60671 resources from a system-wide pool (with per-sender limits) and that leaves queued signals
60672 pending after the sender exits is also permitted.

FUTURE DIRECTIONS

60673 None.

CHANGE HISTORY

60678 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
60679 POSIX Threads Extension.
60680

Issue 6

60681 The *sigqueue()* function is marked as part of the Realtime Signals Extension option.
60682

60683 The [ENOSYS] error condition has been removed as stubs need not be provided if an
60684 implementation does not support the Realtime Signals Extension option.

Issue 7

60685 The *sigqueue()* function is moved from the Realtime Signals Extension option to the Base.
60686

60687 **NAME**
60688 sigrelse, sigset — signal management

60689 **SYNOPSIS**

60690 OB XSI `#include <signal.h>`
60691 `int sigrelse(int sig);`
60692 `void (*sigset(int sig, void (*disp)(int)))(int);`

60693 **DESCRIPTION**

60694 Refer to *sighold()*.

60695 **NAME**

60696 sigsetjmp — set jump point for a non-local goto

60697 **SYNOPSIS**

```
60698 CX #include <setjmp.h>
60699 int sigsetjmp(sigjmp_buf env, int savemask);
```

60700 **DESCRIPTION**60701 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 60702 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 60703 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 60704 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal mask of the calling thread as part of the calling environment.

60706 **RETURN VALUE**

60707 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from
 60708 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

60709 **ERRORS**

60710 No errors are defined.

60711 **EXAMPLES**

60712 None.

60713 **APPLICATION USAGE**

60714 The distinction between *setjmp()/longjmp()* and *sigsetjmp()/siglongjmp()* is only significant for
 60715 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

60716 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified
 60717 whether the signal mask is saved.

60718 **RATIONALE**

60719 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to
 60720 permit implementors to recognize the name in the compiler and not implement an actual
 60721 function. These same restrictions apply to the *sigsetjmp()* macro.

60722 There are processors that cannot easily support these calls, but this was not considered a
 60723 sufficient reason to exclude them.

60724 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *_setjmp()* and
 60725 *_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as
 60726 *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal
 60727 masks, while *_setjmp()* and *_longjmp()* do not. On System V Release 3 and in corresponding
 60728 issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal
 60729 masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to
 60730 signal masks is not specified, and a new set of functions is defined instead.

60731 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching
 60732 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts
 60733 saved by other threads would be at best a questionable practice and were not considered worthy
 60734 of standardization.

60735

FUTURE DIRECTIONS

60736

None.

CHANGE HISTORY

60741

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

60742

Issue 5

60743

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

60744

Issue 6

60745

The DESCRIPTION is reworded in terms of *setjmp()*.

60746

The SYNOPSIS is marked CX since the presence of this function in the <setjmp.h> header is an extension over the ISO C standard.

60747

60748 **NAME**

60749 sigsuspend — wait for a signal

60750 **SYNOPSIS**

```
60751 CX #include <signal.h>
60752 int sigsuspend(const sigset_t *sigmask);
```

60753 **DESCRIPTION**

60754 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set
 60755 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose
 60756 action is either to execute a signal-catching function or to terminate the process. This shall not
 60757 cause any other signals that may have been pending on the process to become pending on the
 60758 thread.

60759 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to
 60760 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching
 60761 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*
 60762 call.

60763 It is not possible to block signals that cannot be ignored. This is enforced by the system without
 60764 causing an error to be indicated.

60765 **RETURN VALUE**

60766 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion
 60767 return value. If a return occurs, -1 shall be returned and *errno* set to indicate the error.

60768 **ERRORS**

60769 The *sigsuspend()* function shall fail if:

60770 [EINTR] A signal is caught by the calling process and control is returned from the
 60771 signal-catching function.

60772 **EXAMPLES**

60773 None.

60774 **APPLICATION USAGE**

60775 Normally, at the beginning of a critical code section, a specified set of signals is blocked using
 60776 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait
 60777 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was
 60778 returned by the *sigprocmask()* call.

60779 **RATIONALE**

60780 Code which wants to avoid the ambiguity of the signal mask for thread cancellation handlers
 60781 can install an additional cancellation handler which resets the signal mask to the expected value.

```
60782 void cleanup(void *arg)
60783 {
60784     sigset_t *ss = (sigset_t *) arg;
60785     pthread_sigmask(SIG_SETMASK, ss, NULL);
60786 }
60787 int call_sigsuspend(const sigset_t *mask)
60788 {
60789     sigset_t oldmask;
60790     int result;
60791     pthread_sigmask(SIG_SETMASK, NULL, &oldmask);
```

```

60792         pthread_cleanup_push(cleanup, &oldmask);
60793         result = sigsuspend(sigmask);
60794         pthread_cleanup_pop(0);
60795         return result;
60796     }

```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6

The text in the RETURN VALUE section has been changed from “suspends process execution” to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

Text in the APPLICATION USAGE section has been replaced.

The SYNOPSIS is marked CX since the presence of this function in the [<signal.h>](#) header is an extension over the ISO C standard.

Issue 7

SD5-XSH-ERN-122 is applied, adding the example code in the RATIONALE.

60814 **NAME**

60815 sigtimedwait, sigwaitinfo — wait for queued signals

60816 **SYNOPSIS**

```
60817 CX      #include <signal.h>
60818
60818      int sigtimedwait(const sigset_t *restrict set,
60819                    siginfo_t *restrict info,
60820                    const struct timespec *restrict timeout);
60821      int sigwaitinfo(const sigset_t *restrict set,
60822                    siginfo_t *restrict info);
```

60823 **DESCRIPTION**

60824 The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals
60825 specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the
60826 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is zero-
60827 valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall return
60828 immediately with an error. If *timeout* is the NULL pointer, the behavior is unspecified. If the
60829 Monotonic Clock option is supported, the CLOCK_MONOTONIC clock shall be used to
60830 measure the time interval specified by the *timeout* argument.

60831 The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of
60832 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the
60833 lowest numbered one. The selection order between realtime and non-realtime signals, or
60834 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at
60835 the time of the call, the calling thread shall be suspended until one or more signals in *set* become
60836 pending or until it is interrupted by an unblocked, caught signal.

60837 The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function if the *info* argument is
60838 NULL. If the *info* argument is non-NULL, the *sigwaitinfo()* function shall be equivalent to
60839 *sigwait()*, except that the selected signal number shall be stored in the *si_signo* member, and the
60840 cause of the signal shall be stored in the *si_code* member. If any value is queued to the selected
60841 signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the
60842 value shall be stored in the *si_value* member of *info*. The system resource used to queue the
60843 signal shall be released and returned to the system for other use. If no value is queued, the
60844 content of the *si_value* member is undefined. If no further signals are queued for the selected
60845 signal, the pending indication for that signal shall be reset.

60846 **RETURN VALUE**

60847 Upon successful completion (that is, one of the signals specified by *set* is pending or is
60848 generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise,
60849 the function shall return a value of -1 and set *errno* to indicate the error.

60850 **ERRORS**

60851 The *sigtimedwait()* function shall fail if:

60852 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.

60853 The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

60854 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be
60855 documented in system documentation whether this error causes these
60856 functions to fail.

60857 The *sigtimedwait()* function may also fail if:

60858 [EINVAL] The *timeout* argument specified a *tv_nsec* value less than zero or greater than
60859 or equal to 1 000 million.

60860 An implementation should only check for this error if no signal is pending in *set* and it is
60861 necessary to wait.

60862 EXAMPLES

60863 None.

60864 APPLICATION USAGE

60865 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application developers
60866 should note that this is inconsistent with other functions such as *pthread_cond_timedwait()* that
60867 return [ETIMEDOUT].

60868 RATIONALE

60869 Existing programming practice on realtime systems uses the ability to pause waiting for a
60870 selected set of events and handle the first event that occurs in-line instead of in a signal-handling
60871 function. This allows applications to be written in an event-directed style similar to a state
60872 machine. This style of programming is useful for largescale transaction processing in which the
60873 overall throughput of an application and the ability to clearly track states are more important
60874 than the ability to minimize the response time of individual event handling.

60875 It is possible to construct a signal-waiting macro function out of the realtime signal function
60876 mechanism defined in this volume of POSIX.1-200x. However, such a macro has to include the
60877 definition of a generalized handler for all signals to be waited on. A significant portion of the
60878 overhead of handler processing can be avoided if the signal-waiting function is provided by the
60879 kernel. This volume of POSIX.1-200x therefore provides two signal-waiting functions—one that
60880 waits indefinitely and one with a timeout—as part of the overall realtime signal function
60881 specification.

60882 The specification of a function with a timeout allows an application to be written that can be
60883 broken out of a wait after a set period of time if no event has occurred. It was argued that setting
60884 a timer event before the wait and recognizing the timer event in the wait would also implement
60885 the same functionality, but at a lower performance level. Because of the performance
60886 degradation associated with the user-level specification of a timer event and the subsequent
60887 cancellation of that timer event after the wait completes for a valid event, and the complexity
60888 associated with handling potential race conditions associated with the user-level method, the
60889 separate function has been included.

60890 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*
60891 function defined by this volume of POSIX.1-200x. The only difference is that *sigwaitinfo()* returns
60892 the queued signal value in the *value* argument. The return of the queued value is required so that
60893 applications can differentiate between multiple events queued to the same signal number.

60894 The two distinct functions are being maintained because some implementations may choose to
60895 implement the POSIX Threads Extension functions and not implement the queued signals
60896 extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value*
60897 argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a
60898 macro on *sigwaitinfo()*.

60899 The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns
60900 regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed
60901 wait, and immediate return, and concerns regarding consistency with other functions where the
60902 conditional and timed waits were separate functions from the pure blocking function. The
60903 semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a macro
60904 with a NULL pointer for *timeout*.

60905 The *sigwait* functions provide a synchronous mechanism for threads to wait for asynchronously-

60906 generated signals. One important question was how many threads that are suspended in a call
 60907 to a *sigwait()* function for a signal should return from the call when the signal is sent. Four
 60908 choices were considered:

- 60909 1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
- 60910 2. One or more threads return.
- 60911 3. All waiting threads return.
- 60912 4. Exactly one thread returns.

60913 Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The
 60914 “one or more” behavior made implementation of conforming packages easy at the expense of
 60915 forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in
 60916 application code in order to achieve predictable behavior. There was concern that the “all
 60917 waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU
 60918 resources by replicating the signals in the general case. Furthermore, no convincing examples
 60919 could be presented that delivery to all was either simpler or more powerful than delivery to one.

60920 Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait*
 60921 function for a signal should return when that signal occurs. This is not an onerous restriction as:

- 60922 • A multi-way signal wait can be built from the single-way wait.
- 60923 • Signals should only be handled by application-level code, as library routines cannot guess
 60924 what the application wants to do with signals generated for the entire process.
- 60925 • Applications can thus arrange for a single thread to wait for any given signal and call any
 60926 needed routines upon its arrival.

60927 In an application that is using signals for interprocess communication, signal processing is
 60928 typically done in one place. Alternatively, if the signal is being caught so that process cleanup
 60929 can be done, the signal handler thread can call separate process cleanup routines for each
 60930 portion of the application. Since the application main line started each portion of the application,
 60931 it is at the right abstraction level to tell each portion of the application to clean up.

60932 Certainly, there exist programming styles where it is logical to consider waiting for a single
 60933 signal in multiple threads. A simple *sigwait_multiple()* routine can be constructed to achieve this
 60934 goal. A possible implementation would be to have each *sigwait_multiple()* caller registered as
 60935 having expressed interest in a set of signals. The caller then waits on a thread-specific condition
 60936 variable. A single server thread calls a *sigwait()* function on the union of all registered signals.
 60937 When the *sigwait()* function returns, the appropriate state is set and condition variables are
 60938 broadcast. New *sigwait_multiple()* callers may cause the pending *sigwait()* call to be canceled
 60939 and reissued in order to update the set of signals being waited for.

60940 FUTURE DIRECTIONS

60941 None.

60946 CHANGE HISTORY

60947 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
 60948 POSIX Threads Extension.

60949 **Issue 6**

60950 These functions are marked as part of the Realtime Signals Extension option.

60951 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function
60952 has been corrected so that the second argument is of type **siginfo_t** *.60953 The [ENOSYS] error condition has been removed as stubs need not be provided if an
60954 implementation does not support the Realtime Signals Extension option.60955 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
60956 CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.60957 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment
60958 with the ISO/IEC 9899:1999 standard.60959 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/130 is applied, restoring wording in the
60960 RETURN VALUE section to that in the original base document (“An implementation should
60961 only check for this error if no signal is pending in *set* and it is necessary to wait”).60962 **Issue 7**60963 The *sigtimedwait()* and *sigwaitinfo()* functions are moved from the Realtime Signals Extension
60964 option to the Base.

60965 **NAME**60966 `sigwait` — wait for queued signals60967 **SYNOPSIS**

```
60968 CX #include <signal.h>
60969 int sigwait(const sigset_t *restrict set, int *restrict sig);
```

60970 **DESCRIPTION**

60971 The `sigwait()` function shall select a pending signal from `set`, atomically clear it from the system's
 60972 set of pending signals, and return that signal number in the location referenced by `sig`. If prior to
 60973 the call to `sigwait()` there are multiple pending instances of a single signal number, it is
 60974 implementation-defined whether upon successful return there are any remaining pending
 60975 signals for that signal number. If the implementation supports queued signals and there are
 60976 multiple signals queued for the signal number selected, the first such queued signal shall cause a
 60977 return from `sigwait()` and the remainder shall remain queued. If no signal in `set` is pending at the
 60978 time of the call, the thread shall be suspended until one or more becomes pending. The signals
 60979 defined by `set` shall have been blocked at the time of the call to `sigwait()`; otherwise, the behavior
 60980 is undefined. The effect of `sigwait()` on the signal actions for the signals in `set` is unspecified.

60981 If more than one thread is using `sigwait()` to wait for the same signal, no more than one of these
 60982 threads shall return from `sigwait()` with the signal number. If more than a single thread is
 60983 blocked in `sigwait()` for a signal when that signal is generated for the process, it is unspecified
 60984 which of the waiting threads returns from `sigwait()`. If the signal is generated for a specific
 60985 thread, as by `pthread_kill()`, only that thread shall return.

60986 Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it
 60987 shall be the lowest numbered one. The selection order between realtime and non-realtime
 60988 signals, or between multiple pending non-realtime signals, is unspecified.

60989 **RETURN VALUE**

60990 Upon successful completion, `sigwait()` shall store the signal number of the received signal at the
 60991 location referenced by `sig` and return zero. Otherwise, an error number shall be returned to
 60992 indicate the error.

60993 **ERRORS**60994 The `sigwait()` function may fail if:60995 [EINVAL] The `set` argument contains an invalid or unsupported signal number.60996 **EXAMPLES**

60997 None.

60998 **APPLICATION USAGE**

60999 None.

61000 **RATIONALE**

61001 To provide a convenient way for a thread to wait for a signal, this volume of POSIX.1-200x
 61002 provides the `sigwait()` function. For most cases where a thread has to wait for a signal, the
 61003 `sigwait()` function should be quite convenient, efficient, and adequate.

61004 However, requests were made for a lower-level primitive than `sigwait()` and for semaphores that
 61005 could be used by threads. After some consideration, threads were allowed to use semaphores
 61006 and `sem_post()` was defined to be async-signal and async-cancel-safe.

61007 In summary, when it is necessary for code run in response to an asynchronous signal to notify a
 61008 thread, `sigwait()` should be used to handle the signal. Alternatively, if the implementation

61009 provides semaphores, they also can be used, either following *sigwait()* or from within a signal
 61010 handling routine previously registered with *sigaction()*.

61011 FUTURE DIRECTIONS

61012 None.

61017 CHANGE HISTORY

61018 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
 61019 POSIX Threads Extension.

61020 Issue 6

61021 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the
 61022 ISO/IEC 9899:1999 standard.

61023 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/131 is applied, updating the
 61024 DESCRIPTION to state that if more than a single thread is blocked in *sigwait()*, it is unspecified
 61025 which of the waiting threads returns, and that if a signal is generated for a specific thread only
 61026 that thread shall return.

61027 Issue 7

61028 Functionality relating to the Realtime Signals Extension option is moved to the Base.

sigwaitinfo()*System Interfaces*

61029 **NAME**
61030 sigwaitinfo — wait for queued signals

61031 **SYNOPSIS**

```
61032 #include <signal.h>  
61033 int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

61034 **DESCRIPTION**

61035 Refer to [sigtimedwait\(\)](#).

61036 **NAME**61037 `sin, sinf, sinl` — sine function61038 **SYNOPSIS**

```
61039 #include <math.h>
61040 double sin(double x);
61041 float sinf(float x);
61042 long double sinl(long double x);
```

61043 **DESCRIPTION**

61044 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 61045 conflict between the requirements described here and the ISO C standard is unintentional. This
 61046 volume of POSIX.1-200x defers to the ISO C standard.

61047 These functions shall compute the sine of their argument x , measured in radians.

61048 An application wishing to check for error situations should set *errno* to zero and call
 61049 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 61050 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 61051 zero, an error has occurred.

61052 **RETURN VALUE**

61053 Upon successful completion, these functions shall return the sine of x .

61054 MX If x is NaN, a NaN shall be returned.

61055 If x is ± 0 , x shall be returned.

61056 If x is subnormal, a range error may occur and x should be returned.

61057 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 61058 defined value shall be returned.

61059 **ERRORS**

61060 These functions shall fail if:

61061 MX **Domain Error** The x argument is $\pm\text{Inf}$.

61062 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 61063 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 61064 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 61065 shall be raised.

61066 These functions may fail if:

61067 MX **Range Error** The value of x is subnormal

61068 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 61069 then *errno* shall be set to [ERANGE]. If the integer expression
 61070 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 61071 floating-point exception shall be raised.

61072 **EXAMPLES**61073 **Taking the Sine of a 45-Degree Angle**

```

61074 #include <math.h>
61075 ...
61076 double radians = 45.0 * M_PI / 180;
61077 double result;
61078 ...
61079 result = sin(radians);

```

61080 **APPLICATION USAGE**

61081 These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

61082 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
61083 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

61084 **RATIONALE**

61085 None.

61086 **FUTURE DIRECTIONS**

61087 None.

61091 **CHANGE HISTORY**

61092 First released in Issue 1. Derived from Issue 1 of the SVID.

61093 **Issue 5**

61094 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
61095 in previous issues.

61096 **Issue 6**

61097 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

61098 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
61099 revised to align with the ISO/IEC 9899:1999 standard.

61100 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
61101 marked.

61102 **NAME**

61103 sinh, sinhf, sinhl — hyperbolic sine functions

61104 **SYNOPSIS**

```
61105     #include <math.h>
61106
61106     double sinh(double x);
61107     float  sinhf(float x);
61108     long double sinhl(long double x);
```

61109 **DESCRIPTION**

61110 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
61111 conflict between the requirements described here and the ISO C standard is unintentional. This
61112 volume of POSIX.1-200x defers to the ISO C standard.

61113 These functions shall compute the hyperbolic sine of their argument x .

61114 An application wishing to check for error situations should set *errno* to zero and call
61115 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
61116 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
61117 zero, an error has occurred.

61118 **RETURN VALUE**

61119 Upon successful completion, these functions shall return the hyperbolic sine of x .

61120 If the result would cause an overflow, a range error shall occur and \pm HUGE_VAL,
61121 \pm HUGE_VALF, and \pm HUGE_VALL (with the same sign as x) shall be returned as appropriate for
61122 the type of the function.

61123 **MX** If x is NaN, a NaN shall be returned.

61124 If x is ± 0 or \pm Inf, x shall be returned.

61125 If x is subnormal, a range error may occur and x should be returned.

61126 **ERRORS**

61127 These functions shall fail if:

61128 Range Error The result would cause an overflow.

61129 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
61130 then *errno* shall be set to [ERANGE]. If the integer expression
61131 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
61132 floating-point exception shall be raised.

61133 These functions may fail if:

61134 **MX** Range Error The value x is subnormal.

61135 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
61136 then *errno* shall be set to [ERANGE]. If the integer expression
61137 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
61138 floating-point exception shall be raised.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

61162 **NAME**
61163 sinl — sine function

61164 **SYNOPSIS**
61165 #include <math.h>
61166 long double sinl(long double x);

61167 **DESCRIPTION**
61168 Refer to *sin()*.

61169 **NAME**61170 `sleep` — suspend execution for an interval of time61171 **SYNOPSIS**61172 `#include <unistd.h>`61173 `unsigned sleep(unsigned seconds);`61174 **DESCRIPTION**

61175 The `sleep()` function shall cause the calling thread to be suspended from execution until either
 61176 the number of realtime seconds specified by the argument `seconds` has elapsed or a signal is
 61177 delivered to the calling thread and its action is to invoke a signal-catching function or to
 61178 terminate the process. The suspension time may be longer than requested due to the scheduling
 61179 of other activity by the system.

61180 If a SIGALRM signal is generated for the calling process during execution of `sleep()` and if the
 61181 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether `sleep()`
 61182 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
 61183 unspecified whether it remains pending after `sleep()` returns or it is discarded.

61184 If a SIGALRM signal is generated for the calling process during execution of `sleep()`, except as a
 61185 result of a prior call to `alarm()`, and if the SIGALRM signal is not being ignored or blocked from
 61186 delivery, it is unspecified whether that signal has any effect other than causing `sleep()` to return.

61187 If a signal-catching function interrupts `sleep()` and examines or changes either the time a
 61188 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
 61189 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

61190 If a signal-catching function interrupts `sleep()` and calls `siglongjmp()` or `longjmp()` to restore an
 61191 environment saved prior to the `sleep()` call, the action associated with the SIGALRM signal and
 61192 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
 61193 unspecified whether the SIGALRM signal is blocked, unless the signal mask of the process is
 61194 restored as part of the environment.

61195 XSI Interactions between `sleep()` and `setitimer()` are unspecified.61196 **RETURN VALUE**

61197 If `sleep()` returns because the requested time has elapsed, the value returned shall be 0. If `sleep()`
 61198 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested
 61199 time minus the time actually slept) in seconds.

61200 **ERRORS**

61201 No errors are defined.

61202 **EXAMPLES**

61203 None.

61204 **APPLICATION USAGE**

61205 None.

61206 **RATIONALE**

61207 There are two general approaches to the implementation of the `sleep()` function. One is to use the
 61208 `alarm()` function to schedule a SIGALRM signal and then suspend the calling thread waiting for
 61209 that signal. The other is to implement an independent facility. This volume of POSIX.1-200x
 61210 permits either approach.

61211 In order to comply with the requirement that no primitive shall change a process attribute unless
 61212 explicitly described by this volume of POSIX.1-200x, an implementation using SIGALRM must
 61213 carefully take into account any SIGALRM signal scheduled by previous `alarm()` calls, the action

61214 previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has
 61215 been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to
 61216 that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-
 61217 catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()*
 61218 would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The
 61219 action and blocking for SIGALRM must be saved and restored.

61220 Historical implementations often implement the SIGALRM-based version using *alarm()* and
 61221 *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*.
 61222 Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid
 61223 that window. That implementation introduces a different problem: when the SIGALRM signal
 61224 interrupts a signal-catching function installed by the user to catch a different signal, the
 61225 *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*,
 61226 *alarm()*, and *sigsuspend()* can avoid these problems.

61227 Despite all reasonable care, there are several very subtle, but detectable and unavoidable,
 61228 differences between the two types of implementations. These are the cases mentioned in this
 61229 volume of POSIX.1-200x where some other activity relating to SIGALRM takes place, and the
 61230 results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of
 61231 concern to most applications.

61232 See also the discussion of the term *realtime* in *alarm()*.

61233 Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early
 61234 under *alarm()* applies to *sleep()* as well.

61235 Application developers should note that the type of the argument *seconds* and the return value of
 61236 *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application
 61237 cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the
 61238 ISO C standard sets as 65535, and any application passing a larger value is restricting its
 61239 portability. A different type was considered, but historical implementations, including those
 61240 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

61241 Scheduling delays may cause the process to return from the *sleep()* function significantly after
 61242 the requested time. In such cases, the return value should be set to zero, since the formula
 61243 (requested time minus the time actually spent) yields a negative number and *sleep()* returns an
 61244 **unsigned**.

61245 FUTURE DIRECTIONS

61246 None.

61250 CHANGE HISTORY

61251 First released in Issue 1. Derived from Issue 1 of the SVID.

61252 Issue 5

61253 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

61254 Issue 6

61255 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/132 is applied, making a correction in the
 61256 RATIONALE section.

61257 **NAME**
61258 **snprintf** — print formatted output

61259 **SYNOPSIS**
61260 #include <stdio.h>
61261 int snprintf(char *restrict *s*, size_t *n*,
61262 const char *restrict *format*, ...);

61263 **DESCRIPTION**
61264 Refer to *fprintf()*.

61265 **NAME**

61266 socketmark — determine whether a socket is at the out-of-band mark

61267 **SYNOPSIS**61268 #include <sys/socket.h>
61269 int socketmark(int s);61270 **DESCRIPTION**61271 The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at
61272 the out-of-band data mark (see [Section 2.10.12](#), on page 499). If the protocol for the socket
61273 supports out-of-band data by marking the stream with an out-of-band data mark, the
61274 *socketmark()* function shall return 1 when all data preceding the mark has been read and the out-
61275 of-band data mark is the first element in the receive queue. The *socketmark()* function shall not
61276 remove the mark from the stream.61277 **RETURN VALUE**61278 Upon successful completion, the *socketmark()* function shall return a value indicating whether
61279 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data
61280 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data
61281 precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it
61282 shall return a value of -1 and set *errno* to indicate the error.61283 **ERRORS**61284 The *socketmark()* function shall fail if:

- 61285 [EBADF] The
- s*
- argument is not a valid file descriptor.
-
- 61286 [ENOTTY] The file associated with the
- s*
- argument is not a socket.

61287 **EXAMPLES**

61288 None.

61289 **APPLICATION USAGE**61290 The use of this function between receive operations allows an application to determine which
61291 received data precedes the out-of-band data and which follows the out-of-band data.61292 There is an inherent race condition in the use of this function. On an empty receive queue, the
61293 current read of the location might well be at the “mark”, but the system has no way of knowing
61294 that the next data segment that will arrive from the network will carry the mark, and
61295 *socketmark()* will return false, and the next read operation will silently consume the mark.61296 Hence, this function can only be used reliably when the application already knows that the out-
61297 of-band data has been seen by the system or that it is known that there is data waiting to be read
61298 at the socket (via SIGURG or *select()*). See [Section 2.10.11](#) (on page 498), [Section 2.10.12](#) (on page
61299 499), [Section 2.10.14](#) (on page 499), and *pselect()* for details.61300 **RATIONALE**61301 The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which
61302 implemented the same functionality on many implementations. Using a wrapper function
61303 follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other
61304 than those now included to support XSI STREAMS. The *socketmark()* function could be
61305 implemented as follows:61306 #include <sys/ioctl.h>
61307 int socketmark(int s)
61308 {
61309 int val;

socketmark()

```
61310         if (ioctl(s,SIOCATMARK,&val)==-1)
61311             return(-1);
61312         return(val);
61313     }
```

61314 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of
61315 SIOCATMARK.

FUTURE DIRECTIONS

61316 None.

CHANGE HISTORY

61321 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

Issue 7

61323 SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.
61324

61325 **NAME**
 61326 socket — create an endpoint for communication

61327 **SYNOPSIS**
 61328 #include <sys/socket.h>

61329 int socket(int domain, int type, int protocol);

61330 DESCRIPTION

61331 The *socket()* function shall create an unbound socket in a communications domain, and return a
 61332 file descriptor that can be used in later function calls that operate on sockets.

61333 The *socket()* function takes the following arguments:

61334 *domain* Specifies the communications domain in which a socket is to be created.

61335 *type* Specifies the type of socket to be created.

61336 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*
 61337 of 0 causes *socket()* to use an unspecified default protocol appropriate for the
 61338 requested socket type.

61339 The *domain* argument specifies the address family used in the communications domain. The
 61340 address families supported by the system are implementation-defined.

61341 Symbolic constants that can be used for the domain argument are defined in the <sys/socket.h>
 61342 header.

61343 The *type* argument specifies the socket type, which determines the semantics of communication
 61344 over the socket. The following socket types are defined; implementations may specify additional
 61345 socket types:

61346 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte
 61347 streams, and may provide a transmission mechanism for out-of-band
 61348 data.

61349 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages
 61350 of fixed maximum length.

61351 SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode transmission
 61352 paths for records. A record can be sent using one or more output
 61353 operations and received using one or more input operations, but a single
 61354 operation never transfers part of more than one record. Record
 61355 boundaries are visible to the receiver via the MSG_EOR flag.

61356 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
 61357 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
 61358 be used. The protocols supported by the system are implementation-defined.

61359 The process may need to have appropriate privileges to use the *socket()* function or to create
 61360 some sockets.

61361 RETURN VALUE

61362 Upon successful completion, *socket()* shall return a non-negative integer, the socket file
 61363 descriptor. Otherwise, a value of -1 shall be returned and *errno* set to indicate the error.

socket()**61364 ERRORS**

61365 The *socket()* function shall fail if:

61366 [EAFNOSUPPORT]

61367 The implementation does not support the specified address family.

61368 [EMFILE]

All file descriptors available to the process are currently open.

61369 [ENFILE]

No more file descriptors are available for the system.

61370 [EPROTONOSUPPORT]

61371 The protocol is not supported by the address family, or the protocol is not
61372 supported by the implementation.

61373 [EPROTOTYPE] The socket type is not supported by the protocol.

61374 The *socket()* function may fail if:

61375 [EACCES]

The process does not have appropriate privileges.

61376 [ENOBUFS]

Insufficient resources were available in the system to perform the operation.

61377 [ENOMEM]

Insufficient memory was available to fulfill the request.

61378 EXAMPLES

61379 None.

61380 APPLICATION USAGE

61381 The documentation for specific address families specifies which protocols each address family
61382 supports. The documentation for specific protocols specifies which socket types each protocol
61383 supports.

61384 The application can determine whether an address family is supported by trying to create a
61385 socket with *domain* set to the protocol in question.

61386 RATIONALE

61387 None.

61388 FUTURE DIRECTIONS

61389 None.

61393 XBD <[netinet/in.h](#)>, <[sys/socket.h](#)>

61394 CHANGE HISTORY

61395 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

61396 **NAME**

61397 socketpair — create a pair of connected sockets

61398 **SYNOPSIS**

```
61399 #include <sys/socket.h>
61400 int socketpair(int domain, int type, int protocol,
61401               int socket_vector[2]);
```

61402 **DESCRIPTION**

61403 The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*,
 61404 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two
 61405 sockets shall be identical. The file descriptors used in referencing the created sockets shall be
 61406 returned in *socket_vector*[0] and *socket_vector*[1].

61407 The *socketpair()* function takes the following arguments:

61408	<i>domain</i>	Specifies the communications domain in which the sockets are to be created.
61409	<i>type</i>	Specifies the type of sockets to be created.
61410	<i>protocol</i>	Specifies a particular protocol to be used with the sockets. Specifying a 61411 <i>protocol</i> of 0 causes <i>socketpair()</i> to use an unspecified default protocol 61412 appropriate for the requested socket type.
61413	<i>socket_vector</i>	Specifies a 2-integer array to hold the file descriptors of the created socket pair.

61414 The *type* argument specifies the socket type, which determines the semantics of communications
 61415 over the socket. The following socket types are defined; implementations may specify additional
 61416 socket types:

61417	SOCK_STREAM	Provides sequenced, reliable, bidirectional, connection-mode byte 61418 streams, and may provide a transmission mechanism for out-of-band 61419 data.
61420	SOCK_DGRAM	Provides datagrams, which are connectionless-mode, unreliable messages 61421 of fixed maximum length.
61422	SOCK_SEQPACKET	Provides sequenced, reliable, bidirectional, connection-mode transmission 61423 paths for records. A record can be sent using one or more output 61424 operations and received using one or more input operations, but a single 61425 operation never transfers part of more than one record. Record 61426 boundaries are visible to the receiver via the MSG_EOR flag.

61427 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
 61428 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
 61429 be used. The protocols supported by the system are implementation-defined.

61430 The process may need to have appropriate privileges to use the *socketpair()* function or to create
 61431 some sockets.

61432 **RETURN VALUE**

61433 Upon successful completion, this function shall return 0; otherwise, -1 shall be returned and
 61434 *errno* set to indicate the error.

61435 **ERRORS**

61436 The *socketpair()* function shall fail if:

socketpair()

61437	[EAFNOSUPPORT]		
61438		The implementation does not support the specified address family.	
61439	[EMFILE]	All, or all but one, of the file descriptors available to the process are currently	
61440		open.	
61441	[ENFILE]	No more file descriptors are available for the system.	
61442	[EOPNOTSUPP]	The specified protocol does not permit creation of socket pairs.	
61443	[EPROTONOSUPPORT]		
61444		The protocol is not supported by the address family, or the protocol is not	
61445		supported by the implementation.	
61446	[EPROTOTYPE]	The socket type is not supported by the protocol.	
61447		The <i>socketpair()</i> function may fail if:	
61448	[EACCES]	The process does not have appropriate privileges.	
61449	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.	
61450	[ENOMEM]	Insufficient memory was available to fulfill the request.	
61451	EXAMPLES		
61452		None.	
61453	APPLICATION USAGE		
61454		The documentation for specific address families specifies which protocols each address family	
61455		supports. The documentation for specific protocols specifies which socket types each protocol	
61456		supports.	
61457		The <i>socketpair()</i> function is used primarily with UNIX domain sockets and need not be	
61458		supported for other domains.

61470 **NAME**
61471 sprintf — print formatted output

61472 **SYNOPSIS**
61473 #include <stdio.h>
61474 int sprintf(char *restrict *s*, const char *restrict *format*, ...);

61475 **DESCRIPTION**
61476 Refer to *fprintf()*.

61477 **NAME**
 61478 sqrt, sqrtf, sqrtl — square root function

61479 **SYNOPSIS**
 61480 #include <math.h>
 61481 double sqrt(double x);
 61482 float sqrtf(float x);
 61483 long double sqrtl(long double x);

61484 **DESCRIPTION**
 61485 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 61486 conflict between the requirements described here and the ISO C standard is unintentional. This
 61487 volume of POSIX.1-200x defers to the ISO C standard.

61488 These functions shall compute the square root of their argument x , \sqrt{x} .

61489 An application wishing to check for error situations should set *errno* to zero and call
 61490 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 61491 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 61492 zero, an error has occurred.

61493 **RETURN VALUE**
 61494 Upon successful completion, these functions shall return the square root of x .

61495 MX For finite values of $x < -0$, a domain error shall occur, and either a NaN (if supported), or an
 61496 implementation-defined value shall be returned.

61497 MX If x is NaN, a NaN shall be returned.

61498 If x is ± 0 or $+\text{Inf}$, x shall be returned.

61499 If x is $-\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 61500 defined value shall be returned.

61501 **ERRORS**
 61502 These functions shall fail if:

61503 MX Domain Error The finite value of x is < -0 , or x is $-\text{Inf}$.

61504 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 61505 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 61506 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 61507 shall be raised.

61508 EXAMPLES

61509 Taking the Square Root of 9.0

```
61510 #include <math.h>
61511 ...
61512 double x = 9.0;
61513 double result;
61514 ...
61515 result = sqrt(x);
```

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

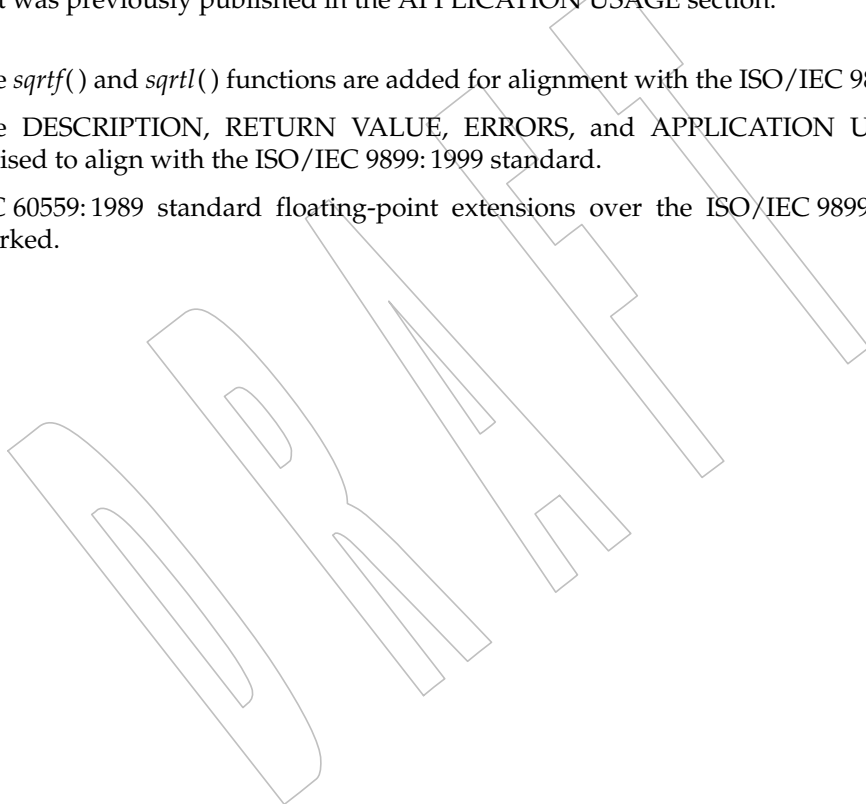

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *sqrftf()* and *sqrftl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

61537 **NAME**
61538 `srand` — pseudo-random number generator

61539 **SYNOPSIS**
61540 `#include <stdlib.h>`
61541 `void srand(unsigned seed);`

61542 **DESCRIPTION**
61543 Refer to *rand()*.

61544 **NAME**
61545 `srand48` — seed the uniformly distributed double-precision pseudo-random number generator

61546 **SYNOPSIS**

```
61547 XSI #include <stdlib.h>  
61548 void srand48(long seedval);
```

61549 **DESCRIPTION**

61550 Refer to [drand48\(\)](#).

srandom()

61551 **NAME**
61552 `srandom` — seed pseudo-random number generator

SYNOPSIS

61553 XSI `#include <stdlib.h>`
61554 `void srandom(unsigned seed);`

DESCRIPTION

61556 Refer to *initstate()*.
61557

61558 **NAME**
61559 scanf — convert formatted input

61560 **SYNOPSIS**

61561 #include <stdio.h>

61562 int sscanf(const char *restrict *s*, const char *restrict *format*, ...);

61563 **DESCRIPTION**

61564 Refer to *fscanf()*.

61565 **NAME**
61566 `stat` — get file status

61567 **SYNOPSIS**
61568 `#include <sys/stat.h>`

61569 `int stat(const char *restrict path, struct stat *restrict buf);`

61570 **DESCRIPTION**
61571 Refer to *[fstatat\(\)](#)*.

61572 **NAME**
61573 statvfs — get file system information

61574 **SYNOPSIS**
61575 #include <sys/statvfs.h>
61576 int statvfs(const char *restrict path, struct statvfs *restrict buf);

61577 **DESCRIPTION**
61578 Refer to *fstatvfs()*.

61579 **NAME**61580 `stderr, stdin, stdout` — standard I/O streams61581 **SYNOPSIS**61582 `#include <stdio.h>`61583 `extern FILE *stderr, *stdin, *stdout;`61584 **DESCRIPTION**61585 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61586 conflict between the requirements described here and the ISO C standard is unintentional. This
61587 volume of POSIX.1-200x defers to the ISO C standard.61588 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type
61589 **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer
61590 to designate the stream in all further transactions. Normally, there are three open streams with
61591 constant pointers declared in the **<stdio.h>** header and associated with the standard open files.61592 At program start-up, three streams shall be predefined and need not be opened explicitly:
61593 *standard input* (for reading conventional input), *standard output* (for writing conventional output),
61594 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not
61595 fully buffered; the standard input and standard output streams are fully buffered if and only if
61596 the stream can be determined not to refer to an interactive device.61597 CX The following symbolic values in **<unistd.h>** define the file descriptors that shall be associated
61598 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:61599 `STDIN_FILENO` Standard input value, *stdin*. Its value is 0.61600 `STDOUT_FILENO` Standard output value, *stdout*. Its value is 1.61601 `STDERR_FILENO` Standard error value, *stderr*. Its value is 2.61602 The *stderr* stream is expected to be open for reading and writing.61603 **RETURN VALUE**

61604 None.

61605 **ERRORS**

61606 No errors are defined.

61607 **EXAMPLES**

61608 None.

61609 **APPLICATION USAGE**

61610 None.

61611 **RATIONALE**

61612 None.

61613 **FUTURE DIRECTIONS**

61619	CHANGE HISTORY
61620	First released in Issue 1.
61621	Issue 6
61622	Extensions beyond the ISO C standard are marked.
61623	A note that <i>stderr</i> is expected to be open for reading and writing is added to the DESCRIPTION.

stpcpy()

61624 **NAME**
61625 stpcpy — copy a string and return a pointer to the end of the result

SYNOPSIS

61626 CX `#include <string.h>`
61627 `char *stpcpy(char *restrict s1, const char *restrict s2);`

DESCRIPTION

61629 Refer to *strcpy()*.
61630

61631 **NAME**
61632 stpncpy — copy fixed length string, returning a pointer to the array end

61633 **SYNOPSIS**

61634 CX `#include <string.h>`
61635 `char *stpncpy(char *restrict s1, const char *restrict s2, size_t size);`

61636 **DESCRIPTION**

61637 Refer to *strncpy()*.

61638 **NAME**
 61639 `strcasemp, strcasemp_l, strncasemp, strncasemp_l` — case-insensitive string comparisons

61640 **SYNOPSIS**
 61641 `#include <strings.h>`
 61642 `int strcasemp(const char *s1, const char *s2);`
 61643 `int strcasemp_l(const char *s1, const char *s2,`
 61644 `locale_t locale);`
 61645 `int strncasemp(const char *s1, const char *s2, size_t n);`
 61646 `int strncasemp_l(const char *s1, const char *s2,`
 61647 `size_t n, locale_t locale);`

61648 **DESCRIPTION**
 61649 The `strcasemp()` and `strcasemp_l()` functions shall compare, while ignoring differences in case,
 61650 the string pointed to by `s1` to the string pointed to by `s2`. The `strncasemp()` and `strncasemp_l()`
 61651 functions shall compare, while ignoring differences in case, not more than `n` bytes from the
 61652 string pointed to by `s1` to the string pointed to by `s2`.

61653 The `strcasemp()` and `strncasemp()` functions use the current locale of the process to determine
 61654 the case of the characters.

61655 The `strcasemp_l()` and `strncasemp_l()` functions use the locale represented by `locale` to determine
 61656 the case of the characters.

61657 When the `LC_CTYPE` category of the current locale is from the POSIX locale, `strcasemp()` and
 61658 `strncasemp()` shall behave as if the strings had been converted to lowercase and then a byte
 61659 comparison performed. Otherwise, the results are unspecified.

61660 **RETURN VALUE**
 61661 Upon completion, `strcasemp()` and `strcasemp_l()` shall return an integer greater than, equal to,
 61662 or less than 0, if the string pointed to by `s1` is, ignoring case, greater than, equal to, or less than
 61663 the string pointed to by `s2`, respectively.

61664 Upon successful completion, `strncasemp()` and `strncasemp_l()` shall return an integer greater
 61665 than, equal to, or less than 0, if the possibly null-terminated array pointed to by `s1` is, ignoring
 61666 case, greater than, equal to, or less than the possibly null-terminated array pointed to by `s2`,
 61667 respectively.

61668 **ERRORS**
 61669 The `strcasemp_l()` and `strncasemp_l()` functions may fail if:
 61670 [EINVAL] `locale` is not a valid locale object handle.

61671 **EXAMPLES**
 61672 None.

61673 **APPLICATION USAGE**
 61674 None.

61675 **RATIONALE**
 61676 None.

61677 **FUTURE DIRECTIONS**
 61678 None.

61679

CHANGE HISTORY

61683

First released in Issue 4, Version 2.

61684

Issue 5

61685

Moved from X/OPEN UNIX extension to BASE.

61686

Issue 7

61687

The *strcasecmp()* and *strncasecmp()* functions are moved from the XSI option to the Base.

61688

The *strcasecmp_l()* and *strncasecmp_l()* functions are added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

61689

61690 **NAME**61691 `strcat` — concatenate two strings61692 **SYNOPSIS**61693 `#include <string.h>`61694 `char *strcat(char *restrict s1, const char *restrict s2);`61695 **DESCRIPTION**61696 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61697 conflict between the requirements described here and the ISO C standard is unintentional. This
61698 volume of POSIX.1-200x defers to the ISO C standard.61699 The `strcat()` function shall append a copy of the string pointed to by `s2` (including the
61700 terminating NUL character) to the end of the string pointed to by `s1`. The initial byte of `s2`
61701 overwrites the NUL character at the end of `s1`. If copying takes place between objects that
61702 overlap, the behavior is undefined.61703 **RETURN VALUE**61704 The `strcat()` function shall return `s1`; no return value is reserved to indicate an error.61705 **ERRORS**

61706 No errors are defined.

61707 **EXAMPLES**

61708 None.

61709 **APPLICATION USAGE**61710 This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 |
61711 applications. Reliable error detection by this function was never guaranteed.61712 **RATIONALE**

61713 None.

61714 **FUTURE DIRECTIONS**

61715 None.

61716 **SEE ALSO**61717 [strncat\(\)](#)61718 XBD [<string.h>](#) |61719 **CHANGE HISTORY**

61720 First released in Issue 1. Derived from Issue 1 of the SVID.

61721 **Issue 6**61722 The `strcat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

61723 **NAME**

61724 `strchr` — string scanning operation

61725 **SYNOPSIS**

61726 `#include <string.h>`

61727 `char *strchr(const char *s, int c);`

61728 **DESCRIPTION**

61729 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61730 conflict between the requirements described here and the ISO C standard is unintentional. This
61731 volume of POSIX.1-200x defers to the ISO C standard.

61732 The `strchr()` function shall locate the first occurrence of `c` (converted to a **char**) in the string
61733 pointed to by `s`. The terminating NUL character is considered to be part of the string.

61734 **RETURN VALUE**

61735 Upon completion, `strchr()` shall return a pointer to the byte, or a null pointer if the byte was not
61736 found.

61737 **ERRORS**

61738 No errors are defined.

61739 **EXAMPLES**

61740 None.

61741 **APPLICATION USAGE**

61742 None.

61748 [strrchr\(\)](#)

61749 XBD [<string.h>](#)

61750 **CHANGE HISTORY**

61751 First released in Issue 1. Derived from Issue 1 of the SVID.

61752 **Issue 6**

61753 Extensions beyond the ISO C standard are marked.

61754 **NAME**61755 `strcmp` — compare two strings61756 **SYNOPSIS**61757 `#include <string.h>`61758 `int strcmp(const char *s1, const char *s2);`61759 **DESCRIPTION**61760 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61761 conflict between the requirements described here and the ISO C standard is unintentional. This
61762 volume of POSIX.1-200x defers to the ISO C standard.61763 The `strcmp()` function shall compare the string pointed to by `s1` to the string pointed to by `s2`.61764 The sign of a non-zero return value shall be determined by the sign of the difference between the
61765 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
61766 being compared.61767 **RETURN VALUE**61768 Upon completion, `strcmp()` shall return an integer greater than, equal to, or less than 0, if the
61769 string pointed to by `s1` is greater than, equal to, or less than the string pointed to by `s2`,
61770 respectively.61771 **ERRORS**

61772 No errors are defined.

61773 **EXAMPLES**61774 **Checking a Password Entry**61775 The following example compares the information read from standard input to the value of the
61776 name of the user entry. If the `strcmp()` function returns 0 (indicating a match), a further check
61777 will be made to see if the user entered the proper old password. The `crypt()` function shall
61778 encrypt the old password entered by the user, using the value of the encrypted password in the
61779 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the
61780 structure, the entered password `oldpasswd` is the correct user's password. Finally, the program
61781 encrypts the new password so that it can store the information in the **passwd** structure.61782 `#include <string.h>`
61783 `#include <unistd.h>`
61784 `#include <stdio.h>`
61785 `...`
61786 `int valid_change;`
61787 `struct passwd *p;`
61788 `char user[100];`
61789 `char oldpasswd[100];`
61790 `char newpasswd[100];`
61791 `char savepasswd[100];`
61792 `...`
61793 `if (strcmp(p->pw_name, user) == 0) {`
61794 `if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {`
61795 `strcpy(savepasswd, crypt(newpasswd, user));`
61796 `p->pw_passwd = savepasswd;`
61797 `valid_change = 1;`
61798 `}`
61799 `else {`

```
61800         fprintf(stderr, "Old password is not valid\n");
61801     }
61802 }
61803 ...
```

APPLICATION USAGE

DRAFT

61817 **NAME**

61818 strcoll, strcoll_l — string comparison using collating information

61819 **SYNOPSIS**

61820 #include <string.h>

61821 int strcoll(const char *s1, const char *s2);

61822 CX int strcoll_l(const char *s1, const char *s2,
61823 locale_t locale);61824 **DESCRIPTION**61825 CX For *strcoll()*: The functionality described on this reference page is aligned with the ISO C
61826 standard. Any conflict between the requirements described here and the ISO C standard is
61827 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.61828 CX The *strcoll()* and *strcoll_l()* functions shall compare the string pointed to by *s1* to the string
61829 pointed to by *s2*, both interpreted as appropriate to the *LC_COLLATE* category of the current
61830 locale, or of the locale represented by *locale*, respectively.61831 CX The *strcoll()* and *strcoll_l()* functions shall not change the setting of *errno* if successful.61832 Since no return value is reserved to indicate an error, an application wishing to check for error
61833 CX situations should set *errno* to 0, then call *strcoll()*, or *strcoll_l()* then check *errno*.61834 **RETURN VALUE**61835 Upon successful completion, *strcoll()* shall return an integer greater than, equal to, or less than 0,
61836 according to whether the string pointed to by *s1* is greater than, equal to, or less than the string
61837 CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error,
61838 *strcoll()* may set *errno*, but no return value is reserved to indicate an error.61839 Upon successful completion, *strcoll_l()* shall return an integer greater than, equal to, or less than
61840 0, according to whether the string pointed to by *s1* is greater than, equal to, or less than the
61841 string pointed to by *s2* when both are interpreted as appropriate to the locale represented by
61842 *locale*. On error, *strcoll_l()* may set *errno*, but no return value is reserved to indicate an error.61843 **ERRORS**

61844 These functions may fail if:

61845 CX [EINVAL] The *s1* or *s2* arguments contain characters outside the domain of the collating
61846 sequence.61847 The *strcoll_l()* function may fail if:61848 CX [EINVAL] *locale* is not a valid locale object handle.61849 **EXAMPLES**61850 **Comparing Nodes**61851 The following example uses an application-defined function, *node_compare()*, to compare two
61852 nodes based on an alphabetical ordering of the *string* field.

61853 #include <string.h>

61854 ...

61855 struct node { /* These are stored in the table. */

61856 char *string;

61857 int length;

61858 };

```

61859     ...
61860     int node_compare(const void *node1, const void *node2)
61861     {
61862         return strcoll(((const struct node *)node1)->string,
61863                       ((const struct node *)node2)->string);
61864     }
61865     ...

```

APPLICATION USAGE

The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

RATIONALE

None.

FUTURE DIRECTIONS

First released in Issue 3.

Issue 5

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] optional error condition is added.

An example is added.

Issue 7

The *strcoll_1()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

61888 **NAME**

61889 stpcpy, strcpy — copy a string and return a pointer to the end of the result

61890 **SYNOPSIS**

61891 #include <string.h>

61892 CX char *stpcpy(char *restrict s1, const char *restrict s2);

61893 char *strcpy(char *restrict s1, const char *restrict s2);

61894 **DESCRIPTION**61895 CX For *stpcpy()*: The functionality described on this reference page is aligned with the ISO C
61896 standard. Any conflict between the requirements described here and the ISO C standard is
61897 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.61898 CX The *stpcpy()* and *strcpy()* functions shall copy the string pointed to by *s2* (including the
61899 terminating NUL character) into the array pointed to by *s1*.

61900 If copying takes place between objects that overlap, the behavior is undefined.

61901 **RETURN VALUE**61902 CX The *stpcpy()* function shall return a pointer to the terminating NUL character copied into the *s1*
61903 buffer.61904 The *strcpy()* function shall return *s1*.

61905 No return values are reserved to indicate an error.

61906 **ERRORS**

61907 No errors are defined.

61908 **EXAMPLES**61909 **Construction of a Multi-Part Message in a Single Buffer**

61910 #include <string.h>

61911 #include <stdio.h>

61912 int

61913 main (void)

61914 {

61915 char buffer [10];

61916 char *name = buffer;

61917 name = stpcpy (stpcpy (stpcpy (name, "ice"), "-"), "cream");

61918 puts (buffer);

61919 return 0;

61920 }

61921 **Initializing a String**61922 The following example copies the string "-----" into the *permstring* variable.

61923 #include <string.h>

61924 ...

61925 static char permstring[11];

61926 ...

61927 strcpy(permstring, "-----");

61928 ...

61929

Storing a Key and Data

61930

The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there. (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct element** *.)

61931

61932

61933

61934

```
#include <string.h>
```

61935

```
#include <stdlib.h>
```

61936

```
#include <stdio.h>
```

61937

```
...
```

61938

```
/* Structure used to read data and store it. */
```

61939

```
struct element {
```

61940

```
    char *key;
```

61941

```
    char *data;
```

61942

```
};
```

61943

```
struct element *tbl, *curtbl;
```

61944

```
char *key, *data;
```

61945

```
int count;
```

61946

```
...
```

61947

```
void dbfree(struct element *, int);
```

61948

```
...
```

61949

```
if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
```

61950

```
    perror("malloc"); dbfree(tbl, count); return NULL;
```

61951

```
}
```

61952

```
strcpy(curtbl->key, key);
```

61953

```
if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
```

61954

```
    perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
```

61955

```
}
```

61956

```
strcpy(curtbl->data, data);
```

61957

```
...
```

61958

APPLICATION USAGE

61959

Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

61960

61961

This version is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

61962

61963

RATIONALE

61964

None.

61965

FUTURE DIRECTIONS

61966

None.

CHANGE HISTORY

61971

First released in Issue 1. Derived from Issue 1 of the SVID.

61972

Issue 6

61973

The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

strcpy()61974
61975
61976**Issue 7**

The *strcpy()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

61977 **NAME**

61978 strcspn — get the length of a complementary substring

61979 **SYNOPSIS**

61980 #include <string.h>

61981 size_t strcspn(const char *s1, const char *s2);

61982 **DESCRIPTION**61983 CX The functionality described on this reference page is aligned with the ISO C standard. Any
61984 conflict between the requirements described here and the ISO C standard is unintentional. This
61985 volume of POSIX.1-200x defers to the ISO C standard.61986 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the
61987 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.61988 **RETURN VALUE**61989 The *strcspn()* function shall return the length of the computed segment of the string pointed to
61990 by *s1*; no return value is reserved to indicate an error.61991 **ERRORS**

61992 No errors are defined.

62001 **SEE ALSO**62002 [strspn\(\)](#)62003 XBD [<string.h>](#)62004 **CHANGE HISTORY**

62005 First released in Issue 1. Derived from Issue 1 of the SVID.

62006 **Issue 5**62007 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and
62008 not *s1* itself as was previously stated.62009 **Issue 6**62010 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is
62011 updated to indicate that the computed segment length is returned, not the *s1* length.

62012 **NAME**62013 `strdup`, `strndup` — duplicate a specific number of bytes from a string62014 **SYNOPSIS**

```
62015 CX      #include <string.h>
62016          char *strdup(const char *s);
62017          char *strndup(const char *s, size_t size);
```

62018 **DESCRIPTION**

62019 The `strdup()` function shall return a pointer to a new string, which is a duplicate of the string
 62020 pointed to by `s`. The returned pointer can be passed to `free()`. A null pointer is returned if the
 62021 new string cannot be created.

62022 The `strndup()` function shall be equivalent to the `strdup()` function, duplicating the provided `s` in
 62023 a new block of memory allocated as if by using `malloc()`, with the exception being that `strndup()`
 62024 copies at most `size` plus one bytes into the newly allocated memory, terminating the new string
 62025 with a NUL character. If the length of `s` is larger than `size`, only `size` bytes shall be duplicated. If
 62026 `size` is larger than the length of `s`, all bytes in `s` shall be copied into the new memory buffer,
 62027 including the terminating NUL character. The newly created string shall always be properly
 62028 terminated.

62029 **RETURN VALUE**

62030 The `strdup()` function shall return a pointer to a new string on success. Otherwise, it shall return
 62031 a null pointer and set `errno` to indicate the error.

62032 Upon successful completion, the `strndup()` function shall return a pointer to the newly allocated
 62033 memory containing the duplicated string. Otherwise, it shall return a null pointer and set `errno`
 62034 to indicate the error.

62035 **ERRORS**

62036 These functions shall fail if:

62037 [ENOMEM] Storage space available is insufficient.

62038 **EXAMPLES**

62039 None.

62040 **APPLICATION USAGE**

62041 None.

62042 **RATIONALE**

62043 None.

62044 **FUTURE DIRECTIONS**

62045 None.

62046 **SEE ALSO**62047 *free()*, *malloc()*, *wcsdup()*62048 XBD `<string.h>`62049 **CHANGE HISTORY**

62050 First released in Issue 4, Version 2.

62051

Issue 5

62052

Moved from X/OPEN UNIX extension to BASE.

62053

Issue 7

62054

Austin Group Interpretation 1003.1-2001 #044 is applied, changing the “may fail” [ENOMEM] error to become a “shall fail” error.

62055

62056

The *strdup()* function is moved from the XSI option to the Base.

62057

The *strndup()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

62058

62059 **NAME**
 62060 `strerror, strerror_l, strerror_r` — get error message string

62061 **SYNOPSIS**
 62062 `#include <string.h>`
 62063 `char *strerror(int errnum);`
 62064 CX `char *strerror_l(int errnum, locale_t locale);`
 62065 `int strerror_r(int errnum, char *strerrbuf, size_t buflen);`

62066 DESCRIPTION

62067 CX For `strerror()`: The functionality described on this reference page is aligned with the ISO C
 62068 standard. Any conflict between the requirements described here and the ISO C standard is
 62069 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

62070 The `strerror()` function shall map the error number in `errnum` to a locale-dependent error
 62071 message string and shall return a pointer to it. Typically, the values for `errnum` come from `errno`,
 62072 but `strerror()` shall map any value of type `int` to a message.

62073 The string pointed to shall not be modified by the application. The string may be overwritten by
 62074 a subsequent call to `strerror()`.

62075 CX The string may be overwritten by a subsequent call to `strerror_l()` in the same thread.

62076 The contents of the error message strings returned by `strerror()` should be determined by the
 62077 setting of the `LC_MESSAGES` category in the current locale.

62078 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 62079 `strerror()`.

62080 CX The `strerror()` and `strerror_l()` functions shall not change the setting of `errno` if successful.

62081 Since no return value is reserved to indicate an error, an application wishing to check for error
 62082 situations should set `errno` to 0, then call `strerror()`, then check `errno`.

62083 The `strerror()` function need not be thread-safe. A function that is not required to be thread-safe
 62084 is not required to be reentrant.

62085 The `strerror_l()` function shall map the error number in `errnum` to a locale-dependent error
 62086 message string in the locale represented by `locale` and shall return a pointer to it.

62087 The `strerror_r()` function shall map the error number in `errnum` to a locale-dependent error
 62088 message string and shall return the string in the buffer pointed to by `strerrbuf`, with length
 62089 `buflen`.

62090 RETURN VALUE

62091 Upon completion, whether successful or not, `strerror()` shall return a pointer to the generated
 62092 CX message string. On error `errno` may be set, but no return value is reserved to indicate an error.

62093 Upon successful completion, `strerror_l()` shall return a pointer to the generated message string. If
 62094 `errnum` is not a valid error number, `errno` may be set to [EINVAL], but a pointer to a message
 62095 string shall still be returned. If any other error occurs, `errno` shall be set to indicate the error and
 62096 a null pointer shall be returned.

62097 Upon successful completion, `strerror_r()` shall return 0. Otherwise, an error number shall be
 62098 returned to indicate the error.

62099 **ERRORS**

62100 These functions may fail if:

62101 CX [EINVAL] The value of *errnum* is not a valid error number.62102 The *strerror_l()* function may fail if:62103 CX [EINVAL] The *locale* argument is not a valid locale object handle.62104 The *strerror_r()* function may fail if:62105 CX [ERANGE] Insufficient storage was supplied via *strrdbuf* and *buflen* to contain the
62106 generated message string.62107 **EXAMPLES**

62108 None.

62109 **APPLICATION USAGE**62110 Historically in some implementations calls to *perror()* would overwrite the string that the
62111 pointer returned by *strerror()* points to. Such implementations did not conform to the ISO C
62112 standard; however, application developers should be aware of this behavior if they wish their
62113 applications to be portable to such implementations.62114 **RATIONALE**62115 The *strerror_l()* function is required to be thread-safe, thereby eliminating the need for an
62116 equivalent to the *strerror_r()* function.62117 **FUTURE DIRECTIONS**

62118 None.

62119 **SEE ALSO**62120 *perror()*

62121 XBD <string.h>

62122 **CHANGE HISTORY**

62123 First released in Issue 3.

62124 **Issue 5**62125 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

62126 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

62127 **Issue 6**

62128 Extensions beyond the ISO C standard are marked.

62129 The following new requirements on POSIX implementations derive from alignment with the
62130 Single UNIX Specification:62131 • In the RETURN VALUE section, the fact that *errno* may be set is added.

62132 • The [EINVAL] optional error condition is added.

62133 The normative text is updated to avoid use of the term “must” for application requirements.

62134 The *strerror_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.62135 The *strerror_r()* function is marked as part of the Thread-Safe Functions option.62136 **Issue 7**

62137 Austin Group Interpretation 1003.1-2001 #072 is applied, updating the ERRORS section.

62138 SD5-XSH-ERN-191 is applied, updating the APPLICATION USAGE section. +

62139 The *strerror_l()* function is added from The Open Group Technical Standard, 2006, Extended API
62140 Set Part 4.

The *strerror_r()* function is moved from the Thread-Safe Functions option to the Base.

62142 **NAME**
 62143 strfmon, strfmon_l — convert monetary value to a string

62144 **SYNOPSIS**
 62145 #include <monetary.h>
 62146 ssize_t strfmon(char *restrict s, size_t maxsize,
 62147 const char *restrict format, ...);
 62148 ssize_t strfmon_l(char *restrict s, size_t maxsize,
 62149 locale_t locale, const char *restrict format, ...);

62150 **DESCRIPTION**
 62151 The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the
 62152 string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

62153 The format is a character string, beginning and ending in its initial state, if any, that contains two
 62154 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*
 62155 *specifications*, each of which shall result in the fetching of zero or more arguments which are
 62156 converted and formatted. The results are undefined if there are insufficient arguments for the
 62157 format. If the format is exhausted while arguments remain, the excess arguments are simply
 62158 ignored.

62159 The application shall ensure that a conversion specification consists of the following sequence:

- 62160 • A '%' character
- 62161 • Optional flags
- 62162 • Optional field width
- 62163 • Optional left precision
- 62164 • Optional right precision
- 62165 • A required conversion specifier character that determines the conversion to be performed

62166 The *strfmon_l()* function shall be equivalent to the *strfmon()* function, except that the locale data
 62167 used is from the locale represented by *locale*.

62168 **Flags**

62169 One or more of the following optional flags can be specified to control the conversion:

- 62170 =*f* An '=' followed by a single character *f* which is used as the numeric fill character. In
 62171 order to work with precision or width counts, the fill character shall be a single byte
 62172 character; if not, the behavior is undefined. The default numeric fill character is the
 62173 <space>. This flag does not affect field width filling which always uses the <space>.
 62174 This flag is ignored unless a left precision (see below) is specified.
- 62175 ^ Do not format the currency amount with grouping characters. The default is to insert
 62176 the grouping characters if defined for the current locale.
- 62177 + or (Specify the style of representing positive and negative currency amounts. Only one of
 62178 '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-'
 62179 are used (for example, in the U.S., the empty string if positive and '-' if negative). If
 62180 '(' is specified, negative amounts are enclosed within parentheses. If neither flag is
 62181 specified, the '+' style is used.

- 62182 ! Suppress the currency symbol from the output conversion.
- 62183 – Specify the alignment. If this flag is present the result of the conversion is left-justified
62184 (padded to the right) rather than right-justified. This flag shall be ignored unless a field
62185 width (see below) is specified.

62186 Field Width

- 62187 *w* A decimal digit string *w* specifying a minimum field width in bytes in which the result
62188 of the conversion is right-justified (or left-justified if the flag ‘-’ is specified). The
62189 default is 0.

62190 Left Precision

- 62191 #*n* A ‘#’ followed by a decimal digit string *n* specifying a maximum number of digits
62192 expected to be formatted to the left of the radix character. This option can be used to
62193 keep the formatted output from multiple calls to the *strfmon()* function aligned in the
62194 same columns. It can also be used to fill unused positions with a special character as in
62195 "\$***123.45". This option causes an amount to be formatted as if it has the number
62196 of digits specified by *n*. If more than *n* digit positions are required, this conversion
62197 specification is ignored. Digit positions in excess of those actually required are filled
62198 with the numeric fill character (see the =*f* flag above).

62199 If grouping has not been suppressed with the ‘^’ flag, and it is defined for the current
62200 locale, grouping separators are inserted before the fill characters (if any) are added.
62201 Grouping separators are not applied to fill characters even if the fill character is a digit.

62202 To ensure alignment, any characters appearing before or after the number in the
62203 formatted output such as currency or sign symbols are padded as necessary with
62204 <space>s to make their positive and negative formats an equal length.

62205 Right Precision

- 62206 .*p* A period followed by a decimal digit string *p* specifying the number of digits after the
62207 radix character. If the value of the right precision *p* is 0, no radix character appears. If a
62208 right precision is not included, a default specified by the current locale is used. The
62209 amount being formatted is rounded to the specified number of digits prior to
62210 formatting.

62211 Conversion Specifier Characters

62212 The conversion specifier characters and their meanings are:

- 62213 *i* The **double** argument is formatted according to the locale’s international currency
62214 format (for example, in the U.S.: USD 1,234.56). If the argument is ±Inf or NaN, the
62215 result of the conversion is unspecified.
- 62216 *n* The **double** argument is formatted according to the locale’s national currency format
62217 (for example, in the U.S.: \$1,234.56). If the argument is ±Inf or NaN, the result of the
62218 conversion is unspecified.
- 62219 % Convert to a ‘%’; no argument is converted. The entire conversion specification shall
62220 be %%.

62221

Locale Information

62222

62223

62224

62225

62226

The *LC_MONETARY* category of the locale of the process affects the behavior of this function including the monetary radix character (which may be different from the numeric radix character affected by the *LC_NUMERIC* category), the grouping separator, the currency symbols, and formats. The international currency symbol should be conformant with the ISO 4217:2001 standard.

62227

If the value of *maxsize* is greater than `{SSIZE_MAX}`, the result is implementation-defined.

62228

RETURN VALUE

62229

62230

62231

62232

If the total number of resulting bytes including the terminating null byte is not more than *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*, not including the terminating NUL character. Otherwise, `-1` shall be returned, the contents of the array are unspecified, and *errno* shall be set to indicate the error.

62233

ERRORS

62234

These functions shall fail if:

62235

[E2BIG] Conversion stopped due to lack of space in the buffer.

62236

The *strfmon_l()* function may fail if:

62237

[EINVAL] *locale* is not a valid locale object.

62238

EXAMPLES

62239

62240

Given a locale for the U.S. and the values 123.45, `-123.45`, and 3456.781, the following output might be produced. Square brackets ("`[]`") are used in this example to delimit the output.

62241

`%n` [\$123.45] Default formatting

62242

[-\$123.45]

62243

[\$3,456.78]

62244

`%11n` [\$123.45] Right align within an 11-character field

62245

[-\$123.45]

62246

[\$3,456.78]

62247

`%#5n` [\$ 123.45] Aligned columns for values up to 99999

62248

[-\$ 123.45]

62249

[\$ 3,456.78]

62250

`%=*#5n` [\$***123.45] Specify a fill character

62251

[-\$***123.45]

62252

[\$*3,456.78]

62253

`%=0#5n` [\$000123.45] Fill characters do not use grouping

62254

[-\$000123.45] even if the fill character is a digit

62255

[\$03,456.78]

62256

`%^#5n` [\$ 123.45] Disable the grouping separator

62257

[-\$ 123.45]

62258

[\$ 3456.78]

62259

`%^#5.0n` [\$ 123] Round off to whole units

62260

[-\$ 123]

62261

[\$ 3457]

62262

`%^#5.4n` [\$ 123.4500] Increase the precision

62263

[-\$ 123.4500]

62264

[\$ 3456.7810]

62265

`%(#5n` [\$ 123.45] Use an alternative pos/neg style

62266

[(\$ 123.45)]

62267 [\$ 3,456.78]

62268 %!(#5n [123.45] Disable the currency symbol

62269 [(123.45)

62270 [3,456.78]

62271 %-14#5.4n [\$ 123.4500] Left-justify the output

62272 [-\$ 123.4500]

62273 [\$ 3,456.7810]

62274 %14#5.4n [\$ 123.4500] Corresponding right-justified output

62275 [-\$ 123.4500]

62276 [\$ 3,456.7810]

62277 See also the EXAMPLES section in *fprintf()*.

62278 APPLICATION USAGE

62279 None.

62280 RATIONALE

62281 None.

62282 FUTURE DIRECTIONS

62283 Lowercase conversion characters are reserved for future standards use and uppercase for
62284 implementation-defined use.

62288 CHANGE HISTORY

62289 First released in Issue 4.

62290 Issue 5

62291 Moved from ENHANCED I18N to BASE.

62292 The [ENOSYS] error is removed.

62293 A sentence is added to the DESCRIPTION warning about values of *maxsize* that are greater than
62294 {SSIZE_MAX}.

62295 Issue 6

62296 The normative text is updated to avoid use of the term “must” for application requirements.

62297 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the
62298 ISO/IEC 9899:1999 standard.

62299 The EXAMPLES section is reworked, clarifying the output format.

62300 Issue 7

62301 SD5-XSH-ERN-29 is applied, updating the examples for %(#5n and %!(#5n.

62302 The *strfmon()* function is moved from the XSI option to the Base.

62303 The *strfmon_l()* function is added from The Open Group Technical Standard, 2006, Extended API
62304 Set Part 4.

62305 **NAME**
 62306 `strptime, strptime_l` — convert date and time to a string

62307 **SYNOPSIS**

```
62308 #include <time.h>
62309
62310 size_t strptime(char *restrict s, size_t maxsize,
62311               const char *restrict format, const struct tm *restrict timeptr);
CX 62311 size_t strptime_l(char *restrict s, size_t maxsize,
62312                 const char *restrict format, const struct tm *restrict timeptr,
62313                 locale_t locale);
```

62314 **DESCRIPTION**

62315 CX For `strptime()`: The functionality described on this reference page is aligned with the ISO C
 62316 standard. Any conflict between the requirements described here and the ISO C standard is
 62317 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

62318 The `strptime()` function shall place bytes into the array pointed to by `s` as controlled by the string
 62319 pointed to by `format`. The format is a character string, beginning and ending in its initial shift
 62320 state, if any. The `format` string consists of zero or more conversion specifications and ordinary
 62321 characters. A conversion specification consists of a '%' character, possibly followed by an `E` or `O`
 62322 modifier, and a terminating conversion specifier character that determines the conversion
 62323 specification's behavior. All ordinary characters (including the terminating NUL character) are
 62324 copied unchanged into the array. If copying takes place between objects that overlap, the
 62325 behavior is undefined. No more than `maxsize` bytes are placed into the array. Each conversion
 62326 specifier is replaced by appropriate characters as described in the following list. The appropriate
 62327 characters are determined using the `LC_TIME` category of the current locale and by the values of
 62328 zero or more members of the broken-down time structure pointed to by `timeptr`, as specified in
 62329 brackets in the description. If any of the specified values are outside the normal range, the
 62330 characters stored are unspecified.

62331 CX The `strptime_l()` function shall be equivalent to the `strptime()` function, except that the locale data
 62332 used is from the locale represented by `locale`.

62333 Local timezone information is used as though `strptime()` called `tzset()`.

62334 The following conversion specifications are supported:

62335	%a	Replaced by the locale's abbreviated weekday name. [<code>tm_wday</code>]
62336	%A	Replaced by the locale's full weekday name. [<code>tm_wday</code>]
62337	%b	Replaced by the locale's abbreviated month name. [<code>tm_mon</code>]
62338	%B	Replaced by the locale's full month name. [<code>tm_mon</code>]
62339	%c	Replaced by the locale's appropriate date and time representation. (See the Base 62340 Definitions volume of POSIX.1-200x, <time.h> .)
62341	%C	Replaced by the year divided by 100 and truncated to an integer, as a decimal number 62342 [00,99]. [<code>tm_year</code>]
62343	%d	Replaced by the day of the month as a decimal number [01,31]. [<code>tm_mday</code>]
62344	%D	Equivalent to %m/%d/%y. [<code>tm_mon, tm_mday, tm_year</code>]
62345	%e	Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded 62346 by a space. [<code>tm_mday</code>]

strftime()*System Interfaces*

62347		%F	Equivalent to %Y-%m-%d (the ISO 8601:2000 standard date format). [<i>tm_year</i> , <i>tm_mon</i> , <i>tm_mday</i>]
62348			
62349		%g	Replaced by the last 2 digits of the week-based year (see below) as a decimal number [00,99]. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
62350			
62351		%G	Replaced by the week-based year (see below) as a decimal number (for example, 1977). [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
62352			
62353		%h	Equivalent to %b. [<i>tm_mon</i>]
62354		%H	Replaced by the hour (24-hour clock) as a decimal number [00,23]. [<i>tm_hour</i>]
62355		%I	Replaced by the hour (12-hour clock) as a decimal number [01,12]. [<i>tm_hour</i>]
62356		%j	Replaced by the day of the year as a decimal number [001,366]. [<i>tm_yday</i>]
62357		%m	Replaced by the month as a decimal number [01,12]. [<i>tm_mon</i>]
62358		%M	Replaced by the minute as a decimal number [00,59]. [<i>tm_min</i>]
62359		%n	Replaced by a <newline>.
62360		%p	Replaced by the locale's equivalent of either a.m. or p.m. [<i>tm_hour</i>]
62361	CX	%r	Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be equivalent to %I:%M:%S %p. [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
62362			
62363		%R	Replaced by the time in 24-hour notation (%H:%M). [<i>tm_hour</i> , <i>tm_min</i>]
62364		%S	Replaced by the second as a decimal number [00,60]. [<i>tm_sec</i>]
62365		%t	Replaced by a <tab>.
62366		%T	Replaced by the time (%H:%M:%S). [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
62367		%u	Replaced by the weekday as a decimal number [1,7], with 1 representing Monday. [<i>tm_wday</i>]
62368			
62369		%U	Replaced by the week number of the year as a decimal number [00,53]. The first Sunday of January is the first day of week 1; days in the new year before this are in week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
62370			
62371			
62372		%V	Replaced by the week number of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1. Both January 4th and the first Thursday of January are always in week 1. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
62373			
62374			
62375			
62376			
62377		%w	Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday. [<i>tm_wday</i>]
62378			
62379		%W	Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
62380			
62381			
62382		%x	Replaced by the locale's appropriate date representation. (See the Base Definitions volume of POSIX.1-200x, <time.h>.)
62383			
62384		%X	Replaced by the locale's appropriate time representation. (See the Base Definitions volume of POSIX.1-200x, <time.h>.)
62385			
62386		%y	Replaced by the last two digits of the year as a decimal number [00,99]. [<i>tm_year</i>]

62387	%Y	Replaced by the year as a decimal number (for example, 1997). [<i>tm_year</i>]
62388	%z	Replaced by the offset from UTC in the ISO 8601:2000 standard format (+hhmm or -hhmm), or by no characters if no timezone is determinable. For example, "-0430"
62389		means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the
62390	CX	standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time
62391		offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [<i>tm_isdst</i>]
62392		
62393	%Z	Replaced by the timezone name or abbreviation, or by no bytes if no timezone
62394		information exists. [<i>tm_isdst</i>]
62395	%%	Replaced by %.
62396		If a conversion specification does not correspond to any of the above, the behavior is undefined.
62397	CX	If a struct tm broken-down time structure is created by <i>localtime()</i> or <i>localtime_r()</i> , or modified
62398		by <i>mktime()</i> , and the value of <i>TZ</i> is subsequently modified, the results of the %Z and %z
62399		<i>strptime()</i> conversion specifiers are undefined, when <i>strptime()</i> is called with such a broken-down
62400		time structure.
62401		If a struct tm broken-down time structure is created or modified by <i>gmtime()</i> or <i>gmtime_r()</i> , it is
62402		unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the
62403		current local timezone, when <i>strptime()</i> is called with such a broken-down time structure.

62404 Modified Conversion Specifiers

62405 Some conversion specifiers can be modified by the E or O modifier characters to indicate that an
 62406 alternative format or specification should be used rather than the one normally used by the
 62407 unmodified conversion specifier. If the alternative format or specification does not exist for the
 62408 current locale (see ERA in XBD Section 7.3.5, on page 144), the behavior shall be as if the
 62409 unmodified conversion specification were used.

62410	%EC	Replaced by the locale's alternative appropriate date and time representation.
62411	%EC	Replaced by the name of the base year (period) in the locale's alternative
62412		representation.
62413	%Ex	Replaced by the locale's alternative date representation.
62414	%EX	Replaced by the locale's alternative time representation.
62415	%EY	Replaced by the offset from %EC (year only) in the locale's alternative representation.
62416	%EY	Replaced by the full alternative year representation.
62417	%Od	Replaced by the day of the month, using the locale's alternative numeric symbols, filled
62418		as needed with leading zeros if there is any alternative symbol for zero; otherwise, with
62419		leading spaces.
62420	%Oe	Replaced by the day of the month, using the locale's alternative numeric symbols, filled
62421		as needed with leading spaces.
62422	%OH	Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.
62423	%OI	Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.
62424	%Om	Replaced by the month using the locale's alternative numeric symbols.
62425	%OM	Replaced by the minutes using the locale's alternative numeric symbols.
62426	%OS	Replaced by the seconds using the locale's alternative numeric symbols.
62427	%Ou	Replaced by the weekday as a number in the locale's alternative representation
62428		(Monday=1).

strftime()

62429 %OU Replaced by the week number of the year (Sunday as the first day of the week, rules
62430 corresponding to %U) using the locale's alternative numeric symbols.

62431 %OV Replaced by the week number of the year (Monday as the first day of the week, rules
62432 corresponding to %V) using the locale's alternative numeric symbols.

62433 %Ow Replaced by the number of the weekday (Sunday=0) using the locale's alternative
62434 numeric symbols.

62435 %OW Replaced by the week number of the year (Monday as the first day of the week) using
62436 the locale's alternative numeric symbols.

62437 %Oy Replaced by the year (offset from %C) using the locale's alternative numeric symbols.

62438 %g, %G, and %V give values according to the ISO 8601:2000 standard week-based year. In this
62439 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,
62440 which is also the week that includes the first Thursday of the year, and is also the first week that
62441 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the
62442 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January
62443 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a
62444 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday
62445 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

62446 If a conversion specifier is not one of the above, the behavior is undefined.

RETURN VALUE

62447 If the total number of resulting bytes including the terminating null byte is not more than
62448 *maxsize*, these functions shall return the number of bytes placed into the array pointed to by *s*,
62449 not including the terminating NUL character. Otherwise, 0 shall be returned and the contents of
62450 the array are unspecified.

ERRORS

62451 The *strftime_l()* function may fail if:

62452 CX [EINVAL] *locale* is not a valid locale object handle.

EXAMPLES**Getting a Localized Date String**

62454 The following example first sets the locale to the user's default. The locale information will be
62455 used in the *nl_langinfo()* and *strftime()* functions. The *nl_langinfo()* function returns the localized
62456 date string which specifies how the date is laid out. The *strftime()* function takes this
62457 information and, using the **tm** structure for values, places the date and time information into
62458 *datestring*.

```
62462            #include <time.h>
62463            #include <locale.h>
62464            #include <langinfo.h>
62465            ...
62466            struct tm *tm;
62467            char datestring[256];
62468            ...
62469            setlocale (LC_ALL, "");
62470            ...
62471            strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
62472            ...
```

APPLICATION USAGE

The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

Some of the conversion specifications are duplicates of others. They are included for compatibility with *nl_cxtime()* and *nl_ascxtime()*, which were published in Issue 2.

Applications should use %Y (4-digit years) in preference to %y (2-digit years).

In the C locale, the E and O modifiers are ignored and the replacement strings for the following specifiers are:

%a	The first three characters of %A.
%A	One of Sunday, Monday, . . . , Saturday.
%b	The first three characters of %B.
%B	One of January, February, . . . , December.
%c	Equivalent to %a %b %e %T %Y.
%p	One of AM or PM.
%r	Equivalent to %I:%M:%S %p.
%x	Equivalent to %m/%d/%y.
%X	Equivalent to %T.
%Z	Implementation-defined.

RATIONALE

None.

FUTURE DIRECTIONS

None.

XBD Section 7.3.5 (on page 144), [<time.h>](#)

CHANGE HISTORY

First released in Issue 3.

Issue 5

The description of %OV is changed to be consistent with %V and defines Monday as the first day of the week.

The description of %Oy is clarified.

Issue 6

Extensions beyond the ISO C standard are marked.

The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from “Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is the last week of the previous year, and the next week is week 1”.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard *date* utility.

62514

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

62515

- The *strftime()* prototype is updated.

62516

- The DESCRIPTION is extensively revised.

62517

- The %z conversion specifier is added.

62518

A new example is added.

62519

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.

62520

Issue 7

62521

The *strftime_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

62522

62523 **NAME**
 62524 `strlen`, `strnlen` — get length of fixed size string

62525 **SYNOPSIS**

62526 `#include <string.h>`
 62527 `size_t strlen(const char *s);`
 62528 CX `size_t strnlen(const char *s, size_t maxlen);`

62529 **DESCRIPTION**

62530 CX For `strlen()`: The functionality described on this reference page is aligned with the ISO C
 62531 standard. Any conflict between the requirements described here and the ISO C standard is
 62532 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

62533 The `strlen()` function shall compute the number of bytes in the string to which `s` points, not
 62534 including the terminating NUL character.

62535 CX The `strnlen()` function shall compute the smaller of the number of bytes in the array to which `s`
 62536 points, not including the terminating NUL character, or the value of the `maxlen` argument. The
 62537 `strnlen()` function shall never examine more than `maxlen` bytes of the array pointed to by `s`.

62538 **RETURN VALUE**

62539 The `strlen()` function shall return the length of `s`; no return value shall be reserved to indicate an
 62540 error.

62541 CX The `strnlen()` function shall return an integer containing the smaller of either the length of the
 62542 string pointed to by `s` or `maxlen`.

62543 **ERRORS**

62544 No errors are defined.

62545 **EXAMPLES**

62546 **Getting String Lengths**

62547 The following example sets the maximum length of `key` and `data` by using `strlen()` to get the
 62548 lengths of those strings.

```
62549 #include <string.h>
62550 ...
62551 struct element {
62552     char *key;
62553     char *data;
62554 };
62555 ...
62556 char *key, *data;
62557 int len;

62558 *keylength = *datalength = 0;
62559 ...
62560 if ((len = strlen(key)) > *keylength)
62561     *keylength = len;
62562 if ((len = strlen(data)) > *datalength)
62563     *datalength = len;
62564 ...
```

strlen()62565 **APPLICATION USAGE**

62566 None.

62567 **RATIONALE**

62568 None.

62569 **FUTURE DIRECTIONS**

62570 None.

62571 **SEE ALSO**62572 *wcslen()*62573 XBD <**string.h**>62574 **CHANGE HISTORY**

62575 First released in Issue 1. Derived from Issue 1 of the SVID.

62576 **Issue 5**62577 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not
62578 *s* itself as was previously stated.62579 **Issue 7**62580 The *strlen()* function is added from The Open Group Technical Standard, 2006, Extended API
62581 Set Part 1.

DRAFT

62582 **NAME**
62583 `strncasecmp, strncasecmp_l` — case-insensitive string comparisons

62584 **SYNOPSIS**
62585 `#include <strings.h>`
62586 `int strncasecmp(const char *s1, const char *s2, size_t n);`
62587 `int strncasecmp_l(const char *s1, const char *s2,`
62588 `size_t n, locale_t locale);`

62589 **DESCRIPTION**
62590 Refer to *strcasecmp()*.

62591 **NAME**
 62592 `strncat` — concatenate a string with part of another

62593 **SYNOPSIS**
 62594 `#include <string.h>`

62595 `char *strncat(char *restrict s1, const char *restrict s2, size_t n);`

62596 **DESCRIPTION**

62597 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 62598 conflict between the requirements described here and the ISO C standard is unintentional. This
 62599 volume of POSIX.1-200x defers to the ISO C standard.

62600 The `strncat()` function shall append not more than *n* bytes (a NUL character and bytes that
 62601 follow it are not appended) from the array pointed to by *s2* to the end of the string pointed to by
 62602 *s1*. The initial byte of *s2* overwrites the NUL character at the end of *s1*. A terminating NUL
 62603 character is always appended to the result. If copying takes place between objects that overlap,
 62604 the behavior is undefined.

62605 **RETURN VALUE**

62606 The `strncat()` function shall return *s1*; no return value shall be reserved to indicate an error.

62607 **ERRORS**

62608 No errors are defined.

62609 **EXAMPLES**

62610 None.

62611 **APPLICATION USAGE**

62612 None.

62613 **RATIONALE**

62614 None.

62615 **FUTURE DIRECTIONS**

62616 None.

62617 **SEE ALSO**

62618 [strcat\(\)](#)

62619 XBD [<string.h>](#)

62620 **CHANGE HISTORY**

62621 First released in Issue 1. Derived from Issue 1 of the SVID.

62622 **Issue 6**

62623 The `strncat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

62624 **NAME**
 62625 `strncmp` — compare part of two strings

62626 **SYNOPSIS**
 62627 `#include <string.h>`
 62628 `int strncmp(const char *s1, const char *s2, size_t n);`

62629 **DESCRIPTION**
 62630 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 62631 conflict between the requirements described here and the ISO C standard is unintentional. This
 62632 volume of POSIX.1-200x defers to the ISO C standard.

62633 The `strncmp()` function shall compare not more than *n* bytes (bytes that follow a NUL character
 62634 are not compared) from the array pointed to by *s1* to the array pointed to by *s2*.

62635 The sign of a non-zero return value is determined by the sign of the difference between the
 62636 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
 62637 being compared.

62638 **RETURN VALUE**
 62639 Upon successful completion, `strncmp()` shall return an integer greater than, equal to, or less than
 62640 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the
 62641 possibly null-terminated array pointed to by *s2* respectively.

62642 **ERRORS**
 62643 No errors are defined.

62644 **EXAMPLES**
 62645 None.

62646 **APPLICATION USAGE**
 62647 None.

62648 **RATIONALE**
 62649 None.

62650 **FUTURE DIRECTIONS**
 62651 None.

62652 **SEE ALSO**

 62654 XBD [<string.h>](#)

62655 **CHANGE HISTORY**
 62656 First released in Issue 1. Derived from Issue 1 of the SVID.

62657 **Issue 6**
 62658 Extensions beyond the ISO C standard are marked.

62659 **NAME**

62660 stpncpy, strncpy — copy fixed length string, returning a pointer to the array end

62661 **SYNOPSIS**

62662 #include <string.h>

62663 CX `char *stpncpy(char *restrict s1, const char *restrict s2, size_t n);`62664 `char *strncpy(char *restrict s1, const char *restrict s2, size_t n);`62665 **DESCRIPTION**62666 CX For *strncpy()*: The functionality described on this reference page is aligned with the ISO C
62667 standard. Any conflict between the requirements described here and the ISO C standard is
62668 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.62669 CX The *stpncpy()* and *strncpy()* functions shall copy not more than *n* bytes (bytes that follow a NUL
62670 character are not copied) from the array pointed to by *s2* to the array pointed to by *s1*.62671 If the array pointed to by *s2* is a string that is shorter than *n* bytes, NUL characters shall be
62672 appended to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

62673 If copying takes place between objects that overlap, the behavior is undefined.

62674 **RETURN VALUE**62675 CX If a NUL character is written to the destination, the *stpncpy()* function shall return the address of
62676 the first such NUL character. Otherwise, it shall return $\&s2[n]$.62677 The *strncpy()* function shall return *s1*.

62678 No return values are reserved to indicate an error.

62679 **ERRORS**

62680 No errors are defined.

62681 **EXAMPLES**

62682 None.

62683 **APPLICATION USAGE**62684 Applications must provide the space in *s1* for the *n* bytes to be transferred, as well as ensure that
62685 the *s2* and *s1* arrays do not overlap.62686 Character movement is performed differently in different implementations. Thus, overlapping
62687 moves may yield surprises.62688 If there is no NUL character byte in the first *n* bytes of the array pointed to by *s2*, the result is not
62689 null-terminated.62690 **RATIONALE**

62691 None.

62692 **FUTURE DIRECTIONS**

62693 None.

62694 **SEE ALSO**62695 *strcpy()*, *wcsncpy()*

CHANGE HISTORY

62698

First released in Issue 1. Derived from Issue 1 of the SVID.

62699

Issue 6

62700

The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

62701

Issue 7

62702

The *stpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

62703

strndup()

62704 **NAME**
62705 `strndup` — duplicate a specific number of bytes from a string

SYNOPSIS

62706 CX `#include <string.h>`
62707 `char *strndup(const char *s, size_t size);`

DESCRIPTION

62709 Refer to *strdup()*.
62710

62711 **NAME**
62712 `strnlen` — get length of fixed size string

62713 **SYNOPSIS**

62714 CX `#include <string.h>`
62715 `size_t strnlen(const char *s, size_t maxlen);`

62716 **DESCRIPTION**

62717 Refer to *strlen()*.

62718 **NAME**
 62719 `strpbrk` — scan a string for a byte

62720 **SYNOPSIS**
 62721 `#include <string.h>`
 62722 `char *strpbrk(const char *s1, const char *s2);`

62723 **DESCRIPTION**
 62724 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 62725 conflict between the requirements described here and the ISO C standard is unintentional. This
 62726 volume of POSIX.1-200x defers to the ISO C standard.

62727 The `strpbrk()` function shall locate the first occurrence in the string pointed to by `s1` of any byte
 62728 from the string pointed to by `s2`.

62729 **RETURN VALUE**
 62730 Upon successful completion, `strpbrk()` shall return a pointer to the byte or a null pointer if no
 62731 byte from `s2` occurs in `s1`.

62732 **ERRORS**
 62733 No errors are defined.

62734 **EXAMPLES**
 62735 None.

62736 **APPLICATION USAGE**
 62737 None.

62738 **RATIONALE**
 62739 None.

62740 **FUTURE DIRECTIONS**
 62741 None.

62742 **SEE ALSO**
 62743 [*strchr\(\)*](#), [*strrchr\(\)*](#)

62744 XBD [*<string.h>*](#)

62745 **CHANGE HISTORY**
 62746 First released in Issue 1. Derived from Issue 1 of the SVID.

62747 **NAME**

62748 strptime — date and time conversion

62749 **SYNOPSIS**

```
62750 XSI #include <time.h>
62751 char *strptime(const char *restrict buf, const char *restrict format,
62752 struct tm *restrict tm);
```

62753 **DESCRIPTION**

62754 The *strptime()* function shall convert the character string pointed to by *buf* to values which are
62755 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

62756 The *format* is composed of zero or more directives. Each directive is composed of one of the
62757 following: one or more white-space characters (as specified by *isspace()*); an ordinary character
62758 (neither '%' nor a white-space character); or a conversion specification. Each conversion
62759 specification is composed of a '%' character followed by a conversion character which specifies
62760 the replacement required. The conversions are determined using the *LC_TIME* category of the
62761 current locale. The application shall ensure that there is white-space or other non-alphanumeric
62762 characters between any two conversion specifications. In the following list, where numeric
62763 ranges of values are given (represented by the pattern [*x*,*y*]), the value shall fall within the
62764 range given (both bounds being inclusive), and the number of characters scanned (excluding the
62765 one matching the next directive) shall be no more than the maximum number required to
62766 represent any value in the range without leading zeros. The following conversion specifications
62767 are supported:

62768	%a	The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.
62769		
62770	%A	Equivalent to %a.
62771	%b	The month, using the locale's month names; either the abbreviated or full name may be specified.
62772		
62773	%B	Equivalent to %b.
62774	%c	Replaced by the locale's appropriate date and time representation.
62775	%C	The century number [00,99]; leading zeros shall be permitted but shall not be required.
62776	%d	The day of the month [01,31]; leading zeros shall be permitted but shall not be required.
62777	%D	The date as %m/%d/%y.
62778	%e	Equivalent to %d.
62779	%h	Equivalent to %b.
62780	%H	The hour (24-hour clock) [00,23]; leading zeros shall be permitted but shall not be required.
62781		
62782	%I	The hour (12-hour clock) [01,12]; leading zeros shall be permitted but shall not be required.
62783		
62784	%j	The day number of the year [001,366]; leading zeros shall be permitted but shall not be required.
62785		
62786	%m	The month number [01,12]; leading zeros shall be permitted but shall not be required.

62787	%M	The minute [00,59]; leading zeros shall be permitted but shall not be required.
62788	%n	Any white space.
62789	%p	The locale's equivalent of a.m. or p.m.
62790	%r	12-hour clock time using the AM/PM notation if t_fmt_ampm is not an empty string in the <i>LC_TIME</i> portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
62791		
62792		
62793	%R	The time as %H:%M.
62794	%S	The seconds [00,60]; leading zeros shall be permitted but shall not be required.
62795	%t	Any white space.
62796	%T	The time as %H:%M:%S.
62797	%U	The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
62798		
62799	%w	The weekday as a decimal number [0,6], with 0 representing Sunday.
62800	%W	The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros shall be permitted but shall not be required.
62801		
62802	%x	The date, using the locale's date format.
62803	%X	The time, using the locale's time format.
62804	%y	The year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required.
62805		
62806		
62807		
62808	Note:	It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
62809		
62810		
62811	%Y	The year, including the century (for example, 1988); leading zeros shall be permitted but shall not be required.
62812		
62813	%%	Replaced by %.

Modified Conversion Specifiers

Some conversion specifiers can be modified by the **E** and **O** modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist in the current locale, the behavior shall be as if the unmodified conversion specification were used.

62819	%Ec	The locale's alternative appropriate date and time representation.
62820	%EC	The name of the base year (period) in the locale's alternative representation.
62821	%Ex	The locale's alternative date representation.
62822	%EX	The locale's alternative time representation.
62823	%Ey	The offset from %EC (year only) in the locale's alternative representation.
62824	%EY	The full alternative year representation.
62825	%Od	The day of the month using the locale's alternative numeric symbols; leading zeros shall be permitted but shall not be required.
62826		

62827	%Oe	Equivalent to %Od.
62828	%OH	The hour (24-hour clock) using the locale's alternative numeric symbols.
62829	%OI	The hour (12-hour clock) using the locale's alternative numeric symbols.
62830	%Om	The month using the locale's alternative numeric symbols.
62831	%OM	The minutes using the locale's alternative numeric symbols.
62832	%OS	The seconds using the locale's alternative numeric symbols.
62833	%OU	The week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.
62834		
62835	%Ow	The number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
62836		
62837	%OW	The week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
62838		
62839	%Oy	The year (offset from %C) using the locale's alternative numeric symbols.
62840		A conversion specification composed of white-space characters is executed by scanning input up to the first character that is not white-space (which remains unscanned), or until no more characters can be scanned.
62841		
62842		
62843		A conversion specification that is an ordinary character is executed by scanning the next character from the buffer. If the character scanned from the buffer differs from the one comprising the directive, the directive fails, and the differing and subsequent characters remain unscanned.
62844		
62845		
62846		
62847		A series of conversion specifications composed of %n, %t, white-space characters, or any combination is executed by scanning up to the first character that is not white space (which remains unscanned), or until no more characters can be scanned.
62848		
62849		
62850		Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the appropriate tm structure members are set to values corresponding to the locale information. Case is ignored when matching items in <i>buf</i> such as month or weekday names. If no match is found, <i>strptime()</i> fails and no more characters are scanned.
62851		
62852		
62853		
62854		
62855		
62856		

RETURN VALUE

62857
62858 Upon successful completion, *strptime()* shall return a pointer to the character following the last
62859 character parsed. Otherwise, a null pointer shall be returned.

ERRORS

62860
62861 No errors are defined.

EXAMPLES**Convert a Data-Plus-Time String to Broken-Down Time and Then into Seconds**

62863
62864 The following example demonstrates the use of *strptime()* to convert a string into broken-down
62865 time. The broken-down time is then converted into seconds since the Epoch using *mktime()*.

```
62866 #include <time.h>
62867 ...
62868 struct tm tm;
62869 time_t t;
```

```

62870     if (strptime("6 Dec 2001 12:33:45", "%d %b %Y %H:%M:%S", &tm) == NULL)
62871         /* Handle error */;

62872     printf("year: %d; month: %d; day: %d;\n",
62873           tm.tm_year, tm.tm_mon, tm.tm_mday);
62874     printf("hour: %d; minute: %d; second: %d\n",
62875           tm.tm_hour, tm.tm_min, tm.tm_sec);
62876     printf("week day: %d; year day: %d\n", tm.tm_wday, tm.tm_yday);

62877     tm.tm_isdst = -1;      /* Not set by strptime(); tells mktime()
62878                           to determine whether daylight saving time
62879                           is in effect */

62880     t = mktime(&tm);
62881     if (t == -1)
62882         /* Handle error */;
62883     printf("seconds since the Epoch: %ld\n", (long) t);"

```

APPLICATION USAGE

Several “equivalent to” formats and the special processing of white-space characters are provided in order to ease the use of identical *format* strings for *strptime()* and *strptime()*.

Applications should use %Y (4-digit years including century) in preference to %y (2-digit years).

It is unspecified whether multiple calls to *strptime()* using the same **tm** structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to *strptime()* with a format and all data needed to completely specify the date and time being converted.

RATIONALE

None.

FUTURE DIRECTIONS

The *strptime()* function is expected to be mandatory in the next version of this volume of POSIX.1-200x.

SEE ALSO

fscanf(), *strptime()*, *time*

XBD <[time.h](#)>

CHANGE HISTORY

First released in Issue 4.

Issue 5

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

The exact meaning of the %y and %Oy specifiers is clarified in the DESCRIPTION.

Issue 6

The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.

The normative text is updated to avoid use of the term “must” for application requirements.

The **restrict** keyword is added to the *strptime()* prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/2 is applied.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” for consistency with *strptime()*.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/133 is applied, adding the example to the

62915

EXAMPLES section.

62916

Issue 7

62917

SD5-XSH-ERN-67 is applied, correcting the APPLICATION USAGE to remove the impression that %Y is 4-digit years.

62918

62919

Austin Group Interpretation 1003.1-2001 #041 is applied, updating the DESCRIPTION and APPLICATION USAGE sections.

62920

62921 **NAME**
 62922 `strrchr` — string scanning operation

62923 **SYNOPSIS**
 62924 `#include <string.h>`
 62925 `char *strrchr(const char *s, int c);`

62926 **DESCRIPTION**
 62927 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 62928 conflict between the requirements described here and the ISO C standard is unintentional. This
 62929 volume of POSIX.1-200x defers to the ISO C standard.

62930 The `strrchr()` function shall locate the last occurrence of `c` (converted to a **char**) in the string
 62931 pointed to by `s`. The terminating NUL character is considered to be part of the string.

62932 **RETURN VALUE**
 62933 Upon successful completion, `strrchr()` shall return a pointer to the byte or a null pointer if `c` does
 62934 not occur in the string.

62935 **ERRORS**
 62936 No errors are defined.

62937 **EXAMPLES**

62938 **Finding the Base Name of a File**

62939 The following example uses `strrchr()` to get a pointer to the base name of a file. The `strrchr()`
 62940 function searches backwards through the name of the file to find the last `'/'` character in `name`.
 62941 This pointer (plus one) will point to the base name of the file.

