a non-negative number. Otherwise, it shall  
29993 CX return `-1`, set an error indicator for the stream, and set `errno` to indicate the error.29994 **ERRORS**29995 Refer to `fputwc()`.29996 **EXAMPLES**

29997 None.

29998 **APPLICATION USAGE**29999 The `fputws()` function does not append a <newline>.30000 **RATIONALE**

30001 None.

30002 **FUTURE DIRECTIONS**

30003 None.

30009 **Issue 5**30010 The Optional Header (OH) marking is removed from `<stdio.h>`.30011 **Issue 6**

30012 Extensions beyond the ISO C standard are marked.

30013 The `fputws()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

30014  
30015

**Issue 7**

Changes are made related to support for finegrained timestamps.

+

30016 **NAME**

30017 fread — binary input

30018 **SYNOPSIS**

30019 #include &lt;stdio.h&gt;

30020 size\_t fread(void \*restrict ptr, size\_t size, size\_t nitems,  
30021 FILE \*restrict stream);30022 **DESCRIPTION**30023 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
30024 conflict between the requirements described here and the ISO C standard is unintentional. This  
30025 volume of POSIX.1-200x defers to the ISO C standard.30026 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size  
30027 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall  
30028 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**  
30029 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be  
30030 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the  
30031 file position indicator for the stream is unspecified. If a partial element is read, its value is  
30032 unspecified.30033 CX The *fread()* function may mark the last data access timestamp of the file associated with *stream* |  
30034 for update. The last data access timestamp shall be marked for update by the first successful |  
30035 execution of *fgetc()*, *fgets()*, *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()*  
30036 using *stream* that returns data not supplied by a prior call to *ungetc()* or *ungetwc()*.30037 **RETURN VALUE**30038 Upon successful completion, *fread()* shall return the number of elements successfully read which  
30039 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*  
30040 shall return 0 and the contents of the array and the state of the stream remain unchanged.30041 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall  
30042 be set to indicate the error.30043 **ERRORS**30044 Refer to *fgetc()*.30045 **EXAMPLES**30046 **Reading from a Stream**30047 The following example reads a single element from the *fp* stream into the array pointed to by  
30048 *buf*.30049 #include <stdio.h>  
30050 ...  
30051 size\_t bytes\_read;  
30052 char buf[100];  
30053 FILE \*fp;  
30054 ...  
30055 bytes\_read = fread(buf, sizeof(buf), 1, fp);  
30056 ...

30057

**APPLICATION USAGE**

30058

The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an end-of-file condition.

30059

30060

Because of possible differences in element length and byte ordering, files written using *fwrite()* are application-dependent, and possibly cannot be read using *fread()* by a different application or by the same application on a different processor.

30061

30062

30063

**RATIONALE**

30064

None.

30065

**FUTURE DIRECTIONS**

30066

None.

30067

**SEE ALSO**

30070

**CHANGE HISTORY**

30071

First released in Issue 1. Derived from Issue 1 of the SVID.

30072

**Issue 6**

30073

Extensions beyond the ISO C standard are marked.

30074

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

30075

- The *fread()* prototype is updated.

30076

- The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

30077

**Issue 7**

30078

Changes are made related to support for finegrained timestamps.

30079 **NAME**

30080 free — free allocated memory

30081 **SYNOPSIS**

30082 #include &lt;stdlib.h&gt;

30083 void free(void \*ptr);

30084 **DESCRIPTION**

30085 CX The functionality described on this reference page is aligned with the ISO C standard. Any  
 30086 conflict between the requirements described here and the ISO C standard is unintentional. This  
 30087 volume of POSIX.1-200x defers to the ISO C standard.

30088 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made  
 30089 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the  
 30090 ADV argument does not match a pointer earlier returned by the *calloc()*, *malloc()*, *posix\_memalign()*,  
 30091 *realloc()*, or *strdup()* function, or if the space has been deallocated by a call to *free()* or *realloc()*,  
 30092 the behavior is undefined.