```
62942 #include <string.h>
62943 ...
62944 const char *name;
62945 char *basename;
62946 ...
62947 basename = strrchr(name, '/') + 1;
62948 ...
```

62949 **APPLICATION USAGE**
 62950 None.

62951 **RATIONALE**
 62952 None.

62953 **FUTURE DIRECTIONS**
 62954 None.

62955 **SEE ALSO**
 62956 [strchr\(\)](#)
 62957 XBD [<string.h>](#)

62958 **CHANGE HISTORY**
 62959 First released in Issue 1. Derived from Issue 1 of the SVID.

62960 **NAME**

62961 strsignal — get name of signal

62962 **SYNOPSIS**

```
62963 CX #include <string.h>
62964 char *strsignal(int signum);
```

62965 **DESCRIPTION**

62966 The *strsignal()* function shall map the signal number in *signum* to an implementation-defined
 62967 string and shall return a pointer to it. It shall use the same set of messages as the *psignal()*
 62968 function.

62969 The string pointed to shall not be modified by the application, but may be overwritten by a
 62970 subsequent call to *strsignal()* or *setlocale()*.

62971 The contents of the message strings returned by *strsignal()* should be determined by the setting
 62972 of the *LC_MESSAGES* category in the current locale.

62973 The implementation shall behave as if no function defined in this standard calls *strsignal()*.

62974 Since no return value is reserved to indicate an error, an application wishing to check for error
 62975 situations should set *errno* to 0, then call *strsignal()*, then check *errno*.

62976 The *strsignal()* function need not be reentrant. A function that is not required to be reentrant is
 62977 not required to be thread-safe.

62978 **RETURN VALUE**

62979 Upon successful completion, *strsignal()* shall return a pointer to a string. Otherwise, if *signum* is
 62980 not a valid signal number, the return value is unspecified.

62981 **ERRORS**

62982 No errors are defined.

62983 **EXAMPLES**

62984 None.

62985 **APPLICATION USAGE**

62986 None.

62987 **RATIONALE**

62988 If *signum* is not a valid signal number, some implementations return NULL, while for others the
 62989 *strsignal()* function returns a pointer to a string containing an unspecified message denoting an
 62990 unknown signal. POSIX.1-200x leaves this return value unspecified.

62991 **FUTURE DIRECTIONS**

62992 None.

62993 **SEE ALSO**

62994 *psiginfo()*, *setlocale()*

63064 SYNOPSIS

63065 #include <stdlib.h>

63066 double strtod(const char *restrict *nptr*, char **restrict *endptr*);63067 float strtodf(const char *restrict *nptr*, char **restrict *endptr*);63068 long double strtold(const char *restrict *nptr*, char **restrict *endptr*);

63069 DESCRIPTION

63070 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63071 conflict between the requirements described here and the ISO C standard is unintentional. This
 63072 volume of POSIX.1-200x defers to the ISO C standard.

63073 These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**,
 63074 and **long double** representation, respectively. First, they decompose the input string into three
 63075 parts:

- 63076 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 63077 2. A subject sequence interpreted as a floating-point constant or representing infinity or
 63078 NaN
- 63079 3. A final string of one or more unrecognized characters, including the terminating NUL
 63080 character of the input string

63081 Then they shall attempt to convert the subject sequence to a floating-point number, and return
 63082 the result.

63083 The expected form of the subject sequence is an optional plus or minus sign, then one of the
 63084 following:

- 63085 • A non-empty sequence of decimal digits optionally containing a radix character; then an
 63086 optional exponent part consisting of the character 'e' or the character 'E', optionally
 63087 followed by a '+' or '-' character, and then followed by one or more decimal digits
- 63088 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix
 63089 character; then an optional binary exponent part consisting of the character 'p' or the
 63090 character 'P', optionally followed by a '+' or '-' character, and then followed by one or
 63091 more decimal digits
- 63092 • One of INF or INFINITY, ignoring case
- 63093 • One of NAN or NAN(*n-char-sequence_{opt}*), ignoring case in the NAN part, where:

```
63094 n-char-sequence :
63095     digit
63096     nondigit
63097     n-char-sequence digit
63098     n-char-sequence nondigit
```

63099 The subject sequence is defined as the longest initial subsequence of the input string, starting
 63100 with the first non-white-space character, that is of the expected form. The subject sequence
 63101 contains no characters if the input string is not of the expected form.

63102 If the subject sequence has the expected form for a floating-point number, the sequence of
 63103 characters starting with the first digit or the decimal-point character (whichever occurs first)
 63104 shall be interpreted as a floating constant of the C language, except that the radix character shall
 63105 be used in place of a period, and that if neither an exponent part nor a radix character appears in

63106 a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal
 63107 floating-point number, an exponent part of the appropriate type with value zero is assumed to
 63108 follow the last digit in the string. If the subject sequence begins with a minus sign, the sequence
 63109 shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an
 63110 infinity, if representable in the return type, else as if it were a floating constant that is too large
 63111 for the range of the return type. A character sequence NAN or NAN(*n-char-sequence_{opt}*) shall be
 63112 interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence
 63113 part that does not have the expected form; the meaning of the *n-char* sequences is
 63114 implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*,
 63115 provided that *endptr* is not a null pointer.

63116 If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value
 63117 resulting from the conversion is correctly rounded.

63118 CX The radix character is defined in the locale of the process (category *LC_NUMERIC*). In the
 63119 POSIX locale, or in a locale where the radix character is not defined, the radix character shall
 63120 default to a period (`'.'`).

63121 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 63122 accepted.

63123 If the subject sequence is empty or does not have the expected form, no conversion shall be
 63124 performed; the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not
 63125 a null pointer.

63126 CX The *strtod()* function shall not change the setting of *errno* if successful.

63127 Since 0 is returned on error and is also a valid return on success, an application wishing to check
 63128 for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

63129 RETURN VALUE

63130 Upon successful completion, these functions shall return the converted value. If no conversion
 63131 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

63132 If the correct value is outside the range of representable values, \pm HUGE_VAL, \pm HUGE_VALF, or
 63133 \pm HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to
 63134 [ERANGE].

63135 If the correct value would cause an underflow, a value whose magnitude is no greater than the
 63136 smallest normalized positive number in the return type shall be returned and *errno* set to
 63137 [ERANGE].

63138 ERRORS

63139 These functions shall fail if:

63140 CX [ERANGE] The value to be returned would cause overflow or underflow.

63141 These functions may fail if:

63142 CX [EINVAL] No conversion could be performed.

63143 EXAMPLES

63144 None.

63145 APPLICATION USAGE

63146 If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the
 63147 result is not exactly representable, the result should be one of the two numbers in the
 63148 appropriate internal format that are adjacent to the hexadecimal floating source value, with the
 63149 extra stipulation that the error should have a correct sign for the current rounding direction.

63150 If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in `<float.h>`)
 63151 significant digits, the result should be correctly rounded. If the subject sequence *D* has the

63152 decimal form and more than DECIMAL_DIG significant digits, consider the two bounding,
 63153 adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the
 63154 values of *L*, *D*, and *U* satisfy $L \leq D \leq U$. The result should be one of the (equal or adjacent)
 63155 values that would be obtained by correctly rounding *L* and *U* according to the current rounding
 63156 direction, with the extra stipulation that the error with respect to *D* should have a correct sign
 63157 for the current rounding direction.

63158 The changes to *strtod()* introduced by the ISO/IEC 9899:1999 standard can alter the behavior of
 63159 well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier
 63160 versions of this standard. One such example would be:

```

63161 int
63162 what_kind_of_number (char *s)
63163 {
63164     char *endp;
63165     double d;
63166     long l;
63167
63168     d = strtod(s, &endp);
63169     if (s != endp && *endp == '\0')
63170         printf("It's a float with value %g\n", d);
63171     else
63172     {
63173         l = strtol(s, &endp, 0);
63174         if (s != endp && *endp == '\0')
63175             printf("It's an integer with value %ld\n", l);
63176         else
63177             return 1;
63178     }
63179     return 0;
  
```

63180 If the function is called with:

```
63181 what_kind_of_number ("0x10")
```

63182 an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
63183 It's an integer with value 16
```

63184 With the ISO/IEC 9899:1999 standard, the result is:

```
63185 It's a float with value 16
```

63186 The change in behavior is due to the inclusion of floating-point numbers in hexadecimal
 63187 notation without requiring that either a decimal point or the binary exponent be present.

63195 **CHANGE HISTORY**

63196 First released in Issue 1. Derived from Issue 1 of the SVID.

63197 **Issue 5**63198 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.63199 **Issue 6**

63200 Extensions beyond the ISO C standard are marked.

63201 The following new requirements on POSIX implementations derive from alignment with the
63202 Single UNIX Specification:

- 63203
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
63204 added if no conversion could be performed.

63205 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 63206
- The *strtod()* function is updated.
 - The *strtof()* and *strtold()* functions are added.
 - The DESCRIPTION is extensively revised.

63209 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

63210 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second
63211 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.63212 **Issue 7**

63213 Austin Group Interpretation 1003.1-2001 #015 is applied.

63214 **NAME**
 63215 `strtoimax, strtoumax` — convert string to integer type

63216 **SYNOPSIS**
 63217 `#include <inttypes.h>`
 63218 `intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,`
 63219 `int base);`
 63220 `uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,`
 63221 `int base);`

63222 **DESCRIPTION**
 63223 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63224 conflict between the requirements described here and the ISO C standard is unintentional. This
 63225 volume of POSIX.1-200x defers to the ISO C standard.
 63226 These functions shall be equivalent to the `strtol()`, `strtoll()`, `strtoul()`, and `strtoull()` functions,
 63227 except that the initial portion of the string shall be converted to `intmax_t` and `uintmax_t`
 63228 representation, respectively.

63229 **RETURN VALUE**
 63230 These functions shall return the converted value, if any.
 63231 If no conversion could be performed, zero shall be returned.
 63232 If the correct value is outside the range of representable values, `{INTMAX_MAX}`,
 63233 `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall be returned (according to the return type and sign
 63234 of the value, if any), and `errno` shall be set to `[ERANGE]`.

63235 **ERRORS**
 63236 These functions shall fail if:
 63237 `[ERANGE]` The value to be returned is not representable.
 63238 These functions may fail if:
 63239 `[EINVAL]` The value of `base` is not supported.

63240 **EXAMPLES**
 63241 None.

63242 **APPLICATION USAGE**
 63243 None.

63244 **RATIONALE**
 63245 None.

63251 **CHANGE HISTORY**
 63252 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

63253 **NAME**
 63254 `strtok, strtok_r` — split string into tokens

63255 **SYNOPSIS**

63256 `#include <string.h>`
 63257 `char *strtok(char *restrict s1, const char *restrict s2);`
 63258 CX `char *strtok_r(char *restrict s, const char *restrict sep,`
 63259 `char **restrict lasts);`

63260 **DESCRIPTION**

63261 CX For `strtok()`: The functionality described on this reference page is aligned with the ISO C
 63262 standard. Any conflict between the requirements described here and the ISO C standard is
 63263 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

63264 A sequence of calls to `strtok()` breaks the string pointed to by `s1` into a sequence of tokens, each
 63265 of which is delimited by a byte from the string pointed to by `s2`. The first call in the sequence
 63266 has `s1` as its first argument, and is followed by calls with a null pointer as their first argument.
 63267 The separator string pointed to by `s2` may be different from call to call.

63268 The first call in the sequence searches the string pointed to by `s1` for the first byte that is *not*
 63269 contained in the current separator string pointed to by `s2`. If no such byte is found, then there
 63270 are no tokens in the string pointed to by `s1` and `strtok()` shall return a null pointer. If such a byte
 63271 is found, it is the start of the first token.

63272 The `strtok()` function then searches from there for a byte that *is* contained in the current separator
 63273 string. If no such byte is found, the current token extends to the end of the string pointed to by
 63274 `s1`, and subsequent searches for a token shall return a null pointer. If such a byte is found, it is
 63275 overwritten by a NUL character, which terminates the current token. The `strtok()` function saves
 63276 a pointer to the following byte, from which the next search for a token shall start.

63277 Each subsequent call, with a null pointer as the value of the first argument, starts searching from
 63278 the saved pointer and behaves as described above.

63279 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 63280 `strtok()`.

63281 CX The `strtok()` function need not be thread-safe. A function that is not required to be thread-safe is
 63282 not required to be reentrant.

63283 The `strtok_r()` function considers the null-terminated string `s` as a sequence of zero or more text
 63284 tokens separated by spans of one or more characters from the separator string `sep`. The
 63285 argument `lasts` points to a user-provided pointer which points to stored information necessary
 63286 for `strtok_r()` to continue scanning the same string.

63287 In the first call to `strtok_r()`, `s` points to a null-terminated string, `sep` to a null-terminated string of
 63288 separator characters, and the value pointed to by `lasts` is ignored. The `strtok_r()` function shall
 63289 return a pointer to the first character of the first token, write a null character into `s` immediately
 63290 following the returned token, and update the pointer to which `lasts` points.

63291 In subsequent calls, `s` is a null pointer and `lasts` shall be unchanged from the previous call so that
 63292 subsequent calls shall move through the string `s`, returning successive tokens until no tokens
 63293 remain. The separator string `sep` may be different from call to call. When no token remains in `s`, a
 63294 null pointer shall be returned.

strtok()63295 **RETURN VALUE**

63296 Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,
63297 if there is no token, *strtok()* shall return a null pointer.

63298 CX The *strtok_r()* function shall return a pointer to the token found, or a null pointer when no token
63299 is found.

63300 **ERRORS**

63301 No errors are defined.

63302 **EXAMPLES**63303 **Searching for Word Separators**

63304 The following example searches for tokens separated by <space>s.

```
63305 #include <string.h>
63306 ...
63307 char *token;
63308 char *line = "LINE TO BE SEPARATED";
63309 char *search = " ";

63310 /* Token will point to "LINE". */
63311 token = strtok(line, search);

63312 /* Token will point to "TO". */
63313 token = strtok(NULL, search);
```

63314 **Breaking a Line**

63315 The following example uses *strtok()* to break a line into two character strings separated by any
63316 combination of <space>s, <tab>s, or <newline>s.

```
63317 #include <string.h>
63318 ...
63319 struct element {
63320     char *key;
63321     char *data;
63322 };
63323 ...
63324 char line[LINE_MAX];
63325 char *key, *data;
63326 ...
63327 key = strtok(line, " \n");
63328 data = strtok(NULL, " \n");
63329 ...
```

63330 **APPLICATION USAGE**

63331 The *strtok_r()* function is thread-safe and stores its state in a user-supplied buffer instead of
63332 possibly using a static data area that may be overwritten by an unrelated call from another
63333 thread.

63334 **RATIONALE**

63335 The *strtok()* function searches for a separator string within a larger string. It returns a pointer to
63336 the last substring between separator strings. This function uses static storage to keep track of
63337 the current string position between calls. The new function, *strtok_r()*, takes an additional
63338 argument, *lasts*, to keep track of the current position in the string.

63339

FUTURE DIRECTIONS

63340

None.

CHANGE HISTORY

63344

First released in Issue 1. Derived from Issue 1 of the SVID.

63345

Issue 5

63346

The *strtok_r()* function is included for alignment with the POSIX Threads Extension.

63347

A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.

63348

Issue 6

63349

Extensions beyond the ISO C standard are marked.

63350

The *strtok_r()* function is marked as part of the Thread-Safe Functions option.

63351

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

63352

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

63353

63354

The **restrict** keyword is added to the *strtok()* and *strtok_r()* prototypes for alignment with the ISO/IEC 9899:1999 standard.

63355

63356

Issue 7

63357

The *strtok_r()* function is moved from the Thread-Safe Functions option to the Base.

DRAFT

63358 **NAME**
 63359 `strtol, strtoll` — convert a string to a long integer

63360 **SYNOPSIS**
 63361 `#include <stdlib.h>`
 63362 `long strtol(const char *restrict str, char **restrict endptr, int base);`
 63363 `long long strtoll(const char *restrict str, char **restrict endptr,`
 63364 `int base)`

63365 **DESCRIPTION**

63366 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63367 conflict between the requirements described here and the ISO C standard is unintentional. This
 63368 volume of POSIX.1-200x defers to the ISO C standard.

63369 These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and
 63370 **long long** representation, respectively. First, they decompose the input string into three parts:

- 63371 1. An initial, possibly empty, sequence of white-space characters (as specified by `isspace()`)
- 63372 2. A subject sequence interpreted as an integer represented in some radix determined by the
 63373 value of *base*
- 63374 3. A final string of one or more unrecognized characters, including the terminating NUL
 63375 character of the input string.

63376 Then they shall attempt to convert the subject sequence to an integer, and return the result.

63377 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
 63378 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A
 63379 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
 63380 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to
 63381 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 63382 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

63383 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 63384 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 63385 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the
 63386 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
 63387 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
 63388 digits, following the sign if present.

63389 The subject sequence is defined as the longest initial subsequence of the input string, starting
 63390 with the first non-white-space character that is of the expected form. The subject sequence shall
 63391 contain no characters if the input string is empty or consists entirely of white-space characters,
 63392 or if the first non-white-space character is other than a sign or a permissible letter or digit.

63393 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
 63394 characters starting with the first digit shall be interpreted as an integer constant. If the subject
 63395 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
 63396 base for conversion, ascribing to each letter its value as given above. If the subject sequence
 63397 begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
 63398 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 63399 pointer.

63400 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 63401 accepted.

63402 If the subject sequence is empty or does not have the expected form, no conversion is performed;

63403 the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 63404 pointer.

63405 CX The *strtol()* function shall not change the setting of *errno* if successful.

63406 Since 0, {LONG_MIN} or {LLONG_MIN}, and {LONG_MAX} or {LLONG_MAX} are returned
 63407 on error and are also valid returns on success, an application wishing to check for error
 63408 situations should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

63409 RETURN VALUE

63410 Upon successful completion, these functions shall return the converted value, if any. If no
 63411 conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

63412 If the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},
 63413 {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and
 63414 *errno* set to [ERANGE].

63415 ERRORS

63416 These functions shall fail if:

63417 [ERANGE] The value to be returned is not representable.

63418 These functions may fail if:

63419 CX [EINVAL] The value of *base* is not supported.

63420 EXAMPLES

63421 None.

63422 APPLICATION USAGE

63423 None.

63424 RATIONALE

63425 None.

63431 CHANGE HISTORY

63432 First released in Issue 1. Derived from Issue 1 of the SVID.

63433 Issue 5

63434 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

63435 Issue 6

63436 Extensions beyond the ISO C standard are marked.

63437 The following new requirements on POSIX implementations derive from alignment with the
 63438 Single UNIX Specification:

- 63439 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 63440 added if no conversion could be performed.

63441 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 63442 • The *strtol()* prototype is updated.
- 63443 • The *strtoll()* function is added.

strtold()

63444 **NAME**
63445 **strtold** — convert a string to a double-precision number

63446 **SYNOPSIS**
63447 #include <stdlib.h>
63448 long double strtold(const char *restrict *nptr*, char **restrict *endptr*);

63449 **DESCRIPTION**
63450 Refer to *strtod()*.

63451 **NAME**
63452 strtoll — convert a string to a long integer

63453 **SYNOPSIS**
63454 #include <stdlib.h>
63455 long long strtoll(const char *restrict str, char **restrict endptr,
63456 int base);

63457 **DESCRIPTION**
63458 Refer to *strtol()*.

63459 **NAME**
 63460 `strtol, strtoull` — convert a string to an unsigned long

63461 **SYNOPSIS**
 63462 `#include <stdlib.h>`
 63463 `unsigned long strtol(const char *restrict str,`
 63464 `char **restrict endptr, int base);`
 63465 `unsigned long long strtoull(const char *restrict str,`
 63466 `char **restrict endptr, int base);`

63467 **DESCRIPTION**

63468 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 63469 conflict between the requirements described here and the ISO C standard is unintentional. This
 63470 volume of POSIX.1-200x defers to the ISO C standard.

63471 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned**
 63472 **long** and **unsigned long long** representation, respectively. First, they decompose the input string
 63473 into three parts:

- 63474 1. An initial, possibly empty, sequence of white-space characters (as specified by `isspace()`)
 63475 2. A subject sequence interpreted as an integer represented in some radix determined by the
 63476 value of *base*
 63477 3. A final string of one or more unrecognized characters, including the terminating NUL
 63478 character of the input string

63479 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
 63480 result.

63481 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
 63482 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A
 63483 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
 63484 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to
 63485 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 63486 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

63487 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 63488 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 63489 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the
 63490 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
 63491 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
 63492 digits, following the sign if present.

63493 The subject sequence is defined as the longest initial subsequence of the input string, starting
 63494 with the first non-white-space character that is of the expected form. The subject sequence shall
 63495 contain no characters if the input string is empty or consists entirely of white-space characters,
 63496 or if the first non-white-space character is other than a sign or a permissible letter or digit.

63497 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
 63498 characters starting with the first digit shall be interpreted as an integer constant. If the subject
 63499 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
 63500 base for conversion, ascribing to each letter its value as given above. If the subject sequence
 63501 begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
 63502 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 63503 pointer.

63504 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
63505 accepted.

63506 If the subject sequence is empty or does not have the expected form, no conversion shall be
63507 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*
63508 is not a null pointer.

63509 CX The *strtol()* function shall not change the setting of *errno* if successful.

63510 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and are also valid returns
63511 on success, an application wishing to check for error situations should set *errno* to 0, then call
63512 *strtol()* or *strtoll()*, then check *errno*.

63513 RETURN VALUE

63514 Upon successful completion, these functions shall return the converted value, if any. If no
63515 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL]. If the
63516 correct value is outside the range of representable values, {ULONG_MAX} or {ULLONG_MAX}
63517 shall be returned and *errno* set to [ERANGE].

63518 ERRORS

63519 These functions shall fail if:

63520 CX [EINVAL] The value of *base* is not supported.

63521 [ERANGE] The value to be returned is not representable.

63522 These functions may fail if:

63523 CX [EINVAL] No conversion could be performed.

63524 EXAMPLES

63525 None.

63526 APPLICATION USAGE

63527 None.

63528 RATIONALE

63529 None.

63530 FUTURE DIRECTIONS

63534 XBD <stdlib.h>

63535 CHANGE HISTORY

63536 First released in Issue 4. Derived from the ANSI C standard.

63537 Issue 5

63538 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

63539 Issue 6

63540 Extensions beyond the ISO C standard are marked.

63541 The following new requirements on POSIX implementations derive from alignment with the
63542 Single UNIX Specification:

- 63543 • The [EINVAL] error condition is added for when the value of *base* is not supported.

63544 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
63545 added if no conversion could be performed.

strtoul()

63546

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

63547

- The *strtoul()* prototype is updated.

63548

- The *strtoull()* function is added.

63549 **NAME**
63550 strtoumax — convert a string to an integer type

63551 **SYNOPSIS**
63552 #include <inttypes.h>

63553 uintmax_t strtoumax(const char *restrict *nptr*, char **restrict *endptr*,
63554 int *base*);

63555 **DESCRIPTION**
63556 Refer to *strtoimax()*.

63557 **NAME**
 63558 `strxfrm, strxfrm_l` — string transformation

63559 **SYNOPSIS**
 63560 `#include <string.h>`
 63561 `size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);`
 63562 CX `size_t strxfrm_l(char *restrict s1, const char *restrict s2,`
 63563 `size_t n, locale_t locale);`

63564 DESCRIPTION

63565 CX For `strxfrm()`: The functionality described on this reference page is aligned with the ISO C
 63566 standard. Any conflict between the requirements described here and the ISO C standard is
 63567 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

63568 CX The `strxfrm()` and `strxfrm_l()` functions shall transform the string pointed to by `s2` and place the
 63569 resulting string into the array pointed to by `s1`. The transformation is such that if `strcmp()` is
 63570 applied to two transformed strings, it shall return a value greater than, equal to, or less than 0,
 63571 corresponding to the result of `strcoll()` or `strcoll_l()`, respectively, applied to the same two
 63572 original strings with the same locale. No more than `n` bytes are placed into the resulting array
 63573 pointed to by `s1`, including the terminating NUL character. If `n` is 0, `s1` is permitted to be a null
 63574 pointer. If copying takes place between objects that overlap, the behavior is undefined.

63575 CX The `strxfrm()` and `strxfrm_l()` functions shall not change the setting of `errno` if successful.

63576 Since no return value is reserved to indicate an error, an application wishing to check for error
 63577 situations should set `errno` to 0, then call `strxfrm()` or `strxfrm_l()`, then check `errno`.

63578 RETURN VALUE

63579 CX Upon successful completion, `strxfrm()` and `strxfrm_l()` shall return the length of the
 63580 transformed string (not including the terminating NUL character). If the value returned is `n` or
 63581 more, the contents of the array pointed to by `s1` are unspecified.

63582 CX On error, `strxfrm()` and `strxfrm_l()` may set `errno` but no return value is reserved to indicate an
 63583 error.

63584 ERRORS

63585 These functions may fail if:

63586 CX [EINVAL] The string pointed to by the `s2` argument contains characters outside the
 63587 domain of the collating sequence.

63588 The `strxfrm_l()` function may fail if:

63589 CX [EINVAL] `locale` is not a valid locale object.

63590 EXAMPLES

63591 None.

63592 APPLICATION USAGE

63593 The transformation function is such that two transformed strings can be ordered by `strcmp()` as
 63594 appropriate to collating sequence information in the locale of the process (category
 63595 `LC_COLLATE`).

63596 The fact that when `n` is 0 `s1` is permitted to be a null pointer is useful to determine the size of the
 63597 `s1` array prior to making the transformation.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the ISO C standard.

Issue 5

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

Issue 6

Extensions beyond the ISO C standard are marked.

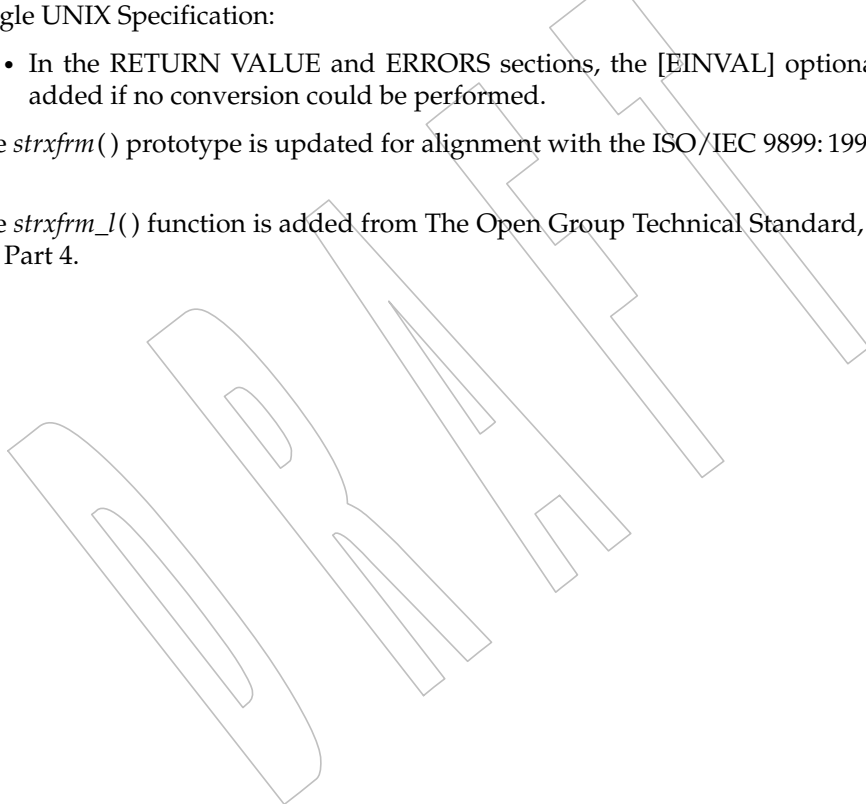

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

Issue 7

The *strxfrm_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

63619 **NAME**63620 `swab` — swap bytes63621 **SYNOPSIS**

```
63622 XSI #include <unistd.h>
63623 void swab(const void *restrict src, void *restrict dest,
63624          ssize_t nbytes);
```

63625 **DESCRIPTION**

63626 The `swab()` function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to
 63627 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, `swab()`
 63628 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If
 63629 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is
 63630 negative, `swab()` does nothing.

63631 **RETURN VALUE**

63632 None.

63633 **ERRORS**

63634 No errors are defined.

63635 **EXAMPLES**

63636 None.

63637 **APPLICATION USAGE**

63638 None.

63639 **RATIONALE**

63640 None.

63641 **FUTURE DIRECTIONS**

63642 None.

63643 **SEE ALSO**63644 XBD [<unistd.h>](#)63645 **CHANGE HISTORY**

63646 First released in Issue 1. Derived from Issue 1 of the SVID.

63647 **Issue 6**

63648 The **restrict** keyword is added to the `swab()` prototype for alignment with the
 63649 ISO/IEC 9899:1999 standard.

63650 **NAME**
63651 `swprintf` — print formatted wide-character output

63652 **SYNOPSIS**

63653 `#include <stdio.h>`

63654 `#include <wchar.h>`

63655 `int swprintf(wchar_t *restrict ws, size_t n,`
63656 `const wchar_t *restrict format, ...);`

63657 **DESCRIPTION**

63658 Refer to *fwprintf()*.

63659 **NAME**
63660 `swscanf` — convert formatted wide-character input

63661 **SYNOPSIS**
63662 `#include <stdio.h>`
63663 `#include <wchar.h>`
63664 `int swscanf(const wchar_t *restrict ws,`
63665 `const wchar_t *restrict format, ...);`

63666 **DESCRIPTION**
63667 Refer to *fwscanf()*.

63668 **NAME**
 63669 `symlink, symlinkat` — make a symbolic link relative to directory file descriptor

63670 **SYNOPSIS**
 63671 `#include <unistd.h>`
 63672 `int symlink(const char *path1, const char *path2);`
 63673 `int symlinkat(const char *path1, int fd, const char *path2);`

63674 **DESCRIPTION**
 63675 The `symlink()` function shall create a symbolic link called `path2` that contains the string pointed to
 63676 by `path1` (`path2` is the name of the symbolic link created, `path1` is the string contained in the
 63677 symbolic link).

63678 The string pointed to by `path1` shall be treated only as a character string and shall not be
 63679 validated as a pathname.

63680 If the `symlink()` function fails for any reason other than [EIO], any file named by `path2` shall be
 63681 unaffected.

63682 The `symlinkat()` function shall be equivalent to the `symlink()` function except in the case where
 63683 `path2` specifies a relative path. In this case the symbolic link is created relative to the directory
 63684 associated with the file descriptor `fd` instead of the current working directory. It is unspecified
 63685 whether directory searches are permitted based on whether the file was opened with search
 63686 permission or on the current permissions of the directory underlying the file descriptor.

63687 If `symlinkat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working
 63688 directory is used and the behavior shall be identical to a call to `symlink()`.

63689 **RETURN VALUE**
 63690 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 63691 return `-1` and set `errno` to indicate the error.

63692 **ERRORS**
 63693 These functions shall fail if:

63694 63695 63696	[EACCES]	Write permission is denied in the directory where the symbolic link is being created, or search permission is denied for a component of the path prefix of <code>path2</code> .
63697	[EEXIST]	The <code>path2</code> argument names an existing file or symbolic link.
63698	[EIO]	An I/O error occurs while reading from or writing to the file system.
63699 63700	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <code>path2</code> argument.
63701 63702 63703 63704	[ENAMETOOLONG]	The length of the <code>path2</code> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX} or the length of the <code>path1</code> argument is longer than {SYMLINK_MAX}.
63705 63706	[ENOENT]	A component of <code>path2</code> does not name an existing file or <code>path2</code> is an empty string.
63707 63708 63709 63710 63711	[ENOSPC]	The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.

- 63712 [ENOTDIR] A component of the path prefix of *path2* is not a directory.
- 63713 [EROFS] The new symbolic link would reside on a read-only file system.
- 63714 The *symlinkat()* function shall fail if:
- 63715 [EBADF] The *path2* argument does not specify an absolute path and the *fd* argument is
63716 neither AT_FDCWD nor a valid file descriptor open for reading.

63717 These functions may fail if:

- 63718 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
63719 resolution of the *path2* argument.

63720 [ENAMETOOLONG]

- 63721 As a result of encountering a symbolic link in resolution of the *path2*
63722 argument, the length of the substituted pathname string exceeded
63723 {PATH_MAX} bytes (including the terminating null byte), or the length of the
63724 string pointed to by *path1* exceeded {SYMLINK_MAX}.

63725 The *symlinkat()* function may fail if:

- 63726 [ENOTDIR] The *path2* argument is not an absolute path and *fd* is neither AT_FDCWD nor a
63727 file descriptor associated with a directory.

63728 EXAMPLES

63729 None.

63730 APPLICATION USAGE

63731 Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a
63732 hard link guarantees the existence of a file, even after the original name has been removed. A
63733 symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not
63734 exist when the link is created. A symbolic link can cross file system boundaries.

63735 Normal permission checks are made on each component of the symbolic link pathname during
63736 its resolution.

63737 RATIONALE

63738 Since POSIX.1-200x does not require any association of file times with symbolic links, there is no
63739 requirement that file times be updated by *symlink()*.

63740 The purpose of the *symlinkat()* function is to create symbolic links in directories other than the
63741 current working directory without exposure to race conditions. Any part of the path of a file
63742 could be changed in parallel to a call to *symlink()*, resulting in unspecified behavior. By opening
63743 a file descriptor for the target directory and using the *symlinkat()* function it can be guaranteed
63744 that the created symbolic link is located relative to the desired directory.

63745 FUTURE DIRECTIONS

63746 None.

63750 CHANGE HISTORY

63751 First released in Issue 4, Version 2.

63752 Issue 5

63753 Moved from X/OPEN UNIX extension to BASE.

63754

Issue 6

63755

The following changes were made to align with the IEEE P1003.1a draft standard:

63756

- The DESCRIPTION text is updated.

63757

- The [ELOOP] optional error condition is added.

63758

Issue 7

63759

The *symlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 2.

63760

63761 **NAME**
63762 `symlinkat` — make a symbolic link relative to directory file descriptor

63763 **SYNOPSIS**
63764 `#include <unistd.h>`
63765 `int symlinkat(const char *path1, int fd, const char *path2);`

63766 **DESCRIPTION**
63767 Refer to *symlink()*.

63768 **NAME**
 63769 sync — schedule file system updates

63770 **SYNOPSIS**

63771 XSI `#include <unistd.h>`
 63772 `void sync(void);`

63773 **DESCRIPTION**

63774 The *sync()* function shall cause all information in memory that updates file systems to be
 63775 scheduled for writing out to all file systems.

63776 The writing, although scheduled, is not necessarily complete upon return from *sync()*.

63777 **RETURN VALUE**

63778 The *sync()* function shall not return a value.

63779 **ERRORS**

63780 No errors are defined.

63796 **NAME**
63797 sysconf — get configurable system variables

63798 **SYNOPSIS**
63799 #include <unistd.h>

63800 long sysconf(int name);

63801 **DESCRIPTION**

63802 The *sysconf()* function provides a method for the application to determine the current value of a
63803 configurable system limit or option (*variable*). The implementation shall support all of the
63804 variables listed in the following table and may support others.

63805 The *name* argument represents the system variable to be queried. The following table lists the
63806 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,
63807 and the symbolic constants defined in <unistd.h> that are the corresponding values used for
63808 *name*.

RETURN VALUE

63938
63939 If *name* is an invalid value, *sysconf()* shall return -1 and set *errno* to indicate the error. If the
63940 variable corresponding to *name* has no limit, *sysconf()* shall return -1 without changing the value
63941 of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

63942 Otherwise, *sysconf()* shall return the current variable value on the system. The value returned
63943 shall not be more restrictive than the corresponding value described to the application when it
63944 was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value shall not change
63945 during the lifetime of the calling process, except that *sysconf(SC_OPEN_MAX)* may return
63946 different values before and after a call to *setrlimit()* which changes the RLIMIT_NOFILE soft

63947

limit.

63948

If the variable corresponding to *name* is dependent on an unsupported option, the results are unspecified.

63949

63950

ERRORS

63951

The *sysconf()* function shall fail if:

63952

[EINVAL] The value of the *name* argument is invalid.

63953

EXAMPLES

63954

None.

63955

APPLICATION USAGE

63956

As -1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *sysconf()*, and, if it returns -1 , check to see if *errno* is non-zero.

63957

63958

63959

Application developers should check whether an option, such as `_POSIX_TRACE`, is supported prior to obtaining and using values for related variables, such as `_POSIX_TRACE_NAME_MAX`.

63960

63961

RATIONALE

63962

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to *pathconf()* and *fpathconf()*.

63963

63964

63965

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of POSIX.1-200x, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in `<limits.h>` or `<unistd.h>`.

63966

63967

63968

63969

63970

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

63971

63972

63973

Two examples are offered:

63974

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it were to rely solely on the `<unistd.h>` value published in this volume of POSIX.1-200x.

63975

63976

63977

63978

2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

63979

63980

63981

63982

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

63983

63984

63985

63986

63987

63988

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application developer.

63989

63990

63991

63992

63993

This runtime facility is not meant to provide ever-changing values that applications have to

63994 check multiple times. The values are seen as changing no more frequently than once per system
 63995 initialization, such as by a system administrator or operator with an automatic configuration
 63996 program. This volume of POSIX.1-200x specifies that they shall not change within the lifetime of
 63997 the process.

63998 Some values apply to the system overall and others vary at the file system or directory level. The
 63999 latter are described in *fpathconf()*.

64000 Note that all values returned must be expressible as integers. String values were considered, but
 64001 the additional flexibility of this approach was rejected due to its added complexity of
 64002 implementation and use.

64003 Some values, such as {PATH_MAX}, are sometimes so large that they must not be used to, say,
 64004 allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic
 64005 constant is not even defined in this case.

64006 Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is
 64007 infinite, returning an error indicating that some other resource limit has been reached is
 64008 conforming behavior.

64009 FUTURE DIRECTIONS

64010 None.

64015 CHANGE HISTORY

64016 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64017 Issue 5

64018 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 64019 Threads Extension.

64020 The `_XBS_` variables and name values are added to the table of system variables in the
 64021 DESCRIPTION. These are all marked EX.

64022 Issue 6

64023 The symbol `CLK_TCK` is obsolescent and removed. It is replaced with the phrase “clock ticks
 64024 per second”.

64025 The symbol {`PASS_MAX`} is removed.

64026 The following changes were made to align with the IEEE P1003.1a draft standard:

- 64027 • Table entries are added for the following variables: `_SC_REGEX`, `_SC_SHELL`,
- 64028 `_SC_REGEX_VERSION`, `_SC_SYMLINK_MAX`.

64029 The following *sysconf()* variables and their associated names are added for alignment with
 64030 IEEE Std 1003.1d-1999:

```

64031     _POSIX_ADVISORY_INFO
64032     _POSIX_CPUTIME
64033     _POSIX_SPAWN
64034     _POSIX_SPORADIC_SERVER
64035     _POSIX_THREAD_CPUTIME
64036     _POSIX_THREAD_SPORADIC_SERVER
64037     _POSIX_TIMEOUTS
  
```

64038 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

64039 • A statement expressing the dependency of support for some system variables on

64040 implementation options is added.

64041 • The following system variables are added:

64042 _POSIX_BARRIERS

64043 _POSIX_CLOCK_SELECTION

64044 _POSIX_MONOTONIC_CLOCK

64045 _POSIX_READER_WRITER_LOCKS

64046 _POSIX_SPIN_LOCKS

64047 _POSIX_TYPED_MEMORY_OBJECTS

64048 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

64049 _POSIX2_PBS

64050 _POSIX2_PBS_ACCOUNTING

64051 _POSIX2_PBS_LOCATE

64052 _POSIX2_PBS_MESSAGE

64053 _POSIX2_PBS_TRACK

64054 The following *sysconf()* variables and their associated names are added for alignment with

64055 IEEE Std 1003.1q-2000:

64056 _POSIX_TRACE

64057 _POSIX_TRACE_EVENT_FILTER

64058 _POSIX_TRACE_INHERIT

64059 _POSIX_TRACE_LOG

64060 The macros associated with the *c89* programming models are marked LEGACY, and new

64061 equivalent macros associated with *c99* are introduced.

64062 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the

64063 DESCRIPTION to denote that the *_PC** and *_SC** symbols are now required to be supported. A

64064 corresponding change has been made in the Base Definitions volume of POSIX.1-200x. The

64065 deletion in the second paragraph removes some duplicated text. Additional symbols that were

64066 erroneously omitted from this reference page have been added.

64067 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the

64068 RETURN VALUE section that the value returned for *sysconf(_SC_OPEN_MAX)* may change if a

64069 call to *setrlimit()* adjusts the RLIMIT_NOFILE soft limit.

64070 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/134 is applied, updating the

64071 DESCRIPTION to remove an erroneous entry for *_POSIX_SYMLOOP_MAX*. This corrects an

64072 error in IEEE Std 1003.1-2001/Cor 1-2002.

64073 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/135 is applied, removing

64074 *_POSIX_FILE_LOCKING*, *_POSIX_MULTI_PROCESS*, *_POSIX2_C_VERSION*, and

64075 *_XOPEN_XCU_VERSION* (and their associated *_SC_** variables) from the DESCRIPTION and

64076 APPLICATION USAGE sections.

64077 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/136 is applied, adding the following

64078 constants (and their associated *_SC_** variables) to the DESCRIPTION:

64079 _POSIX_SS_REPL_MAX
 64080 _POSIX_TRACE_EVENT_NAME_MAX
 64081 _POSIX_TRACE_NAME_MAX
 64082 _POSIX_TRACE_SYS_MAX
 64083 _POSIX_TRACE_USER_EVENT_MAX

64084 The RETURN VALUE and APPLICATION USAGE sections are updated to note that if variables
 64085 are dependent on unsupported options, the results are unspecified.

64086 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/137 is applied, removing
 64087 _REGEX_VERSION and _SC_REGEX_VERSION.

64088 **Issue 7**

64089 SD5-XSH-ERN-166 is applied, changing “Maximum size” to “Initial size” for the “Maximum +
 64090 size of ...” entries in the table in the DESCRIPTION. +

64091 The variables for the supported programming environments are updated to be V7 and the
 64092 LEGACY variables are removed.

64093 The following constants are added:

64094 _POSIX_THREAD_ROBUST_PRIO_INHERIT
 64095 _POSIX_THREAD_ROBUST_PRIO_PROTECT

64096 **NAME**
64097 syslog — log a message

64098 **SYNOPSIS**

64099 XSI `#include <syslog.h>`
64100 `void syslog(int priority, const char *message, ... /* argument */);`

64101 **DESCRIPTION**

64102 Refer to *closelog()*.

64103 **NAME**

64104 system — issue a command

64105 **SYNOPSIS**

64106 #include <stdlib.h>

64107 int system(const char *command);

64108 **DESCRIPTION**

64109 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 64110 conflict between the requirements described here and the ISO C standard is unintentional. This
 64111 volume of POSIX.1-200x defers to the ISO C standard.

64112 If *command* is a null pointer, the *system()* function shall determine whether the host environment
 64113 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the
 64114 string pointed to by *command* to that command processor to be executed in an implementation-
 64115 defined manner; this might then cause the program calling *system()* to behave in a non-
 64116 conforming manner or to terminate.

64117 CX The *system()* function shall behave as if a child process were created using *fork()*, and the child
 64118 process invoked the *sh* utility using *execl()* as follows:

64119

```
execl(<shell path>, "sh", "-c", command, (char *)0);
```

64120 where <shell path> is an unspecified pathname for the *sh* utility. It is unspecified whether the
 64121 handlers registered with *pthread_atfork()* are called as part of the creation of the child process.

64122 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the
 64123 SIGCHLD signal, while waiting for the command to terminate. If this might cause the
 64124 application to miss a signal that would have killed it, then the application should examine the
 64125 return value from *system()* and take whatever action is appropriate to the application if the
 64126 command terminated due to receipt of a signal.

64127 The *system()* function shall not affect the termination status of any child of the calling processes
 64128 other than the process or processes it itself creates.

64129 The *system()* function shall not return until the child process has terminated.

64130 The *system()* function need not be thread-safe. A function that is not required to be thread-safe is
 64131 not required to be reentrant.

64132 **RETURN VALUE**

64133 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor
 64134 CX is available, or zero if none is available. The *system()* function shall always return non-zero
 64135 when *command* is NULL.

64136 CX If *command* is not a null pointer, *system()* shall return the termination status of the command
 64137 language interpreter in the format specified by *waitpid()*. The termination status shall be as
 64138 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents
 64139 the command language interpreter from executing after the child process is created, the return
 64140 value from *system()* shall be as if the command language interpreter had terminated using
 64141 *exit(127)* or *_exit(127)*. If a child process cannot be created, or if the termination status for the
 64142 command language interpreter cannot be obtained, *system()* shall return -1 and set *errno* to
 64143 indicate the error.

64144 **ERRORS**64145 CX The *system()* function may set *errno* values as described by *fork()*.64146 In addition, *system()* may fail if:64147 CX [ECHILD] The status of the child process created by *system()* is no longer available.64148 **EXAMPLES**

64149 None.

64150 **APPLICATION USAGE**64151 If the return value of *system()* is not -1 , its value can be decoded through the use of the macros
64152 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.64153 Note that, while *system()* must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting
64154 for the child to terminate, the handling of signals in the executed command is as specified by
64155 *fork()* and *exec*. For example, if SIGINT is being caught or is set to SIG_DFL when *system()* is
64156 called, then the child is started with SIGINT handling set to SIG_DFL.64157 Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two
64158 processes reading from the same terminal, for example) when the executed command ignores or
64159 catches one of the signals. It is also usually the correct action when the user has given a
64160 command to the application to be executed synchronously (as in the '!' command in many
64161 interactive applications). In either case, the signal should be delivered only to the child process,
64162 not to the application itself. There is one situation where ignoring the signals might have less
64163 than the desired effect. This is when the application uses *system()* to perform some task invisible
64164 to the user. If the user typed the interrupt character (" ^C ", for example) while *system()* is being
64165 used in this way, one would expect the application to be killed, but only the executed command
64166 is killed. Applications that use *system()* in this way should carefully check the return status from
64167 *system()* to see if the executed command was successful, and should take appropriate action
64168 when the command fails.64169 Blocking SIGCHLD while waiting for the child to terminate prevents the application from
64170 catching the signal and obtaining status from *system()*'s child process before *system()* can get the
64171 status itself.64172 The context in which the utility is ultimately executed may differ from that in which *system()*
64173 was called. For example, file descriptors that have the FD_CLOEXEC flag set are closed, and the
64174 process ID and parent process ID are different. Also, if the executed utility changes its
64175 environment variables or its current working directory, that change is not reflected in the caller's
64176 context.64177 There is no defined way for an application to find the specific path for the shell. However,
64178 *confstr()* can provide a value for *PATH* that is guaranteed to find the *sh* utility.64179 Using the *system()* function in more than one thread in a process or when the SIGCHLD signal is
64180 being manipulated by more than one thread in a process may produce unexpected results.64181 **RATIONALE**64182 The *system()* function should not be used by programs that have set user (or group) ID
64183 privileges. The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used
64184 instead. This prevents any unforeseen manipulation of the environment of the user that could
64185 cause execution of commands not anticipated by the calling program.64186 There are three levels of specification for the *system()* function. The ISO C standard gives the
64187 most basic. It requires that the function exists, and defines a way for an application to query
64188 whether a command language interpreter exists. It says nothing about the command language
64189 or the environment in which the command is interpreted.64190 POSIX.1-200x places additional restrictions on *system()*. It requires that if there is a command
64191 language interpreter, the environment must be as specified by *fork()* and *exec*. This ensures, for

64192 example, that *close-on-exec* works, that file locks are not inherited, and that the process ID is
 64193 different. It also specifies the return value from *system()* when the command line can be run,
 64194 thus giving the application some information about the command's completion status.

64195 Finally, POSIX.1-200x requires the command to be interpreted as in the shell command language
 64196 defined in the Shell and Utilities volume of POSIX.1-200x.

64197 Note that, *system(NULL)* is required to return non-zero, indicating that there is a command
 64198 language interpreter. At first glance, this would seem to conflict with the ISO C standard which
 64199 allows *system(NULL)* to return zero. There is no conflict, however. A system must have a
 64200 command language interpreter, and is non-conforming if none is present. It is therefore
 64201 permissible for the *system()* function on such a system to implement the behavior specified by
 64202 the ISO C standard as long as it is understood that the implementation does not conform to
 64203 POSIX.1-200x if *system(NULL)* returns zero.

64204 It was explicitly decided that when *command* is NULL, *system()* should not be required to check
 64205 to make sure that the command language interpreter actually exists with the correct mode, that
 64206 there are enough processes to execute it, and so on. The call *system(NULL)* could, theoretically,
 64207 check for such problems as too many existing child processes, and return zero. However, it
 64208 would be inappropriate to return zero due to such a (presumably) transient condition. If some
 64209 condition exists that is not under the control of this application and that would cause any
 64210 *system()* call to fail, that system has been rendered non-conforming.

64211 Early drafts required, or allowed, *system()* to return with *errno* set to [EINTR] if it was
 64212 interrupted with a signal. This error return was removed, and a requirement that *system()* not
 64213 return until the child has terminated was added. This means that if a *waitpid()* call in *system()*
 64214 exits with *errno* set to [EINTR], *system()* must reissue the *waitpid()*. This change was made for
 64215 two reasons:

- 64216 1. There is no way for an application to clean up if *system()* returns [EINTR], short of calling
 64217 *wait()*, and that could have the undesirable effect of returning the status of children other
 64218 than the one started by *system()*.
- 64219 2. While it might require a change in some historical implementations, those
 64220 implementations already have to be changed because they use *wait()* instead of *waitpid()*.

64221 Note that if the application is catching SIGCHLD signals, it will receive such a signal before a
 64222 successful *system()* call returns.

64223 To conform to POSIX.1-200x, *system()* must use *waitpid()*, or some similar function, instead of
 64224 *wait()*.

64225 The following code sample illustrates how *system()* might be implemented on an
 64226 implementation conforming to POSIX.1-200x.

```
64227 #include <signal.h>
64228 int system(const char *cmd)
64229 {
64230     int stat;
64231     pid_t pid;
64232     struct sigaction sa, savintr, savequit;
64233     sigset_t saveblock;
64234     if (cmd == NULL)
64235         return(1);
64236     sa.sa_handler = SIG_IGN;
64237     sigemptyset(&sa.sa_mask);
64238     sa.sa_flags = 0;
64239     sigemptyset(&savintr.sa_mask);
64240     sigemptyset(&savequit.sa_mask);
```

```

64241     sigaction(SIGINT, &sa, &saveintr);
64242     sigaction(SIGQUIT, &sa, &savequit);
64243     sigaddset(&sa.sa_mask, SIGCHLD);
64244     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
64245     if ((pid = fork()) == 0) {
64246         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
64247         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
64248         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
64249         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
64250         _exit(127);
64251     }
64252     if (pid == -1) {
64253         stat = -1; /* errno comes from fork() */
64254     } else {
64255         while (waitpid(pid, &stat, 0) == -1) {
64256             if (errno != EINTR){
64257                 stat = -1;
64258                 break;
64259             }
64260         }
64261     }
64262     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
64263     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
64264     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
64265     return(stat);
64266 }

```

64267 Note that, while a particular implementation of *system()* (such as the one above) can assume a
64268 particular path for the shell, such a path is not necessarily valid on another system. The above
64269 example is not portable, and is not intended to be.

64270 One reviewer suggested that an implementation of *system()* might want to use an environment
64271 variable such as *SHELL* to determine which command interpreter to use. The supposed
64272 implementation would use the default command interpreter if the one specified by the
64273 environment variable was not available. This would allow a user, when using an application that
64274 prompts for command lines to be processed using *system()*, to specify a different command
64275 interpreter. Such an implementation is discouraged. If the alternate command interpreter did not
64276 follow the command line syntax specified in the Shell and Utilities volume of POSIX.1-200x,
64277 then changing *SHELL* would render *system()* non-conforming. This would affect applications
64278 that expected the specified behavior from *system()*, and since the Shell and Utilities volume of
64279 POSIX.1-200x does not mention that *SHELL* affects *system()*, the application would not know
64280 that it needed to unset *SHELL*.

64281 FUTURE DIRECTIONS

64282 None.

64287 CHANGE HISTORY

64288 First released in Issue 1. Derived from Issue 1 of the SVID.

64289

Issue 6

64290

Extensions beyond the ISO C standard are marked.

64291

Issue 7

64292

SD5-XSH-ERN-30 is applied.

64293

Austin Group Interpretation 1003.1-2001 #055 is applied, clarifying the thread-safety of this function and treatment of *at_fork()* handlers.

64294

64295 **NAME**
 64296 tan, tanf, tanl — tangent function

64297 **SYNOPSIS**
 64298 #include <math.h>
 64299 double tan(double x);
 64300 float tanf(float x);
 64301 long double tanl(long double x);

64302 DESCRIPTION

64303 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 64304 conflict between the requirements described here and the ISO C standard is unintentional. This
 64305 volume of POSIX.1-200x defers to the ISO C standard.

64306 These functions shall compute the tangent of their argument x , measured in radians.

64307 An application wishing to check for error situations should set *errno* to zero and call
 64308 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 64309 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 64310 zero, an error has occurred.

64311 RETURN VALUE

64312 Upon successful completion, these functions shall return the tangent of x .

64313 If the correct value would cause underflow, and is not representable, a range error may occur,
 64314 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

64315 MX If x is NaN, a NaN shall be returned.

64316 If x is ± 0 , x shall be returned.

64317 If x is subnormal, a range error may occur and x should be returned.

64318 If x is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 64319 defined value shall be returned.

64320 If the correct value would cause underflow, and is representable, a range error may occur and
 64321 the correct value shall be returned.

64322 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*
 64323 shall return $\pm\text{HUGE_VAL}$, $\pm\text{HUGE_VALF}$, and $\pm\text{HUGE_VALL}$, respectively, with the same sign
 64324 as the correct value of the function.

64325 ERRORS

64326 These functions shall fail if:

64327 MX **Domain Error** The value of x is $\pm\text{Inf}$.

64328 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 64329 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 64330 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 64331 shall be raised.

64332 XSI **Range Error** The result overflows

64333 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 64334 then *errno* shall be set to [ERANGE]. If the integer expression
 64335 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 64336 floating-point exception shall be raised.

64337 These functions may fail if:

64338 MX Range Error The result underflows, or the value of x is subnormal.

64339 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
64340 then *errno* shall be set to [ERANGE]. If the integer expression
64341 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
64342 floating-point exception shall be raised.

64343 EXAMPLES

64344 Taking the Tangent of a 45-Degree Angle

```
64345 #include <math.h>
64346 ...
64347 double radians = 45.0 * M_PI / 180;
64348 double result;
64349 ...
64350 result = tan (radians);
```

64351 APPLICATION USAGE

64352 There are no known floating-point representations such that for a normal argument, $\tan(x)$ is
64353 either overflow or underflow.

64354 These functions may lose accuracy when their argument is near a multiple of $\pi/2$ or is far from
64355 0.0.

64356 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
64357 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

64358 RATIONALE

64359 None.

64360 FUTURE DIRECTIONS

64361 None.

64365 CHANGE HISTORY

64366 First released in Issue 1. Derived from Issue 1 of the SVID.

64367 Issue 5

64368 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
64369 in previous issues.

64370 Issue 6

64371 The *tanf()* and *tanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

64372 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
64373 revised to align with the ISO/IEC 9899:1999 standard.

64374 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
64375 marked.

64376 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last
64377 paragraph in the RETURN VALUE section.

64378 **NAME**
 64379 tanh, tanhf, tanhl — hyperbolic tangent functions

64380 **SYNOPSIS**
 64381 #include <math.h>
 64382 double tanh(double x);
 64383 float tanhf(float x);
 64384 long double tanhl(long double x);

64385 **DESCRIPTION**
 64386 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 64387 conflict between the requirements described here and the ISO C standard is unintentional. This
 64388 volume of POSIX.1-200x defers to the ISO C standard.

64389 These functions shall compute the hyperbolic tangent of their argument x .

64390 An application wishing to check for error situations should set *errno* to zero and call
 64391 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 64392 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 64393 zero, an error has occurred.

64394 **RETURN VALUE**
 64395 Upon successful completion, these functions shall return the hyperbolic tangent of x .

64396 MX If x is NaN, a NaN shall be returned.
 64397 If x is ± 0 , x shall be returned.
 64398 If x is $\pm\text{Inf}$, ± 1 shall be returned.
 64399 If x is subnormal, a range error may occur and x should be returned.

64400 **ERRORS**
 64401 These functions may fail if:
 64402 MX **Range Error** The value of x is subnormal.
 64403 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 64404 then *errno* shall be set to [ERANGE]. If the integer expression
 64405 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 64406 floating-point exception shall be raised.

64407 **EXAMPLES**
 64408 None.

64409 **APPLICATION USAGE**
 64410 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 64411 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The *tanhf()* and *tanhll()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.

64430 **NAME**
64431 tanl — tangent function

64432 **SYNOPSIS**
64433 #include <math.h>
64434 long double tanl(long double x);

64435 **DESCRIPTION**
64436 Refer to *tan()*.

64437 **NAME**64438 `tcdrain` — wait for transmission of output64439 **SYNOPSIS**64440 `#include <termios.h>`64441 `int tcdrain(int fildev);`64442 **DESCRIPTION**64443 The `tcdrain()` function shall block until all output written to the object referred to by *fildev* is
64444 transmitted. The *fildev* argument is an open file descriptor associated with a terminal.64445 Any attempts to use `tcdrain()` from a process which is a member of a background process group
64446 on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a
64447 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
64448 shall be allowed to perform the operation, and no signal is sent.64449 **RETURN VALUE**64450 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
64451 indicate the error.64452 **ERRORS**64453 The `tcdrain()` function shall fail if:64454 [EBADF] The *fildev* argument is not a valid file descriptor.64455 [EINTR] A signal interrupted `tcdrain()`.64456 [ENOTTY] The file associated with *fildev* is not a terminal.64457 The `tcdrain()` function may fail if:64458 [EIO] The process group of the writing process is orphaned, and the writing process
64459 is not ignoring or blocking SIGTTOU.64460 **EXAMPLES**

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- The [EIO] error is added.

64479 **NAME**

64480 tcflow — suspend or restart the transmission or reception of data

64481 **SYNOPSIS**

64482 #include <termios.h>

64483 int tcflow(int *fildev*, int *action*);64484 **DESCRIPTION**64485 The *tcflow()* function shall suspend or restart transmission or reception of data on the object
64486 referred to by *fildev*, depending on the value of *action*. The *fildev* argument is an open file
64487 descriptor associated with a terminal.

- 64488 • If *action* is TCOOFF, output shall be suspended.
- 64489 • If *action* is TCOON, suspended output shall be restarted.
- 64490 • If *action* is TCIOFF and *fildev* refers to a terminal device, the system shall transmit a STOP |
64491 character, which is intended to cause the terminal device to stop transmitting data to the |
64492 system. If *fildev* is associated with a pseudo-terminal, the STOP character need not be |
64493 transmitted.
- 64494 • If *action* is TCION and *fildev* refers to a terminal device, the system shall transmit a START |
64495 character, which is intended to cause the terminal device to start transmitting data to the |
64496 system. If *fildev* is associated with a pseudo-terminal, the START character need not be |
64497 transmitted.

64498 The default on the opening of a terminal file is that neither its input nor its output are
64499 suspended.64500 Attempts to use *tcflow()* from a process which is a member of a background process group on a
64501 *fildev* associated with its controlling terminal, shall cause the process group to be sent a
64502 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
64503 shall be allowed to perform the operation, and no signal is sent.64504 **RETURN VALUE**64505 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
64506 indicate the error.64507 **ERRORS**64508 The *tcflow()* function shall fail if:

- 64509 [EBADF] The *fildev* argument is not a valid file descriptor.
- 64510 [EINVAL] The *action* argument is not a supported value.
- 64511 [ENOTTY] The file associated with *fildev* is not a terminal.

64512 The *tcflow()* function may fail if:

- 64513 [EIO] The process group of the writing process is orphaned, and the writing process
64514 is not ignoring or blocking SIGTTOU.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] error is added.

Issue 7

SD5-XSH-ERN-190 is applied, clarifying in the DESCRIPTION the transmission of START and + STOP characters.

64535 **NAME**

64536 tcflush — flush non-transmitted output data, non-read input data, or both

64537 **SYNOPSIS**

64538 #include <termios.h>

64539 int tcflush(int *fildev*, int *queue_selector*);64540 **DESCRIPTION**64541 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildev*
64542 (an open file descriptor associated with a terminal) but not transmitted, or data received but not
64543 read, depending on the value of *queue_selector*:

- 64544
- If *queue_selector* is TCIFLUSH, it shall flush data received but not read.
 - If *queue_selector* is TCOFLUSH, it shall flush data written but not transmitted.
 - If *queue_selector* is TCIOFLUSH, it shall flush both data received but not read and data
64547 written but not transmitted.

64548 Attempts to use *tcflush()* from a process which is a member of a background process group on a
64549 *fildev* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU
64550 signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be
64551 allowed to perform the operation, and no signal is sent.64552 **RETURN VALUE**64553 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
64554 indicate the error.64555 **ERRORS**64556 The *tcflush()* function shall fail if:

- 64557 [EBADF] The
- fildev*
- argument is not a valid file descriptor.
-
- 64558 [EINVAL] The
- queue_selector*
- argument is not a supported value.
-
- 64559 [ENOTTY] The file associated with
- fildev*
- is not a terminal.

64560 The *tcflush()* function may fail if:

- 64561 [EIO] The process group of the writing process is orphaned, and the writing process
-
- 64562 is not ignoring or blocking SIGTTOU.

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64576

Issue 6

64577

The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE sections, references to *tcflow()* are replaced with *tcflush()*.

64578

64579

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

64580

64581

- In the DESCRIPTION, the final paragraph is no longer conditional on `_POSIX_JOB_CONTROL`. This is a FIPS requirement.

64582

- The [EIO] error is added.

64583

64584 **NAME**

64585 tcgetattr — get the parameters associated with the terminal

64586 **SYNOPSIS**

64587 #include <termios.h>

64588 int tcgetattr(int *fildev*, struct termios **termios_p*);64589 **DESCRIPTION**64590 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev* and store them in the **termios** structure referenced by *termios_p*. The *fildev* argument is an open file descriptor associated with a terminal.64593 The *termios_p* argument is a pointer to a **termios** structure.64594 The *tcgetattr()* operation is allowed from any process.64595 If the terminal device supports different input and output baud rates, the baud rates stored in the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be the actual baud rate. If the terminal device does not support split baud rates, the input baud rate stored in the **termios** structure shall be the output rate (as one of the symbolic values).64600 **RETURN VALUE**64601 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.64603 **ERRORS**64604 The *tcgetattr()* function shall fail if:64605 [EBADF] The *fildev* argument is not a valid file descriptor.64606 [ENOTTY] The file associated with *fildev* is not a terminal.64607 **EXAMPLES**

64608 None.

64609 **APPLICATION USAGE**

64610 None.

64611 **RATIONALE**64612 Care must be taken when changing the terminal attributes. Applications should always do a *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the terminal state whenever it is done with the terminal. This is necessary because terminal attributes apply to the underlying port and not to each individual open instance; that is, all processes that have used the terminal see the latest attribute changes.

64618 A program that uses these functions should be written to catch all signals and take other appropriate actions to ensure that when the program terminates, whether planned or not, the terminal device's state is restored to its original state.

64621 Existing practice dealing with error returns when only part of a request can be honored is based on calls to the *ioctl()* function. In historical BSD and System V implementations, the corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if some of the requested changes could not be made. Many existing applications assume this behavior and would no longer work correctly if the return value were changed from zero to -1 in this case.

64627 Note that either specification has a problem. When zero is returned, it implies everything

64628 succeeded even if some of the changes were not made. When `-1` is returned, it implies
64629 everything failed even though some of the changes were made.

64630 Applications that need all of the requested changes made to work properly should follow
64631 `tcsetattr()` with a call to `tcgetattr()` and compare the appropriate field values.

64632 FUTURE DIRECTIONS

64633 None.

64637 CHANGE HISTORY

64638 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64639 Issue 6

64640 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.
64641 Previously, the number zero was also allowed but was obsolescent.

DRAFT

64642 **NAME**

64643 tcgetpgrp — get the foreground process group ID

64644 **SYNOPSIS**

64645 #include <unistd.h>

64646 pid_t tcgetpgrp(int *fildev*);64647 **DESCRIPTION**64648 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process
64649 group associated with the terminal.64650 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does
64651 not match the process group ID of any existing process group.64652 The *tcgetpgrp()* function is allowed from a process that is a member of a background process
64653 group; however, the information may be subsequently changed by a process that is a member of
64654 a foreground process group.64655 **RETURN VALUE**64656 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the
64657 foreground process associated with the terminal. Otherwise, `-1` shall be returned and *errno* set to
64658 indicate the error.64659 **ERRORS**64660 The *tcgetpgrp()* function shall fail if:64661 [EBADF] The *fildev* argument is not a valid file descriptor.64662 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
64663 controlling terminal.64664 **EXAMPLES**

64665 None.

64666 **APPLICATION USAGE**

64667 None.

64668 **RATIONALE**

64669 None.

64676 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64677 **Issue 6**64678 In the SYNOPSIS, the optional include of the [<sys/types.h>](#) header is removed.64679 The following new requirements on POSIX implementations derive from alignment with the
64680 Single UNIX Specification:

- 64681
- The requirement to include [<sys/types.h>](#) has been removed. Although [<sys/types.h>](#) was
64682 required for conforming implementations of previous POSIX specifications, it was not
64683 required for UNIX applications.

64684

64685

- In the DESCRIPTION, text previously conditional on support for _POSIX_JOB_CONTROL is now mandatory. This is a FIPS requirement.

64686 **NAME**

64687 tcgetsid — get the process group ID for the session leader for the controlling terminal

64688 **SYNOPSIS**

64689 #include <termios.h>

64690 pid_t tcgetsid(int *fildev*);64691 **DESCRIPTION**64692 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal
64693 specified by *fildev* is the controlling terminal.64694 **RETURN VALUE**64695 Upon successful completion, *tcgetsid()* shall return the process group ID of the session
64696 associated with the terminal. Otherwise, a value of (**pid_t**)-1 shall be returned and *errno* set to
64697 indicate the error.64698 **ERRORS**64699 The *tcgetsid()* function shall fail if:64700 [EBADF] The *fildev* argument is not a valid file descriptor.64701 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
64702 controlling terminal.64703 **EXAMPLES**

64704 None.

64705 **APPLICATION USAGE**

64706 None.

64707 **RATIONALE**

64708 None.

64709 **FUTURE DIRECTIONS**

64710 None.

64711 **SEE ALSO**64712 XBD <[termios.h](#)>64713 **CHANGE HISTORY**

64714 First released in Issue 4, Version 2.

64715 **Issue 5**

64716 Moved from X/OPEN UNIX extension to BASE.

64717 The [EACCES] error has been removed from the list of mandatory errors, and the description of
64718 [ENOTTY] has been reworded.64719 **Issue 7**

64720 SD5-XSH-ERN-180 is applied, clarifying the RETURN VALUE section. +

64721 The *tcgetsid()* function is moved from the XSI option to the Base.

64722 **NAME**
 64723 tcsendbreak — send a break for a specific duration

64724 **SYNOPSIS**
 64725 #include <termios.h>
 64726 int tcsendbreak(int *fildev*, int *duration*);

64727 **DESCRIPTION**
 64728 If the terminal is using asynchronous serial data transmission, *tcsendbreak()* shall cause
 64729 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it
 64730 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5
 64731 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period
 64732 of time.

64733 The *fildev* argument is an open file descriptor associated with a terminal.

64734 If the terminal is not using asynchronous serial data transmission, it is implementation-defined
 64735 whether *tcsendbreak()* sends data to generate a break condition or returns without taking any
 64736 action.

64737 Attempts to use *tcsendbreak()* from a process which is a member of a background process group
 64738 on a *fildev* associated with its controlling terminal shall cause the process group to be sent a
 64739 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
 64740 shall be allowed to perform the operation, and no signal is sent.

64741 **RETURN VALUE**
 64742 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 64743 indicate the error.

64744 **ERRORS**
 64745 The *tcsendbreak()* function shall fail if:
 64746 [EBADF] The *fildev* argument is not a valid file descriptor.
 64747 [ENOTTY] The file associated with *fildev* is not a terminal.
 64748 The *tcsendbreak()* function may fail if:
 64749 [EIO] The process group of the writing process is orphaned, and the writing process
 64750 is not ignoring or blocking SIGTTOU.

64751 **EXAMPLES**
 64752 None.

64753 **APPLICATION USAGE**
 64754 None.

64755 **RATIONALE**
 64756 None.

64757 **FUTURE DIRECTIONS**
 64758 None.

64761

CHANGE HISTORY

64762

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64763

Issue 6

64764

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

64765

- In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.
- The [EIO] error is added.

64766

64767

64768

64769 **NAME**
 64770 tcsetattr — set the parameters associated with the terminal

64771 **SYNOPSIS**
 64772 #include <termios.h>

64773 int tcsetattr(int *fildev*, int *optional_actions*,
 64774 const struct termios **termios_p*);

64775 **DESCRIPTION**

64776 The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the
 64777 open file descriptor *fildev* (an open file descriptor associated with a terminal) from the **termios**
 64778 structure referenced by *termios_p* as follows:

- 64779 • If *optional_actions* is TCSANOW, the change shall occur immediately.
- 64780 • If *optional_actions* is TCSADRAIN, the change shall occur after all output written to *fildev* is
 64781 transmitted. This function should be used when changing parameters that affect output.
- 64782 • If *optional_actions* is TCSAFLUSH, the change shall occur after all output written to *fildev* is
 64783 transmitted, and all input so far received but not read shall be discarded before the change
 64784 is made.

64785 If the output baud rate stored in the **termios** structure pointed to by *termios_p* is the zero baud
 64786 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the
 64787 line.

64788 If the input baud rate stored in the **termios** structure pointed to by *termios_p* is 0, the input baud
 64789 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

64790 The *tcsetattr()* function shall return successfully if it was able to perform any of the requested
 64791 actions, even if some of the requested actions could not be performed. It shall set all the
 64792 attributes that the implementation supports as requested and leave all the attributes not
 64793 supported by the implementation unchanged. If no part of the request can be honored, it shall
 64794 return -1 and set *errno* to [EINVAL]. If the input and output baud rates differ and are a
 64795 combination that is not supported, neither baud rate shall be changed. A subsequent call to
 64796 *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made
 64797 and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values
 64798 found in the **termios** structure under any circumstances.

64799 The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios_p*
 64800 was not derived from the result of a call to *tcgetattr()* on *fildev*; an application should modify
 64801 only fields and flags defined by this volume of POSIX.1-200x between the call to *tcgetattr()* and
 64802 *tcsetattr()*, leaving all other fields and flags unmodified.

64803 No actions defined by this volume of POSIX.1-200x, other than a call to *tcsetattr()* or a close of
 64804 the last file descriptor in the system associated with this terminal device, shall cause any of the
 64805 terminal attributes defined by this volume of POSIX.1-200x to change.

64806 If *tcsetattr()* is called from a process which is a member of a background process group on a *fildev*
 64807 associated with its controlling terminal:

- 64808 • If the calling process is blocking or ignoring SIGTTOU signals, the operation completes
 64809 normally and no signal is sent.
- 64810 • Otherwise, a SIGTTOU signal shall be sent to the process group.

tcsetattr()64811 **RETURN VALUE**

64812 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 64813 indicate the error.

64814 **ERRORS**

64815 The *tcsetattr()* function shall fail if:

64816 [EBADF] The *fildev* argument is not a valid file descriptor.

64817 [EINTR] A signal interrupted *tcsetattr()*.

64818 [EINVAL] The *optional_actions* argument is not a supported value, or an attempt was
 64819 made to change an attribute represented in the **termios** structure to an
 64820 unsupported value.

64821 [ENOTTY] The file associated with *fildev* is not a terminal.

64822 The *tcsetattr()* function may fail if:

64823 [EIO] The process group of the writing process is orphaned, and the writing process
 64824 is not ignoring or blocking SIGTTOU.

64825 **EXAMPLES**

64826 None.

64827 **APPLICATION USAGE**

64828 If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to
 64829 determine what baud rates were actually selected.

64830 **RATIONALE**

64831 The *tcsetattr()* function can be interrupted in the following situations:

- 64832 • It is interrupted while waiting for output to drain.
- 64833 • It is called from a process in a background process group and SIGTTOU is caught.

64834 See also the RATIONALE section in *tcgetattr()*.

64835 **FUTURE DIRECTIONS**

64836 Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be
 64837 supported in a future version of this volume of POSIX.1-200x.

64838 **SEE ALSO**

64839 *cfgetispeed()*, *tcgetattr()*

64840 XBD Chapter 11 (on page 185), **<termios.h>**, **<unistd.h>**

64841 **CHANGE HISTORY**

64842 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

64843 **Issue 6**

64844 The following new requirements on POSIX implementations derive from alignment with the
 64845 Single UNIX Specification:

- 64846 • In the DESCRIPTION, text previously conditional on **_POSIX_JOB_CONTROL** is now
 64847 mandated. This is a FIPS requirement.
- 64848 • The [EIO] error is added.

64849

64850

In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of a background process group is clarified.

64851 **NAME**
 64852 `tcsetpgrp` — set the foreground process group ID

64853 **SYNOPSIS**
 64854 `#include <unistd.h>`
 64855 `int tcsetpgrp(int fildev, pid_t pgid_id);`

64856 **DESCRIPTION**
 64857 If the process has a controlling terminal, `tcsetpgrp()` shall set the foreground process group ID
 64858 associated with the terminal to *pgid_id*. The application shall ensure that the file associated with
 64859 *fildev* is the controlling terminal of the calling process and the controlling terminal is currently
 64860 associated with the session of the calling process. The application shall ensure that the value of
 64861 *pgid_id* matches a process group ID of a process in the same session as the calling process.

64862 Attempts to use `tcsetpgrp()` from a process which is a member of a background process group on
 64863 a *fildev* associated with its controlling terminal shall cause the process group to be sent a
 64864 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
 64865 shall be allowed to perform the operation, and no signal is sent.

64866 **RETURN VALUE**
 64867 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 64868 indicate the error.

64869 **ERRORS**
 64870 The `tcsetpgrp()` function shall fail if:

64871 [EBADF]	The <i>fildev</i> argument is not a valid file descriptor.
64872 [EINVAL]	This implementation does not support the value in the <i>pgid_id</i> argument.
64873 [ENOTTY]	The calling process does not have a controlling terminal, or the file is not the controlling terminal, or the controlling terminal is no longer associated with the session of the calling process.
64874 [EPERM]	The value of <i>pgid_id</i> is a value supported by the implementation, but does not match the process group ID of a process in the same session as the calling process.

64879 **EXAMPLES**
 64880 None.

64881 **APPLICATION USAGE**

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION and ERRORS sections, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

The normative text is updated to avoid use of the term “must” for application requirements.

The Open Group Corrigendum U047/4 is applied.

64903 **NAME**64904 `tdelete`, `tfind`, `tsearch`, `twalk` — manage a binary search tree64905 **SYNOPSIS**

```

64906 XSI      #include <search.h>
64907
64907 void *tdelete(const void *restrict key, void **restrict rootp,
64908             int(*compar)(const void *, const void *));
64909 void *tfind(const void *key, void *const *rootp,
64910           int(*compar)(const void *, const void *));
64911 void *tsearch(const void *key, void **rootp,
64912            int (*compar)(const void *, const void *));
64913 void twalk(const void *root,
64914          void (*action)(const void *, VISIT, int));

```

64915 **DESCRIPTION**

64916 The `tdelete()`, `tfind()`, `tsearch()`, and `twalk()` functions manipulate binary search trees.
64917 Comparisons are made with a user-supplied routine, the address of which is passed as the
64918 `compar` argument. This routine is called with two arguments, which are the pointers to the
64919 elements being compared. The application shall ensure that the user-supplied routine returns an
64920 integer less than, equal to, or greater than 0, according to whether the first argument is to be
64921 considered less than, equal to, or greater than the second argument. The comparison function
64922 need not compare every byte, so arbitrary data may be contained in the elements in addition to
64923 the values being compared.

64924 The `tsearch()` function shall build and access the tree. The `key` argument is a pointer to an element
64925 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed
64926 to by `key`, a pointer to this found node shall be returned. Otherwise, the value pointed to by `key`
64927 shall be inserted (that is, a new node is created and the value of `key` is copied to this node), and a
64928 pointer to this node returned. Only pointers are copied, so the application shall ensure that the
64929 calling routine stores the data. The `rootp` argument points to a variable that points to the root
64930 node of the tree. A null pointer value for the variable pointed to by `rootp` denotes an empty tree;
64931 in this case, the variable shall be set to point to the node which shall be at the root of the new
64932 tree.

64933 Like `tsearch()`, `tfind()` shall search for a node in the tree, returning a pointer to it if found.
64934 However, if it is not found, `tfind()` shall return a null pointer. The arguments for `tfind()` are the
64935 same as for `tsearch()`.

64936 The `tdelete()` function shall delete a node from a binary search tree. The arguments are the same
64937 as for `tsearch()`. The variable pointed to by `rootp` shall be changed if the deleted node was the
64938 root of the tree. The `tdelete()` function shall return a pointer to the parent of the deleted node, or
64939 a null pointer if the node is not found.

64940 The `twalk()` function shall traverse a binary search tree. The `root` argument is a pointer to the root
64941 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below
64942 that node.) The argument `action` is the name of a routine to be invoked at each node. This routine
64943 is, in turn, called with three arguments. The first argument shall be the address of the node being
64944 visited. The structure pointed to by this argument is unspecified and shall not be modified by
64945 the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-
64946 element to access the element stored in the node. The second argument shall be a value from an
64947 enumeration data type:

```

64948 typedef enum { preorder, postorder, endorder, leaf } VISIT;

```

64949 (defined in `<search.h>`), depending on whether this is the first, second, or third time that the
 64950 node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a
 64951 leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

64952 If the calling function alters the pointer to the root, the result is undefined.

64953 RETURN VALUE

64954 If the node is found, both `tsearch()` and `tfind()` shall return a pointer to it. If not, `tfind()` shall
 64955 return a null pointer, and `tsearch()` shall return a pointer to the inserted item.

64956 A null pointer shall be returned by `tsearch()` if there is not enough space available to create a new
 64957 node.

64958 A null pointer shall be returned by `tdelete()`, `tfind()`, and `tsearch()` if `rootp` is a null pointer on
 64959 entry.

64960 The `tdelete()` function shall return a pointer to the parent of the deleted node, or a null pointer if
 64961 the node is not found.

64962 The `twalk()` function shall not return a value.

64963 ERRORS

64964 No errors are defined.

64965 EXAMPLES

64966 The following code reads in strings and stores structures containing a pointer to each string and
 64967 a count of its length. It then walks the tree, printing out the stored strings and their lengths in
 64968 alphabetical order.

```

64969 #include <search.h>
64970 #include <string.h>
64971 #include <stdio.h>
64972 #define STRSZ 10000
64973 #define NODSZ 500
64974 struct node { /* Pointers to these are stored in the tree. */
64975     char *string;
64976     int length;
64977 };
64978 char string_space[STRSZ]; /* Space to store strings. */
64979 struct node nodes[NODSZ]; /* Nodes to store. */
64980 void *root = NULL; /* This points to the root. */
64981 int main(int argc, char *argv[])
64982 {
64983     char *strptr = string_space;
64984     struct node *nodeptr = nodes;
64985     void print_node(const void *, VISIT, int);
64986     int i = 0, node_compare(const void *, const void *);
64987     while (gets(strptr) != NULL && i++ < NODSZ) {
64988         /* Set node. */
64989         nodeptr->string = strptr;
64990         nodeptr->length = strlen(strptr);
64991         /* Put node into the tree. */
64992         (void) tsearch((void *)nodeptr, (void **)&root,
64993             node_compare);
64994         /* Adjust pointers, so we do not overwrite tree. */
64995         strptr += nodeptr->length + 1;

```

```

64996         nodeptr++;
64997     }
64998     twalk(root, print_node);
64999     return 0;
65000 }
65001 /*
65002  * This routine compares two nodes, based on an
65003  * alphabetical ordering of the string field.
65004  */
65005 int
65006 node_compare(const void *node1, const void *node2)
65007 {
65008     return strcmp(((const struct node *) node1)->string,
65009                 ((const struct node *) node2)->string);
65010 }
65011 /*
65012  * This routine prints out a node, the second time
65013  * twalk encounters it or if it is a leaf.
65014  */
65015 void
65016 print_node(const void *ptr, VISIT order, int level)
65017 {
65018     const struct node *p = *(const struct node **) ptr;
65019     if (order == postorder || order == leaf) {
65020         (void) printf("string = %s, length = %d\n",
65021                     p->string, p->length);
65022     }
65023 }

```

APPLICATION USAGE

The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()* and *tsearch()*.

There are two nomenclatures used to refer to the order in which tree nodes are visited. The *tsearch()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which could result in some confusion over the meaning of **postorder**.

RATIONALE

None.

FUTURE DIRECTIONS

None.

65074 **CHANGE HISTORY**

65075 First released in Issue 2.

65076 **NAME**

65077 tempnam — create a name for a temporary file

65078 **SYNOPSIS**

```
65079 OB XSI #include <stdio.h>
65080 char *tempnam(const char *dir, const char *pfx);
```

65081 **DESCRIPTION**65082 The *tempnam()* function shall generate a pathname that may be used for a temporary file.

65083 The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument
 65084 points to the name of the directory in which the file is to be created. If *dir* is a null pointer or
 65085 points to a string which is not a name for an appropriate directory, the path prefix defined as
 65086 P_tmpdir in the <stdio.h> header shall be used. If that directory is not accessible, an
 65087 implementation-defined directory may be used.

65088 Many applications prefer their temporary files to have certain initial letter sequences in their
 65089 names. The *pfx* argument should be used for this. This argument may be a null pointer or point
 65090 to a string of up to five bytes to be used as the beginning of the filename.

65091 Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if
 65092 called more than {TMP_MAX} times in a single process, the behavior is implementation-defined.

65093 **RETURN VALUE**

65094 Upon successful completion, *tempnam()* shall allocate space for a string, put the generated
 65095 pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a
 65096 subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the
 65097 error.

65098 **ERRORS**65099 The *tempnam()* function shall fail if:

65100 [ENOMEM] Insufficient storage space is available.

65101 **EXAMPLES**65102 **Generating a Pathname**

65103 The following example generates a pathname for a temporary file in directory */tmp*, with the
 65104 prefix *file*. After the filename has been created, the call to *free()* deallocates the space used to
 65105 store the filename.

```
65106 #include <stdio.h>
65107 #include <stdlib.h>
65108 ...
65109 char *directory = "/tmp";
65110 char *fileprefix = "file";
65111 char *file;
65112 file = tempnam(directory, fileprefix);
65113 free(file);
```

65114 **APPLICATION USAGE**

65115 This function only creates pathnames. It is the application's responsibility to create and remove
 65116 the files. Between the time a pathname is created and the file is opened, it is possible for some
 65117 other process to create a file with the same name. Applications may find *tmpfile()* more useful.

tempnam()

65118 Applications should use the *tmpfile()*, *mkdtemp()*, or *mkstemp()* functions instead of the
 65119 obsolescent *tempnam()* function.

RATIONALE

65121 None.

FUTURE DIRECTIONS

65122 The *tempnam()* function may be removed in a future version.
 65123

 65133

65134 **NAME**
65135 `tfind` — search binary search tree

65136 **SYNOPSIS**

```
65137 XSI #include <search.h>  
65138 void *tfind(const void *key, void *const *rootp,  
65139 int (*compar)(const void *, const void *));
```

65140 **DESCRIPTION**

65141 Refer to [tdelete\(\)](#).

65142 **NAME**

65143 tgamma, tgammaf, tgammal — compute gamma() function

65144 **SYNOPSIS**

```
65145 #include <math.h>
65146
65146 double tgamma(double x);
65147 float tgammaf(float x);
65148 long double tgammal(long double x);
```

65149 **DESCRIPTION**

65150 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 65151 conflict between the requirements described here and the ISO C standard is unintentional. This
 65152 volume of POSIX.1-200x defers to the ISO C standard.

65153 These functions shall compute the *gamma()* function of *x*.

65154 An application wishing to check for error situations should set *errno* to zero and call
 65155 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 65156 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 65157 zero, an error has occurred.

65158 **RETURN VALUE**

65159 Upon successful completion, these functions shall return *Gamma(x)*.

65160 CX If *x* is a negative integer, a **domain** error may occur and either a NaN (if supported) or an
 65161 MX implementation-defined value shall be returned. On systems that support the IEC 60559
 65162 Floating-Point option, a domain error shall occur and a NaN shall be returned.

65163 If *x* is ± 0 , *tgamma()*, *tgammaf()*, and *tgammal()* shall return \pm HUGE_VAL, \pm HUGE_VALF, and
 65164 MX \pm HUGE_VALL, respectively. On systems that support the IEC 60559 Floating-Point option, a
 65165 pole error shall occur;

65166 CX otherwise, a **pole** error may occur.

65167 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,
 65168 and *tgammal()* shall return \pm HUGE_VAL, \pm HUGE_VALF, or \pm HUGE_VALL, respectively, with
 65169 the same sign as the correct value of the function.

65170 MX If *x* is NaN, a NaN shall be returned.

65171 If *x* is +Inf, *x* shall be returned.

65172 If *x* is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
 65173 defined value shall be returned.

65174 **ERRORS**

65175 These functions shall fail if:

65176 MX **Domain Error** The value of *x* is a negative integer, or *x* is -Inf.
 65177 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 65178 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 65179 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 65180 shall be raised.

65181 MX **Pole Error** The value of *x* is zero.
 65182 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 65183 then *errno* shall be set to [ERANGE]. If the integer expression
 65184 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero

65185		floating-point exception shall be raised.
65186	Range Error	The value overflows.
65187		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
65188		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
65189		(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
65190		floating-point exception shall be raised.
65191		These functions may fail if:
65192	Domain Error	The value of <i>x</i> is a negative integer.
65193		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
65194		then <i>errno</i> shall be set to [EDOM]. If the integer expression (<i>math_errhandling</i>
65195		& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
65196		shall be raised.
65197	Pole Error	The value of <i>x</i> is zero.
65198		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
65199		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
65200		(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
65201		floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

For IEEE Std 754-1985 **double**, overflow happens when $0 < x < 1/\text{DBL_MAX}$, and $171.7 < x$.

On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and *lgamma()* functions.

FUTURE DIRECTIONS

It is possible that the error response for a negative integer argument may be changed to a pole error and a return value of $\pm\text{Inf}$.

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third paragraph in the RETURN VALUE section.

Issue 7

ISO/IEC 9899:1999 standard, Technical Corrigendum 2 #52 (SD5-XSH-ERN-85) is applied.

65223 **NAME**
 65224 `time` — get time

65225 **SYNOPSIS**
 65226 `#include <time.h>`
 65227 `time_t time(time_t *tloc);`

65228 **DESCRIPTION**
 65229 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 65230 conflict between the requirements described here and the ISO C standard is unintentional. This
 65231 volume of POSIX.1-200x defers to the ISO C standard.

65232 CX The `time()` function shall return the value of time in seconds since the Epoch.
 65233 The `tloc` argument points to an area where the return value is also stored. If `tloc` is a null pointer,
 65234 no value is stored.

65235 **RETURN VALUE**
 65236 Upon successful completion, `time()` shall return the value of time. Otherwise, `(time_t)-1` shall be
 65237 returned.

65238 **ERRORS**
 65239 No errors are defined.

65240 **EXAMPLES**

65241 **Getting the Current Time**

65242 The following example uses the `time()` function to calculate the time elapsed, in seconds, since
 65243 the Epoch, `localtime()` to convert that value to a broken-down time, and `asctime()` to convert the
 65244 broken-down time values into a printable string.

```
65245 #include <stdio.h>
65246 #include <time.h>
65247
65248 int main(void)
65249 {
65250     time_t result;
65251
65252     result = time(NULL);
65253     printf("%s%ju secs since the Epoch\n",
65254           asctime(localtime(&result)),
65255           (uintmax_t)result);
65256     return(0);
65257 }
```

65256 This example writes the current time to `stdout` in a form like this:

```
65257 Wed Jun 26 10:32:15 1996
65258 835810335 secs since the Epoch
```

```

65259     Timing an Event
65260     The following example gets the current time, prints it out in the user's format, and prints the
65261     number of minutes to an event being timed.
65262     #include <time.h>
65263     #include <stdio.h>
65264     ...
65265     time_t now;
65266     int minutes_to_event;
65267     ...
65268     time(&now);
65269     minutes_to_event = ...;
65270     printf("The time is ");
65271     puts(asctime(localtime(&now)));
65272     printf("There are %d minutes to the event.\n",
65273           minutes_to_event);
65274     ...

```

APPLICATION USAGE

None.

RATIONALE

The *time()* function returns a value in seconds (type **time_t**) while *times()* returns a set of values in clock ticks (type **clock_t**). Some historical implementations, such as 4.3 BSD, have mechanisms capable of returning more precise times (see below). A generalized timing scheme to unify these various timing mechanisms has been proposed but not adopted.

Implementations in which **time_t** is a 32-bit signed integer (many historical implementations) fail in the year 2038. POSIX.1-200x does not address this problem. However, the use of the **time_t** type is mandated in order to ease the eventual fix.

The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C standard.

Many historical implementations (including Version 7) and the 1984 /usr/group standard use **long** instead of **time_t**. This volume of POSIX.1-200x uses the latter type in order to agree with the ISO C standard.

4.3 BSD includes *time()* only as an alternate function to the more flexible *gettimeofday()* function.

FUTURE DIRECTIONS

In a future version of this volume of POSIX.1-200x, **time_t** is likely to be required to be capable of representing times far in the future. Whether this will be mandated as a 64-bit type or a requirement that a specific date in the future be representable (for example, 10000 AD) is not yet determined. Systems purchased after the approval of this volume of POSIX.1-200x should be evaluated to determine whether their lifetime will extend past 2038.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

65303

Issue 6

65304

Extensions beyond the ISO C standard are marked.

65305

The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.

65306 **NAME**

65307 timer_create — create a per-process timer

65308 **SYNOPSIS**

```
65309 CX      #include <signal.h>
65310      #include <time.h>
65311
65311      int timer_create(clockid_t clockid, struct sigevent *restrict evp,
65312                      timer_t *restrict timerid);
```

65313 **DESCRIPTION**

65314 The *timer_create()* function shall create a per-process timer using the specified clock, *clock_id*, as
 65315 the timing base. The *timer_create()* function shall return, in the location referenced by *timerid*, a
 65316 timer ID of type **timer_t** used to identify the timer in timer requests. This timer ID shall be
 65317 unique within the calling process until the timer is deleted. The particular clock, *clock_id*, is
 65318 defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return
 65319 from *timer_create()*.

65320 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the
 65321 application, defines the asynchronous notification to occur as specified in [Section 2.4.1](#) (on page
 65322 463) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument
 65323 pointed to a **sigevent** structure with the *sigev_notify* member having the value SIGEV_SIGNAL,
 65324 the *sigev_signo* having a default signal number, and the *sigev_value* member having the value of
 65325 the timer ID.

65326 Each implementation shall define a set of clocks that can be used as timing bases for per-process
 65327 timers. All implementations shall support a *clock_id* of CLOCK_REALTIME. If the Monotonic
 65328 Clock option is supported, implementations shall support a *clock_id* of CLOCK_MONOTONIC.

65329 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed
 65330 and deleted by an *exec*.

65331 CPT If **_POSIX_CPUTIME** is defined, implementations shall support *clock_id* values representing the
 65332 CPU-time clock of the calling process.

65333 TCT If **_POSIX_THREAD_CPUTIME** is defined, implementations shall support *clock_id* values
 65334 representing the CPU-time clock of the calling thread.

65335 CPT|TCT It is implementation-defined whether a *timer_create()* function will succeed if the value defined
 65336 by *clock_id* corresponds to the CPU-time clock of a process or thread different from the process
 65337 or thread invoking the function.

65338 TSA If *evp->sigev_notify* is SIGEV_THREAD and *sev->sigev_notify_attributes* is not NULL, if the
 65339 attribute pointed to by *sev->sigev_notify_attributes* has a thread stack address specified by a call
 65340 to *pthread_attr_setstack()*, the results are unspecified if the signal is generated more than once.

65341 **RETURN VALUE**

65342 If the call succeeds, *timer_create()* shall return zero and update the location referenced by *timerid*
 65343 to a **timer_t**, which can be passed to the per-process timer calls. If an error occurs, the function
 65344 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if
 65345 an error occurs.

65346 **ERRORS**65347 The *timer_create()* function shall fail if:

timer_create()

System Interfaces

65348	[EAGAIN]	The system lacks sufficient signal queuing resources to honor the request.
65349	[EAGAIN]	The calling process has already created all of the timers it is allowed by this implementation.
65350		
65351	[EINVAL]	The specified clock ID is not defined.
65352	CPT TCT [ENOTSUP]	The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by <i>clock_id</i> and associated with a process or thread different from the process or thread invoking <i>timer_create()</i> .
65353		
65354		

EXAMPLES

None.

APPLICATION USAGE

If a timer is created which has *evp->sigev_sigev_notify* set to `SIGEV_THREAD` and the attribute pointed to by *evp->sigev_notify_attributes* has a thread stack address specified by a call to *pthread_attr_setstack()*, the memory dedicated as a thread stack cannot be recovered. The reason for this is that the threads created in response to a timer expiration are created detached, or in an unspecified way if the thread attribute's *detachstate* is `PTHREAD_CREATE_JOINABLE`. In neither case is it valid to call *pthread_join()*, which makes it impossible to determine the lifetime of the created thread which thus means the stack memory cannot be reused.

RATIONALE**Periodic Timer Overrun and Resource Allocation**

The specified timer facilities may deliver realtime signals (that is, queued signals) on implementations that support this option. Since realtime applications cannot afford to lose notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it must be possible to ensure that sufficient resources exist to deliver the signal when the event occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a request and a subsequent signal generation. If the request cannot allocate the signal delivery resources, it can fail the call with an [EAGAIN] error.

Periodic timers are a special case. A single request can generate an unspecified number of signals. This is not a problem if the requesting process can service the signals as fast as they are generated, thus making the signal delivery resources available for delivery of subsequent periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the currently pending signal has been delivered.

Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a pending signal are generated, it is implementation-defined whether a signal is delivered for each occurrence. This is not adequate for some realtime applications. So a mechanism is required to allow applications to detect how many timer expirations were delayed without requiring an indefinite amount of system resources to store the delayed expirations.

The specified facilities provide for an overrun count. The overrun count is defined as the number of extra timer expirations that occurred between the time a timer expiration signal is generated and the time the signal is delivered. The signal-catching function, if it is concerned with overruns, can retrieve this count on entry. With this method, a periodic timer only needs one “signal queuing resource” that can be allocated at the time of the *timer_create()* function call.

A function is defined to retrieve the overrun count so that an application need not allocate static storage to contain the count, and an implementation need not update this storage asynchronously on timer expirations. But, for some high-frequency periodic applications, the overhead of an additional system call on each timer expiration may be prohibitive. The functions, as defined, permit an implementation to maintain the overrun count in user space, associated with the *timerid*. The *timer_getoverrun()* function can then be implemented as a macro

65396 that uses the *timerid* argument (which may just be a pointer to a user space structure containing
 65397 the counter) to locate the overrun count with no system call overhead. Other implementations,
 65398 less concerned with this class of applications, can avoid the asynchronous update of user space
 65399 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

65400 **Timer Expiration Signal Parameters**

65401 The Realtime Signals Extension option supports an application-specific datum that is delivered
 65402 to the extended signal handler. This value is explicitly specified by the application, along with
 65403 the signal number to be delivered, in a **sigevent** structure. The type of the application-defined
 65404 value can be either an integer constant or a pointer. This explicit specification of the value, as
 65405 opposed to always sending the timer ID, was selected based on existing practice.

65406 It is common practice for realtime applications (on non-POSIX systems or realtime extended
 65407 POSIX systems) to use the parameters of event handlers as the case label of a switch statement or
 65408 as a pointer to an application-defined data structure. Since *timer_ids* are dynamically allocated
 65409 by the *timer_create()* function, they can be used for neither of these functions without additional
 65410 application overhead in the signal handler; for example, to search an array of saved timer IDs to
 65411 associate the ID with a constant or application data structure.

65412 **FUTURE DIRECTIONS**

65413 None.

65414 **SEE ALSO**

65415 [*clock_getres\(\)*](#), [*timer_delete\(\)*](#), [*timer_getoverrun\(\)*](#)

65416 XBD [**<time.h>**](#)

65417 **CHANGE HISTORY**

65418 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

65419 **Issue 6**

65420 The *timer_create()* function is marked as part of the Timers option.

65421 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 65422 implementation does not support the Timers option.

65423 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

65424 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the
 65425 requirement for the CLOCK_MONOTONIC clock under the Monotonic Clock option.

65426 The **restrict** keyword is added to the *timer_create()* prototype for alignment with the
 65427 ISO/IEC 9899:1999 standard.

65428 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/138 is applied, updating the
 65429 DESCRIPTION and APPLICATION USAGE sections to describe the case when a timer is created
 65430 with the notification method set to SIGEV_THREAD.

65431 **Issue 7**

65432 The *timer_create()* function is moved from the Timers option to the Base.

timer_delete()65433 **NAME**

65434 timer_delete — delete a per-process timer

65435 **SYNOPSIS**

```
65436 CX #include <time.h>
65437 int timer_delete(timer_t timerid);
```

65438 **DESCRIPTION**

65439 The *timer_delete()* function deletes the specified timer, *timerid*, previously created by the
 65440 *timer_create()* function. If the timer is armed when *timer_delete()* is called, the behavior shall be
 65441 as if the timer is automatically disarmed before removal. The disposition of pending signals for
 65442 the deleted timer is unspecified.

65443 **RETURN VALUE**

65444 If successful, the *timer_delete()* function shall return a value of zero. Otherwise, the function shall
 65445 return a value of -1 and set *errno* to indicate the error.

65446 **ERRORS**65447 The *timer_delete()* function may fail if:65448 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.65449 **EXAMPLES**

65450 None.

65451 **APPLICATION USAGE**

65452 None.

65453 **RATIONALE**

65454 None.

65455 **FUTURE DIRECTIONS**

65456 None.

65457 **SEE ALSO**65458 [timer_create\(\)](#)65459 XBD [<time.h>](#)65460 **CHANGE HISTORY**

65461 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

65462 **Issue 6**65463 The *timer_delete()* function is marked as part of the Timers option.

65464 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 65465 implementation does not support the Timers option.

65466 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/139 is applied, updating the ERRORS
 65467 section so that the [EINVAL] error becomes optional.

65468 **Issue 7**65469 The *timer_delete()* function is moved from the Timers option to the Base.

65470 **NAME**

65471 timer_getoverrun, timer_gettime, timer_settime — per-process timers

65472 **SYNOPSIS**

```
65473 CX #include <time.h>
65474
65474 int timer_getoverrun(timer_t timerid);
65475 int timer_gettime(timer_t timerid, struct itimerspec *value);
65476 int timer_settime(timer_t timerid, int flags,
65477     const struct itimerspec *restrict value,
65478     struct itimerspec *restrict ovalue);
```

65479 **DESCRIPTION**

65480 The *timer_gettime()* function shall store the amount of time until the specified timer, *timerid*,
 65481 expires and the reload value of the timer into the space pointed to by the *value* argument. The
 65482 *it_value* member of this structure shall contain the amount of time before the timer expires, or
 65483 zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if
 65484 the timer was armed with absolute time. The *it_interval* member of *value* shall contain the reload
 65485 value last set by *timer_settime()*.

65486 The *timer_settime()* function shall set the time until the next expiration of the timer specified by
 65487 *timerid* from the *it_value* member of the *value* argument and arm the timer if the *it_value* member
 65488 of *value* is non-zero. If the specified timer was already armed when *timer_settime()* is called, this
 65489 call shall reset the time until next expiration to the *value* specified. If the *it_value* member of *value*
 65490 is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending
 65491 expiration notifications is unspecified.

65492 If the flag `TIMER_ABSTIME` is not set in the argument *flags*, *timer_settime()* shall behave as if the
 65493 time until next expiration is set to be equal to the interval specified by the *it_value* member of
 65494 *value*. That is, the timer shall expire in *it_value* nanoseconds from when the call is made. If the
 65495 flag `TIMER_ABSTIME` is set in the argument *flags*, *timer_settime()* shall behave as if the time
 65496 until next expiration is set to be equal to the difference between the absolute time specified by
 65497 the *it_value* member of *value* and the current value of the clock associated with *timerid*. That is,
 65498 the timer shall expire when the clock reaches the value specified by the *it_value* member of *value*.
 65499 If the specified time has already passed, the function shall succeed and the expiration
 65500 notification shall be made.

65501 The reload value of the timer shall be set to the value specified by the *it_interval* member of
 65502 *value*. When a timer is armed with a non-zero *it_interval*, a periodic (or repetitive) timer is
 65503 specified.

65504 Time values that are between two consecutive non-negative integer multiples of the resolution of
 65505 the specified timer shall be rounded up to the larger multiple of the resolution. Quantization
 65506 error shall not cause the timer to expire earlier than the rounded time value.

65507 If the argument *ovalue* is not NULL, the *timer_settime()* function shall store, in the location
 65508 referenced by *ovalue*, a value representing the previous amount of time before the timer would
 65509 have expired, or zero if the timer was disarmed, together with the previous timer reload value.
 65510 Timers shall not expire before their scheduled time.

65511 Only a single signal shall be queued to the process for a given timer at any point in time. When a
 65512 timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun
 65513 shall occur. When a timer expiration signal is delivered to or accepted by a process, the
 65514 *timer_getoverrun()* function shall return the timer expiration overrun count for the specified
 65515 timer. The overrun count returned contains the number of extra timer expirations that occurred

65516 between the time the signal was generated (queued) and when it was delivered or accepted, up
 65517 to but not including an implementation-defined maximum of {DELAYTIMER_MAX}. If the
 65518 number of such extra expirations is greater than or equal to {DELAYTIMER_MAX}, then the
 65519 overrun count shall be set to {DELAYTIMER_MAX}. The value returned by *timer_getoverrun()*
 65520 shall apply to the most recent expiration signal delivery or acceptance for the timer. If no
 65521 expiration signal has been delivered for the timer, the return value of *timer_getoverrun()* is
 65522 unspecified.

RETURN VALUE

65523 If the *timer_getoverrun()* function succeeds, it shall return the timer expiration overrun count as
 65524 explained above.
 65525

65526 If the *timer_gettime()* or *timer_settime()* functions succeed, a value of 0 shall be returned.

65527 If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to
 65528 indicate the error.

ERRORS

65529 The *timer_settime()* function shall fail if:

65531 [EINVAL] A *value* structure specified a nanosecond value less than zero or greater than
 65532 or equal to 1000 million, and the *it_value* member of that structure did not
 65533 specify zero seconds and nanoseconds.

65534 These functions may fail if:

65535 [EINVAL] The *timerid* argument does not correspond to an ID returned by *timer_create()*
 65536 but not yet deleted by *timer_delete()*.

65537 The *timer_settime()* function may fail if:

65538 [EINVAL] The *it_interval* member of *value* is not zero and the timer was created with
 65539 notification by creation of a new thread (*sigev_sigev_notify* was
 65540 SIGEV_THREAD) and a fixed stack address has been set in the thread
 65541 attribute pointed to by *sigev_notify_attributes*.

EXAMPLES

65542 None.
 65543

APPLICATION USAGE

65544 Using fixed stack addresses is problematic when timer expiration is signalled by the creation of a
 65545 new thread. Since it cannot be assumed that the thread created for one expiration is finished
 65546 before the next expiration of the timer, it could happen that two threads use the same memory as
 65547 a stack at the same time. This is invalid and produces undefined results.
 65548

RATIONALE

65549 Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The
 65550 inverse of this tick rate is the clock resolution, also called the clock granularity, which in either
 65551 case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for
 65552 these common rates. The granularity of practical clocks implies that if one reads a given clock
 65553 twice in rapid succession, one may get the same time value twice; and that timers must wait for
 65554 the next clock tick after the theoretical expiration time, to ensure that a timer never returns too
 65555 soon. Note also that the granularity of the clock may be significantly coarser than the resolution
 65556 of the data format used to set and get time and interval values. Also note that some
 65557 implementations may choose to adjust time and/or interval values to exactly match the ticks of
 65558 the underlying clock.
 65559

65560 This volume of POSIX.1-200x defines functions that allow an application to determine the
 65561 implementation-supported resolution for the clocks and requires an implementation to
 65562 document the resolution supported for timers and *nanosleep()* if they differ from the supported
 65563 clock resolution. This is more of a procurement issue than a runtime application issue.

SEE ALSO*clock_getres()*, *timer_create()*XBD <**time.h**>**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions are marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

The [EINVAL] error condition is updated to include the following: “and the *it_value* member of that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC Interpretation 1003.1 #89.

The DESCRIPTION for *timer_getoverrun()* is updated to clarify that “If no expiration signal has been delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of *timer_getoverrun()* is unspecified”.

The **restrict** keyword is added to the *timer_settime()* prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/140 is applied, updating the ERRORS section so that the mandatory [EINVAL] error (“The *timerid* argument does not correspond to an ID returned by *timer_create()* but not yet deleted by *timer_delete()*”) becomes optional.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/141 is applied, updating the ERRORS section to include an optional [EINVAL] error for the case when a timer is created with the notification method set to SIGEV_THREAD. APPLICATION USAGE text is also added.

Issue 7

The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions are moved from the Timers option to the Base.

Functionality relating to the Realtime Signals Extension option is moved to the Base.

65594 **NAME**
 65595 `times` — get process and waited-for child process times

65596 **SYNOPSIS**
 65597 `#include <sys/times.h>`
 65598 `clock_t times(struct tms *buffer);`

65599 **DESCRIPTION**
 65600 The `times()` function shall fill the `tms` structure pointed to by `buffer` with time-accounting
 65601 information. The `tms` structure is defined in `<sys/times.h>`.

65602 All times are measured in terms of the number of clock ticks used.

65603 The times of a terminated child process shall be included in the `tms_cutime` and `tms_cstime`
 65604 elements of the parent when `wait()`, `waitid()`, or `waitpid()` returns the process ID of this
 65605 terminated child. If a child process has not waited for its children, their times shall not be
 65606 included in its times.

- 65607 • The `tms_utime` structure member is the CPU time charged for the execution of user
 65608 instructions of the calling process.
- 65609 • The `tms_stime` structure member is the CPU time charged for execution by the system on
 65610 behalf of the calling process.
- 65611 • The `tms_cutime` structure member is the sum of the `tms_utime` and `tms_cutime` times of the
 65612 child processes.
- 65613 • The `tms_cstime` structure member is the sum of the `tms_stime` and `tms_cstime` times of the
 65614 child processes.

65615 **RETURN VALUE**
 65616 Upon successful completion, `times()` shall return the elapsed real time, in clock ticks, since an
 65617 arbitrary point in the past (for example, system start-up time). This point does not change from
 65618 one invocation of `times()` within the process to another. The return value may overflow the
 65619 possible range of type `clock_t`. If `times()` fails, `(clock_t)-1` shall be returned and `errno` set to
 65620 indicate the error.

65621 **ERRORS**
 65622 No errors are defined.

65623 EXAMPLES

65624 Timing a Database Lookup

65625 The following example defines two functions, `start_clock()` and `end_clock()`, that are used to time
 65626 a lookup. It also defines variables of type `clock_t` and `tms` to measure the duration of
 65627 transactions. The `start_clock()` function saves the beginning times given by the `times()` function.
 65628 The `end_clock()` function gets the ending times and prints the difference between the two times.

```
65629 #include <sys/times.h>
65630 #include <stdio.h>
65631 ...
65632 void start_clock(void);
65633 void end_clock(char *msg);
65634 ...
65635 static clock_t st_time;
65636 static clock_t en_time;
65637 static struct tms st_cpu;
```

```

65638     static struct tms en_cpu;
65639     ...
65640     void
65641     start_clock()
65642     {
65643         st_time = times(&st_cpu);
65644     }
65645     /* This example assumes that the result of each subtraction
65646        is within the range of values that can be represented in
65647        an integer type. */
65648     void
65649     end_clock(char *msg)
65650     {
65651         en_time = times(&en_cpu);
65652         fputs(msg, stdout);
65653         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
65654             (intmax_t)(en_time - st_time),
65655             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
65656             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
65657     }

```

APPLICATION USAGE

Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per second as it may vary from system to system.

RATIONALE

The accuracy of the times reported is intentionally left unspecified to allow implementations flexibility in design, from uniprocessor to multi-processor networks.

The inclusion of times of child processes is recursive, so that a parent process may collect the total times of all of its descendants. But the times of a child are only added to those of its parent when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process can always see the total times of all its descendants; see also the discussion of the term “realtime” in [alarm\(\)](#).

If the type `clock_t` is defined to be a signed 32-bit integer, it overflows in somewhat more than a year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual systems that run continuously for longer than that. This volume of POSIX.1-200x permits an implementation to make the reference point for the returned value be the start-up time of the process, rather than system start-up time.

The term “charge” in this context has nothing to do with billing for services. The operating system accounts for time used in this way. That information must be correct, regardless of how that information is used.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

timezone()

65684 **NAME**
65685 timezone — difference from UTC and local standard time

SYNOPSIS

```
65686 XSI       #include <time.h>  
65687           extern long timezone;
```

DESCRIPTION

65689 Refer to [tzset\(\)](#).
65690

65691 **NAME**
 65692 tmpfile — create a temporary file

65693 **SYNOPSIS**
 65694 #include <stdio.h>
 65695 FILE *tmpfile(void);

65696 DESCRIPTION

65697 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 65698 conflict between the requirements described here and the ISO C standard is unintentional. This
 65699 volume of POSIX.1-200x defers to the ISO C standard.

65700 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file
 65701 shall be automatically deleted when all references to the file are closed. The file is opened as in
 65702 *fopen()* for update (*w+*), except that implementations may restrict the permissions, either by
 65703 clearing the file mode bits or setting them to the value `S_IRUSR | S_IWUSR`.

65704 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is
 65705 killed while it is processing a call to *tmpfile()*.

65706 An error message may be written to standard error if the stream cannot be opened.

65707 RETURN VALUE

65708 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is
 65709 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

65710 ERRORS

65711 The *tmpfile()* function shall fail if:

65712 CX [EINTR] A signal was caught during *tmpfile()*.

65713 CX [EMFILE] All file descriptors available to the process are currently open.

65714 [EMFILE] {STREAM_MAX} streams are currently open in the calling process. +

65715 CX [ENFILE] The maximum allowable number of files is currently open in the system.

65716 CX [ENOSPC] The directory or file system which would contain the new file cannot be
 65717 expanded.

65718 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly
 65719 in an object of type `off_t`.

65720 The *tmpfile()* function may fail if:

65721 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

65722 CX [ENOMEM] Insufficient storage space is available.

65723 EXAMPLES

65724 Creating a Temporary File

65725 The following example creates a temporary file for update, and returns a pointer to a stream for
 65726 the created file in the *fp* variable.

```
65727 #include <stdio.h>
65728 ...
65729 FILE *fp;
65730 fp = tmpfile ();
```

65731 **APPLICATION USAGE**

65732 It should be possible to open at least {TMP_MAX} temporary files during the lifetime of the

65733 program (this limit may be shared with *tmpnam()*) and there should be no limit on the number

65734 simultaneously open other than this limit and any limit on the number of open file descriptors |

65735 or streams ({OPEN_MAX}, {FOPEN_MAX}, {STREAM_MAX}).

65736 **RATIONALE**

65737 None.

65738 **FUTURE DIRECTIONS**

65739 None.

65740 **SEE ALSO**

65741 *fopen()*, *mkdtemp()*, *tmpnam()*, *unlink*

65742 XBD <stdio.h> |

65743 **CHANGE HISTORY**

65744 First released in Issue 1. Derived from Issue 1 of the SVID.

65745 **Issue 5**

65746 Large File Summit extensions are added.

65747 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes

65748 in previous issues.

65749 **Issue 6**

65750 Extensions beyond the ISO C standard are marked.

65751 The following new requirements on POSIX implementations derive from alignment with the

65752 Single UNIX Specification:

- 65753 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support
- 65754 large files.
- 65755 • The [EMFILE] optional error condition is added.

65756 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999

65757 standard.

65758 **Issue 7**

65759 Austin Group Interpretation 1003.1-2001 #025 is applied, clarifying that implementations may +

65760 restrict the permissions of the file created. +

65761 SD5-XBD-ERN-4 is applied, changing the definition of the [EMFILE] error.

65762 SD5-XSH-ERN-149 is applied, adding the mandatory [EMFILE] error condition for |

65763 {STREAM_MAX} streams open.

65764 **NAME**

65765 tmpnam — create a name for a temporary file

65766 **SYNOPSIS**

```
65767 OB #include <stdio.h>
65768 char *tmpnam(char *s);
```

65769 **DESCRIPTION**

65770 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 65771 conflict between the requirements described here and the ISO C standard is unintentional. This
 65772 volume of POSIX.1-200x defers to the ISO C standard.

65773 The *tmpnam()* function shall generate a string that is a valid filename and that is not the same as
 65774 the name of an existing file. The function is potentially capable of generating {TMP_MAX}
 65775 different strings, but any or all of them may already be in use by existing files and thus not be
 65776 suitable return values.

65777 The *tmpnam()* function generates a different string each time it is called from the same process,
 65778 up to {TMP_MAX} times. If it is called more than {TMP_MAX} times, the behavior is
 65779 implementation-defined.

65780 The implementation shall behave as if no function defined in this volume of POSIX.1-200x,
 65781 except *tempnam()*, calls *tmpnam()*.

65782 CX If the application uses any of the POSIX threads functions, the application shall ensure that the
 65783 *tmpnam()* function is called with a non-NULL parameter.

65784 **RETURN VALUE**

65785 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can
 65786 be generated, the *tmpnam()* function shall return a null pointer.

65787 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and
 65788 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the
 65789 argument *s* is not a null pointer, it is presumed to point to an array of at least *L_tmpnam* **chars**;
 65790 *tmpnam()* shall write its result in that array and shall return the argument as its value.

65791 **ERRORS**

65792 No errors are defined.

65793 **EXAMPLES**65794 **Generating a Filename**65795 The following example generates a unique filename and stores it in the array pointed to by *ptr*.

```
65796 #include <stdio.h>
65797 ...
65798 char filename[L_tmpnam+1];
65799 char *ptr;

65800 ptr = tmpnam(filename);
```

65801 **APPLICATION USAGE**65802 This function only creates filenames. It is the application's responsibility to create and remove
65803 the files.65804 Between the time a pathname is created and the file is opened, it is possible for some other
65805 process to create a file with the same name. Applications may find *tmpfile()* more useful.

tmpnam()

65806 Applications should use the *tmpfile()*, *mkstemp()*, or *mkdtemp()* functions instead of the
65807 obsolescent *tmpnam()* function.

RATIONALE

65808 None.
65809

FUTURE DIRECTIONS

65810 The *tmpnam()* function may be removed in a future version.
65811

CHANGE HISTORY

65815 First released in Issue 1. Derived from Issue 1 of the SVID.
65816

Issue 5

65817 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
65818

Issue 6

65819 Extensions beyond the ISO C standard are marked.
65820

65821 The normative text is updated to avoid use of the term “must” for application requirements.

65822 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

65823 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/142 is applied, updating the
65824 DESCRIPTION to allow implementations of the *tempnam()* function to call *tmpnam()*.

Issue 7

65825 The *tmpnam()* function is marked obsolescent.
65826

65827 **NAME**
65828 toascii — translate an integer to a 7-bit ASCII character

65829 **SYNOPSIS**

```
65830 OB XSI #include <ctype.h>  
65831 int toascii(int c);
```

65832 **DESCRIPTION**

65833 The *toascii()* function shall convert its argument into a 7-bit ASCII character.

65834 **RETURN VALUE**

65835 The *toascii()* function shall return the value (*c* & 0x7f).

65836 **ERRORS**

65837 No errors are returned.

65838 **EXAMPLES**

65839 None.

65840 **APPLICATION USAGE**

65841 The *toascii()* function cannot be used portably in a localized application.

65842 **RATIONALE**

65843 None.

65844 **FUTURE DIRECTIONS**

65845 The *toascii()* function may be removed in a future version.

65846 **SEE ALSO**

65847 [isascii\(\)](#)

65848 XBD [<ctype.h>](#)

65849 **CHANGE HISTORY**

65850 First released in Issue 1. Derived from Issue 1 of the SVID.

65851 **Issue 7**

65852 The *toascii()* function is marked obsolescent.

65853 **NAME**
 65854 `tolower, tolower_l` — transliterate uppercase characters to lowercase

SYNOPSIS

```
65855     #include <ctype.h>
65856
65857     int tolower(int c);
65858 CX    int tolower_l(int c, locale_t locale);
```

DESCRIPTION

65859
 65860 CX For `tolower()`: The functionality described on this reference page is aligned with the ISO C
 65861 standard. Any conflict between the requirements described here and the ISO C standard is
 65862 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

65863 CX The `tolower()` and `tolower_l()` functions have as a domain a type `int`, the value of which is
 65864 representable as an **unsigned char** or the value of EOF. If the argument has any other value, the
 65865 behavior is undefined. If the argument of `tolower()` or `tolower_l()` represents an uppercase letter,
 65866 and there exists a corresponding lowercase letter as defined by character type information in the
 65867 program locale or in the locale represented by `locale`, respectively (category `LC_CTYPE`), the
 65868 result shall be the corresponding lowercase letter. All other arguments in the domain are
 65869 returned unchanged.

RETURN VALUE

65870
 65871 CX Upon successful completion, the `tolower()` and `tolower_l()` functions shall return the lowercase
 65872 letter corresponding to the argument passed; otherwise, they shall return the argument
 65873 unchanged.

ERRORS

65874
 65875 The `tolower_l()` function may fail if:

65876 CX `[EINVAL]` `locale` is not a valid locale object handle.

EXAMPLES

65877
 65878 None.

APPLICATION USAGE

65879
 65880 None.

RATIONALE

65881
 65882 None.

FUTURE DIRECTIONS

65883
 65884 None.

65925 None.

65926 **SEE ALSO**65927 [*setlocale\(\), uselocale\(\)*](#)65928 XBD [Chapter 7](#) (on page 121), [*<ctype.h>*](#), [*<locale.h>*](#) |65929 **CHANGE HISTORY**

65930 First released in Issue 1. Derived from Issue 1 of the SVID.

65931 **Issue 6**

65932 Extensions beyond the ISO C standard are marked.

65933 **Issue 7**

65934 SD5-XSH-ERN-181 is applied, clarifying the RETURN VALUE section. |

65935 The `toupper_l()` function is added from The Open Group Technical Standard, 2006, Extended API
65936 Set Part 4.

65937 **NAME**
 65938 towctrans, towctrans_l — wide-character transliteration

65939 **SYNOPSIS**

65940 #include <wctype.h>
 65941 wint_t towctrans(wint_t wc, wctrans_t desc);
 65942 CX wint_t towctrans_l(wint_t wc, wctrans_t desc,
 65943 locale_t locale);

65944 **DESCRIPTION**

65945 CX For *towctrans()*: The functionality described on this reference page is aligned with the ISO C
 65946 standard. Any conflict between the requirements described here and the ISO C standard is
 65947 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

65948 CX The *towctrans()* and *towctrans_l()* functions shall transliterate the wide-character code *wc* using
 65949 the mapping described by *desc*.

65950 CX The current setting of the *LC_CTYPE* category in the current locale of the process or in the locale
 65951 CX represented by *locale*, respectively, should be the same as during the call to *wctrans()* or
 65952 *wctrans_l()* that returned the value *desc*.

65953 If the value of *desc* is invalid (that is, not obtained by a call to *wctrans()* or *desc* is invalidated by a
 65954 subsequent call to *setlocale()* that has affected category *LC_CTYPE*), the result is unspecified.

65955 CX If the value of *desc* is invalid (that is, not obtained by a call to *wctrans_l()* with the same locale
 65956 object *locale*) the result is unspecified.

65957 CX An application wishing to check for error situations should set *errno* to 0 before calling
 65958 *towctrans()* or *towctrans_l()*.

65959 If *errno* is non-zero on return, an error has occurred.

65960 **RETURN VALUE**

65961 CX If successful, the *towctrans()* and *towctrans_l()* functions shall return the mapped value of *wc*
 65962 using the mapping described by *desc*. Otherwise, they shall return *wc* unchanged.

65963 **ERRORS**

65964 These functions may fail if:

65965 CX [EINVAL] *desc* contains an invalid transliteration descriptor.

65966 The *towctrans_l()* function may fail if:

65967 CX [EINVAL] *locale* is not a valid locale object handle.

65968 **EXAMPLES**

65969 None.

65970 **APPLICATION USAGE**

65971 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the
 65972 table below, the functions in the left column are equivalent to the functions in the right column.

65973	towlower(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("tolower"))
65974	towlower_l(<i>wc</i> , <i>locale</i>)	towctrans_l(<i>wc</i> , wctrans("tolower"), <i>locale</i>)
65975	towupper(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("toupper"))
65976	towupper_l(<i>wc</i> , <i>locale</i>)	towctrans_l(<i>wc</i> , wctrans("toupper"), <i>locale</i>)

65977 **RATIONALE**

65978 None.

65979 **FUTURE DIRECTIONS**

65980 None.

65981 **SEE ALSO**65982 *tolower()*, *toupper()*, *wctrans()*65983 XBD <*wctype.h*>65984 **CHANGE HISTORY**

65985 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

65986 **Issue 6**

65987 Extensions beyond the ISO C standard are marked.

65988 **Issue 7**65989 The *towctrans_l()* function is added from The Open Group Technical Standard, 2006, Extended
65990 API Set Part 4.

65991 **NAME**

65992 towlower, towlower_l — transliterate uppercase wide-character code to lowercase

65993 **SYNOPSIS**

65994 #include <wctype.h>

65995 wint_t towlower(wint_t wc);

65996 CX wint_t towlower_l(wint_t wc, locale_t locale);

65997 **DESCRIPTION**65998 CX For *towlower()*: The functionality described on this reference page is aligned with the ISO C
65999 standard. Any conflict between the requirements described here and the ISO C standard is
66000 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.66001 CX The *towlower()* and *towlower_l()* functions have as a domain a type **wint_t**, the value of which
66002 the application shall ensure is a character representable as a **wchar_t**, and a wide-character code
66003 corresponding to a valid character in the current locale or the value of WEOF. If the argument
66004 CX has any other value, the behavior is undefined. If the argument of *towlower()* or *towlower_l()*
66005 represents an uppercase wide-character code, and there exists a corresponding lowercase wide-
66006 CX character code as defined by character type information in the locale of the process or in the
66007 locale represented by *locale*, respectively (category *LC_CTYPE*), the result shall be the
66008 corresponding lowercase wide-character code. All other arguments in the domain are returned
66009 unchanged.66010 **RETURN VALUE**66011 CX Upon successful completion, the *towlower()* and *towlower_l()* functions shall return the
66012 lowercase letter corresponding to the argument passed; otherwise, they shall return the
66013 argument unchanged.66014 **ERRORS**66015 The *towlower_l()* function may fail if:66016 CX [EINVAL] *locale* is not a valid locale object handle.66017 **EXAMPLES**

66018 None.

66079

Issue 5

66080

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

66081

66082

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

66083

66084

Issue 6

66085

The normative text is updated to avoid use of the term “must” for application requirements.

66086

Issue 7

66087

The `towupper_l()` function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

66088

66089 **NAME**
 66090 `trunc`, `truncf`, `truncl` — round to truncated integer value

66091 **SYNOPSIS**
 66092 `#include <math.h>`
 66093 `double trunc(double x);`
 66094 `float truncf(float x);`
 66095 `long double truncl(long double x);`

66096 **DESCRIPTION**
 66097 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66098 conflict between the requirements described here and the ISO C standard is unintentional. This
 66099 volume of POSIX.1-200x defers to the ISO C standard.

66100 These functions shall round their argument to the integer value, in floating format, nearest to but
 66101 no larger in magnitude than the argument.

66102 **RETURN VALUE**
 66103 Upon successful completion, these functions shall return the truncated integer value.

66104 MX If x is NaN, a NaN shall be returned.
 66105 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

66106 **ERRORS**
 66107 No errors are defined.

66108 **EXAMPLES**
 66109 None.

66110 **APPLICATION USAGE**
 66111 None.

66112 **RATIONALE**
 66113 None.

66114 **FUTURE DIRECTIONS**
 66115 None.

66116 **SEE ALSO**
 66117 XBD [<math.h>](#)

66118 **CHANGE HISTORY**
 66119 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

66120 **NAME**

66121 truncate — truncate a file to a specified length

66122 **SYNOPSIS**

66123 #include <unistd.h>

66124 int truncate(const char *path, off_t length);

66125 **DESCRIPTION**66126 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be
66127 equal to *length* bytes.66128 If the file previously was larger than *length*, the extra data is discarded. If the file was previously
66129 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

66130 The application shall ensure that the process has write permission for the file.

66131 If the request would cause the file size to exceed the soft file size limit for the process, the
66132 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.66133 The *truncate()* function shall not modify the file offset for any open file descriptions associated
66134 with the file. Upon successful completion, if the file size is changed, *truncate()* shall mark for
66135 update the last data modification and last file status change timestamps of the file, and the
66136 S_ISUID and S_ISGID bits of the file mode may be cleared.66137 **RETURN VALUE**66138 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*
66139 set to indicate the error.66140 **ERRORS**66141 The *truncate()* function shall fail if:

66142 [EINTR] A signal was caught during execution.

66143 [EINVAL] The *length* argument was less than 0.

66144 [EFBIG] or [EINVAL]

66145 The *length* argument was greater than the maximum file size.

66146 [EIO] An I/O error occurred while reading from or writing to a file system.

66147 [EACCES] A component of the path prefix denies search permission, or write permission
66148 is denied on the file.

66149 [EISDIR] The named file is a directory.

66150 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
66151 argument.

66152 [ENAMETOOLONG]

66153 The length of the *path* argument exceeds {PATH_MAX} or a pathname
66154 component is longer than {NAME_MAX}.66155 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.66156 [ENOTDIR] A component of the path prefix of *path* is not a directory.

66157 [EROFS] The named file resides on a read-only file system.

truncate()

66158 The *truncate()* function may fail if:

66159 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
66160 resolution of the *path* argument.

66161 [ENAMETOOLONG]
66162 Pathname resolution of a symbolic link produced an intermediate result
66163 whose length exceeds {PATH_MAX}.

66164 **EXAMPLES**
66165 None.

66166 **APPLICATION USAGE**
66167 None.

66168 **RATIONALE**
66169 None.

66170 **FUTURE DIRECTIONS**
66171 None.

66172 **SEE ALSO**
66173 *open()*
66174 XBD <[unistd.h](#)>

66175 **CHANGE HISTORY**
66176 First released in Issue 4, Version 2.

66177 **Issue 5**
66178 Moved from X/OPEN UNIX extension to BASE.
66179 Large File Summit extensions are added.

66180 **Issue 6**
66181 This reference page is split out from the *truncate()* reference page.
66182 The normative text is updated to avoid use of the term “must” for application requirements.
66183 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
66184 [ELOOP] error condition is added.

66185 **Issue 7**
66186 The *truncate()* function is moved from the XSI option to the Base.
66187 Changes are made related to support for finegrained timestamps.

66188 **NAME**
66189 `truncf, trunc1` — round to truncated integer value

66190 **SYNOPSIS**
66191 `#include <math.h>`
66192 `float truncf(float x);`
66193 `long double trunc1(long double x);`

66194 **DESCRIPTION**
66195 Refer to *trunc()*.

tsearch()

66196 **NAME**
66197 `tsearch` — search a binary search tree

SYNOPSIS

```
66198 XSI #include <search.h>  
66200 void *tsearch(const void *key, void **rootp,  
66201 int (*compar)(const void *, const void *));
```

DESCRIPTION

66202 Refer to [tdelete\(\)](#).
66203

66204 **NAME**
 66205 `ttyname, ttyname_r` — find the pathname of a terminal

66206 **SYNOPSIS**
 66207 `#include <unistd.h>`
 66208 `char *ttyname(int fildev);`
 66209 `int ttyname_r(int fildev, char *name, size_t namesize);`

66210 **DESCRIPTION**
 66211 The `ttyname()` function shall return a pointer to a string containing a null-terminated pathname
 66212 of the terminal associated with file descriptor *fildev*. The return value may point to static data
 66213 whose content is overwritten by each call.

66214 The `ttyname()` function need not be thread-safe. A function that is not required to be thread-safe
 66215 is not required to be reentrant.

66216 The `ttyname_r()` function shall store the null-terminated pathname of the terminal associated
 66217 with the file descriptor *fildev* in the character array referenced by *name*. The array is *namesize*
 66218 characters long and should have space for the name and the terminating null character. The
 66219 maximum length of the terminal name shall be {TTY_NAME_MAX}.

66220 **RETURN VALUE**
 66221 Upon successful completion, `ttyname()` shall return a pointer to a string. Otherwise, a null
 66222 pointer shall be returned and *errno* set to indicate the error.

66223 If successful, the `ttyname_r()` function shall return zero. Otherwise, an error number shall be
 66224 returned to indicate the error.

66225 **ERRORS**
 66226 The `ttyname()` function may fail if:
 66227 [EBADF] The *fildev* argument is not a valid file descriptor.
 66228 [ENOTTY] The file associated with the *fildev* argument is not a terminal.

66229 The `ttyname_r()` function may fail if:
 66230 [EBADF] The *fildev* argument is not a valid file descriptor.
 66231 [ENOTTY] The file associated with the *fildev* argument is not a terminal.
 66232 [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
 66233 including the terminating null character.

66234 **EXAMPLES**
 66235 None.

66236 **APPLICATION USAGE**
 66237 None.

66238 **RATIONALE**
 66239 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a
 66240 reference to an undefined term.

66241 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-
 66242 zero value if it fails. The non-thread-safe version may return the name in a static data area that
 66243 may be overwritten by each call.

66244

FUTURE DIRECTIONS

66245

None.

CHANGE HISTORY

66249

First released in Issue 1. Derived from Issue 1 of the SVID.

66250

Issue 5

66251

The *ttyname_r()* function is included for alignment with the POSIX Threads Extension.

66252

A note indicating that the *ttyname()* function need not be reentrant is added to the DESCRIPTION.

66253

66254

Issue 6

66255

The *ttyname_r()* function is marked as part of the Thread-Safe Functions option.

66256

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

66257

66258

- The statement that *errno* is set on error is added.

66259

- The [EBADF] and [ENOTTY] optional error conditions are added.

66260

Issue 7

66261

SD5-XSH-ERN-100 is applied, correcting the definition of the [ENOTTY] error condition.

66262

The *ttyname_r()* function is moved from the Thread-Safe Functions option to the Base.

66263 **NAME**
66264 twalk — traverse a binary search tree

66265 **SYNOPSIS**

```
66266 XSI #include <search.h>  
66267 void twalk(const void *root,  
66268           void (*action)(const void *, VISIT, int ));
```

66269 **DESCRIPTION**

66270 Refer to *tdelete()*.

66271 **NAME**
 66272 daylight, timezone, tzname, tzset — set timezone conversion information

66273 **SYNOPSIS**
 66274 #include <time.h>

66275 XSI extern int daylight;
 66276 extern long timezone;
 66277 CX extern char *tzname[2];
 66278 void tzset(void);

66279 **DESCRIPTION**
 66280 The *tzset()* function shall use the value of the environment variable *TZ* to set time conversion
 66281 information used by *ctime()*, *localtime()*, *mktime()*, and *strftime()*. If *TZ* is absent from the
 66282 environment, implementation-defined default timezone information shall be used.

66283 The *tzset()* function shall set the external variable *tzname* as follows:

66284 tzname[0] = "std";
 66285 tzname[1] = "dst";

66286 where *std* and *dst* are as described in XBD Chapter 8 (on page 159).

66287 XSI The *tzset()* function also shall set the external variable *daylight* to 0 if Daylight Savings Time
 66288 conversions should never be applied for the timezone in use; otherwise, non-zero. The external
 66289 variable *timezone* shall be set to the difference, in seconds, between Coordinated Universal Time
 66290 (UTC) and local standard time.

66291 **RETURN VALUE**
 66292 The *tzset()* function shall not return a value.

66293 **ERRORS**
 66294 No errors are defined.

66295 **EXAMPLES**
 66296 Example *TZ* variables and their timezone differences are given in the table below:

<i>TZ</i>	<i>timezone</i>
EST5EDT	5*60*60
GMT0	0*60*60
JST-9	-9*60*60
MET-1MEST	-1*60*60
MST7MDT	7*60*60

Issue 6

The example is corrected.

66317 **NAME**66318 `ulimit` — get and set process limits66319 **SYNOPSIS**

```
66320 OB XSI #include <ulimit.h>
66321 long ulimit(int cmd, ...);
```

66322 **DESCRIPTION**

66323 The `ulimit()` function shall control process limits. The process limits that can be controlled by
 66324 this function include the maximum size of a single file that can be written (this is equivalent to
 66325 using `setrlimit()` with `RLIMIT_FSIZE`). The `cmd` values, defined in `<ulimit.h>`, include:

66326 `UL_GETFSIZE` Return the file size limit (`RLIMIT_FSIZE`) of the process. The limit shall be in
 66327 units of 512-byte blocks and shall be inherited by child processes. Files of any
 66328 size can be read. The return value shall be the integer part of the soft file size
 66329 limit divided by 512. If the result cannot be represented as a **long**, the result is
 66330 unspecified.

66331 `UL_SETFSIZE` Set the file size limit for output operations of the process to the value of the
 66332 second argument, taken as a **long**, multiplied by 512. If the result would
 66333 overflow an `rlim_t`, the actual value set is unspecified. Any process may
 66334 decrease its own limit, but only a process with appropriate privileges may
 66335 increase the limit. The return value shall be the integer part of the new file size
 66336 limit divided by 512.

66337 The `ulimit()` function shall not change the setting of `errno` if successful.

66338 As all return values are permissible in a successful situation, an application wishing to check for
 66339 error situations should set `errno` to 0, then call `ulimit()`, and, if it returns `-1`, check to see if `errno` is
 66340 non-zero.

66341 **RETURN VALUE**

66342 Upon successful completion, `ulimit()` shall return the value of the requested limit. Otherwise, `-1`
 66343 shall be returned and `errno` set to indicate the error.

66344 **ERRORS**

66345 The `ulimit()` function shall fail and the limit shall be unchanged if:

66346 `[EINVAL]` The `cmd` argument is not valid.
 66347 `[EPERM]` A process not having appropriate privileges attempts to increase its file size
 66348 limit.

66349 **EXAMPLES**

66350 None.

66351 **APPLICATION USAGE**

66352 Since the `ulimit()` function uses type **long** rather than `rlim_t`, this function is not sufficient for file
 66353 sizes on many current systems. Applications should use the `getrlimit()` or `setrlimit()` functions
 66354 instead of the obsolescent `ulimit()` function.

66355 **RATIONALE**

66356 None.

66357

FUTURE DIRECTIONS

66358

The *ulimit()* function may be removed in a future version.

66359

66362

CHANGE HISTORY

66363

First released in Issue 1. Derived from Issue 1 of the SVID.

66364

Issue 5

66365

In the description of `UL_SETFSIZE`, the text is corrected to refer to `rlim_t` rather than the spurious `rlimit_t`.

66366

66367

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

66368

Issue 7

66369

The *ulimit()* function is marked obsolescent.

66370 **NAME**
 66371 `umask` — set and get the file mode creation mask

66372 **SYNOPSIS**
 66373 `#include <sys/stat.h>`
 66374 `mode_t umask(mode_t cmask);`

66375 **DESCRIPTION**
 66376 The `umask()` function shall set the file mode creation mask of the process to `cmask` and return the
 66377 previous value of the mask. Only the file permission bits of `cmask` (see `<sys/stat.h>`) are used; the
 66378 meaning of the other bits is implementation-defined.

66379 The file mode creation mask of the process is used to turn off permission bits in the `mode`
 66380 argument supplied during calls to the following functions:

- 66381 • `open()`, `openat()`, `creat()`, `mkdir()`, `mkdirat()`, `mkfifo()`, and `mkfifoat()`
- 66382 XSI • `mknod()`, `mknodat()`
- 66383 MSG • `mq_open()`
- 66384 • `sem_open()`

66385 Bit positions that are set in `cmask` are cleared in the mode of the created file.

66386 **RETURN VALUE**
 66387 The file permission bits in the value returned by `umask()` shall be the previous value of the file
 66388 mode creation mask. The state of any other bits in that value is unspecified, except that a
 66389 subsequent call to `umask()` with the returned value as `cmask` shall leave the state of the mask the
 66390 same as its state before the first call, including any unspecified use of those bits.

66391 **ERRORS**
 66392 No errors are defined.

66393 **EXAMPLES**
 66394 None.

66395 **APPLICATION USAGE**
 66396 None.

66397 **RATIONALE**
 66398 Unsigned argument and return types for `umask()` were proposed. The return type and the
 66399 argument were both changed to **mode_t**.

66400 Historical implementations have made use of additional bits in `cmask` for their implementation-
 66401 defined purposes. The addition of the text that the meaning of other bits of the field is
 66402 implementation-defined permits these implementations to conform to this volume of
 66403 POSIX.1-200x.

66404 **FUTURE DIRECTIONS**
 66405 None.

66406 **SEE ALSO**
 66407 `creat()`, `exec`, `mkdir`, `mkfifo`, `mknod()`, `mq_open()`, `open()`, `sem_open()`
 66408 XBD `<sys/stat.h>`, `<sys/types.h>`

66409

CHANGE HISTORY

66410

First released in Issue 1. Derived from Issue 1 of the SVID.

66411

Issue 6

66412

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

66413

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

66414

66415

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

66416

66417

66418

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/143 is applied, adding the `mknod()`, `mq_open()`, and `sem_open()` functions to the DESCRIPTION and SEE ALSO sections.

66419

66420 **NAME**66421 `uname` — get the name of the current system66422 **SYNOPSIS**66423 `#include <sys/utsname.h>`66424 `int uname(struct utsname *name);`66425 **DESCRIPTION**66426 The `uname()` function shall store information identifying the current system in the structure
66427 pointed to by `name`.66428 The `uname()` function uses the **utsname** structure defined in `<sys/utsname.h>`.66429 The `uname()` function shall return a string naming the current system in the character array
66430 `sysname`. Similarly, `nodename` shall contain the name of this node within an implementation-
66431 defined communications network. The arrays `release` and `version` shall further identify the
66432 operating system. The array `machine` shall contain a name that identifies the hardware that the
66433 system is running on.

66434 The format of each member is implementation-defined.

66435 **RETURN VALUE**66436 Upon successful completion, a non-negative value shall be returned. Otherwise, `-1` shall be
66437 returned and `errno` set to indicate the error.66438 **ERRORS**

66439 No errors are defined.

66440 **EXAMPLES**

66441 None.

66442 **APPLICATION USAGE**66443 The inclusion of the `nodename` member in this structure does not imply that it is sufficient
66444 information for interfacing to communications networks.66445 **RATIONALE**66446 The values of the structure members are not constrained to have any relation to the version of
66447 this volume of POSIX.1-200x implemented in the operating system. An application should
66448 instead depend on `_POSIX_VERSION` and related constants defined in `<unistd.h>`.66449 This volume of POSIX.1-200x does not define the sizes of the members of the structure and
66450 permits them to be of different sizes, although most implementations define them all to be the
66451 same size: eight bytes plus one byte for the string terminator. That size for `nodename` is not
66452 enough for use with many networks.66453 The `uname()` function originated in System III, System V, and related implementations, and it
66454 does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in
66455 those historical implementations.66456 4.3 BSD has `gethostname()` and `gethostid()`, which return a symbolic name and a numeric value,
66457 respectively. There are related `sethostname()` and `sethostid()` functions that are used to set the
66458 values the other two functions return. The former functions are included in this specification, the
66459 latter are not.

66460

FUTURE DIRECTIONS

66461

None.

66464

CHANGE HISTORY

66465

First released in Issue 1. Derived from Issue 1 of the SVID.

66466 **NAME**
 66467 `ungetc` — push byte back into input stream

66468 **SYNOPSIS**
 66469 `#include <stdio.h>`
 66470 `int ungetc(int c, FILE *stream);`

66471 **DESCRIPTION**
 66472 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66473 conflict between the requirements described here and the ISO C standard is unintentional. This
 66474 volume of POSIX.1-200x defers to the ISO C standard.

66475 The `ungetc()` function shall push the byte specified by `c` (converted to an **unsigned char**) back
 66476 onto the input stream pointed to by `stream`. The pushed-back bytes shall be returned by
 66477 subsequent reads on that stream in the reverse order of their pushing. A successful intervening
 66478 call (with the stream pointed to by `stream`) to a file-positioning function (`fseek()`, `fsetpos()`, or
 66479 `rewind()`) shall discard any pushed-back bytes for the stream. The external storage
 66480 corresponding to the stream shall be unchanged.

66481 One byte of push-back shall be provided. If `ungetc()` is called too many times on the same stream
 66482 without an intervening read or file-positioning operation on that stream, the operation may fail.

66483 If the value of `c` equals that of the macro `EOF`, the operation shall fail and the input stream shall
 66484 be left unchanged.

66485 A successful call to `ungetc()` shall clear the end-of-file indicator for the stream. The value of the
 66486 file-position indicator for the stream after reading or discarding all pushed-back bytes shall be
 66487 the same as it was before the bytes were pushed back. The file-position indicator is decremented
 66488 by each successful call to `ungetc()`; if its value was 0 before a call, its value is unspecified after
 66489 the call.

66490 **RETURN VALUE**
 66491 Upon successful completion, `ungetc()` shall return the byte pushed back after conversion.
 66492 Otherwise, it shall return `EOF`.

66493 **ERRORS**
 66494 No errors are defined.

66495 **EXAMPLES**
 66496 None.

66497 **APPLICATION USAGE**
 66498 None.

66499 **RATIONALE**
 66500 None.

66501 **FUTURE DIRECTIONS**

66506

66507

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

66508 **NAME**
 66509 ungetwc — push wide-character code back into the input stream

66510 **SYNOPSIS**
 66511 #include <stdio.h>
 66512 #include <wchar.h>
 66513 wint_t ungetwc(wint_t wc, FILE *stream);

66514 **DESCRIPTION**
 66515 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 66516 conflict between the requirements described here and the ISO C standard is unintentional. This
 66517 volume of POSIX.1-200x defers to the ISO C standard.

66518 The *ungetwc()* function shall push the character corresponding to the wide-character code
 66519 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters
 66520 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A
 66521 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function
 66522 (*fseek()*, *fsetpos()*, or *rewind()*) discards any pushed-back characters for the stream. The external
 66523 storage corresponding to the stream is unchanged.

66524 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on
 66525 the same stream without an intervening read or file-positioning operation on that stream, the
 66526 operation may fail.

66527 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream
 66528 shall be left unchanged.

66529 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the
 66530 file-position indicator for the stream after reading or discarding all pushed-back characters shall
 66531 be the same as it was before the characters were pushed back. The file-position indicator is
 66532 decremented (by one or more) by each successful call to *ungetwc()*; if its value was 0 before a
 66533 call, its value is unspecified after the call.

66534 **RETURN VALUE**
 66535 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to
 66536 the pushed-back character. Otherwise, it shall return WEOF.

66537 **ERRORS**
 66538 The *ungetwc()* function may fail if:

66539 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not
 66540 correspond to a valid character.

66541 **EXAMPLES**
 66542 None.

66543 **APPLICATION USAGE**
 66544 None.

66545 **RATIONALE**
 66546 None.

- 66553 First released in Issue 4. Derived from the MSE working draft.
- 66554 **Issue 5**
- 66555 The Optional Header (OH) marking is removed from `<stdio.h>`.
- 66556 **Issue 6**
- 66557 The [EILSEQ] optional error condition is marked CX.

66558 **NAME**66559 `unlink, unlinkat` — remove a directory entry relative to directory file descriptor66560 **SYNOPSIS**66561 `#include <unistd.h>`66562 `int unlink(const char *path);`66563 `int unlinkat(int fd, const char *path, int flag);`66564 **DESCRIPTION**

66565 The `unlink()` function shall remove a link to a file. If `path` names a symbolic link, `unlink()` shall
 66566 remove the symbolic link named by `path` and shall not affect any file or directory named by the
 66567 contents of the symbolic link. Otherwise, `unlink()` shall remove the link named by the pathname
 66568 pointed to by `path` and shall decrement the link count of the file referenced by the link.

66569 When the file's link count becomes 0 and no process has the file open, the space occupied by the
 66570 file shall be freed and the file shall no longer be accessible. If one or more processes have the file
 66571 open when the last link is removed, the link shall be removed before `unlink()` returns, but the
 66572 removal of the file contents shall be postponed until all references to the file are closed.

66573 The `path` argument shall not name a directory unless the process has appropriate privileges and
 66574 the implementation supports using `unlink()` on directories.

66575 Upon successful completion, `unlink()` shall mark for update the last data modification and last
 66576 file status change timestamps of the parent directory. Also, if the file's link count is not 0, the last
 66577 file status change timestamp of the file shall be marked for update.

66578 The `unlinkat()` function shall be equivalent to the `unlink()` or `rmdir()` function except in the case
 66579 where `path` specifies a relative path. In this case the directory entry to be removed is determined
 66580 relative to the directory associated with the file descriptor `fd` instead of the current working
 66581 directory. It is unspecified whether directory searches are permitted based on whether the file
 66582 was opened with search permission or on the current permissions of the directory underlying
 66583 the file descriptor.

66584 Values for `flag` are constructed by a bitwise-inclusive OR of flags from the following list, defined
 66585 in `<fcntl.h>`:

66586 `AT_REMOVEDIR` Remove the directory entry specified by `fd` and `path` as a directory, not a
 66587 normal file.

66588 If `unlinkat()` is passed the special value `AT_FDCWD` in the `fd` parameter, the current working
 66589 directory is used and the behavior shall be identical to a call to `unlink()` or `rmdir()` respectively,
 66590 depending on whether or not the `AT_REMOVEDIR` bit is set in `flag`.

66591 **RETURN VALUE**

66592 Upon successful completion, these functions shall return 0. Otherwise, these functions shall
 66593 return `-1` and set `errno` to indicate the error. If `-1` is returned, the named file shall not be changed.

66594 **ERRORS**

66595 These functions shall fail and shall not unlink the file if:

66596 `[EACCES]` Search permission is denied for a component of the path prefix, or write
 66597 permission is denied on the directory containing the directory entry to be
 66598 removed.

66599 `[EBUSY]` The file named by the `path` argument cannot be unlinked because it is being
 66600 used by the system or another process and the implementation considers this
 66601 an error.

66602	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
66603		
66604	[ENAMETOOLONG]	
66605		The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
66606		
66607	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
66608	[ENOTDIR]	A component of the path prefix is not a directory.
66609	[EPERM]	The file named by <i>path</i> is a directory, and either the calling process does not have appropriate privileges, or the implementation prohibits using <i>unlink()</i> on directories.
66610		
66611		
66612	XSI [EPERM] or [EACCES]	
66613		The S_ISVTX flag is set on the directory containing the file referred to by the <i>path</i> argument and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges.
66614		
66615		
66616	[EROFS]	The directory entry to be unlinked is part of a read-only file system.
66617		The <i>unlinkat()</i> function shall fail if:
66618	[EBADF]	The <i>path</i> argument does not specify an absolute path and the <i>fd</i> argument is neither AT_FDCWD nor a valid file descriptor open for reading.
66619		
66620	[EEXIST] or [ENOTEMPTY]	
66621		The <i>flag</i> parameter has the AT_REMOVEDIR bit set and the <i>path</i> argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.
66622		
66623		
66624	[ENOTDIR]	The <i>flag</i> parameter has the AT_REMOVEDIR bit set and <i>path</i> does not name a directory.
66625		
66626		These functions may fail and not unlink the file if:
66627	XSI [EBUSY]	The file named by <i>path</i> is a named STREAM.
66628	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
66629		
66630	[ENAMETOOLONG]	
66631		As a result of encountering a symbolic link in resolution of the <i>path</i> argument, the length of the substituted pathname string exceeded {PATH_MAX}.
66632		
66633	[ETXTBSY]	The entry to be unlinked is the last directory entry to a pure procedure (shared text) file that is being executed.
66634		
66635		The <i>unlinkat()</i> function may fail if:
66636	[EINVAL]	The value of the <i>flag</i> argument is not valid.
66637	[ENOTDIR]	The <i>path</i> argument is not an absolute path and <i>fd</i> is neither AT_FDCWD nor a file descriptor associated with a directory.
66638		

66639 EXAMPLES

66640 **Removing a Link to a File**

66641 The following example shows how to remove a link to a file named `/home/cnd/mod1` by
66642 removing the entry named `/modules/pass1`.

```
66643 #include <unistd.h>
66644
66644 char *path = "/modules/pass1";
66645 int status;
66646 ...
66647 status = unlink(path);
```

66648 **Checking for an Error**

66649 The following example fragment creates a temporary password lock file named **LOCKFILE**,
66650 which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for
66651 writing, `unlink()` is used to remove the link between the file descriptor and **LOCKFILE**.

```
66652 #include <sys/types.h>
66653 #include <stdio.h>
66654 #include <fcntl.h>
66655 #include <errno.h>
66656 #include <unistd.h>
66657 #include <sys/stat.h>
66658
66658 #define LOCKFILE "/etc/ptmp"
66659
66659 int pfd; /* Integer for file descriptor returned by open call. */
66660 FILE *fpfd; /* File pointer for use in putpwent(). */
66661 ...
66662 /* Open password Lock file. If it exists, this is an error. */
66663 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
66664 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
66665     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
66666     exit(1);
66667 }
66668
66668 /* Lock file created; proceed with fdopen of lock file so that
66669 putpwent() can be used.
66670 */
66671 if ((fpfd = fdopen(pfd, "w")) == NULL) {
66672     close(pfd);
66673     unlink(LOCKFILE);
66674     exit(1);
66675 }
```

66676 **Replacing Files**

66677 The following example fragment uses `unlink()` to discard links to files, so that they can be
66678 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error
66679 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can
66680 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```
66681 #include <sys/types.h>
66682 #include <stdio.h>
66683 #include <fcntl.h>
```

```

66684     #include <errno.h>
66685     #include <unistd.h>
66686     #include <sys/stat.h>
66687
66687     #define LOCKFILE "/etc/ptmp"
66688     #define PASSWDFILE "/etc/passwd"
66689     #define SAVEFILE "/etc/opasswd"
66690     ...
66691     /* If no change was made, assume error and leave passwd unchanged. */
66692     if (!valid_change) {
66693         fprintf(stderr, "Could not change password for user %s\n", user);
66694         unlink(LOCKFILE);
66695         exit(1);
66696     }
66697
66697     /* Change permissions on new password file. */
66698     chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);
66699
66699     /* Remove saved password file. */
66700     unlink(SAVEFILE);
66701
66701     /* Save current password file. */
66702     link(PASSWDFILE, SAVEFILE);
66703
66703     /* Remove current password file. */
66704     unlink(PASSWDFILE);
66705
66705     /* Save new password file as current password file. */
66706     link(LOCKFILE, PASSWDFILE);
66707
66707     /* Remove lock file. */
66708     unlink(LOCKFILE);
66709
66709     exit(0);

```

APPLICATION USAGE

Applications should use *rmdir()* to remove a directory.

RATIONALE

Unlinking a directory is restricted to the superuser in many historical implementations for reasons given in *link()* (see also *rename()*).

The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume of POSIX.1-200x does not cover the system administration concepts of mounting and unmounting, the description of the error was changed to “resource busy”. (This meaning is used by some device drivers when a second process tries to open an exclusive use device.) The wording is also intended to allow implementations to refuse to remove a directory if it is the root or current working directory of any process.

The standard developers reviewed TR 24715-2006 and noted that LSB-conforming implementations may return [EISDIR] instead of [EPERM] when unlinking a directory. A change to permit this behavior by changing the requirement for [EPERM] to [EPERM] or [EISDIR] was considered, but decided against since it would break existing strictly conforming and conforming applications. Applications written for portability to both POSIX.1-200x and the LSB should be prepared to handle either error code.

The purpose of the *unlinkat()* function is to remove directory entries in directories other than the current working directory without exposure to race conditions. Any part of the path of a file could be changed in parallel to a call to *unlink()*, resulting in unspecified behavior. By opening a file descriptor for the target directory and using the *unlinkat()* function it can be guaranteed that the removed directory entry is located relative to the desired directory.

66732 **FUTURE DIRECTIONS**

66733 None.

66734 **SEE ALSO**66735 *close(), link, remove(), rename(), rmdir, symlink()*66736 XBD *<fcntl.h>*, *<unistd.h>*66737 **CHANGE HISTORY**

66738 First released in Issue 1. Derived from Issue 1 of the SVID.

66739 **Issue 5**

66740 The [EBUSY] error is added to the optional part of the ERRORS section.

66741 **Issue 6**66742 The following new requirements on POSIX implementations derive from alignment with the
66743 Single UNIX Specification:

- 66744 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 66745 • The [ELOOP] mandatory error condition is added.
- 66746 • A second [ENAMETOOLONG] is added as an optional error condition.
- 66747 • The [ETXTBSY] optional error condition is added.

66748 The following changes were made to align with the IEEE P1003.1a draft standard:

- 66749 • The [ELOOP] optional error condition is added.

66750 The normative text is updated to avoid use of the term “must” for application requirements.

66751 **Issue 7**66752 Text arising from the LSB Conflicts TR is added to the RATIONALE about the use of [EPERM]
66753 and [EISDIR].66754 The *unlinkat()* function is added from The Open Group Technical Standard, 2006, Extended API
66755 Set Part 2.

66756 Changes are made related to support for finegrained timestamps. +

66757 **NAME**
66758 unlinkat — remove a directory entry relative to directory file descriptor

66759 **SYNOPSIS**
66760 #include <unistd.h>
66761 int unlinkat(int *fd*, const char **path*, int *flag*);

66762 **DESCRIPTION**
66763 Refer to *unlink*.

66764 **NAME**
 66765 unlockpt — unlock a pseudo-terminal master/slave pair

66766 **SYNOPSIS**
 66767 XSI `#include <stdlib.h>`
 66768 `int unlockpt(int fildev);`

66769 **DESCRIPTION**
 66770 The *unlockpt()* function shall unlock the slave pseudo-terminal device associated with the master
 66771 to which *fildev* refers.

66772 Conforming applications shall ensure that they call *unlockpt()* before opening the slave side of a
 66773 pseudo-terminal device.

66774 **RETURN VALUE**
 66775 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*
 66776 to indicate the error.

66777 **ERRORS**
 66778 The *unlockpt()* function may fail if:
 66779 [EBADF] The *fildev* argument is not a file descriptor open for writing.
 66780 [EINVAL] The *fildev* argument is not associated with a master pseudo-terminal device.

66781 **EXAMPLES**
 66782 None.

66783 **APPLICATION USAGE**
 66784 None.

66785 **RATIONALE**
 66786 None.

66787 **FUTURE DIRECTIONS**
 66788 None.

66789 **SEE ALSO**
 66790 *grantpt()*, *open()*, *ptsname()*
 66791 XBD `<stdlib.h>`

66792 **CHANGE HISTORY**
 66793 First released in Issue 4, Version 2.

66794 **Issue 5**
 66795 Moved from X/OPEN UNIX extension to BASE.

66796 **Issue 6**
 66797 The normative text is updated to avoid use of the term “must” for application requirements.

66798 **NAME**
 66799 unsetenv — remove an environment variable

66800 **SYNOPSIS**

66801 CX `#include <stdlib.h>`
 66802 `int unsetenv(const char *name);`

66803 **DESCRIPTION**

66804 The *unsetenv()* function shall remove an environment variable from the environment of the
 66805 calling process. The *name* argument points to a string, which is the name of the variable to be
 66806 removed. The named argument shall not contain an '=' character. If the named variable does
 66807 not exist in the current environment, the environment shall be unchanged and the function is
 66808 considered to have completed successfully.

66809 If the application modifies *environ* or the pointers to which it points, the behavior of *unsetenv()* is
 66810 undefined. The *unsetenv()* function shall update the list of pointers to which *environ* points.

66811 The *unsetenv()* function need not be thread-safe. A function that is not required to be thread-safe
 66812 is not required to be reentrant.

66813 **RETURN VALUE**

66814 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to
 66815 indicate the error, and the environment shall be unchanged.

66816 **ERRORS**

66817 The *unsetenv()* function shall fail if:

66818 [EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a
 66819 string containing an '=' character.

66820 **EXAMPLES**

66821 None.

66822 **APPLICATION USAGE**

66823 None.

66824 **RATIONALE**

66825 Refer to the RATIONALE section in *setenv()*.

66826 **FUTURE DIRECTIONS**

66827 None.

66828 **SEE ALSO**

66829 *getenv()*, *setenv()*

66830 XBD [<stdlib.h>](#), [<sys/types.h>](#), [<unistd.h>](#)

66831 **CHANGE HISTORY**

66832 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

66833 **NAME**

66834 uselocale — use locale in current thread

66835 **SYNOPSIS**

```
66836 CX      #include <locale.h>
66837      locale_t uselocale(locale_t newloc);
```

66838 **DESCRIPTION**

66839 The *uselocale()* function shall set the current locale for the current thread to the locale
66840 represented by *newloc*.

66841 The value for the *newloc* argument shall be one of the following:

- 66842 1. A value returned by the *newlocale()* or *duplocale()* functions
- 66843 2. The special locale object descriptor *LC_GLOBAL_LOCALE*
- 66844 3. **(locale_t)0**

66845 Once the *uselocale()* function has been called to install a thread-local locale, the behavior of every
66846 interface using data from the current locale shall be affected for the calling thread. The current
66847 locale for other threads shall remain unchanged.

66848 If the *newloc* argument is a null pointer, the object returned is the current locale or
66849 *LC_GLOBAL_LOCALE* if there has been no previous call to *uselocale()* for the current thread.

66850 If the *newloc* argument is *LC_GLOBAL_LOCALE*, the thread shall use the global locale
66851 determined by the *setlocale()* function.

66852 **RETURN VALUE**

66853 The *uselocale()* function returns the locale handle from the previous call for the current thread. If
66854 there was no such previous call, the function shall return the value *LC_GLOBAL_LOCALE*.

66855 **ERRORS**

66856 The *uselocale()* function may fail if:

66857 [EINVAL] *locale* is not a valid locale object.

66858 **EXAMPLES**

66859 None.

66860 **APPLICATION USAGE**

66861 Unlike the *setlocale()* function, the *uselocale()* function does not allow replacing some locale
66862 categories only. Applications that need to install a locale which differs only in a few categories
66863 must use *newlocale()* to change a locale object equivalent to the currently used locale and install
66864 it.

66865 **RATIONALE**

66866 None.

66867 **FUTURE DIRECTIONS**

66868 None.

66869 **SEE ALSO**

66870 *duplocale()*, *freelocale()*, *newlocale()*, *setlocale()*

66871 XBD **<locale.h>**

66872

66873

CHANGE HISTORY

First released in Issue 7.

66874 **NAME**
 66875 `utime` — set file access and modification times

66876 **SYNOPSIS**

66877 OB

```
#include <utime.h>
```

 66878

```
int utime(const char *path, const struct utimbuf *times);
```

66879 **DESCRIPTION**

66880 The `utime()` function shall set the access and modification times of the file named by the `path`
 66881 argument.

66882 If `times` is a null pointer, the access and modification times of the file shall be set to the current
 66883 time. The effective user ID of the process shall match the owner of the file, or the process has
 66884 write permission to the file or has appropriate privileges, to use `utime()` in this manner.

66885 If `times` is not a null pointer, `times` shall be interpreted as a pointer to a **utimbuf** structure and the
 66886 access and modification times shall be set to the values contained in the designated structure.
 66887 Only a process with the effective user ID equal to the user ID of the file or a process with
 66888 appropriate privileges may use `utime()` this way.

66889 The **utimbuf** structure is defined in the `<utime.h>` header. The times in the structure **utimbuf**
 66890 are measured in seconds since the Epoch.

66891 Upon successful completion, the `utime()` function shall mark the last file status change
 66892 timestamp for update; see `<sys/stat.h>`.

66893 **RETURN VALUE**

66894 Upon successful completion, 0 shall be returned. Otherwise, `-1` shall be returned and `errno` shall
 66895 be set to indicate the error, and the file times shall not be affected.

66896 **ERRORS**

66897 The `utime()` function shall fail if:

66898 [EACCES] Search permission is denied by a component of the path prefix; or the `times`
 66899 argument is a null pointer and the effective user ID of the process does not
 66900 match the owner of the file, the process does not have write permission for the
 66901 file, and the process does not have appropriate privileges.

66902 [ELOOP] A loop exists in symbolic links encountered during resolution of the `path`
 66903 argument.

66904 [ENAMETOOLONG] The length of the `path` argument exceeds `{PATH_MAX}` or a pathname
 66905 component is longer than `{NAME_MAX}`.
 66906

66907 [ENOENT] A component of `path` does not name an existing file or `path` is an empty string.

66908 [ENOTDIR] A component of the path prefix is not a directory.

66909 [EPERM] The `times` argument is not a null pointer and the effective user ID of the calling
 66910 process does not match the owner of the file and the calling process does not
 66911 have the appropriate privileges.

66912 [EROFS] The file system containing the file is read-only.

66913 The `utime()` function may fail if:

66914 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
66915 resolution of the *path* argument.

66916 [ENAMETOOLONG]
66917 As a result of encountering a symbolic link in resolution of the *path* argument,
66918 the length of the substituted pathname string exceeded {PATH_MAX}.

EXAMPLES

66919 None.
66920

APPLICATION USAGE

66921 Since the **utimbuf** structure only contains **time_t** variables and is not accurate to fractions of a
66922 second, applications should use the *utimensat()* function instead of the obsolescent *utime()*
66923 function.
66924

RATIONALE

66925 The *actime* structure member must be present so that an application may set it, even though an
66926 implementation may ignore it and not change the last data access timestamp on the file. If an
66927 application intends to leave one of the times of a file unchanged while changing the other, it
66928 should use *stat()* or *fstat()* to retrieve the file's *st_atim* and *st_mtim* parameters, set *actime* and
66929 *modtime* in the buffer, and change one of them before making the *utime()* call. +
66930

FUTURE DIRECTIONS

66931 The *utime()* function may be removed in a future version. |
66932

SEE ALSO

66933 *fstat()*, *fstatat()*, *futimens()*

66934 XBD <sys/stat.h>, <utime.h> |
66935

CHANGE HISTORY

66936 First released in Issue 1. Derived from Issue 1 of the SVID.
66937

Issue 6

66938 The following new requirements on POSIX implementations derive from alignment with the
66939 Single UNIX Specification:
66940

- 66941 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
66942 required for conforming implementations of previous POSIX specifications, it was not
66943 required for UNIX applications.
- 66944 • The [ELOOP] mandatory error condition is added.
- 66945 • A second [ENAMETOOLONG] is added as an optional error condition.

66946 The following changes were made to align with the IEEE P1003.1a draft standard:

- 66947 • The [ELOOP] optional error condition is added.

66948 The normative text is updated to avoid use of the term “must” for application requirements.

Issue 7

66949 The *utime()* function is marked obsolescent. +
66950

66951 Changes are made related to support for finegrained timestamps.

66952 **NAME**
 66953 utimensat, utimes — set file access and modification times relative to directory file descriptor |

66954 **SYNOPSIS**
 66955 #include <sys/stat.h> +
 66956 int utimensat(int *fd*, const char **path*, const struct timespec *times*[2], +
 66957 int *flag*); +

66958 XSI #include <sys/time.h>
 66959 int utimes(const char **path*, const struct timeval *times*[2]); |

66960 **DESCRIPTION**
 66961 Refer to *futimens()*. |

66962

66963 **NAME**

66964 `va_arg, va_copy, va_end, va_start` — handle variable argument list

66965 **SYNOPSIS**

66966 `#include <stdarg.h>`

66967 `type va_arg(va_list ap, type);`

66968 `void va_copy(va_list dest, va_list src);`

66969 `void va_end(va_list ap);`

66970 `void va_start(va_list ap, argN);`

66971 **DESCRIPTION**

66972 Refer to the Base Definitions volume of POSIX.1-200x, `<stdarg.h>`.

66973 **NAME**

66974 vfprintf, vprintf, vsnprintf, vsprintf — format output of a stdarg argument list

66975 **SYNOPSIS**

67058             va_list arg);
67059 int vswprintf(wchar_t *restrict ws, size_t n,
67060             const wchar_t *restrict format, va_list arg);
67061 int vwprintf(const wchar_t *restrict format, va_list arg);
```

67062 DESCRIPTION

67063 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 67064 conflict between the requirements described here and the ISO C standard is unintentional. This
 67065 volume of POSIX.1-200x defers to the ISO C standard.

67066 The *vfwprintf()*, *vswprintf()*, and *vwprintf()* functions shall be equivalent to *fwprintf()*, *swprintf()*,
 67067 and *wprintf()* respectively, except that instead of being called with a variable number of
 67068 arguments, they are called with an argument list as defined by **<stdarg.h>**.

67069 These functions shall not invoke the *va_end* macro. However, as these functions do invoke the
 67070 *va_arg* macro, the value of *ap* after the return is unspecified.

67071 RETURN VALUE

67072 Refer to *fwprintf()*.

67073 ERRORS

67074 Refer to *fwprintf()*.

67075 EXAMPLES

67076 None.

67077 APPLICATION USAGE

67078 Applications using these functions should call *va_end(ap)* afterwards to clean up.

67079 RATIONALE

67080 None.

67081 FUTURE DIRECTIONS

67082 None.

67083 SEE ALSO

67084 *fwprintf()*
 67085 XBD **<stdarg.h>**, **<stdio.h>**, **<wchar.h>**

67086 CHANGE HISTORY

67087 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 67088 (E).

67089 Issue 6

67090 The *vfwprintf()*, *vswprintf()*, and *vwprintf()* prototypes are updated for alignment with the
 67091 ISO/IEC 9899:1999 standard. ()

67092 **NAME**

67093 vfwscanf, vswscanf, vwscanf — wide-character formatted input of a stdarg argument list

67094 **SYNOPSIS**

67095 #include <stdarg.h>

67096 #include <stdio.h>

67097 #include <wchar.h>

67098 int vfwscanf(FILE *restrict stream, const wchar_t *restrict format,
67099 va_list arg);67100 int vswscanf(const wchar_t *restrict ws, const wchar_t *restrict format,
67101 va_list arg);

67102 int vwscanf(const wchar_t *restrict format, va_list arg);

67103 **DESCRIPTION**67104 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67105 conflict between the requirements described here and the ISO C standard is unintentional. This
67106 volume of POSIX.1-200x defers to the ISO C standard.67107 The *vfwscanf()*, *vswscanf()*, and *vwscanf()* functions shall be equivalent to the *fscanf()*,
67108 *swscanf()*, and *wscanf()* functions, respectively, except that instead of being called with a variable
67109 number of arguments, they are called with an argument list as defined in the <stdarg.h> header.
67110 These functions shall not invoke the *va_end* macro. As these functions invoke the *va_arg* macro,
67111 the value of *ap* after the return is unspecified.67112 **RETURN VALUE**67113 Refer to *fscanf()*.67114 **ERRORS**67115 Refer to *fscanf()*.67116 **EXAMPLES**

67117 None.

67118 **APPLICATION USAGE**67119 Applications using these functions should call *va_end(ap)* afterwards to clean up.67120 **RATIONALE**

67121 None.

67122 **FUTURE DIRECTIONS**

67123 None.

67124 **SEE ALSO**67125 *fscanf()*

67127 **CHANGE HISTORY**

67128 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

67129 **NAME**
67130 `vprintf` — format the output of a `stdarg` argument list

67131 **SYNOPSIS**
67132 `#include <stdarg.h>`
67133 `#include <stdio.h>`
67134 `int vprintf(const char *restrict format, va_list ap);`

67135 **DESCRIPTION**
67136 Refer to *vfprintf()*.

67137 **NAME**
67138 vscanf — format input of a stdarg argument list

67139 **SYNOPSIS**
67140 #include <stdarg.h>
67141 #include <stdio.h>
67142 int vscanf(const char *restrict format, va_list arg);

67143 **DESCRIPTION**
67144 Refer to *vfscanf()*.

67145 **NAME**
67146 `vsnprintf`, `vsprintf` — format output of a stdarg argument list

67147 **SYNOPSIS**

```
67148 #include <stdarg.h>  
67149 #include <stdio.h>  
  
67150 int vsnprintf(char *restrict s, size_t n,  
67151             const char *restrict format, va_list ap);  
67152 int vsprintf(char *restrict s, const char *restrict format,  
67153            va_list ap);
```

67154 **DESCRIPTION**

67155 Refer to *fprintf()*.

67156 **NAME**
67157 vsscanf — format input of a stdarg argument list

67158 **SYNOPSIS**

67159 #include <stdarg.h>
67160 #include <stdio.h>

67161 int vsscanf(const char *restrict *s*, const char *restrict *format*,
67162 va_list *arg*);

67163 **DESCRIPTION**

67164 Refer to *vfscanf()*.

67165 **NAME**
67166 `vswprintf` — wide-character formatted output of a `stdarg` argument list

67167 **SYNOPSIS**
67168 `#include <stdarg.h>`
67169 `#include <stdio.h>`
67170 `#include <wchar.h>`
67171 `int vswprintf(wchar_t *restrict ws, size_t n,`
67172 `const wchar_t *restrict format, va_list arg);`

67173 **DESCRIPTION**
67174 Refer to *[vfwprintf\(\)](#)*.

67175 **NAME**
67176 vswscanf — wide-character formatted input of a stdarg argument list

67177 **SYNOPSIS**

67178 #include <stdarg.h>
67179 #include <stdio.h>
67180 #include <wchar.h>

67181 int vswscanf(const wchar_t *restrict ws, const wchar_t *restrict format,
67182 va_list arg);

67183 **DESCRIPTION**

67184 Refer to *vfwscanf()*.

67185 **NAME**
67186 `vwprintf` — wide-character formatted output of a `stdarg` argument list

67187 **SYNOPSIS**
67188 `#include <stdarg.h>`
67189 `#include <stdio.h>`
67190 `#include <wchar.h>`
67191 `int vwprintf(const wchar_t *restrict format, va_list arg);`

67192 **DESCRIPTION**
67193 Refer to *[vfwprintf\(\)](#)*.

67194 **NAME**
67195 vwscanf — wide-character formatted input of a stdarg argument list

67196 **SYNOPSIS**
67197 #include <stdarg.h>
67198 #include <stdio.h>
67199 #include <wchar.h>
67200 int vwscanf(const wchar_t *restrict format, va_list arg);

67201 **DESCRIPTION**
67202 Refer to *vwscanf()*.

67203 **NAME**
 67204 wait, waitpid — wait for a child process to stop or terminate

67205 **SYNOPSIS**
 67206 #include <sys/wait.h>
 67207 pid_t wait(int *stat_loc);
 67208 pid_t waitpid(pid_t pid, int *stat_loc, int options);

67209 **DESCRIPTION**
 67210 The *wait()* and *waitpid()* functions shall obtain status information pertaining to one of the
 67211 caller's child processes. Various options permit status information to be obtained for child
 67212 processes that have terminated or stopped. If status information is available for two or more
 67213 child processes, the order in which their status is reported is unspecified.

67214 The *wait()* function shall suspend execution of the calling thread until status information for one
 67215 of the terminated child processes of the calling process is available, or until delivery of a signal
 67216 whose action is either to execute a signal-catching function or to terminate the process. If more
 67217 than one thread is suspended in *wait()* or *waitpid()* awaiting termination of the same process,
 67218 exactly one thread shall return the process status at the time of the target process termination. If
 67219 status information is available prior to the call to *wait()*, return shall be immediate.

67220 The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is **(pid_t)-1** and the
 67221 *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and
 67222 *options* arguments.

67223 The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()*
 67224 function shall only return the status of a child process from this set:

- 67225 • If *pid* is equal to **(pid_t)-1**, *status* is requested for any child process. In this respect,
 67226 *waitpid()* is then equivalent to *wait()*.
- 67227 • If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is
 67228 requested.
- 67229 • If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that
 67230 of the calling process.
- 67231 • If *pid* is less than **(pid_t)-1**, *status* is requested for any child process whose process group
 67232 ID is equal to the absolute value of *pid*.

67233 The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the
 67234 following flags, defined in the **<sys/wait.h>** header:

67235 XSI **WCONTINUED** The *waitpid()* function shall report the status of any continued child process
 67236 specified by *pid* whose status has not been reported since it continued from a
 67237 job control stop.

67238 **WNOHANG** The *waitpid()* function shall not suspend execution of the calling thread if
 67239 *status* is not immediately available for one of the child processes specified by
 67240 *pid*.

67241 **WUNTRACED** The status of any child processes specified by *pid* that are stopped, and whose
 67242 status has not yet been reported since they stopped, shall also be reported to
 67243 the requesting process.

67244 XSI If the calling process has SA_NOCLDWAIT set or has SIGCHLD set to SIG_IGN, and the process
 67245 has no unwaited-for children that were transformed into zombie processes, the calling thread
 67246 shall block until all of the children of the process containing the calling thread terminate, and

67247		<code>wait()</code> and <code>waitpid()</code> shall fail and set <code>errno</code> to [ECHILD].
67248 67249 67250 67251 67252		If <code>wait()</code> or <code>waitpid()</code> return because the status of a child process is available, these functions shall return a value equal to the process ID of the child process. In this case, if the value of the argument <code>stat_loc</code> is not a null pointer, information shall be stored in the location pointed to by <code>stat_loc</code> . The value stored at the location pointed to by <code>stat_loc</code> shall be 0 if and only if the status returned is from a terminated child process that terminated by one of the following means:
67253 67254 67255		<ol style="list-style-type: none"> 1. The process returned 0 from <code>main()</code>. 2. The process called <code>_exit()</code> or <code>exit()</code> with a <code>status</code> argument of 0. 3. The process was terminated because the last thread in the process terminated.
67256 67257 67258		Regardless of its value, this information may be interpreted using the following macros, which are defined in <code><sys/wait.h></code> and evaluate to integral expressions; the <code>stat_val</code> argument is the integer value pointed to by <code>stat_loc</code> .
67259 67260 67261		WIFEXITED(<i>stat_val</i>) Evaluates to a non-zero value if <code>status</code> was returned for a child process that terminated normally.
67262 67263 67264 67265		WEXITSTATUS(<i>stat_val</i>) If the value of WIFEXITED(<i>stat_val</i>) is non-zero, this macro evaluates to the low-order 8 bits of the <code>status</code> argument that the child process passed to <code>_exit()</code> or <code>exit()</code> , or the value the child process returned from <code>main()</code> .
67266 67267 67268		WIFSIGNALED(<i>stat_val</i>) Evaluates to a non-zero value if <code>status</code> was returned for a child process that terminated due to the receipt of a signal that was not caught (see <code><signal.h></code>).
67269 67270 67271		WTERMSIG(<i>stat_val</i>) If the value of WIFSIGNALED(<i>stat_val</i>) is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.
67272 67273 67274		WIFSTOPPED(<i>stat_val</i>) Evaluates to a non-zero value if <code>status</code> was returned for a child process that is currently stopped.
67275 67276 67277		WSTOPSIG(<i>stat_val</i>) If the value of WIFSTOPPED(<i>stat_val</i>) is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.
67278 67279 67280	XSI	WIFCONTINUED(<i>stat_val</i>) Evaluates to a non-zero value if <code>status</code> was returned for a child process that has continued from a job control stop.
67281 67282 67283 67284	SPN	It is unspecified whether the <code>status</code> value returned by calls to <code>wait()</code> or <code>waitpid()</code> for processes created by <code>posix_spawn()</code> or <code>posix_spawnnp()</code> can indicate a WIFSTOPPED(<i>stat_val</i>) before subsequent calls to <code>wait()</code> or <code>waitpid()</code> indicate WIFEXITED(<i>stat_val</i>) as the result of an error detected before the new process image starts executing.
67285 67286 67287		It is unspecified whether the <code>status</code> value returned by calls to <code>wait()</code> or <code>waitpid()</code> for processes created by <code>posix_spawn()</code> or <code>posix_spawnnp()</code> can indicate a WIFSIGNALED(<i>stat_val</i>) if a signal is sent to the parent's process group after <code>posix_spawn()</code> or <code>posix_spawnnp()</code> is called.
67288 67289 67290 67291	XSI	If the information pointed to by <code>stat_loc</code> was stored by a call to <code>waitpid()</code> that specified the WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros WIFEXITED(*<i>stat_loc</i>) , WIFSIGNALED(*<i>stat_loc</i>) , and WIFSTOPPED(*<i>stat_loc</i>) shall evaluate to a non-zero value.
67292		If the information pointed to by <code>stat_loc</code> was stored by a call to <code>waitpid()</code> that specified the

wait()

67293 XSI WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(*stat_loc),
 67294 XSI WIFSIGNALED(*stat_loc), WIFSTOPPED(*stat_loc), and WIFCONTINUED(*stat_loc) shall
 67295 evaluate to a non-zero value.

67296 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 67297 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the
 67298 macros WIFEXITED(*stat_loc) and WIFSIGNALED(*stat_loc) shall evaluate to a non-zero value.

67299 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 67300 XSI WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait()* function,
 67301 XSI exactly one of the macros WIFEXITED(*stat_loc), WIFSIGNALED(*stat_loc), and
 67302 WIFCONTINUED(*stat_loc) shall evaluate to a non-zero value.

67303 If `_POSIX_REALTIME_SIGNALS` is defined, and the implementation queues the SIGCHLD
 67304 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any
 67305 pending SIGCHLD signal associated with the process ID of the child process shall be discarded.
 67306 Any other pending SIGCHLD signals shall remain pending.

67307 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child
 67308 process is available, any pending SIGCHLD signal shall be cleared unless the status of another
 67309 child process is available.

67310 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD
 67311 signal is delivered.

67312 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()*
 67313 report *status*. This shall not occur unless the calling process or one of its child processes
 67314 explicitly makes use of a non-standard extension. In these cases the interpretation of the
 67315 reported *status* is implementation-defined.

67316 If a parent process terminates without waiting for all of its child processes to terminate, the
 67317 remaining child processes shall be assigned a new parent process ID corresponding to an
 67318 implementation-defined system process.

RETURN VALUE

67319 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions
 67320 shall return a value equal to the process ID of the child process for which *status* is reported. If
 67321 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, `-1` shall be
 67322 returned and *errno* set to [EINTR]. If *waitpid()* was invoked with WNOHANG set in *options*, it
 67323 has at least one child process specified by *pid* for which *status* is not available, and *status* is not
 67324 available for any process specified by *pid*, `0` is returned. Otherwise, `(pid_t)-1` shall be returned,
 67325 and *errno* set to indicate the error.
 67326

ERRORS

67327 The *wait()* function shall fail if:

67328 [ECHILD] The calling process has no existing unwaited-for child processes.

67330 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 67331 by *stat_loc* is undefined.

67332 The *waitpid()* function shall fail if:

67333 [ECHILD] The process specified by *pid* does not exist or is not a child of the calling
 67334 process, or the process group specified by *pid* does not exist or does not have
 67335 any member process that is a child of the calling process.

67336 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 67337 by *stat_loc* is undefined.

67338 [EINVAL] The *options* argument is not valid.

67339 EXAMPLES

67340 Waiting for a Child Process and then Checking its Status

67341 The following example demonstrates the use of *waitpid()*, *fork()*, and the macros used to
 67342 interpret the status value returned by *waitpid()* (and *wait()*). The code segment creates a child
 67343 process which does some unspecified work. Meanwhile the parent loops performing calls to
 67344 *waitpid()* to monitor the status of the child. The loop terminates when child termination is
 67345 detected.

```

67346 #include <stdio.h>
67347 #include <stdlib.h>
67348 #include <unistd.h>
67349 #include <sys/wait.h>
67350 ...
67351 pid_t child_pid, wpid;
67352 int status;
67353
67354 child_pid = fork();
67355 if (child_pid == -1) {          /* fork() failed */
67356     perror("fork");
67357     exit(EXIT_FAILURE);
67358 }
67359 if (child_pid == 0) {          /* This is the child */
67360     /* Child does some work and then terminates */
67361     ...
67362 } else {                        /* This is the parent */
67363     do {
67364         wpid = waitpid(child_pid, &status, WUNTRACED
67365 #ifdef WCONTINUED          /* Not all implementations support this */
67366         | WCONTINUED
67367 #endif
67368         );
67369         if (wpid == -1) {
67370             perror("waitpid");
67371             exit(EXIT_FAILURE);
67372         }
67373         if (WIFEXITED(status)) {
67374             printf("child exited, status=%d\n", WEXITSTATUS(status));
67375         } else if (WIFSIGNALED(status)) {
67376             printf("child killed (signal %d)\n", WTERMSIG(status));
67377         } else if (WIFSTOPPED(status)) {
67378             printf("child stopped (signal %d)\n", WSTOPSIG(status));
67379         }
67380 #ifdef WIFCONTINUED          /* Not all implementations support this */
67381         } else if (WIFCONTINUED(status)) {
67382             printf("child continued\n");
67383         }
67384 #endif
67385     } else {                    /* Non-standard case -- may never happen */
67386         printf("Unexpected status (0x%x)\n", status);
67387     }
67388     } while (!WIFEXITED(status) && !WIFSIGNALED(status));

```

```

67386     }
67387
67387     Waiting for a Child Process in a Signal Handler for SIGCHLD
67388     The following example demonstrates how to use waitpid() in a signal handler for SIGCHLD +
67389     without passing -1 as the pid argument. (See the APPLICATION USAGE section below for the +
67390     reasons why passing a pid of -1 is not recommended.) The method used here relies on the +
67391     standard behavior of waitpid() when SIGCHLD is blocked. On historical non-conforming +
67392     systems, the status of some child processes might not be reported. +
67393
67393     #include <stdlib.h> +
67394     #include <stdio.h> +
67395     #include <signal.h> +
67396     #include <sys/types.h> +

```

APPLICATION USAGE

Calls to *wait()* will collect information about any child process. This may result in interactions with other interfaces that may be waiting for their own children (such as by use of *system()*). For this and other reasons it is recommended that portable applications not use *wait()*, but instead use *waitpid()*. For these same reasons, the use of *waitpid()* with a *pid* argument of *-1*, and the use of *waitid()* with the *idtype* argument set to *P_ALL*, are also not recommended for portable applications.

RATIONALE

A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an *exec* or other function calls) from the parent. If a child produces grandchildren by further use of *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()* from the original parent process. Nothing in this volume of POSIX.1-200x prevents an implementation from providing extensions that permit a process to get *status* from a grandchild or any other process, but a process that does not use such extensions must be guaranteed to see *status* from only its direct children.

The *waitpid()* function is provided for three reasons:

1. To support job control
2. To permit a non-blocking version of the *wait()* function
3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without interfering with other terminated children for which the process has not waited

67485 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The
 67486 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The
 67487 WUNTRACED flag is used only in conjunction with job control on systems supporting job
 67488 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped
 67489 processes in that implementation: processes being traced via the *ptrace()* debugging facility and
 67490 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of
 67491 POSIX.1-200x, only the second type is relevant. The name WUNTRACED was retained because
 67492 its usage is the same, even though the name is not intuitively meaningful in this context.

67493 The third reason for the *waitpid()* function is to permit independent sections of a process to
 67494 spawn and wait for children without interfering with each other. For example, the following
 67495 problem occurs in developing a portable shell, or command interpreter:

```
67496 stream = popen("/bin/true");
67497 (void) system("sleep 100");
67498 (void) pclose(stream);
```

67499 On all historical implementations, the final *pclose()* fails to reap the *wait()* status of the *popen()*.

67500 The status values are retrieved by macros, rather than given as specific bit encodings as they are
 67501 in most historical implementations (and thus expected by existing programs). This was
 67502 necessary to eliminate a limitation on the number of signals an implementation can support that
 67503 was inherent in the traditional encodings. This volume of POSIX.1-200x does require that a *status*
 67504 value of zero corresponds to a process calling *_exit(0)*, as this is the most common encoding
 67505 expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

67506 These macros syntactically operate on an arbitrary integer value. The behavior is undefined
 67507 unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed to
 67508 by the *stat_loc* argument. An early proposal attempted to make this clearer by specifying each
 67509 argument as **stat_loc* rather than *stat_val*. However, that did not follow the conventions of other
 67510 specifications in this volume of POSIX.1-200x or traditional usage. It also could have implied
 67511 that the argument to the macro must literally be **stat_loc*; in fact, that value can be stored or
 67512 passed as an argument to other functions before being interpreted by these macros.

67513 The extension that affects *wait()* and *waitpid()* and is common in historical implementations is
 67514 the *ptrace()* function. It is called by a child process and causes that child to stop and return a
 67515 *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()*
 67516 children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()*
 67517 function). Most applications do not need to concern themselves with such extensions because
 67518 they have control over what extensions they or their children use. However, applications, such
 67519 as command interpreters, that invoke arbitrary processes may see this behavior when those
 67520 arbitrary processes misuse such extensions.

67521 Implementations that support **core** file creation or other implementation-defined actions on
 67522 termination of some processes traditionally provide a bit in the *status* returned by *wait()* to
 67523 indicate that such actions have occurred.

67524 Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated
 67525 with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()*
 67526 category with respect to SIGCHLD.

67527 This definition allows implementations to treat a pending SIGCHLD signal as accepted by the
 67528 process in *wait()*, with the same meaning of “accepted” as when that word is applied to the
 67529 *sigwait()* family of functions.

67530 Allowing the *wait()* family of functions to behave this way permits an implementation to be able
 67531 to deal precisely with SIGCHLD signals.

67532 In particular, an implementation that does accept (discard) the SIGCHLD signal can make the
 67533 following guarantees regardless of the queuing depth of signals in general (the list of waitable

67534

children can hold the SIGCHLD queue):

67535

1. If a SIGCHLD signal handler is established via *sigaction()* without the SA_RESETHAND flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will be delivered to or accepted by the process for every child process that terminates.

67536

67537

67538

67539

2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return immediately with status information for a child process.

67540

67541

67542

3. When SA_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to receive a non-NULL pointer to a **siginfo_t** structure that describes a child process for which a wait via *waitpid()* or *waitid()* will not block or fail.

67543

67544

67545

67546

67547

4. The *system()* function will not cause the SIGCHLD handler of a process to be called as a result of the *fork()/exec* executed within *system()* because *system()* will accept the SIGCHLD signal when it performs a *waitpid()* for its child process. This is a desirable behavior of *system()* so that it can be used in a library without causing side effects to the application linked with the library.

67548

67549

67550

An implementation that does not permit the *wait()* family of functions to accept (discard) a pending SIGCHLD signal associated with a successfully waited-for child, cannot make the guarantees described above for the following reasons:

67551

67552

67553

67554

67555

67556

67557

Guarantee #1

Although it might be assumed that reliable queuing of all SIGCHLD signals generated by the system can make this guarantee, the counter-example is the case of a process that blocks SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the implementation supports queued signals, then eventually the system will run out of memory for the queue. The guarantee cannot be made because there must be some limit to the depth of queuing.

67558

67559

67560

67561

67562

Guarantees #2 and #3

These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()* function) will result in an invocation of the handler when SIGCHLD is unblocked, after the process has disappeared.

67563

67564

67565

67566

67567

67568

Guarantee #4

Although possible to make this guarantee, *system()* would have to set the SIGCHLD handler to SIG_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This would have the undesirable side effect of discarding all SIGCHLD signals pending to the process.

67569

FUTURE DIRECTIONS

67570

None.

67574

CHANGE HISTORY

67575

First released in Issue 1. Derived from Issue 1 of the SVID.

67576

Issue 5

67577

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

67578

Issue 6

67579

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

67580

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

67581

67582

67583

67584

The following changes were made to align with the IEEE P1003.1a draft standard:

67585

- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

67586

The semantics of `WIFSTOPPED(stat_val)`, `WIFEXITED(stat_val)`, and `WIFSIGNALED(stat_val)` are defined with respect to `posix_spawn()` or `posix_spawnnp()` for alignment with IEEE Std 1003.1d-1999.

67587

67588

67589

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

67590

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/145 is applied, adding the example to the EXAMPLES section.

67591

67592

Issue 7

67593

SD5-XSH-ERN-202 is applied. +

67594

APPLICATION USAGE is added, recommending that the `wait()` function not be used. +

67595

An additional example for `waitpid()` is added.

67596 **NAME**
 67597 waitid — wait for a child process to change state

67598 **SYNOPSIS**
 67599 #include <sys/wait.h>

67600 int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);

67601 **DESCRIPTION**

67602 The *waitid()* function shall suspend the calling thread until one child of the process containing
 67603 the calling thread changes state. It records the current state of a child in the structure pointed to
 67604 by *infop*. The fields of the structure pointed to by *infop* are filled in as described for the
 67605 SIGCHLD signal in <signal.h>. If a child process changed state prior to the call to *waitid()*,
 67606 *waitid()* shall return immediately. If more than one thread is suspended in *wait()*, *waitid()*, or
 67607 *waitpid()* waiting for termination of the same process, exactly one thread shall return the process
 67608 status at the time of the target process termination.

67609 The *idtype* and *id* arguments are used to specify which children *waitid()* waits for.

67610 If *idtype* is P_PID, *waitid()* shall wait for the child with a process ID equal to (**pid_t**)*id*.

67611 If *idtype* is P_PGID, *waitid()* shall wait for any child with a process group ID equal to (**pid_t**)*id*.

67612 If *idtype* is P_ALL, *waitid()* shall wait for any children and *id* is ignored.

67613 The *options* argument is used to specify which state changes *waitid()* shall wait for. It is formed
 67614 by OR'ing together the following flags:

67615 WEXITED Wait for processes that have exited.

67616 WSTOPPED Status shall be returned for any child that has stopped upon receipt of a signal.

67617 WCONTINUED Status shall be returned for any child that was stopped and has been
 67618 continued.

67619 WNOHANG Return immediately if there are no children to wait for.

67620 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state. This
 67621 shall not affect the state of the process; the process may be waited for again
 67622 after this call completes.

67623 Applications shall specify at least one of the flags WEXITED, WSTOPPED, or WCONTINUED to
 67624 be OR'd in with the *options* argument.

67625 The application shall ensure that the *infop* argument points to a **siginfo_t** structure. If *waitid()*
 67626 returns because a child process was found that satisfied the conditions indicated by the
 67627 arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the
 67628 system with the status of the process. The *si_signo* member shall always be equal to SIGCHLD.

67629 **RETURN VALUE**

67630 If WNOHANG was specified and there are no children to wait for, 0 shall be returned. If *waitid()*
 67631 returns due to the change of state of one of its children, 0 shall be returned. Otherwise, -1 shall
 67632 be returned and *errno* set to indicate the error.

67633 **ERRORS**

67634 The *waitid()* function shall fail if:

67635 [ECHILD] The calling process has no existing unwaited-for child processes.

waitid()

67636	[EINTR]	The <i>waitid()</i> function was interrupted by a signal.
67637	[EINVAL]	An invalid value was specified for <i>options</i> , or <i>idtype</i> and <i>id</i> specify an invalid set of processes.
67638		

EXAMPLES

67639 None.
67640

APPLICATION USAGE

67641 Calls to *waitid()* with *idtype* equal to P_ALL will collect information about any child process. |
67642 This may result in interactions with other interfaces that may be waiting for their own children |
67643 (such as by use of *system()*). For this reason it is recommended that portable applications not |
67644 use *waitid()* with *idtype* of P_ALL. See also APPLICATION USAGE for *wait()*. |

67661

67662 The *waitid()* function is moved from the XSI option to the Base.

67663 APPLICATION USAGE is added, recommending that the *waitid()* function not be used. +

67664 **NAME**
67665 waitpid — wait for a child process to stop or terminate

67666 **SYNOPSIS**
67667 #include <sys/wait.h>
67668 pid_t waitpid(pid_t pid, int *stat_loc, int options);

67669 **DESCRIPTION**
67670 Refer to *wait*.

wcpcpy()

67671 **NAME**
67672 `wcpcpy` — copy a wide-character string, returning a pointer to its end

SYNOPSIS

67673 CX `#include <wchar.h>`
67674 `wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`

DESCRIPTION

67676 Refer to *wcscopy()*.
67677

67678 **NAME**67679 `wcpncpy` — copy a fixed-size wide-character string, returning a pointer to its end67680 **SYNOPSIS**

```
67681 CX #include <wchar.h>
67682     wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,
67683                     size_t n);
```

67684 **DESCRIPTION**67685 Refer to *wcsncpy()*.

67686 **NAME**67687 `wcrtomb` — convert a wide-character code to a character (restartable)67688 **SYNOPSIS**67689 `#include <stdio.h>`67690 `size_t wcrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);`67691 **DESCRIPTION**67692 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67693 conflict between the requirements described here and the ISO C standard is unintentional. This
67694 volume of POSIX.1-200x defers to the ISO C standard.67695 If *s* is a null pointer, the `wcrtomb()` function shall be equivalent to the call:67696 `wcrtomb(buf, L'\0', ps)`67697 where *buf* is an internal buffer.67698 If *s* is not a null pointer, the `wcrtomb()` function shall determine the number of bytes needed to
67699 represent the character that corresponds to the wide character given by *wc* (including any shift
67700 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At
67701 most {MB_CUR_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,
67702 preceded by any shift sequence needed to restore the initial shift state. The resulting state
67703 described shall be the initial conversion state.67704 If *ps* is a null pointer, the `wcrtomb()` function shall use its own internal **mbstate_t** object, which is
67705 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
67706 pointed to by *ps* shall be used to completely describe the current conversion state of the
67707 associated character sequence. The implementation shall behave as if no function defined in this
67708 volume of POSIX.1-200x calls `wcrtomb()`.67709 CX If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`
67710 functions, the application shall ensure that the `wcrtomb()` function is called with a non-NULL *ps*
67711 argument.67712 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.67713 **RETURN VALUE**67714 The `wcrtomb()` function shall return the number of bytes stored in the array object (including any
67715 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this
67716 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size_t**)-1;
67717 the conversion state shall be undefined.67718 **ERRORS**67719 The `wcrtomb()` function may fail if:67720 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

67721 [EILSEQ] Invalid wide-character code is detected.

CHANGE HISTORY

First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E).

Issue 6

In the DESCRIPTION, a note on using this function in a threaded application is added.

Extensions beyond the ISO C standard are marked.

The normative text is updated to avoid use of the term “must” for application requirements.

The *wrtomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

67741 **NAME**

67742 wscasecmp, wscasecmp_l, wcsncasecmp, wcsncasecmp_l — case-insensitive wide-character
67743 string comparison

67744 **SYNOPSIS**

```
67745 CX #include <wchar.h>
67746
67746 int wscasecmp(const wchar_t *ws1, const wchar_t *ws2);
67747 int wscasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
67748 locale_t locale);
67749 int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
67750 int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
67751 size_t n, locale_t locale);
```

67752 **DESCRIPTION**

67753 The *wscasecmp()* and *wcsncasecmp()* functions are the wide-character equivalent of the
67754 *strcasecmp()* and *strncasecmp()* functions, respectively.

67755 The *wscasecmp()* and *wscasecmp_l()* functions shall compare, while ignoring differences in case,
67756 the wide-character string pointed to by *ws1* to the wide-character string pointed to by *ws2*.

67757 The *wcsncasecmp()* and *wcsncasecmp_l()* functions shall compare, while ignoring differences in
67758 case, not more than *n* wide-characters from the wide-character string pointed to by *ws1* to the
67759 wide-character string pointed to by *ws2*.

67760 When the *LC_CTIME* category of the current locale is from the POSIX locale, these functions
67761 shall behave as if the strings had been converted to lowercase and then a byte comparison
67762 performed. Otherwise, the results are unspecified.

67763 The information for *wscasecmp_l()* and *wcsncasecmp_l()* about the case of the characters comes
67764 from the locale represented by *locale*.

67765 **RETURN VALUE**

67766 Upon completion, the *wscasecmp()* and *wscasecmp_l()* functions shall return an integer greater
67767 than, equal to, or less than 0 if the wide-character string pointed to by *ws1* is, ignoring case,
67768 greater than, equal to, or less than the wide-character string pointed to by *ws2*, respectively.

67769 Upon completion, the *wcsncasecmp()* and *wcsncasecmp_l()* functions shall return an integer
67770 greater than, equal to, or less than 0 if the possibly null wide-character terminated string pointed
67771 to by *ws1* is, ignoring case, greater than, equal to, or less than the possibly null wide-character
67772 terminated string pointed to by *ws2*, respectively.

67773 No return values are reserved to indicate an error.

67774 **ERRORS**

67775 The *wscasecmp_l()* and *wcsncasecmp_l()* functions may fail if:

67776 [EINVAL] *locale* is not a valid locale object handle.

67820 First released in Issue 4. Derived from the MSE working draft.

67821 **Issue 6**67822 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, `s1` is
67823 changed to `ws1`.67824 The `wcscat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

67825 **NAME**
 67826 `wcschr` — wide-character string scanning operation

67827 **SYNOPSIS**
 67828 `#include <wchar.h>`

67829 `wchar_t *wcschr(const wchar_t *ws, wchar_t wc);`

67830 **DESCRIPTION**

67831 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 67832 conflict between the requirements described here and the ISO C standard is unintentional. This
 67833 volume of POSIX.1-200x defers to the ISO C standard.

67834 The `wcschr()` function shall locate the first occurrence of `wc` in the wide-character string pointed
 67835 to by `ws`. The application shall ensure that the value of `wc` is a character representable as a type
 67836 `wchar_t` and a wide-character code corresponding to a valid character in the current locale. The
 67837 terminating null wide-character code is considered to be part of the wide-character string.

67838 **RETURN VALUE**

67839 Upon completion, `wcschr()` shall return a pointer to the wide-character code, or a null pointer if
 67840 the wide-character code is not found.

67841 **ERRORS**

67842 No errors are defined.

67843 **EXAMPLES**

67844 None.

67855 First released in Issue 4. Derived from the MSE working draft.

67856 **Issue 6**

67857 The normative text is updated to avoid use of the term “must” for application requirements.

67858 **NAME**
 67859 `wcscmp` — compare two wide-character strings

67860 **SYNOPSIS**

67861 `#include <wchar.h>`

67862 `int wcscmp(const wchar_t *ws1, const wchar_t *ws2);`

67863 **DESCRIPTION**

67864 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 67865 conflict between the requirements described here and the ISO C standard is unintentional. This
 67866 volume of POSIX.1-200x defers to the ISO C standard.

67867 The `wcscmp()` function shall compare the wide-character string pointed to by `ws1` to the wide-
 67868 character string pointed to by `ws2`.

67869 The sign of a non-zero return value shall be determined by the sign of the difference between the
 67870 values of the first pair of wide-character codes that differ in the objects being compared.

67871 **RETURN VALUE**

67872 Upon completion, `wcscmp()` shall return an integer greater than, equal to, or less than 0, if the
 67873 wide-character string pointed to by `ws1` is greater than, equal to, or less than the wide-character
 67874 string pointed to by `ws2`, respectively.

67888 **CHANGE HISTORY**

67889 First released in Issue 4. Derived from the MSE working draft.

67890 **NAME**
 67891 `wscoll`, `wscoll_l` — wide-character string comparison using collating information

67892 **SYNOPSIS**

```
67893 #include <wchar.h>
67894
67894 int wscoll(const wchar_t *ws1, const wchar_t *ws2);
67895 CX int wscoll_l(const wchar_t *ws1, const wchar_t *ws2,
67896 locale_t locale);
```

67897 **DESCRIPTION**

67898 CX For `wscoll()`: The functionality described on this reference page is aligned with the ISO C
 67899 standard. Any conflict between the requirements described here and the ISO C standard is
 67900 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

67901 CX The `wscoll()` and `wscoll_l()` functions shall compare the wide-character string pointed to by
 67902 `ws1` to the wide-character string pointed to by `ws2`, both interpreted as appropriate to the
 67903 CX `LC_COLLATE` category of the current locale of the process, or the locale represented by `locale`,
 67904 respectively.

67905 CX The `wscoll()` and `wscoll_l()` functions shall not change the setting of `errno` if successful.

67906 CX An application wishing to check for error situations should set `errno` to 0 before calling `wscoll()`
 67907 or `wscoll_l()`. If `errno` is non-zero on return, an error has occurred.

67908 **RETURN VALUE**

67909 CX Upon successful completion, `wscoll()` and `wscoll_l()` shall return an integer greater than, equal
 67910 to, or less than 0, according to whether the wide-character string pointed to by `ws1` is greater
 67911 than, equal to, or less than the wide-character string pointed to by `ws2`, when both are
 67912 CX interpreted as appropriate to the current locale, or to the locale represented by `locale`,
 67913 CX respectively. On error, `wscoll()` and `wscoll_l()` shall set `errno`, but no return value is reserved
 67914 to indicate an error.

67915 **ERRORS**

67916 These functions may fail if:

67917 CX [EINVAL] The `ws1` or `ws2` arguments contain wide-character codes outside the domain of
 67918 the collating sequence.

67919 The `wscoll_l()` function may fail if:

67920 CX [EINVAL] `locale` is not a valid locale object handle.

67921 **EXAMPLES**

67922 None.

67923 **APPLICATION USAGE**

67924 The `wcsxfrm()` and `wscmp()` functions should be used for sorting large lists.

67925 **RATIONALE**

67926 None.

67927 **FUTURE DIRECTIONS**

67928 None.

67929

CHANGE HISTORY

67933

First released in Issue 4. Derived from the MSE working draft.

67934

Issue 5

67935

Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

67936

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

67937

Issue 7

67938

The *wscoll_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

67939

67940 **NAME**67941 `wcpcpy`, `wcscopy` — copy a wide-character string, returning a pointer to its end67942 **SYNOPSIS**67943 `#include <wchar.h>`67944 CX `wchar_t *wcpcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`67945 `wchar_t *wcscopy(wchar_t *restrict ws1, const wchar_t *restrict ws2);`67946 **DESCRIPTION**67947 CX For `wcscopy()`: The functionality described on this reference page is aligned with the ISO C
67948 standard. Any conflict between the requirements described here and the ISO C standard is
67949 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.67950 CX The `wcpcpy()` and `wcscopy()` functions shall copy the wide-character string pointed to by `ws2`
67951 (including the terminating null wide-character code) into the array pointed to by `ws1`.67952 The application shall ensure that there is room for at least `wcslen(ws2)+1` wide characters in the
67953 `ws1` array, and that the `ws2` and `ws1` arrays do not overlap.

67954 If copying takes place between objects that overlap, the behavior is undefined.

67955 **RETURN VALUE**67956 CX The `wcpcpy()` function shall return a pointer to the terminating null wide-character code copied
67957 into the `ws1` buffer.67958 The `wcscopy()` function shall return `ws1`.

67959 No return values are reserved to indicate an error.

67960 **ERRORS**

67961 No errors are defined.

67974 First released in Issue 4. Derived from the MSE working draft.

67975 **Issue 6**67976 The `wcscopy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.67977 **Issue 7**67978 The `wcpcpy()` function is added from The Open Group Technical Standard, 2006, Extended API
67979 Set Part 1.

67980 **NAME**67981 `wcscspn` — get the length of a complementary wide substring67982 **SYNOPSIS**67983 `#include <wchar.h>`67984 `size_t wcscspn(const wchar_t *ws1, const wchar_t *ws2);`67985 **DESCRIPTION**67986 CX The functionality described on this reference page is aligned with the ISO C standard. Any
67987 conflict between the requirements described here and the ISO C standard is unintentional. This
67988 volume of POSIX.1-200x defers to the ISO C standard.67989 The `wcscspn()` function shall compute the length (in wide characters) of the maximum initial
67990 segment of the wide-character string pointed to by `ws1` which consists entirely of wide-character
67991 codes *not* from the wide-character string pointed to by `ws2`.67992 **RETURN VALUE**67993 The `wcscspn()` function shall return the length of the initial substring of `ws1`; no return value is
67994 reserved to indicate an error.67995 **ERRORS**

67996 No errors are defined.

67997 **EXAMPLES**

67998 None.

68005 **SEE ALSO**68006 [*wcsspn\(\)*](#)68007 XBD [*<wchar.h>*](#)68008 **CHANGE HISTORY**

68009 First released in Issue 4. Derived from the MSE working draft.

68010 **Issue 5**68011 The RETURN VALUE section is updated to indicate that `wcscspn()` returns the length of `ws1`,
68012 rather than `ws1` itself.

68013 **NAME**

68014 wcsdup — duplicate a wide-character string

68015 **SYNOPSIS**

```
68016 CX      #include <wchar.h>
68017      wchar_t *wcsdup(const wchar_t *string);
```

68018 **DESCRIPTION**68019 The *wcsdup()* function is the wide-character equivalent of the *strdup()* function.

68020 The *wcsdup()* function shall return a pointer to a new wide-character string, which is the
 68021 duplicate of the wide-character string *string*. The returned pointer can be passed to *free()*. A
 68022 null pointer is returned if the new wide-character string cannot be created.

68023 **RETURN VALUE**

68024 Upon successful completion, the *wcsdup()* function shall return a pointer to the newly allocated
 68025 wide-character string. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

68026 **ERRORS**68027 The *wcsdup()* function shall fail if:

68028 [ENOMEM] Memory large enough for the duplicate string could not be allocated.

68029 **EXAMPLES**

68030 None.

68031 **APPLICATION USAGE**

68032 None.

68033 **RATIONALE**

68040 **CHANGE HISTORY**

68041 First released in Issue 7.

68042 **NAME**68043 `wcsftime` — convert date and time to a wide-character string68044 **SYNOPSIS**68045 `#include <wchar.h>`68046 `size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,`
68047 `const wchar_t *restrict format, const struct tm *restrict timeptr);`68048 **DESCRIPTION**68049 CX The functionality described on this reference page is aligned with the ISO C standard. Any
68050 conflict between the requirements described here and the ISO C standard is unintentional. This
68051 volume of POSIX.1-200x defers to the ISO C standard.68052 The `wcsftime()` function shall be equivalent to the `strftime()` function, except that:

- 68053 • The argument `wcs` points to the initial element of an array of wide characters into which
68054 the generated output is to be placed.
- 68055 • The argument `maxsize` indicates the maximum number of wide characters to be placed in
68056 the output array.
- 68057 • The argument `format` is a wide-character string and the conversion specifications are
68058 replaced by corresponding sequences of wide characters.
- 68059 • The return value indicates the number of wide characters placed in the output array.

68060 If copying takes place between objects that overlap, the behavior is undefined.

68061 **RETURN VALUE**68062 If the total number of resulting wide-character codes including the terminating null wide-
68063 character code is no more than `maxsize`, `wcsftime()` shall return the number of wide-character
68064 codes placed into the array pointed to by `wcs`, not including the terminating null wide-character
68065 code. Otherwise, zero is returned and the contents of the array are unspecified.68066 **ERRORS**

68067 No errors are defined.

68068 **EXAMPLES**

68069 None.

68070 **APPLICATION USAGE**

68081

Issue 5

68082

Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

68083

68084

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format* argument is changed from **const char *** to **const wchar_t ***.

68085

Issue 6

68086

The *wcsftime()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

68087 **NAME**68088 `wcslen`, `wcsnlen` — get length of a fixed-sized wide-character string68089 **SYNOPSIS**68090 `#include <wchar.h>`68091 `size_t wcslen(const wchar_t *ws);`68092 CX `size_t wcsnlen(const wchar_t *ws, size_t maxlen);`68093 **DESCRIPTION**68094 CX For `wcslen()`: The functionality described on this reference page is aligned with the ISO C
68095 standard. Any conflict between the requirements described here and the ISO C standard is
68096 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.68097 The `wcslen()` function shall compute the number of wide-character codes in the wide-character
68098 string to which `ws` points, not including the terminating null wide-character code.68099 CX The `wcsnlen()` function shall compute the smaller of the number of wide characters in the string
68100 to which `ws` points, not including the terminating null wide-character code, and the value of
68101 `maxlen`. The `wcsnlen()` function shall never examine more than the first `maxlen` characters of the
68102 wide-character string pointed to by `ws`.68103 **RETURN VALUE**68104 The `wcslen()` function shall return the length of `ws`.68105 CX The `wcsnlen()` function shall return an integer containing the smaller of either the length of the
68106 wide-character string pointed to by `ws` or `maxlen`.

68107 No return values are reserved to indicate an error.

68108 **ERRORS**

68109 No errors are defined.

68125 Set Part 1.

68126 **NAME**68127 `wcsncasecmp`, `wcsncasecmp_l` — case-insensitive wide-character string comparison68128 **SYNOPSIS**

```
68129 CX #include <wchar.h>
68130 int wcsncasecmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);
68131 int wcsncasecmp_l(const wchar_t *ws1, const wchar_t *ws2,
68132 size_t n, locale_t locale);
```

68133 **DESCRIPTION**68134 Refer to [wcscasecmp\(\)](#).

68135 **NAME**68136 `wcsncat` — concatenate a wide-character string with part of another68137 **SYNOPSIS**68138 `#include <wchar.h>`68139 `wchar_t *wcsncat(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
68140 `size_t n);`68141 **DESCRIPTION**68142 CX The functionality described on this reference page is aligned with the ISO C standard. Any
68143 conflict between the requirements described here and the ISO C standard is unintentional. This
68144 volume of POSIX.1-200x defers to the ISO C standard.68145 The `wcsncat()` function shall append not more than *n* wide-character codes (a null wide-
68146 character code and wide-character codes that follow it are not appended) from the array pointed
68147 to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character
68148 code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null
68149 wide-character code shall always be appended to the result. If copying takes place between
68150 objects that overlap, the behavior is undefined.68151 **RETURN VALUE**68152 The `wcsncat()` function shall return *ws1*; no return value is reserved to indicate an error.68153 **ERRORS**

68154 No errors are defined.

68162 None.

68163 **SEE ALSO**68164 [wcscat\(\)](#)68165 XBD [<wchar.h>](#)68166 **CHANGE HISTORY**

68167 First released in Issue 4. Derived from the MSE working draft.

68168 **Issue 6**68169 The `wcsncat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

68170 **NAME**
 68171 `wcsncmp` — compare part of two wide-character strings

68172 **SYNOPSIS**
 68173 `#include <wchar.h>`
 68174 `int wcsncmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);`

68175 **DESCRIPTION**
 68176 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68177 conflict between the requirements described here and the ISO C standard is unintentional. This
 68178 volume of POSIX.1-200x defers to the ISO C standard.

68179 The `wcsncmp()` function shall compare not more than *n* wide-character codes (wide-character
 68180 codes that follow a null wide-character code are not compared) from the array pointed to by *ws1*
 68181 to the array pointed to by *ws2*.

68182 The sign of a non-zero return value shall be determined by the sign of the difference between the
 68183 values of the first pair of wide-character codes that differ in the objects being compared.

68184 **RETURN VALUE**
 68185 Upon successful completion, `wcsncmp()` shall return an integer greater than, equal to, or less
 68186 than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less
 68187 than the possibly null-terminated array pointed to by *ws2*, respectively.