30093 Any use of a pointer that refers to freed space results in undefined behavior.

30094 **RETURN VALUE**30095 The *free()* function shall not return a value.30096 **ERRORS**

30097 No errors are defined.

30098 **EXAMPLES**

30099 None.

30100 **APPLICATION USAGE**

30101 There is now no requirement for the implementation to support the inclusion of &lt;malloc.h&gt;.

30102 **RATIONALE**

30103 None.

30104 **FUTURE DIRECTIONS**

30105 None.

30106 **SEE ALSO**30107 *calloc()*, *getdelim()*, *malloc()*, *open\_memstream()*, *realloc()*, *strdup()*, *wcsdup()*

30108 XBD &lt;stdlib.h&gt;

30109 **CHANGE HISTORY**

30110 First released in Issue 1. Derived from Issue 1 of the SVID.

30111 **Issue 6**30112 Reference to the *valloc()* function is removed.

30113 **NAME**  
 30114 freeaddrinfo, getaddrinfo — get address information

30115 **SYNOPSIS**

```
30116 #include <sys/socket.h>
30117 #include <netdb.h>

30118 void freeaddrinfo(struct addrinfo *ai);
30119 int getaddrinfo(const char *restrict nodename,
30120 const char *restrict servname,
30121 const struct addrinfo *restrict hints,
30122 struct addrinfo **restrict res);
```

30123 **DESCRIPTION**

30124 The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*,  
 30125 along with any additional storage associated with those structures. If the *ai\_next* field of the  
 30126 structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall  
 30127 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

30128 The *getaddrinfo()* function shall translate the name of a service location (for example, a host  
 30129 name) and/or a service name and shall return a set of socket addresses and associated  
 30130 information to be used in creating a socket with which to address the specified service.

30131 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,  
 30132 RFC 1035, and RFC 1886.

30133 The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

30134 The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated  
 30135 strings. One or both of these two arguments shall be supplied by the application as a non-null  
 30136 pointer.

30137 The format of a valid name depends on the address family or families. If a specific family is not  
 30138 given and the name could be interpreted as valid within multiple supported families, the  
 30139 implementation shall attempt to resolve the name in all supported families and, in absence of  
 30140 errors, one or more results shall be returned.

30141 If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If  
 30142 IP6 the specified address family is AF\_INET, AF\_INET6, or AF\_UNSPEC, valid descriptive names  
 30143 include host names. If the specified address family is AF\_INET or AF\_UNSPEC, address strings  
 30144 using Internet standard dot notation as specified in *inet\_addr()* are valid.

30145 IP6 If the specified address family is AF\_INET6 or AF\_UNSPEC, standard IPv6 text forms described  
 30146 in *inet\_ntop()* are valid.

30147 If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the  
 30148 requested service location is local to the caller.

30149 If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If  
 30150 *servname* is not null, it is a null-terminated character string identifying the requested service.  
 30151 This can be either a descriptive name or a numeric representation suitable for use with the  
 30152 IP6 address family or families. If the specified address family is AF\_INET, AF\_INET6, or  
 30153 AF\_UNSPEC, the service can be specified as a string specifying a decimal port number.

30154 If the *hints* argument is not null, it refers to a structure containing input values that may direct  
 30155 the operation by providing options and by limiting the returned information to a specific socket  
 30156 type, address family, and/or protocol. In this *hints* structure every member other than *ai\_flags*,  
 30157 *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be set to zero or a null pointer. A value of  
 30158 AF\_UNSPEC for *ai\_family* means that the caller shall accept any address family. A value of zero

30159 for *ai\_socktype* means that the caller shall accept any socket type. A value of zero for *ai\_protocol*  
 30160 means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if  
 30161 it referred to a structure containing the value zero for the *ai\_flags*, *ai\_socktype*, and *ai\_protocol*  
 30162 fields, and AF\_UNSPEC for the *ai\_family* field.