68188 **ERRORS**
 68189 No errors are defined.

68190 **EXAMPLES**
 68191 None.

68192 **APPLICATION USAGE**
 68193 None.

68194 **RATIONALE**
 68195 None.

68196 **FUTURE DIRECTIONS**

68201 **CHANGE HISTORY**
 68202 First released in Issue 4. Derived from the MSE working draft.

68203 **NAME**68204 `wcpncpy`, `wcsncpy` — copy a fixed-size wide-character string, returning a pointer to its end68205 **SYNOPSIS**68206 `#include <wchar.h>`68207 CX `wchar_t *wcpncpy(wchar_t restrict *ws1, const wchar_t *restrict ws2,`
68208 `size_t n);`68209 `wchar_t *wcsncpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
68210 `size_t n);`68211 **DESCRIPTION**68212 CX For `wcsncpy()`: The functionality described on this reference page is aligned with the ISO C
68213 standard. Any conflict between the requirements described here and the ISO C standard is
68214 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.68215 CX The `wcpncpy()` and `wcsncpy()` functions shall copy not more than *n* wide-character codes (wide-
68216 character codes that follow a null wide-character code are not copied) from the array pointed to
68217 by *ws2* to the array pointed to by *ws1*. If copying takes place between objects that overlap, the
68218 behavior is undefined.68219 If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character
68220 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,
68221 until *n* wide-character codes in all are written.68222 **RETURN VALUE**68223 CX If any null wide-character codes were written into the destination, the `wcpncpy()` function shall
68224 return the address of the first such null wide-character code. Otherwise, it shall return `&ws1[n]`.68225 The `wcsncpy()` function shall return *ws1*.

68226 No return values are reserved to indicate an error.

68227 **ERRORS**

68228 No errors are defined.

68229 **EXAMPLES**

68230 None.

68231 **APPLICATION USAGE**68232 If there is no null wide-character code in the first *n* wide-character codes of the array pointed to
68233 by *ws2*, the result is not null-terminated.68234 **RATIONALE**

68235 None.

68236 **FUTURE DIRECTIONS**

68237 None.

68238 **SEE ALSO**68239 [strncpy\(\)](#), [wcsncpy\(\)](#)68240 XBD [<wchar.h>](#)68241 **CHANGE HISTORY**

68243

Issue 6

68244

The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

68245

Issue 7

68246

The *wcpncpy()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

68247

wcsnlen()

68248 **NAME**
68249 `wcsnlen` — get length of a fixed-sized wide-character string

SYNOPSIS

68251 CX `#include <wchar.h>`
68252 `size_t wcsnlen(const wchar_t *ws, size_t maxlen);`

DESCRIPTION

68253 Refer to *wcslen()*.
68254

68255 **NAME**68256 `wcsnrtombs` — convert wide-character string to multi-byte string68257 **SYNOPSIS**

```
68258 CX #include <wchar.h>  
68259 size_t wcsnrtombs(char *dst, const wchar_t **src, size_t nwc,  
68260 size_t len, mbstate_t *ps);
```

68261 **DESCRIPTION**68262 Refer to [wcsrtombs\(\)](#).

68263 **NAME**68264 `wcspbrk` — scan a wide-character string for a wide-character code68265 **SYNOPSIS**68266 `#include <wchar.h>`68267 `wchar_t *wcspbrk(const wchar_t *ws1, const wchar_t *ws2);`68268 **DESCRIPTION**68269 CX The functionality described on this reference page is aligned with the ISO C standard. Any
68270 conflict between the requirements described here and the ISO C standard is unintentional. This
68271 volume of POSIX.1-200x defers to the ISO C standard.68272 The `wcspbrk()` function shall locate the first occurrence in the wide-character string pointed to by
68273 `ws1` of any wide-character code from the wide-character string pointed to by `ws2`.68274 **RETURN VALUE**68275 Upon successful completion, `wcspbrk()` shall return a pointer to the wide-character code or a null
68276 pointer if no wide-character code from `ws2` occurs in `ws1`.68277 **ERRORS**

68278 No errors are defined.

68279 **EXAMPLES**

68280 None.

68281 **APPLICATION USAGE**

68282 None.

68283 **RATIONALE**

68284 None.

68285 **FUTURE DIRECTIONS**

68286 None.

68287 **SEE ALSO**68288 [*wcchr\(\)*](#), [*wcsrchr\(\)*](#)68289 XBD [*<wchar.h>*](#)68290 **CHANGE HISTORY**

68291 First released in Issue 4. Derived from the MSE working draft.

68292 **NAME**
 68293 wcsrchr — wide-character string scanning operation

68294 **SYNOPSIS**
 68295 #include <wchar.h>
 68296 wchar_t *wcsrchr(const wchar_t *ws, wchar_t wc);

68297 **DESCRIPTION**
 68298 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68299 conflict between the requirements described here and the ISO C standard is unintentional. This
 68300 volume of POSIX.1-200x defers to the ISO C standard.

68301 The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed
 68302 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type
 68303 **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The
 68304 terminating null wide-character code shall be considered to be part of the wide-character string.

68305 **RETURN VALUE**
 68306 Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null
 68307 pointer if *wc* does not occur in the wide-character string.

68308 **ERRORS**
 68309 No errors are defined.

68310 **EXAMPLES**
 68311 None.

68312 **APPLICATION USAGE**
 68313 None.

68314 **RATIONALE**
 68315 None.

68316 **FUTURE DIRECTIONS**
 68317 None.

68318 **SEE ALSO**

 68320 XBD <wchar.h>

68321 **CHANGE HISTORY**
 68322 First released in Issue 4. Derived from the MSE working draft.

68323 **Issue 6**
 68324 The normative text is updated to avoid use of the term “must” for application requirements.

68325 **NAME**

68326 wcsnrtombs, wcsrtombs — convert a wide-character string to a character string (restartable)

68327 **SYNOPSIS**

68328 #include <wchar.h>

68329 CX

```
size_t wcsnrtombs(char *dst, const wchar_t **src, size_t nwc,  
size_t len, mbstate_t *ps);
```

68330

```
size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,  
size_t len, mbstate_t *restrict ps);
```

68333 **DESCRIPTION**68334 CX For *wcsrtombs()*: The functionality described on this reference page is aligned with the ISO C
68335 standard. Any conflict between the requirements described here and the ISO C standard is
68336 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.68337 The *wcsrtombs()* function shall convert a sequence of wide characters from the array indirectly
68338 pointed to by *src* into a sequence of corresponding characters, beginning in the conversion state
68339 described by the object pointed to by *ps*. If *dst* is not a null pointer, the converted characters
68340 shall then be stored into the array pointed to by *dst*. Conversion continues up to and including a
68341 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the
68342 following cases:

- 68343
- When a code is reached that does not correspond to a valid character
 - When the next character would exceed the limit of *len* total bytes to be stored in the array
68344 pointed to by *dst* (and *dst* is not a null pointer)

68346 Each conversion shall take place as if by a call to the *wcrtomb()* function.68347 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
68348 pointer (if conversion stopped due to reaching a terminating null wide character) or the address
68349 just past the last wide character converted (if any). If conversion stopped due to reaching a
68350 terminating null wide character, the resulting state described shall be the initial conversion state.68351 If *ps* is a null pointer, the *wcsrtombs()* function shall use its own internal **mbstate_t** object, which
68352 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
68353 pointed to by *ps* shall be used to completely describe the current conversion state of the
68354 associated character sequence.68355 CX If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`
68356 functions, the application shall ensure that the *wcsrtombs()* function is called with a non-NULL
68357 *ps* argument.68358 The *wcsnrtombs()* function shall be equivalent to the *wcsrtombs()* function, except that the
68359 conversion is limited to the first *nwc* wide characters.68360 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.68361 The implementation shall behave as if no function defined in System Interfaces volume of
68362 POSIX.1-200x calls these functions.68363 **RETURN VALUE**68364 If conversion stops because a code is reached that does not correspond to a valid character, an
68365 encoding error occurs. In this case, these functions shall store the value of the macro `[EILSEQ]` in
68366 *errno* and return (**size_t**)-1; the conversion state is undefined. Otherwise, these functions shall
68367 return the number of bytes in the resulting character sequence, not including the terminating
68368 null (if any).

68369 **ERRORS**

68370 These functions may fail if:

68371 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

68372 [EILSEQ] A wide-character code does not correspond to a valid character.

68373 **EXAMPLES**

68374 None.

68375 **APPLICATION USAGE**

68376 None.

68377 **RATIONALE**

68378 None.

68379 **FUTURE DIRECTIONS**

68380 None.

68381 **SEE ALSO**68382 *mbsinit()*, *wcrtomb()*68383 XBD <[wchar.h](#)>68384 **CHANGE HISTORY**68385 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
68386 (E).68387 **Issue 6**

68388 In the DESCRIPTION, a note on using this function in a threaded application is added.

68389 Extensions beyond the ISO C standard are marked.

68390 The normative text is updated to avoid use of the term “must” for application requirements.

68391 The *wcsrtombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.68392 **Issue 7**68393 The *wcnsrtombs()* function is added from The Open Group Technical Standard, 2006, Extended
68394 API Set Part 1.

68395 **NAME**
 68396 `wcsspn` — get the length of a wide substring

68397 **SYNOPSIS**
 68398 `#include <wchar.h>`

68399 `size_t wcsspn(const wchar_t *ws1, const wchar_t *ws2);`

68400 **DESCRIPTION**

68401 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68402 conflict between the requirements described here and the ISO C standard is unintentional. This
 68403 volume of POSIX.1-200x defers to the ISO C standard.

68404 The `wcsspn()` function shall compute the length (in wide characters) of the maximum initial
 68405 segment of the wide-character string pointed to by `ws1` which consists entirely of wide-character
 68406 codes from the wide-character string pointed to by `ws2`.

68407 **RETURN VALUE**

68408 The `wcsspn()` function shall return the length of the initial substring of `ws1`; no return value is
 68409 reserved to indicate an error.

68410 **ERRORS**

68411 No errors are defined.

68412 **EXAMPLES**

68413 None.

68414 **APPLICATION USAGE**

68415 None.

68416 **RATIONALE**

68417 None.

68418 **FUTURE DIRECTIONS**

68424 First released in Issue 4. Derived from the MSE working draft.

68425 **Issue 5**

68426 The RETURN VALUE section is updated to indicate that `wcsspn()` returns the length of `ws1`
 68427 rather than `ws1` itself.

68428 **NAME**68429 `wcsstr` — find a wide-character substring68430 **SYNOPSIS**68431 `#include <wchar.h>`68432 `wchar_t *wcsstr(const wchar_t *restrict ws1,`
68433 `const wchar_t *restrict ws2);`68434 **DESCRIPTION**68435 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
68436 conflict between the requirements described here and the ISO C standard is unintentional. This
68437 volume of POSIX.1-200x defers to the ISO C standard.68438 The `wcsstr()` function shall locate the first occurrence in the wide-character string pointed to by
68439 `ws1` of the sequence of wide characters (excluding the terminating null wide character) in the
68440 wide-character string pointed to by `ws2`.68441 **RETURN VALUE**68442 Upon successful completion, `wcsstr()` shall return a pointer to the located wide-character string,
68443 or a null pointer if the wide-character string is not found.68444 If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.68445 **ERRORS**

68446 No errors are defined.

68447 **EXAMPLES**

68448 None.

68449 **APPLICATION USAGE**

68450 None.

68451 **RATIONALE**

68452 None.

68453 **FUTURE DIRECTIONS**

68454 None.

68455 **SEE ALSO**68456 [*wcschr\(\)*](#)68457 XBD [*<wchar.h>*](#)68458 **CHANGE HISTORY**68459 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
68460 (E).68461 **Issue 6**68462 The `wcsstr()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

68463 **NAME**
 68464 `wcstod`, `wcstof`, `wcstold` — convert a wide-character string to a double-precision number

68465 **SYNOPSIS**
 68466 `#include <wchar.h>`
 68467 `double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);`
 68468 `float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);`
 68469 `long double wcstold(const wchar_t *restrict nptr,`
 68470 `wchar_t **restrict endptr);`

68471 DESCRIPTION

68472 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68473 conflict between the requirements described here and the ISO C standard is unintentional. This
 68474 volume of POSIX.1-200x defers to the ISO C standard.

68475 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to
 68476 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the
 68477 input wide-character string into three parts:

- 68478 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 68479 `iswspace()`)
- 68480 2. A subject sequence interpreted as a floating-point constant or representing infinity or
 68481 NaN
- 68482 3. A final wide-character string of one or more unrecognized wide-character codes,
 68483 including the terminating null wide-character code of the input wide-character string

68484 Then they shall attempt to convert the subject sequence to a floating-point number, and return
 68485 the result.

68486 The expected form of the subject sequence is an optional plus or minus sign, then one of the
 68487 following:

- 68488 • A non-empty sequence of decimal digits optionally containing a radix character; then an
 68489 optional exponent part consisting of the wide character 'e' or the wide character 'E',
 68490 optionally followed by a '+' or '-' wide character, and then followed by one or more
 68491 decimal digits
- 68492 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix
 68493 character; then an optional binary exponent part consisting of the wide character 'p' or
 68494 the wide character 'P', optionally followed by a '+' or '-' wide character, and then
 68495 followed by one or more decimal digits
- 68496 • One of INF or INFINITY, or any other wide string equivalent except for case
- 68497 • One of NAN or NAN(*n-wchar-sequence_{opt}*), or any other wide string ignoring case in the
 68498 NAN part, where:

68499 `n-wchar-sequence:`
 68500 `digit`
 68501 `nondigit`
 68502 `n-wchar-sequence digit`
 68503 `n-wchar-sequence nondigit`

68504 The subject sequence is defined as the longest initial subsequence of the input wide string,
 68505 starting with the first non-white-space wide character, that is of the expected form. The subject
 68506 sequence contains no wide characters if the input wide string is not of the expected form.

68507 If the subject sequence has the expected form for a floating-point number, the sequence of wide
 68508 characters starting with the first digit or the radix character (whichever occurs first) shall be
 68509 interpreted as a floating constant according to the rules of the C language, except that the radix
 68510 character shall be used in place of a period, and that if neither an exponent part nor a radix
 68511 character appears in a decimal floating-point number, or if a binary exponent part does not
 68512 appear in a hexadecimal floating-point number, an exponent part of the appropriate type with
 68513 value zero shall be assumed to follow the last digit in the string. If the subject sequence begins
 68514 with a minus sign, the sequence shall be interpreted as negated. A wide-character sequence INF
 68515 or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it
 68516 were a floating constant that is too large for the range of the return type. A wide-character
 68517 sequence NAN or NAN(*n-wchar-sequence_{opt}*) shall be interpreted as a quiet NaN, if supported in
 68518 the return type, else as if it were a subject sequence part that does not have the expected form;
 68519 the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide
 68520 string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

68521 If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the
 68522 conversion shall be rounded in an implementation-defined manner.

68523 CX The radix character shall be as defined in the locale of the process (category *LC_NUMERIC*). In
 68524 the POSIX locale, or in a locale where the radix character is not defined, the radix character shall
 68525 default to a period (' . ').

68526 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 68527 accepted.

68528 If the subject sequence is empty or does not have the expected form, no conversion shall be
 68529 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
 68530 *endptr* is not a null pointer.

68531 CX The *wcstod()* function shall not change the setting of *errno* if successful.

68532 Since 0 is returned on error and is also a valid return on success, an application wishing to check
 68533 for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check
 68534 *errno*.

68535 RETURN VALUE

68536 Upon successful completion, these functions shall return the converted value. If no conversion
 68537 CX could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

68538 If the correct value is outside the range of representable values, \pm HUGE_VAL, \pm HUGE_VALF, or
 68539 \pm HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to
 68540 [ERANGE].

68541 If the correct value would cause underflow, a value whose magnitude is no greater than the
 68542 smallest normalized positive number in the return type shall be returned and *errno* set to
 68543 [ERANGE].

68544 ERRORS

68545 The *wcstod()* function shall fail if:

68546 [ERANGE] The value to be returned would cause overflow or underflow.

68547 The *wcstod()* function may fail if:

68548 CX [EINVAL] No conversion could be performed.

EXAMPLES

68549 None.
68550

APPLICATION USAGE

68551 If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the
68552 result is not exactly representable, the result should be one of the two numbers in the
68553 appropriate internal format that are adjacent to the hexadecimal floating source value, with the
68554 extra stipulation that the error should have a correct sign for the current rounding direction.
68555

68556 If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in `<float.h>`)
68557 significant digits, the result should be correctly rounded. If the subject sequence *D* has the
68558 decimal form and more than DECIMAL_DIG significant digits, consider the two bounding,
68559 adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the
68560 values of *L*, *D*, and *U* satisfy " $L \leq D \leq U$ ". The result should be one of the (equal or
68561 adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current
68562 rounding direction, with the extra stipulation that the error with respect to *D* should have a
68563 correct sign for the current rounding direction.

RATIONALE

68564 None.
68565

FUTURE DIRECTIONS

68566 None.

CHANGE HISTORY

68571 First released in Issue 4. Derived from the MSE working draft.
68572

Issue 5

68573 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
68574

Issue 6

68575 Extensions beyond the ISO C standard are marked.
68576

68577 The following new requirements on POSIX implementations derive from alignment with the
68578 Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

68581 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The *wcstod()* prototype is updated.
- The *wcstof()* and *wcstold()* functions are added.
- If the correct value for *wcstod()* would cause underflow, the return value changed from 0 (as specified in Issue 5) to the smallest normalized positive number.
- The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively updated.

68588 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

68589 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second
68590 paragraph in the RETURN VALUE section.

68591

Issue 7

68592

Austin Group Interpretation 1003.1-2001 #015 is applied.

68593 **NAME**68594 `wcstoimax`, `wcstoumax` — convert a wide-character string to an integer type68595 **SYNOPSIS**68596 `#include <stddef.h>`68597 `#include <inttypes.h>`

```
68598     intmax_t wcstoimax(const wchar_t *restrict nptr,
68599                     wchar_t **restrict endptr, int base);
68600     uintmax_t wcstoumax(const wchar_t *restrict nptr,

```

68602 **DESCRIPTION**

68603 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68604 conflict between the requirements described here and the ISO C standard is unintentional. This
 68605 volume of POSIX.1-200x defers to the ISO C standard.

68606 These functions shall be equivalent to the `wcstol()`, `wcstoll()`, `wcstoul()`, and `wcstoull()` functions,
 68607 respectively, except that the initial portion of the wide string shall be converted to `intmax_t` and
 68608 `uintmax_t` representation, respectively.

68609 **RETURN VALUE**

68610 These functions shall return the converted value, if any.

68611 If no conversion could be performed, zero shall be returned. If the correct value is outside the
 68612 range of representable values, `{INTMAX_MAX}`, `{INTMAX_MIN}`, or `{UINTMAX_MAX}` shall
 68613 be returned (according to the return type and sign of the value, if any), and `errno` shall be set to
 68614 `[ERANGE]`.

68615 **ERRORS**

68616 These functions shall fail if:

68617 `[EINVAL]` The value of `base` is not supported.68618 `[ERANGE]` The value to be returned is not representable.

68619 These functions may fail if:

68620 `[EINVAL]` No conversion could be performed.68621 **EXAMPLES**

68622 None.

68623 **APPLICATION USAGE**

68624 None.

68625 **RATIONALE**

68626 None.

68627 **FUTURE DIRECTIONS**

68628 None.

68633

CHANGE HISTORY

First released in Issue 6. Derived from the ISO/IEC 9899: 1999 standard.

68634 **NAME**
 68635 `wcstok` — split a wide-character string into tokens

68636 **SYNOPSIS**
 68637 `#include <wchar.h>`
 68638 `wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
 68639 `wchar_t **restrict ptr);`

68640 **DESCRIPTION**

68641 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68642 conflict between the requirements described here and the ISO C standard is unintentional. This
 68643 volume of POSIX.1-200x defers to the ISO C standard.

68644 A sequence of calls to `wcstok()` shall break the wide-character string pointed to by `ws1` into a
 68645 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-
 68646 character string pointed to by `ws2`. The `ptr` argument points to a caller-provided `wchar_t` pointer
 68647 into which the `wcstok()` function shall store information necessary for it to continue scanning the
 68648 same wide-character string.

68649 The first call in the sequence has `ws1` as its first argument, and is followed by calls with a null
 68650 pointer as their first argument. The separator string pointed to by `ws2` may be different from call
 68651 to call.

68652 The first call in the sequence shall search the wide-character string pointed to by `ws1` for the first
 68653 wide-character code that is *not* contained in the current separator string pointed to by `ws2`. If no
 68654 such wide-character code is found, then there are no tokens in the wide-character string pointed
 68655 to by `ws1` and `wcstok()` shall return a null pointer. If such a wide-character code is found, it shall
 68656 be the start of the first token.

68657 The `wcstok()` function shall then search from there for a wide-character code that *is* contained in
 68658 the current separator string. If no such wide-character code is found, the current token extends
 68659 to the end of the wide-character string pointed to by `ws1`, and subsequent searches for a token
 68660 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a
 68661 null wide character, which terminates the current token. The `wcstok()` function shall save a
 68662 pointer to the following wide-character code, from which the next search for a token shall start.

68663 Each subsequent call, with a null pointer as the value of the first argument, shall start searching
 68664 from the saved pointer and behave as described above.

68665 The implementation shall behave as if no function calls `wcstok()`.

68666 **RETURN VALUE**

68667 Upon successful completion, the `wcstok()` function shall return a pointer to the first wide-
 68668 character code of a token. Otherwise, if there is no token, `wcstok()` shall return a null pointer.

68669 **ERRORS**

68670 No errors are defined.

CHANGE HISTORY

68682

First released in Issue 4.

68683

Issue 5

68684

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is added to the definition of *wcstok()* in the SYNOPSIS.

68685

68686

Issue 6

68687

The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

DRAFT

68688 **NAME**
 68689 `wcstol, wcstoll` — convert a wide-character string to a long integer

68690 **SYNOPSIS**
 68691 `#include <wchar.h>`
 68692 `long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,`
 68693 `int base);`
 68694 `long long wcstoll(const wchar_t *restrict nptr,`
 68695 `wchar_t **restrict endptr, int base);`

68696 **DESCRIPTION**

68697 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68698 conflict between the requirements described here and the ISO C standard is unintentional. This
 68699 volume of POSIX.1-200x defers to the ISO C standard.

68700 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to
 68701 **long** and **long long**, respectively. First, they shall decompose the input string into three parts:

- 68702 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 68703 `iswspace()`)
- 68704 2. A subject sequence interpreted as an integer represented in some radix determined by the
 68705 value of *base*
- 68706 3. A final wide-character string of one or more unrecognized wide-character codes,
 68707 including the terminating null wide-character code of the input wide-character string

68708 Then they shall attempt to convert the subject sequence to an integer, and return the result.

68709 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
 68710 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal
 68711 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
 68712 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
 68713 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 68714 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

68715 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 68716 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 68717 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
 68718 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
 68719 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code
 68720 representations of 0x or 0X may optionally precede the sequence of letters and digits, following
 68721 the sign if present.

68722 The subject sequence is defined as the longest initial subsequence of the input wide-character
 68723 string, starting with the first non-white-space wide-character code that is of the expected form.
 68724 The subject sequence contains no wide-character codes if the input wide-character string is
 68725 empty or consists entirely of white-space wide-character code, or if the first non-white-space
 68726 wide-character code is other than a sign or a permissible letter or digit.

68727 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes
 68728 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
 68729 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for
 68730 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
 68731 minus sign, the value resulting from the conversion shall be negated. A pointer to the final wide-
 68732 character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a
 68733 null pointer.

68734 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
68735 accepted.

68736 If the subject sequence is empty or does not have the expected form, no conversion shall be
68737 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
68738 *endptr* is not a null pointer.

68739 CX These functions shall not change the setting of *errno* if successful.

68740 Since 0, {LONG_MIN} or {LLONG_MIN} and {LONG_MAX} or {LLONG_MAX} are returned on
68741 error and are also valid returns on success, an application wishing to check for error situations
68742 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.

68743 RETURN VALUE

68744 Upon successful completion, these functions shall return the converted value, if any. If no
68745 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If
68746 the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},
68747 {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and
68748 *errno* set to [ERANGE].

68749 ERRORS

68750 These functions shall fail if:

68751 CX [EINVAL] The value of *base* is not supported.

68752 [ERANGE] The value to be returned is not representable.

68753 These functions may fail if:

68754 CX [EINVAL] No conversion could be performed.

68755 EXAMPLES

68756 None.

68757 APPLICATION USAGE

68758 None.

68759 RATIONALE

68760 None.

68761 FUTURE DIRECTIONS

68766 CHANGE HISTORY

68767 First released in Issue 4. Derived from the MSE working draft.

68768 Issue 5

68769 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

68770 Issue 6

68771 Extensions beyond the ISO C standard are marked.

68772 The following new requirements on POSIX implementations derive from alignment with the
68773 Single UNIX Specification:

- 68774 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
68775 added if no conversion could be performed.

68776 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

wcstol()

68777

- The *wcstol()* prototype is updated.

68778

- The *wcstoll()* function is added.

68779

Issue 7

68780

SD5-XSH-ERN-56 is applied, removing the reference to **unsigned long** and **unsigned long long** from the DESCRIPTION.

68781

68782 **NAME**
68783 `wcstold` — convert a wide-character string to a double-precision number

68784 **SYNOPSIS**
68785 `#include <wchar.h>`
68786 `long double wcstold(const wchar_t *restrict nptr,`
68787 `wchar_t **restrict endptr);`

68788 **DESCRIPTION**
68789 Refer to *wcstod()*.

68790 **NAME**
68791 `wcstoll` — convert a wide-character string to a long integer

68792 **SYNOPSIS**
68793 `#include <wchar.h>`
68794 `long long wcstoll(const wchar_t *restrict nptr,`
68795 `wchar_t **restrict endptr, int base);`

68796 **DESCRIPTION**
68797 Refer to *wcstol()*.

68798 **NAME**
 68799 `wcstombs` — convert a wide-character string to a character string

68800 **SYNOPSIS**
 68801 `#include <stdlib.h>`
 68802 `size_t wcstombs(char *restrict s, const wchar_t *restrict pwcs,`
 68803 `size_t n);`

68804 **DESCRIPTION**

68805 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 68806 conflict between the requirements described here and the ISO C standard is unintentional. This
 68807 volume of POSIX.1-200x defers to the ISO C standard.

68808 The `wcstombs()` function shall convert the sequence of wide-character codes that are in the array
 68809 pointed to by `pwcs` into a sequence of characters that begins in the initial shift state and store
 68810 these characters into the array pointed to by `s`, stopping if a character would exceed the limit of `n`
 68811 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to
 68812 `wctomb()`, except that the shift state of `wctomb()` shall not be affected.

68813 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.

68814 No more than `n` bytes shall be modified in the array pointed to by `s`. If copying takes place
 68815 CX between objects that overlap, the behavior is undefined. If `s` is a null pointer, `wcstombs()` shall
 68816 return the length required to convert the entire array regardless of the value of `n`, but no values
 68817 are stored.

68818 The `wcstombs()` function need not be thread-safe. A function that is not required to be thread-
 68819 safe is not required to be reentrant.

68820 **RETURN VALUE**

68821 If a wide-character code is encountered that does not correspond to a valid character (of one or
 68822 more bytes each), `wcstombs()` shall return `(size_t)-1`. Otherwise, `wcstombs()` shall return the
 68823 number of bytes stored in the character array, not including any terminating null byte. The array
 68824 shall not be null-terminated if the value returned is `n`.

68825 **ERRORS**

68826 The `wcstombs()` function may fail if:

68827 CX **[EILSEQ]** A wide-character code does not correspond to a valid character.

68828 **EXAMPLES**

68829 None.

68830 **APPLICATION USAGE**

68831 None.

68832 **RATIONALE**

68833 None.

68834 **FUTURE DIRECTIONS**

68835 None.

68836 **SEE ALSO**

68839

CHANGE HISTORY

68840

First released in Issue 4. Derived from the ISO C standard.

68841

Issue 6

68842

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

68843

- The DESCRIPTION states the effect of when *s* is a null pointer.
- The [EILSEQ] error condition is added.

68844

68845

68846

The *wcstombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

68847 **NAME**68848 `wcstoul`, `wcstoull` — convert a wide-character string to an unsigned long68849 **SYNOPSIS**68850 `#include <wchar.h>`68851 `unsigned long wcstoul(const wchar_t *restrict nptr,`
68852 `wchar_t **restrict endptr, int base);`68853 `unsigned long long wcstoull(const wchar_t *restrict nptr,`
68854 `wchar_t **restrict endptr, int base);`68855 **DESCRIPTION**68856 CX The functionality described on this reference page is aligned with the ISO C standard. Any
68857 conflict between the requirements described here and the ISO C standard is unintentional. This
68858 volume of POSIX.1-200x defers to the ISO C standard.68859 The `wcstoul()` and `wcstoull()` functions shall convert the initial portion of the wide-character
68860 string pointed to by `nptr` to **unsigned long** and **unsigned long long** representation, respectively.
68861 First, they shall decompose the input wide-character string into three parts:

- 68862 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
-
- 68863
- `iswspace()`
-)
-
- 68864 2. A subject sequence interpreted as an integer represented in some radix determined by the
-
- 68865 value of
- `base`
-
- 68866 3. A final wide-character string of one or more unrecognized wide-character codes,
-
- 68867 including the terminating null wide-character code of the input wide-character string

68868 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
68869 result.68870 If `base` is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
68871 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal
68872 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
68873 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
68874 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
68875 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.68876 If the value of `base` is between 2 and 36, the expected form of the subject sequence is a sequence
68877 of letters and digits representing an integer with the radix specified by `base`, optionally preceded
68878 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
68879 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
68880 than that of `base` shall be permitted. If the value of `base` is 16, the wide-character codes 0x or 0X
68881 may optionally precede the sequence of letters and digits, following the sign if present.68882 The subject sequence is defined as the longest initial subsequence of the input wide-character
68883 string, starting with the first wide-character code that is not white space and is of the expected
68884 form. The subject sequence contains no wide-character codes if the input wide-character string is
68885 empty or consists entirely of white-space wide-character codes, or if the first wide-character
68886 code that is not white space is other than a sign or a permissible letter or digit.68887 If the subject sequence has the expected form and `base` is 0, the sequence of wide-character codes
68888 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
68889 the expected form and the value of `base` is between 2 and 36, it shall be used as the base for
68890 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
68891 minus sign, the value resulting from the conversion shall be negated. A pointer to the final wide-
68892 character string shall be stored in the object pointed to by `endptr`, provided that `endptr` is not a

wcstoul()

68893 null pointer.

68894 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
68895 accepted.

68896 If the subject sequence is empty or does not have the expected form, no conversion shall be
68897 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
68898 *endptr* is not a null pointer.

68899 CX The *wcstoul()* function shall not change the setting of *errno* if successful.

68900 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and 0 is also a valid return
68901 on success, an application wishing to check for error situations should set *errno* to 0, then call
68902 *wcstoul()* or *wcstoull()*, then check *errno*.

RETURN VALUE

68903 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted
68904 value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to
68905 indicate the error. If the correct value is outside the range of representable values,
68906 {ULONG_MAX} or {ULLONG_MAX} respectively shall be returned and *errno* set to [ERANGE].
68907

ERRORS

68908 These functions shall fail if:

68909 CX [EINVAL] The value of *base* is not supported.

68910 [ERANGE] The value to be returned is not representable.

68911 These functions may fail if:

68912 CX [EINVAL] No conversion could be performed.

EXAMPLES

68914 None.
68915

APPLICATION USAGE

CHANGE HISTORY

68924 First released in Issue 4. Derived from the MSE working draft.

Issue 5

68925 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
68926

Issue 6

68927 Extensions beyond the ISO C standard are marked.
68928

68929 The following new requirements on POSIX implementations derive from alignment with the
68930 Single UNIX Specification:

- 68931 • The [EINVAL] error condition is added for when the value of *base* is not supported.

68932 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
68933 added if no conversion could be performed.
68934
68935

68936

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

68937

- The *wcstoul()* prototype is updated.

68938

- The *wcstoull()* function is added.

68939 **NAME**
68940 `wcstoumax` — convert a wide-character string to an integer type

68941 **SYNOPSIS**
68942 `#include <stddef.h>`
68943 `#include <inttypes.h>`
68944 `uintmax_t wcstoumax(const wchar_t *restrict nptr,`
68945 `wchar_t **restrict endptr, int base);`

68946 **DESCRIPTION**
68947 Refer to [wcstoimax\(\)](#).

68948 **NAME**

68949 wcswidth — number of column positions of a wide-character string

68950 **SYNOPSIS**

```
68951 XSI #include <wchar.h>
68952 int wcswidth(const wchar_t *pwcs, size_t n);
```

68953 **DESCRIPTION**

68954 The *wcswidth()* function shall determine the number of column positions required for *n* wide-
 68955 character codes (or fewer than *n* wide-character codes if a null wide-character code is
 68956 encountered before *n* wide-character codes are exhausted) in the string pointed to by *pwcs*.

68957 **RETURN VALUE**

68958 The *wcswidth()* function either shall return 0 (if *pwcs* points to a null wide-character code), or
 68959 return the number of column positions to be occupied by the wide-character string pointed to by
 68960 *pwcs*, or return -1 (if any of the first *n* wide-character codes in the wide-character string pointed
 68961 to by *pwcs* is not a printable wide-character code).

68962 **ERRORS**

68963 No errors are defined.

68964 **EXAMPLES**

68965 None.

68966 **APPLICATION USAGE**

68967 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the
 68968 return value for a non-printable wide character is not specified.

68969 **RATIONALE**

68970 None.

68971 **FUTURE DIRECTIONS**

68972 None.

68977 First released in Issue 4. Derived from the MSE working draft.

68978 **Issue 6**

68979 The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

68980 **NAME**68981 `wcsxfrm`, `wcsxfrm_l` — wide-character string transformation68982 **SYNOPSIS**68983

```
#include <wchar.h>
```

68984

```
size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2,  
size_t n);
```

68985

```
CX size_t wcsxfrm_l(wchar_t *restrict ws1, const wchar_t *restrict ws2,  
68987 size_t n, locale_t locale);
```

68988 **DESCRIPTION**68989 CX For `wcsxfrm()`: The functionality described on this reference page is aligned with the ISO C
68990 standard. Any conflict between the requirements described here and the ISO C standard is
68991 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.68992 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall transform the wide-character string pointed to
68993 by `ws2` and place the resulting wide-character string into the array pointed to by `ws1`. The
68994 transformation shall be such that if `wcscmp()` is applied to two transformed wide strings, it shall
68995 return a value greater than, equal to, or less than 0, corresponding to the result of `wscoll()` and
68996 `wscoll_l()` applied to the same two original wide-character strings, and the same `LC_COLLATE`
68997 category of the locale of the process or the locale object `locale`, respectively. No more than `n`
68998 wide-character codes shall be placed into the resulting array pointed to by `ws1`, including the
68999 terminating null wide-character code. If `n` is 0, `ws1` is permitted to be a null pointer. If copying
69000 takes place between objects that overlap, the behavior is undefined.69001 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall not change the setting of `errno` if successful.69002 Since no return value is reserved to indicate an error, an application wishing to check for error
69003 situations should set `errno` to 0, then call `wcsxfrm()` or `wcsxfrm_l()`, then check `errno`.69004 **RETURN VALUE**69005 CX The `wcsxfrm()` and `wcsxfrm_l()` functions shall return the length of the transformed wide-
69006 character string (not including the terminating null wide-character code). If the value returned is
69007 `n` or more, the contents of the array pointed to by `ws1` are unspecified.69008 CX On error, the `wcsxfrm()` and `wcsxfrm_l()` functions may set `errno`, but no return value is reserved
69009 to indicate an error.69010 **ERRORS**

69011 These functions may fail if:

69012 CX [EINVAL] The wide-character string pointed to by `ws2` contains wide-character codes
69013 outside the domain of the collating sequence.69014 The `wcsxfrm_l()` function may fail if:69015 CX [EINVAL] `locale` is not a valid locale object handle.

69016 **EXAMPLES**

69017 None.

69018 **APPLICATION USAGE**

69019 The transformation function is such that two transformed wide-character strings can be ordered
 69020 by *wscmp()* as appropriate to collating sequence information in the locale of the process
 69021 (category *LC_COLLATE*).

69022 The fact that when *n* is 0 *ws1* is permitted to be a null pointer is useful to determine the size of
 69023 the *ws1* array prior to making the transformation.

69024 **RATIONALE**

69025 None.

69026 **FUTURE DIRECTIONS**

69027 None.

69028 **SEE ALSO**69029 *wscmp()*, *wscoll()*69030 XBD <*wchar.h*>69031 **CHANGE HISTORY**

69032 First released in Issue 4. Derived from the MSE working draft.

69033 **Issue 5**

69034 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

69035 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.69036 **Issue 6**69037 In earlier versions, this function was required to return *-1* on error.

69038 Extensions beyond the ISO C standard are marked.

69039 The following new requirements on POSIX implementations derive from alignment with the
 69040 Single UNIX Specification:

- 69041 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
 69042 added if no conversion could be performed.

69043 The *wcsxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.69044 **Issue 7**

69045 The *wcsxfrm_l()* function is added from The Open Group Technical Standard, 2006, Extended
 69046 API Set Part 4.

69047 **NAME**
 69048 `wctob` — wide-character to single-byte conversion

69049 **SYNOPSIS**
 69050 `#include <stdio.h>`
 69051 `#include <wchar.h>`
 69052 `int wctob(wint_t c);`

69053 **DESCRIPTION**
 69054 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69055 conflict between the requirements described here and the ISO C standard is unintentional. This
 69056 volume of POSIX.1-200x defers to the ISO C standard.

69057 The `wctob()` function shall determine whether `c` corresponds to a member of the extended
 69058 character set whose character representation is a single byte when in the initial shift state.

69059 The behavior of this function shall be affected by the `LC_CTYPE` category of the current locale.

69060 **RETURN VALUE**
 69061 The `wctob()` function shall return EOF if `c` does not correspond to a character with length one in
 69062 the initial shift state. Otherwise, it shall return the single-byte representation of that character as
 69063 an **unsigned char** converted to **int**.

69064 **ERRORS**
 69065 No errors are defined.

69066 **EXAMPLES**
 69067 None.

69068 **APPLICATION USAGE**
 69069 None.

69070 **RATIONALE**
 69071 None.

69072 **FUTURE DIRECTIONS**
 69073 None.

69077 **CHANGE HISTORY**
 69078 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 69079 (E).

69080 **NAME**
 69081 wctomb — convert a wide-character code to a character

69082 **SYNOPSIS**
 69083 #include <stdlib.h>

69084 int wctomb(char *s, wchar_t wchar);

69085 DESCRIPTION

69086 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69087 conflict between the requirements described here and the ISO C standard is unintentional. This
 69088 volume of POSIX.1-200x defers to the ISO C standard.

69089 The *wctomb()* function shall determine the number of bytes needed to represent the character
 69090 corresponding to the wide-character code whose value is *wchar* (including any change in the
 69091 shift state). It shall store the character representation (possibly multiple bytes and any special
 69092 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most
 69093 {MB_CUR_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any
 69094 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift
 69095 state.

69096 CX The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 69097 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 69098 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 69099 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 69100 null pointer shall cause this function to return a non-zero value if encodings have state
 69101 dependency, and 0 otherwise. Changing the *LC_CTYPE* category causes the shift state of this
 69102 function to be unspecified.

69103 The *wctomb()* function need not be thread-safe. A function that is not required to be thread-safe
 69104 is not required to be reentrant.

69105 The implementation shall behave as if no function defined in this volume of POSIX.1-200x calls
 69106 *wctomb()*.

69107 RETURN VALUE

69108 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,
 69109 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*
 69110 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the
 69111 number of bytes that constitute the character corresponding to the value of *wchar*.

69112 In no case shall the value returned be greater than the value of the {MB_CUR_MAX} macro.

69113 ERRORS

69114 No errors are defined.

69115 EXAMPLES

69116 None.

69117 APPLICATION USAGE

69118 None.

CHANGE HISTORY

69127

First released in Issue 4. Derived from the ANSI C standard.

69128

Issue 6

69129

Extensions beyond the ISO C standard are marked.

69130

In the DESCRIPTION, a note about reentrancy and thread-safety is added.

69131 **NAME**

69132 wctrans, wctrans_l — define character mapping

69133 **SYNOPSIS**

69134 #include <wctype.h>

69135 wctrans_t wctrans(const char *charclass);

69136 CX wctrans_t wctrans_l(const char *charclass, locale_t locale);

69137 **DESCRIPTION**69138 CX For *wctrans()*: The functionality described on this reference page is aligned with the ISO C
69139 standard. Any conflict between the requirements described here and the ISO C standard is
69140 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.69141 CX The *wctrans()* and *wctrans_l()* functions are defined for valid character mapping names
69142 identified in the current locale. The *charclass* is a string identifying a generic character mapping
69143 name for which codeset-specific information is required. The following character mapping
69144 names are defined in all locales: **tolower** and **toupper**.69145 These functions shall return a value of type **wctrans_t**, which can be used as the second
69146 argument to subsequent calls of *towctrans()* and *towctrans_l()*.69147 CX The *wctrans()* and *wctrans_l()* functions shall determine values of **wctrans_t** according to the
69148 rules of the coded character set defined by character mapping information in the locale of the
69149 process or in the locale represented by *locale*, respectively (category *LC_CTYPE*).69150 The values returned by *wctrans()* shall be valid until a call to *setlocale()* that modifies the
69151 category *LC_CTYPE*.69152 CX The values returned by *wctrans_l()* shall be valid only in calls to *wctrans_l()* with a locale
69153 represented by *locale* with the same *LC_CTYPE* category value.69154 **RETURN VALUE**69155 CX The *wctrans()* and *wctrans_l()* functions shall return 0 and may set *errno* to indicate the error if
69156 the given character mapping name is not valid for the current locale (category *LC_CTYPE*);
69157 otherwise, they shall return a non-zero object of type **wctrans_t** that can be used in calls to
69158 *towctrans()* and *towctrans_l()*.69159 **ERRORS**

69160 These functions may fail if:

69161 CX [EINVAL] The character mapping name pointed to by *charclass* is not valid in the current
69162 locale.69163 The *wctrans_l()* function may fail if:69164 CX [EINVAL] *locale* is not a valid locale object handle.69165 **EXAMPLES**

69166 None.

69167 **APPLICATION USAGE**

69168 None.

69169 **RATIONALE**

69170 None.

CHANGE HISTORY

69177

First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

69178

Issue 7

69179

The *wctrans_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

69180

69181 **NAME**
 69182 `wctype, wctype_l` — define character class

69183 **SYNOPSIS**

69184 `#include <wctype.h>`
 69185 `wctype_t wctype(const char *property);`
 69186 CX `wctype_t wctype_l(const char *property, locale_t locale);`

69187 **DESCRIPTION**

69188 CX For `wctype()`: The functionality described on this reference page is aligned with the ISO C
 69189 standard. Any conflict between the requirements described here and the ISO C standard is
 69190 unintentional. This volume of POSIX.1-200x defers to the ISO C standard.

69191 CX The `wctype()` and `wctype_l()` functions are defined for valid character class names as defined in
 69192 CX the current locale or in the locale represented by `locale`, respectively.

69193 The `property` argument is a string identifying a generic character class for which codeset-specific
 69194 type information is required. The following character class names shall be defined in all locales:

69195	alnum	digit	punct
69196	alpha	graph	space
69197	blank	lower	upper
69198	cntrl	print	xdigit

69199 Additional character class names defined in the locale definition file (category `LC_CTYPE`) can
 69200 also be specified.

69201 These functions shall return a value of type `wctype_t`, which can be used as the second
 69202 CX argument to subsequent calls of `iswctype()` and `iswctype_l()`.

69203 CX The `wctype()` and `wctype_l()` functions shall determine values of `wctype_t` according to the
 69204 rules of the coded character set defined by character type information in the locale of the process
 69205 CX or in the locale represented by `locale`, respectively (category `LC_CTYPE`).

69206 The values returned by `wctype()` shall be valid until a call to `setlocale()` that modifies the category
 69207 `LC_CTYPE`.

69208 CX The values returned by `wctype_l()` shall be valid only in calls to `iswctype_l()` with a locale
 69209 represented by `locale` with the same `LC_CTYPE` category value.

69210 **RETURN VALUE**

69211 CX The `wctype()` and `wctype_l()` functions shall return 0 if the given character class name is not
 69212 valid for the current locale (category `LC_CTYPE`); otherwise, they shall return an object of type
 69213 CX `wctype_t` that can be used in calls to `iswctype()` and `iswctype_l()`.

69214 **ERRORS**

69215 The `wctype_l()` function may fail if:

69216 CX [EINVAL] `locale` is not a valid locale object handle.

CHANGE HISTORY

69229

First released in Issue 4.

69230

Issue 5

69231

The following change has been made in this version for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

69232

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

69233

69234

69235

Issue 7

69236

The *wctype_l()* function is added from The Open Group Technical Standard, 2006, Extended API Set Part 4.

69237

69238 **NAME**
 69239 `wcwidth` — number of column positions of a wide-character code

69240 **SYNOPSIS**

```
69241 XSI #include <wchar.h>
69242 int wcwidth(wchar_t wc);
```

69243 **DESCRIPTION**

69244 The `wcwidth()` function shall determine the number of column positions required for the wide
 69245 character `wc`. The application shall ensure that the value of `wc` is a character representable as a
 69246 `wchar_t`, and is a wide-character code corresponding to a valid character in the current locale.

69247 **RETURN VALUE**

69248 The `wcwidth()` function shall either return 0 (if `wc` is a null wide-character code), or return the
 69249 number of column positions to be occupied by the wide-character code `wc`, or return -1 (if `wc`
 69250 does not correspond to a printable wide-character code).

69251 **ERRORS**

69252 No errors are defined.

69253 **EXAMPLES**

69254 None.

69255 **APPLICATION USAGE**

69256 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the
 69257 return value for a non-printable wide character is not specified.

69258 **RATIONALE**

69259 None.

69260 **FUTURE DIRECTIONS**

69261 None.

69262 **SEE ALSO**

69263 [*wcswidth\(\)*](#)
 69264 XBD [**<wchar.h>**](#)

69265 **CHANGE HISTORY**

69266 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
 69267 draft.

69268 **Issue 6**

69269 The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

69270 The normative text is updated to avoid use of the term “must” for application requirements.

69271 **NAME**
 69272 `wmemchr` — find a wide character in memory

69273 **SYNOPSIS**
 69274 `#include <wchar.h>`

69275 `wchar_t *wmemchr(const wchar_t *ws, wchar_t wc, size_t n);`

69276 **DESCRIPTION**

69277 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69278 conflict between the requirements described here and the ISO C standard is unintentional. This
 69279 volume of POSIX.1-200x defers to the ISO C standard.

69280 The `wmemchr()` function shall locate the first occurrence of `wc` in the initial `n` wide characters of
 69281 the object pointed to by `ws`. This function shall not be affected by locale and all `wchar_t` values
 69282 shall be treated identically. The null wide character and `wchar_t` values not corresponding to
 69283 valid characters shall not be treated specially.

69284 If `n` is zero, the application shall ensure that `ws` is a valid pointer and the function behaves as if
 69285 no valid occurrence of `wc` is found.

69286 **RETURN VALUE**

69287 The `wmemchr()` function shall return a pointer to the located wide character, or a null pointer if
 69288 the wide character does not occur in the object.

69289 **ERRORS**

69290 No errors are defined.

69291 **EXAMPLES**

69292 None.

69293 **APPLICATION USAGE**

69294 None.

69295 **RATIONALE**

 69304 (E).

69305 **Issue 6**

69306 The normative text is updated to avoid use of the term “must” for application requirements.

69307 **NAME**
 69308 wmemcmp — compare wide characters in memory

69309 **SYNOPSIS**

69310 #include <wchar.h>

69311 int wmemcmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);

69312 **DESCRIPTION**

69313 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69314 conflict between the requirements described here and the ISO C standard is unintentional. This
 69315 volume of POSIX.1-200x defers to the ISO C standard.

69316 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by
 69317 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be
 69318 affected by locale and all **wchar_t** values shall be treated identically. The null wide character and
 69319 **wchar_t** values not corresponding to valid characters shall not be treated specially.

69320 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
 69321 shall behave as if the two objects compare equal.

69322 **RETURN VALUE**

69323 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,
 69324 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object
 69325 pointed to by *ws2*.

69326 **ERRORS**

69327 No errors are defined.

69328 **EXAMPLES**

69329 None.

69330 **APPLICATION USAGE**

69331 None.

69340 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 69341 (E).

69342 **Issue 6**

69343 The normative text is updated to avoid use of the term “must” for application requirements.

69344 **NAME**
 69345 `wmemcpy` — copy wide characters in memory

69346 **SYNOPSIS**
 69347 `#include <wchar.h>`

69348 `wchar_t *wmemcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
 69349 `size_t n);`

69350 DESCRIPTION

69351 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69352 conflict between the requirements described here and the ISO C standard is unintentional. This
 69353 volume of POSIX.1-200x defers to the ISO C standard.

69354 The `wmemcpy()` function shall copy *n* wide characters from the object pointed to by *ws2* to the
 69355 object pointed to by *ws1*. This function shall not be affected by locale and all **wchar_t** values
 69356 shall be treated identically. The null wide character and **wchar_t** values not corresponding to
 69357 valid characters shall not be treated specially.

69358 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
 69359 shall copy zero wide characters.

69360 RETURN VALUE

69361 The `wmemcpy()` function shall return the value of *ws1*.

69362 ERRORS

69363 No errors are defined.

69364 EXAMPLES

69365 None.

69375 CHANGE HISTORY

69376 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 69377 (E).

69378 Issue 6

69379 The normative text is updated to avoid use of the term “must” for application requirements.

69380 The `wmemcpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

69381 **NAME**
 69382 wmemmove — copy wide characters in memory with overlapping areas

69383 **SYNOPSIS**
 69384 #include <wchar.h>

69385 wchar_t *wmemmove(wchar_t *ws1, const wchar_t *ws2, size_t n);

69386 DESCRIPTION

69387 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69388 conflict between the requirements described here and the ISO C standard is unintentional. This
 69389 volume of POSIX.1-200x defers to the ISO C standard.

69390 The *wmemmove()* function shall copy *n* wide characters from the object pointed to by *ws2* to the
 69391 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object
 69392 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not
 69393 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary
 69394 array are copied into the object pointed to by *ws1*.

69395 This function shall not be affected by locale and all **wchar_t** values shall be treated identically.
 69396 The null wide character and **wchar_t** values not corresponding to valid characters shall not be
 69397 treated specially.

69398 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
 69399 shall copy zero wide characters.

69400 RETURN VALUE

69401 The *wmemmove()* function shall return the value of *ws1*.

69402 ERRORS

69403 No errors are defined

69415 CHANGE HISTORY

69416 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 69417 (E).

69418 Issue 6

69419 The normative text is updated to avoid use of the term “must” for application requirements.

69420 **NAME**
 69421 `wmemset` — set wide characters in memory

69422 **SYNOPSIS**
 69423 `#include <wchar.h>`
 69424 `wchar_t *wmemset(wchar_t *ws, wchar_t wc, size_t n);`

69425 **DESCRIPTION**
 69426 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 69427 conflict between the requirements described here and the ISO C standard is unintentional. This
 69428 volume of POSIX.1-200x defers to the ISO C standard.

69429 The `wmemset()` function shall copy the value of `wc` into each of the first n wide characters of the
 69430 object pointed to by `ws`. This function shall not be affected by locale and all `wchar_t` values shall
 69431 be treated identically. The null wide character and `wchar_t` values not corresponding to valid
 69432 characters shall not be treated specially.

69433 If n is zero, the application shall ensure that `ws` is a valid pointer, and the function shall copy
 69434 zero wide characters.

69435 **RETURN VALUE**
 69436 The `wmemset()` functions shall return the value of `ws`.

69437 **ERRORS**
 69438 No errors are defined.

69439 **EXAMPLES**
 69440 None.

69441 **APPLICATION USAGE**
 69442 None.

69443 **RATIONALE**

69450 **CHANGE HISTORY**
 69451 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 69452 (E).

69453 **Issue 6**
 69454 The normative text is updated to avoid use of the term “must” for application requirements.

69455 **NAME**
 69456 wordexp, wordfree — perform word expansions

69457 **SYNOPSIS**
 69458 #include <wordexp.h>
 69459 int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
 69460 int flags);
 69461 void wordfree(wordexp_t *pwordexp);

69462 **DESCRIPTION**
 69463 The *wordexp()* function shall perform word expansions as described in XCU Section 2.6 (on page
 69464 2253), subject to quoting as described in XCU Section 2.2 (on page 2246), and place the list of
 69465 expanded words into the structure pointed to by *pwordexp*.

69466 The *words* argument is a pointer to a string containing one or more words to be expanded. The
 69467 expansions shall be the same as would be performed by the command line interpreter if *words*
 69468 were the part of a command line representing the arguments to a utility. Therefore, the
 69469 application shall ensure that *words* does not contain an unquoted <newline> or any of the
 69470 unquoted shell special characters '|', '&', ';', '<', '>' except in the context of command
 69471 substitution as specified in XCU Section 2.6.3 (on page 2256). It also shall not contain unquoted
 69472 parentheses or braces, except in the context of command or variable substitution. The
 69473 application shall ensure that every member of *words* which it expects to have expanded by
 69474 *wordexp()* does not contain an unquoted initial comment character. The application shall also
 69475 ensure that any words which it intends to be ignored (because they begin or continue a
 69476 comment) are deleted from *words*. If the argument *words* contains an unquoted comment
 69477 character (number sign) that is the beginning of a token, *wordexp()* shall either treat the
 69478 comment character as a regular character, or interpret it as a comment indicator and ignore the
 69479 remainder of *words*.

69480 The structure type **wordexp_t** is defined in the <wordexp.h> header and includes at least the
 69481 following members:

Member Type	Member Name	Description
size_t	<i>we_wordc</i>	Count of words matched by <i>words</i> .
char **	<i>we_wordv</i>	Pointer to list of expanded words.
size_t	<i>we_offs</i>	Slots to reserve at the beginning of <i>pwordexp->we_wordv</i> .

69486 The *wordexp()* function shall store the number of generated words into *pwordexp->we_wordc* and
 69487 a pointer to a list of pointers to words in *pwordexp->we_wordv*. Each individual field created
 69488 during field splitting (see XCU Section 2.6.5, on page 2258) or pathname expansion (see XCU
 69489 Section 2.6.6, on page 2259) shall be a separate word in the *pwordexp->we_wordv* list. The words
 69490 shall be in order as described in XCU Section 2.6 (on page 2253). The first pointer after the last
 69491 word pointer shall be a null pointer. The expansion of special parameters described in XCU
 69492 Section 2.5.2 (on page 2250) is unspecified.

69493 It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()*
 69494 function shall allocate other space as needed, including memory pointed to by
 69495 *pwordexp->we_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a
 69496 previous call to *wordexp()*.

69497 The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the bitwise-
 69498 inclusive OR of zero or more of the following constants, which are defined in <wordexp.h>:

69499	WRDE_APPEND	Append words generated to the ones from a previous call to <i>wordexp()</i> .
69500	WRDE_DOOFFS	Make use of <i>pwordexp->we_offs</i> . If this flag is set, <i>pwordexp->we_offs</i> is used to specify how many null pointers to add to the beginning of <i>pwordexp->we_wordv</i> . In other words, <i>pwordexp->we_wordv</i> shall point to <i>pwordexp->we_offs</i> null pointers, followed by <i>pwordexp->we_wordc</i> word pointers, followed by a null pointer.
69501		
69502		
69503		
69504		
69505	WRDE_NOCMD	If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-200x, fail if command substitution, as specified in XCU Section 2.6.3 (on page 2256), is requested.
69506		
69507		
69508	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to <i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result shall be the same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i> without WRDE_REUSE.
69509		
69510		
69511		
69512	WRDE_SHOWERR	Do not redirect <i>stderr</i> to /dev/null .
69513	WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.
69514		The WRDE_APPEND flag can be used to append a new set of words to those generated by a previous call to <i>wordexp()</i> . The following rules apply to applications when two or more calls to <i>wordexp()</i> are made with the same value of <i>pwordexp</i> and without intervening calls to <i>wordfree()</i> :
69515		
69516		
69517		1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.
69518		2. All of the calls shall set WRDE_DOOFFS, or all shall not set it.
69519		3. After the second and each subsequent call, <i>pwordexp->we_wordv</i> shall point to a list containing the following:
69520		
69521		a. Zero or more null pointers, as specified by WRDE_DOOFFS and <i>pwordexp->we_offs</i>
69522		
69523		b. Pointers to the words that were in the <i>pwordexp->we_wordv</i> list before the call, in the same order as before
69524		
69525		c. Pointers to the new words generated by the latest call, in the specified order
69526		4. The count returned in <i>pwordexp->we_wordc</i> shall be the total number of words from all of the calls.
69527		
69528		5. The application can change any of the fields after a call to <i>wordexp()</i> , but if it does it shall reset them to the original value before a subsequent call, using the same <i>pwordexp</i> value, to <i>wordfree()</i> or <i>wordexp()</i> with the WRDE_APPEND or WRDE_REUSE flag.
69529		
69530		
69531		If the implementation supports the utilities defined in the Shell and Utilities volume of POSIX.1-200x, and <i>words</i> contains an unquoted character—<newline>, ' ', ' & ', ' ; ', ' < ', ' > ', ' (', ') ', ' { ', ' } '—in an inappropriate context, <i>wordexp()</i> shall fail, and the number of expanded words shall be 0.
69532		
69533		
69534		
69535		Unless WRDE_SHOWERR is set in <i>flags</i> , <i>wordexp()</i> shall redirect <i>stderr</i> to /dev/null for any utilities executed as a result of command substitution while expanding <i>words</i> . If WRDE_SHOWERR is set, <i>wordexp()</i> may write messages to <i>stderr</i> if syntax errors are detected while expanding <i>words</i> .
69536		
69537		
69538		
69539		The application shall ensure that if WRDE_DOOFFS is set, then <i>pwordexp->we_offs</i> has the same value for each <i>wordexp()</i> call and <i>wordfree()</i> call using a given <i>pwordexp</i> .
69540		
69541		The following constants are defined as error return values:

69542	WRDE_BADCHAR	One of the unquoted characters—<newline>, ' ', '&', ';', '<', '>', '(', ')', '{', '}'—appears in <i>words</i> in an inappropriate context.
69543		
69544	WRDE_BADVAL	Reference to undefined shell variable when WRDE_UNDEF is set in <i>flags</i> .
69545	WRDE_CMDSUB	Command substitution requested when WRDE_NOCMD was set in <i>flags</i> .
69546	WRDE_NOSPACE	Attempt to allocate memory failed.
69547	WRDE_SYNTAX	Shell syntax error, such as unbalanced parentheses or unterminated string.
69548		

RETURN VALUE

69549
69550 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described
69551 in <*wordexp.h*>, shall be returned to indicate an error. If *wordexp()* returns the value
69552 WRDE_NOSPACE, then *pwordexp*→*we_wordc* and *pwordexp*→*we_wordv* shall be updated to
69553 reflect any words that were successfully expanded. In other cases, they shall not be modified.

69554 The *wordfree()* function shall not return a value.

ERRORS

69555
69556 No errors are defined.

EXAMPLES

69557
69558 None.

APPLICATION USAGE

69559
69560 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's
69561 expansions on a word or words obtained from a user. For example, if the application prompts
69562 for a filename (or list of filenames) and then uses *wordexp()* to process the input, the user could
69563 respond with anything that would be valid as input to the shell.

69564
69565 The WRDE_NOCMD flag is provided for applications that, for security or other reasons, want to
69566 prevent a user from executing shell commands. Disallowing unquoted shell special characters
also prevents unwanted side effects, such as executing a command or writing a file.

RATIONALE

69567
69568 This function was included as an alternative to *glob()*. There had been continuing controversy
69569 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*
69570 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*
69571 (which is faster, but which only performs pathname expansion, without tilde or parameter
69572 expansion) this will satisfy the majority of applications.

69573
69574 While *wordexp()* could be implemented entirely as a library routine, it is expected that most
implementations run a shell in a subprocess to do the expansion.

69575
69576 Two different approaches have been proposed for how the required information might be
presented to the shell and the results returned. They are presented here as examples.

69577
69578 One proposal is to extend the *echo* utility by adding a *-q* option. This option would cause *echo* to
69579 add a backslash before each backslash and <blank> that occurs within an argument. The
wordexp() function could then invoke the shell as follows:

```
69580 (void) strcpy(buffer, "echo -q");
69581 (void) strcat(buffer, words);
69582 if ((flags & WRDE_SHOWERR) == 0)
69583     (void) strcat(buffer, "2>/dev/null");
69584 f = popen(buffer, "r");
```

69585
69586 The *wordexp()* function would read the resulting output, remove unquoted backslashes, and
69587 break into words at unquoted <blank>s. If the WRDE_NOCMD flag was set, *wordexp()* would
have to scan *words* before starting the subshell to make sure that there would be no command

69588 substitution. In any case, it would have to scan *words* for unquoted special characters.

69589 Another proposal is to add the following options to *sh*:

69590 **-w** *wordlist*

69591 This option provides a wordlist expansion service to applications. The words in *wordlist*
69592 shall be expanded and the following written to standard output:

- 69593 1. The count of the number of words after expansion, in decimal, followed by a null
69594 byte
- 69595 2. The number of bytes needed to represent the expanded words (not including null
69596 separators), in decimal, followed by a null byte
- 69597 3. The expanded words, each terminated by a null byte

69598 If an error is encountered during word expansion, *sh* exits with a non-zero status after
69599 writing the former to report any words successfully expanded

69600 **-P** Run in “protected” mode. If specified with the **-w** option, no command substitution shall
69601 be performed.

69602 With these options, *wordexp()* could be implemented fairly simply by creating a subprocess
69603 using *fork()* and executing *sh* using the line:

69604 `execl(<shell path>, "sh", "-P", "-w", words, (char *)0);`

69605 after directing standard error to **/dev/null**.

69606 It seemed objectionable for a library routine to write messages to standard error, unless explicitly
69607 requested, so *wordexp()* is required to redirect standard error to **/dev/null** to ensure that no
69608 messages are generated, even for commands executed for command substitution. The
69609 **WRDE_SHOWERR** flag can be specified to request that error messages be written.

69610 The **WRDE_REUSE** flag allows the implementation to avoid the expense of freeing and
69611 reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when
69612 **WRDE_REUSE** is set.

69613 FUTURE DIRECTIONS

69614 None.

69619 CHANGE HISTORY

69620 First released in Issue 4. Derived from the ISO POSIX-2 standard.

69621 Issue 5

69622 Moved from POSIX2 C-language Binding to BASE.

69623 Issue 6

69624 The normative text is updated to avoid use of the term “must” for application requirements.

69625 The **restrict** keyword is added to the *wordexp()* prototype for alignment with the
69626 ISO/IEC 9899:1999 standard.

69627 **NAME**
69628 `wprintf` — print formatted wide-character output

69629 **SYNOPSIS**
69630 `#include <stdio.h>`
69631 `#include <wchar.h>`
69632 `int wprintf(const wchar_t *restrict format, ...);`

69633 **DESCRIPTION**
69634 Refer to *fwprintf()*.

69635 **NAME**

69636 pwrite, write — write on a file

69637 **SYNOPSIS**

69638 #include <unistd.h>

69639 ssize_t pwrite(int *fildes*, const void **buf*, size_t *nbyte*,
69640 off_t *offset*);69641 ssize_t write(int *fildes*, const void **buf*, size_t *nbyte*);69642 **DESCRIPTION**69643 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the
69644 file associated with the open file descriptor, *fildes*.69645 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the
69646 *write()* function may detect and return errors as described below. In the absence of errors, or if
69647 error detection is not performed, the *write()* function shall return zero and have no other results.
69648 If *nbyte* is zero and the file is not a regular file, the results are unspecified.69649 On a regular file or other file capable of seeking, the actual writing of data shall proceed from
69650 the position in the file indicated by the file offset associated with *fildes*. Before successful return
69651 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a
69652 regular file, if the position of the last byte written is greater than or equal to the length of the file,
69653 the length of the file shall be set to this position plus one.69654 On a file not capable of seeking, writing shall always take place starting at the current position.
69655 The value of a file offset associated with such a device is undefined.69656 If the O_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file
69657 prior to each write and no intervening file modification operation shall occur between changing
69658 the file offset and the write operation.69659 XSI If a *write()* requests that more bytes be written than there is room for (for example, the file size
69660 limit of the process or the physical end of a medium), only as many bytes as there is room for
69661 shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a
69662 limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would
69663 give a failure return (except as noted below).69664 XSI If the request would cause the file size to exceed the soft file size limit for the process and there
69665 is no room for any bytes to be written, the request shall fail and the implementation shall
69666 generate the SIGXFSZ signal for the thread.69667 If *write()* is interrupted by a signal before it writes any data, it shall return -1 with *errno* set to
69668 [EINTR].69669 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the
69670 number of bytes written.69671 If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.69672 After a *write()* to a regular file has successfully returned:69673 • Any successful *read()* from each byte position in the file that was modified by that write
69674 shall return the data specified by the *write()* for that position until such byte positions are
69675 again modified.69676 • Any subsequent successful *write()* to the same byte position in the file shall overwrite that
69677 file data.

69678 Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the

69679

following exceptions:

69680

- There is no file offset associated with a pipe, hence each write request shall append to the end of the pipe.

69681

69682

- Write requests of {PIPE_BUF} bytes or less shall not be interleaved with data from other processes doing writes on the same pipe. Writes of greater than {PIPE_BUF} bytes may have data interleaved, on arbitrary boundaries, with writes by other processes, whether or not the O_NONBLOCK flag of the file status flags is set.

69683

69684

69685

69686

- If the O_NONBLOCK flag is clear, a write request may cause the thread to block, but on normal completion it shall return *nbyte*.

69687

69688

- If the O_NONBLOCK flag is set, *write()* requests shall be handled differently, in the following ways:

69689

69690

— The *write()* function shall not block the thread.

69691

— A write request for {PIPE_BUF} or fewer bytes shall have the following effect: if there is sufficient space available in the pipe, *write()* shall transfer all the data and return the number of bytes requested. Otherwise, *write()* shall transfer no data and return -1 with *errno* set to [EAGAIN].

69692

69693

69694

69695

— A write request for more than {PIPE_BUF} bytes shall cause one of the following:

69696

— When at least one byte can be written, transfer what it can and return the number of bytes written. When all data previously written to the pipe is read, it shall transfer at least {PIPE_BUF} bytes.

69697

69698

69699

— When no data can be written, transfer no data, and return -1 with *errno* set to [EAGAIN].

69700

69701

When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-blocking writes and cannot accept the data immediately:

69702

69703

- If the O_NONBLOCK flag is clear, *write()* shall block the calling thread until the data can be accepted.

69704

69705

- If the O_NONBLOCK flag is set, *write()* shall not block the thread. If some data can be written without blocking the thread, *write()* shall write what it can and return the number of bytes written. Otherwise, it shall return -1 and set *errno* to [EAGAIN].

69706

69707

69708

Upon successful completion, where *nbyte* is greater than 0, *write()* shall mark for update the last data modification and last file status change timestamps of the file, and if the file is a regular file, the S_ISUID and S_ISGID bits of the file mode may be cleared.

69709

69710

69711

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with *filides*.

69712

69713

If *filides* refers to a socket, *write()* shall be equivalent to *send()* with no flags set.

69714 SIO

If the O_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.

69715

69716

If the O_SYNC bit has been set, write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

69717

69718 SHM

If *filides* refers to a shared memory object, the result of the *write()* function is unspecified.

69719 TYM

If *filides* refers to a typed memory object, the result of the *write()* function is unspecified.

69720 OB_XSR

If *filides* refers to a STREAM, the operation of *write()* shall be determined by the values of the minimum and maximum *nbyte* range (packet size) accepted by the STREAM. These values are determined by the topmost STREAM module. If *nbyte* falls within the packet size range, *nbyte*

69721

69722

69723 bytes shall be written. If *nbyte* does not fall within the range and the minimum packet size value
 69724 is 0, *write()* shall break the buffer into maximum packet size segments prior to sending the data
 69725 downstream (the last segment may contain less than the maximum packet size). If *nbyte* does not
 69726 fall within the range and the minimum value is non-zero, *write()* shall fail with *errno* set to
 69727 [ERANGE]. Writing a zero-length buffer (*nbyte* is 0) to a STREAMS device sends 0 bytes with 0
 69728 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no
 69729 message and 0 is returned. The process may issue `I_SWROPT ioctl()` to enable zero-length
 69730 messages to be sent across the pipe or FIFO.

69731 When writing to a STREAM, data messages are created with a priority band of 0. When writing
 69732 to a STREAM that is not a pipe or FIFO:

- 69733 • If `O_NONBLOCK` is clear, and the STREAM cannot accept data (the STREAM write queue
 69734 is full due to internal flow control conditions), *write()* shall block until data can be
 69735 accepted.
- 69736 • If `O_NONBLOCK` is set and the STREAM cannot accept data, *write()* shall return `-1` and
 69737 set *errno* to [EAGAIN].
- 69738 • If `O_NONBLOCK` is set and part of the buffer has been written while a condition in which
 69739 the STREAM cannot accept additional data occurs, *write()* shall terminate and return the
 69740 number of bytes written.

69741 In addition, *write()* shall fail if the STREAM head has processed an asynchronous error before
 69742 the call. In this case, the value of *errno* does not reflect the result of *write()*, but reflects the prior
 69743 error.

69744 The *pwrite()* function shall be equivalent to *write()*, except that it writes into a given position
 69745 and does not change the file offset (regardless of whether `O_APPEND` is set). The first three
 69746 arguments to *pwrite()* are the same as *write()* with the addition of a fourth argument *offset* for
 69747 the desired position inside the file.

69748 RETURN VALUE

69749 Upon successful completion, these functions shall return the number of bytes actually written to
 69750 the file associated with *fildev*. This number shall never be greater than *nbyte*. Otherwise, `-1` shall
 69751 be returned and *errno* set to indicate the error.

69752 ERRORS

69753 These functions shall fail if:

69754 69755	[EAGAIN]	The <code>O_NONBLOCK</code> flag is set for the file descriptor and the thread would be delayed in the <i>write()</i> operation.
69756	[EBADF]	The <i>fildev</i> argument is not a valid file descriptor open for writing.
69757 69758 69759	[EFBIG]	An attempt was made to write a file that exceeds the implementation-defined maximum file size or the file size limit of the process, and there was no room for any bytes to be written.
69760 69761 69762	[EFBIG]	The file is a regular file, <i>nbyte</i> is greater than 0, and the starting position is greater than or equal to the offset maximum established in the open file description associated with <i>fildev</i> .
69763 69764	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
69765 69766 69767 69768	[EIO]	The process is a member of a background process group attempting to write to its controlling terminal, <code>TOSTOP</code> is set, the process is neither ignoring nor blocking <code>SIGTTOU</code> , and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.

69769		[ENOSPC]	There was no free space remaining on the device containing the file.
69770		[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by any process, or that only has one end open. A SIGPIPE signal shall also be sent to the thread.
69771			
69772			
69773	OB XSR	[ERANGE]	The transfer request size was outside the range supported by the STREAMS file associated with <i>fildev</i> .
69774			
69775			The <i>write()</i> function shall fail if:
69776		[EAGAIN] or [EWOULDBLOCK]	The file descriptor is for a socket, is marked O_NONBLOCK, and write would block.
69777			
69778			
69779		[ECONNRESET]	A write was attempted on a socket that is not connected.
69780		[EPIPE]	A write was attempted on a socket that is shut down for writing, or is no longer connected. In the latter case, if the socket is of type SOCK_STREAM, a SIGPIPE signal shall also be sent to the thread.
69781			
69782			
69783			These functions may fail if:
69784	OB XSR	[EINVAL]	The STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or indirectly) downstream from a multiplexer.
69785			
69786		[EIO]	A physical I/O error has occurred.
69787		[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
69788		[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
69789			
69790	OB XSR	[ENXIO]	A hangup occurred on the STREAM being written to.
69791	OB XSR		A write to a STREAMS file may fail if an error message has been received at the STREAM head. In this case, <i>errno</i> is set to the value included in the error message.
69792			
69793			The <i>write()</i> function may fail if:
69794		[EACCES]	A write was attempted on a socket and the calling process does not have appropriate privileges.
69795			
69796		[ENETDOWN]	A write was attempted on a socket and the local network interface used to reach the destination is down.
69797			
69798		[ENETUNREACH]	A write was attempted on a socket and no route to the network is present.
69799			
69800			The <i>pwrite()</i> function shall fail and the file pointer remain unchanged if:
69801	XSI	[EINVAL]	The <i>offset</i> argument is invalid. The value is negative.
69802	XSI	[ESPIPE]	<i>fildev</i> is associated with a pipe or FIFO.

69803 **EXAMPLES**

69804 **Writing from a Buffer**

69805 The following example writes data from the buffer pointed to by *buf* to the file associated with
69806 the file descriptor *fd*.

```
69807 #include <sys/types.h>
69808 #include <string.h>
69809 ...
69810 char buf[20];
69811 size_t nbytes;
69812 ssize_t bytes_written;
69813 int fd;
69814 ...
69815 strcpy(buf, "This is a test\n");
69816 nbytes = strlen(buf);
69817
69818 bytes_written = write(fd, buf, nbytes);
69819 ...
```

69819 **APPLICATION USAGE**

69820 None.

69821 **RATIONALE**

69822 See also the RATIONALE section in [read](#).

69823 An attempt to write to a pipe or FIFO has several major characteristics:

- 69824 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not
69825 interleaved with data from any other process. This is useful when there are multiple
69826 writers sending data to a single reader. Applications need to know how large a write
69827 request can be expected to be performed atomically. This maximum is called {PIPE_BUF}.
69828 This volume of POSIX.1-200x does not say whether write requests for more than
69829 {PIPE_BUF} bytes are atomic, but requires that writes of {PIPE_BUF} or fewer bytes shall
69830 be atomic.
- 69831 • *Blocking/immediate*: Blocking is only possible with O_NONBLOCK clear. If there is enough
69832 space for all the data requested to be written immediately, the implementation should do
69833 so. Otherwise, the calling thread may block; that is, pause until enough space is available
69834 for writing. The effective size of a pipe or FIFO (the maximum amount that can be written
69835 in one operation without blocking) may vary dynamically, depending on the
69836 implementation, so it is not possible to specify a fixed value for it.

- 69837 • *Complete/partial/deferred*: A write request:

```
69838 int fildes;
69839 size_t nbyte;
69840 ssize_t ret;
69841 char *buf;
69842
69843 ret = write(fildes, buf, nbyte);
```

69843 may return:

69844 Complete *ret*=*nbyte*

69845 Partial *ret*<*nbyte*

69846 This shall never happen if *nbyte*≤{PIPE_BUF}. If it does happen (with
69847 *nbyte*>{PIPE_BUF}), this volume of POSIX.1-200x does not guarantee
69848 atomicity, even if *ret*≤{PIPE_BUF}, because atomicity is guaranteed according
69849 to the amount *requested*, not the amount *written*.

69895

Deferred: *ret* = -1, *errno* = [EAGAIN]

This error indicates that a later request may succeed. It does not indicate that it *shall* succeed, even if *nbyte* ≤ {PIPE_BUF}, because if no process reads from the pipe or FIFO, the write never succeeds. An application could usefully count the number of times [EAGAIN] is caused by a particular value of *nbyte* > {PIPE_BUF} and perhaps do later writes with a smaller value, on the assumption that the effective size of the pipe may have decreased.

Partial and deferred writes are only possible with O_NONBLOCK set.

The relations of these properties are shown in the following tables:

Write to a Pipe or FIFO with O_NONBLOCK clear			
Immediately Writable:	None	Some	<i>nbyte</i>
<i>nbyte</i> ≤ {PIPE_BUF}	Atomic blocking <i>nbyte</i>	Atomic blocking <i>nbyte</i>	Atomic immediate <i>nbyte</i>
<i>nbyte</i> > {PIPE_BUF}	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>	Blocking <i>nbyte</i>

If the O_NONBLOCK flag is clear, a write request shall block if the amount writable immediately is less than that requested. If the flag is set (by *fcntl()*), a write request shall never block.

Write to a Pipe or FIFO with O_NONBLOCK set			
Immediately Writable:	None	Some	<i>nbyte</i>
<i>nbyte</i> ≤ {PIPE_BUF}	-1, [EAGAIN]	-1, [EAGAIN]	Atomic <i>nbyte</i>
<i>nbyte</i> > {PIPE_BUF}	-1, [EAGAIN]	< <i>nbyte</i> or -1, [EAGAIN]	≤ <i>nbyte</i> or -1, [EAGAIN]

There is no exception regarding partial writes when O_NONBLOCK is set. With the exception of writing to an empty pipe, this volume of POSIX.1-200x does not specify exactly when a partial write is performed since that would require specifying internal details of the implementation. Every application should be prepared to handle partial writes when O_NONBLOCK is set and the requested amount is greater than {PIPE_BUF}, just as every application should be prepared to handle partial writes on other kinds of file descriptors.

The intent of forcing writing at least one byte if any can be written is to assure that each write makes progress if there is any room in the pipe. If the pipe is empty, {PIPE_BUF} bytes must be written; if not, at least some progress must have been made.

Where this volume of POSIX.1-200x requires -1 to be returned and *errno* set to [EAGAIN], most historical implementations return zero (with the O_NDELAY flag set, which is the historical predecessor of O_NONBLOCK, but is not itself in this volume of POSIX.1-200x). The error indications in this volume of POSIX.1-200x were chosen so that an application can distinguish these cases from end-of-file. While *write()* cannot receive an indication of end-of-file, *read()* can, and the two functions have similar return values. Also, some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file indication; for those systems, a return value of zero from *write()* indicates a successful write of an end-of-file indication.

Implementations are allowed, but not required, to perform error checking for *write()* requests of zero bytes.

The concept of a {PIPE_MAX} limit (indicating the maximum number of bytes that can be written to a pipe in a single operation) was considered, but rejected, because this concept would unnecessarily limit application writing.

See also the discussion of O_NONBLOCK in *read*.

Writes can be serialized with respect to other reads and writes. If a *read()* of file data can be proven (by any means) to occur after a *write()* of the data, it must reflect that *write()*, even if the calls are made by different processes. A similar requirement applies to multiple write operations to the same file position. This is needed to guarantee the propagation of data from *write()* calls to subsequent *read()* calls. This requirement is particularly significant for networked file systems, where some caching schemes violate these semantics.

Note that this is specified in terms of *read()* and *write()*. The XSI extensions *readv()* and *writew()* also obey these semantics. A new “high-performance” write analog that did not follow these serialization requirements would also be permitted by this wording. This volume of POSIX.1-200x is also silent about any effects of application-level caching (such as that done by *stdio*).

This volume of POSIX.1-200x does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as [EBADF], the concept is meaningless since no file is involved. For errors that are detected immediately, such as [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

This volume of POSIX.1-200x does not specify behavior of concurrent writes to a file from multiple processes. Applications should use some form of concurrency control.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The *pwrite()* function is added.

Issue 6

The DESCRIPTION states that the *write()* function does not block the thread. Previously this said “process” rather than “thread”.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION now states that if *write()* is interrupted by a signal after it has successfully written some data, it returns the number of bytes written. In the POSIX.1-1988 standard, it was optional whether *write()* returned the number of bytes written, or whether it returned -1 with *errno* set to [EINTR]. This is a FIPS requirement.
- The following changes are made to support large files:
 - For regular files, no data transfer occurs past the offset maximum established in the open file description associated with the *files*.

69964
69965

— A second [EFBIG] error condition is added.

- The [EIO] error condition is added.
- The [EPIPE] error condition is added for when a pipe has only one end open.
- The [ENXIO] optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that *write()* results are unspecified for typed memory objects.

The following error conditions are added for operations on sockets: [EAGAIN], [EWOULDBLOCK], [ECONNRESET], [ENOTCONN], and [EPIPE].

The [EIO] error is made optional.

The [ENOBUS] error is added for sockets.

The following error conditions are added for operations on sockets: [EACCES], [ENETDOWN], and [ENETUNREACH].

The *writew()* function is split out into a separate reference page.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/146 is applied, updating text in the ERRORS section from “a SIGPIPE signal is generated to the calling process” to “a SIGPIPE signal shall also be sent to the thread”.

IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/147 is applied, making a correction to the RATIONALE.

Issue 7

The *pwrite()* function is moved from the XSI option to the Base.

Functionality relating to the XSI STREAMS option is marked obsolescent.

SD5-XSH-ERN-160 is applied, updating the DESCRIPTION to clarify the requirements for the *pwrite()* function, and to change the use of the phrase “file pointer” to “file offset”.

69966 **NAME**

69967 writev — write a vector

69968 **SYNOPSIS**

```
69969 XSI #include <sys/uio.h>
69970 ssize_t writev(int fildes, const struct iovec *iov, int iovcnt);
```

69971 **DESCRIPTION**

69972 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*
 69973 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*
 69974 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*-1]. The *iovcnt* argument is valid if greater than 0 and less than
 69975 or equal to {IOV_MAX}, as defined in <limits.h>.

69976 Each *iovec* entry specifies the base address and length of an area in memory from which data
 69977 should be written. The *writev()* function shall always write a complete area before proceeding to
 69978 the next.

69979 If *fildes* refers to a regular file and all of the *iov_len* members in the array pointed to by *iov* are 0,
 69980 *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

69981 If the sum of the *iov_len* values is greater than {SSIZE_MAX}, the operation shall fail and no data
 69982 shall be transferred.

69983 **RETURN VALUE**

69984 Upon successful completion, *writev()* shall return the number of bytes actually written.
 69985 Otherwise, it shall return a value of -1, the file-pointer shall remain unchanged, and *errno* shall
 69986 be set to indicate an error.

69987 **ERRORS**69988 Refer to *write*.69989 In addition, the *writev()* function shall fail if:69990 [EINVAL] The sum of the *iov_len* values in the *iov* array would overflow an *ssize_t*.69991 The *writev()* function may fail and set *errno* to:69992 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.69993 **EXAMPLES**69994 **Writing Data from an Array**

69995 The following example writes data from the buffers specified by members of the *iov* array to the
 69996 file associated with the file descriptor *fd*.

```
69997 #include <sys/types.h>
69998 #include <sys/uio.h>
69999 #include <unistd.h>
70000 ...
70001 ssize_t bytes_written;
70002 int fd;
70003 char *buf0 = "short string\n";
70004 char *buf1 = "This is a longer string\n";
70005 char *buf2 = "This is the longest string in this example\n";
70006 int iocnt;
70007 struct iovec iov[3];
```

```
70008     iov[0].iov_base = buf0;
70009     iov[0].iov_len = strlen(buf0);
70010     iov[1].iov_base = buf1;
70011     iov[1].iov_len = strlen(buf1);
70012     iov[2].iov_base = buf2;
70013     iov[2].iov_len = strlen(buf2);
70014     ...
70015     iovcnt = sizeof(iov) / sizeof(struct iovec);
70016     bytes_written = writev(fd, iov, iovcnt);
70017     ...
```

APPLICATION USAGE

None.

RATIONALE

Refer to *write*.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 6

Split out from the *write()* reference page.

70031 **NAME**
70032 `wscanf` — convert formatted wide-character input

70033 **SYNOPSIS**
70034 `#include <stdio.h>`
70035 `#include <wchar.h>`
70036 `int wscanf(const wchar_t *restrict format, ...);`

70037 **DESCRIPTION**
70038 Refer to *fwscanf()*.

70039 **NAME**
 70040 y_0 , y_1 , y_n — Bessel functions of the second kind

70041 **SYNOPSIS**

```
70042 xSI #include <math.h>
70043 double y0(double x);
70044 double y1(double x);
70045 double yn(int n, double x);
```

70046 **DESCRIPTION**

70047 The $y_0()$, $y_1()$, and $y_n()$ functions shall compute Bessel functions of x of the second kind of
 70048 orders 0, 1, and n , respectively.

70049 An application wishing to check for error situations should set *errno* to zero and call
 70050 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 70051 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 70052 zero, an error has occurred.

70053 **RETURN VALUE**

70054 Upon successful completion, these functions shall return the relevant Bessel value of x of the
 70055 second kind.

70056 If x is NaN, NaN shall be returned.

70057 If the x argument to these functions is negative, $-\text{HUGE_VAL}$ or NaN shall be returned, and a
 70058 domain error may occur.

70059 If x is 0.0, $-\text{HUGE_VAL}$ shall be returned and a pole error may occur.

70060 If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

70061 If the correct result would cause overflow, $-\text{HUGE_VAL}$ or 0.0 shall be returned and a range
 70062 error may occur.

70063 **ERRORS**

70064 These functions may fail if:

70065 Domain Error The value of x is negative.

70066 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 70067 then *errno* shall be set to [EDOM]. If the integer expression (*math_errhandling*
 70068 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 70069 shall be raised.

70070 Pole Error The value of x is zero.

70071 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 70072 then *errno* shall be set to [ERANGE]. If the integer expression
 70073 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the divide-by-zero
 70074 floating-point exception shall be raised.

70075 Range Error The correct result would cause overflow.

70076 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 70077 then *errno* shall be set to [ERANGE]. If the integer expression
 70078 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the overflow
 70079 floating-point exception shall be raised.

70080 Range Error The value of x is too large in magnitude, or the correct result would cause
 70081 underflow.
 70082 If the integer expression (*math_errhandling* & MATH_ERRNO) is non-zero,
 70083 then *errno* shall be set to [ERANGE]. If the integer expression
 70084 (*math_errhandling* & MATH_ERREXCEPT) is non-zero, then the underflow
 70085 floating-point exception shall be raised.

EXAMPLES

70086 None.
 70087

APPLICATION USAGE

70088 On error, the expressions (*math_errhandling* & MATH_ERRNO) and (*math_errhandling* &
 70089 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.
 70090

RATIONALE

70091 None.

CHANGE HISTORY

70098 First released in Issue 1. Derived from Issue 1 of the SVID.
 70099

Issue 5

70100 The DESCRIPTION is updated to indicate how an application should check for an error. This
 70101 text was previously published in the APPLICATION USAGE section.
 70102

Issue 6

70103 The normative text is updated to avoid use of the term “must” for application requirements.
 70104

70105 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
 70106 with the ISO/IEC 9899:1999 standard.

70107 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/148 is applied, updating the RETURN
 70108 VALUE and ERRORS sections. The changes are made for consistency with the general rules
 70109 stated in “Treatment of Error Conditions for Mathematical Functions” in the Base Definitions
 70110 volume of POSIX.1-200x.

The Institute of Electrical and Electronics Engineers, Inc.

The Shell and Utilities volume of POSIX.1-200x describes the commands and utilities offered to application programs by POSIX-conformant systems.

1.1 Relationship to Other Documents

1.1.1 System Interfaces

This subsection describes some of the features provided by the System Interfaces volume of POSIX.1-200x that are assumed to be globally available on all systems conforming to this volume of POSIX.1-200x. This subsection does not attempt to detail all of the features defined in the System Interfaces volume of POSIX.1-200x that are required by all of the utilities defined in this volume of POSIX.1-200x; the utility and function descriptions point out additional functionality required to provide the corresponding specific features needed by each.

The following subsections describe frequently used concepts. Many of these concepts are described in the Base Definitions volume of POSIX.1-200x. Utility and function description statements override these defaults when appropriate.

1.1.1.1 Process Attributes

The following process attributes, as described in the System Interfaces volume of POSIX.1-200x, are assumed to be supported for all processes in this volume of POSIX.1-200x:

Controlling Terminal	Real Group ID
Current Working Directory	Real User ID
Effective Group ID	Root Directory
Effective User ID	Saved Set-Group-ID
File Descriptors	Saved Set-User-ID
File Mode Creation Mask	Session Membership
Process Group ID	Supplementary Group IDs
Process ID	

A conforming implementation may include additional process attributes.

1.1.1.2 Concurrent Execution of Processes

The following functionality of the *fork()* function defined in the System Interfaces volume of POSIX.1-200x shall be available on all systems conforming to this volume of POSIX.1-200x:

1. Independent processes shall be capable of executing independently without either process terminating.
2. A process shall be able to create a new process with all of the attributes referenced in [Section 1.1.1.1](#), determined according to the semantics of a call to the *fork()* function defined in the System Interfaces volume of POSIX.1-200x followed by a call in the child process to one of the *exec* functions defined in the System Interfaces volume of

70153 POSIX.1-200x.

70154 1.1.1.3 *File Access Permissions*

70155 The file access control mechanism described by XBD [Section 4.4](#) (on page 96) shall apply to all
70156 files on an implementation conforming to this volume of POSIX.1-200x.

70157 1.1.1.4 *File Read, Write, and Creation*

70158 If a file that does not exist is to be written, it shall be created as described below, unless the
70159 utility description states otherwise.

70160 When a file that does not exist is created, the following features defined in the System Interfaces
70161 volume of POSIX.1-200x shall apply unless the utility or function description states otherwise:

- 70162 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 70163 2. The group ID of the file shall be set to the effective group ID of the calling process or the
70164 group ID of the directory in which the file is being created.
- 70165 3. If the file is a regular file, the permission bits of the file shall be set to:

70166 S_IROTH | S_IWOTH | S_IRGRP | S_IWGRP | S_IRUSR | S_IWUSR

70167 (see the description of *File Modes* in XBD [Chapter 13](#) (on page 205), `<sys/stat.h>`) except
70168 that the bits specified by the file mode creation mask of the process shall be cleared. If the
70169 file is a directory, the permission bits shall be set to:

70170 S_IRWXU | S_IRWXG | S_IRWXO

70171 except that the bits specified by the file mode creation mask of the process shall be
70172 cleared.

- 70173 4. The last data access, last data modification, and last file status change timestamps of the
70174 file shall be updated as specified in XBD [Section 4.8](#) (on page 97).
- 70175 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length
70176 zero.
- 70177 6. If the file is a symbolic link, the effect shall be undefined unless the {POSIX2_SYMLINKS}
70178 variable is in effect for the directory in which the symbolic link would be created.
- 70179 7. Unless otherwise specified, the file created shall be a regular file.

70180 When an attempt is made to create a file that already exists, the utility shall take the action
70181 indicated in [Table 1-1](#) (on page 2229) corresponding to the type of the file the utility is trying to
70182 create and the type of the existing file, unless the utility description states otherwise.

70183

Table 1-1 Actions when Creating a File that Already Exists

70198

The following codes are used in [Table 1-1](#):

70199

70200

70201

F Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with a non-zero exit status, depending on the description of the utility.

70202

70203

70204

70205

FL Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

70206

70207

O Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

70208

70209

70210

70211

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.
2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

70212

OF The named file shall be opened with the consequences defined for that file type.

70213

RF Regular file. When attempting to create a regular file, and the existing file is a regular file:

70214

70215

70216

70217

1. The user ID, group ID, and permission bits of the file shall not be changed.
2. The file shall be truncated to zero length.
3. The last data modification and last file status change timestamps shall be marked for update.

70218

— The effect is implementation-defined unless specified by the utility description.

70219

U The effect is unspecified unless specified by the utility description.

70220

***** There is no portable way to create a file of this type.

70221

****** Not portable.

70222

70223

70224

When a file is to be appended, the file shall be opened in a manner equivalent to using the `O_APPEND` flag, without the `O_TRUNC` flag, in the `open()` function defined in the System Interfaces volume of POSIX.1-200x.

70225 When a file is to be read or written, the file shall be opened with an access mode corresponding
 70226 to the operation to be performed. If file access permissions deny access, the requested operation
 70227 shall fail.

70228 1.1.1.5 File Removal

70229 When a directory that is the root directory or current working directory of any process is
 70230 removed, the effect is implementation-defined. If file access permissions deny access, the
 70231 requested operation shall fail. Otherwise, when a file is removed:

- 70232 1. Its directory entry shall be removed from the file system.
- 70233 2. The link count of the file shall be decremented.
- 70234 3. If the file is an empty directory (see XBD Section 3.143, on page 53):
 - 70235 a. If no process has the directory open, the space occupied by the directory shall be
 70236 freed and the directory shall no longer be accessible.
 - 70237 b. If one or more processes have the directory open, the directory contents shall be
 70238 preserved until all references to the file have been closed.
- 70239 4. If the file is a directory that is not empty, the last file status change timestamp shall be
 70240 marked for update.
- 70241 5. If the file is not a directory:
 - 70242 a. If the link count becomes zero:
 - 70243 i. If no process has the file open, the space occupied by the file shall be freed
 70244 and the file shall no longer be accessible.
 - 70245 ii. If one or more processes have the file open, the file contents shall be
 70246 preserved until all references to the file have been closed.
 - 70247 b. If the link count is not reduced to zero, the last file status change timestamp shall
 70248 be marked for update.
- 70249 6. The last data modification and last file status change timestamps of the containing
 70250 directory shall be marked for update.

70251 1.1.1.6 File Time Values

70252 All files shall have the three time values described by XBD Section 4.8 (on page 97).

70253 1.1.1.7 File Contents

70254 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of
 70255 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the
 70256 following operations defined in the System Interfaces volume of POSIX.1-200x:

```
70257 while (read (fildes, buf, nbytes) > 0)
70258     ;
```

70259 If the file is indicated by a *pathname*, the file descriptor shall be determined by the
 70260 equivalent of the following operation defined in the System Interfaces volume of POSIX.1-200x:

```
70261 fildes = open (pathname, O_RDONLY);
```

70262 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data
 70263 returned by *read()* would vary with different values, the value shall be one that results in the
 70264 most data being returned.

70265 If the *read()* function calls would return an error, it is unspecified whether the contents of the file
70266 are considered to include any data from offsets in the file beyond where the error would be
70267 returned.

70268 1.1.1.8 Pathname Resolution

70269 The pathname resolution algorithm, described by XBD Section 4.12 (on page 99), shall be used |
70270 by implementations conforming to this volume of POSIX.1-200x; see also XBD Section 4.5 (on |
70271 page 96).

70272 1.1.1.9 Changing the Current Working Directory

70273 When the current working directory (see XBD Section 3.121, on page 50) is to be changed, unless |
70274 the utility or function description states otherwise, the operation shall succeed unless a call to |
70275 the *chdir()* function defined in the System Interfaces volume of POSIX.1-200x would fail when
70276 invoked with the new working directory pathname as its argument.

70277 1.1.1.10 Establish the Locale

70278 The functionality of the *setlocale()* function defined in the System Interfaces volume of
70279 POSIX.1-200x shall be available on all systems conforming to this volume of POSIX.1-200x; that
70280 is, utilities that require the capability of establishing an international operating environment
70281 shall be permitted to set the specified category of the international environment.

70282 1.1.1.11 Actions Equivalent to Functions

70283 Some utility descriptions specify that a utility performs actions equivalent to a function defined
70284 in the System Interfaces volume of POSIX.1-200x. Such specifications require only that the
70285 external effects be equivalent, not that any effect within the utility and visible only to the utility
70286 be equivalent.

70287 1.1.2 Concepts Derived from the ISO C Standard

70288 Some of the standard utilities perform complex data manipulation using their own procedure
70289 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS
70290 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type
70291 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,
70292 as described in the following sections. Note that there is no requirement that the standard
70293 utilities be implemented in any particular programming language.

70294 1.1.2.1 Arithmetic Precision and Operations

70295 Integer variables and constants, including the values of operands and option-arguments, used
70296 by the standard utilities listed in this volume of POSIX.1-200x shall be implemented as
70297 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as
70298 equivalent to the ISO C standard **double** type. Conversions between types shall be as described
70299 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned
70300 by the input to the application.

70301 Arithmetic operators and control flow keywords shall be implemented as equivalent to those in
70302 the cited ISO C standard section, as listed in Table 1-2 (on page 2232).

if () if () ... else switch ()	Section 6.8.4, Selection Statements
while () do ... while () for ()	Section 6.8.5, Iteration Statements
goto continue break return	Section 6.8.6, Jump Statements

The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5, Expressions, of the ISO C standard.

70346 1.1.2.2 *Mathematical Functions*70347 Any mathematical functions with the same names as those in the following sections of the ISO C
70348 standard:

- 70349
- Section 7.12, Mathematics, <math.h>
 - Section 7.20.2, Pseudo-Random Sequence Generation Functions
- 70350

70351 shall be implemented to return the results equivalent to those returned from a call to the
70352 corresponding function described in the ISO C standard.70353 **1.2 Utility Limits**70354 This section lists magnitude limitations imposed by a specific implementation. The braces
70355 notation, {LIMIT}, is used in this volume of POSIX.1-200x to indicate these values, but the braces
70356 are not part of the name.70357 **Table 1-3** Utility Limit Minimum Values70358
70359
70360
70361
70362
70363
70364
70365
70366
70367
70368
70369

70371
70372
70373
70374
70375
70376
70377
70378
70379
70380
70381
70382

Name	Description	Value
{POSIX2_BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	2 048
{POSIX2_BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	1 000
{POSIX2_COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the border_start keyword in XBD Section 7.3.2 (on page 132).	2
{POSIX2_EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	32
{POSIX2_LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	2 048
{POSIX2_RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$; see XBD Section 9.3.6 (on page 172).	255

70383 The values specified in [Table 1-3](#) represent the lowest values conforming implementations shall
70384 provide and, consequently, the largest values on which an application can rely without further
70385 enquiries, as described below. These values shall be accessible to applications via the *getconf*
70386 utility (see *getconf*, on page 2701).70387 Implementations may provide more liberal, or less restrictive, values than shown in [Table 1-3](#).
70388 These possibly more liberal values are accessible using the symbols in [Table 1-4](#) (on page 2234).

70389 The *sysconf()* function defined in the System Interfaces volume of POSIX.1-200x or the *getconf*
 70390 utility return the value of each symbol on each specific implementation. The value so retrieved is
 70391 the largest, or most liberal, value that is available throughout the session lifetime, as determined
 70392 at session creation. The literal names shown in the table apply only to the *getconf* utility; the
 70393 high-level language binding describes the exact form of each name to be used by the interfaces
 70394 in that binding.

70395 All numeric limits defined by the System Interfaces volume of POSIX.1-200x, such as
 70396 {PATH_MAX}, shall also apply to this volume of POSIX.1-200x. All the utilities defined by this
 70397 volume of POSIX.1-200x are implicitly limited by these values, unless otherwise noted in the
 70398 utility descriptions.

70399 It is not guaranteed that the application can actually reach the specified limit of an
 70400 implementation in any given case, or at all, as a lack of virtual memory or other resources may
 70401 prevent this. The limit value indicates only that the implementation does not specifically impose
 70402 any arbitrary, more restrictive limit.

70403 **Table 1-4** Symbolic Utility Limits

Name	Description	Minimum Value
{BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_BASE_MAX}
{BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	{POSIX2_BC_DIM_MAX}
{BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_SCALE_MAX}
{BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	{POSIX2_BC_STRING_MAX}
{COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the order_start keyword in XBD Section 7.3.2 (on page 132).	{POSIX2_COLL_WEIGHTS_MAX}
{EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	{POSIX2_EXPR_NEST_MAX}
{LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	{POSIX2_LINE_MAX}

70436

70438
70439
70440
70441
70442

Name	Description	Minimum Value
{RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$; see XBD Section 9.3.6 (on page 172).	{POSIX2_RE_DUP_MAX}

70443
70444
70445
70446
70447

The following value may be a constant within an implementation or may vary from one pathname to another.

{POSIX2_SYMLINKS}

When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2_SYMLINKS} is undefined.

70448

1.3 Grammar Conventions

70449
70450
70451
70452
70453
70454
70455
70456
70457
70458

Portions of this volume of POSIX.1-200x are expressed in terms of a special grammar notation. It is used to portray the complex syntax of certain program input. The grammar is based on the syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input, suitable for program use; the lexical processing and all semantic requirements are described only in textual form. The grammar is not based on source used in any traditional implementation and has not been tested with the semantic code that would normally be required to accompany it. Furthermore, there is no implication that the partial *yacc* code presented represents the most efficient, or only, means of supporting the complex syntax within the utility. Implementations may use other programming languages or algorithms, as long as the syntax supported is the same as that represented by the grammar.

70459
70460

The following typographical conventions are used in the grammar; they have no significance except to aid in reading.

70461
70462
70463
70464
70465

- The identifiers for the reserved words of the language are shown with a leading capital letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- The identifiers for terminals in the grammar are all named with uppercase letters and underscores; for example, **NEWLINE**, **ASSIGN_OP**, **NAME**.
- The identifiers for non-terminals are all lowercase.

70466

1.4 Utility Description Defaults

70467
70468
70469
70470
70471

This section describes all of the subsections used within the utility descriptions, including:

- Intended usage of the section
- Global defaults that affect all the standard utilities
- The meanings of notations used in this volume of POSIX.1-200x that are specific to individual utility sections

70472
70473

NAME

This section gives the name or names of the utility and briefly states its purpose.

70474
70475
70476

SYNOPSIS

The SYNOPSIS section summarizes the syntax of the calling sequence for the utility, including options, option-arguments, and operands. Standards for utility naming are

70477 described in XBD Section 12.2 (on page 201); for describing the utility's arguments in
70478 XBD Section 12.1 (on page 199).

70479 DESCRIPTION

70480 The DESCRIPTION section describes the actions of the utility. If the utility has a very
70481 complex set of subcommands or its own procedural language, an EXTENDED
70482 DESCRIPTION section is also provided. Most explanations of optional functionality are
70483 omitted here, as they are usually explained in the OPTIONS section.

70484 As stated in Section 1.1.1.11 (on page 2231), some functions are described in terms of
70485 equivalent functionality. When specific functions are cited, the implementation shall
70486 provide equivalent functionality including side effects associated with successful
70487 execution of the function. The treatment of errors and intermediate results from the
70488 individual functions cited is generally not specified by this volume of POSIX.1-200x.
70489 See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all
70490 actions associated with errors encountered by the utility.

70491 OPTIONS

70492 The OPTIONS section describes the utility options and option-arguments, and how
70493 they modify the actions of the utility. Standard utilities that have options either fully
70494 comply with XBD Section 12.2 (on page 201) or describe all deviations. Apparent
70495 disagreements between functionality descriptions in the OPTIONS and DESCRIPTION
70496 (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS
70497 section.

70498 Each OPTIONS section that uses the phrase "The ... utility shall conform to the Utility
70499 Syntax Guidelines ..." refers only to the use of the utility as specified by this volume of
70500 POSIX.1-200x; implementation extensions should also conform to the guidelines, but
70501 may allow exceptions for historical practice.

70502 Unless otherwise stated in the utility description, when given an option unrecognized
70503 by the implementation, or when a required option-argument is not provided, standard
70504 utilities shall issue a diagnostic message to standard error and exit with a non-zero exit
70505 status.

70506 All utilities in this volume of POSIX.1-200x shall be capable of processing arguments
70507 using eight-bit transparency.

70508 **Default Behavior:** When this section is listed as "None.", it means that the
70509 implementation need not support any options. Standard utilities that do not accept
70510 options, but that do accept operands, shall recognize "--" as a first argument to be
70511 discarded.

70512 The requirement for recognizing "--" is because conforming applications need a way
70513 to shield their operands from any arbitrary options that the implementation may
70514 provide as an extension. For example, if the standard utility *foo* is listed as taking no
70515 options, and the application needed to give it a pathname with a leading hyphen, it
70516 could safely do it as:

```
70517 foo -- -myfile
```

70518 and avoid any problems with **-m** used as an extension.

70519 OPERANDS

70520 The OPERANDS section describes the utility operands, and how they affect the actions
70521 of the utility. Apparent disagreements between functionality descriptions in the
70522 OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be
70523 resolved in favor of the OPERANDS section.

70524 If an operand naming a file can be specified as ‘-’, which means to use the standard
70525 input instead of a named file, this is explicitly stated in this section. Unless otherwise
70526 stated, the use of multiple instances of ‘-’ to mean standard input in a single
70527 command produces unspecified results.

70528 Unless otherwise stated, the standard utilities that accept operands shall process those
70529 operands in the order specified in the command line.

70530 **Default Behavior:** When this section is listed as “None.”, it means that the
70531 implementation need not support any operands.

70532 STDIN

70533 The STDIN section describes the standard input of the utility. This section is frequently
70534 merely a reference to the following section, as many utilities treat standard input and
70535 input files in the same manner. Unless otherwise stated, all restrictions described in the
70536 INPUT FILES section shall apply to this section as well.

70537 Use of a terminal for standard input can cause any of the standard utilities that read
70538 standard input to stop when used in the background. For this reason, applications
70539 should not use interactive features in scripts to be placed in the background.

70540 The specified standard input format of the standard utilities shall not depend on the
70541 existence or value of the environment variables defined in this volume of
70542 POSIX.1-200x, except as provided by this volume of POSIX.1-200x.

70543 **Default Behavior:** When this section is listed as “Not used.”, it means that the standard
70544 input shall not be read when the utility is used as described by this volume of
70545 POSIX.1-200x.

70546 INPUT FILES

70547 The INPUT FILES section describes the files, other than the standard input, used as
70548 input by the utility. It includes files named as operands and option-arguments as well
70549 as other files that are referred to, such as start-up and initialization files, databases, and
70550 so on. Commonly-used files are generally described in one place and cross-referenced
70551 by other utilities.

70552 All utilities in this volume of POSIX.1-200x shall be capable of processing input files
70553 using eight-bit transparency.

70554 When a standard utility reads a seekable input file and terminates without an error
70555 before it reaches end-of-file, the utility shall ensure that the file offset in the open file
70556 description is properly positioned just past the last byte processed by the utility. For
70557 files that are not seekable, the state of the file offset in the open file description for that
70558 file is unspecified. A conforming application shall not assume that the following three
70559 commands are equivalent:

```
70560 tail -n +2 file
70561 (sed -n 1q; cat) < file
70562 cat file | (sed -n 1q; cat)
```

70563 The second command is equivalent to the first only when the file is seekable. The third
70564 command leaves the file offset in the open file description in an unspecified state. Other
70565 utilities, such as *head*, *read*, and *sh*, have similar properties.

70566 Some of the standard utilities, such as filters, process input files a line or a block at a
70567 time and have no restrictions on the maximum input file size. Some utilities may have
70568 size limitations that are not as obvious as file space or memory limitations. Such
70569 limitations should reflect resource limitations of some sort, not arbitrary limits set by
70570 implementors. Implementations shall document those utilities that are limited by

70571 constraints other than file system space, available memory, and other limits specifically
 70572 cited by this volume of POSIX.1-200x, and identify what the constraint is and indicate a
 70573 way of estimating when the constraint would be reached. Similarly, some utilities
 70574 descend the directory tree (recursively). Implementations shall also document any
 70575 limits that they may have in descending the directory tree that are beyond limits cited
 70576 by this volume of POSIX.1-200x.

70577 When an input file is described as a “text file”, the utility produces undefined results if
 70578 given input that is not from a text file, unless otherwise stated. Some utilities (for
 70579 example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline>
 70580 convention; unless otherwise stated, the utility need not be able to accumulate more
 70581 than {LINE_MAX} bytes from a set of multiple, continued input lines. Thus, for a
 70582 conforming application the total of all the continued lines in a set cannot exceed
 70583 {LINE_MAX}. If a utility using the escaped <newline> convention detects an end-of-
 70584 file condition immediately after an escaped <newline>, the results are unspecified.

70585 Record formats are described in a notation similar to that used by the C-language
 70586 function, *printf()*. See XBD Chapter 5 (on page 107) for a description of this notation.
 70587 The format description is intended to be sufficiently rigorous to allow other
 70588 applications to generate these input files. However, since <blank>s can legitimately be
 70589 included in some of the fields described by the standard utilities, particularly in locales
 70590 other than the POSIX locale, this intent is not always realized.

70591 **Default Behavior:** When this section is listed as “None.”, it means that no input files
 70592 are required to be supplied when the utility is used as described by this volume of
 70593 POSIX.1-200x.

70594 ENVIRONMENT VARIABLES

70595 The ENVIRONMENT VARIABLES section lists what variables affect the utility’s
 70596 execution.

70597 The entire manner in which environment variables described in this volume of
 70598 POSIX.1-200x affect the behavior of each utility is described in the ENVIRONMENT
 70599 VARIABLES section for that utility, in conjunction with the global effects of the *LANG*,
 70600 XSI *LC_ALL*, and *NLSPATH* environment variables described in XBD Chapter 8 (on page
 70601 159). The existence or value of environment variables described in this volume of
 70602 POSIX.1-200x shall not otherwise affect the specified behavior of the standard utilities.
 70603 Any effects of the existence or value of environment variables not described by this
 70604 volume of POSIX.1-200x upon the standard utilities are unspecified.

70605 For those standard utilities that use environment variables as a means for selecting a
 70606 utility to execute (such as *CC* in *make*), the string provided to the utility is subjected to
 70607 the path search described for *PATH* in XBD Chapter 8 (on page 159).

70608 All utilities in this volume of POSIX.1-200x shall be capable of processing environment
 70609 variable names and values using eight-bit transparency.

70610 **Default Behavior:** When this section is listed as “None.”, it means that the behavior of
 70611 the utility is not directly affected by environment variables described by this volume of
 70612 POSIX.1-200x when the utility is used as described by this volume of POSIX.1-200x.

70613 ASYNCHRONOUS EVENTS

70614 The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as
 70615 signals and what signals are caught.

70616 **Default Behavior:** When this section is listed as “Default.”, or it refers to “the standard
 70617 action for all other signals; see Section 1.4 (on page 2235)” it means that the action taken
 70618 as a result of the signal shall be one of the following:

- 70619 1. The action shall be that inherited from the parent according to the rules of
- 70620 inheritance of signal actions defined in the System Interfaces volume of
- 70621 POSIX.1-200x.
- 70622 2. When no action has been taken to change the default, the default action shall be
- 70623 that specified by the System Interfaces volume of POSIX.1-200x.
- 70624 3. The result of the utility's execution is as if default actions had been taken.

70625 A utility is permitted to catch a signal, perform some additional processing (such as

70626 deleting temporary files), restore the default signal action (or action inherited from the

70627 parent process), and resignal itself.

70628 STDOUT

70629 The STDOUT section completely describes the standard output of the utility. This

70630 section is frequently merely a reference to the following section, OUTPUT FILES,

70631 because many utilities treat standard output and output files in the same manner.

70632 Use of a terminal for standard output may cause any of the standard utilities that write

70633 standard output to stop when used in the background. For this reason, applications

70634 should not use interactive features in scripts to be placed in the background.

70635 Record formats are described in a notation similar to that used by the C-language

70636 function, *printf()*. See XBD [Chapter 5](#) (on page 107) for a description of this notation.

70637 The specified standard output of the standard utilities shall not depend on the

70638 existence or value of the environment variables defined in this volume of

70639 POSIX.1-200x, except as provided by this volume of POSIX.1-200x.

70640 Some of the standard utilities describe their output using the verb *display*, defined in

70641 XBD [Section 3.132](#) (on page 51). Output described in the STDOUT sections of such

70642 utilities may be produced using means other than standard output. When standard

70643 output is directed to a terminal, the output described shall be written directly to the

70644 terminal. Otherwise, the results are undefined.

70645 **Default Behavior:** When this section is listed as "Not used.", it means that the standard

70646 output shall not be written when the utility is used as described by this volume of

70647 POSIX.1-200x.

70648 STDERR

70649 The STDERR section describes the standard error output of the utility. Only those

70650 messages that are purposely sent by the utility are described.

70651 Use of a terminal for standard error may cause any of the standard utilities that write

70652 standard error output to stop when used in the background. For this reason,

70653 applications should not use interactive features in scripts to be placed in the

70654 background.

70655 The format of diagnostic messages for most utilities is unspecified, but the language

70656 and cultural conventions of diagnostic and informative messages whose format is

70657 unspecified by this volume of POSIX.1-200x should be affected by the setting of

70658 XSI `LC_MESSAGES` and `NLSPATH`.

70659 The specified standard error output of standard utilities shall not depend on the

70660 existence or value of the environment variables defined in this volume of

70661 POSIX.1-200x, except as provided by this volume of POSIX.1-200x.

70662 **Default Behavior:** When this section is listed as "The standard error shall be used only

70663 for diagnostic messages.", it means that, unless otherwise stated, the diagnostic

70664 messages shall be sent to the standard error only when the exit status indicates that an

70665 error occurred and the utility is used as described by this volume of POSIX.1-200x.

70666 When this section is listed as “Not used.”, it means that the standard error shall not be
70667 used when the utility is used as described in this volume of POSIX.1-200x.

70668 OUTPUT FILES

70669 The OUTPUT FILES section completely describes the files created or modified by the
70670 utility. Temporary or system files that are created for internal usage by this utility or
70671 other parts of the implementation (for example, spool, log, and audit files) are not
70672 described in this, or any, section. The utilities creating such files and the names of such
70673 files are unspecified. If applications are written to use temporary or intermediate files,
70674 they should use the *TMPDIR* environment variable, if it is set and represents an
70675 accessible directory, to select the location of temporary files.

70676 Implementations shall ensure that temporary files, when used by the standard utilities,
70677 are named so that different utilities or multiple instances of the same utility can operate
70678 simultaneously without regard to their working directories, or any other process
70679 characteristic other than process ID. There are two exceptions to this rule:

- 70680 1. Resources for temporary files other than the name space (for example, disk
70681 space, available directory entries, or number of processes allowed) are not
70682 guaranteed.
- 70683 2. Certain standard utilities generate output files that are intended as input for
70684 other utilities (for example, *lex* generates *lex.yy.c*), and these cannot have unique
70685 names. These cases are explicitly identified in the descriptions of the respective
70686 utilities.

70687 Any temporary file created by the implementation shall be removed by the
70688 implementation upon a utility’s successful exit, exit because of errors, or before
70689 termination by any of the SIGHUP, SIGINT, or SIGTERM signals, unless specified
70690 otherwise by the utility description.

70691 Receipt of the SIGQUIT signal should generally cause termination (unless in some
70692 debugging mode) that would bypass any attempted recovery actions.

70693 Record formats are described in a notation similar to that used by the C-language
70694 function, *printf()*; see XBD [Chapter 5](#) (on page 107) for a description of this notation.

70695 **Default Behavior:** When this section is listed as “None.”, it means that no files are
70696 created or modified as a consequence of direct action on the part of the utility when the
70697 utility is used as described by this volume of POSIX.1-200x. However, the utility may
70698 create or modify system files, such as log files, that are outside the utility’s normal
70699 execution environment.

70700 EXTENDED DESCRIPTION

70701 The EXTENDED DESCRIPTION section provides a place for describing the actions of
70702 very complicated utilities, such as text editors or language processors, which typically
70703 have elaborate command languages.

70704 **Default Behavior:** When this section is listed as “None.”, no further description is
70705 necessary.

70706 EXIT STATUS

70707 The EXIT STATUS section describes the values the utility shall return to the calling
70708 program, or shell, and the conditions that cause these values to be returned. Usually,
70709 utilities return zero for successful completion and values greater than zero for various
70710 error conditions. If specific numeric values are listed in this section, the system shall
70711 use those values for the errors described. In some cases, status values are listed more

70712 loosely, such as >0 . A strictly conforming application shall not rely on any specific
70713 value in the range shown and shall be prepared to receive any value in the range.

70714 For example, a utility may list zero as a successful return, 1 as a failure for a specific
70715 reason, and >1 as “an error occurred”. In this case, unspecified conditions may cause a
70716 2 or 3, or other value, to be returned. A conforming application should be written so
70717 that it tests for successful exit status values (zero in this case), rather than relying upon
70718 the single specific error value listed in this volume of POSIX.1-200x. In that way, it has
70719 maximum portability, even on implementations with extensions.

70720 Unspecified error conditions may be represented by specific values not listed in this
70721 volume of POSIX.1-200x.

70722 CONSEQUENCES OF ERRORS

70723 The CONSEQUENCES OF ERRORS section describes the effects on the environment,
70724 file systems, process state, and so on, when error conditions occur. It does not describe
70725 error messages produced or exit status values used.

70726 The many reasons for failure of a utility are generally not specified by the utility
70727 descriptions. Utilities may terminate prematurely if they encounter: invalid usage of
70728 options, arguments, or environment variables; invalid usage of the complex syntaxes
70729 expressed in EXTENDED DESCRIPTION sections; difficulties accessing, creating,
70730 reading, or writing files; or difficulties associated with the privileges of the process.

70731 The following shall apply to each utility, unless otherwise stated:

70732 • If the requested action cannot be performed on an operand representing a file,
70733 directory, user, process, and so on, the utility shall issue a diagnostic message to
70734 standard error and continue processing the next operand in sequence, but the
70735 final exit status shall be returned as non-zero.

70736 For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if
70737 the requested action cannot be performed on a file or directory encountered in the
70738 hierarchy, the utility shall issue a diagnostic message to standard error and
70739 continue processing the remaining files in the hierarchy, but the final exit status
70740 shall be returned as non-zero.

70741 • If the requested action characterized by an option or option-argument cannot be
70742 performed, the utility shall issue a diagnostic message to standard error and the
70743 exit status returned shall be non-zero.

70744 • When an unrecoverable error condition is encountered, the utility shall exit with a
70745 non-zero exit status.

70746 • A diagnostic message shall be written to standard error whenever an error
70747 condition occurs.

70748 When a utility encounters an error condition several actions are possible, depending on
70749 the severity of the error and the state of the utility. Included in the possible actions of
70750 various utilities are: deletion of temporary or intermediate work files; deletion of
70751 incomplete files; validity checking of the file system or directory.

70752 **Default Behavior:** When this section is listed as “Default.”, it means that any changes
70753 to the environment are unspecified.

70754 APPLICATION USAGE

70755 This section is informative.

70756 The APPLICATION USAGE section gives advice to the application programmer or
70757 user about the way the utility should be used.

EXAMPLES

This section is informative.

The EXAMPLES section gives one or more examples of usage, where appropriate. In the event of conflict between an example and a normative part of the specification, the normative material is to be taken as correct.

In all examples, quoting has been used, showing how sample commands (utility names combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to the *system()* function defined in the System Interfaces volume of POSIX.1-200x. Such quoting would not be used if the utility is invoked using one of the *exec* functions defined in the System Interfaces volume of POSIX.1-200x.

RATIONALE

This section is informative.

This section contains historical information concerning the contents of this volume of POSIX.1-200x and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is informative.

The FUTURE DIRECTIONS section should be used as a guide to current thinking; there is not necessarily a commitment to implement all of these future directions in their entirety.

SEE ALSO

This section is informative.

The SEE ALSO section lists related entries.

CHANGE HISTORY

This section is informative.

This section shows the derivation of the entry and any significant changes that have been made to it.

Certain of the standard utilities describe how they can invoke other utilities or applications, such as by passing a command string to the command interpreter. The external influences (STDIN, ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF ERRORS, and so on) of such invoked utilities are not described in the section concerning the standard utility that invokes them.

1.5 Considerations for Utilities in Support of Files of Arbitrary Size

The following utilities support files of any size up to the maximum that can be created by the implementation. This support includes correct writing of file size-related values (such as file sizes and offsets, line numbers, and block counts) and correct interpretation of command line arguments that contain such values.

70795	<i>basename</i>	Return non-directory portion of pathname.
70796	<i>cat</i>	Concatenate and print files.
70797	<i>cd</i>	Change working directory.
70798	<i>chgrp</i>	Change file group ownership.
70799	<i>chmod</i>	Change file modes.
70800	<i>chown</i>	Change file ownership.
70801	<i>cksum</i>	Write file checksums and sizes.
70802	<i>cmp</i>	Compare two files.
70803	<i>cp</i>	Copy files.
70804	<i>dd</i>	Convert and copy a file.
70805	<i>df</i>	Report free disk space.
70806	<i>dirname</i>	Return directory portion of pathname.
70807	<i>du</i>	Estimate file space usage.
70808	<i>find</i>	Find files.
70809	<i>ln</i>	Link files.
70810	<i>ls</i>	List directory contents.
70811	<i>mkdir</i>	Make directories.
70812	<i>mv</i>	Move files.
70813	<i>pathchk</i>	Check pathnames.
70814	<i>pwd</i>	Return working directory name.
70815	<i>rm</i>	Remove directory entries.
70816	<i>rmdir</i>	Remove directories.
70817	<i>sh</i>	Shell, the standard command language interpreter.
70818	<i>sum</i>	Print checksum and block or byte count of a file.
70819	<i>test</i>	Evaluate expression.
70820	<i>touch</i>	Change file access and modification times.
70821	<i>ulimit</i>	Set or report file size limit.

Exceptions to the requirement that utilities support files of any size up to the maximum are as follows:

1. Uses of files as command scripts, or for configuration or control, are exempt. For example, it is not required that *sh* be able to read an arbitrarily large **.profile**.

- 70826 2. Shell input and output redirection are exempt. For example, it is not required that the
70827 redirections *sum < file* or *echo foo > file* succeed for an arbitrarily large existing file.

70828 1.6 Built-In Utilities

70829 Any of the standard utilities may be implemented as regular built-in utilities within the
70830 command language interpreter. This is usually done to increase the performance of frequently
70831 used utilities or to achieve functionality that would be more difficult in a separate environment.
70832 The utilities named in Table 1-5 are frequently provided in built-in form. All of the utilities
70833 named in the table have special properties in terms of command search order within the shell, as
70834 described in Section 2.9.1.1 (on page 2264).

70835 **Table 1-5** Regular Built-In Utilities

70836	<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
70837	<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
70838	<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
70839	<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

70840 However, all of the standard utilities, including the regular built-ins in the table, but not the
70841 special built-ins described in Section 2.14 (on page 2280), shall be implemented in a manner so
70842 that they can be accessed via the *exec* family of functions as defined in the System Interfaces
70843 volume of POSIX.1-200x and can be invoked directly by those standard utilities that require it
70844 (*env, find, nice, nohup, time, xargs*).

70847 This chapter contains the definition of the Shell Command Language.

70848 2.1 Shell Introduction

70849 The shell is a command language interpreter. This chapter describes the syntax of that command
70850 language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the
70851 System Interfaces volume of POSIX.1-200x.

70852 The shell operates according to the following general overview of operations. The specific
70853 details are included in the cited sections of this chapter.

- 70854 1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and
70855 *popen()* functions defined in the System Interfaces volume of POSIX.1-200x. If the first
70856 line of a file of shell commands starts with the characters "#!", the results are
70857 unspecified.
- 70858 2. The shell breaks the input into tokens: words and operators; see [Section 2.3](#) (on page
70859 2247).
- 70860 3. The shell parses the input into simple commands (see [Section 2.9.1](#), on page 2263) and
70861 compound commands (see [Section 2.9.4](#), on page 2268).
- 70862 4. The shell performs various expansions (separately) on different parts of each command,
70863 resulting in a list of pathnames and fields to be treated as a command and arguments; see
70864 [Section 2.6](#) (on page 2253).
- 70865 5. The shell performs redirection (see [Section 2.7](#), on page 2259) and removes redirection
70866 operators and their operands from the parameter list.
- 70867 6. The shell executes a function (see [Section 2.9.5](#), on page 2270), built-in (see [Section 2.14](#),
70868 on page 2280), executable file, or script, giving the names of the arguments as positional
70869 parameters numbered 1 to *n*, and the name of the command (or in the case of a function
70870 within a script, the name of the script) as the positional parameter numbered 0 (see
70871 [Section 2.9.1.1](#), on page 2264).
- 70872 7. The shell optionally waits for the command to complete and collects the exit status (see
70873 [Section 2.8.2](#), on page 2262).

2.2 Quoting

Quoting is used to remove the special meaning of certain characters or words to the shell. Quoting can be used to preserve the literal meaning of the special characters in the next paragraph, prevent reserved words from being recognized as such, and prevent parameter expansion and command substitution within here-document processing (see [Section 2.7.4](#), on page 2260).

The application shall quote the following characters if they are to represent themselves:

```
| & ; < > ( ) $ ` \ " ' <space> <tab> <newline>
```

and the following may need to be quoted under certain circumstances. That is, these characters may be special depending on conditions described elsewhere in this volume of POSIX.1-200x:

```
* ? [ # ~ = %
```

The various quoting mechanisms are the escape character, single-quotes, and double-quotes. The here-document represents another form of quoting; see [Section 2.7.4](#) (on page 2260).

2.2.1 Escape Character (Backslash)

A backslash that is not quoted shall preserve the literal value of the following character, with the exception of a <newline>. If a <newline> follows the backslash, the shell shall interpret this as line continuation. The backslash and <newline>s shall be removed before splitting the input into tokens. Since the escaped <newline> is removed entirely from the input and is not replaced by any white space, it cannot serve as a token separator.

2.2.2 Single-Quotes

Enclosing characters in single-quotes (' ') shall preserve the literal value of each character within the single-quotes. A single-quote cannot occur within single-quotes.

2.2.3 Double-Quotes

Enclosing characters in double-quotes (" ") shall preserve the literal value of all characters within the double-quotes, with the exception of the characters dollar sign, backquote, and backslash, as follows:

§ The dollar sign shall retain its special meaning introducing parameter expansion (see [Section 2.6.2](#), on page 2254), a form of command substitution (see [Section 2.6.3](#), on page 2256), and arithmetic expansion (see [Section 2.6.4](#), on page 2257).

The input characters within the quoted string that are also enclosed between "\$ (" and the matching ') ' shall not be affected by the double-quotes, but rather shall define that command whose output replaces the "\$ (. . .) " when the word is expanded. The tokenizing rules in [Section 2.3](#) (on page 2247), not including the alias substitutions in [Section 2.3.1](#) (on page 2248), shall be applied recursively to find the matching ') '.

Within the string of characters from an enclosed "\$ { " to the matching ' } ' , an even number of unescaped double-quotes or single-quotes, if any, shall occur. A preceding backslash character shall be used to escape a literal ' { ' or ' } ' . The rule in [Section 2.6.2](#) (on page 2254) shall be used to determine the matching ' } ' .

` The backquote shall retain its special meaning introducing the other form of command substitution (see [Section 2.6.3](#), on page 2256). The portion of the quoted string from the initial backquote and the characters up to the next backquote that is not preceded by a backslash, having escape characters removed, defines that command whose output replaces

70916 " ` . . . ` " when the word is expanded. Either of the following cases produces undefined
70917 results:

- 70918 • A single-quoted or double-quoted string that begins, but does not end, within the
70919 " ` . . . ` " sequence
- 70920 • A " ` . . . ` " sequence that begins, but does not end, within the same double-quoted
70921 string

70922 \ The backslash shall retain its special meaning as an escape character (see [Section 2.2.1](#), on
70923 page 2246) only when followed by one of the following characters when considered special:

70924 \$ ` " \ <newline>

70925 The application shall ensure that a double-quote is preceded by a backslash to be included
70926 within double-quotes. The parameter '@' has special meaning inside double-quotes and is
70927 described in [Section 2.5.2](#) (on page 2250).

70928 2.3 Token Recognition

70929 The shell shall read its input in terms of lines from a file, from a terminal in the case of an
70930 interactive shell, or from a string in the case of *sh -c* or *system()*. The input lines can be of
70931 unlimited length. These lines shall be parsed using two major modes: ordinary token recognition
70932 and processing of here-documents.

70933 When an **io_here** token has been recognized by the grammar (see [Section 2.10](#), on page 2271),
70934 one or more of the subsequent lines immediately following the next **NEWLINE** token form the
70935 body of one or more here-documents and shall be parsed according to the rules of [Section 2.7.4](#)
70936 (on page 2260).

70937 When it is not processing an **io_here**, the shell shall break its input into tokens by applying the
70938 first applicable rule below to the next character in its input. The token shall be from the current
70939 position in the input until a token is delimited according to one of the rules below; the characters
70940 forming the token are exactly those in the input, including any quoting characters. If it is
70941 indicated that a token is delimited, and no characters have been included in a token, processing
70942 shall continue until an actual token is delimited.

- 70943 1. If the end of input is recognized, the current token shall be delimited. If there is no
70944 current token, the end-of-input indicator shall be returned as the token.
- 70945 2. If the previous character was used as part of an operator and the current character is not
70946 quoted and can be used with the current characters to form an operator, it shall be used as
70947 part of that (operator) token.
- 70948 3. If the previous character was used as part of an operator and the current character cannot
70949 be used with the current characters to form an operator, the operator containing the
70950 previous character shall be delimited.
- 70951 4. If the current character is backslash, single-quote, or double-quote (` ` , ' ' , or " ") and
70952 it is not quoted, it shall affect quoting for subsequent characters up to the end of the
70953 quoted text. The rules for quoting are as described in [Section 2.2](#) (on page 2246). During
70954 token recognition no substitutions shall be actually performed, and the result token shall
70955 contain exactly the characters that appear in the input (except for <newline> joining),
70956 unmodified, including any embedded or enclosing quotes or substitution operators,
70957 between the quote mark and the end of the quoted text. The token shall not be delimited
70958 by the end of the quoted field.

- 70959 5. If the current character is an unquoted '\$' or '\', the shell shall identify the start of any
 70960 candidates for parameter expansion (Section 2.6.2, on page 2254), command substitution
 70961 (Section 2.6.3, on page 2256), or arithmetic expansion (Section 2.6.4, on page 2257) from
 70962 their introductory unquoted character sequences: '\$' or "\${", "\$(" or '\', and "\$(",
 70963 respectively. The shell shall read sufficient input to determine the end of the unit to be
 70964 expanded (as explained in the cited sections). While processing the characters, if
 70965 instances of expansions or quoting are found nested within the substitution, the shell
 70966 shall recursively process them in the manner specified for the construct that is found. The
 70967 characters found from the beginning of the substitution to its end, allowing for any
 70968 recursion necessary to recognize embedded constructs, shall be included unmodified in
 70969 the result token, including any embedded or enclosing substitution operators or quotes.
 70970 The token shall not be delimited by the end of the substitution.
- 70971 6. If the current character is not quoted and can be used as the first character of a new
 70972 operator, the current token (if any) shall be delimited. The current character shall be used
 70973 as the beginning of the next (operator) token.
- 70974 7. If the current character is an unquoted <newline>, the current token shall be delimited.
- 70975 8. If the current character is an unquoted <blank>, any token containing the previous
 70976 character is delimited and the current character shall be discarded.
- 70977 9. If the previous character was part of a word, the current character shall be appended to
 70978 that word.
- 70979 10. If the current character is a '#', it and all subsequent characters up to, but excluding, the
 70980 next <newline> shall be discarded as a comment. The <newline> that ends the line is not
 70981 considered part of the comment.
- 70982 11. The current character is used as the start of a new word.

70983 Once a token is delimited, it is categorized as required by the grammar in Section 2.10 (on page
 70984 2271).

70985 2.3.1 Alias Substitution

70986 After a token has been delimited, but before applying the grammatical rules in Section 2.10 (on
 70987 page 2271), a resulting word that is identified to be the command name word of a simple
 70988 command shall be examined to determine whether it is an unquoted, valid alias name. However,
 70989 reserved words in correct grammatical context shall not be candidates for alias substitution. A
 70990 valid alias name (see XBD Section 3.10, on page 34) shall be one that has been defined by the
 70991 *alias* utility and not subsequently undefined using *unalias*. Implementations also may provide
 70992 predefined valid aliases that are in effect when the shell is invoked. To prevent infinite loops in
 70993 recursive aliasing, if the shell is not currently processing an alias of the same name, the word
 70994 shall be replaced by the value of the alias; otherwise, it shall not be replaced.

70995 If the value of the alias replacing the word ends in a <blank>, the shell shall check the next
 70996 command word for alias substitution; this process shall continue until a word is found that is
 70997 not a valid alias or an alias value does not end in a <blank>.

70998 When used as specified by this volume of POSIX.1-200x, alias definitions shall not be inherited
 70999 by separate invocations of the shell or by the utility execution environments invoked by the
 71000 shell; see Section 2.12 (on page 2277).

71001 **2.4 Reserved Words**

71002 Reserved words are words that have special meaning to the shell; see [Section 2.9](#) (on page 2263).
 71003 The following words shall be recognized as reserved words:

71004	!	do	esac	in
71005	{	done	fi	then
71006	}	elif	for	until
71007	case	else	if	while

71008 This recognition shall only occur when none of the characters is quoted and when the word is
 71009 used as:

- 71010 • The first word of a command
- 71011 • The first word following one of the reserved words other than **case**, **for**, or **in**
- 71012 • The third word in a **case** command (only **in** is valid in this case)
- 71013 • The third word in a **for** command (only **in** and **do** are valid in this case)

71014 See the grammar in [Section 2.10](#) (on page 2271).

71015 The following words may be recognized as reserved words on some implementations (when
 71016 none of the characters are quoted), causing unspecified results:

71017	[[]]	function	select
-------	-----------	-----------	-----------------	---------------

71018 Words that are the concatenation of a name and a colon (' : ') are reserved; their use produces
 71019 unspecified results.

71020 **2.5 Parameters and Variables**

71021 A parameter can be denoted by a name, a number, or one of the special characters listed in
 71022 [Section 2.5.2](#) (on page 2250). A variable is a parameter denoted by a name.

71023 A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can
 71024 only be unset by using the *unset* special built-in command.

71025 **2.5.1 Positional Parameters**

71026 A positional parameter is a parameter denoted by the decimal value represented by one or more
 71027 digits, other than the single digit 0. The digits denoting the positional parameters shall always
 71028 be interpreted as a decimal value, even if there is a leading zero. When a positional parameter
 71029 with more than one digit is specified, the application shall enclose the digits in braces (see
 71030 [Section 2.6.2](#), on page 2254). Positional parameters are initially assigned when the shell is
 71031 invoked (see *sh*), temporarily replaced when a shell function is invoked (see [Section 2.9.5](#), on
 71032 page 2270), and can be reassigned with the *set* special built-in command.

71033 **2.5.2 Special Parameters**

71034 Listed below are the special parameters and the values to which they shall expand. Only the
71035 values of the special parameters are listed; see [Section 2.6](#) (on page 2253) for a detailed summary
71036 of all the stages involved in expanding words.

- 71037 @ Expands to the positional parameters, starting from one. When the expansion occurs within
71038 double-quotes, and where field splitting (see [Section 2.6.5](#), on page 2258) is performed, each
71039 positional parameter shall expand as a separate field, with the provision that the expansion
71040 of the first parameter shall still be joined with the beginning part of the original word
71041 (assuming that the expanded parameter was embedded within a word), and the expansion
71042 of the last parameter shall still be joined with the last part of the original word. If there are
71043 no positional parameters, the expansion of '@' shall generate zero fields, even when '@' is
71044 double-quoted.
- 71045 * Expands to the positional parameters, starting from one. When the expansion occurs within
71046 a double-quoted string (see [Section 2.2.3](#), on page 2246), it shall expand to a single field with
71047 the value of each parameter separated by the first character of the *IFS* variable, or by a
71048 <space> if *IFS* is unset. If *IFS* is set to a null string, this is not equivalent to unsetting it; its
71049 first character does not exist, so the parameter values are concatenated.
- 71050 # Expands to the decimal number of positional parameters. The command name (parameter
71051 0) shall not be counted in the number given by '# ' because it is a special parameter, not a
71052 positional parameter.
- 71053 ? Expands to the decimal exit status of the most recent pipeline (see [Section 2.9.2](#), on page
71054 2265).
- 71055 – (Hyphen.) Expands to the current option flags (the single-letter option names concatenated
71056 into a string) as specified on invocation, by the *set* special built-in command, or implicitly
71057 by the shell.
- 71058 \$ Expands to the decimal process ID of the invoked shell. In a subshell (see [Section 2.12](#), on
71059 page 2277), '\$ ' shall expand to the same value as that of the current shell.
- 71060 ! Expands to the decimal process ID of the most recent background command (see [Section
71061 2.9.3](#), on page 2266) executed from the current shell. (For example, background commands
71062 executed from subshells do not affect the value of "\$!" in the current shell environment.)
71063 For a pipeline, the process ID is that of the last command in the pipeline.
- 71064 0 (Zero.) Expands to the name of the shell or shell script. See *sh* (on page 3074) for a detailed
71065 description of how this name is derived.

71066 See the description of the *IFS* variable in [Section 2.5.3](#).

71067 **2.5.3 Shell Variables**

71068 Variables shall be initialized from the environment (as defined by XBD [Chapter 8](#) (on page 159) |
71069 and the *exec* function in the System Interfaces volume of POSIX.1-200x) and can be given new
71070 values with variable assignment commands. If a variable is initialized from the environment, it
71071 shall be marked for export immediately; see the *export* special built-in. New variables can be
71072 defined and initialized with variable assignments, with the *read* or *getopts* utilities, with the *name*
71073 parameter in a **for** loop, with the $\${name=word}$ expansion, or with other mechanisms provided
71074 as implementation extensions.

71075 The following variables shall affect the execution of the shell:

71076	UP XSI	ENV	The processing of the <i>ENV</i> shell variable shall be supported on all XSI-conformant systems or if the system supports the User Portability Utilities option.
71077			
71078			
71079			This variable, when and only when an interactive shell is invoked, shall be subjected to parameter expansion (see Section 2.6.2 , on page 2254) by the shell and the resulting value shall be used as a pathname of a file containing shell commands to execute in the current environment. The file need not be executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the results are unspecified. <i>ENV</i> shall be ignored if the user's real and effective user IDs or real and effective group IDs are different.
71080			
71081			
71082			
71083			
71084			
71085			
71086		HOME	The pathname of the user's home directory. The contents of <i>HOME</i> are used in tilde expansion (see Section 2.6.1 , on page 2253).
71087			
71088		IFS	A string treated as a list of characters that is used for field splitting and to split lines into fields with the <i>read</i> command.
71089			
71090			If <i>IFS</i> is not set, it shall behave as normal for an unset variable, except that field splitting by the shell and line splitting by the <i>read</i> command shall be performed as if the value of <i>IFS</i> is <space><tab><newline>; see Section 2.6.5 (on page 2258).
71091			
71092			
71093			
71094			Implementations may ignore the value of <i>IFS</i> in the environment, or the absence of <i>IFS</i> from the environment, at the time the shell is invoked, in which case the shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked.
71095			
71096			
71097		LANG	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)
71098			
71099			
71100			
71101		LC_ALL	The value of this variable overrides the <i>LC_*</i> variables and <i>LANG</i> , as described in XBD Chapter 8 (on page 159).
71102			
71103		LC_COLLATE	Determine the behavior of range expressions, equivalence classes, and multi-character collating elements within pattern matching.
71104			
71105		LC_CTYPE	Determine the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters), which characters are defined as letters (character class alpha) and <blank>s (character class blank), and the behavior of character classes within pattern matching. Changing the value of <i>LC_CTYPE</i> after the shell has started shall not affect the lexical processing of shell commands in the current shell execution environment or its subshells. Invoking a shell script or performing <i>exec sh</i> subjects the new shell to the changes in <i>LC_CTYPE</i> .
71106			
71107			
71108			
71109			
71110			
71111			
71112			
71113		LC_MESSAGES	Determine the language in which messages should be written.
71114		LINENO	Set by the shell to a decimal number representing the current sequential line number (numbered starting with 1) within a script or function before it executes each command. If the user unsets or resets <i>LINENO</i> , the variable may lose its special meaning for the life of the shell. If the shell is not currently executing a script or function, the value of <i>LINENO</i> is unspecified. This volume of POSIX.1-200x specifies the effects of the variable only for systems supporting the User Portability Utilities option.
71115			
71116			
71117			
71118			
71119			
71120			

71121	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
71122			
71123		<i>PATH</i>	A string formatted as described in XBD Chapter 8 (on page 159), used to effect command interpretation; see Section 2.9.1.1 (on page 2264).
71124			
71125		<i>PPID</i>	Set by the shell to the decimal process ID of the process that invoked this shell. In a subshell (see Section 2.12, on page 2277), <i>PPID</i> shall be set to the same value as that of the parent of the current shell. For example, <i>echo \$PPID</i> and (<i>echo \$PPID</i>) would produce the same value. This volume of POSIX.1-200x specifies the effects of the variable only for systems supporting the User Portability Utilities option.
71126			
71127			
71128			
71129			
71130			
71131		<i>PS1</i>	Each time an interactive shell is ready to read a command, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value shall be "\$ ". For users who have specific additional implementation-defined privileges, the default may be another, implementation-defined value. The shell shall replace each instance of the character '!' in <i>PS1</i> with the history file number of the next command to be typed. Escaping the '!' with another '!' (that is, "!!") shall place the literal character '!' in the prompt. This volume of POSIX.1-200x specifies the effects of the variable only for systems supporting the User Portability Utilities option.
71132			
71133			
71134			
71135			
71136			
71137			
71138			
71139			
71140			
71141		<i>PS2</i>	Each time the user enters a <newline> prior to completing a command line in an interactive shell, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value is "> ". This volume of POSIX.1-200x specifies the effects of the variable only for systems supporting the User Portability Utilities option.
71142			
71143			
71144			
71145			
71146		<i>PS4</i>	When an execution trace (<i>set -x</i>) is being performed in an interactive shell, before each line in the execution trace, the value of this variable shall be subjected to parameter expansion and written to standard error. The default value is "+ ". This volume of POSIX.1-200x specifies the effects of the variable only for systems supporting the User Portability Utilities option.
71147			
71148			
71149			
71150			
71151		<i>PWD</i>	Set by the shell to be an absolute pathname of the current working directory, containing no components of type symbolic link, no components that are dot, and no components that are dot-dot when the shell is initialized. If an application sets or unsets the value of <i>PWD</i> , the behaviors of the <i>cd</i> and <i>pwd</i> utilities are unspecified.
71152			
71153			
71154			
71155			

2.6 Word Expansions

This section describes the various expansions that are performed on words. Not all expansions are performed on every word, as explained in the following sections.

Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and quote removals that occur within a single word expand to a single field. It is only field splitting or pathname expansion that can create multiple fields from a single word. The single exception to this rule is the expansion of the special parameter '@' within double-quotes, as described in [Section 2.5.2](#) (on page 2250).

The order of word expansion shall be as follows:

1. Tilde expansion (see [Section 2.6.1](#)), parameter expansion (see [Section 2.6.2](#), on page 2254), command substitution (see [Section 2.6.3](#), on page 2256), and arithmetic expansion (see [Section 2.6.4](#), on page 2257) shall be performed, beginning to end. See item 5 in [Section 2.3](#) (on page 2247).
2. Field splitting (see [Section 2.6.5](#), on page 2258) shall be performed on the portions of the fields generated by step 1, unless *IFS* is null.
3. Pathname expansion (see [Section 2.6.6](#), on page 2259) shall be performed, unless *set -f* is in effect.
4. Quote removal (see [Section 2.6.7](#), on page 2259) shall always be performed last.

The expansions described in this section shall occur in the same shell environment as that in which the command is executed.

If the complete expansion appropriate for a word results in an empty field, that empty field shall be deleted from the list of fields that form the completely expanded command, unless the original word contained single-quote or double-quote characters.

The '\$' character is used to introduce parameter expansion, command substitution, or arithmetic evaluation. If an unquoted '\$' is followed by a character that is either not numeric, the name of one of the special parameters (see [Section 2.5.2](#), on page 2250), a valid first character of a variable name, a left curly brace ('{') or a left parenthesis, the result is unspecified.

2.6.1 Tilde Expansion

A “tilde-prefix” consists of an unquoted tilde character at the beginning of a word, followed by all of the characters preceding the first unquoted slash in the word, or all the characters in the word if there is no slash. In an assignment (see [XBD Section 4.22](#), on page 106), multiple tilde-prefixes can be used: at the beginning of the word (that is, following the equal sign of the assignment), following any unquoted colon, or both. A tilde-prefix in an assignment is terminated by the first unquoted colon or slash. If none of the characters in the tilde-prefix are quoted, the characters in the tilde-prefix following the tilde are treated as a possible login name from the user database. A portable login name cannot contain characters outside the set given in the description of the *LOGNAME* environment variable in [XBD Section 8.3](#) (on page 163). If the login name is null (that is, the tilde-prefix contains only the tilde), the tilde-prefix is replaced by the value of the variable *HOME*. If *HOME* is unset, the results are unspecified. Otherwise, the tilde-prefix shall be replaced by a pathname of the initial working directory associated with the login name obtained using the *getpwnam()* function as defined in the System Interfaces volume of POSIX.1-200x. If the system does not recognize the login name, the results are undefined.

2.6.2 Parameter Expansion

The format for parameter expansion is as follows:

```
${expression}
```

where *expression* consists of all characters until the matching `'}'`. Any `'}'` escaped by a backslash or within a quoted string, and characters in embedded arithmetic expansions, command substitutions, and variable expansions, shall not be examined in determining the matching `'}'`.

The simplest form for parameter expansion is:

```
${parameter}
```

The value, if any, of *parameter* shall be substituted.

The parameter name or symbol can be enclosed in braces, which are optional except for positional parameters with more than one digit or when *parameter* is followed by a character that could be interpreted as part of the name. The matching closing brace shall be determined by counting brace levels, skipping over enclosed quoted strings, and command substitutions.

If the parameter name or symbol is not enclosed in braces, the expansion shall use the longest valid name (see XBD Section 3.229, on page 65), whether or not the symbol represented by that name exists.

If a parameter expansion occurs inside double-quotes:

- Pathname expansion shall not be performed on the results of the expansion.
- Field splitting shall not be performed on the results of the expansion, with the exception of `'@'`; see Section 2.5.2 (on page 2250).

In addition, a parameter expansion can be modified by using one of the following formats. In each case that a value of *word* is needed (based on the state of *parameter*, as described below), *word* shall be subjected to tilde expansion, parameter expansion, command substitution, and arithmetic expansion. If *word* is not needed, it shall not be expanded. The `'}'` character that delimits the following parameter expansion modifications shall be determined as described previously in this section and in Section 2.2.3 (on page 2246). (For example, `${foo-bar}xyz` would result in the expansion of `foo` followed by the string `xyz` if `foo` is set, else the string `"barxyz"`).

`${parameter:-word}` **Use Default Values.** If *parameter* is unset or null, the expansion of *word* shall be substituted; otherwise, the value of *parameter* shall be substituted.

`${parameter:=word}` **Assign Default Values.** If *parameter* is unset or null, the expansion of *word* shall be assigned to *parameter*. In all cases, the final value of *parameter* shall be substituted. Only variables, not positional parameters or special parameters, can be assigned in this way.

`${parameter:?[word]}` **Indicate Error if Null or Unset.** If *parameter* is unset or null, the expansion of *word* (or a message indicating it is unset if *word* is omitted) shall be written to standard error and the shell exits with a non-zero exit status. Otherwise, the value of *parameter* shall be substituted. An interactive shell need not exit.

`${parameter:+word}` **Use Alternative Value.** If *parameter* is unset or null, null shall be substituted; otherwise, the expansion of *word* shall be substituted.

In the parameter expansions shown previously, use of the colon in the format shall result in a test for a parameter that is unset or null; omission of the colon shall result in a test for a

71242 parameter that is only unset. The following table summarizes the effect of the colon:

71243
71244

	<i>parameter</i> Set and Not Null	<i>parameter</i> Set But Null	<i>parameter</i> Unset
71245 71246	<code>\${parameter:-word}</code> <code>\${parameter-word}</code>	substitute <i>parameter</i> substitute <i>parameter</i>	substitute <i>word</i> substitute <i>word</i>
71247 71248	<code>\${parameter:=word}</code> <code>\${parameter=word}</code>	substitute <i>parameter</i> substitute <i>parameter</i>	assign <i>word</i> assign <i>word</i>
71249 71250	<code>\${parameter?word}</code> <code>\${parameter?word}</code>	substitute <i>parameter</i> substitute <i>parameter</i>	error, exit error, exit
71251 71252	<code>\${parameter+word}</code> <code>\${parameter+word}</code>	substitute <i>word</i> substitute <i>word</i>	substitute null substitute null

71253
71254

In all cases shown with “substitute”, the expression is replaced with the value shown. In all cases shown with “assign”, *parameter* is assigned that value, which also replaces the expression.

71255
71256
71257

`#{parameter}` **String Length.** The length in characters of the value of *parameter* shall be substituted. If *parameter* is '*' or '@', the result of the expansion is unspecified.

71258
71259
71260
71261
71262
71263

The following four varieties of parameter expansion provide for substring processing. In each case, pattern matching notation (see Section 2.13, on page 2278), rather than regular expression notation, shall be used to evaluate the patterns. If *parameter* is '*' or '@', the result of the expansion is unspecified. Enclosing the full parameter expansion string in double-quotes shall not cause the following four varieties of pattern characters to be quoted, whereas quoting characters within the braces shall have this effect.

71264
71265
71266

`{parameter%word}` **Remove Smallest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the suffix matched by the *pattern* deleted.

71267
71268
71269

`{parameter%%word}` **Remove Largest Suffix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the largest portion of the suffix matched by the *pattern* deleted.

71270
71271
71272

`{parameter#word}` **Remove Smallest Prefix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the smallest portion of the prefix matched by the *pattern* deleted.

71273
71274
71275

`{parameter##word}` **Remove Largest Prefix Pattern.** The *word* shall be expanded to produce a pattern. The parameter expansion shall then result in *parameter*, with the largest portion of the prefix matched by the *pattern* deleted.

71276

Examples

71277
71278
71279

`{parameter :-word}`
In this example, *ls* is executed only if *x* is null or unset. (The `$(ls)` command substitution notation is explained in Section 2.6.3 (on page 2256).)

71280

```
{x:-$(ls)}
```

71281
71282
71283
71284

```
{parameter :=word}
unset X
echo ${X:=abc}
abc
```

```

71285  ${parameter:?word}
71286      unset posix
71287      echo ${posix:?}
71288      sh: posix: parameter null or not set

```

```

71289  ${parameter:+word}
71290      set a b c
71291      echo ${3:+posix}
71292      posix

```

```

71293  $#parameter}
71294      HOME=/usr/posix
71295      echo $#HOME}
71296      10

```

```

71297  ${parameter%word}
71298      x=file.c
71299      echo ${x%.c}.o
71300      file.o

```

```

71301  ${parameter%%word}
71302      x=posix/src/std
71303      echo ${x%%/*}
71304      posix

```

```

71305  ${parameter#word}
71306      x=$HOME/src/cmd
71307      echo ${x#$HOME}
71308      /src/cmd

```

```

71309  ${parameter##word}
71310      x=/one/two/three
71311      echo ${x##*/}
71312      three

```

The double-quoting of patterns is different depending on where the double-quotes are placed:

```

71313  " ${x#*} "   The asterisk is a pattern character.
71314  ${x#"*" }  The literal asterisk is quoted and not special.
71315

```

2.6.3 Command Substitution

Command substitution allows the output of a command to be substituted in place of the command name itself. Command substitution shall occur when the command is enclosed as follows:

```

71320  $(command)

```

or (backquoted version):

```

71322  `command`

```

The shell shall expand the command substitution by executing *command* in a subshell environment (see [Section 2.12](#), on page 2277) and replacing the command substitution (the text of *command* plus the enclosing "\$ ()" or backquotes) with the standard output of the command, removing sequences of one or more <newline>s at the end of the substitution. Embedded <newline>s before the end of the output shall not be removed; however, they may be treated as field delimiters and eliminated during field splitting, depending on the value of *IFS* and quoting

71329 that is in effect.

71330 Within the backquoted style of command substitution, backslash shall retain its literal meaning,
71331 except when followed by: '\$', '`', or '\`' (dollar sign, backquote, backslash). The search for
71332 the matching backquote shall be satisfied by the first unquoted non-escaped backquote; during
71333 this search, if a non-escaped backquote is encountered within a shell comment, a here-
71334 document, an embedded command substitution of the \$(*command*) form, or a quoted string,
71335 undefined results occur. A single-quoted or double-quoted string that begins, but does not end,
71336 within the "`...`" sequence produces undefined results.

71337 With the \$(*command*) form, all characters following the open parenthesis to the matching closing
71338 parenthesis constitute the *command*. Any valid shell script can be used for *command*, except a
71339 script consisting solely of redirections which produces unspecified results.

71340 The results of command substitution shall not be processed for further tilde expansion,
71341 parameter expansion, command substitution, or arithmetic expansion. If a command
71342 substitution occurs inside double-quotes, field splitting and pathname expansion shall not be
71343 performed on the results of the substitution.

71344 Command substitution can be nested. To specify nesting within the backquoted version, the
71345 application shall precede the inner backquotes with backslashes, for example:

```
71346 \ `command` `
```

71347 If the command substitution consists of a single subshell, such as:

```
71348 $( (command) )
```

71349 a conforming application shall separate the "\$(" and "(" into two tokens (that is, separate
71350 them with white space). This is required to avoid any ambiguities with arithmetic expansion.

71351 2.6.4 Arithmetic Expansion

71352 Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and
71353 substituting its value. The format for arithmetic expansion shall be as follows:

```
71354 $( (expression) )
```

71355 The expression shall be treated as if it were in double-quotes, except that a double-quote inside
71356 the expression is not treated specially. The shell shall expand all tokens in the expression for
71357 parameter expansion, command substitution, and quote removal.

71358 Next, the shell shall treat this as an arithmetic expression and substitute the value of the
71359 expression. The arithmetic expression shall be processed according to the rules given in [Section](#)
71360 [1.1.2.1](#) (on page 2231), with the following exceptions:

- 71361 • Only signed long integer arithmetic is required.
- 71362 • Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in
71363 the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- 71364 • The *sizeof*() operator and the prefix and postfix "++" and "--" operators are not required.
- 71365 • Selection, iteration, and jump statements are not supported.

71366 All changes to variables in an arithmetic expression shall be in effect after the arithmetic
71367 expansion, as in the parameter expansion "\${x=value}".

71368 If the shell variable *x* contains a value that forms a valid integer constant, then the arithmetic
71369 expansions "\$({x})" and "\$({\$x})" shall return the same value.

71370 As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell

71371 may use a signed integer type with a rank larger than the rank of **signed long**. The shell may
 71372 use a real-floating type instead of **signed long** as long as it does not affect the results in cases
 71373 where there is no overflow. If the expression is invalid, the expansion fails and the shell shall
 71374 write a message to standard error indicating the failure.

71375 Examples

71376 A simple example using arithmetic expansion:

```
71377 # repeat a command 100 times
71378 x=100
71379 while [ $x -gt 0 ]
71380 do
71381     command
71382     x=$(( $x-1 ))
71383 done
```

71384 2.6.5 Field Splitting

71385 After parameter expansion (Section 2.6.2, on page 2254), command substitution (Section 2.6.3, on
 71386 page 2256), and arithmetic expansion (Section 2.6.4, on page 2257), the shell shall scan the results
 71387 of expansions and substitutions that did not occur in double-quotes for field splitting and
 71388 multiple fields can result.

71389 The shell shall treat each character of the *IFS* as a delimiter and use the delimiters as field
 71390 terminators to split the results of parameter expansion and command substitution into fields.

- 71391 1. If the value of *IFS* is a <space>, <tab>, and <newline>, or if it is unset, any sequence of
 71392 <space>s, <tab>s, or <newline>s at the beginning or end of the input shall be ignored and
 71393 any sequence of those characters within the input shall delimit a field. For example, the
 71394 input:

```
71395 <newline><space><tab>foo<tab><tab>bar<space>
```

71396 yields two fields, **foo** and **bar**.

- 71397 2. If the value of *IFS* is null, no field splitting shall be performed.
- 71398 3. Otherwise, the following rules shall be applied in sequence. The term “*IFS* white space”
 71399 is used to mean any sequence (zero or more instances) of white space characters that are
 71400 in the *IFS* value (for example, if *IFS* contains <space>/<comma>/<tab>, any sequence of
 71401 <space>s and <tab>s is considered *IFS* white space).
 - 71402 a. *IFS* white space shall be ignored at the beginning and end of the input.
 - 71403 b. Each occurrence in the input of an *IFS* character that is not *IFS* white space, along
 71404 with any adjacent *IFS* white space, shall delimit a field, as described previously.
 - 71405 c. Non-zero-length *IFS* white space shall delimit a field.

71406 2.6.6 Pathname Expansion

71407 After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be
 71408 expanded using the algorithm described in [Section 2.13](#) (on page 2278), qualified by the rules in
 71409 [Section 2.13.3](#) (on page 2279).

71410 2.6.7 Quote Removal

71411 The quote characters: `'\'`, `'\''`, and `'\"'` (backslash, single-quote, double-quote) that were
 71412 present in the original word shall be removed unless they have themselves been quoted.

71413 2.7 Redirection

71414 Redirection is used to open and close files for the current shell execution environment (see
 71415 [Section 2.12](#), on page 2277) or for any command. Redirection operators can be used with
 71416 numbers representing file descriptors (see [XBD Section 3.165](#), on page 56) as described below.

71417 The overall format used for redirection is:

71418 `[n]redir-op word`

71419 The number *n* is an optional decimal number designating the file descriptor number; the
 71420 application shall ensure it is delimited from any preceding text and immediately precede the
 71421 redirection operator *redir-op*. If *n* is quoted, the number shall not be recognized as part of the
 71422 redirection expression. For example:

71423 `echo \2>a`

71424 writes the character 2 into file **a**. If any part of *redir-op* is quoted, no redirection expression is
 71425 recognized. For example:

71426 `echo 2\>a`

71427 writes the characters `2>a` to standard output. The optional number, redirection operator, and
 71428 *word* shall not appear in the arguments provided to the command to be executed (if any).

71429 Open files are represented by decimal numbers starting with zero. The largest possible value is
 71430 implementation-defined; however, all implementations shall support at least 0 to 9, inclusive, for
 71431 use by the application. These numbers are called "file descriptors". The values 0, 1, and 2 have
 71432 special meaning and conventional uses and are implied by certain redirection operations; they
 71433 are referred to as *standard input*, *standard output*, and *standard error*, respectively. Programs
 71434 usually take their input from standard input, and write output on standard output. Error
 71435 messages are usually written on standard error. The redirection operators can be preceded by
 71436 one or more digits (with no intervening <blank>s allowed) to designate the file descriptor
 71437 number.

71438 If the redirection operator is `"<<"` or `"<<-"`, the word that follows the redirection operator shall
 71439 be subjected to quote removal; it is unspecified whether any of the other expansions occur. For
 71440 the other redirection operators, the word that follows the redirection operator shall be subjected
 71441 to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and
 71442 quote removal. Pathname expansion shall not be performed on the word by a non-interactive
 71443 shell; an interactive shell may perform it, but shall do so only when the expansion would result
 71444 in one word.

71445 If more than one redirection operator is specified with a command, the order of evaluation is
 71446 from beginning to end.

71447 A failure to open or create a file shall cause a redirection to fail.

71448 2.7.1 Redirecting Input

71449 Input redirection shall cause the file whose name results from the expansion of *word* to be
71450 opened for reading on the designated file descriptor, or standard input if the file descriptor is
71451 not specified.

71452 The general format for redirecting input is:

71453 `[n]<word`

71454 where the optional *n* represents the file descriptor number. If the number is omitted, the
71455 redirection shall refer to standard input (file descriptor 0).

71456 2.7.2 Redirecting Output

71457 The two general formats for redirecting output are:

71458 `[n]>word`

71459 `[n]>|word`

71460 where the optional *n* represents the file descriptor number. If the number is omitted, the
71461 redirection shall refer to standard output (file descriptor 1).

71462 Output redirection using the '>' format shall fail if the *noclobber* option is set (see the
71463 description of *set -C*) and the file named by the expansion of *word* exists and is a regular file.
71464 Otherwise, redirection using the '>' or '>|' formats shall cause the file whose name results
71465 from the expansion of *word* to be created and opened for output on the designated file
71466 descriptor, or standard output if none is specified. If the file does not exist, it shall be created;
71467 otherwise, it shall be truncated to be an empty file after being opened.

71468 2.7.3 Appending Redirected Output

71469 Appended output redirection shall cause the file whose name results from the expansion of
71470 *word* to be opened for output on the designated file descriptor. The file is opened as if the *open()*
71471 function as defined in the System Interfaces volume of POSIX.1-200x was called with the
71472 *O_APPEND* flag. If the file does not exist, it shall be created.

71473 The general format for appending redirected output is as follows:

71474 `[n]>>word`

71475 where the optional *n* represents the file descriptor number. If the number is omitted, the
71476 redirection refers to standard output (file descriptor 1).

71477 2.7.4 Here-Document

71478 The redirection operators "<<" and "<<-" both allow redirection of lines contained in a shell
71479 input file, known as a "here-document", to the input of a command.

71480 The here-document shall be treated as a single word that begins after the next <newline> and
71481 continues until there is a line containing only the delimiter and a <newline>, with no <blank>s
71482 in between. Then the next here-document starts, if there is one. The format is as follows:

71483 `[n]<<word`

71484 `here-document`

71485 `delimiter`

71486 where the optional *n* represents the file descriptor number. If the number is omitted, the here-
71487 document refers to standard input (file descriptor 0).

71488 If any character in *word* is quoted, the delimiter shall be formed by performing quote removal on
 71489 *word*, and the here-document lines shall not be expanded. Otherwise, the delimiter shall be the
 71490 *word* itself.

71491 If no characters in *word* are quoted, all lines of the here-document shall be expanded for
 71492 parameter expansion, command substitution, and arithmetic expansion. In this case, the
 71493 backslash in the input behaves as the backslash inside double-quotes (see Section 2.2.3, on page
 71494 2246). However, the double-quote character (' " ') shall not be treated specially within a here-
 71495 document, except when the double-quote appears within "\$ ()", "` `", or "\$ { }".

71496 If the redirection symbol is "<<-", all leading <tab>s shall be stripped from input lines and the
 71497 line containing the trailing delimiter. If more than one "<<" or "<<-" operator is specified on a
 71498 line, the here-document associated with the first operator shall be supplied first by the
 71499 application and shall be read first by the shell.

71500 Examples

71501 An example of a here-document follows:

```
71502 cat <<eof1; cat <<eof2
71503 Hi,
71504 eof1
71505 Helene.
71506 eof2
```

71507 2.7.5 Duplicating an Input File Descriptor

71508 The redirection operator:

```
71509 [n]<&word
```

71510 shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one
 71511 or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be
 71512 made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a
 71513 file descriptor already open for input, a redirection error shall result; see Section 2.8.1 (on page
 71514 2262). If *word* evaluates to '-', file descriptor *n*, or standard input if *n* is not specified, shall be
 71515 closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word*
 71516 evaluates to something else, the behavior is unspecified.

71517 2.7.6 Duplicating an Output File Descriptor

71518 The redirection operator:

```
71519 [n]>&word
```

71520 shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to
 71521 one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall
 71522 be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent
 71523 a file descriptor already open for output, a redirection error shall result; see Section 2.8.1 (on
 71524 page 2262). If *word* evaluates to '-', file descriptor *n*, or standard output if *n* is not specified, is
 71525 closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word*
 71526 evaluates to something else, the behavior is unspecified.

71527 2.7.7 Open File Descriptors for Reading and Writing

71528 The redirection operator:

71529 `[n]<>word`

71530 shall cause the file whose name is the expansion of *word* to be opened for both reading and
71531 writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does
71532 not exist, it shall be created.

71533 2.8 Exit Status and Errors

71534 2.8.1 Consequences of Shell Errors

71535 For a non-interactive shell, an error condition encountered by a special built-in (see [Section 2.14](#),
71536 on page 2280) or other type of utility shall cause the shell to write a diagnostic message to
71537 standard error and exit as shown in the following table:

Error	Special Built-In	Other Utilities
Shell language syntax error	Shall exit	Shall exit
Utility syntax error (option or operand error)	Shall exit	Shall not exit
Redirection error	Shall exit	Shall not exit
Variable assignment error	Shall exit	Shall not exit
Expansion error	Shall exit	Shall exit
Command not found	N/A	May exit
Dot script not found	Shall exit	N/A

71546 An expansion error is one that occurs when the shell expansions defined in [Section 2.6](#) (on page
71547 2253) are carried out (for example, " `${x!y}` ", because `!` is not a valid operator); an
71548 implementation may treat these as syntax errors if it is able to detect them during tokenization,
71549 rather than during expansion.

71550 If any of the errors shown as "shall exit" or "(may) exit" occur in a subshell, the subshell shall
71551 (respectively may) exit with a non-zero status, but the script containing the subshell shall not
71552 exit because of the error.

71553 In all of the cases shown in the table, an interactive shell shall write a diagnostic message to
71554 standard error without exiting.

71555 2.8.2 Exit Status for Commands

71556 Each command has an exit status that can influence the behavior of other shell commands. The
71557 exit status of commands that are not utilities is documented in this section. The exit status of the
71558 standard utilities is documented in their respective sections.

71559 If a command is not found, the exit status shall be 127. If the command name is found, but it is
71560 not an executable utility, the exit status shall be 126. Applications that invoke utilities without
71561 using the shell should use these exit status values to report similar errors.

71562 If a command fails during word expansion or redirection, its exit status shall be greater than
71563 zero.

71564 Internally, for purposes of deciding whether a command exits with a non-zero exit status, the
71565 shell shall recognize the entire status value retrieved for the command by the equivalent of the

71566 *wait()* function WEXITSTATUS macro (as defined in the System Interfaces volume of
 71567 POSIX.1-200x). When reporting the exit status with the special parameter '??', the shell shall
 71568 report the full eight bits of exit status available. The exit status of a command that terminated
 71569 because it received a signal shall be reported as greater than 128.

71570 2.9 Shell Commands

71571 This section describes the basic structure of shell commands. The following command
 71572 descriptions each describe a format of the command that is only used to aid the reader in
 71573 recognizing the command type, and does not formally represent the syntax. Each description
 71574 discusses the semantics of the command; for a formal definition of the command language,
 71575 consult [Section 2.10](#) (on page 2271).

71576 A *command* is one of the following:

- 71577 • Simple command (see [Section 2.9.1](#))
- 71578 • Pipeline (see [Section 2.9.2](#), on page 2265)
- 71579 • List compound-list (see [Section 2.9.3](#), on page 2266)
- 71580 • Compound command (see [Section 2.9.4](#), on page 2268)
- 71581 • Function definition (see [Section 2.9.5](#), on page 2270)

71582 Unless otherwise stated, the exit status of a command shall be that of the last simple command
 71583 executed by the command. There shall be no limit on the size of any shell command other than
 71584 that imposed by the underlying system (memory constraints, {ARG_MAX}, and so on).

71585 2.9.1 Simple Commands

71586 A “simple command” is a sequence of optional variable assignments and redirections, in any
 71587 sequence, optionally followed by words and redirections, terminated by a control operator.

71588 When a given simple command is required to be executed (that is, when any conditional
 71589 construct such as an AND-OR list or a **case** statement has not bypassed the simple command),
 71590 the following expansions, assignments, and redirections shall all be performed from the
 71591 beginning of the command text to the end:

- 71592 1. The words that are recognized as variable assignments or redirections according to
 71593 [Section 2.10.2](#) (on page 2272) are saved for processing in steps 3 and 4.
- 71594 2. The words that are not variable assignments or redirections shall be expanded. If any
 71595 fields remain following their expansion, the first field shall be considered the command
 71596 name and remaining fields are the arguments for the command.
- 71597 3. Redirections shall be performed as described in [Section 2.7](#) (on page 2259).
- 71598 4. Each variable assignment shall be expanded for tilde expansion, parameter expansion,
 71599 command substitution, arithmetic expansion, and quote removal prior to assigning the
 71600 value.

71601 In the preceding list, the order of steps 3 and 4 may be reversed for the processing of special
 71602 built-in utilities; see [Section 2.14](#) (on page 2280).

71603 If no command name results, variable assignments shall affect the current execution
 71604 environment. Otherwise, the variable assignments shall be exported for the execution
 71605 environment of the command and shall not affect the current execution environment (except for
 71606 special built-ins). If any of the variable assignments attempt to assign a value to a read-only

71607 variable, a variable assignment error shall occur. See [Section 2.8.1](#) (on page 2262) for the
71608 consequences of these errors.

71609 If there is no command name, any redirections shall be performed in a subshell environment; it
71610 is unspecified whether this subshell environment is the same one as that used for a command
71611 substitution within the command. (To affect the current execution environment, see the *exec*
71612 special built-in.) If any of the redirections performed in the current shell execution environment
71613 fail, the command shall immediately fail with an exit status greater than zero, and the shell shall
71614 write an error message indicating the failure. See [Section 2.8.1](#) (on page 2262) for the
71615 consequences of these failures on interactive and non-interactive shells.

71616 If there is a command name, execution shall continue as described in [Section 2.9.1.1](#). If there is
71617 no command name, but the command contained a command substitution, the command shall
71618 complete with the exit status of the last command substitution performed. Otherwise, the
71619 command shall complete with a zero exit status.

71620 2.9.1.1 Command Search and Execution

71621 If a simple command results in a command name and an optional list of arguments, the
71622 following actions shall be performed:

71623 1. If the command name does not contain any slashes, the first successful step in the
71624 following sequence shall occur:

71625 a. If the command name matches the name of a special built-in utility, that special
71626 built-in utility shall be invoked.

71627 b. If the command name matches the name of a function known to this shell, the
71628 function shall be invoked as described in [Section 2.9.5](#) (on page 2270). If the
71629 implementation has provided a standard utility in the form of a function, it shall
71630 not be recognized at this point. It shall be invoked in conjunction with the path
71631 search in step 1d.

71632 c. If the command name matches the name of a utility listed in the following table,
71633 that utility shall be invoked.

71634	<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
71635	<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
71636	<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
71637	<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

71638 d. Otherwise, the command shall be searched for using the *PATH* environment
71639 variable as described in XBD [Chapter 8](#) (on page 159):

71640 i. If the search is successful:

71641 a. If the system has implemented the utility as a regular built-in or as a
71642 shell function, it shall be invoked at this point in the path search.

71643 b. Otherwise, the shell executes the utility in a separate utility
71644 environment (see [Section 2.12](#), on page 2277) with actions equivalent
71645 to calling the *execve()* function as defined in the System Interfaces
71646 volume of POSIX.1-200x with the *path* argument set to the pathname
71647 resulting from the search, *arg0* set to the command name, and the
71648 remaining arguments set to the operands, if any.

71649 If the *execve()* function fails due to an error equivalent to the
71650 [ENOEXEC] error defined in the System Interfaces volume of
71651 POSIX.1-200x, the shell shall execute a command equivalent to

71652 having a shell invoked with the pathname resulting from the search
 71653 as its first operand, with any remaining arguments passed to the new
 71654 shell, except that the value of "\$0" in the new shell may be set to the
 71655 command name. If the executable file is not a text file, the shell may
 71656 bypass this command execution. In this case, it shall write an error
 71657 message, and shall return an exit status of 126.

71658 Once a utility has been searched for and found (either as a result of this
 71659 specific search or as part of an unspecified shell start-up activity), an
 71660 implementation may remember its location and need not search for the
 71661 utility again unless the *PATH* variable has been the subject of an assignment.
 71662 If the remembered location fails for a subsequent invocation, the shell shall
 71663 repeat the search to find the new location for the utility, if any.

71664 ii. If the search is unsuccessful, the command shall fail with an exit status of
 71665 127 and the shell shall write an error message.

71666 2. If the command name contains at least one slash, the shell shall execute the utility in a
 71667 separate utility environment with actions equivalent to calling the *execve()* function
 71668 defined in the System Interfaces volume of POSIX.1-200x with the *path* and *arg0*
 71669 arguments set to the command name, and the remaining arguments set to the operands, if
 71670 any.

71671 If the *execve()* function fails due to an error equivalent to the [ENOEXEC] error, the shell
 71672 shall execute a command equivalent to having a shell invoked with the command name
 71673 as its first operand, with any remaining arguments passed to the new shell. If the
 71674 executable file is not a text file, the shell may bypass this command execution. In this case,
 71675 it shall write an error message and shall return an exit status of 126.

71676 2.9.2 Pipelines

71677 A *pipeline* is a sequence of one or more commands separated by the control operator '|'. The
 71678 standard output of all but the last command shall be connected to the standard input of the next
 71679 command.

71680 The format for a pipeline is:

71681 [!] *command1* [| *command2* . . .]

71682 The standard output of *command1* shall be connected to the standard input of *command2*. The
 71683 standard input, standard output, or both of a command shall be considered to be assigned by
 71684 the pipeline before any redirection specified by redirection operators that are part of the
 71685 command (see Section 2.7, on page 2259).

71686 If the pipeline is not in the background (see Section 2.9.3.1, on page 2266), the shell shall wait for
 71687 the last command specified in the pipeline to complete, and may also wait for all commands to
 71688 complete.

71689 Exit Status

71690 If the reserved word ! does not precede the pipeline, the exit status shall be the exit status of the
 71691 last command specified in the pipeline. Otherwise, the exit status shall be the logical NOT of the
 71692 exit status of the last command. That is, if the last command returns zero, the exit status shall be
 71693 1; if the last command returns greater than zero, the exit status shall be zero.

71694 **2.9.3 Lists**

71695 An *AND-OR list* is a sequence of one or more pipelines separated by the operators "&&" and
71696 "||".

71697 A *list* is a sequence of one or more AND-OR lists separated by the operators ';' and '&' and
71698 optionally terminated by ';&', '&', or <newline>.

71699 The operators "&&" and "||" shall have equal precedence and shall be evaluated with left
71700 associativity. For example, both of the following commands write solely **bar** to standard output:

```
71701 false && echo foo || echo bar
71702 true || echo foo && echo bar
```

71703 A ';' or <newline> terminator shall cause the preceding AND-OR list to be executed
71704 sequentially; an '&' shall cause asynchronous execution of the preceding AND-OR list.

71705 The term "compound-list" is derived from the grammar in [Section 2.10](#) (on page 2271); it is
71706 equivalent to a sequence of *lists*, separated by <newline>s, that can be preceded or followed by
71707 an arbitrary number of <newline>s.

71708 **Examples**

71709 The following is an example that illustrates <newline>s in compound-lists:

```
71710 while
71711     # a couple of <newline>s
71712     # a list
71713     date && who || ls; cat file
71714     # a couple of <newline>s
71715     # another list
71716     wc file > output & true
71717 do
71718     # 2 lists
71719     ls
71720     cat file
71721 done
```

71722 **2.9.3.1 Asynchronous Lists**

71723 If a command is terminated by the control operator ampersand ('&'), the shell shall execute the
71724 command asynchronously in a subshell. This means that the shell shall not wait for the
71725 command to finish before executing the next command.

71726 The format for running a command in the background is:

```
71727 command1 & [command2 & ... ]
```

71728 The standard input for an asynchronous list, before any explicit redirections are performed, shall
71729 be considered to be assigned to a file that has the same properties as **/dev/null**. If it is an
71730 interactive shell, this need not happen. In all cases, explicit redirection of standard input shall
71731 override this activity.

71732 When an element of an asynchronous list (the portion of the list ended by an ampersand, such as
71733 *command1*, above) is started by the shell, the process ID of the last command in the asynchronous
71734 list element shall become known in the current shell execution environment; see [Section 2.12](#) (on

71735 page 2277). This process ID shall remain known until:

- 71736 1. The command terminates and the application waits for the process ID.
- 71737 2. Another asynchronous list is invoked before "\$!" (corresponding to the previous
- 71738 asynchronous list) is expanded in the current execution environment.

71739 The implementation need not retain more than the {CHILD_MAX} most recent entries in its list

71740 of known process IDs in the current shell execution environment.

71741 **Exit Status**

71742 The exit status of an asynchronous list shall be zero.

71743 2.9.3.2 *Sequential Lists*

71744 Commands that are separated by a semicolon (';') shall be executed sequentially.

71745 The format for executing commands sequentially shall be:

71746 *command1* [; *command2*] . . .

71747 Each command shall be expanded and executed in the order specified.

71748 **Exit Status**

71749 The exit status of a sequential list shall be the exit status of the last command in the list.

71750 2.9.3.3 *AND Lists*

71751 The control operator "&&" denotes an AND list. The format shall be:

71752 *command1* [&& *command2*] . . .

71753 First *command1* shall be executed. If its exit status is zero, *command2* shall be executed, and so on,

71754 until a command has a non-zero exit status or there are no more commands left to execute. The

71755 commands are expanded only if they are executed.

71756 **Exit Status**

71757 The exit status of an AND list shall be the exit status of the last command that is executed in the

71758 list.

71759 2.9.3.4 *OR Lists*

71760 The control operator "||" denotes an OR List. The format shall be:

71761 *command1* [|| *command2*] . . .

71762 First, *command1* shall be executed. If its exit status is non-zero, *command2* shall be executed, and

71763 so on, until a command has a zero exit status or there are no more commands left to execute.

71764 **Exit Status**

71765 The exit status of an OR list shall be the exit status of the last command that is executed in the

71766 list.

71767 2.9.4 Compound Commands

71768 The shell has several programming constructs that are “compound commands”, which provide
 71769 control flow for commands. Each of these compound commands has a reserved word or control
 71770 operator at the beginning, and a corresponding terminator reserved word or operator at the end.
 71771 In addition, each can be followed by redirections on the same line as the terminator. Each
 71772 redirection shall apply to all the commands within the compound command that do not
 71773 explicitly override that redirection.

71774 2.9.4.1 Grouping Commands

71775 The format for grouping commands is as follows:

71776 (*compound-list*) Execute *compound-list* in a subshell environment; see [Section 2.12](#) (on page
 71777 2277). Variable assignments and built-in commands that affect the
 71778 environment shall not remain in effect after the list finishes.

71779 { *compound-list*;} Execute *compound-list* in the current process environment. The semicolon
 71780 shown here is an example of a control operator delimiting the } reserved
 71781 word. Other delimiters are possible, as shown in [Section 2.10](#) (on page
 71782 2271); a <newline> is frequently used.

71783 Exit Status

71784 The exit status of a grouping command shall be the exit status of *compound-list*.

71785 2.9.4.2 The for Loop

71786 The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for**
 71787 loop requires that the reserved words **do** and **done** be used to delimit the sequence of
 71788 commands.

71789 The format for the **for** loop is as follows:

```
71790 for name [ in [word ... ] ]
71791 do
71792     compound-list
71793 done
```

71794 First, the list of words following **in** shall be expanded to generate a list of items. Then, the
 71795 variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no
 71796 items result from the expansion, the *compound-list* shall not be executed. Omitting:

71797 **in** *word*...

71798 shall be equivalent to:

71799 **in** "\$@"

71800 Exit Status

71801 The exit status of a **for** command shall be the exit status of the last command that executes. If
 71802 there are no items, the exit status shall be zero.

71803 2.9.4.3 Case Conditional Construct

71804 The conditional construct **case** shall execute the *compound-list* corresponding to the first one of
 71805 several *patterns* (see Section 2.13, on page 2278) that is matched by the string resulting from the
 71806 tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote
 71807 removal of the given word. The reserved word **in** shall denote the beginning of the patterns to
 71808 be matched. Multiple patterns with the same *compound-list* shall be delimited by the '|'
 71809 symbol. The control operator ')' terminates a list of patterns corresponding to a given action.
 71810 The *compound-list* for each list of patterns, with the possible exception of the last, shall be
 71811 terminated with ";;". The **case** construct terminates with the reserved word **esac** (**case**
 71812 reversed).

71813 The format for the **case** construct is as follows:

```
71814 case word in
71815     [(]pattern1) compound-list;;
71816     [(]pattern[ | pattern] ... ) compound-list;;] ...
71817     [(]pattern[ | pattern] ... ) compound-list]
71818 esac
```

71819 The " ; " is optional for the last *compound-list*.

71820 In order from the beginning to the end of the **case** statement, each *pattern* that labels a *compound-*
 71821 *list* shall be subjected to tilde expansion, parameter expansion, command substitution, and
 71822 arithmetic expansion, and the result of these expansions shall be compared against the
 71823 expansion of *word*, according to the rules described in Section 2.13 (on page 2278) (which also
 71824 describes the effect of quoting parts of the pattern). After the first match, no more patterns shall
 71825 be expanded, and the *compound-list* shall be executed. The order of expansion and comparison of
 71826 multiple *patterns* that label a *compound-list* statement is unspecified.

71827 **Exit Status**

71828 The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be
 71829 the exit status of the last command executed in the *compound-list*.

71830 2.9.4.4 The if Conditional Construct

71831 The **if** command shall execute a *compound-list* and use its exit status to determine whether to
 71832 execute another *compound-list*.

71833 The format for the **if** construct is as follows:

```
71834 if compound-list
71835 then
71836     compound-list
71837 [elif compound-list
71838 then
71839     compound-list] ...
71840 [else
71841     compound-list]
71842 fi
```

71843 The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be
 71844 executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed,
 71845 in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command
 71846 shall complete. Otherwise, the **else** *compound-list* shall be executed.

71847 **Exit Status**

71848 The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that
71849 was executed, or zero, if none was executed.

71850 2.9.4.5 *The while Loop*

71851 The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has
71852 a zero exit status.

71853 The format of the **while** loop is as follows:

```
71854 while compound-list-1
71855 do
71856     compound-list-2
71857 done
```

71858 The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command
71859 shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

71860 **Exit Status**

71861 The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or
71862 zero if none was executed.

71863 2.9.4.6 *The until Loop*

71864 The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has
71865 a non-zero exit status.

71866 The format of the **until** loop is as follows:

```
71867 until compound-list-1
71868 do
71869     compound-list-2
71870 done
```

71871 The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command
71872 completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

71873 **Exit Status**

71874 The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or
71875 zero if none was executed.

71876 **2.9.5 Function Definition Command**

71877 A function is a user-defined name that is used as a simple command to call a compound
71878 command with new positional parameters. A function is defined with a “function definition
71879 command”.

71880 The format of a function definition command is as follows:

```
71881 fname ( ) compound-command [io-redirect ...]
```

71882 The function is named *fname*; the application shall ensure that it is a name (see XBD [Section](#)
71883 [3.229](#), on page 65). An implementation may allow other characters in a function name as an
71884 extension. The implementation shall maintain separate name spaces for functions and variables.

71885 The argument *compound-command* represents a compound command, as described in [Section](#)
71886 [2.9.4](#) (on page 2268).

71887 When the function is declared, none of the expansions in [Section 2.6](#) (on page 2253) shall be
 71888 performed on the text in *compound-command* or *io-redirect*; all expansions shall be performed as
 71889 normal each time the function is called. Similarly, the optional *io-redirect* redirections and any
 71890 variable assignments within *compound-command* shall be performed during the execution of the
 71891 function itself, not the function definition. See [Section 2.8.1](#) (on page 2262) for the consequences
 71892 of failures of these operations on interactive and non-interactive shells.

71893 When a function is executed, it shall have the syntax-error and variable-assignment properties
 71894 described for special built-in utilities in the enumerated list at the beginning of [Section 2.14](#) (on
 71895 page 2280).

71896 The *compound-command* shall be executed whenever the function name is specified as the name
 71897 of a simple command (see [Section 2.9.1.1](#), on page 2264). The operands to the command
 71898 temporarily shall become the positional parameters during the execution of the *compound-*
 71899 *command*; the special parameter '#' also shall be changed to reflect the number of operands.
 71900 The special parameter 0 shall be unchanged. When the function completes, the values of the
 71901 positional parameters and the special parameter '#' shall be restored to the values they had
 71902 before the function was executed. If the special built-in *return* is executed in the *compound-*
 71903 *command*, the function completes and execution shall resume with the next command after the
 71904 function call.

71905 **Exit Status**

71906 The exit status of a function definition shall be zero if the function was declared successfully;
 71907 otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit
 71908 status of the last command executed by the function.

71909 **2.10 Shell Grammar**

71910 The following grammar defines the Shell Command Language. This formal syntax shall take
 71911 precedence over the preceding text syntax description.

71912 **2.10.1 Shell Grammar Lexical Conventions**

71913 The input language to the shell must be first recognized at the character level. The resulting
 71914 tokens shall be classified by their immediate context according to the following rules (applied in
 71915 order). These rules shall be used to determine what a "token" is that is subject to parsing at the
 71916 token level. The rules for token recognition in [Section 2.3](#) (on page 2247) shall apply.

- 71917 1. A <newline> shall be returned as the token identifier **NEWLINE**.
- 71918 2. If the token is an operator, the token identifier for that operator shall result.
- 71919 3. If the string consists solely of digits and the delimiter character is one of '<' or '>', the
 71920 token identifier **IO_NUMBER** shall be returned.
- 71921 4. Otherwise, the token identifier **TOKEN** results.

71922 Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields
 71923 **WORD**, a **NAME**, an **ASSIGNMENT**, or one of the reserved words below, dependent upon the
 71924 context. Some of the productions in the grammar below are annotated with a rule number from
 71925 the following list. When a **TOKEN** is seen where one of those annotated productions could be
 71926 used to reduce the symbol, the applicable rule shall be applied to convert the token identifier
 71927 type of the **TOKEN** to a token identifier acceptable at that point in the grammar. The reduction
 71928 shall then proceed based upon the token identifier type yielded by the rule applied. When more
 71929 than one rule applies, the highest numbered rule shall apply (which in turn may refer to another

71930 rule). (Note that except in rule 7, the presence of an ' = ' in the token has no effect.)

71931 The **WORD** tokens shall have the word expansion rules applied to them immediately before the
71932 associated command is executed, not at the time the command is parsed.

71933 2.10.2 Shell Grammar Rules

71934 1. [Command Name]

71935 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word
71936 shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any
71937 state where only a reserved word could be the next correct token, proceed as above.

71938 **Note:** Because at this point quote marks are retained in the token, quoted strings cannot be
71939 recognized as reserved words. This rule also implies that reserved words are not
71940 recognized except in certain positions in the input, such as after a <newline> or
71941 semicolon; the grammar presumes that if the reserved word is intended, it is properly
71942 delimited by the user, and does not attempt to reflect that requirement directly. Also
71943 note that line joining is done before tokenization, as described in Section 2.2.1 (on page
71944 2246), so escaped <newline>s are already removed at this point.

71945 Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or
71946 applies globally.

71947 2. [Redirection to or from filename]

71948 The expansions specified in Section 2.7 (on page 2259) shall occur. As specified there,
71949 exactly one field can result (or the result is unspecified), and there are additional
71950 requirements on pathname expansion.

71951 3. [Redirection from here-document]

71952 Quote removal shall be applied to the word to determine the delimiter that is used to find
71953 the end of the here-document that begins after the next <newline>.

71954 4. [Case statement termination]

71955 When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall
71956 result. Otherwise, the token **WORD** shall be returned.

71957 5. [NAME in for]

71958 When the **TOKEN** meets the requirements for a name (see XBD Section 3.229, on page
71959 65), the token identifier **NAME** shall result. Otherwise, the token **WORD** shall be
71960 returned.

71961 6. [Third word of for and case]

71962 a. [case only]

71963 When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall
71964 result. Otherwise, the token **WORD** shall be returned.

71965 b. [for only]

71966 When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in**
71967 or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.

71968 (For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If
71969 <newline>s are present at the indicated location, it is the token after them that is treated
71970 in this fashion.)

- 71971 7. [Assignment preceding command name]
- 71972 a. [When the first word]
- 71973 If the **TOKEN** does not contain the character '=' , rule 1 is applied. Otherwise, 7b
- 71974 shall be applied.
- 71975 b. [Not the first word]
- 71976 If the **TOKEN** contains the equal sign character:
- 71977 — If it begins with '=' , the token **WORD** shall be returned.
- 71978 — If all the characters preceding '=' form a valid name (see XBD Section 3.229, |
- 71979 on page 65), the token **ASSIGNMENT_WORD** shall be returned. (Quoted
- 71980 characters cannot participate in forming a valid name.)
- 71981 — Otherwise, it is unspecified whether it is **ASSIGNMENT_WORD** or **WORD**
- 71982 that is returned.

71983 Assignment to the **NAME** shall occur as specified in Section 2.9.1 (on page 2263).

- 71984 8. [**NAME** in function]
- 71985 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word
- 71986 shall result. Otherwise, when the **TOKEN** meets the requirements for a name, the token
- 71987 identifier **NAME** shall result. Otherwise, rule 7 applies.

- 71988 9. [Body of function]
- 71989 Word expansion and assignment shall never occur, even when required by the rules
- 71990 above, when this rule is being parsed. Each **TOKEN** that might either be expanded or
- 71991 have assignment applied to it shall instead be returned as a single **WORD** consisting only
- 71992 of characters that are exactly the token described in Section 2.3 (on page 2247).

2.11 Signals and Error Handling

72176

72177

72178

72179

72180

72181

When a command is in an asynchronous list, it shall inherit from the shell a signal action of ignored (SIG_IGN) for the SIGQUIT and SIGINT signals, and may inherit a signal mask in which SIGQUIT and SIGINT are blocked. Otherwise, the signal actions and signal mask inherited by the command shall be the same as those inherited by the shell from its parent unless a signal action is modified by the *trap* special built-in (see *trap*)

72182

72183

72184

72185

72186

72187

When a signal for which a trap has been set is received while the shell is waiting for the completion of a utility executing a foreground command, the trap associated with that signal shall not be executed until after the foreground command has completed. When the shell is waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit status >128, immediately after which the trap associated with that signal shall be taken.

72188

72189

If multiple signals are pending for the shell for which there are associated trap actions, the order of execution of trap actions is unspecified.

2.12 Shell Execution Environment

72190

72191

72192

72193

72194

72195

72196

72197

72198

72199

72200

72201

72202

72203

A shell execution environment consists of the following:

- Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- Working directory as set by *cd*
- File creation mask set by *umask*
- Current traps set by *trap*
- Shell parameters that are set by variable assignment (see the *set* special built-in) or from the System Interfaces volume of POSIX.1-200x environment inherited by the shell when it begins (see the *export* special built-in)
- Shell functions; see [Section 2.9.5](#) (on page 2270)
- Options turned on at invocation or by *set*
- Process IDs of the last commands in asynchronous lists known to this shell environment; see [Section 2.9.3.1](#) (on page 2266)
- Shell aliases; see [Section 2.3.1](#) (on page 2248)

72204

72205

72206

Utilities other than the special built-ins (see [Section 2.14](#), on page 2280) shall be invoked in a separate environment that consists of the following. The initial value of these objects shall be the same as that for the parent shell, except as noted below.

72207

72208

- Open files inherited on invocation of the shell, open files controlled by the *exec* special built-in plus any modifications, and additions specified by any redirections to the utility

- 72209 • Current working directory
- 72210 • File creation mask
- 72211 • If the utility is a shell script, traps caught by the shell shall be set to the default values and
- 72212 traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell
- 72213 script, the trap actions (default or ignore) shall be mapped into the appropriate signal
- 72214 handling actions for the utility
- 72215 • Variables with the *export* attribute, along with those explicitly exported for the duration of
- 72216 the command, shall be passed to the utility environment variables

72217 The environment of the shell process shall not be changed by the utility unless explicitly
72218 specified by the utility description (for example, *cd* and *umask*).

72219 A subshell environment shall be created as a duplicate of the shell environment, except that
72220 signal traps set by that shell environment shall be set to the default values. Changes made to the
72221 subshell environment shall not affect the shell environment. Command substitution, commands
72222 that are grouped with parentheses, and asynchronous lists shall be executed in a subshell
72223 environment. Additionally, each command of a multi-command pipeline is in a subshell
72224 environment; as an extension, however, any or all commands in a pipeline may be executed in
72225 the current environment. All other commands shall be executed in the current shell
72226 environment.

72227 2.13 Pattern Matching Notation

72228 The pattern matching notation described in this section is used to specify patterns for matching
72229 strings in the shell. Historically, pattern matching notation is related to, but slightly different
72230 from, the regular expression notation described in XBD [Chapter 9](#) (on page 167). For this reason,
72231 the description of the rules for this pattern matching notation are based on the description of
72232 regular expression notation, modified to include backslash escape processing.

72233 2.13.1 Patterns Matching a Single Character

72234 The following patterns matching a single character shall match a single character: ordinary
72235 characters, special pattern characters, and pattern bracket expressions. The pattern bracket
72236 expression also shall match a single collating element. A backslash character shall escape the
72237 following character. The escaping backslash shall be discarded.

72238 An ordinary character is a pattern that shall match itself. It can be any character in the supported
72239 character set except for NUL, those special shell characters in [Section 2.2](#) (on page 2246) that
72240 require quoting, and the following three special pattern characters. Matching shall be based on
72241 the bit pattern used for encoding the character, not on the graphic representation of the
72242 character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern shall
72243 match the character itself. The shell special characters always require quoting.

72244 When unquoted and outside a bracket expression, the following three characters shall have
72245 special meaning in the specification of patterns:

- 72246 ? A question-mark is a pattern that shall match any character.
- 72247 * An asterisk is a pattern that shall match multiple characters, as described in [Section 2.13.2](#)
72248 (on page 2279).
- 72249 [The open bracket shall introduce a pattern bracket expression.

72250 The description of basic regular expression bracket expressions in XBD [Section 9.3.5](#) (on page
72251 170) shall also apply to the pattern bracket expression, except that the exclamation mark

72252 character (' ! ') shall replace the circumflex character (' ^ ') in its role in a “non-matching list” in
 72253 the regular expression notation. A bracket expression starting with an unquoted circumflex
 72254 character produces unspecified results.

72255 When pattern matching is used where shell quote removal is not performed (such as in the
 72256 argument to the *find -name* primary when *find* is being called using one of the *exec* functions as
 72257 defined in the System Interfaces volume of POSIX.1-200x, or in the *pattern* argument to the
 72258 *fnmatch()* function), special characters can be escaped to remove their special meaning by
 72259 preceding them with a backslash character. This escaping backslash is discarded. The sequence
 72260 " \ " represents one literal backslash. All of the requirements and effects of quoting on ordinary,
 72261 shell special, and special pattern characters shall apply to escaping in this context.

72262 2.13.2 Patterns Matching Multiple Characters

72263 The following rules are used to construct patterns matching multiple characters from patterns
 72264 matching a single character:

- 72265 1. The asterisk (' * ') is a pattern that shall match any string, including the null string.
- 72266 2. The concatenation of patterns matching a single character is a valid pattern that shall
 72267 match the concatenation of the single characters or collating elements matched by each of
 72268 the concatenated patterns.
- 72269 3. The concatenation of one or more patterns matching a single character with one or more
 72270 asterisks is a valid pattern. In such patterns, each asterisk shall match a string of zero or
 72271 more characters, matching the greatest possible number of characters that still allows the
 72272 remainder of the pattern to match the string.

72273 2.13.3 Patterns Used for Filename Expansion

72274 The rules described so far in [Section 2.13.1](#) (on page 2278) and [Section 2.13.2](#) are qualified by the
 72275 following rules that apply when pattern matching notation is used for filename expansion:

- 72276 1. The slash character in a pathname shall be explicitly matched by using one or more
 72277 slashes in the pattern; it shall neither be matched by the asterisk or question-mark special
 72278 characters nor by a bracket expression. Slashes in the pattern shall be identified before
 72279 bracket expressions; thus, a slash cannot be included in a pattern bracket expression used
 72280 for filename expansion. If a slash character is found following an unescaped open square
 72281 bracket character before a corresponding closing square bracket is found, the open
 72282 bracket shall be treated as an ordinary character. For example, the pattern "a[b/c]d"
 72283 does not match such pathnames as **abd** or **a/d**. It only matches a pathname of literally
 72284 **a[b/c]d**.
- 72285 2. If a filename begins with a period (' . '), the period shall be explicitly matched by using a
 72286 period as the first character of the pattern or immediately following a slash character. The
 72287 leading period shall not be matched by:
 - 72288 • The asterisk or question-mark special characters
 - 72289 • A bracket expression containing a non-matching list, such as "[!a]", a range
 72290 expression, such as "[%-0]", or a character class expression, such as
 72291 "[[:punct:]]"

72292 It is unspecified whether an explicit period in a bracket expression matching list, such as
 72293 "[.abc]", can match a leading period in a filename.

72294 3. Specified patterns shall be matched against existing filenames and pathnames, as
 72295 appropriate. Each component that contains a pattern character shall require read
 72296 permission in the directory containing that component. Any component, except the last,
 72297 that does not contain a pattern character shall require search permission. For example,
 72298 given the pattern:

72299 `/foo/bar/x*/bam`

72300 search permission is needed for directories `/` and `foo`, search and read permissions are
 72301 needed for directory `bar`, and search permission is needed for each `x*` directory. If the
 72302 pattern matches any existing filenames or pathnames, the pattern shall be replaced with
 72303 those filenames and pathnames, sorted according to the collating sequence in effect in the
 72304 current locale. If the pattern contains an invalid bracket expression or does not match any
 72305 existing filenames or pathnames, the pattern string shall be left unchanged.

72306 2.14 Special Built-In Utilities

72307 The following “special built-in” utilities shall be supported in the shell command language. The
 72308 output of each command, if any, shall be written to standard output, subject to the normal
 72309 redirection and piping possible with all commands.

72310 The term “built-in” implies that the shell can execute the utility directly and does not need to
 72311 search for it. An implementation may choose to make any utility a built-in; however, the special
 72312 built-in utilities described here differ from regular built-in utilities in two respects:

- 72313 1. A syntax error in a special built-in utility may cause a shell executing that utility to abort,
 72314 while a syntax error in a regular built-in utility shall not cause a shell executing that
 72315 utility to abort. (See [Section 2.8.1](#) (on page 2262) for the consequences of errors on
 72316 interactive and non-interactive shells.) If a special built-in utility encountering a syntax
 72317 error does not abort the shell, its exit value shall be non-zero.
- 72318 2. Variable assignments specified with special built-in utilities remain in effect after the
 72319 built-in completes; this shall not be the case with a regular built-in or other utility.

72320 The special built-in utilities in this section need not be provided in a manner accessible via the
 72321 `exec` family of functions defined in the System Interfaces volume of POSIX.1-200x.

72322 Some of the special built-ins are described as conforming to XBD [Section 12.2](#) (on page 201). For
 72323 those that are not, the requirement in [Section 1.4](#) (on page 2235) that “--” be recognized as a
 72324 first argument to be discarded does not apply and a conforming application shall not use that
 72325 argument.

72326 **NAME**

72327 `break` — exit from `for`, `while`, or `until` loop

72328 **SYNOPSIS**

72329 `break` [*n*]

72330 **DESCRIPTION**

72331 The *break* utility shall exit from the smallest enclosing **for**, **while**, or **until** loop, if any; or from

72332 the *n*th enclosing loop if *n* is specified. The value of *n* is an unsigned decimal integer greater

72333 than or equal to 1. The default shall be equivalent to *n*=1. If *n* is greater than the number of

72334 enclosing loops, the outermost enclosing loop shall be exited. Execution shall continue with the

72335 command immediately following the loop.

72336 **OPTIONS**

72337 None.

72338 **OPERANDS**

72339 See the DESCRIPTION.

72340 **STDIN**

72341 Not used.

72342 **INPUT FILES**

72343 None.

72344 **ENVIRONMENT VARIABLES**

72345 None.

72346 **ASYNCHRONOUS EVENTS**

72347 Default.

72348 **STDOUT**

72349 Not used.

72350 **STDERR**

72351 The standard error shall be used only for diagnostic messages.

72352 **OUTPUT FILES**

72353 None.

72354 **EXTENDED DESCRIPTION**

72355 None.

72356 **EXIT STATUS**

72357 0 Successful completion.

72358 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.

72359 **CONSEQUENCES OF ERRORS**

72360 Default.

break72361 **APPLICATION USAGE**

72362 None.

72363 **EXAMPLES**

```
72364     for i in *
72365     do
72366         if test -d "$i"
72367         then break
72368         fi
72369     done
```

72370 **RATIONALE**

72371 In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer
 72372 to a label associated with the appropriate loop as a preferable alternative to the *n* method.
 72373 However, this volume of POSIX.1-200x does reserve the name space of command names ending
 72374 with a colon. It is anticipated that a future implementation could take advantage of this and
 72375 provide something like:

```
72376 outofloop: for i in a b c d e
72377 do
72378     for j in 0 1 2 3 4 5 6 7 8 9
72379     do
72380         if test -r "${i}${j}"
72381         then break outofloop
72382         fi
72383     done
72384 done
```

72385 and that this might be standardized after implementation experience is achieved.

72386 **FUTURE DIRECTIONS**

72387 None.

72388 **SEE ALSO**72389 [Section 2.14](#) (on page 2280)72390 **CHANGE HISTORY**72391 **Issue 6**

72392 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 72393 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
 72394 behavior is intended.

72395 **NAME**

72396 colon — null utility

72397 **SYNOPSIS**72398 : [*argument...*]72399 **DESCRIPTION**72400 This utility shall only expand command *arguments*. It is used when a command is needed, as in
72401 the **then** condition of an **if** command, but nothing is to be done by the command.72402 **OPTIONS**

72403 None.

72404 **OPERANDS**

72405 See the DESCRIPTION.

72406 **STDIN**

72407 Not used.

72408 **INPUT FILES**

72409 None.

72410 **ENVIRONMENT VARIABLES**

72411 None.

72412 **ASYNCHRONOUS EVENTS**

72413 Default.

72414 **STDOUT**

72415 Not used.

72416 **STDERR**

72417 The standard error shall be used only for diagnostic messages.

72418 **OUTPUT FILES**

72419 None.

72420 **EXTENDED DESCRIPTION**

72421 None.

72422 **EXIT STATUS**

72423 Zero.

72424 **CONSEQUENCES OF ERRORS**

72425 Default.

72426 **APPLICATION USAGE**

72427 None.

72428 **EXAMPLES**

```

72429 : ${X=abc}
72430 if     false
72431 then  :
72432 else  echo $X
72433 fi
72434 abc

```

72435 As with any of the special built-ins, the null utility can also have variable assignments and
 72436 redirections associated with it, such as:

```

72437 x=y : > z

```

colon*Shell Command Language*

72438 which sets variable *x* to the value *y* (so that it persists after the null utility completes) and creates
72439 or truncates file *z*.

DRAFT

- 72453 **NAME**
- 72454 continue — continue for, while, or until loop
- 72455 **SYNOPSIS**
- 72456 continue [*n*]
- 72457 **DESCRIPTION**
- 72458 The *continue* utility shall return to the top of the smallest enclosing **for**, **while**, or **until** loop, or to
- 72459 the top of the *n*th enclosing loop, if *n* is specified. This involves repeating the condition list of a
- 72460 **while** or **until** loop or performing the next assignment of a **for** loop, and re-executing the loop if
- 72461 appropriate.
- 72462 The value of *n* is a decimal integer greater than or equal to 1. The default shall be equivalent to
- 72463 *n*=1. If *n* is greater than the number of enclosing loops, the outermost enclosing loop shall be
- 72464 used.
- 72465 **OPTIONS**
- 72466 None.
- 72467 **OPERANDS**
- 72468 See the DESCRIPTION.

72511	NAME
72512	dot — execute commands in the current environment
72513	SYNOPSIS
72514	. <i>file</i>
72515	DESCRIPTION
72516	The shell shall execute commands from the <i>file</i> in the current environment.
72517	If <i>file</i> does not contain a slash, the shell shall use the search path specified by <i>PATH</i> to find the
72518	directory containing <i>file</i> . Unlike normal command search, however, the file searched for by the
72519	<i>dot</i> utility need not be executable. If no readable file is found, a non-interactive shell shall abort;
72520	an interactive shell shall write a diagnostic message to standard error, but this condition shall
72521	not be considered a syntax error.
72522	OPTIONS
72523	None.
72524	OPERANDS
72525	See the DESCRIPTION.
72526	STDIN
72527	Not used.
72528	INPUT FILES
72529	See the DESCRIPTION.
72530	ENVIRONMENT VARIABLES
72531	See the DESCRIPTION.
72532	ASYNCHRONOUS EVENTS
72533	Default.
72534	STDOUT
72535	Not used.
72536	STDERR
72537	The standard error shall be used only for diagnostic messages.
72538	OUTPUT FILES
72539	None.
72540	EXTENDED DESCRIPTION
72541	None.
72542	EXIT STATUS
72543	Returns the value of the last command executed, or a zero exit status if no command is executed.
72544	CONSEQUENCES OF ERRORS
72545	Default.

72546 **APPLICATION USAGE**

72547 None.

72548 **EXAMPLES**72549 `cat foobar`72550 `foo=hello bar=world`72551 `. foobar`72552 `echo $foo $bar`72553 `hello world`72554 **RATIONALE**

72555 Some older implementations searched the current directory for the *file*, even if the value of *PATH*
72556 disallowed it. This behavior was omitted from this volume of POSIX.1-200x due to concerns
72557 about introducing the susceptibility to trojan horses that the user might be trying to avoid by
72558 leaving **dot** out of *PATH*.

72559 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.
72560 This is a valid extension that allows a *dot* script to behave identically to a function.

72561 **FUTURE DIRECTIONS**

72562 None.

72563 **SEE ALSO**72564 [Section 2.14](#) (on page 2280)72565 **CHANGE HISTORY**72566 **Issue 6**

72567 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
72568 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
72569 behavior is intended.

72570 **NAME**

72571 eval — construct command by concatenating arguments

72572 **SYNOPSIS**

72573 eval [*argument...*]

72574 **DESCRIPTION**

72575 The *eval* utility shall construct a command by concatenating *arguments* together, separating each

72576 with a <space>. The constructed command shall be read and executed by the shell.

72577 **OPTIONS**

72578 None.

72579 **OPERANDS**

72580 See the DESCRIPTION.

72581 **STDIN**

72582 Not used.

72583 **INPUT FILES**

72584 None.

72585 **ENVIRONMENT VARIABLES**

72586 None.

72587 **ASYNCHRONOUS EVENTS**

72588 Default.

72589 **STDOUT**

72590 Not used.

72591 **STDERR**

72592 The standard error shall be used only for diagnostic messages.

72593 **OUTPUT FILES**

72594 None.

72595 **EXTENDED DESCRIPTION**

72596 None.

72597 **EXIT STATUS**

72598 If there are no *arguments*, or only null arguments, *eval* shall return a zero exit status; otherwise, it

72599 shall return the exit status of the command defined by the string of concatenated *arguments*

72600 separated by <space>s.

72601 **CONSEQUENCES OF ERRORS**

72602 Default.

72603 **APPLICATION USAGE**

72604 None.

72605 **EXAMPLES**

72606 foo=10 x=foo

72607 y=' '\$x

72608 echo \$y

72609 **\$foo**

72610 eval y=' '\$x

72611 echo \$y

Issue 6

72621

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

72622

72623

72624

Issue 7

72625

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

72626 **NAME**
 72627 `exec` — execute commands and open, close, or copy file descriptors

72628 **SYNOPSIS**
 72629 `exec [command [argument...]]`

72630 **DESCRIPTION**
 72631 The `exec` utility shall open, close, and/or copy file descriptors as specified by any redirections as
 72632 part of the command.

72633 If `exec` is specified without `command` or `arguments`, and any file descriptors with numbers greater
 72634 than 2 are opened with associated redirection statements, it is unspecified whether those file
 72635 descriptors remain open when the shell invokes another utility. Scripts concerned that child
 72636 shells could misuse open file descriptors can always close them explicitly, as shown in one of the
 72637 following examples.

72638 If `exec` is specified with `command`, it shall replace the shell with `command` without creating a new
 72639 process. If `arguments` are specified, they shall be arguments to `command`. Redirection affects the
 72640 current shell execution environment.

72641 **OPTIONS**
 72642 None.

72643 **OPERANDS**
 72644 See the DESCRIPTION.

72645 **STDIN**
 72646 Not used.

72647 **INPUT FILES**
 72648 None.

72649 **ENVIRONMENT VARIABLES**
 72650 None.

72651 **ASYNCHRONOUS EVENTS**
 72652 Default.

72653 **STDOUT**
 72654 Not used.

72655 **STDERR**
 72656 The standard error shall be used only for diagnostic messages.

72657 **OUTPUT FILES**
 72658 None.

72659 **EXTENDED DESCRIPTION**
 72660 None.