30163 The *ai\_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-  
 30164 inclusive OR of one or more of the values AI\_PASSIVE, AI\_CANONNAME,  
 30165 AI\_NUMERICHOST, AI\_NUMERICSERV, AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG.

30166 If the AI\_PASSIVE flag is specified, the returned address information shall be suitable for use in  
 30167 binding a socket for accepting incoming connections for the specified service. In this case, if the  
 30168 *nodename* argument is null, then the IP address portion of the socket address structure shall be  
 30169 set to INADDR\_ANY for an IPv4 address or IN6ADDR\_ANY\_INIT for an IPv6 address. If the  
 30170 AI\_PASSIVE flag is not specified, the returned address information shall be suitable for a call to  
 30171 *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a  
 30172 connectionless protocol). In this case, if the *nodename* argument is null, then the IP address  
 30173 portion of the socket address structure shall be set to the loopback address. The AI\_PASSIVE  
 30174 flag shall be ignored if the *nodename* argument is not null.

30175 If the AI\_CANONNAME flag is specified and the *nodename* argument is not null, the function  
 30176 shall attempt to determine the canonical name corresponding to *nodename* (for example, if  
 30177 *nodename* is an alias or shorthand notation for a complete name).

30178 **Note:** Since different implementations use different conceptual models, the terms “canonical name”  
 30179 and “alias” cannot be precisely defined for the general case. However, Domain Name System  
 30180 implementations are expected to interpret them as they are used in RFC 1034.

30181 A numeric host address string is not a “name”, and thus does not have a “canonical name”  
 30182 form; no address to host name translation is performed. See below for handling of the case  
 30183 where a canonical name cannot be obtained.

30184 If the AI\_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a  
 30185 numeric host address string. Otherwise, an [EAI\_NONAME] error is returned. This flag shall  
 30186 prevent any type of name resolution service (for example, the DNS) from being invoked.

30187 If the AI\_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a  
 30188 numeric port string. Otherwise, an [EAI\_NONAME] error shall be returned. This flag shall  
 30189 prevent any type of name resolution service (for example, NIS+) from being invoked.

30190 IP6 If the AI\_V4MAPPED flag is specified along with an *ai\_family* of AF\_INET6, then *getaddrinfo()*  
 30191 shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai\_addrlen*  
 30192 shall be 16). The AI\_V4MAPPED flag shall be ignored unless *ai\_family* equals AF\_INET6. If the  
 30193 AI\_ALL flag is used with the AI\_V4MAPPED flag, then *getaddrinfo()* shall return all matching  
 30194 IPv6 and IPv4 addresses. The AI\_ALL flag without the AI\_V4MAPPED flag is ignored.

30195 IP6 If the AI\_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4  
 30196 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6  
 30197 address is configured on the local system.

30198 The *ai\_socktype* field to which argument *hints* points specifies the socket type for the service, as  
 30199 defined in *socket()*. If a specific socket type is not given (for example, a value of zero) and the  
 30200 service name could be interpreted as valid with multiple supported socket types, the  
 30201 implementation shall attempt to resolve the service name for all supported socket types and, in  
 30202 the absence of errors, all possible results shall be returned. A non-zero socket type value shall  
 30203 limit the returned information to values with the specified socket type.

30204 If the *ai\_family* field to which *hints* points has the value AF\_UNSPEC, addresses shall be  
 30205 returned for use with any address family that can be used with the specified *nodename* and/or  
 30206 *servname*. Otherwise, addresses shall be returned for use only with the specified address family.  
 30207 If *ai\_family* is not AF\_UNSPEC and *ai\_protocol* is not zero, then addresses are returned for use

**freeaddrinfo()**

System Interfaces

30208 only with the specified address family and protocol; the value of *ai\_protocol* shall be interpreted  
30209 as in a call to the *socket()* function with the corresponding values of *ai\_family* and *ai\_protocol*.