72661 **EXIT STATUS**
 72662 If `command` is specified, `exec` shall not return to the shell; rather, the exit status of the process shall
 72663 be the exit status of the program implementing `command`, which overlaid the shell. If `command` is
 72664 not found, the exit status shall be 127. If `command` is found, but it is not an executable utility, the
 72665 exit status shall be 126. If a redirection error occurs (see [Section 2.8.1](#), on page 2262), the shell
 72666 shall exit with a value in the range 1–125. Otherwise, `exec` shall return a zero exit status.

72667 **CONSEQUENCES OF ERRORS**

72668 Default.

72669 **APPLICATION USAGE**

72670 None.

72671 **EXAMPLES**72672 Open *readfile* as file descriptor 3 for reading:72673 `exec 3< readfile`72674 Open *writefile* as file descriptor 4 for writing:72675 `exec 4> writefile`

72676 Make file descriptor 5 a copy of file descriptor 0:

72677 `exec 5<&0`

72678 Close file descriptor 3:

72679 `exec 3<&-`72680 Cat the file **maggie** by replacing the current shell with the *cat* utility:72681 `exec cat maggie`72682 **RATIONALE**

72683 Most historical implementations were not conformant in that:

72684 `foo=bar exec cmd`72685 did not pass **foo** to **cmd**.72686 **FUTURE DIRECTIONS**

72687 None.

72688 **SEE ALSO**72689 [Section 2.14](#) (on page 2280)72690 **CHANGE HISTORY**72691 **Issue 6**72692 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
72693 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
72694 behavior is intended.72695 **Issue 7**

72696 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

72697 **NAME**

72698 exit — cause the shell to exit

72699 **SYNOPSIS**72700 exit [*n*]72701 **DESCRIPTION**

72702 The *exit* utility shall cause the shell to exit with the exit status specified by the unsigned decimal
 72703 integer *n*. If *n* is specified, but its value is not between 0 and 255 inclusively, the exit status is
 72704 undefined.

72705 A *trap* on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is
 72706 invoked in that *trap* itself, in which case the shell shall exit immediately.

72707 **OPTIONS**

72708 None.

72709 **OPERANDS**

72710 See the DESCRIPTION.

72711 **STDIN**

72712 Not used.

72713 **INPUT FILES**

72714 None.

72715 **ENVIRONMENT VARIABLES**

72716 None.

72717 **ASYNCHRONOUS EVENTS**

72718 Default.

72719 **STDOUT**

72720 Not used.

72721 **STDERR**

72722 The standard error shall be used only for diagnostic messages.

72723 **OUTPUT FILES**

72724 None.

72725 **EXTENDED DESCRIPTION**

72726 None.

72727 **EXIT STATUS**

72728 The exit status shall be *n*, if specified. Otherwise, the value shall be the exit value of the last
 72729 command executed, or zero if no command was executed. When *exit* is executed in a *trap* action,
 72730 the last command is considered to be the command that executed immediately preceding the
 72731 *trap* action.

72732 **CONSEQUENCES OF ERRORS**

72733 Default.

72734

APPLICATION USAGE

72735

None.

72736

EXAMPLES

72737

Exit with a *true* value:

72738

`exit 0`

72739

Exit with a *false* value:

72740

`exit 1`

72741

RATIONALE

72742

As explained in other sections, certain exit status values have been reserved for special uses and should be used by applications only for those purposes:

72743

72744

126 A file to be executed was found, but it was not an executable utility.

72745

127 A utility to be executed was not found.

72746

>128 A command was interrupted by a signal.

72747

FUTURE DIRECTIONS

72748

None.

72749

CHANGE HISTORY

72752

Issue 6

72753

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

72754

72755

72756 **NAME**
 72757 export — set the export attribute for variables

72758 **SYNOPSIS**
 72759 export name[=word] . . .

72760 export -p

72761 **DESCRIPTION**

72762 The shell shall give the *export* attribute to the variables corresponding to the specified *names*,
 72763 which shall cause them to be in the environment of subsequently executed commands. If the
 72764 name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.

72765 The *export* special built-in shall support XBD [Section 12.2](#) (on page 201).

72766 When **-p** is specified, *export* shall write to the standard output the names and values of all
 72767 exported variables, in the following format:

72768 "export %s=%s\n", <name>, <value>

72769 if *name* is set, and:

72770 "export %s\n", <name>

72771 if *name* is unset.

72772 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 72773 reinput to the shell as commands that achieve the same exporting results, except:

- 72774 1. Read-only variables with values cannot be reset.
 72775 2. Variables that were unset at the time they were output need not be reset to the unset state
 72776 if a value is assigned to the variable between the time the state was saved and the time at
 72777 which the saved output is reinput to the shell.

72778 When no arguments are given, the results are unspecified.

72779 **OPTIONS**
 72780 See the DESCRIPTION.

72781 **OPERANDS**
 72782 See the DESCRIPTION.

72783 **STDIN**
 72784 Not used.

72785 **INPUT FILES**
 72786 None.

72787 **ENVIRONMENT VARIABLES**
 72788 None.

72789 **ASYNCHRONOUS EVENTS**
 72790 Default.

72791 **STDOUT**
 72792 See the DESCRIPTION.

export

72793 **STDERR**
 72794 The standard error shall be used only for diagnostic messages.

72795 **OUTPUT FILES**
 72796 None.

72797 **EXTENDED DESCRIPTION**
 72798 None.

72799 **EXIT STATUS**
 72800 Zero.

72801 **CONSEQUENCES OF ERRORS**
 72802 Default.

72803 **APPLICATION USAGE**
 72804 None.

72805 **EXAMPLES**
 72806 Export *PWD* and *HOME* variables:
 72807 `export PWD HOME`
 72808 Set and export the *PATH* variable:
 72809 `export PATH=/local/bin:$PATH`
 72810 Save and restore all exported variables:
 72811 `export -p > temp-file`
 72812 `unset a lot of variables`
 72813 `... processing`
 72814 `. temp-file`

72815 **RATIONALE**
 72816 Some historical shells use the no-argument case as the functional equivalent of what is required
 72817 here with `-p`. This feature was left unspecified because it is not historical practice in all shells,
 72818 and some scripts may rely on the now-unspecified results on their implementations. Attempts to
 72819 specify the `-p` output as the default case were unsuccessful in achieving consensus. The `-p`
 72820 option was added to allow portable access to the values that can be saved and then later restored
 72821 using; for example, a *dot* script.

72822 **FUTURE DIRECTIONS**
 72823 None.

72824 **SEE ALSO**
 72825 [Section 2.14](#) (on page 2280)
 72826 XBD [Section 12.2](#) (on page 201)

CHANGE HISTORY

72827 **Issue 6**
 72828 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.
 72829
 72830 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 72831 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
 72832 behavior is intended.
 72833
 72834 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to
 72835 the end of the first paragraph of the DESCRIPTION: "If the name of a variable is followed by
 72836 `=word`, then the value of that variable shall be set to *word*.". The reason for this change is that the
 SYNOPSIS for *export* includes:

72837 `export name[=word]...`
72838 but the meaning of the optional “=word” is never explained in the text.

72839 **NAME**
 72840 `readonly` — set the readonly attribute for variables

72841 **SYNOPSIS**
 72842 `readonly name[=word]. . .`

72843 `readonly -p`

72844 **DESCRIPTION**

72845 The variables whose *names* are specified shall be given the *readonly* attribute. The values of
 72846 variables with the *readonly* attribute cannot be changed by subsequent assignment, nor can those
 72847 variables be unset by the *unset* utility. If the name of a variable is followed by *=word*, then the
 72848 value of that variable shall be set to *word*.

72849 The *readonly* special built-in shall support XBD [Section 12.2](#) (on page 201).

72850 When `-p` is specified, *readonly* writes to the standard output the names and values of all read-
 72851 only variables, in the following format:

72852 `"readonly %s=%s\n", <name>, <value>`

72853 if *name* is set, and

72854 `"readonly %s\n", <name>`

72855 if *name* is unset.

72856 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 72857 reinput to the shell as commands that achieve the same value and *readonly* attribute-setting
 72858 results in a shell execution environment in which:

- 72859 1. Variables with values at the time they were output do not have the *readonly* attribute set.
 72860 2. Variables that were unset at the time they were output do not have a value at the time at
 72861 which the saved output is reinput to the shell.

72862 When no arguments are given, the results are unspecified.

72863 **OPTIONS**

72864 See the DESCRIPTION.

72865 **OPERANDS**

72866 See the DESCRIPTION.

72867 **STDIN**

72868 Not used.

72869 **INPUT FILES**

72870 None.

72871 **ENVIRONMENT VARIABLES**

72872 None.

72873 **ASYNCHRONOUS EVENTS**

72874 Default.

72875 **STDOUT**

72876 See the DESCRIPTION.

72877 **STDERR**
 72878 The standard error shall be used only for diagnostic messages.

72879 **OUTPUT FILES**
 72880 None.

72881 **EXTENDED DESCRIPTION**
 72882 None.

72883 **EXIT STATUS**
 72884 Zero.

72885 **CONSEQUENCES OF ERRORS**
 72886 Default.

72887 **APPLICATION USAGE**
 72888 None.

72889 **EXAMPLES**
 72890 `readonly HOME PWD`

72891 **RATIONALE**
 72892 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of
 72893 POSIX.1-200x allows this behavior, but does not require it.

72894 The `-p` option allows portable access to the values that can be saved and then later restored
 72895 using, for example, a *dot* script. Also see the RATIONALE for *export* (on page 2295) for a
 72896 description of the no-argument and `-p` output cases and a related example.

72897 Read-only functions were considered, but they were omitted as not being historical practice or
 72898 particularly useful. Furthermore, functions must not be read-only across invocations to preclude
 72899 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-
 72900 known utility with the intent of subverting the real intent of the user) of administrative or
 72901 security-relevant (or security-conscious) shell scripts.

72902 **FUTURE DIRECTIONS**
 72903 None.

72904 **SEE ALSO**
 72905 [Section 2.14](#) (on page 2280)
 72906 XBD [Section 12.2](#) (on page 201)

72907 **CHANGE HISTORY**

72908 **Issue 6**
 72909 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.
 72910 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 72911 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
 72912 behavior is intended.
 72913 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to
 72914 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by
 72915 `=word`, then the value of that variable shall be set to *word*.”. The reason for this change is that the
 72916 SYNOPSIS for *readonly* includes:
 72917 `readonly name[=word] . . .`
 72918 but the meaning of the optional “`=word`” is never explained in the text.

return*Shell Command Language*72919 **NAME**

72920 return — return from a function

72921 **SYNOPSIS**72922 return [*n*]72923 **DESCRIPTION**72924 The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the
72925 shell is not currently executing a function or *dot* script, the results are unspecified.72926 **OPTIONS**

72927 None.

72928 **OPERANDS**

72929 See the DESCRIPTION.

72930 **STDIN**

72931 Not used.

72932 **INPUT FILES**

72933 None.

72934 **ENVIRONMENT VARIABLES**

72935 None.

72936 **ASYNCHRONOUS EVENTS**

72937 Default.

72938 **STDOUT**

72939 Not used.

72940 **STDERR**

72941 The standard error shall be used only for diagnostic messages.

72942 **OUTPUT FILES**

72943 None.

72944 **EXTENDED DESCRIPTION**

72945 None.

72946 **EXIT STATUS**72947 The value of the special parameter '*?*' shall be set to *n*, an unsigned decimal integer, or to the
72948 exit status of the last command executed if *n* is not specified. If the value of *n* is greater than 255,
72949 the results are undefined. When *return* is executed in a *trap* action, the last command is
72950 considered to be the command that executed immediately preceding the *trap* action.72951 **CONSEQUENCES OF ERRORS**

72952 Default.

72953 **APPLICATION USAGE**

72954 None.

72955 **EXAMPLES**

72956 None.

72957 **RATIONALE**72958 The behavior of *return* when not in a function or *dot* script differs between the System V shell
72959 and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is
72960 the same as *exit*.

72961 The results of returning a number greater than 255 are undefined because of differing practices

72962 in the various historical implementations. Some shells AND out all but the low-order 8 bits;
72963 others allow larger values, but not of unlimited size.

72964 See the discussion of appropriate exit status values under *exit* (on page 2293).

72965 FUTURE DIRECTIONS

72966 None.

72967 SEE ALSO

72968 [Section 2.14](#) (on page 2280)

72969 CHANGE HISTORY

72970 Issue 6

72971 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
72972 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
72973 behavior is intended.

NAME

set — set or unset options and positional parameters

SYNOPSIS

XSI set [-abCefmnuvx] [-h] [-o *option*] [*argument...*]

XSI set [+abCefmnuvx] [+h] [+o *option*] [*argument...*]

set -- [*argument...*]

set -o

set +o

DESCRIPTION

If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables in the collation sequence of the current locale. Each *name* shall start on a separate line, using the format:

```
"%s=%s\n", <name>, <value>
```

The *value* string shall be written with appropriate quoting; see the description of shell quoting in [Section 2.2](#) (on page 2246). The output shall be suitable for reinput to the shell, setting or resetting, as far as possible, the variables that are currently set; read-only variables cannot be reset.

When options are specified, they shall set or unset attributes of the shell, as described below. When *arguments* are specified, they cause positional parameters to be set or unset, as described below. Setting or unsetting attributes and positional parameters are not necessarily related actions, but they can be combined in a single invocation of *set*.

The *set* special built-in shall support XBD [Section 12.2](#) (on page 201) except that options can be specified with either a leading hyphen (meaning enable the option) or plus sign (meaning disable it) unless otherwise specified.

Implementations shall support the options in the following list in both their hyphen and plus-sign forms. These options can also be specified as options to *sh*.

-a When this option is on, the *export* attribute shall be set for each variable to which an assignment is performed; see XBD [Section 4.22](#) (on page 106). If the assignment precedes a utility name in a command, the *export* attribute shall not persist in the current execution environment after the utility completes, with the exception that preceding one of the special built-in utilities causes the *export* attribute to persist after the built-in has completed. If the assignment does not precede a utility name in the command, or if the assignment is a result of the operation of the *getopts* or *read* utilities, the *export* attribute shall persist until the variable is unset.

-b This option shall be supported if the implementation supports the User Portability Utilities option. It shall cause the shell to notify the user asynchronously of background job completions. The following message is written to standard error:

```
"[%d]%c %s%s\n", <job-number>, <current>, <status>, <job-name>
```

where the fields shall be as follows:

<i><current></i>	The character '+' identifies the job that would be used as a default for the <i>fg</i> or <i>bg</i> utilities; this job can also be specified using the <i>job_id</i> "%+" or "%%". The character '-' identifies the job that would become the default if the current default job were to exit; this job can also be specified using the <i>job_id</i> "%-". For other jobs, this field is a <space>. At most one job
------------------------	---

- 73018 can be identified with '+' and at most one job can be identified with '-'.
 73019 If there is any suspended job, then the current job shall be a suspended
 73020 job. If there are at least two suspended jobs, then the previous job also
 73021 shall be a suspended job.
- 73022 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*,
 73023 and *kill* utilities. Using these utilities, the job can be identified by prefixing
 73024 the job number with '% '.
- 73025 <status> Unspecified.
- 73026 <job-name> Unspecified.
- 73027 When the shell notifies the user a job has been completed, it may remove the job's process
 73028 ID from the list of those known in the current shell execution environment; see [Section](#)
 73029 [2.9.3.1](#) (on page 2266). Asynchronous notification shall not be enabled by default.
- 73030 -C (Uppercase C.) Prevent existing files from being overwritten by the shell's '>' redirection
 73031 operator (see [Section 2.7.2](#), on page 2260); the ">|" redirection operator shall override this
 73032 *noclobber* option for an individual file.
- 73033 -e When this option is on, if a simple command fails for any of the reasons listed in [Section](#)
 73034 [2.8.1](#) (on page 2262) or returns an exit status value >0, and is not part of the compound list
 73035 following a **while**, **until**, or **if** keyword, and is not a part of an AND or OR list, and is not a
 73036 pipeline preceded by the ! reserved word, then the shell shall immediately exit.
- 73037 -f The shell shall disable pathname expansion.
- 73038 XSI -h Locate and remember utilities invoked by functions as those functions are defined (the
 73039 utilities are normally located when the function is executed).
- 73040 -m This option shall be supported if the implementation supports the User Portability Utilities
 73041 option. All jobs shall be run in their own process groups. Immediately before the shell issues
 73042 a prompt after completion of the background job, a message reporting the exit status of the
 73043 background job shall be written to standard error. If a foreground job stops, the shell shall
 73044 write a message to standard error to that effect, formatted as described by the *jobs* utility. In
 73045 addition, if a job changes status other than exiting (for example, if it stops for input or
 73046 output or is stopped by a SIGSTOP signal), the shell shall write a similar message
 73047 immediately prior to writing the next prompt. This option is enabled by default for
 73048 interactive shells.
- 73049 -n The shell shall read commands but does not execute them; this can be used to check for
 73050 shell script syntax errors. An interactive shell may ignore this option.
- 73051 -o Write the current settings of the options to standard output in an unspecified format.
- 73052 +o Write the current option settings to standard output in a format that is suitable for reinput
 73053 to the shell as commands that achieve the same options settings.
- 73054 -o *option*
 73055 This option is supported if the system supports the User Portability Utilities option. It shall
 73056 set various options, many of which shall be equivalent to the single option letters. The
 73057 following values of *option* shall be supported:
- 73058 *allexport* Equivalent to -a.
- 73059 *errexit* Equivalent to -e.
- 73060 *ignoreeof* Prevent an interactive shell from exiting on end-of-file. This setting prevents
 73061 accidental logouts when <control>-D is entered. A user shall explicitly *exit* to
 73062 leave the interactive shell.

set*Shell Command Language*

73063	<i>monitor</i>	Equivalent to -m . This option is supported if the system supports the User Portability Utilities option.
73064		
73065	<i>noclobber</i>	Equivalent to -C (uppercase C).
73066	<i>noglob</i>	Equivalent to -f .
73067	<i>noexec</i>	Equivalent to -n .
73068	<i>nolog</i>	Prevent the entry of function definitions into the command history; see Command History List (on page 3078).
73069		
73070	<i>notify</i>	Equivalent to -b .
73071	<i>nounset</i>	Equivalent to -u .
73072	<i>verbose</i>	Equivalent to -v .
73073	<i>vi</i>	Allow shell command line editing using the built-in <i>vi</i> editor. Enabling <i>vi</i> mode shall disable any other command line editing mode provided as an implementation extension.
73074		
73075		
73076		It need not be possible to set <i>vi</i> mode on for certain block-mode terminals.
73077	<i>xtrace</i>	Equivalent to -x .
73078	-u	The shell shall write a message to standard error when it tries to expand a variable that is not set and immediately exit. An interactive shell shall not exit.
73079		
73080	-v	The shell shall write its input to standard error as it is read.
73081	-x	The shell shall write to standard error a trace for each command after it expands the command and before it executes it. It is unspecified whether the command that turns tracing off is traced.
73082		
73083		
73084		The default for all these options shall be off (unset) unless stated otherwise in the description of the option or unless the shell was invoked with them on; see <i>sh</i> .
73085		
73086		The remaining arguments shall be assigned in order to the positional parameters. The special parameter '# ' shall be set to reflect the number of positional parameters. All positional parameters shall be unset before any new values are assigned.
73087		
73088		
73089		If the first argument is '- ', the results are unspecified.
73090		The special argument "--" immediately following the <i>set</i> command name can be used to delimit the arguments if the first argument begins with '+' or '-', or to prevent inadvertent listing of all shell variables when there are no arguments. The command <i>set --</i> without <i>argument</i> shall unset all positional parameters and set the special parameter '# ' to zero.
73091		
73092		
73093

73119 None.

73120 **EXAMPLES**

73121 Write out all variables and their values:

73122 `set`

73123 Set \$1, \$2, and \$3 and set "\$#" to 3:

73124 `set c a b`73125 Turn on the `-x` and `-v` options:73126 `set -xv`

73127 Unset all positional parameters:

73128 `set --`73129 Set \$1 to the value of `x`, even if it begins with `'-'` or `'+'`:73130 `set -- "$x"`73131 Set the positional parameters to the expansion of `x`, even if `x` expands with a leading `'-'` or `'+'`:73132 `set -- $x`73133 **RATIONALE**

73134 The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the
 73135 Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether
 73136 the `set --` form might be misinterpreted as being equivalent to `set` without any options or
 73137 arguments. The functionality of this form has been adopted from the KornShell. In System V, `set`
 73138 `--` only unsets parameters if there is at least one argument; the only way to unset all parameters
 73139 is to use `shift`. Using the KornShell version should not affect System V scripts because there
 73140 should be no reason to issue it without arguments deliberately; if it were issued as, for example:

73141 `set -- "$@"`

73142 and there were in fact no arguments resulting from `"$@"`, unsetting the parameters would have
 73143 no result.

73144 The *set +* form in early proposals was omitted as being an unnecessary duplication of *set* alone
 73145 and not widespread historical practice.

73146 The *noclobber* option was changed to allow *set -C* as well as the *set -o noclobber* option. The
 73147 single-letter version was added so that the historical "\$-" paradigm would not be broken; see
 73148 [Section 2.5.2](#) (on page 2250).

73149 The *-h* flag is related to command name hashing and is only required on XSI-conformant
 73150 systems.

73151 The following *set* flags were omitted intentionally with the following rationale:

73152 **-k** The *-k* flag was originally added by the author of the Bourne shell to make it easier for
 73153 users of pre-release versions of the shell. In early versions of the Bourne shell the construct
 73154 *set name=value* had to be used to assign values to shell variables. The problem with *-k* is
 73155 that the behavior affects parsing, virtually precluding writing any compilers. To explain the
 73156 behavior of *-k*, it is necessary to describe the parsing algorithm, which is implementation-
 73157 defined. For example:

```
73158     set -k; echo name=value
```

73159 and:

```
73160     set -k
73161     echo name=value
```

73162 behave differently. The interaction with functions is even more complex. What is more, the
 73163 *-k* flag is never needed, since the command line could have been reordered.

73164 **-t** The *-t* flag is hard to specify and almost never used. The only known use could be done
 73165 with here-documents. Moreover, the behavior with *ksh* and *sh* differs. The reference page
 73166 says that it exits after reading and executing one command. What is one command? If the
 73167 input is *date;date*, *sh* executes both *date* commands while *ksh* does only the first.

73168 Consideration was given to rewriting *set* to simplify its confusing syntax. A specific suggestion
 73169 was that the *unset* utility should be used to unset options instead of using the non-*getopt*(-)-able
 73170 *+option* syntax. However, the conclusion was reached that the historical practice of using *+option*
 73171 was satisfactory and that there was no compelling reason to modify such widespread historical
 73172 practice.

73173 The *-o* option was adopted from the KornShell to address user needs. In addition to its
 73174 generally friendly interface, *-o* is needed to provide the *vi* command line editing mode, for
 73175 which historical practice yields no single-letter option name. (Although it might have been
 73176 possible to invent such a letter, it was recognized that other editing modes would be developed
 73177 and *-o* provides ample name space for describing such extensions.)

73178 Historical implementations are inconsistent in the format used for *-o* option status reporting.
 73179 The *+o* format without an option-argument was added to allow portable access to the options
 73180 that can be saved and then later restored using, for instance, a dot script.

73181 Historically, *sh* did trace the command *set +x*, but *ksh* did not.

73182 The *ignoreeof* setting prevents accidental logouts when the end-of-file character (typically
 73183 <control>-D) is entered. A user shall explicitly *exit* to leave the interactive shell.

73184 The *set -m* option was added to apply only to the UPE because it applies primarily to interactive
 73185 use, not shell script applications.

73186 The ability to do asynchronous notification became available in the 1988 version of the
 73187 KornShell. To have it occur, the user had to issue the command:

```
73188     trap "jobs -n" CLD
```

73189 The C shell provides two different levels of an asynchronous notification capability. The
 73190 environment variable *notify* is analogous to what is done in *set -b* or *set -o notify*. When *set*, it
 73191 notifies the user immediately of background job completions. When *unset*, this capability is
 73192 turned off.

73193 The other notification ability comes through the built-in utility *notify*. The syntax is:

```
73194 notify [%job ... ]
```

73195 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when
 73196 the state of the current job changes. If given operands, *notify* asynchronously informs the user of
 73197 changes in the states of the specified jobs.

73198 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,
 73199 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX
 73200 environment variable name).

73201 The *set -b* option was selected as a compromise.

73202 The *notify* built-in was considered to have more functionality than was required for simple
 73203 asynchronous notification.

73204 FUTURE DIRECTIONS

73205 None.

73209 CHANGE HISTORY

73210 Issue 6

73211 The obsolescent *set* command name followed by ‘-’ has been removed.

73212 The following new requirements on POSIX implementations derive from alignment with the
 73213 Single UNIX Specification:

- 73214 • The *nolog* option is added to *set -o*.

73215 IEEE PASC Interpretation 1003.2 #167 is applied, clarifying that the options default also takes
 73216 into account the description of the option.

73217 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 73218 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
 73219 behavior is intended.

73220 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/8 is applied, changing the square
 73221 brackets in the example in RATIONALE to be in bold, which is the typeface used for optional
 73222 items.

73223 Issue 7

73224 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first
 73225 argument is ‘-’.

73226 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

shift73227 **NAME**

73228 shift — shift positional parameters

73229 **SYNOPSIS**73230 shift [*n*]73231 **DESCRIPTION**

73232 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of
 73233 parameter (1+*n*), parameter 2 shall be assigned the value of parameter (2+*n*), and so on. The
 73234 parameters represented by the numbers "\$#" down to "\$#-*n*+1" shall be unset, and the
 73235 parameter '#' is updated to reflect the new number of positional parameters.

73236 The value *n* shall be an unsigned decimal integer less than or equal to the value of the special
 73237 parameter '#'. If *n* is not given, it shall be assumed to be 1. If *n* is 0, the positional and special
 73238 parameters are not changed.

73239 **OPTIONS**

73240 None.

73241 **OPERANDS**

CHANGE HISTORY**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in behavior is intended.

73281 **NAME**73282 `times` — write process times73283 **SYNOPSIS**73284 `times`73285 **DESCRIPTION**73286 The `times` utility shall write the accumulated user and system times for the shell and for all of its
73287 child processes, in the following POSIX locale format:

```
73288 "%dm%fs %dm%fs\n%dm%fs %dm%fs\n", <shell user minutes>,
73289 <shell user seconds>, <shell system minutes>,
73290 <shell system seconds>, <children user minutes>,
73291 <children user seconds>, <children system minutes>,
73292 <children system seconds>
```

73293 The four pairs of times shall correspond to the members of the `<sys/times.h>` `tms` structure |
73294 (defined in XBD [Chapter 13](#), on page 205) as returned by `times()`: `tms_utime`, `tms_stime`,
73295 `tms_cutime`, and `tms_cstime`, respectively.

73296 **OPTIONS**

73297 None.

73298 **OPERANDS**

CHANGE HISTORY**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/9 is applied, changing text in the DESCRIPTION from: "Write the accumulated user and system times for the shell and for all of its child processes ..." to: "The *times* utility shall write the accumulated user and system times for the shell and for all of its child processes ...".

73340 **NAME**

73341 trap — trap signals

73342 **SYNOPSIS**73343 trap *n* [*condition...*] +73344 trap [*action condition...*]73345 **DESCRIPTION**

73346 If the first operand is an unsigned decimal integer, the shell shall treat all operands as +
 73347 conditions, and shall reset each condition to the default value. Otherwise, if there are operands, +
 73348 the first is treated as an action and the remaining as conditions. +

73349 If *action* is '-', the shell shall reset each *condition* to the default value. If *action* is null (" "), the
 73350 shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read
 73351 and executed by the shell when one of the corresponding conditions arises. The action of *trap*
 73352 shall override a previous action (either default action or one explicitly set). The value of "\$?"
 73353 after the *trap* action completes shall be the value it had before *trap* was invoked.

73354 The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name,
 73355 without the SIG prefix, as listed in the tables of signal names in the <signal.h> header defined in |
 73356 XBD Chapter 13 (on page 205); for example, HUP, INT, QUIT, TERM. Implementations may |
 73357 permit names with the SIG prefix or ignore case in signal names as an extension. Setting a trap |
 73358 for SIGKILL or SIGSTOP produces undefined results.

73359 The environment in which the shell executes a *trap* on EXIT shall be identical to the environment
 73360 immediately after the last command executed before the *trap* on EXIT was taken.

73361 Each time *trap* is invoked, the *action* argument shall be processed in a manner equivalent to:

73362 eval *action*

73363 Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although
 73364 no error need be reported when attempting to do so. An interactive shell may reset or catch
 73365 signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed
 73366 with another *trap* command.

73367 When a subshell is entered, traps that are not being ignored are set to the default actions. This
 73368 does not imply that the *trap* command cannot be used within the subshell to set new traps.

73369 The *trap* command with no arguments shall write to standard output a list of commands
 73370 associated with each condition. The format shall be:

73371 "trap -- %s %s ... \n", <action>, <condition> ...

73372 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 73373 reinput to the shell as commands that achieve the same trapping results. For example:

73374 save_traps=\$(trap)

73375 ...

73376 eval "\$save_traps"

73377 XSI
 73378 XSI-conformant systems also allow numeric signal numbers for the conditions corresponding to
 the following signal names:

73379 1 SIGHUP

73380 2 SIGINT

73381	3	SIGQUIT
73382	6	SIGABRT
73383	9	SIGKILL
73384	14	SIGALRM
73385	15	SIGTERM

73386 The *trap* special built-in shall conform to XBD [Section 12.2](#) (on page 201).

73387 OPTIONS

73388 None.

73389 OPERANDS

73390 See the DESCRIPTION.

73391 STDIN

73392 Not used.

73393 INPUT FILES

73394 None.

73395 ENVIRONMENT VARIABLES

73396 None.

73397 ASYNCHRONOUS EVENTS

73398 Default.

73399 STDOUT

73400 See the DESCRIPTION.

73401 STDERR

73402 The standard error shall be used only for diagnostic messages.

73403 OUTPUT FILES

73404 None.

73405 EXTENDED DESCRIPTION

73406 None.

73407 EXIT STATUS

73408 XSI If the trap name **or number** is invalid, a non-zero exit status shall be returned; otherwise, zero
 73409 XSI shall be returned. For both interactive and non-interactive shells, invalid signal names **or**
 73410 **numbers** shall not be considered a syntax error and do not cause the shell to abort.

73411 CONSEQUENCES OF ERRORS

73412 Default.

73413 APPLICATION USAGE

73414 None.

73415 EXAMPLES

73416 Write out a list of all traps and actions:

73417 trap

73418 Set a trap so the *logout* utility in the directory referred to by the *HOME* environment variable
 73419 executes when the shell terminates:

73420 trap '\$HOME/logout' EXIT

73421 or:

73422 trap '\$HOME/logout' 0

73423 Unset traps on INT, QUIT, TERM, and EXIT:

73424 trap - INT QUIT TERM EXIT

73425 RATIONALE

73426 Implementations may permit lowercase signal names as an extension. Implementations may
73427 also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill*
73428 utilities in this volume of POSIX.1-200x are now consistent in their omission of the SIG prefix for
73429 signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the signals
73430 without prefixes.

73431 Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but
73432 it has no effect. Portable POSIX applications cannot attempt to trap these signals.

73433 The output format is not historical practice. Since the output of historical *trap* commands is not
73434 portable (because numeric signal values are not portable) and had to change to become so, an
73435 opportunity was taken to format the output in a way that a shell script could use to save and
73436 then later reuse a trap if it wanted.

73437 The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is
73438 allowable as an extension, but was not mandated, as other shells have not used it.

73439 The text about the environment for the EXIT trap invalidates the behavior of some historical
73440 versions of interactive shells which, for example, close the standard input before executing a
73441 trap on 0. For example, in some historical interactive shell sessions the following trap on 0
73442 would always print "--":

73443 trap 'read foo; echo "--\$foo--"' 0

73444 The command:

73445 trap '\$cmd' 0

73446 causes the contents of the shell variable *cmd* to be executed as a command when the shell exits. +
73447 Using double-quotes instead of single-quotes might have unexpected behavior, since in theory +
73448 the value of *cmd* might be a decimal integer which would be treated as a condition, not an +
73449 action; or *cmd* might begin with '-'. Also, using double-quotes will cause the value of *cmd* to be +
73450 expanded twice, once when *trap* is executed, and once when the condition arises.

73451 FUTURE DIRECTIONS

73452 None.

73453 SEE ALSO

73456 CHANGE HISTORY

73457 Issue 6

73458 XSI-conforming implementations provide the mapping of signal names to numbers given above
73459 (previously this had been marked obsolescent). Other implementations need not provide this
73460 optional mapping.

73461 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
73462 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
73463 behavior is intended.

73464

Issue 7

73465

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

73466

Austin Group Interpretation 1003.1-2001 #116 is applied.

+

73467 **NAME**
 73468 `unset` — unset values and attributes of variables and functions

73469 **SYNOPSIS**
 73470 `unset [-fv] name...`

73471 **DESCRIPTION**
 73472 Each variable or function specified by *name* shall be unset.
 73473 If `-v` is specified, *name* refers to a variable name and the shell shall unset it and remove it from
 73474 the environment. Read-only variables cannot be unset.
 73475 If `-f` is specified, *name* refers to a function and the shell shall unset the function definition.
 73476 If neither `-f` nor `-v` is specified, *name* refers to a variable; if a variable by that name does not
 73477 exist, it is unspecified whether a function by that name, if any, shall be unset.
 73478 Unsetting a variable or function that was not previously set shall not be considered an error and
 73479 does not cause the shell to abort.

73480 The *unset* special built-in shall support XBD [Section 12.2](#) (on page 201).

73481 Note that:

73482 `VARIABLE=`

73483 is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to " ". Also, the
 73484 variables that can be *unset* should not be misinterpreted to include the special parameters (see
 73485 [Section 2.5.2](#), on page 2250).

73486 **OPTIONS**
 73487 See the DESCRIPTION.

73488 **OPERANDS**
 73489 See the DESCRIPTION.

73490 **STDIN**
 73491 Not used.

73492 **INPUT FILES**
 73493 None.

73494 **ENVIRONMENT VARIABLES**
 73495 None.

73496 **ASYNCHRONOUS EVENTS**
 73497 Default.

73498 **STDOUT**
 73499 Not used.

73500 **STDERR**
 73501 The standard error shall be used only for diagnostic messages.

73502 **OUTPUT FILES**
 73503 None.

73504 **EXTENDED DESCRIPTION**
 73505 None.

73506 **EXIT STATUS**73507 0 All *name* operands were successfully unset.73508 >0 At least one *name* could not be unset.73509 **CONSEQUENCES OF ERRORS**

73510 Default.

73511 **APPLICATION USAGE**

73512 None.

73513 **EXAMPLES**73514 Unset *VISUAL* variable:

73515 unset -v VISUAL

73516 Unset the functions **foo** and **bar**:

73517 unset -f foo bar

73518 **RATIONALE**73519 Consideration was given to omitting the `-f` option in favor of an *unfunction* utility, but the
73520 standard developers decided to retain historical practice.73521 The `-v` option was introduced because System V historically used one name space for both
73522 variables and functions. When *unset* is used without options, System V historically unset either a
73523 function or a variable, and there was no confusion about which one was intended. A portable
73524 POSIX application can use *unset* without an option to unset a variable, but not a function; the `-f`
73525 option must be used.73526 **FUTURE DIRECTIONS**

73527 None.

73528 **SEE ALSO**73529 [Section 2.14](#) (on page 2280)73530 XBD [Section 12.2](#) (on page 201)73531 **CHANGE HISTORY**73532 **Issue 6**73533 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
73534 sections use terms as described in the Utility Description Defaults ([Section 1.4](#)). No change in
73535 behavior is intended.73536 **Issue 7**

73537 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

Batch Environment Services

73538

73539

73540

OB BE

This chapter describes the services and utilities that shall be implemented on all systems that claim conformance to the Batch Environment Services and Utilities option. The functionality described in this section shall be provided on implementations that support the Batch Environment Services and Utilities option (and the rest of this section is not further shaded for this option).

73541

73542

73543

73544

73545

Note that the Batch Environment Services and Utilities option is marked obsolescent in Issue 7.

73546

73547

3.1.1 Batch Client-Server Interaction

73548

73549

73550

Batch jobs are created and managed by batch servers. A batch client interacts with a batch server to access batch services on behalf of the user. In order to use batch services, a user must have access to a batch client.

73551

73552

A batch server is a computational entity, such as a daemon process, that provides batch services. Batch servers route, queue, modify, and execute batch jobs on behalf of batch clients.

73553

73554

73555

73556

73557

The batch utilities described in this volume of POSIX.1-200x (and listed in [Table 3-1](#)) are clients of batch services; they allow users to perform actions on the job such as creating, modifying, and deleting batch jobs from a shell command line. Although these batch utilities may be said to accomplish certain services, they actually obtain services on behalf of a user by means of requests to batch servers.

73558

Table 3-1 Batch Utilities

73559

73560

73561

<i>qalter</i>	<i>qmove</i>	<i>qrls</i>	<i>qstat</i>
<i>qdel</i>	<i>qmsg</i>	<i>qselect</i>	<i>qsub</i>
<i>qhold</i>	<i>qrerun</i>	<i>qsig</i>	

73562

73563

73564

73565

73566

Client-server interaction takes place by means of the batch requests defined in this chapter. Because direct access to batch jobs and queues is limited to batch servers, clients and servers of different implementations can interoperate, since dependencies on private structures for batch jobs and queues are limited to batch servers. Also, batch servers may be clients of other batch servers.

73567 3.1.2 Batch Queues

73568 Two types of batch queue are described: routing queues and execution queues. When a batch job
73569 is placed in a routing queue, it is a candidate for routing. A batch job is removed from routing
73570 queues under the following conditions:

- 73571 • The batch job has been routed to another queue.
- 73572 • The batch job has been deleted from the batch queue.
- 73573 • The batch job has been aborted.

73574 When a batch job is placed in an execution queue, it is a candidate for execution.

73575 A batch job is removed from an execution queue under the following conditions:

- 73576 • The batch job has been executed and exited.
- 73577 • The batch job has been aborted.
- 73578 • The batch job has been deleted from the batch queue.
- 73579 • The batch job has been moved to another queue.

73580 Access to a batch queue is limited to the batch server that manages the batch queue. Clients
73581 never access a batch queue or a batch job directly, either to read or write information; all client
73582 access to batch queues or jobs takes place through batch servers.

73583 3.1.3 Batch Job Creation

73584 When a batch server creates a batch job on behalf of a client, it shall assign a batch job identifier
73585 to the job. A batch job identifier consists of both a sequence number that is unique among the
73586 sequence numbers issued by that server and the name of the server. Since the batch server name
73587 is unique within a name space, the job identifier is likewise unique within the name space.

73588 The batch server that creates a batch job shall return the batch server-assigned job identifier to
73589 the client that requested the job creation. If the batch server routes or moves the job to another
73590 server, it sends the job identifier with the job. Once assigned, the job identifier of a batch job
73591 shall never change.

73592 3.1.4 Batch Job Tracking

73593 Since a batch job may be moved after creation, the batch server name component of the job
73594 identifier need not indicate the location of the job. An implementation may provide a batch job
73595 tracking mechanism, in which case the user generally does not need to know the location of the
73596 job. However, an implementation need not provide a batch job tracking mechanism, in which
73597 case the user must find routed jobs by probing the possible destinations.

73598 3.1.5 Batch Job Routing

73599 To route a batch job, a batch server either moves the job to some other queue that is managed by
73600 the batch server, or requests that some other batch server accept the job.

73601 Each routing queue has one or more queues to which it can route batch jobs. The batch server
73602 administrator creates routing queues.

73603 A batch server may route a batch job from a routing queue to another routing queue. Batch
73604 servers shall prevent or otherwise handle cases of circular routing paths. As a deferred service, a
73605 batch server routes jobs from the routing queues that it manages. The algorithm by which a
73606 batch server selects a batch queue to which to route a batch job is implementation-defined.

73607 A batch job need not be eligible for routing to all the batch queues fed by the routing queue from
 73608 which it is routed. A batch server that has been asked to accept the job may reject the request if
 73609 the job requires resources that are unavailable to that batch server, or if the client is not
 73610 authorized to access the batch server.

73611 Batch servers may route high-priority jobs before low-priority jobs, but, on other than
 73612 overloaded systems, the effect may be imperceptible to the user. If all the batch servers fed by a
 73613 routing queue reject requests to accept the job for reasons that are permanent, the batch server
 73614 that manages the job shall abort the job. If all or some rejections are temporary, the batch server
 73615 should try to route the job again at some later point.

73616 The reasons for rejecting a batch job are implementation-defined.

73617 The reasons for which the routing should be retried later and the reasons for which the job
 73618 should be aborted are also implementation-defined.

73619 3.1.6 Batch Job Execution

73620 To execute a batch job is to create a session leader (a process) that runs the shell program
 73621 indicated by the *Shell_Path* attribute of the job. The script shall be passed to the program as its
 73622 standard input. An implementation may pass the script to the program by other
 73623 implementation-defined means. At the time a batch job begins execution, it is defined to enter
 73624 the RUNNING state. The primary program that is executed by a batch job is typically, though
 73625 not necessarily, a shell program.

73626 A batch server shall execute eligible jobs as a deferred service—no client request is necessary
 73627 once the batch job is created and eligible. However, the attributes of a batch job, such as the job
 73628 hold type, may render the job ineligible. A batch server shall scan the execution queues that it
 73629 manages for jobs that are eligible for execution. The algorithm by which the batch server selects
 73630 eligible jobs for execution is implementation-defined.

73631 As part of creating the process for the batch job, the batch server shall open the standard output
 73632 and standard error streams of the session.

73633 The attributes of a batch job may indicate that the batch server executing the job shall send mail
 73634 to a list of users at the time it begins execution of the job.

73635 3.1.7 Batch Job Exit

73636 When the session leader of an executing job terminates, the job exits. As part of exiting a batch
 73637 job, the batch server that manages the job shall remove the job from the batch queue in which it
 73638 resides. The server shall transfer output files of the job to a location described by the attributes of
 73639 the job.

73640 The attributes of a batch job may indicate that the batch server managing the job shall send mail
 73641 to a list of users at the time the job exits.

73642 3.1.8 Batch Job Abort

73643 A batch server shall abort jobs for which a required deferred service cannot be performed. The
 73644 attributes of a batch job may indicate that the batch server that aborts the job shall send mail to a
 73645 list of users at the time it aborts the job.

73646 3.1.9 Batch Authorization

73647 Clients, such as the batch environment utilities (marked BE), access batch services by means of
73648 requests to one or more batch servers. To acquire the services of any given batch server, the user
73649 identifier under which the client runs must be authorized to use that batch server.

73650 The user with an associated user name that creates a batch job shall own the job and can perform
73651 actions such as read, modify, delete, and move.

73652 A user identifier of the same value at a different host need not be the same user. For example,
73653 user name *smith* at host **alpha** may or may not represent the same person as user name *smith* at
73654 host **beta**. Likewise, the same person may have access to different user names on different hosts.

73655 An implementation may optionally provide an authorization mechanism that permits one user
73656 name to access jobs under another user name.

73657 A process on a client host may be authorized to run processes under multiple user names at a
73658 batch server host. Where appropriate, the utilities defined in this volume of POSIX.1-200x
73659 provide a means for a user to choose from among such user names when creating or modifying
73660 a batch job.

73661 3.1.10 Batch Administration

73662 The processing of a batch job by a batch server is affected by the attributes of the job. The
73663 processing of a batch job may also be affected by the attributes of the batch queue in which the
73664 job resides and by the status of the batch server that manages the job. See also XBD [Chapter 3](#)
73665 (on page 33) for batch definitions.

73666 3.1.11 Batch Notification

73667 Whereas batch servers are persistent entities, clients are often transient. For example, the *qsub*
73668 utility creates a batch job and exits. For this reason, batch servers notify users of batch job events
73669 by sending mail to the user that owns the job, or to other designated users.

73670 3.2 Batch Services

73671 The presence of Batch Environment Services and Utilities option services is indicated by the
73672 configuration variable `POSIX2_PBS`. A conforming batch server provides services as defined in
73673 this section.

73674 A batch server shall provide batch services in two ways:

- 73675 1. The batch server provides a service at the request of a client.
- 73676 2. The batch server provides a deferred service as a result of a change in conditions
73677 monitored by the batch server.

73678 If a batch server cannot complete a request, it shall reject the request. If a batch server cannot
73679 complete a deferred service for a batch job, the batch server shall abort the batch job. [Table 3-2](#)
73680 (on page 2323) is a summary of environment variables that shall be supported by an
73681 implementation of the batch server and utilities.

73682

Table 3-2 Environment Variable Summary

73683

Variable	Description
<i>PBS_DPREFIX</i>	Defines the directive prefix (see <i>qsub</i>)
<i>PBS_ENVIRONMENT</i>	Batch Job is batch or interactive (see Section 3.2.2.1)
<i>PBS_JOBID</i>	The <i>job_identifier</i> attribute of job (see Section 3.2.3.8)
<i>PBS_JOBNAME</i>	The <i>job_name</i> attribute of job (see Section 3.2.3.8)
<i>PBS_O_HOME</i>	Defines the <i>HOME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_HOST</i>	Defines the host name of the batch client (see <i>qsub</i>)
<i>PBS_O_LANG</i>	Defines the <i>LANG</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_LOGNAME</i>	Defines the <i>LOGNAME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_MAIL</i>	Defines the <i>MAIL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_PATH</i>	Defines the <i>PATH</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_QUEUE</i>	Defines the submit queue of the batch client (see <i>qsub</i>)
<i>PBS_O_SHELL</i>	Defines the <i>SHELL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_TZ</i>	Defines the <i>TZ</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_WORKDIR</i>	Defines the working directory of the batch client (see <i>qsub</i>)
<i>PBS_QUEUE</i>	Defines the initial execution queue (see Section 3.2.2.1)

73699

3.2.1 Batch Job States

73700

A batch job shall always be in one of the following states: QUEUED, RUNNING, HELD, WAITING, EXITING, or TRANSITING. The state of a batch job determines the types of requests that the batch server that manages the batch job can accept for the batch job. A batch server shall change the state of a batch job either in response to service requests from clients or as a result of deferred services, such as job execution or job routing.

73701

73702

73703

73704

73705

73706

A batch job that is in the QUEUED state resides in a queue but is still pending either execution or routing, depending on the queue type.

73707

73708

73709

73710

73711

A batch server that queues a batch job in a routing queue shall put the batch job in the QUEUED state. A batch server that puts a batch job in an execution queue, but has not yet executed the batch job, shall put the batch job in the QUEUED state. A batch job that resides in an execution queue and is executing is defined to be in the RUNNING state. While a batch job is in the RUNNING state, a session leader is associated with the batch job.

73712

73713

A batch job that resides in an execution queue, but is ineligible to run because of a hold attribute, is defined to be in the HELD state.

73714

73715

A batch job that is not held, but must wait until a future date and time before executing, is defined to be in the WAITING state.

73716

73717

When the session leader associated with a running job exits, the batch job shall be placed in the EXITING state.

73718

73719

73720

73721

73722

A batch job for which the session leader has terminated is defined to be in the EXITING state, and the batch server that manages such a batch job cannot accept job modification requests that affect the batch job. While a batch job is in the EXITING state, the batch server that manages the batch job is staging output files and notifying clients of job completion. Once a batch job has exited, it no longer exists as an object managed by a batch server.

73723

73724

A batch job that is being moved from a routing queue to another queue is defined to be in the TRANSITING state.

73725

73726

When a batch job in a routing queue has been selected to be moved to a new destination, then the batch job shall be in either the QUEUED state or the TRANSITING state, depending on the

73727 batch server implementation.

73728 Batch jobs with either an *Execution_Time* attribute value set in the future or a *Hold_Types* attribute
73729 of value not equal to NO_HOLD, or both, may be routed or held in the routing queue. The
73730 treatment of jobs with the *Execution_Time* or *Hold_Types* attributes in a routing queue is
73731 implementation-defined.

73732 When a batch job in a routing queue has not been selected to be moved to a new destination and
73733 the batch job has a *Hold_Types* attribute value of other than NO_HOLD, then the job should be in
73734 the HELD state.

73735 **Note:** The effect of a hold upon a batch job in a routing queue is implementation-defined. The
73736 implementation should use the state that matches whether the batch job can route with a hold
73737 or not.

73738 When a batch job in a routing queue has not been selected to be moved to a new destination and
73739 the batch job has:

- 73740 • A *Hold_Types* attribute value of NO_HOLD
- 73741 • An *Execution_Time* attribute in the past

73742 then the batch job shall be in the QUEUED state.

73743 When a batch job in a routing queue has not been selected to be moved to a new destination and
73744 the batch job has:

- 73745 • A *Hold_Types* attribute value of NO_HOLD
- 73746 • An *Execution_Time* attribute in the future

73747 then the batch job may be in the WAITING state.

73748 **Note:** The effect of a future execution time upon a batch job in a routing queue is implementation-
73749 defined. The implementation should use the state that matches whether the batch job can route
73750 with a hold or not.

73751 [Table 3-3](#) (on page 2325) describes the next state of a batch job, given the current state of the
73752 batch job and the type of request. [Table 3-4](#) (on page 2326) describes the response of a batch
73753 server to a request, given the current state of the batch job and the type of request.

73754 3.2.2 Deferred Batch Services

73755 This section describes the deferred services performed by batch servers: job execution, job
73756 routing, job exit, job abort, and the rerunning of jobs after a restart.

73757 3.2.2.1 Batch Job Execution

73758 To execute a batch job is to create a session leader (a process) that runs the shell program
73759 indicated by the *Shell_Path_List* attribute of the batch job. The script is passed to the program as
73760 its standard input. An implementation may pass the script to the program by other
73761 implementation-defined means. At the time a batch job begins execution, it is defined to enter
73762 the RUNNING state.

73790

A batch server that has an execution queue containing jobs is said to own the queue and manage the batch jobs in that queue. A batch server that has been started shall execute the batch jobs in the execution queues owned by the batch server. The batch server shall schedule for execution those jobs in the execution queues that are in the QUEUED state. The algorithm for scheduling jobs is implementation-defined.

73795

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, an environment variable named *PBS_ENVIRONMENT*, the value of which is the string *PBS_BATCH* encoded in the portable character set.

73796

73797

73798

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, an environment variable named *PBS_QUEUE*, the value of which is the name of the execution queue of the batch job encoded in the portable character set.

73799

73800

73801

To rerun a batch job is to requeue a batch job that is currently executing and then kill the session leader of the executing job by sending a SIGKILL prior to completion; see [Section 3.2.3.11](#) (on page 2338). A batch server that reruns a batch job shall append the standard output and standard error files of the batch job to the corresponding files of the previous execution, if they exist, with appropriate annotation. If either file does not exist, that file shall be created as in

73802

73803

73804

73805

73806 normal execution.

73825 Legend

73826 O OK

73827 e Error message

73828 The execution of a batch job by a batch server shall be controlled by job, queue, and server
73829 attributes, as defined in this section.

73830 Account_Name Attribute

73831 Batch accounting is an optional feature of batch servers. If a batch server implements
73832 accounting, the statements in this section apply and the configuration variable
73833 POSIX2_PBS_ACCOUNTING shall be set to 1.

73834 A batch server that executes a batch job shall charge the account named in the *Account_Name*
73835 attribute of the batch job for resources consumed by the batch job.

73836 If the *Account_Name* attribute of the batch job is absent from the batch job attribute list or is
73837 altered while the batch job is in execution, the batch server action is implementation-defined.

73838 Checkpoint Attribute

73839 Batch checkpointing is an optional feature of batch servers. If a batch server implements
73840 checkpointing, the statements in this section apply and the configuration variable
73841 POSIX2_PBS_CHECKPOINT shall be set to 1.

73842 There are two attributes associated with the checkpointing feature: *Checkpoint* and
73843 *Minimum_Cpu_Interval*. *Checkpoint* is a batch job attribute, while *Minimum_Cpu_Interval* is a
73844 queue attribute. An implementation that does not support checkpointing shall support the
73845 *Checkpoint* job attribute to the extent that the batch server shall maintain and pass this attribute
73846 to other servers.

73847 The behavior of a batch server that executes a batch job for which the value of the *Checkpoint*

73848 attribute is CHECKPOINT_UNSPECIFIED is implementation-defined. A batch server that
 73849 executes a batch job for which the value of the *Checkpoint* attribute is NO_CHECKPOINT shall
 73850 not checkpoint the batch job.

73851 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
 73852 CHECKPOINT_AT_SHUTDOWN shall checkpoint the batch job only when the batch server
 73853 accepts a request to shut down during the time when the batch job is in the RUNNING state.

73854 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
 73855 CHECKPOINT_AT_MIN_CPU_INTERVAL shall checkpoint the batch job at the interval
 73856 specified by the *Minimum_Cpu_Interval* attribute of the queue for which the batch job has been
 73857 selected. The *Minimum_Cpu_Interval* attribute shall be specified in units of CPU minutes.

73858 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is an
 73859 unsigned integer shall checkpoint the batch job at an interval that is the value of either the
 73860 *Checkpoint* attribute, or the *Minimum_Cpu_Interval* attribute of the queue for which the batch job
 73861 has been selected, whichever is greater. Both intervals shall be in units of CPU minutes. When
 73862 the *Minimum_Cpu_Interval* attribute is greater than the *Checkpoint* attribute, the batch job shall
 73863 write a warning message to the standard error stream of the batch job.

73864 **Error_Path Attribute**

73865 The *Error_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When
 73866 the *Join_Path* attribute of the batch job is set to the value FALSE and the *Keep_Files* attribute of
 73867 the batch job does not contain the value KEEP_STD_ERROR, a batch server that executes a batch
 73868 job shall perform one of the following actions:

- 73869 • Set the standard error stream of the session leader of the batch job to the path described by
 73870 the value of the *Error_Path* attribute of the batch job.
- 73871 • Buffer the standard error of the session leader of the batch job until completion of the batch
 73872 job, and when the batch job exits return the contents to the destination described by the
 73873 value of the *Error_Path* attribute of the batch job.

73874 Applications shall not rely on having access to the standard error of a batch job prior to the
 73875 completion of the batch job.

73876 When the *Error_Path* attribute does not specify a host name, then the batch server shall retain the
 73877 standard error of the batch job on the host of execution.

73878 When the *Error_Path* attribute does specify a host name and the *Keep_Files* attribute does not
 73879 contain the value KEEP_STD_ERROR, then the final destination of the standard error of the
 73880 batch job shall be on the host whose host name is specified.

73881 If the path indicated by the value of the *Error_Path* attribute of the batch job is a relative path, the
 73882 batch server shall expand the path relative to the home directory of the user on the host to which
 73883 the file is being returned.

73884 When the batch server buffers the standard error of the batch job and the file cannot be opened
 73885 for write upon completion of the batch job, then the server shall place the standard error in an
 73886 implementation-defined location and notify the user of the location via mail. It shall be possible
 73887 for the user to process this mail using the *mailx* utility.

73888 If a batch server that does not buffer the standard error cannot open the standard error path of
 73889 the batch job for write access, then the batch server shall abort the batch job.

73890 **Execution_Time Attribute**

73891 A batch server shall not execute a batch job before the time represented by the value of the
 73892 *Execution_Time* attribute of the batch job. The *Execution_Time* attribute is defined in seconds since
 73893 the Epoch.

73894 **Hold_Types Attribute**

73895 A batch server shall support the following hold types:

- 73896 s Can be set or released by a user with at least a privilege level of batch administrator
 73897 (SYSTEM).
- 73898 o Can be set or released by a user with at least a privilege level of batch operator
 73899 (OPERATOR).
- 73900 u Can be set or released by the user with at least a privilege level of user, where the user is
 73901 defined in the *Job_Owner* attribute (USER).
- 73902 n Indicates that none of the *Hold_Types* attributes are set (NO_HOLD).

73903 An implementation may define other hold types. Any additional hold types, how they are
 73904 specified, their internal representation, their behavior, and how they affect the behavior of other
 73905 utilities are implementation-defined.

73906 The value of the *Hold_Types* attribute shall be the union of the valid hold types ('s', 'o', 'u',
 73907 and any implementation-defined hold types), or 'n'.

73908 A batch server shall not execute a batch job if the *Hold_Types* attribute of the batch job has a
 73909 value other than NO_HOLD. If the *Hold_Types* attribute of the batch job has a value other than
 73910 NO_HOLD, the batch job shall be in the HELD state.

73911 **Job_Owner Attribute**

73912 The *Job_Owner* attribute consists of a pair of user name and host name values of the form:

73913 `username@hostname`

73914 A batch server that accepts a *Queue Batch Job Request* shall set the *Job_Owner* attribute to a string
 73915 that is the `username@hostname` of the user who submitted the job.

73916 **Join_Path Attribute**

73917 A batch server that executes a batch job for which the value of the *Join_Path* attribute is TRUE
 73918 shall ignore the value of the *Error_Path* attribute and merge the standard error of the batch job
 73919 with the standard output of the batch job.

73920 **Keep_Files Attribute**

73921 A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes
 73922 the value KEEP_STD_OUTPUT shall retain the standard output of the batch job on the host
 73923 where execution occurs. The standard output shall be retained in the home directory of the user
 73924 under whose user ID the batch job is executed and the filename shall be the default filename for
 73925 the standard output as defined under the `-o` option of the *qsub* utility. The *Output_Path* attribute
 73926 is not modified.

73927 A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes
 73928 the value KEEP_STD_ERROR shall retain the standard error of the batch job on the host where
 73929 execution occurs. The standard error shall be retained in the home directory of the user under
 73930 whose user ID the batch job is executed and the filename shall be the default filename for

73931 standard error as defined under the `-e` option of the `qsub` utility. The `Error_Path` attribute is not
73932 modified.

73933 A batch server that executes a batch job for which the value of the `Keep_Files` attribute includes
73934 values other than `KEEP_STD_OUTPUT` and `KEEP_STD_ERROR` shall retain these other files on
73935 the host where execution occurs. These files (with implementation-defined names) shall be
73936 retained in the home directory of the user under whose user identifier the batch job is executed.

73937 **Mail_Points and Mail_Users Attributes**

73938 A batch server that executes a batch job for which one of the values of the `Mail_Points` attribute is
73939 the value `MAIL_AT_BEGINNING` shall send a mail message to each user account listed in the
73940 `Mail_Users` attribute of the batch job.

73941 The mail message shall contain at least the batch job identifier, queue, and server at which the
73942 batch job currently resides, and the `Job_Owner` attribute.

73943 **Output_Path Attribute**

73944 The `Output_Path` attribute of a running job cannot be changed by a `Modify Batch Job Request`.
73945 When the `Keep_Files` attribute of the batch job does not contain the value `KEEP_STD_OUTPUT`, a
73946 batch server that executes a batch job shall either:

- 73947 • Set the standard output stream of the session leader of the batch job to the destination
73948 described by the value of the `Output_Path` attribute of the batch job.

73949 or:

- 73950 • Buffer the standard output of the session leader of the batch job until completion of the
73951 batch job, and when the batch job exits return the contents to the destination described by
73952 the value of the `Output_Path` attribute of the batch job.

73953 When the `Output_Path` attribute does not specify a host name, then the batch server shall retain
73954 the standard output of the batch job on the host of execution.

73955 When the `Keep_Files` attribute does not contain the value `KEEP_STD_OUTPUT` and the
73956 `Output_Path` attribute does specify a host name, then the final destination of the standard output
73957 of the batch job shall be on the host specified.

73958 If the path specified in the `Output_Path` attribute of the batch job is a relative path, the batch
73959 server shall expand the path relative to the home directory of the user on the host to which the
73960 file is being returned.

73961 Whether or not the batch server buffers the standard output of the batch job until completion of
73962 the batch job is implementation-defined. Applications shall not rely on having access to the
73963 standard output of a batch job prior to the completion of the batch job.

73964 When the batch server does buffer the standard output of the batch job and the file cannot be
73965 opened for write upon completion of the batch job, then the batch server shall place the standard
73966 output in an implementation-defined location and notify the user of the location via mail. It shall
73967 be possible for the user to process this mail using the `mailx` utility.

73968 If a batch server that does not buffer the standard output cannot open the standard output path
73969 of the batch job for write access, then the batch server shall abort the batch job.

73970 **Priority Attribute**

73971 A batch server implementation may choose to preferentially execute a batch job based on the
 73972 *Priority* attribute. The interpretation of the batch job *Priority* attribute by a batch server is
 73973 implementation-defined. If an implementation uses the *Priority* attribute, it shall interpret larger
 73974 values of the *Priority* attribute to mean the batch job shall be preferentially selected for execution.

73975 **Rerunable Attribute**

73976 A batch job that began execution but did not complete, because the batch server either shut
 73977 down or terminated abnormally, shall be requeued if the *Rerunable* attribute of the batch job has
 73978 the value TRUE.

73979 If a batch job, which was requeued after beginning execution but prior to completion, has a valid
 73980 checkpoint file and the batch server supports checkpointing, then the batch job shall be restarted
 73981 from the last valid checkpoint.

73982 If the batch job cannot be restarted from a checkpoint, then when a batch job has a *Rerunable*
 73983 attribute value of TRUE and was requeued after beginning execution but prior to completion,
 73984 the batch server shall place the batch job into execution at the beginning of the job.

73985 When a batch job has a *Rerunable* attribute value other than TRUE and was requeued after
 73986 beginning execution but prior to completion, and the batch job cannot be restarted from a
 73987 checkpoint, then the batch server shall abort the batch job.

73988 **Resource_List Attribute**

73989 A batch server that executes a batch job shall establish the resource limits of the session leader of
 73990 the batch job according to the values of the *Resource_List* attribute of the batch job. Resource
 73991 limits shall be enforced by an implementation-defined method.

73992 **Shell_Path_List Attribute**

73993 The *Shell_Path_List* job attribute consists of a list of pairs of pathname and host name values. The
 73994 host name component can be omitted, in which case the pathname serves as the default
 73995 pathname when a batch server cannot find the name of the host on which it is running in the list.

73996 A batch server that executes a batch job shall select, from the value of the *Shell_Path_List*
 73997 attribute of the batch job, a pathname where the shell to execute the batch job shall be found.
 73998 The batch server shall select the pathname, in order of preference, according to the following
 73999 methods:

- 74000 • Select the pathname that contains the name of the host on which the batch server is
 74001 running.
- 74002 • Select the pathname for which the host name has been omitted.
- 74003 • Select the pathname for the login shell of the user under which the batch job is to execute.

74004 If the shell path value selected is an invalid pathname, the batch server shall abort the batch job.

74005 If the value of the selected pathname from the *Shell_Path_List* attribute of the batch job
 74006 represents a partial path, the batch server shall expand the path relative to a path that is
 74007 implementation-defined.

74008 The batch server that executes the batch job shall execute the program that was selected from the
 74009 *Shell_Path_List* attribute of the batch job. The batch server shall pass the path to the script of the
 74010 batch job as the first argument to the shell program.

74011 **User_List Attribute**

74012 The *User_List* job attribute consists of a list of pairs of user name and host name values. The host
 74013 name component can be omitted, in which case the user name serves as a default when a batch
 74014 server cannot find the name of the host on which it is running in the list.

74015 A batch server that executes a batch job shall select, from the value of the *User_List* attribute of
 74016 the batch job, a user name under which to create the session leader. The server shall select the
 74017 user name, in order of preference, according to the following methods:

- 74018 • Select the user name of a value that contains the name of the host on which the batch
 74019 server executes.
- 74020 • Select the user name of a value for which the host name has been omitted.
- 74021 • Select the user name from the *Job_Owner* attribute of the batch job.

74022 **Variable_List Attribute**

74023 A batch server that executes a batch job shall create, in the environment of the session leader of
 74024 the batch job, each environment variable listed in the *Variable_List* attribute of the batch job, and
 74025 set the value of each such environment variable to that of the corresponding variable in the
 74026 variable list.

74027 3.2.2.2 *Batch Job Routing*

74028 To route a batch job is to select a queue from a list and move the batch job to that queue.

74029 A batch server that has routing queues, which have been started, shall route the jobs in the
 74030 routing queues owned by the batch server. A batch server may delay the routing of a batch job.
 74031 The algorithm for selecting a batch job and the queue to which it will be routed is
 74032 implementation-defined.

74033 When a routing queue has multiple possible destinations specified, then the precedence of the
 74034 destinations is implementation-defined.

74035 A batch server that routes a batch job to a queue at another server shall move the batch job into
 74036 the target queue with a *Queue Batch Job Request*.

74037 If the target server rejects the *Queue Batch Job Request*, the routing server shall retry routing the
 74038 batch job or abort the batch job. A batch server that retries failed routings shall provide a means
 74039 for the batch administrator to specify the number of retries and the minimum period of time
 74040 between retries. The means by which an administrator specifies the number of retries and the
 74041 delay between retries is implementation-defined. When the number of retries specified by the
 74042 batch administrator has been exhausted, the batch server shall abort the batch job and perform
 74043 the functions of *Batch Job Exit*; see [Section 3.2.2.3](#).

74044 3.2.2.3 *Batch Job Exit*

74045 For each job in the EXITING state, the batch server that exited the batch job shall perform the
 74046 following deferred services in the order specified:

- 74047 1. If buffering standard error, move that file into the location specified by the *Error_Path*
 74048 attribute of the batch job.
- 74049 2. If buffering standard output, move that file into the location specified by the *Output_Path*
 74050 attribute of the batch job.

- 74051 3. If the *Mail_Points* attribute of the batch job includes MAIL_AT_EXIT, send mail to the
 74052 users listed in the *Mail_Users* attribute of the batch job. The mail message shall contain at
 74053 least the batch job identifier, queue, and server at which the batch job currently resides,
 74054 and the *Job_Owner* attribute.
- 74055 4. Remove the batch job from the queue.

74056 If a batch server that buffers the standard error output cannot return the standard error file to
 74057 the standard error path at the time the batch job exits, the batch server shall do one of the
 74058 following:

- 74059 • Mail the standard error file to the batch job owner.
- 74060 • Save the standard error file and mail the location and name of the file where the standard
 74061 error is stored to the batch job owner.
- 74062 • Save the standard error file and notify the user by other implementation-defined means.

74063 If a batch server that buffers the standard output cannot return the standard output file to the
 74064 standard output path at the time the batch job exits, the batch server shall do one of the
 74065 following:

- 74066 • Mail the standard output file to the batch job owner.
- 74067 • Save the standard output file and mail the location and name of the file where the standard
 74068 output is stored to the batch job owner.
- 74069 • Save the standard output file and notify the user by other implementation-defined means.

74070 At the conclusion of job exit processing, the batch job is no longer managed by a batch server.

74071 3.2.2.4 *Batch Server Restart*

74072 A batch server that has been either shutdown or terminated abnormally, and has returned to
 74073 operation, is said to have “restarted”.

74074 Upon restarting, a batch server shall requeue those jobs managed by the batch server that were
 74075 in the RUNNING state at the time the batch server shut down and for which the *Rerunable*
 74076 attribute of the batch job has the value TRUE.

74077 Queues are defined to be non-volatile. A batch server shall store the content of queues that it
 74078 controls in such a way that server and system shutdowns do not erase the content of the queues.

74079 3.2.2.5 *Batch Job Abort*

74080 A batch server that cannot perform a deferred service for a batch job shall abort the batch job.

74081 A batch server that aborts a batch job shall perform the following services:

- 74082 • Delete the batch job from the queue in which it resides.
- 74083 • If the *Mail_Points* attribute of the batch job includes the value MAIL_AT_ABORT, send
 74084 mail to the users listed in the value of the *Mail_Users* attribute of the job. The mail message
 74085 shall contain at least the batch job identifier, queue, and server at which the batch job
 74086 currently resides, the *Job_Owner* attribute, and the reason for the abort.
- 74087 • If the batch job was in the RUNNING state, terminate the session leader of the executing
 74088 job by sending the session leader a SIGKILL, place the batch job in the EXITING state, and
 74089 perform the actions of *Batch Job Exit*.

3.2.3 Requested Batch Services

This section describes the services provided by batch servers in response to requests from clients. Table 3-5 summarizes the current set of batch service requests and for each gives its type (deferred or not) and whether it is an optional function.

Table 3-5 Batch Services Summary

Batch Service	Deferred	Optional
<i>Batch Job Execution</i>	Yes	No
<i>Batch Job Routing</i>	Yes	No
<i>Batch Job Exit</i>	Yes	No
<i>Batch Server Restart</i>	Yes	No
<i>Batch Job Abort</i>	Yes	No
<i>Delete Batch Job Request</i>	No	No
<i>Hold Batch Job Request</i>	No	No
<i>Batch Job Message Request</i>	No	Yes
<i>Batch Job Status Request</i>	No	No
<i>Locate Batch Job Request</i>	No	Yes
<i>Modify Batch Job Request</i>	No	No
<i>Move Batch Job Request</i>	No	No
<i>Queue Batch Job Request</i>	No	No
<i>Batch Queue Status Request</i>	No	No
<i>Release Batch Job Request</i>	No	No
<i>Rerun Batch Job Request</i>	No	No
<i>Select Batch Jobs Request</i>	No	No
<i>Server Shutdown Request</i>	No	No
<i>Server Status Request</i>	No	No
<i>Signal Batch Job Request</i>	No	No
<i>Track Batch Job Request</i>	No	Yes

If a request is rejected because the batch client is not authorized to perform the action, the batch server shall return the same status as when the batch job does not exist.

3.2.3.1 Delete Batch Job Request

A batch job is defined to have been deleted when it has been removed from the queue in which it resides and not instantiated in another queue. A client requests that the server that manages a batch job delete the batch job. Such a request is called a *Delete Batch Job Request*.

A batch server shall reject a *Delete Batch Job Request* if any of the following statements are true:

- The user of the batch client is not authorized to delete the designated job.
- The designated job is not managed by the batch server.
- The designated job is in a state inconsistent with the delete request.

A batch server may reject a *Delete Batch Job Request* for other implementation-defined reasons. The method used to determine whether the user of a client is authorized to perform the requested action is implementation-defined.

A batch server requested to delete a batch job shall delete the batch job if the batch job exists and is not in the EXITING state.

A batch server that deletes a batch job in the RUNNING state shall send a SIGKILL signal to the

74133 session leader of the batch job. It is implementation-defined whether additional signals are sent
74134 to the session leader of the job prior to sending the SIGKILL signal.

74135 A batch server that deletes a batch job in the RUNNING state shall place the batch job in the
74136 EXITING state after it has killed the session leader of the batch job and shall perform the actions
74137 of *Batch Job Exit*.

74138 3.2.3.2 *Hold Batch Job Request*

74139 A batch client can request that the batch server add one or more holds to a batch job. Such a
74140 request is called a *Hold Batch Job Request*.

74141 A batch server shall reject a *Hold Batch Job Request* if any of the following statements are true:

- 74142 • The batch server does not support one or more of the requested holds to be added to the
74143 batch job.
- 74144 • The user of the batch client is not authorized to add one or more of the requested holds to
74145 the batch job.
- 74146 • The batch server does not manage the specified job.
- 74147 • The designated job is in the EXITING state.

74148 A batch server may reject a *Hold Batch Job Request* for other implementation-defined reasons. The
74149 method used to determine whether the user of a client is authorized to perform the requested
74150 action is implementation-defined.

74151 A batch server that accepts a *Hold Batch Job Request* for a batch job in the RUNNING state shall
74152 place a hold on the batch job. The effects, if any, the hold will have on a batch job in the
74153 RUNNING state are implementation-defined.

74154 A batch server that accepts a *Hold Batch Job Request* shall add each type of hold listed in the *Hold*
74155 *Batch Job Request*, that is not already present, to the value of the *Hold_Types* attribute of the batch
74156 job.

74157 3.2.3.3 *Batch Job Message Request*

74158 *Batch Job Message Request* is an optional feature of batch servers. If an implementation supports
74159 *Batch Job Message Request*, the statements in this section apply and the configuration variable
74160 POSIX2_PBS_MESSAGE shall be set to 1.

74161 A batch client can request that a batch server write a message into certain output files of a batch
74162 job. Such a request is called a *Batch Job Message Request*.

74163 A batch server shall reject a *Batch Job Message Request* if any of the following statements are true:

- 74164 • The batch server does not support sending messages to jobs.
- 74165 • The user of the batch client is not authorized to post a message to the designated job.
- 74166 • The designated job does not exist on the batch server.
- 74167 • The designated job is not in the RUNNING state.

74168 A batch server may reject a *Batch Job Message Request* for other implementation-defined reasons.
74169 The method used to determine whether the user of a client is authorized to perform the
74170 requested action is implementation-defined.

74171 A batch server that accepts a *Batch Job Message Request* shall write the message sent by the batch
74172 client into the files indicated by the batch client.

74173 3.2.3.4 *Batch Job Status Request*

74174 A batch client can request that a batch server respond with the status and attributes of a batch
74175 job. Such a request is called a *Batch Job Status Request*.

74176 A batch server shall reject a *Batch Job Status Request* if any of the following statements are true:

- 74177 • The user of the batch client is not authorized to query the status of the designated job.
- 74178 • The designated job is not managed by the batch server.

74179 A batch server may reject a *Batch Job Status Request* for other implementation-defined reasons.
74180 The method used to determine whether the user of a client is authorized to perform the
74181 requested action is implementation-defined.

74182 A batch server that accepts a *Batch Job Status Request* shall return a *Batch Job Status Message* to the
74183 batch client.

74184 A batch server may return other information in response to a *Batch Job Status Request*.

74185 3.2.3.5 *Locate Batch Job Request*

74186 *Locate Batch Job Request* is an optional feature of batch servers. If an implementation supports
74187 *Locate Batch Job Request*, the statements in this section apply and the configuration variable
74188 POSIX2_PBS_LOCATE shall be set to 1.

74189 A batch client can ask a batch server to respond with the location of a batch job that was created
74190 by the batch server. Such a request is called a *Locate Batch Job Request*.

74191 A batch server that accepts a *Locate Batch Job Request* shall return a *Batch Job Location Message* to
74192 the batch client.

74193 A batch server may reject a *Locate Batch Job Request* for a batch job that was not created by that
74194 server.

74195 A batch server may reject a *Locate Batch Job Request* for a batch job that is no longer managed by
74196 that server; that is, for a batch job that is not in a queue owned by that server.

74197 A batch server may reject a *Locate Batch Job Request* for other implementation-defined reasons.

74198 3.2.3.6 *Modify Batch Job Request*

74199 Batch clients modify (alter) the attributes of a batch job by making a request to the server that
74200 manages the batch job. Such a request is called a *Modify Batch Job Request*.

74201 A batch server shall reject a *Modify Batch Job Request* if any of the following statements are true:

- 74202 • The user of the batch client is not authorized to make the requested modification to the
74203 batch job.
- 74204 • The designated job is not managed by the batch server.
- 74205 • The requested modification is inconsistent with the state of the batch job.
- 74206 • An unrecognized resource is requested for a batch job in an execution queue.

74207 A batch server may reject a *Modify Batch Job Request* for other implementation-defined reasons.
74208 The method used to determine whether the user of a client is authorized to perform the
74209 requested action is implementation-defined.

74210 A batch server that accepts a *Modify Batch Job Request* shall modify all the specified attributes of
74211 the batch job. A batch server that rejects a *Modify Batch Job Request* shall modify none of the
74212 attributes of the batch job.

74213 If the servicing by a batch server of an otherwise valid request would result in no change, then
74214 the batch server shall indicate successful completion of the request.

74215 3.2.3.7 *Move Batch Job Request*

74216 A batch client can request that a batch server move a batch job to another destination. Such a
74217 request is called a *Move Batch Job Request*.

74218 A batch server shall reject a *Move Batch Job Request* if any of the following statements are true:

- 74219 • The user of the batch client is not authorized to remove the designated job from the queue
74220 in which the batch job resides.
- 74221 • The user of the batch client is not authorized to move the designated job to the destination.
- 74222 • The designated job is not managed by the batch server.
- 74223 • The designated job is in the EXITING state.
- 74224 • The destination is inaccessible.

74225 A batch server can reject a *Move Batch Job Request* for other implementation-defined reasons. The
74226 method used to determine whether the user of a client is authorized to perform the requested
74227 action is implementation-defined.

74228 A batch server that accepts a *Move Batch Job Request* shall perform the following services:

- 74229 • Queue the designated job at the destination.
- 74230 • Remove the designated job from the queue in which the batch job resides.

74231 If the destination resides on another batch server, the batch server shall queue the batch job at
74232 the destination by sending a *Queue Batch Job Request* to the other server. If the *Queue Batch Job*
74233 *Request* fails, the batch server shall reject the *Move Batch Job Request*. If the *Queue Batch Job*
74234 *Request* succeeds, the batch server shall remove the batch job from its queue.

74235 The batch server shall not modify any attributes of the batch job.

74236 3.2.3.8 *Queue Batch Job Request*

74237 A batch queue is controlled by one and only one batch server. A batch server is said to own the
74238 queues that it controls. Batch clients make requests of batch servers to have jobs queued. Such a
74239 request is called a *Queue Batch Job Request*.

74240 A batch server requested to queue a batch job for which the queue is not specified shall select an
74241 implementation-defined queue for the batch job. Such a queue is called the “default queue” of
74242 the batch server. The implementation shall provide the means for a batch administrator to
74243 specify the default queue. The queue, whether specified or defaulted, is called the “target
74244 queue”.

74245 A batch server shall reject a *Queue Batch Job Request* if any of the following statements are true:

- 74246 • The client is not authorized to create a batch job in the target queue.
- 74247 • The request specifies a queue that does not exist on the batch server.
- 74248 • The target queue is an execution queue and the batch server cannot satisfy a resource
74249 requirement of the batch job.
- 74250 • The target queue is an execution queue and an unrecognized resource is requested.

- 74251 • The target queue is an execution queue, the batch server does not support checkpointing,
74252 and the value of the *Checkpoint* attribute of the batch job is not NO_CHECKPOINT.
- 74253 • The job requires access to a user identifier that the batch client is not authorized to access.

74254 A batch server may reject a *Queue Batch Job Request* for other implementation-defined reasons.

74255 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
74256 PBS_O_QUEUE value is missing from the value of the *Variable_List* attribute of the batch job
74257 shall add that variable to the list and set the value to the name of the target queue. Once set, no
74258 server shall change the value of PBS_O_QUEUE, even if the batch job is moved to another
74259 queue.

74260 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the PBS_JOBID
74261 value is missing from the value of the *Variable_List* attribute shall add that variable to the list and
74262 set the value to the batch job identifier assigned by the server in the format:

74263 `sequence_number.server`

74264 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
74265 PBS_JOBNAME value is missing from the value of the *Variable_List* attribute of the batch job
74266 shall add that variable to the list and set the value to the *Job_Name* attribute of the batch job.

74267 3.2.3.9 *Batch Queue Status Request*

74268 A batch client can request that a batch server respond with the status and attributes of a queue.
74269 Such a request is called a *Batch Queue Status Request*.

74270 A batch server shall reject a *Batch Queue Status Request* if any of the following statements are
74271 true:

- 74272 • The user of the batch client is not authorized to query the status of the designated queue.
- 74273 • The designated queue does not exist on the batch server.

74274 A batch server may reject a *Batch Queue Status Request* for other implementation-defined reasons.
74275 The method used to determine whether the user of a client is authorized to perform the
74276 requested action is implementation-defined.

74277 A batch server that accepts a *Batch Queue Status Request* shall return a *Batch Queue Status Reply* to
74278 the batch client.

74279 3.2.3.10 *Release Batch Job Request*

74280 A batch client can request that the server remove one or more holds from a batch job. Such a
74281 request is called a *Release Batch Job Request*.

74282 A batch server shall reject a *Release Batch Job Request* if any of the following statements are true:

- 74283 • The user of the batch client is not authorized to remove one or more of the requested holds
74284 from the batch job.
- 74285 • The batch server does not manage the specified job.

74286 A batch server may reject a *Release Batch Job Request* for other implementation-defined reasons.
74287 The method used to determine whether the user of a client is authorized to perform the
74288 requested action is implementation-defined.

74289 A batch server that accepts a *Release Batch Job Request* shall remove each type of hold listed in the
74290 *Release Batch Job Request*, that is present, from the value of the *Hold_Types* attribute of the batch
74291 job.

74292 3.2.3.11 *Rerun Batch Job Request*

74293 To rerun a batch job is to kill the session leader of the batch job and leave the batch job eligible
74294 for re-execution. A batch client can request that a batch server rerun a batch job. Such a request
74295 is called *Rerun Batch Job Request*.

74296 A batch server shall reject a *Rerun Batch Job Request* if any of the following statements are true:

- 74297 • The user of the batch client is not authorized to rerun the designated job.
- 74298 • The *Rerunable* attribute of the designated job has the value FALSE.
- 74299 • The designated job is not in the RUNNING state.
- 74300 • The batch server does not manage the designated job.

74301 A batch server may reject a *Rerun Batch Job Request* for other implementation-defined reasons.
74302 The method used to determine whether the user of a client is authorized to perform the
74303 requested action is implementation-defined.

74304 A batch server that rejects a *Rerun Batch Job Request* shall in no way modify the execution of the
74305 batch job.

74306 A batch server that accepts a request to rerun a batch job shall perform the following services:

- 74307 • Requeue the batch job in the execution queue in which it was executing.
- 74308 • Send a SIGKILL signal to the process group of the session leader of the batch job.

74309 An implementation may indicate to the batch job owner that the batch job has been rerun.
74310 Whether and how the batch job owner is notified that a batch job is rerun is implementation-
74311 defined.

74312 A batch server that reruns a batch job may send other implementation-defined signals to the
74313 session leader of the batch job prior to sending the SIGKILL signal.

74314 A batch server may preferentially select a rerun job for execution. Whether rerun jobs shall be
74315 selected for execution before other jobs is implementation-defined.

74316 3.2.3.12 *Select Batch Jobs Request*

74317 A batch client can request from a batch server a list of jobs managed by that server that match a
74318 list of selection criteria. Such a request is called a *Select Batch Jobs Request*. All the batch jobs
74319 managed by the batch server that receives the request are candidates for selection.

74320 A batch server that accepts a *Select Batch Jobs Request* shall return a list of zero or more job
74321 identifiers that correspond to jobs that meet the selection criteria.

74322 If the batch client is not authorized to query the status of a batch job, the batch server shall not
74323 select the batch job.

74324 3.2.3.13 *Server Shutdown Request*

74325 A batch server is defined to have shut down when it does not respond to requests from clients
74326 and does not perform deferred services for jobs. A batch client can request that a batch server
74327 shut down. Such a request is called a *Server Shutdown Request*.

74328 A batch server shall reject a *Server Shutdown Request* from a client that is not authorized to shut
74329 down the batch server. The method used to determine whether the user of a client is authorized
74330 to perform the requested action is implementation-defined.

74331 A batch server may reject a *Server Shutdown Request* for other implementation-defined reasons.
74332 The reasons for which a *Server Shutdown Request* may be rejected are implementation-defined.

74333 At server shutdown, a batch server shall do, in order of preference, one of the following:

- 74334 • If checkpointing is implemented and the batch job is checkpointable, then checkpoint the
- 74335 batch job and requeue it.
- 74336 • If the batch job is rerunnable, then requeue the batch job to be rerun (restarted from the
- 74337 beginning).
- 74338 • Abort the batch job.

74339 3.2.3.14 *Server Status Request*

74340 A batch client can request that a batch server respond with the status and attributes of the batch
74341 server. Such a request is called a *Server Status Request*.

74342 A batch server shall reject a *Server Status Request* if the following statement is true:

- 74343 • The user of the batch client is not authorized to query the status of the designated server.

74344 A batch server may reject a *Server Status Request* for other implementation-defined reasons. The
74345 method used to determine whether the user of a client is authorized to perform the requested
74346 action is implementation-defined.

74347 A batch server that accepts a *Server Status Request* shall return a *Server Status Reply* to the batch
74348 client.

74349 3.2.3.15 *Signal Batch Job Request*

74350 A batch client can request that a batch server signal the session leader of a batch job. Such a
74351 request is called a *Signal Batch Job Request*.

74352 A batch server shall reject a *Signal Batch Job Request* if any of the following statements are true:

- 74353 • The user of the batch client is not authorized to signal the batch job.
- 74354 • The job is not in the RUNNING state.
- 74355 • The batch server does not manage the designated job.
- 74356 • The requested signal is not supported by the implementation.

74357 A batch server may reject a *Signal Batch Job Request* for other implementation-defined reasons.
74358 The method used to determine whether the user of a client is authorized to perform the
74359 requested action is implementation-defined.

74360 A batch server that accepts a request to signal a batch job shall send the signal requested by the
74361 batch client to the process group of the session leader of the batch job.

74362 3.2.3.16 *Track Batch Job Request*

74363 *Track Batch Job Request* is an optional feature of batch servers. If an implementation supports
74364 *Track Batch Job Request*, the statements in this section apply and the configuration variable
74365 POSIX2_PBS_TRACK shall be set to 1.

74366 *Track Batch Job Request* provides a method for tracking the current location of a batch job. Clients
74367 may use the tracking information to determine the batch server that should receive a batch
74368 server request.

74369 If *Track Batch Job Request* is supported by a batch server, then when the batch server queues a
74370 batch job as a result of a *Queue Batch Job Request*, and the batch server is not the batch server that
74371 created the batch job, the batch server shall send a *Track Batch Job Request* to the batch server that
74372 created the job.

74373 If *Track Batch Job Request* is supported by a batch server, then the *Track Batch Job Request* may also
 74374 be sent to other servers as a backup to the primary server. The method by which backup servers
 74375 are specified is implementation-defined.

74376 If *Track Batch Job Request* is supported by a batch server that receives a *Track Batch Job Request*,
 74377 then the batch server shall record the current location of the batch job as contained in the
 74378 request.

74379 3.3 Common Behavior for Batch Environment Utilities

74380 3.3.1 Batch Job Identifier

74381 A utility shall recognize *job_identifiers* of the format:

74382 [*sequence_number*] [. *server_name*] [@*server*]

74383 where:

74384 *sequence_number* An integer that, when combined with *server_name*, provides a batch job
 74385 identifier that is unique within the batch system.

74386 *server_name* The name of the batch server to which the batch job was originally submitted.

74387 *server* The name of the batch server that is currently managing the batch job.

74388 If the application omits the batch *server_name* portion of a batch job identifier, a utility shall use
 74389 the name of a default batch server.

74390 If the application omits the batch *server* portion of a batch job identifier, a utility shall use:

- 74391 • The batch server indicated by *server_name*, if present
- 74392 • The name of the default batch server
- 74393 • The name of the batch server that is currently managing the batch job

74394 If only @*server* is specified, then the status of all jobs owned by the user on the requested server
 74395 is listed.

74396 The means by which a utility determines the default batch server is implementation-defined.

74397 If the application presents the batch *server* portion of a batch job identifier to a utility, the utility
 74398 shall send the request to the specified server.

74399 A strictly conforming application shall use the syntax described for the job identifier. Whenever
 74400 a batch job identifier is specified whose syntax is not recognized by an implementation, then a
 74401 message for each error that occurs shall be written to standard error and the utility shall exit
 74402 with an exit status greater than zero.

74403 When a batch job identifier is supplied as an argument to a batch utility and the *server_name*
 74404 portion of the batch job identifier is omitted, then the utility shall use the name of the default
 74405 batch server.

74406 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*
 74407 portion of the batch job identifier is omitted, then the utility shall use either:

- 74408 • The name of the default batch server

74409 or:

- 74410
- The name of the batch server that is currently managing the batch job

74411 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*
74412 portion of the batch job identifier is specified, then the utility shall send the required *Batch Server*
74413 *Request* to the specified server.

74414 3.3.2 Destination

74415 The utility shall recognize a *destination* of the format:

74416 [*queue*] [@*server*]

74417 where:

74418 *queue* The name of a valid execution or routing queue at the batch server denoted by
74419 @*server*, defined as a string of up to 15 alphanumeric characters in the portable
74420 character set (see XBD Section 6.1, on page 111) where the first character is
74421 alphabetic.

74422 *server* The name of a batch server, defined as a string of alphanumeric characters in the
74423 portable character set.

74424 If the application omits the batch *server* portion of a destination, then the utility shall use either:

- The name of the default batch server

74426 or:

- The name of the batch server that is currently managing the batch job

74428 The means by which a utility determines the default batch server is implementation-defined.

74429 If the application omits the *queue* portion of a destination, then the utility shall use the name of
74430 the default queue at the batch server chosen. The means by which a batch server determines its
74431 default queue is implementation-defined. If a destination is specified in the *queue@server* form,
74432 then the utility shall use the specified queue at the specified server.

74433 A strictly conforming application shall use the syntax described for a destination. Whenever a
74434 destination is specified whose syntax is not recognized by an implementation, then a message
74435 shall be written to standard error and the utility shall exit with an exit status greater than zero.

74436 3.3.3 Multiple Keyword-Value Pairs

74437 For each option that can have multiple keyword-value pair arguments, the following rules shall
74438 apply. Examples of options that can have list-oriented option-arguments are `-u value@keyword`
74439 and `-l keyword=value`.

1. If a batch utility is presented with a list-oriented option-argument for which a keyword
74440 has a corresponding value that begins with a single or double quote, then the utility shall
74441 stop interpreting the input stream for delimiters until a second single or double quote,
74442 respectively, is encountered. This feature allows some flexibility for a comma (',') or
74443 equals sign ('=') to be part of the value string for a particular keyword; for example:

74445 `keywd1='val1, val2', keywd2="val3, val4"`

74446 **Note:** This may require the user to escape the quotes as in the following command:

74447 `foo -xkeywd1='val1, val2\ ', keywd2=\"val3, val4\"`

2. If a batch server is presented with a list-oriented attribute that has a keyword that was
74448 encountered earlier in the list, then the later entry for that keyword shall replace the
74449 earlier entry.
74450

- 74451
- 74452
- 74453
- 74454
- 74455
- 74456
- 74457
- 74458
- 74459
- 74460
- 74461
- 74462
- 74463
- 74464
- 74465
- 74466
- 74467
- 74468
- 74469
- 74470
- 74471
- 74472
- 74473
- 74474
- 74475
3. If a batch server is presented with a list-oriented attribute that has a keyword without any corresponding value of the form *keyword=* or *@keyword* and the same keyword was encountered earlier in the list, then the prior entry for that keyword shall be ignored by the batch server.
 4. If a batch utility is expecting a list-oriented option-argument entry of the form *keyword=value*, but is presented with an entry of the form *keyword* without any corresponding *value*, then the entry shall be treated as though a default value of NULL was assigned (that is, *keyword=NULL*) for entry parsing purposes. The utility shall include only the keyword, not the NULL value, in the associated job attribute.
 5. If a batch utility is expecting a list-oriented option-argument entry of the form *value@keyword*, but is presented with an entry of the form *value* without any corresponding *keyword*, then the entry shall be treated as though a keyword of NULL was assigned (that is, *value@NULL*) for entry parsing purposes. The utility shall include only the value, not the NULL keyword, in the associated job attribute.
 6. A batch server shall accept a list-oriented attribute that has multiple occurrences of the same keyword, interpreting the keywords, in order, with the last value encountered taking precedence over prior instances of the same keyword. This rule allows, but does not require, a batch utility to preprocess the attribute to remove duplicate keywords.
 7. If a batch utility is presented with multiple list-oriented option-arguments on the command line or in script directives, or both, for a single option, then the utility shall concatenate, in order, any command line keyword and value pairs to the end of any directive keyword and value pairs separated by a single comma to produce a single string that is an equivalent, valid option-argument. The resulting string shall be assigned to the associated attribute of the batch job (after optionally removing duplicate entries as described in item 6).

74476

Chapter 4

74477

Utilities

74478

This chapter contains the definitions of the utilities, as follows:

74479

- Mandatory utilities that are present on every conformant system

74480

- Optional utilities that are present only on systems supporting the associated option; see [Section 1.7.1](#) (on page 7) for information on the options in this volume of POSIX.1-200x

74481

74482 **NAME**74483 admin — create and administer SCCS files (**DEVELOPMENT**)74484 **SYNOPSIS**

```

74485 XSI admin -i[name] [-n] [-a login] [-d flag] [-e login] [-f flag]
74486         [-m mrlist] [-r rel] [-t[name] [-y[comment]]] newfile
74487
74487 admin -n [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
74488         [-t[name]] [-y[comment]] newfile...
74489
74489 admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t[name]] file...
74490
74490 admin -h file...
74491
74491 admin -z file...

```

74492 **DESCRIPTION**

74493 The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named
 74494 file does not exist, it shall be created, and its parameters shall be initialized according to the
 74495 specified options. Parameters not initialized by an option shall be assigned a default value. If a
 74496 named file does exist, parameters corresponding to specified options shall be changed, and other
 74497 parameters shall be left as is.

74498 All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files
 74499 shall be given read-only permission mode. Write permission in the parent directory is required
 74500 to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*)
 74501 created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode
 74502 as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file
 74503 shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This
 74504 ensures that changes are made to the SCCS file only if no errors occur.

74505 The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent
 74506 simultaneous updates to the SCCS file; see *get*.

74507 **OPTIONS**

74508 The *admin* utility shall conform to XBD [Section 12.2](#) (on page 201), except that the *-i*, *-t*, and *-y*
 74509 options have optional option-arguments. These optional option-arguments shall not be
 74510 presented as separate arguments. The following options are supported:

74511 **-n** Create a new SCCS file. When *-n* is used without *-i*, the SCCS file shall be created
 74512 with control information but without any file data.

74513 **-i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken.
 74514 The text constitutes the first delta of the file (see the *-r* option for the delta
 74515 numbering scheme). If the *-i* option is used, but the *name* option-argument is
 74516 omitted, the text shall be obtained by reading the standard input. If this option is
 74517 omitted, the SCCS file shall be created with control information but without any
 74518 file data. The *-i* option implies the *-n* option.

74519 **-r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that
 74520 is, the branch and sequence numbers shall be zero or missing. The level number is
 74521 optional, and defaults to 1.

74522 **-t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be
 74523 taken. In the case of existing SCCS files (neither *-i* nor *-n* is specified):

- 74524 • A **-t** option without a *name* option-argument shall cause the removal of
74525 descriptive text (if any) currently in the SCCS file.
- 74526 • A **-t** option with a *name* option-argument shall cause the text (if any) in the
74527 named file to replace the descriptive text (if any) currently in the SCCS file.
- 74528 **-f flag** Specify a *flag*, and, possibly, a value for the *flag*, to be placed in the SCCS file.
74529 Several **-f** options may be supplied on a single *admin* command line.
74530 Implementations shall recognize the following flags and associated values:
- 74531 **b** Allow use of the **-b** option on a *get* command to create branch deltas.
- 74532 **cceil** Specify the highest release (that is, ceiling), a number less than or equal to
74533 9999, which may be retrieved by a *get* command for editing. The default
74534 value for an unspecified **c** flag shall be 9999.
- 74535 **ffloor** Specify the lowest release (that is, floor), a number greater than 0 but less
74536 than 9999, which may be retrieved by a *get* command for editing. The
74537 default value for an unspecified **f** flag shall be 1.
- 74538 **dSID** Specify the default delta number (SID) to be used by a *get* command.
- 74539 **istr** Treat the “No ID keywords” message issued by *get* or *delta* as a fatal error.
74540 In the absence of this flag, the message is only a warning. The message is
74541 issued if no SCCS identification keywords (see *get*) are found in the text
74542 retrieved or stored in the SCCS file. If a value is supplied, the application
74543 shall ensure that the keywords exactly match the given string; however,
74544 the string shall contain a keyword, and no embedded <newline>s.
- 74545 **j** Allow concurrent *get* commands for editing on the same SID of an SCCS
74546 file. This allows multiple concurrent updates to the same version of the
74547 SCCS file.
- 74548 **l|list** Specify a *list* of releases to which deltas can no longer be made (that is, *get*
74549 **-e** against one of these locked releases fails). Conforming applications
74550 shall use the following syntax to specify a *list*. Implementations may
74551 accept additional forms as an extension:
- 74552 <list> ::= a | <range-list>
74553 <range-list> ::= <range> | <range-list>, <range>
74554 <range> ::= <SID>
- 74555 The character *a* in the *list* shall be equivalent to specifying all releases for
74556 the named SCCS file. The non-terminal <SID> in range shall be the delta
74557 number of an existing delta associated with the SCCS file.
- 74558 **n** Cause *delta* to create a null delta in each of those releases (if any) being
74559 skipped when a delta is made in a new release (for example, in making
74560 delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas
74561 shall serve as anchor points so that branch deltas may later be created
74562 from them. The absence of this flag shall cause skipped releases to be
74563 nonexistent in the SCCS file, preventing branch deltas from being created
74564 from them in the future. During the initial creation of an SCCS file, the **n**
74565 flag may be ignored; that is, if the **-r** option is used to set the release
74566 number of the initial SID to a value greater than 1, null deltas need not be
74567 created for the “skipped” releases.
- 74568 **qtext** Substitute user-definable *text* for all occurrences of the %Q% keyword in
74569 the SCCS file text retrieved by *get*.

74570	mmod	Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the m flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' . ' removed.
74571		
74572		
74573		
74574	ttype	Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .
74575		
74576	vpgm	Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the m option is also used even if its value is null.)
74577		
74578		
74579		
74580		
74581	-d flag	Remove (delete) the specified <i>flag</i> from an SCCS file. Several -d options may be supplied on a single <i>admin</i> command. See the -f option for allowable <i>flag</i> names. (The l ist flag gives a <i>list</i> of releases to be unlocked. See the -f option for further description of the l flag and the syntax of a <i>list</i> .)
74582		
74583		
74584		
74585	-a login	Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several -a options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a '!', the users so specified shall be denied permission to make deltas.
74586		
74587		
74588		
74589		
74590		
74591		
74592	-e login	Specify a <i>login</i> name, or numerical group ID, to be erased from the list of users allowed to make deltas (changes) to the SCCS file. Specifying a group ID is equivalent to specifying all <i>login</i> names common to that group ID. Several -e options may be used on a single <i>admin</i> command line.
74593		
74594		
74595		
74596	-y[comment]	Insert the <i>comment</i> text into the SCCS file as a comment for the initial delta in a manner identical to that of <i>delta</i> . In the POSIX locale, omission of the -y option shall result in a default comment line being inserted in the form:
74597		
74598		
74599		"date and time created %s %s by %s", <date>, <time>, <login>
74600		where <date> is expressed in the format of the <i>date</i> utility's %Y/%m/%d conversion specification, <time> in the format of the <i>date</i> utility's %T conversion specification format, and <login> is the login name of the user creating the file.
74601		
74602		
74603	-m mrlist	Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the v flag is set and the MR numbers are validated if the v flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the v flag is not set or MR validation fails.
74604		
74605		
74606		
74607		
74608	-h	Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.
74609		
74610		
74611		
74612	-z	Recompute the SCCS file checksum and store it in the first line of the SCCS file (see the -h option above). Note that use of this option on a truly corrupted file may prevent future detection of the corruption.
74613		
74614		

74615 **OPERANDS**

74616 The following operands shall be supported:

74617 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*
 74618 utility shall behave as though each file in the directory were specified as a named
 74619 file, except that non-SCCS files (last component of the pathname does not begin
 74620 with **s**.) and unreadable files shall be silently ignored.

74621 *newfile* A pathname of an SCCS file to be created.

74622 If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each
 74623 line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-
 74624 SCCS files and unreadable files shall be silently ignored.

74625 **STDIN**

74626 The standard input shall be a text file used only if **-i** is specified without an option-argument or
 74627 if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is
 74628 <SOH> in the POSIX locale, the results are unspecified.

74629 **INPUT FILES**

74630 The existing SCCS files shall be text files of an unspecified format.

74631 The application shall ensure that the file named by the **-i** option's *name* option-argument shall
 74632 be a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results
 74633 are unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the
 74634 header for this file shall be 99 999 for this delta.

74635 **ENVIRONMENT VARIABLES**74636 The following environment variables shall affect the execution of *admin*:

74637 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 74638 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 74639 variables used to determine the values of locale categories.)

74640 **LC_ALL** If set to a non-empty string value, override the values of all the other
 74641 internationalization variables.

74642 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 74643 characters (for example, single-byte as opposed to multi-byte characters in
 74644 arguments and input files).

74645 **LC_MESSAGES**
 74646 Determine the locale that should be used to affect the format and contents of
 74647 diagnostic messages written to standard error and the contents of the default **-y**
 74648 comment.

74649 **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

74650 **ASYNCHRONOUS EVENTS**

74651 Default.

74652 **STDOUT**

74653 Not used.

74654 **STDERR**

74655 The standard error shall be used only for diagnostic messages.

74656 **OUTPUT FILES**

74657 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a
 74658 locking *z-file*, as described in *get* (on page 2693), may be created and deleted.

74659 **EXTENDED DESCRIPTION**

74660 None.

74661 **EXIT STATUS**

74662 The following exit values shall be returned:

74663 0 Successful completion.

74664 >0 An error occurred.

74665 **CONSEQUENCES OF ERRORS**

74666 Default.

74667 **APPLICATION USAGE**

74668 It is recommended that directories containing SCCS files be writable by the owner only, and that
 74669 SCCS files themselves be read-only. The mode of the directories should allow only the owner to
 74670 modify SCCS files contained in the directories. The mode of the SCCS files prevents any
 74671 modification at all except by SCCS commands.

74672 **EXAMPLES**

74673 None.

74674 **RATIONALE**

74675 None.

74676 **FUTURE DIRECTIONS**

74677 None.

74678 **SEE ALSO**74679 *delta, get, prs, what*74680 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

+

74681 **CHANGE HISTORY**

74682 First released in Issue 2.

74683 **Issue 6**

74684 The normative text is reworded to avoid use of the term “must” for application requirements,
 74685 and to emphasize the term “shall” for implementation requirements.

74686 The grammar is updated.

74687 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES
 74688 section warning that the maximum lines recorded in the file is 99 999.

74689 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h**
 74690 option.

74691 **NAME**
 74692 alias — define or display aliases

74693 **SYNOPSIS**
 74694 alias [*alias-name*[=*string*]. . .]

74695 **DESCRIPTION**
 74696 The *alias* utility shall create or redefine alias definitions or write the values of existing alias
 74697 definitions to standard output. An alias definition provides a string value that shall replace a
 74698 command name when it is encountered; see [Section 2.3.1](#) (on page 2248).

74699 An alias definition shall affect the current shell execution environment and the execution
 74700 environments of the subshells of the current shell. When used as specified by this volume of
 74701 POSIX.1-200x, the alias definition shall not affect the parent process of the current shell nor any
 74702 utility environment invoked by the shell; see [Section 2.12](#) (on page 2277).

74703 **OPTIONS**
 74704 None.

74705 **OPERANDS**
 74706 The following operands shall be supported:
 74707 *alias-name* Write the alias definition to standard output.
 74708 *alias-name=string*
 74709 Assign the value of *string* to the alias *alias-name*.
 74710 If no operands are given, all alias definitions shall be written to standard output.

74711 **STDIN**
 74712 Not used.

74713 **INPUT FILES**
 74714 None.

74715 **ENVIRONMENT VARIABLES**
 74716 The following environment variables shall affect the execution of *alias*:
 74717 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 74718 (See [XBD Section 8.2](#) (on page 160) for the precedence of internationalization |
 74719 variables used to determine the values of locale categories.)

74720 *LC_ALL* If set to a non-empty string value, override the values of all the other
 74721 internationalization variables.

74722 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 74723 characters (for example, single-byte as opposed to multi-byte characters in
 74724 arguments).

74725 *LC_MESSAGES*
 74726 Determine the locale that should be used to affect the format and contents of
 74727 diagnostic messages written to standard error.

74728 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

74729 **ASYNCHRONOUS EVENTS**
 74730 Default.

74731 **STDOUT**

74732 The format for displaying aliases (when no operands or only *name* operands are specified) shall
74733 be:

74734 `"%s=%s\n", name, value`

74735 The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the
74736 shell. See the description of shell quoting in [Section 2.2](#) (on page 2246).

74737 **STDERR**

74738 The standard error shall be used only for diagnostic messages.

74739 **OUTPUT FILES**

74740 None.

74741 **EXTENDED DESCRIPTION**

74742 None.

74743 **EXIT STATUS**

74744 The following exit values shall be returned:

74745 0 Successful completion.

74746 >0 One of the *name* operands specified did not have an alias definition, or an error occurred.

74747 **CONSEQUENCES OF ERRORS**

74748 Default.

74749 **APPLICATION USAGE**

74750 None.

74751 **EXAMPLES**

74752 1. Create a short alias for a commonly used *ls* command:

74753 `alias lf="ls -CF"`

74754 2. Create a simple "redo" command to repeat previous entries in the command history file:

74755 `alias r='fc -s'`

74756 3. Use 1K units for *du*:

74757 `alias du=du\ -k`

74758 4. Set up *nohup* so that it can deal with an argument that is itself an alias name:

74759 `alias nohup="nohup "`

74760 **RATIONALE**

74761 The *alias* description is based on historical KornShell implementations. Known differences exist
74762 between that and the C shell. The KornShell version was adopted to be consistent with all the
74763 other KornShell features in this volume of POSIX.1-200x, such as command line editing.

74764 Since *alias* affects the current shell execution environment, it is generally provided as a shell
74765 regular built-in.

74766 Historical versions of the KornShell have allowed aliases to be exported to scripts that are
74767 invoked by the same shell. This is triggered by the *alias -x* flag; it is allowed by this volume of
74768 POSIX.1-200x only when an explicit extension such as *-x* is used. The standard developers
74769 considered that aliases were of use primarily to interactive users and that they should normally
74770 not affect shell scripts called by those users; functions are available to such scripts.

74771 Historical versions of the KornShell had not written aliases in a quoted manner suitable for
74772 reentry to the shell, but this volume of POSIX.1-200x has made this a requirement for all similar
74773 output. Therefore, consistency was chosen over this detail of historical practice.

74774

FUTURE DIRECTIONS

74775

None.

CHANGE HISTORY

74780

First released in Issue 4.

74781

Issue 6

74782

This utility is marked as part of the User Portability Utilities option.

74783

The APPLICATION USAGE section is added.

74784

Issue 7

74785

The *alias* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

74786

74787

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

74788

The first example is changed to remove the creation of an alias for a standard utility that alters its behavior to be non-conforming. +

74789

DRAFT

74790 NAME

74791 ar — create and maintain library archives

74802 ar -r -b [-cuv] posname archive file...

74803 ar -r -i [-cuv] posname archive file...

74804 XSI ar -t [-v] [-s] archive [file...]

74805 XSI ar -x [-v] [-sCT] archive [file...]

74806 DESCRIPTION

74807 The *ar* utility is part of the Software Development Utilities option.

74808 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once
 74809 an archive has been created, new files can be added, and existing files in an archive can be
 74810 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the
 74811 implementation shall format the archive so that it is usable as a library for link editing (see *c99*
 74812 and *fort77*). When some of the archived files are not valid object files, the suitability of the
 74813 XSI archive for library use is undefined. If an archive consists entirely of printable files, the entire
 74814 archive shall be printable.

74815 When *ar* creates an archive, it creates administrative information indicating whether a symbol
 74816 table is present in the archive. When there is at least one object file that *ar* recognizes as such in
 74817 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is
 74818 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update
 74819 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the
 74820 symbol table to be rebuilt.

74821 All *file* operands can be pathnames. However, files within archives shall be named by a filename,
 74822 which is the last component of the pathname used when the file was entered into the archive.
 74823 The comparison of *file* operands to the names of files in archives shall be performed by
 74824 comparing the last component of the operand to the name of the file in the archive.

74825 It is unspecified whether multiple files in the archive may be identically named. In the case of
 74826 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive
 74827 having a name that is the same as the last component of the operand.

74828 OPTIONS

74829 The *ar* utility shall conform to XBD Section 12.2 (on page 201), except for Guideline 9.

74830 The following options shall be supported:

- 74831 XSI **-a** Position new files in the archive after the file named by the *posname* operand.
- 74832 XSI **-b** Position new files in the archive before the file named by the *posname* operand.
- 74833 **-c** Suppress the diagnostic message that is written to standard error by default when
74834 the archive *archive* is created.
- 74835 XSI **-C** Prevent extracted files from replacing like-named files in the file system. This
74836 option is useful when **-T** is also used, to prevent truncated filenames from
74837 replacing files with the same prefix.
- 74838 **-d** Delete one or more *files* from *archive*.
- 74839 XSI **-i** Position new files in the archive before the file in the archive named by the *posname*
74840 operand (equivalent to **-b**).
- 74841 XSI **-m** Move the named files in the archive. The **-a**, **-b**, or **-i** options with the *posname*
74842 operand indicate the position; otherwise, move the names files in the archive to the
74843 end of the archive.
- 74844 **-p** Write the contents of the *files* in the archive named by *file* operands from *archive* to
74845 the standard output. If no *file* operands are specified, the contents of all files in the
74846 archive shall be written in the order of the archive.
- 74847 XSI **-q** Append the named files to the end of the archive. In this case *ar* does not check
74848 whether the added files are already in the archive. This is useful to bypass the
74849 searching otherwise done when creating a large archive piece by piece.
- 74850 **-r** Replace or add *files* to *archive*. If the archive named by *archive* does not exist, a new
74851 archive shall be created and a diagnostic message shall be written to standard error
74852 (unless the **-c** option is specified). If no *files* are specified and the *archive* exists, the
74853 results are undefined. Files that replace existing files in the archive shall not change
74854 the order of the archive. Files that do not replace existing files in the archive shall
74855 be appended to the archive unless a **-a**, **-b**, or **-i** option specifies another position.
- 74856 XSI **-s** Force the regeneration of the archive symbol table even if *ar* is not invoked with an
74857 option that modifies the archive contents. This option is useful to restore the
74858 archive symbol table after it has been stripped; see *strip*.
- 74859 **-t** Write a table of contents of *archive* to the standard output. Only the files specified
74860 by the *file* operands shall be included in the written list. If no *file* operands are
74861 specified, all files in *archive* shall be included in the order of the archive.
- 74862 XSI **-T** Allow filename truncation of extracted files whose archive names are longer than
74863 the file system can support. By default, extracting a file with a name that is too
74864 long shall be an error; a diagnostic message shall be written and the file shall not
74865 be extracted.
- 74866 **-u** Update older files in the archive. When used with the **-r** option, files in the archive
74867 shall be replaced only if the corresponding *file* has a modification time that is at
74868 least as new as the modification time of the file in the archive.
- 74869 **-v** Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a
74870 detailed file-by-file description of the archive creation and maintenance activity, as
74871 described in the STDOUT section.
- 74872 When used with **-p**, write the name of the file in the archive to the standard output

74873 before writing the file in the archive itself to the standard output, as described in
 74874 the STDOUT section.

74875 When used with `-t`, include a long listing of information about the files in the
 74876 archive, as described in the STDOUT section.

74877 `-x` Extract the files in the archive named by the *file* operands from *archive*. The
 74878 contents of the archive shall not be changed. If no *file* operands are given, all files
 74879 in the archive shall be extracted. The modification time of each file extracted shall
 74880 be set to the time the file is extracted from the archive.

OPERANDS

74881 The following operands shall be supported:

74882 *archive* A pathname of the archive.

74883 *file* A pathname. Only the last component shall be used when comparing against the
 74884 names of files in the archive. If two or more *file* operands have the same last
 74885 pathname component (basename), the results are unspecified. The
 74886 implementation's archive format shall not truncate valid filenames of files added
 74887 to or replaced in the archive.

74888 XSI *posname* The name of a file in the archive, used for relative positioning; see options `-m` and
 74889 `-r`.

STDIN

74891 Not used.

INPUT FILES

74892 The archive named by *archive* shall be a file in the format created by `ar -r`.

ENVIRONMENT VARIABLES

74895 The following environment variables shall affect the execution of *ar*:

74897 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 74898 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 74899 variables used to determine the values of locale categories.)

74900 *LC_ALL* If set to a non-empty string value, override the values of all the other
 74901 internationalization variables.

74902 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 74903 characters (for example, single-byte as opposed to multi-byte characters in
 74904 arguments and input files).

74905 *LC_MESSAGES*
 74906 Determine the locale that should be used to affect the format and contents of
 74907 diagnostic messages written to standard error.

74908 *LC_TIME* Determine the format and content for date and time strings written by `ar -tv`.

74909 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

74910 *TMPDIR* Determine the pathname that overrides the default directory for temporary files, if
 74911 any.

74912 *TZ* Determine the timezone used to calculate date and time strings written by `ar -tv`.
 74913 If *TZ* is unset or null, an unspecified default timezone shall be used.

74914 **ASYNCHRONOUS EVENTS**

74915 Default.

74916 **STDOUT**74917 If the `-d` option is used with the `-v` option, the standard output format shall be:74918 `"d - %s\n", <file>`74919 where *file* is the operand specified on the command line.74920 If the `-p` option is used with the `-v` option, *ar* shall precede the contents of each file with:74921 `"\n<%s>\n\n", <file>`74922 where *file* is the operand specified on the command line, if *file* operands were specified, and the
74923 name of the file in the archive if they were not.74924 If the `-r` option is used with the `-v` option:74925 • If *file* is already in the archive, the standard output format shall be:74926 `"r - %s\n", <file>`74927 where *<file>* is the operand specified on the command line.74928 • If *file* is not already in the archive, the standard output format shall be:74929 `"a - %s\n", <file>`74930 where *<file>* is the operand specified on the command line.74931 If the `-t` option is used, *ar* shall write the names of the files in the archive to the standard output
74932 in the format:74933 `"%s\n", <file>`74934 where *file* is the operand specified on the command line, if *file* operands were specified, or the
74935 name of the file in the archive if they were not.74936 If the `-t` option is used with the `-v` option, the standard output format shall be:74937 `"%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>,
74938 <group ID>, <number of bytes in member>,
74939 <abbreviated month>, <day-of-month>, <hour>,
74940 <minute>, <year>, <file>`

74941 where:

74942 *<file>* Shall be the operand specified on the command line, if *file* operands were specified,
74943 or the name of the file in the archive if they were not.74944 *<member mode>*74945 Shall be formatted the same as the *<file mode>* string defined in the STDOUT
74946 section of *ls*, except that the first character, the *<entry type>*, is not used; the string
74947 represents the file mode of the file in the archive at the time it was added to or
74948 replaced in the archive.74949 The following represent the last-modification time of a file when it was most recently added to
74950 or replaced in the archive:74951 *<abbreviated month>*74952 Equivalent to the format of the `%b` conversion specification format in *date*.74953 *<day-of-month>*74954 Equivalent to the format of the `%e` conversion specification format in *date*.

74955 <hour> Equivalent to the format of the %H conversion specification format in *date*.

74956 <minute> Equivalent to the format of the %M conversion specification format in *date*.

74957 <year> Equivalent to the format of the %Y conversion specification format in *date*.

74958 When *LC_TIME* does not specify the POSIX locale, a different format and order of presentation
74959 of these fields relative to each other may be used in a format appropriate in the specified locale.

74960 If the *-x* option is used with the *-v* option, the standard output format shall be:

74961 "x - %s\n", <file>

74962 where *file* is the operand specified on the command line, if *file* operands were specified, or the
74963 name of the file in the archive if they were not.

74964 **STDERR**

74965 The standard error shall be used only for diagnostic messages. The diagnostic message about
74966 creating a new archive when *-c* is not specified shall not modify the exit status.

74967 **OUTPUT FILES**

74968 Archives are files with unspecified formats.

74969 **EXTENDED DESCRIPTION**

74970 None.

74971 **EXIT STATUS**

74972 The following exit values shall be returned:

74973 0 Successful completion.

74974 >0 An error occurred.

74975 **CONSEQUENCES OF ERRORS**

74976 Default.

74977 **APPLICATION USAGE**

74978 None.

74979 **EXAMPLES**

74980 None.

74981 **RATIONALE**

74982 The archive format is not described. It is recognized that there are several known *ar* formats,
74983 which are not compatible. The *ar* utility is included, however, to allow creation of archives that
74984 are intended for use only on one machine. The archive is specified as a file, and it can be moved
74985 as a file. This does allow an archive to be moved from one machine to another machine that uses
74986 the same implementation of *ar*.

74987 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable "archives". This is a not
74988 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the
74989 compilers, based on a historical model.

74990 In historical implementations, the *-q* option (available on XSI-conforming systems) is known to
74991 execute quickly because *ar* does not check on whether the added members are already in the
74992 archive. This is useful to bypass the searching otherwise done when creating a large archive
74993 piece-by-piece. These remarks may but need not remain true for a brand new implementation of
74994 this utility; hence, these remarks have been moved into the RATIONALE.

74995 BSD implementations historically required applications to provide the *-s* option whenever the
74996 archive was supposed to contain a symbol table. As in this volume of POSIX.1-200x, System V
74997 historically creates or updates an archive symbol table whenever an object file is removed from,
74998 added to, or updated in the archive.

74999 The OPERANDS section requires what might seem to be true without specifying it: the archive
 75000 cannot truncate the filenames below {NAME_MAX}. Some historical implementations do so,
 75001 however, causing unexpected results for the application. Therefore, this volume of POSIX.1-200x
 75002 makes the requirement explicit to avoid misunderstandings.

75003 According to the System V documentation, the options `-dmpqrtx` are not required to begin with
 75004 a hyphen ('-'). This volume of POSIX.1-200x requires that a conforming application use the
 75005 leading hyphen.

75006 The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as
 75007 an example:

75008 A file created by *ar* begins with the "magic" string "`!<arch>\n". The rest of the archive
 75009 is made up of objects, each of which is composed of a header for a file, a possible filename,
 75010 and the file contents. The header is portable between machine architectures, and, if the file
 75011 contents are printable, the archive is itself printable.`

75012 The header is made up of six ASCII fields, followed by a two-character trailer. The fields
 75013 are the object name (16 characters), the file last modification time (12 characters), the user
 75014 and group IDs (each 6 characters), the file mode (8 characters), and the file size (10
 75015 characters). All numeric fields are in decimal, except for the file mode, which is in octal.

75016 The modification time is the file `st_mtime` field. The user and group IDs are the file `st_uid`
 75017 and `st_gid` fields. The file mode is the file `st_mode` field. The file size is the file `st_size` field.
 75018 The two-byte trailer is the string "`\n`".

75019 Only the name field has any provision for overflow. If any filename is more than 16
 75020 characters in length or contains an embedded space, the string "`#1/`" followed by the
 75021 ASCII length of the name is written in the name field. The file size (stored in the archive
 75022 header) is incremented by the length of the name. The name is then written immediately
 75023 following the archive header.

75024 Any unused characters in any of these fields are written as `<space>s`. If any fields are their
 75025 particular maximum number of characters in length, there is no separation between the
 75026 fields.

75027 Objects in the archive are always an even number of bytes long; files that are an odd
 75028 number of bytes long are padded with a `<newline>`, although the size in the header does
 75029 not reflect this.

75030 The *ar* utility description requires that (when all its members are valid object files) *ar* produce an
 75031 object code library, which the linkage editor can use to extract object modules. If the linkage
 75032 editor needs a symbol table to permit random access to the archive, *ar* must provide it; however,
 75033 *ar* does not require a symbol table.

75034 The BSD `-o` option was omitted. It is a rare conforming application that uses *ar* to extract object
 75035 code from a library with concern for its modification time, since this can only be of importance
 75036 to *make*. Hence, since this functionality is not deemed important for applications portability, the
 75037 modification time of the extracted files is set to the current time.

75038 There is at least one known implementation (for a small computer) that can accommodate only
 75039 object files for that system, disallowing mixed object and other files. The ability to handle any
 75040 type of file is not only historical practice for most implementations, but is also a reasonable
 75041 expectation.

75042 Consideration was given to changing the output format of *ar* `-tv` to the same format as the
 75043 output of *ls* `-l`. This would have made parsing the output of *ar* the same as that of *ls*. This was
 75044 rejected in part because the current *ar* format is commonly used and changes would break
 75045 historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a
 75046 slash. Changing this to be the user name and group name would not be correct if the archive

75047 were moved to a machine that contained a different user database. Since *ar* cannot know
75048 whether the archive was generated on the same machine, it cannot tell what to report.

75049 The text on the **-ur** option combination is historical practice—since one filename can easily
75050 represent two different files (for example, **/a/foo** and **/b/foo**), it is reasonable to replace the file in
75051 the archive even when the modification time in the archive is identical to that in the file system.

75052 FUTURE DIRECTIONS

75053 None.

75054 SEE ALSO

75055 *c99, date, fort77, pax, strip*

75056 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201), [<unistd.h>](#), description of
75057 {POSIX_NO_TRUNC}

75058 CHANGE HISTORY

75059 First released in Issue 2.

75060 Issue 5

75061 The FUTURE DIRECTIONS section is added.

75062 Issue 6

75063 This utility is marked as part of the Software Development Utilities option.

75064 The STDOUT description is changed for the **-v** option to align with the IEEE P1003.2b draft
75065 standard.

75066 The normative text is reworded to avoid use of the term “must” for application requirements.

75067 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

75068 IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use
75069 “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being
75070 operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is
75071 contained in the archive.

75072 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the
75073 SYNOPSIS. The change was needed since the **-a**, **-b**, and **-i** options are mutually-exclusive, and
75074 *posname* is required if any of these options is specified.

75075 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description
75076 of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a
75077 backquote followed by a <newline>.

75078 Issue 7

75079 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not
75080 apply.

75081 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75082 The description of the **-t** option is changed to say “Only the files specified ...”. +

75083 **NAME**
 75084 `asa` — interpret carriage-control characters

75085 **SYNOPSIS**
 75086 FR `asa [file...]`

75087 **DESCRIPTION**
 75088 The *asa* utility shall write its input files to standard output, mapping carriage-control characters
 75089 from the text files to line-printer control sequences in an implementation-defined manner.
 75090 The first character of every line shall be removed from the input, and the following actions are
 75091 performed.
 75092 If the character removed is:
 75093 <space> The rest of the line is output without change.
 75094 0 A <newline> is output, then the rest of the input line.
 75095 1 One or more implementation-defined characters that causes an advance to the next
 75096 page shall be output, followed by the rest of the input line.
 75097 + The <newline> of the previous line shall be replaced with one or more implementation-
 75098 defined characters that causes printing to return to column position 1, followed by the
 75099 rest of the input line. If the '+' is the first character in the input, it shall be equivalent
 75100 to <space>.
 75101 The action of the *asa* utility is unspecified upon encountering any character other than those
 75102 listed above as the first character in a line.

75103 **OPTIONS**
 75104 None.

75105 **OPERANDS**
 75106 *file* A pathname of a text file used for input. If no *file* operands are specified, the
 75107 standard input shall be used.

75108 **STDIN**
 75109 The standard input shall be used only if no *file* operands are specified; see the INPUT FILES
 75110 section.

75111 **INPUT FILES**
 75112 The input files shall be text files.

75113 **ENVIRONMENT VARIABLES**
 75114 The following environment variables shall affect the execution of *asa*:
 75115 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 75116 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 75117 variables used to determine the values of locale categories.)
 75118 *LC_ALL* If set to a non-empty string value, override the values of all the other
 75119 internationalization variables.
 75120 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 75121 characters (for example, single-byte as opposed to multi-byte characters in
 75122 arguments and input files).

75123 *LC_MESSAGES*
 75124 Determine the locale that should be used to affect the format and contents of
 75125 diagnostic messages written to standard error.

75126 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

75127 ASYNCHRONOUS EVENTS

75128 Default.

75129 STDOUT

75130 The standard output shall be the text from the input file modified as described in the
 75131 DESCRIPTION section.

75132 STDERR

75133 None.

75134 OUTPUT FILES

75135 None.

75136 EXTENDED DESCRIPTION

75137 None.

75138 EXIT STATUS

75139 The following exit values shall be returned:

75140 0 All input files were output successfully.

75141 >0 An error occurred.

75142 CONSEQUENCES OF ERRORS

75143 Default.

75144 APPLICATION USAGE

75145 None.

75146 EXAMPLES

75147 1. The following command:

75148 `asa file`

75149 permits the viewing of *file* (created by a program using FORTRAN-style carriage-control
 75150 characters) on a terminal.

75151 2. The following command:

75152 `a.out | asa | lp`

75153 formats the FORTRAN output of **a.out** and directs it to the printer.

75154 RATIONALE

75155 The *asa* utility is needed to map “standard” FORTRAN 77 output into a form acceptable to
 75156 contemporary printers. Usually, *asa* is used to pipe data to the *lp* utility; see *lp*.

75157 This utility is generally used only by FORTRAN programs. The standard developers decided to
 75158 retain *asa* to avoid breaking the historical large base of FORTRAN applications that put carriage-
 75159 control characters in their output files. There is no requirement that a system have a FORTRAN
 75160 compiler in order to run applications that need *asa*.

75161 Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII
 75162 <carriage-return> in response to a '+'. It is suggested that implementations treat characters
 75163 other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.
 75164 However, the action is listed here as “unspecified”, permitting an implementation to provide
 75165 extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.

75166

FUTURE DIRECTIONS

75167

None.

75168

75171

CHANGE HISTORY

75172

First released in Issue 4.

75173

Issue 6

75174

This utility is marked as part of the FORTRAN Runtime Utilities option.

75175

The normative text is reworded to avoid use of the term “must” for application requirements.

75176

Issue 7

75177

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75178 **NAME**
 75179 `at` — execute commands at a later time

75180 **SYNOPSIS**
 75181 `at [-m] [-f file] [-q queueName] -t time_arg`
 75182 `at [-m] [-f file] [-q queueName] timespec...`
 75183 `at -r at_job_id...`
 75184 `at -l -q queueName`
 75185 `at -l [at_job_id...]`

75186 **DESCRIPTION**
 75187 The `at` utility shall read commands from standard input and group them together as an *at-job*, to
 75188 be executed at a later time.

75189 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process
 75190 group with no controlling terminal, except that the environment variables, current working
 75191 directory, file creation mask, and other implementation-defined execution-time attributes in
 75192 effect when the `at` utility is executed shall be retained and used when the *at-job* is executed.

75193 When the *at-job* is submitted, the *at_job_id* and scheduled time shall be written to standard error.
 75194 The *at_job_id* is an identifier that shall be a string consisting solely of alphanumeric characters
 75195 and the period character. The *at_job_id* shall be assigned by the system when the job is scheduled
 75196 such that it uniquely identifies a particular job.

75197 User notification and the processing of the job's standard output and standard error are
 75198 described under the `-m` option.

75199 XSI Users shall be permitted to use `at` if their name appears in the file **at.allow** which is located in an
 75200 implementation-defined directory. If that file does not exist, the file **at.deny**, which is located in
 75201 an implementation-defined directory, shall be checked to determine whether the user shall be
 75202 denied access to `at`. If neither file exists, only a process with the appropriate privileges shall be
 75203 allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted. The
 75204 **at.allow** and **at.deny** files shall consist of one user name per line.

75205 **OPTIONS**
 75206 The `at` utility shall conform to XBD [Section 12.2](#) (on page 201).

75207 The following options shall be supported:

75208 `-f file` Specify the pathname of a file to be used as the source of the *at-job*, instead of
 75209 standard input.

75210 `-l` (The letter ell.) Report all jobs scheduled for the invoking user if no *at_job_id*
 75211 operands are specified. If *at_job_ids* are specified, report only information for these
 75212 jobs. The output shall be written to standard output.

75213 `-m` Send mail to the invoking user after the *at-job* has run, announcing its completion.
 75214 Standard output and standard error produced by the *at-job* shall be mailed to the
 75215 user as well, unless redirected elsewhere. Mail shall be sent even if the job
 75216 produces no output.

75217 If `-m` is not used, the job's standard output and standard error shall be provided to
 75218 the user by means of mail, unless they are redirected elsewhere; if there is no such
 75219 output to provide, the implementation need not notify the user of the job's
 75220 completion.

- 75221 **-q** *queuename*
- 75222 Specify in which queue to schedule a job for submission. When used with the **-l**
- 75223 option, limit the search to that particular queue. By default, at-jobs shall be
- 75224 scheduled in queue *a*. In contrast, queue *b* shall be reserved for batch jobs; see
- 75225 *batch*. The meanings of all other *queuenames* are implementation-defined. If **-q** is
- 75226 specified along with either of the **-t** *time_arg* or *timespec* arguments, the results are
- 75227 unspecified.
- 75228 **-r** Remove the jobs with the specified *at_job_id* operands that were previously
- 75229 scheduled by the *at* utility.
- 75230 **-t** *time_arg* Submit the job to be run at the time specified by the *time* option-argument, which
- 75231 the application shall ensure has the format as specified by the *touch -t time* utility.

OPERANDS

The following operands shall be supported:

- 75234 *at_job_id* The name reported by a previous invocation of the *at* utility at the time the job was
- 75235 scheduled.
- 75236 *timespec* Submit the job to be run at the date and time specified. All of the *timespec* operands
- 75237 are interpreted as if they were separated by <space>s and concatenated, and shall
- 75238 be parsed as described in the grammar at the end of this section. The date and time
- 75239 shall be interpreted as being in the timezone of the user (as determined by the *TZ*
- 75240 variable), unless a timezone name appears as part of *time*, below.
- 75241 In the POSIX locale, the following describes the three parts of the time specification
- 75242 string. All of the values from the *LC_TIME* categories in the POSIX locale shall be
- 75243 recognized in a case-insensitive manner.
- 75244 *time* The time can be specified as one, two, or four digits. One-digit and
- 75245 two-digit numbers shall be taken to be hours; four-digit numbers to
- 75246 be hours and minutes. The time can alternatively be specified as two
- 75247 numbers separated by a colon, meaning *hour:minute*. An AM/PM
- 75248 indication (one of the values from the **am_pm** keywords in the
- 75249 *LC_TIME* locale category) can follow the time; otherwise, a 24-hour
- 75250 clock time shall be understood. A timezone name can also follow to
- 75251 further qualify the time. The acceptable timezone names are
- 75252 implementation-defined, except that they shall be case-insensitive
- 75253 and the string **utc** is supported to indicate the time is in Coordinated
- 75254 Universal Time. In the POSIX locale, the *time* field can also be one of
- 75255 the following tokens:
- 75256 **midnight** Indicates the time 12:00 am (00:00).
- 75257 **noon** Indicates the time 12:00 pm.
- 75258 **now** Indicates the current day and time. Invoking *at* <**now**>
- 75259 shall submit an at-job for potentially immediate
- 75260 execution (that is, subject only to unspecified
- 75261 scheduling delays).
- 75262 *date* An optional *date* can be specified as either a month name (one of the
- 75263 values from the **mon** or **abmon** keywords in the *LC_TIME* locale
- 75264 category) followed by a day number (and possibly year number
- 75265 preceded by a comma), or a day of the week (one of the values from
- 75266 the **day** or **abday** keywords in the *LC_TIME* locale category). In the
- 75267 POSIX locale, two special days shall be recognized:

75268 **today** Indicates the current day.

75269 **tomorrow** Indicates the day following the current day.

75270 If no *date* is given, **today** shall be assumed if the given time is greater
75271 than the current time, and **tomorrow** shall be assumed if it is less. If
75272 the given month is less than the current month (and no year is given),
75273 next year shall be assumed.

75274 *increment* The optional *increment* shall be a number preceded by a plus sign
75275 ('+') and suffixed by one of the following: **minutes**, **hours**, **days**,
75276 **weeks**, **months**, or **years**. (The singular forms shall also be accepted.)
75277 The keyword **next** shall be equivalent to an increment number of +1.
75278 For example, the following are equivalent commands:

75279 at 2pm + 1 week
75280 at 2pm next week

75281 The following grammar describes the precise format of *timespec* in the POSIX locale. The general
75282 conventions for this style of grammar are described in [Section 1.3](#) (on page 2235). This formal
75283 syntax shall take precedence over the preceding text syntax description. The longest possible
75284 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space
75285 shall also delimit tokens.

```
75286 %token hr24clock_hr_min
75287 %token hr24clock_hour
75288 /*
75289     An hr24clock_hr_min is a one, two, or four-digit number. A one-digit
75290     or two-digit number constitutes an hr24clock_hour. An hr24clock_hour
75291     may be any of the single digits [0,9], or may be double digits, ranging
75292     from [00,23]. If an hr24clock_hr_min is a four-digit number, the
75293     first two digits shall be a valid hr24clock_hour, while the last two
75294     represent the number of minutes, from [00,59].
75295 */
75296 %token wallclock_hr_min
75297 %token wallclock_hour

```

STDIN

75389 The standard input shall be a text file consisting of commands acceptable to the shell command
75390 language described in [Chapter 2](#) (on page 2245). The standard input shall only be used if no `-f`
75391 `file` option is specified.
75392

INPUT FILES

75393 See the STDIN section.
75394

75395 XSI The text files `at.allow` and `at.deny`, which are located in an implementation-defined directory,
75396 shall contain zero or more user names, one per line, of users who are, respectively, authorized or
75397 denied access to the `at` and `batch` utilities.

ENVIRONMENT VARIABLES

75398 The following environment variables shall affect the execution of `at`:
75399

75400 `LANG` Provide a default value for the internationalization variables that are unset or null. |
75401 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
75402 variables used to determine the values of locale categories.)

75403 `LC_ALL` If set to a non-empty string value, override the values of all the other
75404 internationalization variables.

75405 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as
75406 characters (for example, single-byte as opposed to multi-byte characters in
75407 arguments and input files).

75408 `LC_MESSAGES`
75409 Determine the locale that should be used to affect the format and contents of
75410 diagnostic messages written to standard error and informative messages written to
75411 standard output.

75412 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

75413 `LC_TIME` Determine the format and contents for date and time strings written and accepted
75414 by `at`.

75415 *SHELL* Determine a name of a command interpreter to be used to invoke the *at*-job. If the
 75416 variable is unset or null, *sh* shall be used. If it is set to a value other than a name for
 75417 *sh*, the implementation shall do one of the following: use that shell; use *sh*; use the
 75418 login shell from the user database; or any of the preceding accompanied by a
 75419 warning diagnostic about which was chosen.

75420 *TZ* Determine the timezone. The job shall be submitted for execution at the time
 75421 specified by *timespec* or *-t time* relative to the timezone specified by the *TZ*
 75422 variable. If *timespec* specifies a timezone, it shall override *TZ*. If *timespec* does not
 75423 specify a timezone and *TZ* is unset or null, an unspecified default timezone shall
 75424 be used.

75425 **ASYNCHRONOUS EVENTS**

75426 Default.

75427 **STDOUT**

75428 When standard input is a terminal, prompts of unspecified format for each line of the user input
 75429 described in the *STDIN* section may be written to standard output.

75430 In the POSIX locale, the following shall be written to the standard output for each job when jobs
 75431 are listed in response to the *-l* option:

75432 `"%s\t%s\n", at_job_id, <date>`

75433 where *date* shall be equivalent in format to the output of:

75434 `date +"%a %b %e %T %Y"`

75435 The date and time written shall be adjusted so that they appear in the timezone of the user (as
 75436 determined by the *TZ* variable).

75437 **STDERR**

75438 In the POSIX locale, the following shall be written to standard error when a job has been
 75439 successfully submitted:

75440 `"job %s at %s\n", at_job_id, <date>`

75441 where *date* has the same format as that described in the *STDOUT* section. Neither this, nor
 75442 warning messages concerning the selection of the command interpreter, shall be considered a
 75443 diagnostic that changes the exit status.

75444 Diagnostic messages, if any, shall be written to standard error.

75445 **OUTPUT FILES**

75446 None.

75447 **EXTENDED DESCRIPTION**

75448 None.

75449 **EXIT STATUS**

75450 The following exit values shall be returned:

75451 0 The *at* utility successfully submitted, removed, or listed a job or jobs.

75452 >0 An error occurred.

75453 **CONSEQUENCES OF ERRORS**

75454 The job shall not be scheduled, removed, or listed.

APPLICATION USAGE

The format of the *at* command line shown here is guaranteed only for the POSIX locale. Other cultures may be supported with substantially different interfaces, although implementations are encouraged to provide comparable levels of functionality.

Since the commands run in a separate shell invocation, running in a separate process group with no controlling terminal, open file descriptors, traps, and priority inherited from the invoking environment are lost.

Some implementations do not allow substitution of different shells using *SHELL*. System V systems, for example, have used the login shell value for the user in */etc/passwd*. To select reliably another command interpreter, the user must include it as part of the script, such as:

```
$ at 1800
myshell myscript
EOT
job ... at ...
$
```

EXAMPLES

1. This sequence can be used at a terminal:

```
at -m 0730 tomorrow
sort < file >outfile
EOT
```

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

```
at now + 1 hour <<!
diff file1 file2 2>&1 >outfile | mailx mygroup
!
```

3. To have a job reschedule itself, *at* can be invoked from within the at-job. For example, this daily processing script named **my.daily** runs every day (although *crontab* is a more appropriate vehicle for such work):

```
# my.daily runs every day
daily processing
at now tomorrow < my.daily
```

4. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as there are no ambiguities. Examples of various times and operand presentation include:

```
at 0815am Jan 24
at 8 :15amjan24
at now "+ 1day"
at 5 pm FRIday
at '17
    utc+
    30minutes'
```

RATIONALE

The *at* utility reads from standard input the commands to be executed at a later time. It may be useful to redirect standard output and standard error within the specified commands.

The *-t time* option was added as a new capability to support an internationalized way of specifying a time for execution of the submitted job.

Early proposals added a “jobname” concept as a way of giving submitted jobs names that are meaningful to the user submitting them. The historical, system-specified *at_job_id* gives no

75502 indication of what the job is. Upon further reflection, it was decided that the benefit of this was
 75503 not worth the change in historical interface. The *at* functionality is useful in simple
 75504 environments, but in large or complex situations, the functionality provided by the Batch
 75505 Services option is more suitable.

75506 The `-q` option historically has been an undocumented option, used mainly by the *batch* utility.

75507 The System V `-m` option was added to provide a method for informing users that an at-job had
 75508 completed. Otherwise, users are only informed when output to standard error or standard
 75509 output are not redirected.

75510 The behavior of *at* `<now>` was changed in an early proposal from being unspecified to
 75511 submitting a job for potentially immediate execution. Historical BSD *at* implementations support
 75512 this. Historical System V implementations give an error in that case, but a change to the System
 75513 V versions should have no backwards-compatibility ramifications.

75514 On BSD-based systems, a `-u user` option has allowed those with appropriate privileges to access
 75515 the work of other users. Since this is primarily a system administration feature and is not
 75516 universally implemented, it has been omitted. Similarly, a specification for the output format for
 75517 a user with appropriate privileges viewing the queues of other users has been omitted.

75518 The `-f file` option from System V is used instead of the BSD method of using the last operand as
 75519 the pathname. The BSD method is ambiguous—does:

75520 `at 1200 friday`

75521 mean the same thing if there is a file named **friday** in the current directory?

75522 The *at_job_id* is composed of a limited character set in historical practice, and it is mandated here
 75523 to invalidate systems that might try using characters that require shell quoting or that could not
 75524 be easily parsed by shell scripts.

75525 The *at* utility varies between System V and BSD systems in the way timezones are used. On
 75526 System V systems, the *TZ* variable affects the at-job submission times and the times displayed
 75527 for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved
 75528 with the current specification. If the user wishes to have the timezone default to that of the
 75529 system, they merely need to issue the *at* command immediately following an unsetting or null
 75530 assignment to *TZ*. For example:

75531 `TZ= at noon ...`

75532 gives the desired BSD result.

75533 While the *yacc*-like grammar specified in the OPERANDS section is lexically unambiguous with
 75534 respect to the digit strings, a lexical analyzer would probably be written to look for and return
 75535 digit strings in those cases. The parser could then check whether the digit string returned is a
 75536 valid *day_number*, *year_number*, and so on, based on the context.

75537 FUTURE DIRECTIONS

75538 None.

+

75542 CHANGE HISTORY

75543 First released in Issue 2.

75544 **Issue 6**
75545 This utility is marked as part of the User Portability Utilities option.

75546 The following new requirements on POSIX implementations derive from alignment with the
75547 Single UNIX Specification:

- 75548 • If **-m** is not used, the job's standard output and standard error are provided to the user by
75549 mail.

75550 The effects of using the **-q** and **-t** options as defined in the IEEE P1003.2b draft standard are
75551 specified.

75552 The normative text is reworded to avoid use of the term "must" for application requirements.

75553 **Issue 7**

75554 The *at* utility is moved from the User Portability Utilities option to the Base. User Portability
75555 Utilities is now an option for interactive utilities.

75556 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced
75557 by the *at* utility.

75558 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

75559 **NAME**
 75560 awk — pattern scanning and processing language

75561 **SYNOPSIS**
 75562 awk [-F *ERE*] [-v *assignment*...] *program* [*argument*...]

75563 awk [-F *ERE*] -f *progfile* [-f *progfile*]... [-v *assignment*]...
 75564 [*argument*...]

75565 DESCRIPTION

75566 The *awk* utility shall execute programs written in the *awk* programming language, which is
 75567 specialized for textual data manipulation. An *awk* program is a sequence of patterns and
 75568 corresponding actions. When input is read that matches a pattern, the action associated with that
 75569 pattern is carried out.

75570 Input shall be interpreted as a sequence of records. By default, a record is a line, less its
 75571 terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of
 75572 input shall be matched in turn against each pattern in the program. For each pattern matched,
 75573 the associated action shall be executed.

75574 The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field
 75575 is a string of non-<blank>s. This default white-space field delimiter can be changed by using the
 75576 **FS** built-in variable or **-F *ERE***. The *awk* utility shall denote the first field in a record \$1, the
 75577 second \$2, and so on. The symbol \$0 shall refer to the entire record; setting any other field causes
 75578 the re-evaluation of \$0. Assigning to \$0 shall reset the values of all other fields and the **NF** built-
 75579 in variable.

75580 OPTIONS

75581 The *awk* utility shall conform to XBD [Section 12.2](#) (on page 201).

75582 The following options shall be supported:

75583 **-F *ERE*** Define the input field separator to be the extended regular expression *ERE*, before
 75584 any input is read; see [Regular Expressions](#) (on page 2379).

75585 **-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. If multiple
 75586 instances of this option are specified, the concatenation of the files specified as
 75587 *progfile* in the order specified shall be the *awk* program. The *awk* program can
 75588 alternatively be specified in the command line as a single argument.

75589 **-v *assignment***
 75590 The application shall ensure that the *assignment* argument is in the same form as an
 75591 *assignment* operand. The specified variable assignment shall occur prior to
 75592 executing the *awk* program, including the actions associated with **BEGIN** patterns
 75593 (if any). Multiple occurrences of this option can be specified.

75594 OPERANDS

75595 The following operands shall be supported:

75596 *program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk*
 75597 program. The application shall supply the *program* operand as a single argument to
 75598 *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.

75599 *argument* Either of the following two types of *argument* can be intermixed:

75600 *file* A pathname of a file that contains the input to be read, which is
 75601 matched against the set of patterns in the program. If no *file* operands
 75602 are specified, or if a *file* operand is '-', the standard input shall be
 75603 used.

75604 *assignment* An operand that begins with an underscore or alphabetic character
 75605 from the portable character set (see the table in XBD Section 6.1, on
 75606 page 111), followed by a sequence of underscores, digits, and
 75607 alphabets from the portable character set, followed by the '='
 75608 character, shall specify a variable assignment rather than a pathname.
 75609 The characters before the '=' represent the name of an *awk* variable;
 75610 if that name is an *awk* reserved word (see Grammar, on page 2386)
 75611 the behavior is undefined. The characters following the equal sign
 75612 shall be interpreted as if they appeared in the *awk* program preceded
 75613 and followed by a double-quote ('"') character, as a **STRING** token
 75614 (see Grammar, on page 2386), except that if the last character is an
 75615 unescaped backslash, it shall be interpreted as a literal backslash
 75616 rather than as the first character of the sequence "\". The variable
 75617 shall be assigned the value of that **STRING** token and, if appropriate,
 75618 shall be considered a *numeric string* (see Expressions in awk, on page
 75619 2374), the variable shall also be assigned its numeric value. Each such
 75620 variable assignment shall occur just prior to the processing of the
 75621 following *file*, if any. Thus, an assignment before the first *file*
 75622 argument shall be executed after the **BEGIN** actions (if any), while an
 75623 assignment after the last *file* argument shall occur before the **END**
 75624 actions (if any). If there are no *file* arguments, assignments shall be
 75625 executed before processing the standard input.

75626 STDIN

75627 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-';
 75628 see the INPUT FILES section. If the *awk* program contains no actions and no patterns, but is
 75629 otherwise a valid *awk* program, standard input and any *file* operands shall not be read and *awk*
 75630 shall exit with a return status of zero.

75631 INPUT FILES

75632 Input files to the *awk* program from any of the following sources shall be text files:

- 75633 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV**
 75634 and **ARGC**
- 75635 • Standard input in the absence of any *file* operands
- 75636 • Arguments to the **getline** function

75637 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,
 75638 implementations shall support records terminated with the specified separator up to
 75639 {LINE_MAX} bytes and may support longer records.

75640 If **-f progfile** is specified, the application shall ensure that the files named by each of the *progfile*
 75641 option-arguments are text files and their concatenation, in the same order as they appear in the
 75642 arguments, is an *awk* program.

75643 ENVIRONMENT VARIABLES

75644 The following environment variables shall affect the execution of *awk*:

75645 **LANG** Provide a default value for the internationalization variables that are unset or null.
 75646 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 75647 variables used to determine the values of locale categories.)

75648 **LC_ALL** If set to a non-empty string value, override the values of all the other
 75649 internationalization variables.

75650 **LC_COLLATE**

75651 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 75652 character collating elements within regular expressions and in comparisons of

75653 string values.

75654 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 75655 characters (for example, single-byte as opposed to multi-byte characters in
 75656 arguments and input files), the behavior of character classes within regular
 75657 expressions, the identification of characters as letters, and the mapping of
 75658 uppercase and lowercase characters for the **toupper** and **tolower** functions.

75659 **LC_MESSAGES**
 75660 Determine the locale that should be used to affect the format and contents of
 75661 diagnostic messages written to standard error.

75662 **LC_NUMERIC**
 75663 Determine the radix character used when interpreting numeric input, performing
 75664 conversions between numeric and string values, and formatting numeric output.
 75665 Regardless of locale, the period character (the decimal-point character of the POSIX
 75666 locale) is the decimal-point character recognized in processing *awk* programs
 75667 (including assignments in command line arguments).

75668 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

75669 **PATH** Determine the search path when looking for commands executed by *system(expr)*,
 75670 or input and output pipes; see XBD [Chapter 8](#) (on page 159).

75671 In addition, all environment variables shall be visible via the *awk* variable **ENVIRON**.

75672 ASYNCHRONOUS EVENTS

75673 Default.

75674 STDOUT

75675 The nature of the output files depends on the *awk* program.

75676 STDERR

75677 The standard error shall be used only for diagnostic messages.

75678 OUTPUT FILES

75679 The nature of the output files depends on the *awk* program.

75680 EXTENDED DESCRIPTION

75681 Overall Program Structure

75682 An *awk* program is composed of pairs of the form:

75683 *pattern* { *action* }

75684 Either the pattern or the action (including the enclosing brace characters) can be omitted.

75685 A missing pattern shall match any record of input, and a missing action shall be equivalent to:

75686 { *print* }

75687 Execution of the *awk* program shall start by first executing the actions associated with all **BEGIN**
 75688 patterns in the order they occur in the program. Then each *file* operand (or standard input if no
 75689 files were specified) shall be processed in turn by reading data from the file until a record
 75690 separator is seen (<newline> by default). Before the first reference to a field in the record is
 75691 evaluated, the record shall be split into fields, according to the rules in [Regular Expressions](#) (on
 75692 page 2379), using the value of **FS** that was current at the time the record was read. Each pattern
 75693 in the program then shall be evaluated in the order of occurrence, and the action associated with
 75694 each pattern that matches the current record executed. The action for a matching pattern shall be
 75695 executed before evaluating subsequent patterns. Finally, the actions associated with all **END**
 75696 patterns shall be executed in the order they occur in the program.

75697

Expressions in awk

75698

75699

75700

75701

75702

75703

75704

75705

Expressions describe computations used in *patterns* and *actions*. In the following table, valid expression operations are given in groups from highest precedence first to lowest precedence last, with equal-precedence operators grouped between horizontal lines. In expression evaluation, where the grammar is formally ambiguous, higher precedence operators shall be evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side of an assignment operator). The precise syntax of expressions is given in [Grammar](#) (on page 2386).

75747

75748

75749

75750

Each expression shall have either a string value, a numeric value, or both. Except as stated for specific contexts, the value of an expression shall be implicitly converted to the type needed for the context in which it is used. A string value shall be converted to a numeric value by the equivalent of the following calls to functions defined by the ISO C standard:

75751

```
setlocale(LC_NUMERIC, "");
```

75752

```
numeric_value = atof(string_value);
```

75753

75754

75755

75756

75757

75758

75759

75760

75761

75762

75763

A numeric value that is exactly equal to the value of an integer (see [Section 1.1.2](#), on page 2231) shall be converted to a string by the equivalent of a call to the `sprintf` function (see [String Functions](#), on page 2384) with the string `"%d"` as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. Any other numeric value shall be converted to a string by the equivalent of a call to the `sprintf` function with the value of the variable `CONVFMT` as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. The result of the conversion is unspecified if the value of `CONVFMT` is not a floating-point format specification. This volume of POSIX.1-200x specifies no explicit conversions between numbers and strings. An application can force an expression to be treated as a number by adding zero to it, or can force it to be treated as a string by concatenating the null string (`" "`) to it.

75764

A string value shall be considered a *numeric string* if it comes from one of the following:

75765

1. Field variables

75766

2. Input from the `getline()` function

75767

3. `FILENAME`

75768

4. `ARGV` array elements

75769

5. `ENVIRON` array elements

75770

6. Array elements created by the `split()` function

75771

7. A command line variable assignment

75772

8. Variable assignment from another numeric string variable

75773

75774

75775

and after all the following conversions have been applied, the resulting string would lexically be recognized as a **NUMBER** token as described by the lexical conventions in [Grammar](#) (on page 2386):

75776

- All leading and trailing `<blank>`s are discarded.

75777

- If the first non-`<blank>` is `'+'` or `'-'`, it is discarded.

75778

- Changing each occurrence of the decimal point character from the current locale to a period.

75779

75780

75781

75782

75783

75784

If a `'-'` character is ignored in the preceding description, the numeric value of the *numeric string* shall be the negation of the numeric value of the recognized **NUMBER** token. Otherwise, the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER** token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that term is used in this section.

75785

75786

75787

75788

When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall be treated as false and any other value shall be treated as true. Otherwise, a string value of the null string shall be treated as false and any other value shall be treated as true. A Boolean context shall be one of the following:

- 75789 • The first subexpression of a conditional expression
- 75790 • An expression operated on by logical NOT, logical AND, or logical OR
- 75791 • The second expression of a **for** statement
- 75792 • The expression of an **if** statement
- 75793 • The expression of the **while** clause in either a **while** or **do...while** statement
- 75794 • An expression used as a pattern (as in Overall Program Structure)

75795 All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C
75796 standard (see [Section 1.1.2](#), on page 2231).

75797 The value of the expression:

75798 `expr1 ^ expr2`

75799 shall be equivalent to the value returned by the ISO C standard function call:

75800 `pow(expr1, expr2)`

75801 The expression:

75802 `lvalue ^= expr`

75803 shall be equivalent to the ISO C standard expression:

75804 `lvalue = pow(lvalue, expr)`

75805 except that `lvalue` shall be evaluated only once. The value of the expression:

75806 `expr1 % expr2`

75807 shall be equivalent to the value returned by the ISO C standard function call:

75808 `fmod(expr1, expr2)`

75809 The expression:

75810 `lvalue %= expr`

75811 shall be equivalent to the ISO C standard expression:

75812 `lvalue = fmod(lvalue, expr)`

75813 except that `lvalue` shall be evaluated only once.

75814 Variables and fields shall be set by the assignment statement:

75815 `lvalue = expression`

75816 and the type of *expression* shall determine the resulting variable type. The assignment includes
75817 the arithmetic assignments ("`+=`", "`-=`", "`*=`", "`/=`", "`%=`", "`^=`", "`++`", "`--`") all of which
75818 shall produce a numeric result. The left-hand side of an assignment and the target of increment
75819 and decrement operators can be one of a variable, an array with index, or a field selector.

75820 The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not
75821 be declared. They shall initially be empty, and their sizes shall change dynamically. The
75822 subscripts, or element identifiers, are strings, providing a type of associative array capability. An
75823 array name followed by a subscript within square brackets can be used as an lvalue and thus as
75824 an expression, as described in the grammar; see [Grammar](#) (on page 2386). Unsubscripted array
75825 names can be used in only the following contexts:

- 75826 • A parameter in a function definition or function call

- 75827 • The **NAME** token following any use of the keyword **in** as specified in the grammar (see
75828 [Grammar](#), on page 2386); if the name used in this context is not an array name, the
75829 behavior is undefined

75830 A valid array *index* shall consist of one or more comma-separated expressions, similar to the way
75831 in which multi-dimensional arrays are indexed in some programming languages. Because *awk*
75832 arrays are really one-dimensional, such a comma-separated list shall be converted to a single
75833 string by concatenating the string values of the separate expressions, each separated from the
75834 other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be
75835 equivalent:

```
75836 var[expr1, expr2, ... exprn]
```

```
75837 var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]
```

75838 The application shall ensure that a multi-dimensioned *index* used with the **in** operator is
75839 parenthesized. The **in** operator, which tests for the existence of a particular array element, shall
75840 not cause that element to exist. Any other reference to a nonexistent array element shall
75841 automatically create it.

75842 Comparisons (with the '<', '<=', '!=', '==', '>', and '>=' operators) shall be made
75843 numerically if both operands are numeric, if one is numeric and the other has a string value that
75844 is a numeric string, or if one is numeric and the other has the uninitialized value. Otherwise,
75845 operands shall be converted to strings as required and a string comparison shall be made using
75846 the locale-specific collation sequence. The value of the comparison expression shall be 1 if the
75847 relation is true, or 0 if the relation is false.

75848 Variables and Special Variables

75849 Variables can be used in an *awk* program by referencing them. With the exception of function
75850 parameters (see [User-Defined Functions](#), on page 2386), they are not explicitly declared.
75851 Function parameter names shall be local to the function; all other variable names shall be global.
75852 The same name shall not be used as both a function parameter name and as the name of a
75853 function or a special *awk* variable. The same name shall not be used both as a variable name with
75854 global scope and as the name of a function. The same name shall not be used within the same
75855 scope both as a scalar variable and as an array. Uninitialized variables, including scalar
75856 variables, array elements, and field variables, shall have an uninitialized value. An uninitialized
75857 value shall have both a numeric value of zero and a string value of the empty string. Evaluation
75858 of variables with an uninitialized value, to either string or numeric, shall be determined by the
75859 context in which they are used.

75860 Field variables shall be designated by a '\$' followed by a number or numerical expression. The
75861 effect of the field number *expression* evaluating to anything other than a non-negative integer is
75862 unspecified; uninitialized variables or string values need not be converted to numeric values in
75863 this context. New field variables can be created by assigning a value to them. References to
75864 nonexistent fields (that is, fields after **\$NF**), shall evaluate to the uninitialized value. Such
75865 references shall not create new fields. However, assigning to a nonexistent field (for example,
75866 $\$(NF+2)=5$) shall increase the value of **NF**; create any intervening fields with the uninitialized
75867 value; and cause the value of **\$0** to be recomputed, with the fields being separated by the value
75868 of **OFS**. Each field variable shall have a string value or an uninitialized value when created.
75869 Field variables shall have the uninitialized value when created from **\$0** using **FS** and the variable
75870 does not contain any characters. If appropriate, the field variable shall be considered a numeric
75871 string (see [Expressions in awk](#), on page 2374).

75872 Implementations shall support the following other special variables that are set by *awk*:

75873 **ARGC** The number of elements in the **ARGV** array.

75874 75875	ARGV	An array of command line arguments, excluding options and the <i>program</i> argument, numbered from zero to ARGC -1.
75876 75877 75878 75879 75880 75881 75882		The arguments in ARGV can be modified or added to; ARGC can be altered. As each input file ends, <i>awk</i> shall treat the next non-null element of ARGV , up to the current value of ARGC -1, inclusive, as the name of the next input file. Thus, setting an element of ARGV to null means that it shall not be treated as an input file. The name '-' indicates the standard input. If an argument matches the format of an <i>assignment</i> operand, this argument shall be treated as an <i>assignment</i> rather than a <i>file</i> argument.
75883 75884	CONVFMT	The printf format for converting numbers to strings (except for output statements, where OFMT is used); "% . 6g" by default.
75885 75886 75887 75888 75889 75890 75891	ENVIRON	An array representing the value of the environment, as described in the <i>exec</i> functions defined in the System Interfaces volume of POSIX.1-200x. The indices of the array shall be strings consisting of the names of the environment variables, and the value of each array element shall be a string consisting of the value of that variable. If appropriate, the environment variable shall be considered a <i>numeric string</i> (see Expressions in awk , on page 2374); the array element shall also have its numeric value.
75892 75893 75894 75895 75896 75897		In all cases where the behavior of <i>awk</i> is affected by environment variables (including the environment of any commands that <i>awk</i> executes via the system function or via pipeline redirections with the print statement, the printf statement, or the getline function), the environment used shall be the environment at the time <i>awk</i> began executing; it is implementation-defined whether any modification of ENVIRON affects this environment.
75898 75899 75900	FILENAME	A pathname of the current input file. Inside a BEGIN action the value is undefined. Inside an END action the value shall be the name of the last input file processed.
75901 75902 75903	FNR	The ordinal number of the current record in the current file. Inside a BEGIN action the value shall be zero. Inside an END action the value shall be the number of the last record processed in the last file processed.
75904	FS	Input field separator regular expression; a <space> by default.
75905 75906 75907 75908 75909	NF	The number of fields in the current record. Inside a BEGIN action, the use of NF is undefined unless a getline function without a <i>var</i> argument is executed previously. Inside an END action, NF shall retain the value it had for the last record read, unless a subsequent, redirected, getline function without a <i>var</i> argument is performed prior to entering the END action.
75910 75911 75912	NR	The ordinal number of the current record from the start of input. Inside a BEGIN action the value shall be zero. Inside an END action the value shall be the number of the last record processed.
75913 75914 75915	OFMT	The printf format for converting numbers to strings in output statements (see Output Statements , on page 2382); "% . 6g" by default. The result of the conversion is unspecified if the value of OFMT is not a floating-point format specification.
75916	OFS	The print statement output field separator; <space> by default.
75917	ORS	The print statement output record separator; a <newline> by default.
75918	RLENGTH	The length of the string matched by the match function.

- 75919 **RS** The first character of the string value of **RS** shall be the input record separator; a
 75920 <newline> by default. If **RS** contains more than one character, the results are
 75921 unspecified. If **RS** is null, then records are separated by sequences consisting of a
 75922 <newline> plus one or more blank lines, leading or trailing blank lines shall not
 75923 result in empty records at the beginning or end of the input, and a <newline> shall
 75924 always be a field separator, no matter what the value of **FS** is.
- 75925 **RSTART** The starting position of the string matched by the **match** function, numbering from
 75926 1. This shall always be equivalent to the return value of the **match** function.
- 75927 **SUBSEP** The subscript separator string for multi-dimensional arrays; the default value is
 75928 implementation-defined.

75929 Regular Expressions

75930 The *awk* utility shall make use of the extended regular expression notation (see XBD Section 9.4,
 75931 on page 174) except that it shall allow the use of C-language conventions for escaping special
 75932 characters within the EREs, as specified in the table in XBD Chapter 5 (on page 107) ('\\',
 75933 '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v') and the following table; these escape sequences
 75934 shall be recognized both inside and outside bracket expressions. Note that records need not be
 75935 separated by <newline>s and string constants can contain <newline>s, so even the "\\n"
 75936 sequence is valid in *awk* EREs. Using a slash character within an ERE requires the escaping
 75937 shown in the following table.

75938 **Table 4-2** Escape Sequences in *awk*

Escape Sequence	Description	Meaning
\"	Backslash quotation-mark	Quotation-mark character
\/	Backslash slash	Slash character
\\ddd	A backslash character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading '\\' for each byte.
\\c	A backslash character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 107) ('\\', '\\a', '\\b', '\\f', '\\n', '\\r', '\\t', '\\v').	Undefined

75955 A regular expression can be matched against a specific field or string by using one of the two
 75956 regular expression matching operators, '~' and '!~'. These operators shall interpret their
 75957 right-hand operand as a regular expression and their left-hand operand as a string. If the regular
 75958 expression matches the string, the '~' expression shall evaluate to a value of 1, and the '!~'
 75959 expression shall evaluate to a value of 0. (The regular expression matching operation is as
 75960 defined by the term matched in XBD Section 9.1 (on page 167), where a match occurs on any part
 75961 of the string unless the regular expression is limited with the circumflex or dollar sign special
 75962 characters.) If the regular expression does not match the string, the '~' expression shall evaluate
 75963 to a value of 0, and the '!~' expression shall evaluate to a value of 1. If the right-hand operand
 75964 is any expression other than the lexical token **ERE**, the string value of the expression shall be
 75965 interpreted as an extended regular expression, including the escape conventions described
 75966 above. Note that these same escape conventions shall also be applied in determining the value

75967 of a string literal (the lexical token **STRING**), and thus shall be applied a second time when a
75968 string literal is used in this context.

75969 When an **ERE** token appears as an expression in any context other than as the right-hand of the
75970 '`~`' or '`!~`' operator or as one of the built-in function arguments described below, the value of
75971 the resulting expression shall be the equivalent of:

75972 `$0 ~ /ere/`

75973 The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function
75974 (see [String Functions](#), on page 2384) shall be interpreted as extended regular expressions. These
75975 can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner
75976 as the right-hand side of the '`~`' or '`!~`' operator.

75977 An extended regular expression can be used to separate fields by using the `-F ERE` option or by
75978 assigning a string containing the expression to the built-in variable **FS**. The default value of the
75979 **FS** variable shall be a single `<space>`. The following describes **FS** behavior:

- 75980 1. If **FS** is a null string, the behavior is unspecified.
- 75981 2. If **FS** is a single character:
 - 75982 a. If **FS** is `<space>`, skip leading and trailing `<blank>`s; fields shall be delimited by
75983 sets of one or more `<blank>`s.
 - 75984 b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single
75985 occurrence of *c*.
- 75986 3. Otherwise, the string value of **FS** shall be considered to be an extended regular
75987 expression. Each occurrence of a sequence matching the extended regular expression shall
75988 delimit fields.

75989 Except for the '`~`' and '`!~`' operators, and in the **gsub**, **match**, **split**, and **sub** built-in functions,
75990 ERE matching shall be based on input records; that is, record separator characters (the first
75991 character of the value of the variable **RS**, `<newline>` by default) cannot be embedded in the
75992 expression, and no expression shall match the record separator character. If the record separator
75993 is not `<newline>`, `<newline>`s embedded in the expression can be matched. For the '`~`' and
75994 '`!~`' operators, and in those four built-in functions, ERE matching shall be based on text
75995 strings; that is, any character (including `<newline>` and the record separator) can be embedded
75996 in the pattern, and an appropriate pattern shall match any character. However, in all *awk* ERE
75997 matching, the use of one or more NUL characters in the pattern, input record, or text string
75998 produces undefined results.

75999 **Patterns**

76000 A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or
76001 one of the two special patterns **BEGIN** or **END**.

76002 **Special Patterns**

76003 The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern
76004 shall be matched once and its associated action executed before the first record of input is read—
76005 except possibly by use of the **getline** function (see [Input/Output and General Functions](#), on
76006 page 2385) in a prior **BEGIN** action—and before command line assignment is done. Each **END**
76007 pattern shall be matched once and its associated action executed after the last record of input has
76008 been read. These two patterns shall have associated actions.

76009 **BEGIN** and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns
76010 shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order
76011 specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern
76012 in a program.

76013 If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action
 76014 contains no **getline** function, *awk* shall exit without reading its input when the last statement in
 76015 the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern
 76016 **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the
 76017 statements in the **END** actions are executed.

76018 Expression Patterns

76019 An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the
 76020 result is true, the pattern shall be considered to match, and the associated action (if any) shall be
 76021 executed. If the result is false, the action shall not be executed.

76022 Pattern Ranges

76023 A pattern range consists of two expressions separated by a comma; in this case, the action shall
 76024 be performed for all records between a match of the first expression and the following match of
 76025 the second expression, inclusive. At this point, the pattern range can be repeated starting at
 76026 input records subsequent to the end of the matched range.

76027 Actions

76028 An action is a sequence of statements as shown in the grammar in [Grammar](#) (on page 2386).
 76029 Any single statement can be replaced by a statement list enclosed in braces. The application shall
 76030 ensure that statements in a statement list are separated by <newline>s or semicolons. Statements
 76031 in a statement list shall be executed sequentially in the order that they appear.

76032 The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero
 76033 or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement
 76034 following the **else** shall be executed.

76035 The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard
 76036 (see [Section 1.1.2](#), on page 2231), except that the Boolean expressions shall be treated as
 76037 described in [Expressions in awk](#) (on page 2374), and except in the case of:

```
76038 for (variable in array)
```

76039 which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of
 76040 adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue**
 76041 statement occurs outside of a loop, the behavior is undefined.

76042 The **delete** statement shall remove an individual array element. Thus, the following code deletes
 76043 an entire array:

```
76044 for (index in array)
76045     delete array[index]
```

76046 The **next** statement shall cause all further processing of the current input record to be
 76047 abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or
 76048 **END** action.

76049 The **exit** statement shall invoke all **END** actions in the order in which they occur in the program
 76050 source and then terminate the program without reading further input. An **exit** statement inside
 76051 an **END** action shall terminate the program without further execution of **END** actions. If an
 76052 expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*,
 76053 unless subsequent errors are encountered or a subsequent **exit** statement with an expression is
 76054 executed.

76055

Output Statements

76056

Both **print** and **printf** statements shall write to standard output by default. The output shall be written to the location specified by *output_redirection* if one is supplied, as follows:

76057

76058

```
> expression
```

76059

```
>> expression
```

76060

```
| expression
```

76061

In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into which to write (for '**>**' or "**>>**") or as a command to be executed (for '**|**'). Using the first two forms, if the file of that name is not currently open, it shall be opened, creating it if necessary and using the first form, truncating the file. The output then shall be appended to the file. As long as the file remains open, subsequent calls in which *expression* evaluates to the same string value shall simply append output to the file. The file remains open until the **close** function (see [Input/Output and General Functions](#), on page 2385) is called with an expression that evaluates to the same string value.

76062

76063

76064

76065

76066

76067

76068

The third form shall write output onto a stream piped to the input of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen()* function defined in the System Interfaces volume of POSIX.1-200x with the value of *expression* as the *command* argument and a value of *w* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall write output to the existing stream. The stream shall remain open until the **close** function (see [Input/Output and General Functions](#), on page 2385) is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in the System Interfaces volume of POSIX.1-200x.

76069

76070

76071

76072

76073

76074

76075

76076

76077

76078

As described in detail by the grammar in [Grammar](#) (on page 2386), these output statements shall take a comma-separated list of *expressions* referred to in the grammar by the non-terminal symbols **expr_list**, **print_expr_list**, or **print_expr_list_opt**. This list is referred to here as the *expression list*, and each member is referred to as an *expression argument*.

76083

76084

76085

76086

76087

76088

76089

The **print** statement shall write the value of each expression argument onto the indicated output stream separated by the current output field separator (see variable **OFS** above), and terminated by the output record separator (see variable **ORS** above). All expression arguments shall be taken as strings, being converted if necessary; this conversion shall be as described in [Expressions in awk](#) (on page 2374), with the exception that the **printf** format in **OFMT** shall be used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole input record (**\$0**).

76090

76091

76092

76093

76094

The **printf** statement shall produce output based on a notation similar to the File Format Notation used to describe file formats in this volume of POSIX.1-200x (see [XBD Chapter 5](#), on page 107). Output shall be produced as specified with the first *expression* argument as the string *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the following exceptions:

76095

76096

76097

76098

1. The *format* shall be an actual character string rather than a graphical representation. Therefore, it cannot contain empty character positions. The **<space>** in the *format* string, in any context other than a *flag* of a conversion specification, shall be treated as an ordinary character that is copied to the output.

76099

76100

2. If the character set contains a '**Δ**' character and that character appears in the *format* string, it shall be treated as an ordinary character that is copied to the output.

76101

76102

76103

3. The *escape sequences* beginning with a backslash character shall be treated as sequences of ordinary characters that are copied to the output. Note that these same sequences shall be interpreted lexically by *awk* when they appear in literal strings, but they shall not be

- 76104 treated specially by the **printf** statement.
- 76105 4. A *field width* or *precision* can be specified as the '*' character instead of a digit string. In
76106 this case the next argument from the expression list shall be fetched and its numeric value
76107 taken as the field width or precision.
- 76108 5. The implementation shall not precede or follow output from the d or u conversion
76109 specifier characters with <blank>s not specified by the *format* string.
- 76110 6. The implementation shall not precede output from the o conversion specifier character
76111 with leading zeros not specified by the *format* string.
- 76112 7. For the c conversion specifier character: if the argument has a numeric value, the
76113 character whose encoding is that value shall be output. If the value is zero or is not the
76114 encoding of any character in the character set, the behavior is undefined. If the argument
76115 does not have a numeric value, the first character of the string value shall be output; if the
76116 string does not contain any characters, the behavior is undefined.
- 76117 8. For each conversion specification that consumes an argument, the next expression
76118 argument shall be evaluated. With the exception of the c conversion specifier character,
76119 the value shall be converted (according to the rules specified in [Expressions in awk](#), on
76120 page 2374) to the appropriate type for the conversion specification.
- 76121 9. If there are insufficient expression arguments to satisfy all the conversion specifications in
76122 the *format* string, the behavior is undefined.
- 76123 10. If any character sequence in the *format* string begins with a '%' character, but does not
76124 form a valid conversion specification, the behavior is unspecified.

76125 Both **print** and **printf** can output at least {LINE_MAX} bytes.

76126 Functions

76127 The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and
76128 general.

76129 Arithmetic Functions

76130 The arithmetic functions, except for **int**, shall be based on the ISO C standard (see [Section 1.1.2](#),
76131 on page 2231). The behavior is undefined in cases where the ISO C standard specifies that an
76132 error be returned or that the behavior is undefined. Although the grammar (see [Grammar](#), on
76133 page 2386) permits built-in functions to appear with no arguments or parentheses, unless the
76134 argument or parentheses are indicated as optional in the following list (by displaying them
76135 within the "[]" brackets), such use is undefined.

- 76136 **atan2**(*y*,*x*) Return arctangent of *y*/*x* in radians in the range $[-\pi, \pi]$.
- 76137 **cos**(*x*) Return cosine of *x*, where *x* is in radians.
- 76138 **sin**(*x*) Return sine of *x*, where *x* is in radians.
- 76139 **exp**(*x*) Return the exponential function of *x*.
- 76140 **log**(*x*) Return the natural logarithm of *x*.
- 76141 **sqrt**(*x*) Return the square root of *x*.
- 76142 **int**(*x*) Return the argument truncated to an integer. Truncation shall be toward 0 when
76143 *x*>0.
- 76144 **rand**() Return a random number *n*, such that $0 \leq n < 1$.

76145 **srand**(*expr*) Set the seed value for *rand* to *expr* or use the time of day if *expr* is omitted. The
76146 previous seed value shall be returned.

76147 String Functions

76148 The string functions in the following list shall be supported. Although the grammar (see
76149 [Grammar](#), on page 2386) permits built-in functions to appear with no arguments or parentheses,
76150 unless the argument or parentheses are indicated as optional in the following list (by displaying
76151 them within the "[]" brackets), such use is undefined.

76152 **gsub**(*ere, repl*[, *in*])
76153 Behave like **sub** (see below), except that it shall replace all occurrences of the
76154 regular expression (like the *ed* utility global substitute) in *\$0* or in the *in* argument,
76155 when specified.

76156 **index**(*s, t*) Return the position, in characters, numbering from 1, in string *s* where string *t* first
76157 occurs, or zero if it does not occur at all.

76158 **length**[(*s*)] Return the length, in characters, of its argument taken as a string, or of the whole
76159 record, *\$0*, if there is no argument.

76160 **match**(*s, ere*) Return the position, in characters, numbering from 1, in string *s* where the
76161 extended regular expression *ere* occurs, or zero if it does not occur at all. RSTART
76162 shall be set to the starting position (which is the same as the returned value), zero
76163 if no match is found; RLENGTH shall be set to the length of the matched string, -1
76164 if no match is found.

76165 **split**(*s, a*[, *fs*])
76166 Split the string *s* into array elements *a*[1], *a*[2], ..., *a*[*n*], and return *n*. All elements
76167 of the array shall be deleted before the split is performed. The separation shall be
76168 done with the ERE *fs* or with the field separator **FS** if *fs* is not given. Each array
76169 element shall have a string value when created and, if appropriate, the array
76170 element shall be considered a numeric string (see [Expressions in awk](#), on page
76171 2374). The effect of a null string as the value of *fs* is unspecified.

76172 **sprintf**(*fmt, expr, expr, ...*)
76173 Format the expressions according to the **printf** format given by *fmt* and return the
76174 resulting string.

76175 **sub**(*ere, repl*[, *in*])
76176 Substitute the string *repl* in place of the first instance of the extended regular
76177 expression *ERE* in string *in* and return the number of substitutions. An ampersand
76178 ('&') appearing in the string *repl* shall be replaced by the string from *in* that
76179 matches the ERE. An ampersand preceded with a backslash ('\&') shall be
76180 interpreted as the literal ampersand character. An occurrence of two consecutive
76181 backslashes shall be interpreted as just a single literal backslash character. Any
76182 other occurrence of a backslash (for example, preceding any other character) shall
76183 be treated as a literal backslash character. Note that if *repl* is a string literal (the
76184 lexical token **STRING**; see [Grammar](#), on page 2386), the handling of the
76185 ampersand character occurs after any lexical processing, including any lexical
76186 backslash escape sequence processing. If *in* is specified and it is not an lvalue (see
76187 [Expressions in awk](#), on page 2374), the behavior is undefined. If *in* is omitted, *awk*
76188 shall use the current record (*\$0*) in its place.

76189 **substr**(*s, m*[, *n*])
76190 Return the at most *n*-character substring of *s* that begins at position *m*, numbering
76191 from 1. If *n* is omitted, or if *n* specifies more characters than are left in the string,
76192 the length of the substring shall be limited by the length of the string *s*.

- 76193 **tolower(s)** Return a string based on the string *s*. Each character in *s* that is an uppercase letter
76194 specified to have a **tolower** mapping by the *LC_CTYPE* category of the current
76195 locale shall be replaced in the returned string by the lowercase letter specified by
76196 the mapping. Other characters in *s* shall be unchanged in the returned string.
- 76197 **toupper(s)** Return a string based on the string *s*. Each character in *s* that is a lowercase letter
76198 specified to have a **toupper** mapping by the *LC_CTYPE* category of the current
76199 locale is replaced in the returned string by the uppercase letter specified by the
76200 mapping. Other characters in *s* are unchanged in the returned string.

76201 All of the preceding functions that take *ERE* as a parameter expect a pattern or a string valued
76202 expression that is a regular expression as defined in [Regular Expressions](#) (on page 2379).

76203 **Input/Output and General Functions**

76204 The input/output and general functions are:

76205 **close(expression)**
76206 Close the file or pipe opened by a **print** or **printf** statement or a call to **getline** with
76207 the same string-valued *expression*. The limit on the number of open *expression*
76208 arguments is implementation-defined. If the close was successful, the function
76209 shall return zero; otherwise, it shall return non-zero.

76210 *expression* | **getline** [*var*]
76211 Read a record of input from a stream piped from the output of a command. The
76212 stream shall be created if no stream is currently open with the value of *expression* as
76213 its command name. The stream created shall be equivalent to one created by a call
76214 to the *popen()* function with the value of *expression* as the *command* argument and a
76215 value of *r* as the *mode* argument. As long as the stream remains open, subsequent
76216 calls in which *expression* evaluates to the same string value shall read subsequent
76217 records from the stream. The stream shall remain open until the **close** function is
76218 called with an expression that evaluates to the same string value. At that time, the
76219 stream shall be closed as if by a call to the *pclose()* function. If *var* is omitted, \$0 and
76220 **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered
76221 a numeric string (see [Expressions in awk](#), on page 2374).

76222 The **getline** operator can form ambiguous constructs when there are
76223 unparenthesized operators (including concatenate) to the left of the ' | ' (to the
76224 beginning of the expression containing **getline**). In the context of the '\$' operator,
76225 ' | ' shall behave as if it had a lower precedence than '\$'. The result of evaluating
76226 other operators is unspecified, and conforming applications shall parenthesize
76227 properly all such usages.

76228 **getline** Set \$0 to the next input record from the current input file. This form of **getline** shall
76229 set the **NF**, **NR**, and **FNR** variables.

76230 **getline** *var* Set variable *var* to the next input record from the current input file and, if
76231 appropriate, *var* shall be considered a numeric string (see [Expressions in awk](#), on
76232 page 2374). This form of **getline** shall set the **FNR** and **NR** variables.

76233 **getline** [*var*] < *expression*
76234 Read the next record of input from a named file. The *expression* shall be evaluated
76235 to produce a string that is used as a pathname. If the file of that name is not
76236 currently open, it shall be opened. As long as the stream remains open, subsequent
76237 calls in which *expression* evaluates to the same string value shall read subsequent
76238 records from the file. The file shall remain open until the **close** function is called
76239 with an expression that evaluates to the same string value. If *var* is omitted, \$0 and
76240 **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered
76241 a numeric string (see [Expressions in awk](#), on page 2374).

The **getline** operator can form ambiguous constructs when there are unparenthesized binary operators (including concatenate) to the right of the '<' (up to the end of the expression containing the **getline**). The result of evaluating such a construct is unspecified, and conforming applications shall parenthesize properly all such usages.

system(*expression*)

Execute the command given by *expression* in a manner equivalent to the *system*() function defined in the System Interfaces volume of POSIX.1-200x and return the exit status of the command.

All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

Where strings are used as the name of a file or pipeline, the application shall ensure that the strings are textually identical. The terminology "same string value" implies that "equivalent strings", even those that differ only by <space>s, represent different files.

User-Defined Functions

The *awk* language also provides user-defined functions. Such functions can be defined as:

```
function name([parameter, ...]) { statements }
```

A function can be referred to anywhere in an *awk* program; in particular, its use can precede its definition. The scope of a function is global.

Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is passed as a parameter that the function uses as an array. Function parameters shall be passed by value if scalar and by reference if array name.

The number of parameters in the function definition need not match the number of parameters in the function call. Excess formal parameters can be used as local variables. If fewer arguments are supplied in a function call than are in the function definition, the extra parameters that are used in the function body as scalars shall evaluate to the uninitialized value until they are otherwise initialized, and the extra parameters that are used in the function body as arrays shall be treated as uninitialized arrays where each element evaluates to the uninitialized value until otherwise initialized.

When invoking a function, no white space can be placed between the function name and the opening parenthesis. Function calls can be nested and recursive calls can be made upon functions. Upon return from any nested or recursive function call, the values of all of the calling function's parameters shall be unchanged, except for array parameters passed by reference. The **return** statement can be used to return a value. If a **return** statement appears outside of a function definition, the behavior is undefined.

In the function definition, <newline>s shall be optional before the opening brace and after the closing brace. Function definitions can appear anywhere in the program where a *pattern-action* pair is allowed.

Grammar

The grammar in this section and the lexical conventions in the following section shall together describe the syntax for *awk* programs. The general conventions for this style of grammar are described in [Section 1.3](#) (on page 2235). A valid program can be represented as the non-terminal symbol *program* in the grammar. This formal syntax shall take precedence over the preceding text syntax description.

```
%token NAME NUMBER STRING ERE
%token FUNC_NAME /* Name followed by '(' without white space. */
```

```

76288      /* Keywords */
76289      %token      Begin      End
76290      /*          'BEGIN' 'END'                                     */
76291
76291      %token      Break      Continue      Delete      Do      Else

```

This grammar has several ambiguities that shall be resolved as follows:

- Operator precedence and associativity shall be as described in [Table 4-1](#) (on page 2374).
- In case of ambiguity, an **else** shall be associated with the most immediately preceding **if** that would satisfy the grammar.
- In some contexts, a slash ('/') that is used to surround an ERE could also be the division operator. This shall be resolved in such a way that wherever the division operator could appear, a slash is assumed to be the division operator. (There is no unary division operator.)

Each expression in an *awk* program shall conform to the precedence and associativity rules, even when this is not needed to resolve an ambiguity. For example, because '\$' has higher precedence than '++', the string "\$x++--" is not a valid *awk* expression, even though it is unambiguously parsed by the grammar as "\$ (x++) --".

One convention that might not be obvious from the formal grammar is where <newline>s are acceptable. There are several obvious placements such as terminating a statement, and a backslash can be used to escape <newline>s between any lexical tokens. In addition, <newline>s without backslashes can follow a comma, an open brace, logical AND operator ("&&"), logical OR operator ("||"), the **do** keyword, the **else** keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```

76587     { print $1,
76588         $2 }

```

76589

Lexical Conventions

76590

The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as follows:

76591

76592

1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a given point.

76593

76594

2. A comment shall consist of any characters beginning with the number sign character and terminated by, but excluding the next occurrence of, a <newline>. Comments shall have no effect, except to delimit lexical tokens.

76595

76596

76597

3. The <newline> shall be recognized as the token **NEWLINE**.

76598

4. A backslash character immediately followed by a <newline> shall have no effect.

76599

76600

76601

76602

76603

76604

76605

76606

76607

5. The token **STRING** shall represent a string constant. A string constant shall begin with the character ' '. Within a string constant, a backslash character shall be considered to begin an escape sequence as specified in the table in XBD Chapter 5 (on page 107) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences in Table 4-2 (on page 2379) shall be recognized. A <newline> shall not occur within a string constant. A string constant shall be terminated by the first unescaped occurrence of the character ' ' after the one that begins the string constant. The value of the string shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting ' ' characters.

76608

76609

76610

76611

76612

76613

76614

76615

76616

76617

6. The token **ERE** represents an extended regular expression constant. An ERE constant shall begin with the slash character. Within an ERE constant, a backslash character shall be considered to begin an escape sequence as specified in the table in XBD Chapter 5 (on page 107). In addition, the escape sequences in Table 4-2 (on page 2379) shall be recognized. The application shall ensure that a <newline> does not occur within an ERE constant. An ERE constant shall be terminated by the first unescaped occurrence of the slash character after the one that begins the ERE constant. The extended regular expression represented by the ERE constant shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting slash characters.

76618

76619

7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE** tokens.

76620

76621

76622

8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall be equivalent to either of the tokens **floating-constant** or **integer-constant** as specified by the ISO C standard, with the following exceptions:

76623

76624

- a. An integer constant cannot begin with 0x or include the hexadecimal digits 'a', 'b', 'c', 'd', 'e', 'f', 'A', 'B', 'C', 'D', 'E', or 'F'.

76625

76626

- b. The value of an integer constant beginning with 0 shall be taken in decimal rather than octal.

76627

- c. An integer constant cannot include a suffix ('u', 'U', 'l', or 'L').

76628

- d. A floating constant cannot include a suffix ('f', 'F', 'l', or 'L').

76629

76630

If the value is too large or too small to be representable (see Section 1.1.2, on page 2231), the behavior is undefined.

76631

76632

76633

9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see XBD Section 6.1, on page 111), beginning with an underscore or alphabetic, shall be considered a word.

76634 10. The following words are keywords that shall be recognized as individual tokens; the
76635 name of the token is the same as the keyword:

76636 **BEGIN** **delete** **END** **function** **in** **printf**
76637 **break** **do** **exit** **getline** **next** **return**
76638 **continue** **else** **for** **if** **print** **while**

76639 11. The following words are names of built-in functions and shall be recognized as the token
76640 **BUILTIN_FUNC_NAME**:

76641 **atan2** **gsub** **log** **split** **sub** **toupper**
76642 **close** **index** **match** **sprintf** **substr**
76643 **cos** **int** **rand** **sqrt** **system**
76644 **exp** **length** **sin** **srand** **tolower**

76645 The above-listed keywords and names of built-in functions are considered reserved
76646 words.

76647 12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in
76648 function and is not followed immediately (without any delimiters) by the ' (' character.

76649 13. The token **FUNC_NAME** shall consist of a word that is not a keyword or a name of a
76650 built-in function, followed immediately (without any delimiters) by the ' (' character.
76651 The ' (' character shall not be included as part of the token.

76652 14. The following two-character sequences shall be recognized as the named tokens:

Token Name	Sequence	Token Name	Sequence
ADD_ASSIGN	+=	NO_MATCH	!~
SUB_ASSIGN	-=	EQ	==
MUL_ASSIGN	*=	LE	<=
DIV_ASSIGN	/=	GE	>=
MOD_ASSIGN	%=	NE	!=
POW_ASSIGN	^=	INCR	++
OR	 	DECR	--
AND	&&	APPEND	>>

76662 15. The following single characters shall be recognized as tokens whose names are the
76663 character:

76664 <newline> { } () [] , ; + - * % ^ ! > < | ? : ~ \$ =

76665 There is a lexical ambiguity between the token **ERE** and the tokens **/'/'** and **DIV_ASSIGN**.
76666 When an input sequence begins with a slash character in any syntactic context where the token
76667 **/'/'** or **DIV_ASSIGN** could appear as the next token in a valid program, the longer of those two
76668 tokens that can be recognized shall be recognized. In any other syntactic context where the token
76669 **ERE** could appear as the next token in a valid program, the token **ERE** shall be recognized.

76670 EXIT STATUS

76671 The following exit values shall be returned:

76672 0 All input files were processed successfully.

76673 >0 An error occurred.

76674 The exit status can be altered within the program by using an **exit** expression.

CONSEQUENCES OF ERRORS

If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a diagnostic message to standard error and terminate without any further action.

If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk* program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

APPLICATION USAGE

The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with bytes.

Because the concatenation operation is represented by adjacent expressions rather than an explicit operator, it is often necessary to use parentheses to enforce the proper evaluation precedence.

EXAMPLES

The *awk* program specified in the command line is most easily specified within single-quotes (for example, '*program*') for applications using *sh*, because *awk* programs commonly contain characters that are special to the shell, including double-quotes. In the cases where an *awk* program contains single-quote characters, it is usually easiest to specify most of the program as strings within single-quotes concatenated by the shell with quoted single-quote characters. For example:

```
awk '/'\''/ { print "quote:", $0 }'
```

prints all lines from the standard input containing a single-quote character, prefixed with *quote:*.

The following are examples of simple *awk* programs:

1. Write to the standard output all input lines for which field 3 is greater than 5:

```
$3 > 5
```

2. Write every tenth line:

```
(NR % 10) == 0
```

3. Write any line with a substring matching the regular expression:

```
/(G|D)(2[0-9][[:alpha:]]*)/
```

4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits and characters. This example uses character classes **digit** and **alpha** to match language-independent digit and alphabetic characters respectively:

```
/(G|D)([:digit:][:alpha:]]*)/
```

5. Write any line in which the second field matches the regular expression and the fourth field does not:

```
$2 ~ /xyz/ && $4 !~ /xyz/
```

6. Write any line in which the second field contains a backslash:

```
$2 ~ /\\"/>

```

7. Write any line in which the second field contains a backslash. Note that backslash escapes are interpreted twice; once in lexical processing of the string and once in processing the regular expression:

```
$2 ~ "\\\"/>

```

- 76716 8. Write the second to the last and the last field in each line. Separate the fields by a colon:
- 76717 `{OFS=":";print $(NF-1), $NF}`
- 76718 9. Write the line number and number of fields in each line. The three strings representing
- 76719 the line number, the colon, and the number of fields are concatenated and that string is
- 76720 written to standard output:
- 76721 `{print NR ":" NF}`
- 76722 10. Write lines longer than 72 characters:
- 76723 `length($0) > 72`
- 76724 11. Write the first two fields in opposite order separated by **OFS**:
- 76725 `{ print $2, $1 }`
- 76726 12. Same, with input fields separated by a comma or <space>s and <tab>s, or both:
- 76727 `BEGIN { FS = ", [\t]* | [\t]+" }`
- 76728 `{ print $2, $1 }`
- 76729 13. Add up the first column, print sum, and average:
- 76730 `{s += $1 }`
- 76731 `END {print "sum is ", s, " average is", s/NR}`
- 76732 14. Write fields in reverse order, one per line (many lines out for each line in):
- 76733 `{ for (i = NF; i > 0; --i) print $i }`
- 76734 15. Write all lines between occurrences of the strings **start** and **stop**:
- 76735 `/start/, /stop/`
- 76736 16. Write all lines whose first field is different from the previous one:
- 76737 `$1 != prev { print; prev = $1 }`
- 76738 17. Simulate *echo*:
- 76739 `BEGIN {`
- 76740 `for (i = 1; i < ARGV; ++i)`
- 76741 `printf("%s%s", ARGV[i], i==ARGV-1?"\n":" ")`
- 76742 `}`
- 76743 18. Write the path prefixes contained in the *PATH* environment variable, one per line:
- 76744 `BEGIN {`
- 76745 `n = split (ENVIRON["PATH"], path, ":")`
- 76746 `for (i = 1; i <= n; ++i)`
- 76747 `print path[i]`
- 76748 `}`
- 76749 19. If there is a file named **input** containing page headers of the form:
- 76750 `Page #`
- 76751 and a file named **program** that contains:
- 76752 `/Page/ { $2 = n++; }`
- 76753 `{ print }`
- 76754 then the command line:
- 76755 `awk -f program n=5 input`

76756 prints the file **input**, filling in page numbers starting at 5.

76757 RATIONALE

76758 This description is based on the new *awk*, “nawk”, (see the referenced *The AWK Programming*
76759 *Language*), which introduced a number of new features to the historical *awk*:

- 76760 1. New keywords: **delete**, **do**, **function**, **return**
- 76761 2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**
- 76762 3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
- 76763 4. New expression operators: **?**, **:**, **„**, **^**
- 76764 5. The **FS** variable and the third argument to **split**, now treated as extended regular
76765 expressions.
- 76766 6. The operator precedence, changed to more closely match the C language. Two examples
76767 of code that operate differently are:

```
76768 while ( n /= 10 > 1 ) ...
76769 if (!"wk" ~ /bwk/) ...
```

76770 Several features have been added based on newer implementations of *awk*:

- 76771 • Multiple instances of **-f *progfile*** are permitted.
- 76772 • The new option **-v *assignment***.
- 76773 • The new predefined variable **ENVIRON**.
- 76774 • New built-in functions **toupper** and **tolower**.
- 76775 • More formatting capabilities are added to **printf** to match the ISO C standard.

76776 The overall *awk* syntax has always been based on the C language, with a few features from the
76777 shell command language and other sources. Because of this, it is not completely compatible with
76778 any other language, which has caused confusion for some users. It is not the intent of the
76779 standard developers to address such issues. A few relatively minor changes toward making the
76780 language more compatible with the ISO C standard were made; most of these changes are based
76781 on similar changes in recent implementations, as described above. There remain several C-
76782 language conventions that are not in *awk*. One of the notable ones is the comma operator, which
76783 is commonly used to specify multiple expressions in the C language **for** statement. Also, there
76784 are various places where *awk* is more restrictive than the C language regarding the type of
76785 expression that can be used in a given context. These limitations are due to the different features
76786 that the *awk* language does provide.

76787 Regular expressions in *awk* have been extended somewhat from historical implementations to
76788 make them a pure superset of extended regular expressions, as defined by POSIX.1-200x (see
76789 XBD Section 9.4, on page 174). The main extensions are internationalization features and
76790 interval expressions. Historical implementations of *awk* have long supported backslash escape
76791 sequences as an extension to extended regular expressions, and this extension has been retained
76792 despite inconsistency with other utilities. The number of escape sequences recognized in both
76793 extended regular expressions and strings has varied (generally increasing with time) among
76794 implementations. The set specified by POSIX.1-200x includes most sequences known to be
76795 supported by popular implementations and by the ISO C standard. One sequence that is not
76796 supported is hexadecimal value escapes beginning with ‘\x’. This would allow values
76797 expressed in more than 9 bits to be used within *awk* as in the ISO C standard. However, because
76798 this syntax has a non-deterministic length, it does not permit the subsequent character to be a
76799 hexadecimal digit. This limitation can be dealt with in the C language by the use of lexical string
76800 concatenation. In the *awk* language, concatenation could also be a solution for strings, but not for
76801 extended regular expressions (either lexical ERE tokens or strings used dynamically as regular

76802 expressions). Because of this limitation, the feature has not been added to POSIX.1-200x.

76803 When a string variable is used in a context where an extended regular expression normally
76804 appears (where the lexical token ERE is used in the grammar) the string does not contain the
76805 literal slashes.

76806 Some versions of *awk* allow the form:

```
76807 func name(args, ... ) { statements }
```

76808 This has been deprecated by the authors of the language, who asked that it not be specified.

76809 Historical implementations of *awk* produce an error if a **next** statement is executed in a **BEGIN**
76810 action, and cause *awk* to terminate if a **next** statement is executed in an **END** action. This
76811 behavior has not been documented, and it was not believed that it was necessary to standardize
76812 it.

76813 The specification of conversions between string and numeric values is much more detailed than
76814 in the documentation of historical implementations or in the referenced *The AWK Programming*
76815 *Language*. Although most of the behavior is designed to be intuitive, the details are necessary to
76816 ensure compatible behavior from different implementations. This is especially important in
76817 relational expressions since the types of the operands determine whether a string or numeric
76818 comparison is performed. From the perspective of an application developer, it is usually
76819 sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating
76820 a null string) when the type of an expression does not obviously match what is needed. The
76821 intent has been to specify historical practice in almost all cases. The one exception is that, in
76822 historical implementations, variables and constants maintain both string and numeric values
76823 after their original value is converted by any use. This means that referencing a variable or
76824 constant can have unexpected side effects. For example, with historical implementations the
76825 following program:

```
76826 {  
76827     a = "+2"  
76828     b = 2  
76829     if (NR % 2)  
76830         c = a + b  
76831     if (a == b)  
76832         print "numeric comparison"  
76833     else  
76834         print "string comparison"  
76835 }
```

76836 would perform a numeric comparison (and output numeric comparison) for each odd-
76837 numbered line, but perform a string comparison (and output string comparison) for each even-
76838 numbered line. POSIX.1-200x ensures that comparisons will be numeric if necessary. With
76839 historical implementations, the following program:

```
76840 BEGIN {  
76841     OFMT = "%e"  
76842     print 3.14  
76843     OFMT = "%f"  
76844     print 3.14  
76845 }
```

76846 would output "3.140000e+00" twice, because in the second **print** statement the constant
76847 "3.14" would have a string value from the previous conversion. POSIX.1-200x requires that the
76848 output of the second **print** statement be "3.140000". The behavior of historical
76849 implementations was seen as too unintuitive and unpredictable.

76850 It was pointed out that with the rules contained in early drafts, the following script would print

```

76851     nothing:
76852     BEGIN {
76853         y[1.5] = 1
76854         OFMT = "%e"
76855         print y[1.5]
76856     }

```

76857 Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to
 76858 affecting output conversions of numbers to strings and **CONVFMT** is used for internal
 76859 conversions, such as comparisons or array indexing. The default value is the same as that for
 76860 **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it
 76861 will receive the historical behavior associated with internal string conversions.

76862 The POSIX *awk* lexical and syntactic conventions are specified more formally than in other
 76863 sources. Again the intent has been to specify historical practice. One convention that may not be
 76864 obvious from the formal grammar as in other verbal descriptions is where <newline>s are
 76865 acceptable. There are several obvious placements such as terminating a statement, and a
 76866 backslash can be used to escape <newline>s between any lexical tokens. In addition, <newline>s
 76867 without backslashes can follow a comma, an open brace, a logical AND operator ("&&"), a
 76868 logical OR operator ("||"), the **do** keyword, the **else** keyword, and the closing parenthesis of an
 76869 **if**, **for**, or **while** statement. For example:

```

76870     { print $1,
76871         $2 }

```

76872 The requirement that *awk* add a trailing <newline> to the program argument text is to simplify
 76873 the grammar, making it match a text file in form. There is no way for an application or test suite
 76874 to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

76875 POSIX.1-200x requires several changes from historical implementations in order to support
 76876 internationalization. Probably the most subtle of these is the use of the decimal-point character,
 76877 defined by the *LC_NUMERIC* category of the locale, in representations of floating-point
 76878 numbers. This locale-specific character is used in recognizing numeric input, in converting
 76879 between strings and numeric values, and in formatting output. However, regardless of locale,
 76880 the period character (the decimal-point character of the POSIX locale) is the decimal-point
 76881 character recognized in processing *awk* programs (including assignments in command line
 76882 arguments). This is essentially the same convention as the one used in the ISO C standard. The
 76883 difference is that the C language includes the *setlocale()* function, which permits an application
 76884 to modify its locale. Because of this capability, a C application begins executing with its locale set
 76885 to the C locale, and only executes in the environment-specified locale after an explicit call to
 76886 *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as
 76887 inappropriate for POSIX.1-200x. It is possible to execute an *awk* program explicitly in any desired
 76888 locale by setting the environment in the shell.

76889 The undefined behavior resulting from NULs in extended regular expressions allows future
 76890 extensions for the GNU *gawk* program to process binary data.

76891 The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic
 76892 errors) is undefined because it was considered overly limiting on implementations to specify. In
 76893 most cases such errors can be expected to produce a diagnostic and a non-zero exit status.
 76894 However, some implementations may choose to extend the language in ways that make use of
 76895 certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but
 76896 otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect
 76897 in some implementations. Also, different implementations might detect a given error during an
 76898 initial parsing of the program (before reading any input files) while others might detect it when
 76899 executing the program after reading some input. Implementors should be aware that diagnosing
 76900 errors as early as possible and producing useful diagnostics can ease debugging of applications,

76901 and thus make an implementation more usable.

76902 The unspecified behavior from using multi-character **RS** values is to allow possible future
76903 extensions based on extended regular expressions used for record separators. Historical
76904 implementations take the first character of the string and ignore the others.

76905 Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future
76906 extension that would split up a string into an array of individual characters.

76907 In the context of the **getline** function, equally good arguments for different precedences of the |
76908 and < operators can be made. Historical practice has been that:

```
76909 getline < "a" "b"
```

76910 is parsed as:

```
76911 ( getline < "a" ) "b"
```

76912 although many would argue that the intent was that the file **ab** should be read. However:

```
76913 getline < "x" + 1
```

76914 parses as:

```
76915 getline < ( "x" + 1 )
```

76916 Similar problems occur with the | version of **getline**, particularly in combination with \$. For
76917 example:

```
76918 $"echo hi" | getline
```

76919 (This situation is particularly problematic when used in a **print** statement, where the |**getline**
76920 part might be a redirection of the **print**.)

76921 Since in most cases such constructs are not (or at least should not) be used (because they have a
76922 natural ambiguity for which there is no conventional parsing), the meaning of these constructs
76923 has been made explicitly unspecified. (The effect is that a conforming application that runs into
76924 the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual
76925 uses of such constructs.

76926 Grammars can be written that would cause an error under these circumstances. Where
76927 backwards-compatibility is not a large consideration, implementors may wish to use such
76928 grammars.

76929 Some historical implementations have allowed some built-in functions to be called without an
76930 argument list, the result being a default argument list chosen in some “reasonable” way. Use of
76931 **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely
76932 known or widely used; this particular form is documented in various places (for example, most
76933 historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as
76934 legitimate practice. With this exception, default argument lists have always been undocumented
76935 and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-
76936 defined functions. They add no useful functionality and preclude possible future extensions that
76937 might need to name functions without calling them. Not standardizing them seems the simplest
76938 course. The standard developers considered that **length** merited special treatment, however,
76939 since it has been documented in the past and sees possibly substantial use in historical
76940 programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the
76941 obsolescent marking for XSI-conforming implementations and many otherwise conforming
76942 applications depend on this feature.

76943 In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive
76944 backslash characters should be used in the string to ensure a single backslash will precede the
76945 ampersand when the resultant string is passed to the function. (For example, to specify one
76946 literal ampersand in the replacement string, use **gsub(ERE, "\\&")**.)

76947 Historically the only special character in the *repl* argument of **sub** and **gsub** string functions was
 76948 the ampersand ('&') character and preceding it with the backslash character was used to turn
 76949 off its special meaning.

76950 The description in the ISO POSIX-2:1993 standard introduced behavior such that the backslash
 76951 character was another special character and it was unspecified whether there were any other
 76952 special characters. This description introduced several portability problems, some of which are
 76953 described below, and so it has been replaced with the more historical description. Some of the
 76954 problems include:

- 76955 • Historically, to create the replacement string, a script could use **gsub(ERE, "\\&")**, but
 76956 with the ISO POSIX-2:1993 standard wording, it was necessary to use **gsub(ERE,**
 76957 **"\\\\&")**. Backslash characters are doubled here because all string literals are subject to
 76958 lexical analysis, which would reduce each pair of backslash characters to a single backslash
 76959 before being passed to **gsub**.
- 76960 • Since it was unspecified what the special characters were, for portable scripts to guarantee
 76961 that characters are printed literally, each character had to be preceded with a backslash.
 76962 (For example, a portable script had to use **gsub(ERE, "\\h\\i")** to produce a replacement
 76963 string of "hi".)

76964 The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe
 76965 historical practice because of the way numeric strings are compared as numbers. The current
 76966 rules cause the following code:

```
76967 if (0 == "000")
76968     print "strange, but true"
76969 else
76970     print "not true"
```

76971 to do a numeric comparison, causing the **if** to succeed. It should be intuitively obvious that this
 76972 is incorrect behavior, and indeed, no historical implementation of *awk* actually behaves this way.

76973 To fix this problem, the definition of *numeric string* was enhanced to include only those values
 76974 obtained from specific circumstances (mostly external sources) where it is not possible to
 76975 determine unambiguously whether the value is intended to be a string or a numeric.

76976 Variables that are assigned to a numeric string shall also be treated as a numeric string. (For
 76977 example, the notion of a numeric string can be propagated across assignments.) In comparisons,
 76978 all variables having the uninitialized value are to be treated as a numeric operand evaluating to
 76979 the numeric value zero.

76980 Uninitialized variables include all types of variables including scalars, array elements, and
 76981 fields. The definition of an uninitialized value in [Variables and Special Variables](#) (on page 2377)
 76982 is necessary to describe the value placed on uninitialized variables and on fields that are valid
 76983 (for example, < \$NF) but have no characters in them and to describe how these variables are to
 76984 be used in comparisons. A valid field, such as \$1, that has no characters in it can be obtained
 76985 from an input line of "\t\t" when FS='\t'. Historically, the comparison (\$1<10) was done
 76986 numerically after evaluating \$1 to the value zero.

76987 The phrase "... also shall have the numeric value of the numeric string" was removed from
 76988 several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary
 76989 implementation detail. It is not necessary for POSIX.1-200x to specify that these objects be
 76990 assigned two different values. It is only necessary to specify that these objects may evaluate to
 76991 two different values depending on context.

76992 The description of numeric string processing is based on the behavior of the *atof()* function in
 76993 the ISO C standard. While it is not a requirement for an implementation to use this function,
 76994 many historical implementations of *awk* do. In the ISO C standard, floating-point constants use a
 76995 period as a decimal point character for the language itself, independent of the current locale, but

76996 the *atof()* function and the associated *strtod()* function use the decimal point character of the
 76997 current locale when converting strings to numeric values. Similarly in *awk*, floating-point
 76998 constants in an *awk* script use a period independent of the locale, but input strings use the
 76999 decimal point character of the locale.

77007 CHANGE HISTORY

77008 First released in Issue 2.

77009 Issue 5

77010 The FUTURE DIRECTIONS section is added.

77011 Issue 6

77012 The *awk* utility is aligned with the IEEE P1003.2b draft standard.

77013 The normative text is reworded to avoid use of the term “must” for application requirements.

77014 IEEE PASC Interpretation 1003.2 #211 is applied, adding the sentence “An occurrence of two
 77015 consecutive backslashes shall be interpreted as just a single literal backslash character.” into the
 77016 description of the **sub** string function.

77017 Issue 7

77018 PASC Interpretation 1003.2-1992 #107 (SD5-XCU-ERN-73) is applied, updating the description of
 77019 the **OFS** variable.

77020 SD5-XCU-ERN-79 is applied, restoring the horizontal lines to [Table 4-1](#) (on page 2374), and
 77021 SD5-XCU-ERN-80 is applied, changing the order of some table entries.

77022 SD5-XCU-ERN-87 is applied, updating the descriptive text of the Grammar.

77023 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77024 **NAME**
 77025 `basename` — return non-directory portion of a pathname

77026 **SYNOPSIS**
 77027 `basename string [suffix]`

77028 **DESCRIPTION**
 77029 The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.265](#) (on page 70).
 77030 The string *string* shall be converted to the filename corresponding to the last pathname
 77031 component in *string* and then the suffix string *suffix*, if present, shall be removed. This shall be
 77032 done by performing actions equivalent to the following steps in order:

- 77033 1. If *string* is a null string, it is unspecified whether the resulting string is `.'` or a null
 77034 string. In either case, skip steps 2 through 6.
- 77035 2. If *string* is `"/"`, it is implementation-defined whether steps 3 to 6 are skipped or
 77036 processed.
- 77037 3. If *string* consists entirely of slash characters, *string* shall be set to a single slash character.
 77038 In this case, skip steps 4 to 6.
- 77039 4. If there are any trailing slash characters in *string*, they shall be removed.
- 77040 5. If there are any slash characters remaining in *string*, the prefix of *string* up to and
 77041 including the last slash character in *string* shall be removed.
- 77042 6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is
 77043 identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed
 77044 from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an
 77045 error if *suffix* is not found in *string*.

77046 The resulting string shall be written to standard output.

77047 **OPTIONS**
 77048 None.

77049 **OPERANDS**
 77050 The following operands shall be supported:

77051 *string* A string.
 77052 *suffix* A string.

77053 **STDIN**
 77054 Not used.

77055 **INPUT FILES**
 77056 None.

77057 **ENVIRONMENT VARIABLES**
 77058 The following environment variables shall affect the execution of *basename*:

77059 *LANG* Provide a default value for the internationalization variables that are unset or null.
 77060 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 77061 variables used to determine the values of locale categories.)

77062 *LC_ALL* If set to a non-empty string value, override the values of all the other
 77063 internationalization variables.

77064 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
77065 characters (for example, single-byte as opposed to multi-byte characters in
77066 arguments).

77067 *LC_MESSAGES*
77068 Determine the locale that should be used to affect the format and contents of
77069 diagnostic messages written to standard error.

77070 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

77071 **ASYNCHRONOUS EVENTS**

77072 Default.

77073 **STDOUT**

77074 The *basename* utility shall write a line to the standard output in the following format:

77075 "%s\n", <resulting string>

77076 **STDERR**

77077 The standard error shall be used only for diagnostic messages.

77078 **OUTPUT FILES**

77079 None.

77080 **EXTENDED DESCRIPTION**

77081 None.

77082 **EXIT STATUS**

77083 The following exit values shall be returned:

77084 0 Successful completion.

77085 >0 An error occurred.

77086 **CONSEQUENCES OF ERRORS**

77087 Default.

77088 **APPLICATION USAGE**

77089 The definition of *pathname* specifies implementation-defined behavior for pathnames starting
77090 with two slash characters. Therefore, applications shall not arbitrarily add slashes to the
77091 beginning of a pathname unless they can ensure that there are more or less than two or are
77092 prepared to deal with the implementation-defined consequences.

77093 **EXAMPLES**

77094 If the string *string* is a valid pathname:

77095 \$(basename "*string*")

77096 produces a filename that could be used to open the file named by *string* in the directory returned
77097 by:

77098 \$(dirname "*string*")

77099 If the string *string* is not a valid pathname, the same algorithm is used, but the result need not be
77100 a valid filename. The *basename* utility is not expected to make any judgements about the validity
77101 of *string* as a pathname; it just follows the specified algorithm to produce a result string.

77102 The following shell script compiles */usr/src/cmd/cat.c* and moves the output to a file named **cat**
77103 in the current directory when invoked with the argument */usr/src/cmd/cat* or with the argument
77104 */usr/src/cmd/cat.c*:

77105 c99 \$(dirname "\$1")/\$(basename "\$1" .c).c

77106 mv a.out \$(basename "\$1" .c)

77107
77108
77109
77110
77111
77112
77113
77114
77115
77116
77117
77118
77119
77120
77121
77122
77123
77124
77125
77126
77127

RATIONALE

The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid pathname:

```
$(basename "string")
```

would be a valid filename for the file in the directory:

```
$(dirname "string")
```

This would not work for the early proposal versions of these utilities due to the way it specified handling of trailing slashes.

Since the definition of *pathname* specifies implementation-defined behavior for pathnames starting with two slash characters, this volume of POSIX.1-200x specifies similar implementation-defined behavior for the *basename* and *dirname* utilities.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

IEEE PASC Interpretation 1003.2 #164 is applied.

The normative text is reworded to avoid use of the term “must” for application requirements.

77128 **NAME**77129 `batch` — schedule commands to be executed in a batch queue77130 **SYNOPSIS**77131 `batch`77132 **DESCRIPTION**77133 The *batch* utility shall read commands from standard input and schedule them for execution in a
77134 batch queue. It shall be the equivalent of the command:77135 `at -q b -m now`77136 where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to
77137 the batch queue with no time constraints and shall be run by the system using algorithms, based
77138 on unspecified factors, that may vary with each invocation of *batch*.77139 XSI Users shall be permitted to use *batch* if their name appears in the file **at.allow** which is located in
77140 an implementation-defined directory. If that file does not exist, the file **at.deny**, which is located
77141 in an implementation-defined directory, shall be checked to determine whether the user shall be
77142 denied access to *batch*. If neither file exists, only a process with the appropriate privileges shall
77143 be allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be permitted.
77144 The **at.allow** and **at.deny** files shall consist of one user name per line.77145 **OPTIONS**

77146 None.

77147 **OPERANDS**

77148 None.

77149 **STDIN**77150 The standard input shall be a text file consisting of commands acceptable to the shell command
77151 language described in [Chapter 2](#) (on page 2245).77152 **INPUT FILES**77153 XSI The text files **at.allow** and **at.deny**, which are located in an implementation-defined directory,
77154 shall contain zero or more user names, one per line, of users who are, respectively, authorized or
77155 denied access to the *at* and *batch* utilities.77156 **ENVIRONMENT VARIABLES**77157 The following environment variables shall affect the execution of *batch*:77158 **LANG** Provide a default value for the internationalization variables that are unset or null. |
77159 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
77160 variables used to determine the values of locale categories.)77161 **LC_ALL** If set to a non-empty string value, override the values of all the other
77162 internationalization variables.77163 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
77164 characters (for example, single-byte as opposed to multi-byte characters in
77165 arguments and input files).77166 **LC_MESSAGES**77167 Determine the locale that should be used to affect the format and contents of
77168 diagnostic messages written to standard error and informative messages written to
77169 standard output.

77170		<i>LC_TIME</i>	Determine the format and contents for date and time strings written by <i>batch</i> .
77171	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
77172		<i>SHELL</i>	Determine the name of a command interpreter to be used to invoke the at-job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; any of the preceding accompanied by a warning diagnostic about which was chosen.
77173			
77174			
77175			
77176			
77177		<i>TZ</i>	Determine the timezone. The job shall be submitted for execution at the time specified by <i>timespec</i> or <i>-t time</i> relative to the timezone specified by the <i>TZ</i> variable. If <i>timespec</i> specifies a timezone, it overrides <i>TZ</i> . If <i>timespec</i> does not specify a timezone and <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
77178			
77179			
77180			
77181			

ASYNCHRONOUS EVENTS

77182 Default.

77183

STDOUT

77184 When standard input is a terminal, prompts of unspecified format for each line of the user input described in the STDIN section may be written to standard output.

77185

77186

STDERR

77187 The following shall be written to standard error when a job has been successfully submitted:

77188

77189

"job %s at %s\n", *at_job_id*, <*date*>

77190

where *date* shall be equivalent in format to the output of:

77191

`date +"%a %b %e %T %Y"`

77192

77193

The date and time written shall be adjusted so that they appear in the timezone of the user (as determined by the *TZ* variable).

77194

77195

Neither this, nor warning messages concerning the selection of the command interpreter, are considered a diagnostic that changes the exit status.

77196

Diagnostic messages, if any, shall be written to standard error.

OUTPUT FILES

77197 None.

77198

EXTENDED DESCRIPTION

77199 None.

77200

EXIT STATUS

77201 The following exit values shall be returned:

77202

77203

0 Successful completion.

77204

>0 An error occurred.

CONSEQUENCES OF ERRORS

77205 The job shall not be scheduled.

77206

77207

APPLICATION USAGE

77208

It may be useful to redirect standard output within the specified commands.

77209

EXAMPLES

77210

1. This sequence can be used at a terminal:

77211

```
batch
```

77212

```
sort < file >outfile
```

77213

```
EOT
```

77214

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

77215

```
batch <<!
```

77216

```
diff file1 file2 2>&1 >outfile | mailx mygroup
```

77217

```
!
```

77218

77219

RATIONALE

77220

Early proposals described *batch* in a manner totally separated from *at*, even though the historical model treated it almost as a synonym for *at -qb*. A number of features were added to list and control batch work separately from those in *at*. Upon further reflection, it was decided that the benefit of this did not merit the change to the historical interface.

77221

77222

77223

77224

The *-m* option was included on the equivalent *at* command because it is historical practice to mail results to the submitter, even if all job-produced output is redirected. As explained in the RATIONALE for *at*, the **now** keyword submits the job for immediate execution (after scheduling delays), despite some historical systems where *at now* would have been considered an error.

77225

77226

77227

77228

FUTURE DIRECTIONS

77229

None.

77233

CHANGE HISTORY

77234

First released in Issue 2.

77235

Issue 6

77236

This utility is marked as part of the User Portability Utilities option.

77237

The NAME is changed to align with the IEEE P1003.2b draft standard.

77238

The normative text is reworded to avoid use of the term “must” for application requirements.

77239

Issue 7

77240

The *batch* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

77241

77242

SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced by the *batch* utility.

77243

- 77244 **NAME**
- 77245 bc — arbitrary-precision arithmetic language
- 77246 **SYNOPSIS**
- 77247 bc [-l] [*file...*]
- 77248 **DESCRIPTION**
- 77249 The *bc* utility shall implement an arbitrary precision calculator. It shall take input from any files
- 77250 given, then read from the standard input. If the standard input and standard output to *bc* are
- 77251 attached to a terminal, the invocation of *bc* shall be considered to be *interactive*, causing
- 77252 behavioral constraints described in the following sections.
- 77253 **OPTIONS**
- 77254 The *bc* utility shall conform to XBD [Section 12.2](#) (on page 201).
- 77255 The following option shall be supported:
- 77256 -l (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the
- 77257 default zero; see the EXTENDED DESCRIPTION section.
- 77258 **OPERANDS**
- 77259 The following operand shall be supported:
- 77260 *file* A pathname of a text file containing *bc* program statements. After all *files* have
- 77261 been read, *bc* shall read the standard input.
- 77262 **STDIN**
- 77263 See the INPUT FILES section.
- 77264 **INPUT FILES**
- 77265 Input files shall be text files containing a sequence of comments, statements, and function
- 77266 definitions that shall be executed as they are read.
- 77267 **ENVIRONMENT VARIABLES**
- 77268 The following environment variables shall affect the execution of *bc*:
- 77269 LANG Provide a default value for the internationalization variables that are unset or null. |
- 77270 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
- 77271 variables used to determine the values of locale categories.)
- 77272 LC_ALL If set to a non-empty string value, override the values of all the other
- 77273 internationalization variables.
- 77274 LC_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as
- 77275 characters (for example, single-byte as opposed to multi-byte characters in
- 77276 arguments and input files).
- 77277 LC_MESSAGES
- 77278 Determine the locale that should be used to affect the format and contents of
- 77279 diagnostic messages written to standard error.
- 77280 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 77281 **ASYNCHRONOUS EVENTS**
- 77282 Default.

77283 **STDOUT**

77284 The output of the *bc* utility shall be controlled by the program read, and consist of zero or more
 77285 lines containing the value of all executed expressions without assignments. The radix and
 77286 precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the
 77287 EXTENDED DESCRIPTION section.

77288 **STDERR**

77289 The standard error shall be used only for diagnostic messages.

77290 **OUTPUT FILES**

77291 None.

77292 **EXTENDED DESCRIPTION**77293 **Grammar**

77294 The grammar in this section and the lexical conventions in the following section shall together
 77295 describe the syntax for *bc* programs. The general conventions for this style of grammar are
 77296 described in [Section 1.3](#) (on page 2235). A valid program can be represented as the non-terminal
 77297 symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax
 77298 description.