**RETURN VALUE**

30210  
30211 A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value  
30212 indicates failure. The possible values for the failures are listed in the ERRORS section.

30213 Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list  
30214 of **addrinfo** structures, each of which shall specify a socket address and information for use in  
30215 creating a socket with which to use that socket address. The list shall include at least one  
30216 **addrinfo** structure. The *ai\_next* field of each structure contains a pointer to the next structure on  
30217 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall  
30218 include values for use with a call to the *socket()* function, and a socket address for use with the  
30219 *connect()* function or, if the AI\_PASSIVE flag was specified, for use with the *bind()* function. The  
30220 fields *ai\_family*, *ai\_socktype*, and *ai\_protocol* shall be usable as the arguments to the *socket()*  
30221 function to create a socket suitable for use with the returned address. The fields *ai\_addr* and  
30222 *ai\_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket,  
30223 according to the AI\_PASSIVE flag.

30224 If *nodename* is not null, and if requested by the AI\_CANONNAME flag, the *ai\_canonname* field of  
30225 the first returned **addrinfo** structure shall point to a null-terminated string containing the  
30226 canonical name corresponding to the input *nodename*; if the canonical name is not available, then  
30227 *ai\_canonname* shall refer to the *nodename* argument or a string with the same contents. The  
30228 contents of the *ai\_flags* field of the returned structures are undefined.

30229 All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an  
30230 explicit argument (for example, *sin6\_flowinfo*) shall be set to zero.

30231 **Note:** This makes it easier to compare socket address structures.

**ERRORS**

30232 The *getaddrinfo()* function shall fail and return the corresponding error value if:

30233 [EAI\_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

30234 [EAI\_BADFLAGS] The *flags* parameter had an invalid value.

30235 [EAI\_FAIL] A non-recoverable error occurred when attempting to resolve the name.

30236 [EAI\_FAMILY] The address family was not recognized.

30237 [EAI\_MEMORY] There was a memory allocation failure when trying to allocate storage for the  
30238 return value.

30239 [EAI\_NONAME] The name does not resolve for the supplied parameters.

30240 Neither *nodename* nor *servname* were supplied. At least one of these shall be  
30241 supplied.

30242 [EAI\_SERVICE] The service passed was not recognized for the specified socket type.

30243 [EAI\_SOCKTYPE] The intended socket type was not recognized.

30244 [EAI\_SYSTEM] A system error occurred; the error code can be found in *errno*.

**EXAMPLES**

30248  
30249 None.

**APPLICATION USAGE**

30250  
30251 If the caller handles only TCP and not UDP, for example, then the *ai\_protocol* member of the *hints*  
30252 structure should be set to IPPROTO\_TCP when *getaddrinfo()* is called.

30253  
30254 If the caller handles only IPv4 and not IPv6, then the *ai\_family* member of the *hints* structure  
should be set to AF\_INET when *getaddrinfo()* is called.

30255  
30256 The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181).  
30257 It should be noted that the canonical name is a result of alias processing, and not necessarily a  
30258 unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this  
in the Domain Name System context.

**RATIONALE**

30259  
30260 None.

**FUTURE DIRECTIONS**

30261  
30262 None.

**SEE ALSO**

**CHANGE HISTORY**

30267  
30268 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

30269  
30270 The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the  
30271 ISO/IEC 9899:1999 standard.

30272  
30273 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the  
30274 DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical  
30275 name”. A reference to RFC 2181 is also added to the Informative References.

30276  
30277 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for  
30278 alignment with IPv6. These include the following:

- 30275 • Adding AI\_V4MAPPED, AI\_ALL, and AI\_ADDRCONFIG to the allowed values for the  
30276 *ai\_flags* field
- 30277 • Adding a description of AI\_ADDRCONFIG
- 30278 • Adding a description of the consequences of ignoring the AI\_PASSIVE flag.

30279