```

77400 Lexical Conventions in bc

77401 The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as
77402 follows:

- 77403 1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a
77404 given point.
- 77405 2. A comment shall consist of any characters beginning with the two adjacent characters
77406 `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`.
77407 Comments shall have no effect except to delimit lexical tokens.
- 77408 3. The `<newline>` shall be recognized as the token **NEWLINE**.
- 77409 4. The token **STRING** shall represent a string constant; it shall consist of any characters
77410 beginning with the double-quote character (`'"`) and terminated by another occurrence
77411 of the double-quote character. The value of the string is the sequence of all characters
77412 between, but not including, the two double-quote characters. All characters shall be taken
77413 literally from the input, and there is no way to specify a string containing a double-quote
77414 character. The length of the value of each string shall be limited to `{BC_STRING_MAX}`
77415 bytes.
- 77416 5. A `<blank>` shall have no effect except as an ordinary character if it appears within a
77417 **STRING** token, or to delimit a lexical token other than **STRING**.
- 77418 6. The combination of a backslash character immediately followed by a `<newline>` shall
77419 have no effect other than to delimit lexical tokens with the following exceptions:
 - 77420 • It shall be interpreted as the character sequence `"\<newline>"` in **STRING** tokens.
 - 77421 • It shall be ignored as part of a multi-line **NUMBER** token.

- 77422 7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the
77423 following grammar:
- ```
77424 NUMBER : integer
77425 | '.' integer
77426 | integer '.'
77427 | integer '.' integer
77428 ;

77429 integer : digit
77430 | integer digit
77431 ;

77432 digit : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
77433 | 8 | 9 | A | B | C | D | E | F
77434 ;
```
- 77435 8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by  
77436 the value of the internal register **ibase** (described below). Each of the **digit** characters  
77437 shall have the value from 0 to 15 in the order listed here, and the period character shall  
77438 represent the radix point. The behavior is undefined if digits greater than or equal to the  
77439 value of **ibase** appear in the token. However, note the exception for single-digit values  
77440 being assigned to **ibase** and **obase** themselves, in [Operations in bc](#) (on page 2414).
- 77441 9. The following keywords shall be recognized as tokens:
- ```
77442 auto      ibase      length      return      while
77443 break     if          obase       scale
77444 define    for          quit        sqrt
```
- 77445 10. Any of the following characters occurring anywhere except within a keyword shall be
77446 recognized as the token **LETTER**:
- ```
77447 a b c d e f g h i j k l m n o p q r s t u v w x y z
```
- 77448 11. The following single-character and two-character sequences shall be recognized as the  
77449 token **ASSIGN\_OP**:
- ```
77450 = += -= *= /= %= ^=
```
- 77451 12. If an '=' character, as the beginning of a token, is followed by a '-' character with no
77452 intervening delimiter, the behavior is undefined.
- 77453 13. The following single-characters shall be recognized as the token **MUL_OP**:
- ```
77454 * / %
```
- 77455 14. The following single-character and two-character sequences shall be recognized as the  
77456 token **REL\_OP**:
- ```
77457 == <= >= != < >
```
- 77458 15. The following two-character sequences shall be recognized as the token **INCR_DECR**:
- ```
77459 ++ --
```
- 77460 16. The following single characters shall be recognized as tokens whose names are the  
77461 character:
- ```
77462 <newline> ( ) , + - ; [ ] ^ { }
```
- 77463 17. The token **EOF** is returned when the end of input is reached.

77464

Operations in bc

77465

77466

77467

77468

77469

77470

77471

There are three kinds of identifiers: ordinary identifiers, array identifiers, and function identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed by square brackets (" []"). An array subscript is required except in an argument or auto list. Arrays are singly dimensioned and can contain up to {BC_DIM_MAX} elements. Indexing shall begin at zero so an array is indexed from 0 to {BC_DIM_MAX}-1. Subscripts shall be truncated to integers. The application shall ensure that function identifiers are followed by parentheses, possibly enclosing arguments. The three types of identifiers do not conflict.

77472

77473

77474

The following table summarizes the rules for precedence and associativity of all operators. Operators on the same line shall have the same precedence; rows are in order of decreasing precedence.

77475

Table 4-3 Operators in *bc*

77476

77477

77478

77479

77480

77481

77482

77483

Operator	Associativity
++, --	N/A
unary -	N/A
^	Right to left
*, /, %	Left to right
+, binary -	Left to right
=, +=, -=, *=, /=, %=, ^=	Right to left
==, <=, >=, !=, <, >	None

77484

77485

Each expression or named expression has a *scale*, which is the number of decimal digits that shall be maintained as the fractional portion of the expression.

77486

77487

77488

77489

Named expressions are places where values are stored. Named expressions shall be valid on the left side of an assignment. The value of a named expression shall be the value stored in the place named. Simple identifiers and array elements are named expressions; they have an initial value of zero and an initial scale of zero.

77490

77491

77492

77493

77494

77495

77496

The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an expression consisting of the name of one of these registers shall be zero; values assigned to any of these registers are truncated to integers. The **scale** register shall contain a global value used in computing the scale of expressions (as described below). The value of the register **scale** is limited to $0 \leq \text{scale} \leq \{\text{BC_SCALE_MAX}\}$ and shall have a default value of zero. The **ibase** and **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be limited to:

77497

$$2 \leq \text{ibase} \leq 16$$

77498

The value of **obase** shall be limited to:

77499

$$2 \leq \text{obase} \leq \{\text{BC_BASE_MAX}\}$$

77500

77501

77502

77503

77504

When either **ibase** or **obase** is assigned a single **digit** value from the list in [Lexical Conventions in bc](#) (on page 2412), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall have initial values of 10.

77505

77506

77507

Internal computations shall be conducted as if in decimal, regardless of the input and output bases, to the specified number of decimal digits. When an exact result is not achieved (for example, **scale=0**; 3.2/1), the result shall be truncated.

77508

77509

For all values of **obase** specified by this volume of POSIX.1-200x, *bc* shall output numeric values by performing each of the following steps in order:

- 77510 1. If the value is less than zero, a hyphen ('-') character shall be output.
- 77511 2. One of the following is output, depending on the numerical value:
- 77512 • If the absolute value of the numerical value is greater than or equal to one, the
 - 77513 integer portion of the value shall be output as a series of digits appropriate to **obase**
 - 77514 (as described below), most significant digit first. The most significant non-zero digit
 - 77515 shall be output next, followed by each successively less significant digit.
 - 77516 • If the absolute value of the numerical value is less than one but greater than zero
 - 77517 and the scale of the numerical value is greater than zero, it is unspecified whether
 - 77518 the character 0 is output.
 - 77519 • If the numerical value is zero, the character 0 shall be output.
- 77520 3. If the scale of the value is greater than zero and the numeric value is not zero, a period
- 77521 character shall be output, followed by a series of digits appropriate to **obase** (as described
- 77522 below) representing the most significant portion of the fractional part of the value. If *s*
- 77523 represents the scale of the value being output, the number of digits output shall be *s* if
- 77524 **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s*
- 77525 if **obase** is less than 10. For **obase** values other than 10, this should be the number of
- 77526 digits needed to represent a precision of 10^s .

77527 For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

77528 0 1 2 3 4 5 6 7 8 9 A B C D E F

77529 which represent the values zero to 15, inclusive, respectively.

77530 For bases greater than 16, each digit shall be written as a separate multi-digit decimal number.

77531 Each digit except the most significant fractional digit shall be preceded by a single <space>. For

77532 bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1 000, three-

77533 digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be

77534 written as:

77535 Δ01Δ15Δ24

77536 and in base 125, as:

77537 Δ008Δ024

77538 Very large numbers shall be split across lines with 70 characters per line in the POSIX locale;

77539 other locales may split at different character boundaries. Lines that are continued shall end with

77540 a backslash ('\').

77541 A function call shall consist of a function name followed by parentheses containing a comma-

77542 separated list of expressions, which are the function arguments. A whole array passed as an

77543 argument shall be specified by the array name followed by empty square brackets. All function

77544 arguments shall be passed by value. As a result, changes made to the formal parameters shall

77545 have no effect on the actual arguments. If the function terminates by executing a **return**

77546 statement, the value of the function shall be the value of the expression in the parentheses of the

77547 **return** statement or shall be zero if no expression is provided or if there is no **return** statement.

77548 The result of **sqrt(expression)** shall be the square root of the expression. The result shall be

77549 truncated in the least significant decimal place. The scale of the result shall be the scale of the

77550 expression or the value of **scale**, whichever is larger.

77551 The result of **length(expression)** shall be the total number of significant decimal digits in the

77552 expression. The scale of the result shall be zero.

77553 The result of **scale(expression)** shall be the scale of the expression. The scale of the result shall be

77554 zero.

77555 A numeric constant shall be an expression. The scale shall be the number of digits that follow the
77556 radix point in the input representing the constant, or zero if no radix point appears.

77557 The sequence (*expression*) shall be an expression with the same value and scale as *expression*.
77558 The parentheses can be used to alter the normal precedence.

77559 The semantics of the unary and binary operators are as follows:

77560 *-expression*
77561 The result shall be the negative of the *expression*. The scale of the result shall be the scale of
77562 *expression*.

77563 The unary increment and decrement operators shall not modify the scale of the named
77564 expression upon which they operate. The scale of the result shall be the scale of that named
77565 expression.

77566 *++named-expression*
77567 The named expression shall be incremented by one. The result shall be the value of the
77568 named expression after incrementing.

77569 *--named-expression*
77570 The named expression shall be decremented by one. The result shall be the value of the
77571 named expression after decrementing.

77572 *named-expression++*
77573 The named expression shall be incremented by one. The result shall be the value of the
77574 named expression before incrementing.

77575 *named-expression--*
77576 The named expression shall be decremented by one. The result shall be the value of the
77577 named expression before decrementing.

77578 The exponentiation operator, circumflex ('^'), shall bind right to left.

77579 *expression^expression*
77580 The result shall be the first *expression* raised to the power of the second *expression*. If the
77581 second *expression* is not an integer, the behavior is undefined. If *a* is the scale of the left
77582 *expression* and *b* is the absolute value of the right *expression*, the scale of the result shall be:
77583 if $b \geq 0$ $\min(a * b, \max(\text{scale}, a))$ if $b < 0$ scale

77584 The multiplicative operators ('*', '/', '%') shall bind left to right.

77585 *expression*expression*
77586 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two
77587 expressions, then the scale of the result shall be:
77588 $\min(a+b, \max(\text{scale}, a, b))$

77589 *expression/expression*
77590 The result shall be the quotient of the two expressions. The scale of the result shall be the
77591 value of **scale**.

77592 *expression%expression*
77593 For expressions *a* and *b*, *a%b* shall be evaluated equivalent to the steps:
77594 1. Compute *a/b* to current scale.
77595 2. Use the result to compute:
77596 $a - (a / b) * b$
77597 to scale:
77598 $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

77599 The scale of the result shall be:

77600 $\max(\text{scale} + \text{scale}(b), \text{scale}(a))$

77601 When **scale** is zero, the '**%**' operator is the mathematical remainder operator.

77602 The additive operators ('+', '-') shall bind left to right.

77603 *expression+expression*

77604 The result shall be the sum of the two expressions. The scale of the result shall be the

77605 maximum of the scales of the expressions.

77606 *expression-expression*

77607 The result shall be the difference of the two expressions. The scale of the result shall be the

77608 maximum of the scales of the expressions.

77609 The assignment operators ('=', '+=', '-=', '*=', '/=', '%=', '^=') shall bind right to left.

77610 *named-expression=expression*

77611 This expression shall result in assigning the value of the expression on the right to the

77612 named expression on the left. The scale of both the named expression and the result shall be

77613 the scale of *expression*.

77614 The compound assignment forms:

77615 *named-expression <operator>= expression*

77616 shall be equivalent to:

77617 *named-expression=named-expression <operator> expression*

77618 except that the *named-expression* shall be evaluated only once.

77619 Unlike all other operators, the relational operators ('<', '>', '<=', '>=', '==', '!=') shall be

77620 only valid as the object of an **if**, **while**, or inside a **for** statement.

77621 *expression1<expression2*

77622 The relation shall be true if the value of *expression1* is strictly less than the value of

77623 *expression2*.

77624 *expression1>expression2*

77625 The relation shall be true if the value of *expression1* is strictly greater than the value of

77626 *expression2*.

77627 *expression1<=expression2*

77628 The relation shall be true if the value of *expression1* is less than or equal to the value of

77629 *expression2*.

77630 *expression1>=expression2*

77631 The relation shall be true if the value of *expression1* is greater than or equal to the value of

77632 *expression2*.

77633 *expression1==expression2*

77634 The relation shall be true if the values of *expression1* and *expression2* are equal.

77635 *expression1!=expression2*

77636 The relation shall be true if the values of *expression1* and *expression2* are unequal.

77637 There are only two storage classes in *bc*: global and automatic (local). Only identifiers that are

77638 local to a function need be declared with the **auto** command. The arguments to a function shall

77639 be local to the function. All other identifiers are assumed to be global and available to all

77640 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as **auto**

77641 shall be allocated on entry to the function and released on returning from the function. They

77642 therefore do not retain values between function calls. Auto arrays shall be specified by the array

77643 name followed by empty square brackets. On entry to a function, the old values of the names
 77644 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the
 77645 function returns, reference to these names shall refer only to the new values.

77646 References to any of these names from other functions that are called from this function also
 77647 refer to the new value until one of those functions uses the same name for a local variable.

77648 When a statement is an expression, unless the main operator is an assignment, execution of the
 77649 statement shall write the value of the expression followed by a <newline>.

77650 When a statement is a string, execution of the statement shall write the value of the string.

77651 Statements separated by semicolons or <newline>s shall be executed sequentially. In an
 77652 interactive invocation of *bc*, each time a <newline> is read that satisfies the grammatical
 77653 production:

77654 `input_item : semicolon_list NEWLINE`

77655 the sequential list of statements making up the **semicolon_list** shall be executed immediately
 77656 and any output produced by that execution shall be written without any delay due to buffering.

77657 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

77658 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;
 77659 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the
 77660 *relation* is false, execution shall resume after *statement*.

77661 A **for** statement(**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

```
77662 first-expression
77663 while (relation) {
77664     statement
77665     last-expression
77666 }
```

77667 The application shall ensure that all three expressions are present.

77668 The **break** statement shall cause termination of a **for** or **while** statement.

77669 The **auto** statement (**auto** *identifier* [*identifier*] ...) shall cause the values of the identifiers to be
 77670 pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers
 77671 shall be specified by following the array name by empty square brackets. The application shall
 77672 ensure that the **auto** statement is the first statement in a function definition.

77673 A **define** statement:

```
77674 define LETTER ( opt_parameter_list ) {
77675     opt_auto_define_list
77676     statement_list
77677 }
```

77678 defines a function named **LETTER**. If a function named **LETTER** was previously defined, the
 77679 **define** statement shall replace the previous definition. The expression:

77680 `LETTER (opt_argument_list)`

77681 shall invoke the function named **LETTER**. The behavior is undefined if the number of
 77682 arguments in the invocation does not match the number of parameters in the definition.
 77683 Functions shall be defined before they are invoked. A function shall be considered to be defined
 77684 within its own body, so recursive calls are valid. The values of numeric constants within a
 77685 function shall be interpreted in the base specified by the value of the **ibase** register when the
 77686 function is invoked.

77687 The **return** statements (**return** and **return**(*expression*)) shall cause termination of a function,

77688 popping of its auto variables, and specification of the result of the function. The first form shall
 77689 be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the
 77690 value and scale of the expression returned.

77691 The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement
 77692 occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

77693 The following functions shall be defined when the **-I** option is specified:

77694 **s**(*expression*)
 77695 Sine of argument in radians.

77696 **c**(*expression*)
 77697 Cosine of argument in radians.

77698 **a**(*expression*)
 77699 Arctangent of argument.

77700 **l**(*expression*)
 77701 Natural logarithm of argument.

77702 **e**(*expression*)
 77703 Exponential function of argument.

77704 **j**(*expression*, *expression*)
 77705 Bessel function of integer order.

77706 The scale of the result returned by these functions shall be the value of the **scale** register at the
 77707 time the function is invoked. The value of the **scale** register after these functions have completed
 77708 their execution shall be the same value it had upon invocation. The behavior is undefined if any
 77709 of these functions is invoked with an argument outside the domain of the mathematical
 77710 function.

77711 EXIT STATUS

77712 The following exit values shall be returned:

77713 0 All input files were processed successfully.

77714 *unspecified* An error occurred.

77715 CONSEQUENCES OF ERRORS

77716 If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic
 77717 message to standard error and terminate without any further action.

77718 In an interactive invocation of *bc*, the utility should print an error message and recover following
 77719 any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined
 77720 behavior.

77721 APPLICATION USAGE

77722 Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.

77723 For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has
 77724 occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by
 77725 interactive users (who can react to error messages) or by application programs that can
 77726 somehow validate the answers returned as not including error messages.

77727 The *bc* utility always uses the period (**' . '**) character to represent a radix point, regardless of any
 77728 decimal-point character specified as part of the current locale. In languages like C or *awk*, the
 77729 period character is used in program source, so it can be portable and unambiguous, while the
 77730 locale-specific character is used in input and output. Because there is no distinction between
 77731 source and input in *bc*, this arrangement would not be possible. Using the locale-specific
 77732 character in *bc*'s input would introduce ambiguities into the language; consider the following
 77733 example in a locale with a comma as the decimal-point character:

```

77734     define f(a,b) {
77735         ...
77736     }
77737     ...
77738     f(1,2,3)

```

77739 Because of such ambiguities, the period character is used in input. Having input follow different
77740 conventions from output would be confusing in either pipeline usage or interactive usage, so the
77741 period is also used in output.

77742 EXAMPLES

77743 In the shell, the following assigns an approximation of the first ten digits of ' π ' to the variable *x*:

```
77744 x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)
```

77745 The following *bc* program prints the same approximation of ' π ', with a label, to standard
77746 output:

```

77747     scale = 10
77748     "pi equals "
77749     104348 / 33215

```

77750 The following defines a function to compute an approximate value of the exponential function
77751 (note that such a function is predefined if the `-l` option is specified):

```

77752     scale = 20
77753     define e(x){
77754         auto a, b, c, i, s
77755         a = 1
77756         b = 1
77757         s = 1
77758         for (i = 1; 1 == 1; i++){
77759             a = a*x
77760             b = b*i
77761             c = a/b
77762             if (c == 0) {
77763                 return(s)
77764             }
77765             s = s+c
77766         }
77767     }

```

77768 The following prints approximate values of the exponential function of the first ten integers:

```

77769     for (i = 1; i <= 10; ++i) {
77770         e(i)
77771     }

```

77772 RATIONALE

77773 The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to
77774 be part of this volume of POSIX.1-200x because *bc* was thought to have a more intuitive
77775 programmatic interface. Current implementations that implement *bc* using *dc* are expected to be
77776 compliant.

77777 The exit status for error conditions has been left unspecified for several reasons:

- 77778 • The *bc* utility is used in both interactive and non-interactive situations. Different exit codes
77779 may be appropriate for the two uses.

- 77780 • It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions,
77781 and syntax errors are all possibilities.
- 77782 • It is not clear what utility the exit status has.
- 77783 • In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with
77784 *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc*
77785 aborted.

77786 The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief
77787 that *bc file1 file2* is used most often when at least *file1* contains data/function
77788 declarations/initializations. Having *bc* continue with prerequisite files missing is probably not
77789 useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check
77790 all its files for accessibility before opening any of them.

77791 There was considerable debate on the appropriateness of the language accepted by *bc*. Several
77792 reviewers preferred to see either a pure subset of the C language or some changes to make the
77793 language more compatible with C. While the *bc* language has some obvious similarities to C, it
77794 has never claimed to be compatible with any version of C. An interpreter for a subset of C might
77795 be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility
77796 is known in historical practice, and it was not within the scope of this volume of POSIX.1-200x
77797 to define such a language and utility. If and when they are defined, it may be appropriate to
77798 include them in a future version of this standard. This left the following alternatives:

- 77799 1. Exclude any calculator language from this volume of POSIX.1-200x.

77800 The consensus of the standard developers was that a simple programmatic calculator
77801 language is very useful for both applications and interactive users. The only arguments
77802 for excluding any calculator were that it would become obsolete if and when a C-
77803 compatible one emerged, or that the absence would encourage the development of such a
77804 C-compatible one. These arguments did not sufficiently address the needs of current
77805 application developers.

- 77806 2. Standardize the historical *dc*, possibly with minor modifications.

77807 The consensus of the standard developers was that *dc* is a fundamentally less usable
77808 language and that that would be far too severe a penalty for avoiding the issue of being
77809 similar to but incompatible with C.

- 77810 3. Standardize the historical *bc*, possibly with minor modifications.

77811 This was the approach taken. Most of the proponents of changing the language would not
77812 have been satisfied until most or all of the incompatibilities with C were resolved. Since
77813 most of the changes considered most desirable would break historical applications and
77814 require significant modification to historical implementations, almost no modifications
77815 were made. The one significant modification that was made was the replacement of the
77816 historical *bc* assignment operators "*a*+", and so on, with the more modern "*a*=", and so
77817 on. The older versions are considered to be fundamentally flawed because of the lexical
77818 ambiguity in uses like *a*--1.

77819 In order to permit implementations to deal with backwards-compatibility as they see fit,
77820 the behavior of this one ambiguous construct was made undefined. (At least three
77821 implementations have been known to support this change already, so the degree of
77822 change involved should not be great.)

77823 The '%' operator is the mathematical remainder operator when **scale** is zero. The behavior of
77824 this operator for other values of **scale** is from historical implementations of *bc*, and has been
77825 maintained for the sake of historical applications despite its non-intuitive nature.

77826 Historical implementations permit setting **ibase** and **obase** to a broader range of values. This
77827 includes values less than 2, which were not seen as sufficiently useful to standardize. These

77828 implementations do not interpret input properly for values of **ibase** that are greater than 16. This
 77829 is because numeric constants are recognized syntactically, rather than lexically, as described in
 77830 this volume of POSIX.1-200x. They are built from lexical tokens of single hexadecimal digits and
 77831 periods. Since <blank>s between tokens are not visible at the syntactic level, it is not possible to
 77832 recognize the multi-digit “digits” used in the higher bases properly. The ability to recognize
 77833 input in these bases was not considered useful enough to require modifying these
 77834 implementations. Note that the recognition of numeric constants at the syntactic level is not a
 77835 problem with conformance to this volume of POSIX.1-200x, as it does not impact the behavior of
 77836 conforming applications (and correct *bc* programs). Historical implementations also accept input
 77837 with all of the digits ‘0’–‘9’ and ‘A’–‘F’ regardless of the value of **ibase**; since digits with
 77838 value greater than or equal to **ibase** are not really appropriate, the behavior when they appear is
 77839 undefined, except for the common case of:

```
77840 ibase=8;
77841     /* Process in octal base. */
77842     ...
77843 ibase=A
77844     /* Restore decimal base. */
```

77845 In some historical implementations, if the expression to be written is an uninitialized array
 77846 element, a leading <space> and/or up to four leading 0 characters may be output before the
 77847 character zero. This behavior is considered a bug; it is unlikely that any currently conforming
 77848 application relies on:

```
77849 echo 'b[3]' | bc
```

77850 returning 00000 rather than 0.

77851 Exact calculation of the number of fractional digits to output for a given value in a base other
 77852 than 10 can be computationally expensive. Historical implementations use a faster
 77853 approximation, and this is permitted. Note that the requirements apply only to values of **obase**
 77854 that this volume of POSIX.1-200x requires implementations to support (in particular, not to 1, 0,
 77855 or negative bases, if an implementation supports them as an extension).

77856 Historical implementations of *bc* did not allow array parameters to be passed as the last
 77857 parameter to a function. New implementations are encouraged to remove this restriction even
 77858 though it is not required by the grammar.

77859 FUTURE DIRECTIONS

77860 None.

77863 [XBD Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

77864 CHANGE HISTORY

77865 First released in Issue 4.

77866 Issue 5

77867 The FUTURE DIRECTIONS section is added.

77868 Issue 6

77869 Updated to align with the IEEE P1003.2b draft standard, which included resolution of several
 77870 interpretations of the ISO POSIX-2: 1993 standard.

77871 The normative text is reworded to avoid use of the term “must” for application requirements.

77872

77873

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77874 **NAME**
 77875 `bg` — run jobs in the background

77876 **SYNOPSIS**
 77877 UP `bg [job_id...]`

77878 **DESCRIPTION**
 77879 If job control is enabled (see the description of `set -m`), the `bg` utility shall resume suspended jobs
 77880 from the current environment (see [Section 2.12](#), on page 2277) by running them as background
 77881 jobs. If the job specified by `job_id` is already a running background job, the `bg` utility shall have
 77882 no effect and shall exit successfully.

77883 Using `bg` to place a job into the background shall cause its process ID to become “known in the
 77884 current shell execution environment”, as if it had been started as an asynchronous list; see
 77885 [Section 2.9.3.1](#) (on page 2266).

77886 **OPTIONS**
 77887 None.

77888 **OPERANDS**
 77889 The following operand shall be supported:
 77890 `job_id` Specify the job to be resumed as a background job. If no `job_id` operand is given,
 77891 the most recently suspended job shall be used. The format of `job_id` is described in
 77892 XBD [Section 3.202](#) (on page 61).

77893 **STDIN**
 77894 Not used.

77895 **INPUT FILES**
 77896 None.

77897 **ENVIRONMENT VARIABLES**
 77898 The following environment variables shall affect the execution of `bg`:
 77899 `LANG` Provide a default value for the internationalization variables that are unset or null.
 77900 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 77901 variables used to determine the values of locale categories.)

77902 `LC_ALL` If set to a non-empty string value, override the values of all the other
 77903 internationalization variables.

77904 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as
 77905 characters (for example, single-byte as opposed to multi-byte characters in
 77906 arguments).

77907 `LC_MESSAGES`
 77908 Determine the locale that should be used to affect the format and contents of
 77909 diagnostic messages written to standard error.

77910 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

77911 **ASYNCHRONOUS EVENTS**
 77912 Default.

77913 **STDOUT**77914 The output of *bg* shall consist of a line in the format:

77915 "[%d] %s\n", <job-number>, <command>

77916 where the fields are as follows:

77917 <job-number> A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using
77918 these utilities, the job can be identified by prefixing the job number with '% '.

77919 <command> The associated command that was given to the shell.

77920 **STDERR**

77921 The standard error shall be used only for diagnostic messages.

77922 **OUTPUT FILES**

77923 None.

77924 **EXTENDED DESCRIPTION**

77925 None.

77926 **EXIT STATUS**

77927 The following exit values shall be returned:

77928 0 Successful completion.

77929 >0 An error occurred.

77930 **CONSEQUENCES OF ERRORS**77931 If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the
77932 background.77933 **APPLICATION USAGE**77934 A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see
77935 XBD Chapter 11 (on page 185). At that point, *bg* can put the job into the background. This is
77936 most effective when the job is expecting no terminal input and its output has been redirected to
77937 non-terminal files. A background job can be forced to stop when it has terminal output by
77938 issuing the command:77939 `stty tostop`

77940 A background job can be stopped with the command:

77941 `kill -s stop job ID`77942 The *bg* utility does not work as expected when it is operating in its own utility execution
77943 environment because that environment has no suspended jobs. In the following examples:77944 `... | xargs bg`
77945 `(bg)`77946 each *bg* operates in a different environment and does not share its parent shell's understanding
77947 of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.77948 **EXAMPLES**

77949 None.

77950 **RATIONALE**77951 The extensions to the shell specified in this volume of POSIX.1-200x have mostly been based on
77952 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also
77953 based on the KornShell. The standard developers examined the characteristics of the C shell
77954 versions of these utilities and found that differences exist. Despite widespread use of the C shell,
77955 the KornShell versions were selected for this volume of POSIX.1-200x to maintain a degree of
77956 uniformity with the rest of the KornShell features selected (such as the very popular command

77957

line editing features).

77958

The *bg* utility is expected to wrap its output if the output exceeds the number of display columns.

77959

FUTURE DIRECTIONS

77960

None.

77965

CHANGE HISTORY

77966

First released in Issue 4.

Issue 6

77967

This utility is marked as part of the User Portability Utilities option.

77968

77969

The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory in this version. This is a FIPS requirement.

77970

Issue 7

77971

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

77972

77973 **NAME**
 77974 `c99` — compile standard C programs

77975 **SYNOPSIS**
 77976 CD `c99 [options...] pathname [pathname[-D directory`
 77977 `[-L directory] [-l library]]...`

77978 DESCRIPTION

77979 The `c99` utility is an interface to the standard C compilation system; it shall accept source code
 77980 conforming to the ISO C standard. The system conceptually consists of a compiler and link
 77981 editor. The input files referenced by *pathname* operands and `-I` option-arguments shall be
 77982 compiled and linked to produce an executable file. (It is unspecified whether the linking occurs
 77983 entirely within the operation of `c99`; some implementations may produce objects that are not
 77984 fully resolved until the file is executed.)

77985 If the `-c` option is specified, for all *pathname* operands of the form *file.c*, the files:

77986 `$(basename pathname .c).o`

77987 shall be created as the result of successful compilation. If the `-c` option is not specified, it is
 77988 unspecified whether such `.o` files are created or deleted for the *file.c* operands.

77989 If there are no options that prevent link editing (such as `-c` or `-E`), and all input files compile and
 77990 link without error, the resulting executable file shall be written according to the `-o outfile` option
 77991 (if present) or to the file `a.out`.

77992 The executable file shall be created as specified in [Section 1.1.1.4](#) (on page 2228), except that the
 77993 file permission bits shall be set to:

77994 `S_IRWXO | S_IRWXG | S_IRWXU`

77995 and the bits specified by the *umask* of the process shall be cleared.

77996 OPTIONS

77997 The `c99` utility shall conform to XBD [Section 12.2](#) (on page 201), except that:

- 77998 • Options can be interspersed with operands.
- 77999 • The order of specifying the `-I`, `-L`, and `-I` options, and the order of specifying `-I` options
 78000 with respect to *pathname* operands is significant.
- 78001 • Conforming applications shall specify each option separately; that is, grouping option
 78002 letters (for example, `-cO`) need not be recognized by all implementations.

78003 The following options shall be supported:

78004 `-c` Suppress the link-edit phase of the compilation, and do not remove any object files
 78005 that are produced.

78006 `-D name[=value]`

78007 Define *name* as if by a C-language `#define` directive. If no *=value* is given, a value of
 78008 1 shall be used. The `-D` option has lower precedence than the `-U` option. That is, if
 78009 *name* is used in both a `-U` and a `-D` option, *name* shall be undefined regardless of
 78010 the order of the options. Additional implementation-defined *names* may be
 78011 provided by the compiler. Implementations shall support at least 2 048 bytes of `-D`
 78012 definitions and 256 *names*.

- 78013 -E Copy C-language source files to standard output, expanding all preprocessor
78014 directives; no compilation shall be performed. If any operand is not a text file, the
78015 effects are unspecified.
- 78016 -g Produce symbolic information in the object or executable files; the nature of this +
78017 information is unspecified, and may be modified by implementation-defined +
78018 interactions with other options.
- 78019 -I *directory* Change the algorithm for searching for headers whose names are not absolute
78020 pathnames to look in the directory named by the *directory* pathname before looking
78021 in the usual places. Thus, headers whose names are enclosed in double-quotes (" ")
78022 shall be searched for first in the directory of the file with the #include line, then in
78023 directories named in -I options, and last in the usual places. For headers whose
78024 names are enclosed in angle brackets ("< >"), the header shall be searched for only
78025 in directories named in -I options and then in the usual places. Directories named
78026 in -I options shall be searched in the order specified. Implementations shall
78027 support at least ten instances of this option in a single c99 command invocation.
- 78028 -L *directory* Change the algorithm of searching for the libraries named in the -l objects to look
78029 in the directory named by the *directory* pathname before looking in the usual
78030 places. Directories named in -L options shall be searched in the order specified.
78031 Implementations shall support at least ten instances of this option in a single c99
78032 command invocation. If a directory specified by a -L option contains files with
78033 names starting with any of the strings "libc.", "libl.", "libpthread.",
78034 "libm.", "librt.", "libtrace.", "libxnet.", or "liby.", the results are
78035 unspecified.
- 78036 -l *library* Search the library named **liblibrary.a**. A library shall be searched when its name is +
78037 encountered, so the placement of a -l option is significant. Several standard +
78038 libraries can be specified in this manner, as described in the EXTENDED +
78039 DESCRIPTION section. Implementations may recognize implementation-defined +
78040 suffixes other than .a as denoting libraries.
- 78041 -O *optlevel* Specify the level of code optimization. If the *optlevel* option-argument is the digit
78042 '0', all special code optimizations shall be disabled. If it is the digit '1', the
78043 nature of the optimization is unspecified. If the -O option is omitted, the nature of
78044 the system's default optimization is unspecified. It is unspecified whether code
78045 generated in the presence of the -O 0 option is the same as that generated when
78046 -O is omitted. Other *optlevel* values may be supported.
- 78047 -o *outfile* Use the pathname *outfile*, instead of the default **a.out**, for the executable file +
78048 produced. If the -o option is present with -c or -E, the result is unspecified. +
- 78049 -s Produce object or executable files, or both, from which symbolic and other +
78050 information not required for proper execution using the *exec* family defined in the +
78051 System Interfaces volume of POSIX.1-200x has been removed (stripped). If both -g +
78052 and -s options are present, the action taken is unspecified.
- 78053 -U *name* Remove any initial definition of *name*.
- 78054 Multiple instances of the -D, -I, -L, -l, and -U options can be specified.

OPERANDS

78055 The application shall ensure that at least one *pathname* operand is specified. The following forms |
78056 for *pathname* operands shall be supported:
78057

- 78058 *file.c* A C-language source file to be compiled and optionally linked. The application
78059 shall ensure that the operand is of this form if the -c option is used.

78060 *file.a* A library of object files typically produced by the *ar* utility, and passed directly to
 78061 the link editor. Implementations may recognize implementation-defined suffixes
 78062 other than *.a* as denoting object file libraries.

78063 *file.o* An object file produced by *c99 -c* and passed directly to the link editor.
 78064 Implementations may recognize implementation-defined suffixes other than *.o* as
 78065 denoting object files.

78066 The processing of other files is implementation-defined. -

78067 STDIN

78068 Not used.

78069 INPUT FILES

78070 The input file shall be one of the following: a text file containing a C-language source program,
 78071 an object file in the format produced by *c99 -c*, or a library of object files, in the format produced
 78072 by archiving zero or more object files, using *ar*. Implementations may supply additional utilities
 78073 that produce files in these formats. Additional input file formats are implementation-defined.

78074 ENVIRONMENT VARIABLES

78075 The following environment variables shall affect the execution of *c99*:

78076 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 78077 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 78078 variables used to determine the values of locale categories.)

78079 *LC_ALL* If set to a non-empty string value, override the values of all the other
 78080 internationalization variables.

78081 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 78082 characters (for example, single-byte as opposed to multi-byte characters in
 78083 arguments and input files).

78084 *LC_MESSAGES*
 78085 Determine the locale that should be used to affect the format and contents of
 78086 diagnostic messages written to standard error.

78087 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

78088 *TMPDIR* Provide a pathname that should override the default directory for temporary files,
 78089 XSI if any. On XSI-conforming systems, provide a pathname that shall override the
 78090 default directory for temporary files, if any.

78091 ASYNCHRONOUS EVENTS

78092 Default.

78093 STDOUT

78094 If more than one *pathname* operand ending in *.c* (or possibly other unspecified suffixes) is given,
 78095 for each such file:

78096 "%s:\n", <pathname> |

78097 may be written. These messages, if written, shall precede the processing of each input file; they
 78098 shall not be written to the standard output if they are written to the standard error, as described
 78099 in the *STDERR* section.

78100 If the *-E* option is specified, the standard output shall be a text file that represents the results of
 78101 the preprocessing stage of the language; it may contain extra information appropriate for
 78102 subsequent compilation passes.

78103 **STDERR**

78104 The standard error shall be used only for diagnostic messages. If more than one *pathname*
 78105 operand ending in *.c* (or possibly other unspecified suffixes) is given, for each such file:

78106 "%s:\n", <pathname>

78107 may be written to allow identification of the diagnostic and warning messages with the
 78108 appropriate input file. These messages, if written, shall precede the processing of each input file;
 78109 they shall not be written to the standard error if they are written to the standard output, as
 78110 described in the STDOUT section.

78111 This utility may produce warning messages about certain conditions that do not warrant
 78112 returning an error (non-zero) exit value.

78113 **OUTPUT FILES**

78114 Object files or executable files or both are produced in unspecified formats. If an existing file that
 78115 does not resolve to a regular file matches the name of an object file being written or matches the
 78116 name of an executable file being created by *c99*, it is unspecified whether *c99* shall attempt to
 78117 write the object file or create the executable file, or shall issue a diagnostic and exit with a non-
 78118 zero exit status.

78119 **EXTENDED DESCRIPTION**78120 **Standard Libraries**

78121 The *c99* utility shall recognize the following **-l** options for standard libraries:

78122 **-l c** This option shall make available all interfaces referenced in the System Interfaces
 78123 volume of POSIX.1-200x, with the possible exception of those interfaces listed as
 78124 residing in < aio.h >, < arpa/inet.h >, < complex.h >, < fenv.h >, < math.h >,
 78125 < mqueue.h >, < netdb.h >, < net/if.h >, < netinet/in.h >, < pthread.h >, < sched.h >,
 78126 < semaphore.h >, < spawn.h >, < sys/socket.h >, *pthread_kill()*, and *pthread_sigmask()*
 78127 in < signal.h >, < trace.h >, interfaces marked as optional in < sys/mman.h >,
 78128 interfaces marked as ADV (Advisory Information) in < fcntl.h >, and interfaces
 78129 beginning with the prefix *clock_* or *time_* in < time.h >. This option shall not be
 78130 required to be present to cause a search of this library.

78131 **-l l** This option shall make available all interfaces required by the C-language output
 78132 of *lex* that are not made available through the **-l c** option.

78133 **-l pthread** This option shall make available all interfaces referenced in < pthread.h > and
 78134 *pthread_kill()* and *pthread_sigmask()* referenced in < signal.h >. An implementation
 78135 may search this library in the absence of this option.

78136 **-l m** This option shall make available all interfaces referenced in < math.h >,
 78137 < complex.h >, and < fenv.h >. An implementation may search this library in the
 78138 absence of this option.

78139 **-l rt** This option shall make available all interfaces referenced in < aio.h >, < mqueue.h >,
 78140 < sched.h >, < semaphore.h >, and < spawn.h >, interfaces marked as optional in
 78141 < sys/mman.h >, interfaces marked as ADV (Advisory Information) in < fcntl.h >,
 78142 and interfaces beginning with the prefix *clock_* and *time_* in < time.h >. An
 78143 implementation may search this library in the absence of this option.

78144 **-l trace** This option shall make available all interfaces referenced in < trace.h >. An
 78145 implementation may search this library in the absence of this option.

78146 **-l xnet** This option shall make available all interfaces referenced in < arpa/inet.h >,
 78147 < netdb.h >, < net/if.h >, < netinet/in.h >, and < sys/socket.h >. An implementation
 78148 may search this library in the absence of this option.

78149 **-l y** This option shall make available all interfaces required by the C-language output |
78150 of *yacc* that are not made available through the **-l c** option. |

78151 In the absence of options that inhibit invocation of the link editor, such as **-c** or **-E**, the *c99* utility |
78152 shall cause the equivalent of a **-l c** option to be passed to the link editor as the last *pathname* |
78153 operand or **-l** option, causing it to be searched after all other object files and libraries are loaded. |

78154 OB It is unspecified whether the libraries **libc.a**, **libl.a**, **libm.a**, **libpthread.a**, **librt.a**, **libtrace.a**, -
78155 **libxnet.a**, or **liby.a** exist as regular files. The implementation may accept as **-l** option-arguments |
78156 names of objects that do not exist as regular files.

78157 External Symbols

78158 The C compiler and link editor shall support the significance of external symbols up to a length |
78159 of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation- |
78160 defined maximum symbol length is unspecified.

78161 The compiler and link editor shall support a minimum of 511 external symbols per source or |
78162 object file, and a minimum of 4095 external symbols in total. A diagnostic message shall be |
78163 written to the standard output if the implementation-defined limit is exceeded; other actions are |
78164 unspecified.

78165 Programming Environments

78166 All implementations shall support one of the following programming environments as a default. |
78167 Implementations may support more than one of the following programming environments. |
78168 Applications can use *sysconf()* or *getconf* to determine which programming environments are |
78169 supported.

78170 **Table 4-4** Programming Environments: Type Sizes

Programming Environment <i>getconf</i> Name	Bits in int	Bits in long	Bits in pointer	Bits in off_t
_POSIX_V7_ILP32_OFF32	32	32	32	32
_POSIX_V7_ILP32_OFFBIG	32	32	32	≥64
_POSIX_V7_LP64_OFF64	32	64	64	64
_POSIX_V7_LP64_OFFBIG	≥32	≥64	≥64	≥64

78177 All implementations shall support one or more environments where the widths of the following |
78178 types are no greater than the width of type **long**:

78179 **blksize_t** **ptrdiff_t** **tcflag_t**
78180 **cc_t** **size_t** **wchar_t**
78181 **mode_t** **speed_t** **wint_t**
78182 **nfds_t** **ssize_t**
78183 **pid_t** **suseconds_t**

78184 The executable files created when these environments are selected shall be in a proper format for |
78185 execution by the *exec* family of functions. Each environment may be one of the ones in [Table 4-4](#), |
78186 or it may be another environment. The names for the environments that meet this requirement |
78187 shall be output by a *getconf* command using the `POSIX_V7_WIDTH_RESTRICTED_ENVS` |
78188 argument, as a <newline>-separated list of names suitable for use with the *getconf -v* option. If |
78189 more than one environment meets the requirement, the names of all such environments shall be |
78190 output on separate lines. Any of these names can then be used in a subsequent *getconf* command |
78191 to obtain the flags specific to that environment with the following suffixes added as appropriate:

78192 _CFLAGS To get the C compiler flags.

78193 _LDFLAGS To get the linker/loader flags.

78194 _LIBS To get the libraries.

78195 This requirement may be removed in a future version.

78196 When this utility processes a file containing a function called *main()*, it shall be defined with a
78197 return type equivalent to **int**. Using return from the initial call to *main()* shall be equivalent
78198 (other than with respect to language scope issues) to calling *exit()* with the returned value.
78199 Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The
78200 implementation shall not declare a prototype for this function.

78201 Implementations provide configuration strings for C compiler flags, linker/loader flags, and
78202 libraries for each supported environment. When an application needs to use a specific
78203 programming environment rather than the implementation default programming environment
78204 while compiling, the application shall first verify that the implementation supports the desired
78205 environment. If the desired programming environment is supported, the application shall then
78206 invoke *c99* with the appropriate C compiler flags as the first options for the compile, the
78207 appropriate linker/loader flags after any other options except **-I** but before any operands or **-I**
78208 options, and the appropriate libraries at the end of the operands and **-I** options.

78209 Conforming applications shall not attempt to link together object files compiled for different
78210 programming models. Applications shall also be aware that binary data placed in shared
78211 memory or in files might not be recognized by applications built for other programming models.

78212 **Table 4-5** Programming Environments: *c99* and *cc* Arguments

Programming Environment <i>getconf</i> Name	Use	<i>c99</i> and <i>cc</i> Arguments <i>getconf</i> Name
_POSIX_V7_ILP32_OFF32	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_ILP32_OFF32_CFLAGS POSIX_V7_ILP32_OFF32_LDFLAGS POSIX_V7_ILP32_OFF32_LIBS
_POSIX_V7_ILP32_OFFBIG	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_ILP32_OFFBIG_CFLAGS POSIX_V7_ILP32_OFFBIG_LDFLAGS POSIX_V7_ILP32_OFFBIG_LIBS
_POSIX_V7_LP64_OFF64	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_LP64_OFF64_CFLAGS POSIX_V7_LP64_OFF64_LDFLAGS POSIX_V7_LP64_OFF64_LIBS
_POSIX_V7_LPBIG_OFFBIG	C Compiler Flags Linker/Loader Flags Libraries	POSIX_V7_LPBIG_OFFBIG_CFLAGS POSIX_V7_LPBIG_OFFBIG_LDFLAGS POSIX_V7_LPBIG_OFFBIG_LIBS

78227 EXIT STATUS

78228 The following exit values shall be returned:

78229 0 Successful compilation or link edit.

78230 >0 An error occurred.

78231 CONSEQUENCES OF ERRORS

78232 When *c99* encounters a compilation error that causes an object file not to be created, it shall write
78233 a diagnostic to standard error and continue to compile other source code operands, but it shall
78234 not perform the link phase and return a non-zero exit status. If the link edit is unsuccessful, a
78235 diagnostic message shall be written to standard error and *c99* exits with a non-zero status. A
78236 conforming application shall rely on the exit status of *c99*, rather than on the existence or mode
78237 of the executable file.

APPLICATION USAGE

Since the *c99* utility usually creates files in the current directory during the compilation process, it is typically necessary to run the *c99* utility in a directory in which a file can be created.

On systems providing POSIX Conformance (see XBD Chapter 2, on page 15), *c99* is required only with the C-Language Development option; XSI-conformant systems always provide *c99*.

Some historical implementations have created *.o* files when *-c* is not specified and more than one source file is given. Since this area is left unspecified, the application cannot rely on *.o* files being created, but it also must be prepared for any related *.o* files that already exist being deleted at the completion of the link edit.

There is the possible implication that if a user supplies versions of the standard functions (before they would be encountered by an implicit *-l c* or explicit *-l m*), that those versions would be used in place of the standard versions. There are various reasons this might not be true (functions defined as macros, manipulations for clean name space, and so on), so the existence of files named in the same manner as the standard libraries within the *-L* directories is explicitly stated to produce unspecified behavior.

All of the functions specified in the System Interfaces volume of POSIX.1-200x may be made visible by implementations when the Standard C Library is searched. Conforming applications must explicitly request searching the other standard libraries when functions made visible by those libraries are used.

EXAMPLES

1. The following usage example compiles **foo.c** and creates the executable file **foo**:

```
c99 -o foo foo.c
```

The following usage example compiles **foo.c** and creates the object file **foo.o**:

```
c99 -c foo.c
```

The following usage example compiles **foo.c** and creates the executable file **a.out**:

```
c99 foo.c
```

The following usage example compiles **foo.c**, links it with **bar.o**, and creates the executable file **a.out**. It may also create and leave **foo.o**:

```
c99 foo.c bar.o
```

2. The following example shows how an application using threads interfaces can test for support of and use a programming environment supporting 32-bit **int**, **long**, and **pointer** types and an **off_t** type using at least 64 bits:

```
if [ $(getconf _POSIX_V7_ILP32_OFFBIG) != "-1" ]
then
    c99 $(getconf POSIX_V7_ILP32_OFFBIG_CFLAGS) -D_XOPEN_SOURCE=700 \
        $(getconf POSIX_V7_ILP32_OFFBIG_LDFLAGS) foo.c -o foo \
        $(getconf POSIX_V7_ILP32_OFFBIG_LIBS) -l pthread
else
    echo ILP32_OFFBIG programming environment not supported
    exit 1
fi
```

3. The following examples clarify the use and interactions of *-L* and *-l* options.

Consider the case in which module **a.c** calls function *f()* in library **libQ.a**, and module **b.c** calls function *g()* in library **libp.a**. Assume that both libraries reside in */a/b/c*. The command line to compile and link in the desired way is:

78283 `c99 -L /a/b/c main.o a.c -l Q b.c -l p`

78284 In this case the `-L` option need only precede the first `-l` option, since both `libQ.a` and
78285 `libp.a` reside in the same directory.

78286 Multiple `-L` options can be used when library name collisions occur. Building on the
78287 previous example, suppose that the user wants to use a new `libp.a`, in `/a/a/a`, but still
78288 wants `f()` from `/a/b/c/libQ.a`:

78289 `c99 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p`

78290 In this example, the linker searches the `-L` options in the order specified, and finds
78291 `/a/a/a/libp.a` before `/a/b/c/libp.a` when resolving references for `b.c`. The order of the `-l`
78292 options is still important, however.

78293 4. The following example shows how an application can use a programming environment
78294 where the widths of the following types:

78295 **blksize_t, cc_t, mode_t, nfd_t, pid_t, ptrdiff_t, size_t, speed_t, ssize_t, suseconds_t,**
78296 **tcflag_t, wchar_t, wint_t**

78297 are no greater than the width of type **long**:

```
78298 # First choose one of the listed environments ...
78299 # ... if there are no additional constraints, the first one will do:
78300 CENV=$(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS | head -n 1)
78301 # ... or, if an environment that supports large files is preferred,
78302 # look for names that contain "OFF64" or "OFFBIG". (This chooses
78303 # the last one in the list if none match.)
78304 for CENV in $(getconf POSIX_V7_WIDTH_RESTRICTED_ENVS)
78305 do
78306     case $CENV in
78307         *OFF64*|*OFFBIG*) break ;;
78308     esac
78309 done
78310 # The chosen environment name can now be used like this:
78311 c99 $(getconf ${CENV}_CFLAGS) -D _POSIX_C_SOURCE=200xxxL \
78312 $(getconf ${CENV}_LDFLAGS) foo.c -o foo \
78313 $(getconf ${CENV}_LIBS)
```

78314 RATIONALE

78315 The `c99` utility is based on the `c89` utility originally introduced in the ISO POSIX-2:1993
78316 standard.

78317 Some of the changes from `c89` include the ability to intersperse options and operands (which
78318 many `c89` implementations allowed despite it not being specified), the description of `-l` as an
78319 option instead of an operand, and the modification to the contents of the Standard Libraries
78320 section to account for new headers and options; for example, `<spawn.h>` added to the
78321 description of `-l rt`, and `-l trace` added for the Tracing option.

78322 POSIX.1-200x specifies that the `c99` utility must be able to use regular files for `*.o` files and for
78323 `a.out` files. Implementations are free to overwrite existing files of other types when attempting to
78324 create object files and executable files, but are not required to do so. If something other than a
78325 regular file is specified and using it fails for any reason, `c99` is required to issue a diagnostic
78326 message and exit with a non-zero exit status. But for some file types, the problem may not be
78327 noticed for a long time. For example, if a FIFO named `a.out` exists in the current directory, `c99`
78328 may attempt to open `a.out` and will hang in the `open()` call until another process opens the FIFO

78329 for reading. Then *c99* may write most of the **a.out** to the FIFO and fail when it tries to seek back
 78330 close to the start of the file to insert a timestamp (FIFOs are not seekable files). The *c99* utility is
 78331 also allowed to issue a diagnostic immediately if it encounters an **a.out** or ***.o** file that is not a
 78332 regular file. For portable use, applications should ensure that any **a.out**, **-o** option-argument, or
 78333 ***.o** files corresponding to any ***.c** files do not conflict with names already in use that are not
 78334 regular files or symbolic links that point to regular files.

78335 FUTURE DIRECTIONS

78336 None.

78341 CHANGE HISTORY

78342 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

78343 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/12 is applied, correcting the EXTENDED
 78344 DESCRIPTION of **-l c** and **-l m**. Previously, the text did not take into account the presence of
 78345 the *c99* math headers.

78346 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/13 is applied, changing the reference to
 78347 the **libxnet** library to **libxnet.a**.

78348 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/5 is applied, updating the OPTIONS
 78349 section, so that the names of files contained in the directory specified by the **-L** option are not
 78350 assumed to end in the **.a** suffix. The set of library prefixes is also updated.

78351 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/6 is applied, removing the lead
 78352 underscore from the POSIX_V6_WIDTH_RESTRICTED_ENVS variable in the EXTENDED
 78353 DESCRIPTION and the EXAMPLES sections.

78354 Issue 7

78355 Austin Group Interpretation 1003.1-2001 #020 (SD5-XCU-ERN-10) is applied, adding to the
 78356 OUTPUT FILES section and also adding associated RATIONALE.

78357 Austin Group Interpretation 1003.1-2001 #095 is applied, clarifying the **-l library** operand.

78358 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not
 78359 apply (options can be interspersed with operands).

78360 SD5-XCU-ERN-11 is applied, adding the **<net/if.h>** header to the descriptions of **-l c** and
 78361 **-l xnet**.

78362 SD5-XCU-ERN-65 is applied, updating the EXAMPLES section.

78363 SD5-XCU-ERN-67 and SD5-XCU-ERN-97 are applied, updating the SYNOPSIS. |

78364 SD5-XCU-ERN-133 is applied, updating the EXTENDED DESCRIPTION. |

78365 The *getconf* variables for the supported programming environments are updated to be V7.

78366 The **-l trace** operand is marked obsolescent. +

78367 The *c99* reference page is rewritten to describe **-l** as an option rather than an operand.

78368 **NAME**

78369 cal — print a calendar

78370 **SYNOPSIS**78371 XSI cal `[[month] year]`78372 **DESCRIPTION**

78373 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from
 78374 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,
 78375 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on
 78376 September 14, 1752.

78377 **OPTIONS**

78378 None.

78379 **OPERANDS**

78380 The following operands shall be supported:

78381 *month* Specify the month to be displayed, represented as a decimal integer from 1
 78382 (January) to 12 (December). The default shall be the current month.

78383 *year* Specify the year for which the calendar is displayed, represented as a decimal
 78384 integer from 1 to 9999. The default shall be the current year.

78385 **STDIN**

78386 Not used.

78387 **INPUT FILES**

78388 None.

78389 **ENVIRONMENT VARIABLES**78390 The following environment variables shall affect the execution of *cal*:

78391 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 78392 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 78393 variables used to determine the values of locale categories.)

78394 *LC_ALL* If set to a non-empty string value, override the values of all the other
 78395 internationalization variables.

78396 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 78397 characters (for example, single-byte as opposed to multi-byte characters in
 78398 arguments).

78399 *LC_MESSAGES*

78400 Determine the locale that should be used to affect the format and contents of
 78401 diagnostic messages written to standard error, and informative messages written
 78402 to standard output.

78403 *LC_TIME* Determine the format and contents of the calendar.

78404 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

78405 *TZ* Determine the timezone used to calculate the value of the current month.

78406 **ASYNCHRONOUS EVENTS**

78407 Default.

78408 **STDOUT**

78409 The standard output shall be used to display the calendar, in an unspecified format.

78410 **STDERR**

78411 The standard error shall be used only for diagnostic messages.

78412 **OUTPUT FILES**

78413 None.

78414 **EXTENDED DESCRIPTION**

78415 None.

78416 **EXIT STATUS**

78417 The following exit values shall be returned:

78418 0 Successful completion.

78419 >0 An error occurred.

78420 **CONSEQUENCES OF ERRORS**

78421 Default.

78422 **APPLICATION USAGE**

78423 Note that:

78424 `cal 83`

78425 refers to A.D. 83, not 1983.

78426 **EXAMPLES**

78427 None.

78428 **RATIONALE**

78429 None.

78430 **FUTURE DIRECTIONS**78431 A future version of this standard may support locale-specific recognition of the date of adoption
78432 of the Gregorian calendar.78433 **SEE ALSO**78434 XBD [Chapter 8](#) (on page 159)78435 **CHANGE HISTORY**

78436 First released in Issue 2.

78437 **Issue 6**78438 The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of
78439 the Gregorian calendar.78440 **Issue 7**

78441 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78442 **NAME**

78443 cat — concatenate and print files

78444 **SYNOPSIS**78445 cat [-u] [*file...*]78446 **DESCRIPTION**78447 The *cat* utility shall read files in sequence and shall write their contents to the standard output in
78448 the same sequence.78449 **OPTIONS**78450 The *cat* utility shall conform to XBD [Section 12.2](#) (on page 201).

78451 The following option shall be supported:

78452 **-u** Write bytes from the input file to the standard output without delay as each is
78453 read.78454 **OPERANDS**

78455 The following operand shall be supported:

78456 *file* A pathname of an input file. If no *file* operands are specified, the standard input
78457 shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at
78458 that point in the sequence. The *cat* utility shall not close and reopen standard input
78459 when it is referenced in this way, but shall accept multiple occurrences of '-' as a
78460 *file* operand.78461 **STDIN**78462 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.
78463 See the INPUT FILES section.78464 **INPUT FILES**

78465 The input files can be any file type.

78466 **ENVIRONMENT VARIABLES**78467 The following environment variables shall affect the execution of *cat*:78468 **LANG** Provide a default value for the internationalization variables that are unset or null.
78469 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
78470 variables used to determine the values of locale categories.)78471 **LC_ALL** If set to a non-empty string value, override the values of all the other
78472 internationalization variables.78473 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
78474 characters (for example, single-byte as opposed to multi-byte characters in
78475 arguments).78476 **LC_MESSAGES**78477 Determine the locale that should be used to affect the format and contents of
78478 diagnostic messages written to standard error.78479 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.78480 **ASYNCHRONOUS EVENTS**

78481 Default.

78482 **STDOUT**

78483 The standard output shall contain the sequence of bytes read from the input files. Nothing else
78484 shall be written to the standard output.

78485 **STDERR**

78486 The standard error shall be used only for diagnostic messages.

78487 **OUTPUT FILES**

78488 None.

78489 **EXTENDED DESCRIPTION**

78490 None.

78491 **EXIT STATUS**

78492 The following exit values shall be returned:

78493 0 All input files were output successfully.

78494 >0 An error occurred.

78495 **CONSEQUENCES OF ERRORS**

78496 Default.

78497 **APPLICATION USAGE**

78498 The `-u` option has value in prototyping non-blocking reads from FIFOs. The intent is to support
78499 the following sequence:

```
78500 mkfifo foo
78501 cat -u foo > /dev/ttyl3 &
78502 cat -u > foo
```

78503 It is unspecified whether standard output is or is not buffered in the default case. This is
78504 sometimes of interest when standard output is associated with a terminal, since buffering may
78505 delay the output. The presence of the `-u` option guarantees that unbuffered I/O is available. It is
78506 implementation-defined whether the `cat` utility buffers output if the `-u` option is not specified.
78507 Traditionally, the `-u` option is implemented using the equivalent of the `setvbuf()` function
78508 defined in the System Interfaces volume of POSIX.1-200x.

78509 **EXAMPLES**

78510 The following command:

```
78511 cat myfile
```

78512 writes the contents of the file **myfile** to standard output.

78513 The following command:

```
78514 cat doc1 doc2 > doc.all
```

78515 concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

78516 Because of the shell language mechanism used to perform output redirection, a command such
78517 as this:

```
78518 cat doc doc.end > doc
```

78519 causes the original data in **doc** to be lost.

78520 The command:

```
78521 cat start - middle - end > file
```

78522 when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a
78523 single invocation of `cat`. Note, however, that if standard input is a regular file, this would be
78524 equivalent to the command:

78525 `cat start - middle /dev/null end > file`

78526 because the entire contents of the file would be consumed by *cat* the first time '-' was used as a
78527 *file* operand and an end-of-file condition would be detected immediately when '-' was
78528 referenced the second time.

78529 RATIONALE

78530 Historical versions of the *cat* utility include the options `-e`, `-t`, and `-v`, which permit the ends of
78531 lines, `<tab>`s, and invisible characters, respectively, to be rendered visible in the output. The
78532 standard developers omitted these options because they provide too fine a degree of control
78533 over what is made visible, and similar output can be obtained using a command such as:

78534 `sed -n -e 's/$/$/' -e l pathname`

78535 The `-s` option was omitted because it corresponds to different functions in BSD and System
78536 V-based systems. The BSD `-s` option to squeeze blank lines can be accomplished by the shell
78537 script shown in the following example:

```
78538 sed -n '  
78539 # Write non-empty lines.  
78540 ./ {  
78541     p  
78542     d  
78543 }  
78544 # Write a single empty line, then look for more empty lines.  
78545 /^$/ p  
78546 # Get next line, discard the held <newline> (empty line),  
78547 # and look for more empty lines.  
78548 :Empty  
78549 /^$/ {  
78550     N  
78551     s/././  
78552     b Empty  
78553 }  
78554 # Write the non-empty line before going back to search  
78555 # for the first in a set of empty lines.  
78556 p  
78557 '
```

78558 The System V `-s` option to silence error messages can be accomplished by redirecting the
78559 standard error. Note that the BSD documentation for *cat* uses the term "blank line" to mean the
78560 same as the POSIX "empty line": a line consisting only of a `<newline>`.

78561 The BSD `-n` option was omitted because similar functionality can be obtained from the `-n`
78562 option of the *pr* utility.

78563 FUTURE DIRECTIONS

78564 None.

CHANGE HISTORY

78570

First released in Issue 2.

78571

Issue 7

78572

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78573 **NAME**
78574 cd — change the working directory

78575 **SYNOPSIS**
78576 cd [-L|-P] [*directory*]

78577 cd -

78578 DESCRIPTION

78579 The *cd* utility shall change the working directory of the current shell execution environment (see
78580 [Section 2.12](#), on page 2277) by executing the following steps in sequence. (In the following steps,
78581 the symbol **curpath** represents an intermediate value used to simplify the description of the
78582 algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

- 78583 1. If no *directory* operand is given and the *HOME* environment variable is empty or
78584 undefined, the default behavior is implementation-defined and no further steps shall be
78585 taken.
- 78586 2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty
78587 value, the *cd* utility shall behave as if the directory named in the *HOME* environment
78588 variable was specified as the *directory* operand.
- 78589 3. If the *directory* operand begins with a slash character, set **curpath** to the operand and
78590 proceed to step 7.
- 78591 4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
- 78592 5. Starting with the first pathname in the colon-separated pathnames of *CDPATH* (see the
78593 ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the
78594 concatenation of that pathname, a slash character, and the *directory* operand names a
78595 directory. If the pathname is null, test if the concatenation of dot, a slash character, and
78596 the operand names a directory. In either case, if the resulting string names an existing
78597 directory, set **curpath** to that string and proceed to step 7. Otherwise, repeat this step with
78598 the next pathname in *CDPATH* until all pathnames have been tested.
- 78599 6. If the **-P** option is in effect, set **curpath** to the *directory* operand. Otherwise, set **curpath** to
78600 the string formed by the concatenation of the value of *PWD*, a slash character, and the
78601 operand.
- 78602 7. If the **-P** option is in effect, proceed to step 10. If **curpath** does not begin with a slash
78603 character, set **curpath** to the string formed by the concatenation of the value of *PWD*, a
78604 slash character, and **curpath**.
- 78605 8. The **curpath** value shall then be converted to canonical form as follows, considering each
78606 component from beginning to end, in sequence:
 - 78607 a. Dot components and any slashes that separate them from the next component shall
78608 be deleted.
 - 78609 b. For each dot-dot component, if there is a preceding component and it is neither
78610 root nor dot-dot, then:
 - 78611 i. If the preceding component does not refer (in the context of pathname
78612 resolution with symbolic links followed) to a directory, then the *cd* utility
78613 shall display an appropriate error message and no further steps shall be
78614 taken.

- 78615 ii. The preceding component, all slashes separating the preceding component
78616 from dot-dot, dot-dot, and all slashes separating dot-dot from the following
78617 component (if any) shall be deleted.
- 78618 c. An implementation may further simplify **curpath** by removing any trailing slash
78619 characters that are not also leading slashes, replacing multiple non-leading
78620 consecutive slashes with a single slash, and replacing three or more leading slashes
78621 with a single slash. If, as a result of this canonicalization, the **curpath** variable is
78622 null, no further steps shall be taken.
- 78623 9. If **curpath** is longer than {PATH_MAX} bytes (including the terminating null) and the
78624 *directory* operand was not longer than {PATH_MAX} bytes (including the terminating
78625 null), then **curpath** shall be converted from an absolute pathname to an equivalent
78626 relative pathname if possible. This conversion shall always be considered possible if the
78627 value of *PWD*, with a trailing slash added if it does not already have one, is an initial
78628 substring of **curpath**. Whether or not it is considered possible under other circumstances
78629 is unspecified. Implementations may also apply this conversion if **curpath** is not longer
78630 than {PATH_MAX} bytes or the *directory* operand was longer than {PATH_MAX} bytes.
- 78631 10. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with
78632 **curpath** as the *path* argument. If these actions fail for any reason, the *cd* utility shall
78633 display an appropriate error message and the remainder of this step shall not be
78634 executed. If the **-P** option is not in effect, the *PWD* environment variable shall be set to
78635 the value that **curpath** had on entry to step 9 (i.e., before conversion to a relative
78636 pathname). If the **-P** option is in effect, the *PWD* environment variable shall be set to an
78637 absolute pathname for the current working directory and shall not contain filename
78638 components that, in the context of pathname resolution, refer to a file of type symbolic
78639 link. If there is insufficient permission on the new directory, or on any parent of that
78640 directory, to determine the current working directory, the value of the *PWD* environment
78641 variable is unspecified.

78642 If, during the execution of the above steps, the *PWD* environment variable is changed, the
78643 *OLDPWD* environment variable shall also be changed to the value of the old working directory
78644 (that is the current working directory immediately prior to the call to *cd*).

78645 OPTIONS

78646 The *cd* utility shall conform to XBD [Section 12.2](#) (on page 201).

78647 The following options shall be supported by the implementation:

- 78648 **-L** Handle the operand dot-dot logically; symbolic link components shall not be
78649 resolved before dot-dot components are processed (see steps 8. and 9. in the
78650 DESCRIPTION).
- 78651 **-P** Handle the operand dot-dot physically; symbolic link components shall be
78652 resolved before dot-dot components are processed (see step 7. in the
78653 DESCRIPTION).

78654 If both **-L** and **-P** options are specified, the last of these options shall be used and all others
78655 ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the
78656 DESCRIPTION.

78657 OPERANDS

78658 The following operands shall be supported:

- 78659 *directory* An absolute or relative pathname of the directory that shall become the new
78660 working directory. The interpretation of a relative pathname by *cd* depends on the
78661 **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an
78662 empty string, the results are unspecified.

78663 – When a hyphen is used as the operand, this shall be equivalent to the command:

78664 cd "\$OLDPWD" && pwd

78665 which changes to the previous working directory and then writes its name.

78666 **STDIN**

78667 Not used.

78668 **INPUT FILES**

78669 None.

78670 **ENVIRONMENT VARIABLES**

78671 The following environment variables shall affect the execution of *cd*:

78672 *CDPATH* A colon-separated list of pathnames that refer to directories. The *cd* utility shall use
78673 this list in its attempt to change the directory, as described in the DESCRIPTION.
78674 An empty string in place of a directory pathname represents the current directory.
78675 If *CDPATH* is not set, it shall be treated as if it were an empty string.

78676 *HOME* The name of the directory, used when no *directory* operand is specified.

78677 *LANG* Provide a default value for the internationalization variables that are unset or null. |
78678 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
78679 variables used to determine the values of locale categories.)

78680 *LC_ALL* If set to a non-empty string value, override the values of all the other
78681 internationalization variables.

78682 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
78683 characters (for example, single-byte as opposed to multi-byte characters in
78684 arguments).

78685 *LC_MESSAGES* Determine the locale that should be used to affect the format and contents of
78686 diagnostic messages written to standard error.
78687

78688 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

78689 *OLDPWD* A pathname of the previous working directory, used by *cd -*.

78690 *PWD* This variable shall be set as specified in the DESCRIPTION. If an application sets
78691 or unsets the value of *PWD*, the behavior of *cd* is unspecified.

78692 **ASYNCHRONOUS EVENTS**

78693 Default.

78694 **STDOUT**

78695 If a non-empty directory name from *CDPATH* is used, or if *cd -* is used, an absolute pathname of
78696 the new working directory shall be written to the standard output as follows:

78697 "%s\n", <new directory>

78698 Otherwise, there shall be no output.

78699 **STDERR**

78700 The standard error shall be used only for diagnostic messages.

78701 **OUTPUT FILES**

78702 None.

78703 **EXTENDED DESCRIPTION**

78704 None.

78705 **EXIT STATUS**

78706 The following exit values shall be returned:

78707 0 The directory was successfully changed.

78708 >0 An error occurred.

78709 **CONSEQUENCES OF ERRORS**

78710 The working directory shall remain unchanged.

78711 **APPLICATION USAGE**78712 Since *cd* affects the current shell execution environment, it is always provided as a shell regular
78713 built-in. If it is called in a subshell or separate utility execution environment, such as one of the
78714 following:78715 (cd /tmp)
78716 nohup cd
78717 find . -exec cd {} \;

78718 it does not affect the working directory of the caller's environment.

78719 The user must have execute (search) permission in *directory* in order to change to it.78720 **EXAMPLES**

78721 None.

78722 **RATIONALE**78723 The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of
78724 the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.78725 A common extension when *HOME* is undefined is to get the login directory from the user
78726 database for the invoking user. This does not occur on System V implementations.78727 Some historical shells, such as the KornShell, took special actions when the directory name
78728 contained a dot-dot component, selecting the logical parent of the directory, rather than the
78729 actual parent directory; that is, it moved up one level toward the '/' in the pathname,
78730 remembering what the user typed, rather than performing the equivalent of:78731 `chdir("../");`78732 In such a shell, the following commands would not necessarily produce equivalent output for all
78733 directories:78734 `cd .. && ls ls ..`78735 This behavior is now the default. It is not consistent with the definition of dot-dot in most
78736 historical practice; that is, while this behavior has been optionally available in the KornShell,
78737 other shells have historically not supported this functionality. The logical pathname is stored in
78738 the *PWD* environment variable when the *cd* utility completes and this value is used to construct
78739 the next directory name if *cd* is invoked with the *-L* option.78740 **FUTURE DIRECTIONS**

78741 None.

78742 **SEE ALSO**78743 [Section 2.12](#) (on page 2277), *pwd*78744 [XBD Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)78745 [XSH *chdir*\(\)](#)

78746

CHANGE HISTORY

78747

First released in Issue 2.

78748

Issue 6

78749

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

78750

- The *cd* **-** operand, *PWD*, and *OLDPWD* are added.

78751

78752

The **-L** and **-P** options are added to align with the IEEE P1003.2b draft standard. This also includes the introduction of a new description to include the effect of these options.

78753

78754

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to make it clear that the **-L** and **-P** options are mutually-exclusive.

78755

78756

Issue 7

78757

Austin Group Interpretation 1003.1-2001 #037 is applied.

78758

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78759

Step 7 of the processing performed by *cd* is revised to refer to **curpath** instead of “the operand”. +

78760 **NAME**
 78761 cflow — generate a C-language flowgraph (DEVELOPMENT)

78762 **SYNOPSIS**
 78763 XSI cflow [-r] [-d num] [-D name[=def]]... [-i incl] [-I dir]...
 78764 [-U dir]... file...

78765 **DESCRIPTION**
 78766 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*
 78767 source files, and attempt to build a graph, written to standard output, charting the external
 78768 references.

78769 **OPTIONS**
 78770 The *cflow* utility shall conform to XBD Section 12.2 (on page 201), except that the order of the **-D**,
 78771 **-I**, and **-U** options (which are identical to their interpretation by *c99*) is significant.

78772 The following options shall be supported:

78773 **-d num** Indicate the depth at which the flowgraph is cut off. The application shall ensure
 78774 that the argument *num* is a decimal integer. By default this is a very large number
 78775 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive
 78776 integer shall be ignored.

78777 **-i incl** Increase the number of included symbols. The *incl* option-argument is one of the
 78778 following characters:

78779 *x* Include external and static data symbols. The default shall be to include only
 78780 functions in the flowgraph.

78781 *_* (Underscore) Include names that begin with an underscore. The default shall
 78782 be to exclude these functions (and data if **-i x** is used).

78783 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the
 78784 callers of each function. The listing shall also be sorted in lexicographical order by
 78785 callee.

78786 **OPERANDS**
 78787 The following operand is supported:

78788 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by
 78789 **.I** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c99* input, and **.i** as the
 78790 output of *c99* -E. Such files shall be processed as appropriate, determined by their
 78791 suffix.

78792 Files suffixed by **.s** (conventionally assembler source) may have more limited
 78793 information extracted from them.

78794 **STDIN**
 78795 Not used.

78796 **INPUT FILES**
 78797 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

78798 **ENVIRONMENT VARIABLES**
 78799 The following environment variables shall affect the execution of *cflow*:

78800 **LANG** Provide a default value for the internationalization variables that are unset or null.
 78801 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 78802 variables used to determine the values of locale categories.)

- 78803 *LC_ALL* If set to a non-empty string value, override the values of all the other
78804 internationalization variables.
- 78805 *LC_COLLATE*
78806 Determine the locale for the ordering of the output when the `-r` option is used.
- 78807 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
78808 characters (for example, single-byte as opposed to multi-byte characters in
78809 arguments and input files).
- 78810 *LC_MESSAGES*
78811 Determine the locale that should be used to affect the format and contents of
78812 diagnostic messages written to standard error.
- 78813 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

78814 Default.
78815

STDOUT

78816 The flowgraph written to standard output shall be formatted as follows:
78817

78818 "`%d %s:%s\n`", *<reference number>*, *<global>*, *<definition>*

78819 Each line of output begins with a reference (that is, line) number, followed by indentation of at
78820 least one column position per level. This is followed by the name of the global, a colon, and its
78821 definition. Normally globals are only functions not defined as an external or beginning with an
78822 underscore; see the **OPTIONS** section for the `-i` inclusion option. For information extracted from
78823 C-language source, the definition consists of an abstract type declaration (for example, `char *`)
78824 and, delimited by angle brackets, the name of the source file and the line number where the
78825 definition was found. Definitions extracted from object files indicate the filename and location
78826 counter under which the symbol appeared (for example, *text*).

78827 Once a definition of a name has been written, subsequent references to that name contain only
78828 the reference number of the line where the definition can be found. For undefined references,
78829 only "`<>`" shall be written.

STDERR

78830 The standard error shall be used only for diagnostic messages.
78831

OUTPUT FILES

78832 None.
78833

EXTENDED DESCRIPTION

78834 None.
78835

EXIT STATUS

78836 The following exit values shall be returned:
78837

78838 0 Successful completion.

78839 >0 An error occurred.

CONSEQUENCES OF ERRORS

78840 Default.
78841

78842

APPLICATION USAGE

78843

Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

78844

78845

EXAMPLES

78846

Given the following in **file.c**:

78847

```
int i;
```

78848

```
int f();
```

78849

```
int g();
```

78850

```
int h();
```

78851

```
int
```

78852

```
main()
```

78853

```
{
```

78854

```
    f();
```

78855

```
    g();
```

78856

```
    f();
```

78857

```
}
```

78858

```
int
```

78859

```
f()
```

78860

```
{
```

78861

```
    i = h();
```

78862

```
}
```

78863

The command:

78864

```
cflow -i x file.c
```

78865

produces the output:

78866

```
1 main: int(), <file.c 6>
```

78867

```
2   f: int(), <file.c 13>
```

78868

```
3     h: <>
```

78869

```
4     i: int, <file.c 1>
```

78870

```
5   g: <>
```

78871

RATIONALE

78872

None.

78873

FUTURE DIRECTIONS

78874

None.

78875

78878

CHANGE HISTORY

78879

First released in Issue 2.

78880

Issue 6

78881

The normative text is reworded to avoid use of the term “must” for application requirements.

78882

Issue 7

78883

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

78884 **NAME**
 78885 chgrp — change the file group ownership

78886 **SYNOPSIS**
 78887 chgrp [-h] group file...
 78888 chgrp -R [-H|-L|-P] group file...

78889 **DESCRIPTION**
 78890 The *chgrp* utility shall set the group ID of the file named by each *file* operand to the group ID
 78891 specified by the *group* operand.

78892 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the
 78893 directory trees specified by the *file* operands, the *chgrp* utility shall perform actions equivalent to
 78894 the *chown()* function defined in the System Interfaces volume of POSIX.1-200x, called with the
 78895 following arguments:

- 78896 • The *file* operand shall be used as the *path* argument.
- 78897 • The user ID of the file shall be used as the *owner* argument.
- 78898 • The specified group ID shall be used as the *group* argument.

78899 Unless *chgrp* is invoked by a process with appropriate privileges, the set-user-ID and set-group-
 78900 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-
 78901 group-ID bits of other file types may be cleared.

78902 **OPTIONS**
 78903 The *chgrp* utility shall conform to XBD [Section 12.2](#) (on page 201).

78904 The following options shall be supported by the implementation:

- 78905 **-h** If the system supports group IDs for symbolic links, for each *file* operand that
 78906 names a file of type symbolic link, *chgrp* shall attempt to set the group ID of the
 78907 symbolic link instead of the file referenced by the symbolic link. If the system does
 78908 not support group IDs for symbolic links, for each *file* operand that names a file of
 78909 type symbolic link, *chgrp* shall do nothing more with the current file and shall go
 78910 on to any remaining files.
- 78911 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory
 78912 is specified on the command line, *chgrp* shall change the group of the directory
 78913 referenced by the symbolic link and all files in the file hierarchy below it.
- 78914 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory
 78915 is specified on the command line or encountered during the traversal of a file
 78916 hierarchy, *chgrp* shall change the group of the directory referenced by the symbolic
 78917 link and all files in the file hierarchy below it.
- 78918 **-P** If the **-R** option is specified and a symbolic link is specified on the command line
 78919 or encountered during the traversal of a file hierarchy, *chgrp* shall change the group
 78920 ID of the symbolic link if the system supports this operation. The *chgrp* utility shall
 78921 not follow the symbolic link to any other part of the file hierarchy.
- 78922 **-R** Recursively change file group IDs. For each *file* operand that names a directory,
 78923 *chgrp* shall change the group of the directory and all files in the file hierarchy
 78924 below it. Unless a **-H**, **-L**, or **-P** option is specified, it is unspecified which of these
 78925 options will be used as the default.

78926 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be
 78927 considered an error. The last option specified shall determine the behavior of the utility.

78928 **OPERANDS**

78929 The following operands shall be supported:

78930 *group* A group name from the group database or a numeric group ID. Either specifies a
 78931 group ID to be given to each file named by one of the *file* operands. If a numeric
 78932 *group* operand exists in the group database as a group name, the group ID number
 78933 associated with that group name is used as the group ID.

78934 *file* A pathname of a file whose group ID is to be modified.

78935 **STDIN**

78936 Not used.

78937 **INPUT FILES**

78938 None.

78939 **ENVIRONMENT VARIABLES**78940 The following environment variables shall affect the execution of *chgrp*:

78941 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 78942 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 78943 variables used to determine the values of locale categories.)

78944 *LC_ALL* If set to a non-empty string value, override the values of all the other
 78945 internationalization variables.

78946 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 78947 characters (for example, single-byte as opposed to multi-byte characters in
 78948 arguments).

78949 *LC_MESSAGES*

78950 Determine the locale that should be used to affect the format and contents of
 78951 diagnostic messages written to standard error.

78952 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

78953 **ASYNCHRONOUS EVENTS**

78954 Default.

78955 **STDOUT**

78956 Not used.

78957 **STDERR**

78958 The standard error shall be used only for diagnostic messages.

78959 **OUTPUT FILES**

78960 None.

78961 **EXTENDED DESCRIPTION**

78962 None.

78963 **EXIT STATUS**

78964 The following exit values shall be returned:

78965 0 The utility executed successfully and all requested changes were made.

78966 >0 An error occurred.

78967 **CONSEQUENCES OF ERRORS**

78968 Default.

79000
79001
79002**APPLICATION USAGE**

Only the owner of a file or the user with appropriate privileges may change the owner or group of a file.

Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the *group* specified is not the effective group ID or one of the supplementary group IDs of the calling process.

EXAMPLES

None.

RATIONALE

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. The standard developers chose to mask these by specifying only 0 and >0 as exit values.

The functionality of *chgrp* is described substantially through references to *chown()*. In this way, there is no duplication of effort required for describing the interactions of permissions, multiple groups, and so on.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These options affect the processing of symbolic links.

IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to "Default."

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to make it clear that **-h** and **-R** are optional.

Issue 7

SD5-XCU-ERN-8 is applied, removing the **-R** from the first line of the SYNOPSIS.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79003	NAME	
79004		chmod — change the file modes
79005	SYNOPSIS	
79006		chmod [-R] mode file...
79007	DESCRIPTION	
79008		The <i>chmod</i> utility shall change any or all of the file mode bits of the file named by each <i>file</i> operand in the way specified by the <i>mode</i> operand.
79009		
79010		It is implementation-defined whether and how the <i>chmod</i> utility affects any alternate or additional file access control mechanism (see XBD Section 4.4, on page 96) being used for the specified file.
79011		
79012		
79013		Only a process whose effective user ID matches the user ID of the file, or a process with the appropriate privileges, shall be permitted to change the file mode bits of a file.
79014		
79015	OPTIONS	
79016		The <i>chmod</i> utility shall conform to XBD Section 12.2 (on page 201).
79017		The following option shall be supported:
79018	-R	Recursively change file mode bits. For each <i>file</i> operand that names a directory, <i>chmod</i> shall change the file mode bits of the directory and all files in the file hierarchy below it.
79019		
79020		
79021	OPERANDS	
79022		The following operands shall be supported:
79023	<i>mode</i>	Represents the change to be made to the file mode bits of each file named by one of the <i>file</i> operands; see the EXTENDED DESCRIPTION section.
79024		
79025	<i>file</i>	A pathname of a file whose file mode bits shall be modified.
79026	STDIN	
79027		Not used.
79028	INPUT FILES	
79029		None.
79030	ENVIRONMENT VARIABLES	
79031		The following environment variables shall affect the execution of <i>chmod</i> :
79032	<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)
79033		
79034		
79035	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
79036		
79037	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
79038		
79039		
79040	<i>LC_MESSAGES</i>	
79041		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
79042		
79043	XSI	<i>NLSPATH</i> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .

79044 ASYNCHRONOUS EVENTS

79045 Default.

79046 STDOUT

79047 Not used.

79048 STDERR

79049 The standard error shall be used only for diagnostic messages.

79050 OUTPUT FILES

79051 None.

79052 EXTENDED DESCRIPTION

79053 The *mode* operand shall be either a *symbolic_mode* expression or a non-negative octal integer. The
79054 *symbolic_mode* form is described by the grammar later in this section.79055 Each **clause** shall specify an operation to be performed on the current file mode bits of each *file*.
79056 The operations shall be performed on each *file* in the order in which the **clauses** are specified.79057 The **who** symbols **u**, **g**, and **o** shall specify the *user*, *group*, and *other* parts of the file mode bits,
79058 respectively. A **who** consisting of the symbol **a** shall be equivalent to **ugo**.79059 The **perm** symbols **r**, **w**, and **x** represent the *read*, *write*, and *execute/search* portions of file mode
79060 bits, respectively. The **perm** symbol **s** shall represent the *set-user-ID-on-execution* (when **who**
79061 contains or implies **u**) and *set-group-ID-on-execution* (when **who** contains or implies **g**) bits.79062 The **perm** symbol **X** shall represent the execute/search portion of the file mode bits if the file is a
79063 directory or if the current (unmodified) file mode bits have at least one of the execute bits
79064 (S_IXUSR, S_IXGRP, or S_IXOTH) set. It shall be ignored if the file is not a directory and none of
79065 the execute bits are set in the current file mode bits.79066 The **permcop** symbols **u**, **g**, and **o** shall represent the current permissions associated with the
79067 user, group, and other parts of the file mode bits, respectively. For the remainder of this section,
79068 **perm** refers to the non-terminals **perm** and **permcop** in the grammar.79069 If multiple **actionlists** are grouped with a single **wholist** in the grammar, each **actionlist** shall be
79070 applied in the order specified with that **wholist**. The *op* symbols shall represent the operation
79071 performed, as follows:79072 + If **perm** is not specified, the '+' operation shall not change the file mode bits.79073 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and
79074 other permissions, except for those with corresponding bits in the file mode creation mask
79075 of the invoking process, shall be set.79076 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.79077 - If **perm** is not specified, the '-' operation shall not change the file mode bits.79078 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and
79079 other permissions, except for those with corresponding bits in the file mode creation mask
79080 of the invoking process, shall be cleared.79081 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be
79082 cleared.79083 = Clear the file mode bits specified by the **who** value, or, if no **who** value is specified, all of the
79084 file mode bits specified in this volume of POSIX.1-200x.79085 If **perm** is not specified, the '=' operation shall make no further modifications to the file
79086 mode bits.79087 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and
79088 other permissions, except for those with corresponding bits in the file mode creation mask

79089 of the invoking process, shall be set.

79090 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

79091 When using the symbolic mode form on a regular file, it is implementation-defined whether or
79092 not:

- 79093 • Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all
79094 execute bits are currently clear and none are being set are ignored.
- 79095 • Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-
79096 on-execution bits.
- 79097 • Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all
79098 execute bits are currently clear are ignored. However, if the command `ls -l file` writes an *s*
79099 in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is
79100 set, the commands `chmod u-s file` or `chmod g-s file`, respectively, shall not be ignored.

79101 When using the symbolic mode form on other file types, it is implementation-defined whether
79102 or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are
79103 honored.

79104 If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols
79105 being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be
79106 modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm**
79107 symbol **s**.

79108 XSI The **perm** symbol **t** shall specify the S_ISVTX bit. When used with a file of type directory, it can
79109 be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who**
79110 symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these
79111 combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other
79112 than directory is unspecified.

79113 For an octal integer *mode* operand, the file mode bits shall be set absolutely.

79114 For each bit set in the octal number, the corresponding file permission bit shown in the following
79115 table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in
79116 the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-
79117 execution, bits shown in the following table shall be set; if these bits are not set in the octal
79118 number, they are cleared. For other file types, it is implementation-defined whether or not
79119 requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are
79120 honored.

79121	Octal	Mode Bit	Octal	Mode Bit	Octal	Mode Bit	Octal	Mode Bit
79122	4000	S_ISUID	0400	S_IRUSR	0040	S_IRGRP	0004	S_IROTH
79123	2000	S_ISGID	0200	S_IWUSR	0020	S_IWGRP	0002	S_IWOTH
79124	XSI 1000	S_ISVTX	0100	S_IXUSR	0010	S_IXGRP	0001	S_IXOTH

79125 When bits are set in the octal number other than those listed in the table above, the behavior is
79126 unspecified.

79127

Grammar for chmod79128
79129
79130
79131
79132

The grammar and lexical conventions in this section describe the syntax for the *symbolic_mode* operand. The general conventions for this style of grammar are described in [Section 1.3](#) (on page 2235). A valid *symbolic_mode* can be represented as the non-terminal symbol *symbolic_mode* in the grammar. This formal syntax shall take precedence over the preceding text syntax description.

79133
79134

The lexical processing is based entirely on single characters. Implementations need not allow <blank>s within the single argument being processed.

79135
79136

                  ;
```

79164

EXIT STATUS

79165

The following exit values shall be returned:

79166

0 The utility executed successfully and all requested changes were made.

79167

>0 An error occurred.

79168

CONSEQUENCES OF ERRORS

79169

Default.

APPLICATION USAGE

Some implementations of the *chmod* utility change the mode of a directory before the files in the directory when performing a recursive (**-R** option) change; others change the directory mode after the files in the directory. If an application tries to remove read or search permission for a file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users should not try to make a hierarchy inaccessible to themselves.

Some implementations of *chmod* never used the *umask* of the process when changing modes; systems conformant with this volume of POSIX.1-200x do so when **who** is not specified. Note the difference between:

```
chmod a-w file
```

which removes all write permissions, and:

```
chmod -- -w file
```

which removes write permissions that would be allowed if **file** was created with the same *umask*.

Conforming applications should never assume that they know how the set-user-ID and set-group-ID bits on directories are interpreted.

EXAMPLES

Mode	Results
<i>a+=</i>	Equivalent to <i>a+,a=</i> ; clears all file mode bits.
<i>go+-w</i>	Equivalent to <i>go+,go-w</i> ; clears group and other write bits.
<i>g=o-w</i>	Equivalent to <i>g=o,g-w</i> ; sets group bit to match other bits and then clears group write bit.
<i>g-r+w</i>	Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.
<i>uo=g</i>	Sets owner bits to match group bits and sets other bits to match group bits.

RATIONALE

The functionality of *chmod* is described substantially through references to concepts defined in the System Interfaces volume of POSIX.1-200x. In this way, there is less duplication of effort required for describing the interactions of permissions. However, the behavior of this utility is not described in terms of the *chmod()* function from the System Interfaces volume of POSIX.1-200x because that specification requires certain side effects upon alternate file access control mechanisms that might not be appropriate, depending on the implementation.

Implementations that support mandatory file and record locking as specified by the 1984 /usr/group standard historically used the combination of set-group-ID bit set and group execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory locking mode is not changed without explicit indication that that was what the user intended. Therefore, the details on how the implementation treats these conditions must be defined in the documentation. This volume of POSIX.1-200x does not require mandatory locking (nor does the System Interfaces volume of POSIX.1-200x), but does allow it as an extension. However, this volume of POSIX.1-200x does require that the *ls* and *chmod* utilities work consistently in this area. If *ls -l file* indicates that the set-group-ID bit is set, *chmod g-s file* must clear it (assuming appropriate privileges exist to change modes).

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it

79218 can overflow the range of valid exit status values. This problem is avoided here by specifying
79219 only 0 and >0 as exit values.

79220 The System Interfaces volume of POSIX.1-200x indicates that implementation-defined
79221 restrictions may cause the S_ISUID and S_ISGID bits to be ignored. This volume of
79222 POSIX.1-200x allows the *chmod* utility to choose to modify these bits before calling *chmod()* (or
79223 some function providing equivalent capabilities) for non-regular files. Among other things, this
79224 allows implementations that use the set-user-ID and set-group-ID bits on directories to enable
79225 extended features to handle these extensions in an intelligent manner.

79226 The **X perm** symbol was adopted from BSD-based systems because it provides commonly
79227 desired functionality when doing recursive (**-R** option) modifications. Similar functionality is
79228 not provided by the *find* utility. Historical BSD versions of *chmod*, however, only supported **X**
79229 with *op+*; it has been extended in this volume of POSIX.1-200x because it is also useful with *op=*.
79230 (It has also been added for *op-* even though it duplicates **x**, in this case, because it is intuitive
79231 and easier to explain.)

79232 The grammar was extended with the *permcop* non-terminal to allow historical-practice forms of
79233 symbolic modes like **o=u -g** (that is, set the “other” permissions to the permissions of “owner”
79234 minus the permissions of “group”).

79235 FUTURE DIRECTIONS

79242 First released in Issue 2.

79243 Issue 6

79244 The following new requirements on POSIX implementations derive from alignment with the
79245 Single UNIX Specification:

- 79246 • Octal modes have been kept and made mandatory despite being marked obsolescent in the
79247 ISO POSIX-2:1993 standard.

79248 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS
79249 section to “Default.”.

79250 The Open Group Base Resolution bwg2001-010 is applied, adding the description of the
79251 S_ISVTX bit and the **t perm** symbol as part of the XSI option.

79252 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded
79253 text in the EXTENDED DESCRIPTION from:

79254 “The **perm** symbol **t** shall specify the S_ISVTX bit and shall apply to directories only. The
79255 effect when using it with any other file type is unspecified. It can be used with the **who**
79256 symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**
79257 or **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

79258 to:

79259
79260
79261
79262
79263

“The **perm** symbol **t** shall specify the S_ISVTX bit. When used with a file of type directory, it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other than directory is unspecified.”

79264

This change is to permit historical behavior.

79265

Issue 7

79266

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79267 **NAME**

79268 chown — change the file ownership

79269 **SYNOPSIS**

79270 chown [-h] owner[:group] file...

79271 chown -R [-H|-L|-P] owner[:group] file...

79272 **DESCRIPTION**79273 The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID
79274 specified by the *owner* operand.79275 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the
79276 directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to
79277 the *chown()* function defined in the System Interfaces volume of POSIX.1-200x, called with the
79278 following arguments:

- 79279
1. The *file* operand shall be used as the *path* argument.
 - 79280 2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner*
79281 argument.
 - 79282 3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used
79283 as the *group* argument; otherwise, the group ownership shall not be changed.

79284 Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-group-
79285 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-
79286 group-ID bits of other file types may be cleared.79287 **OPTIONS**79288 The *chown* utility shall conform to XBD [Section 12.2](#) (on page 201).

79289 The following options shall be supported by the implementation:

- 79290
- h**
- If the system supports user IDs for symbolic links, for each
- file*
- operand that names
-
- 79291 a file of type symbolic link,
- chown*
- shall attempt to set the user ID of the symbolic
-
- 79292 link. If the system supports group IDs for symbolic links, and a group ID was
-
- 79293 specified, for each
- file*
- operand that names a file of type symbolic link,
- chown*
- shall
-
- 79294 attempt to set the group ID of the symbolic link. If the system does not support
-
- 79295 user or group IDs for symbolic links, for each
- file*
- operand that names a file of type
-
- 79296 symbolic link,
- chown*
- shall do nothing more with the current file and shall go on to
-
- 79297 any remaining files.
-
- 79298
- H**
- If the
- R**
- option is specified and a symbolic link referencing a file of type directory
-
- 79299 is specified on the command line,
- chown*
- shall change the user ID (and group ID, if
-
- 79300 specified) of the directory referenced by the symbolic link and all files in the file
-
- 79301 hierarchy below it.
-
- 79302
- L**
- If the
- R**
- option is specified and a symbolic link referencing a file of type directory
-
- 79303 is specified on the command line or encountered during the traversal of a file
-
- 79304 hierarchy,
- chown*
- shall change the user ID (and group ID, if specified) of the
-
- 79305 directory referenced by the symbolic link and all files in the file hierarchy below it.
-
- 79306
- P**
- If the
- R**
- option is specified and a symbolic link is specified on the command line
-
- 79307 or encountered during the traversal of a file hierarchy,
- chown*
- shall change the
-
- 79308 owner ID (and group ID, if specified) of the symbolic link if the system supports
-
- 79309 this operation. The
- chown*
- utility shall not follow the symbolic link to any other part
-
- 79310 of the file hierarchy.

79311 **-R** Recursively change file user and group IDs. For each *file* operand that names a
79312 directory, *chown* shall change the user ID (and group ID, if specified) of the
79313 directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is
79314 specified, it is unspecified which of these options will be used as the default.

79315 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be
79316 considered an error. The last option specified shall determine the behavior of the utility.

79317 OPERANDS

79318 The following operands shall be supported:

79319 *owner[:group]* A user ID and optional group ID to be assigned to *file*. The *owner* portion of this
79320 operand shall be a user name from the user database or a numeric user ID. Either
79321 specifies a user ID which shall be given to each file named by one of the *file*
79322 operands. If a numeric *owner* operand exists in the user database as a user name,
79323 the user ID number associated with that user name shall be used as the user ID.
79324 Similarly, if the *group* portion of this operand is present, it shall be a group name
79325 from the group database or a numeric group ID. Either specifies a group ID which
79326 shall be given to each file. If a numeric group operand exists in the group database
79327 as a group name, the group ID number associated with that group name shall be
79328 used as the group ID.

79329 *file* A pathname of a file whose user ID is to be modified.

79330 STDIN

79331 Not used.

79332 INPUT FILES

79333 None.

79334 ENVIRONMENT VARIABLES

79335 The following environment variables shall affect the execution of *chown*:

79336 **LANG** Provide a default value for the internationalization variables that are unset or null. |
79337 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
79338 variables used to determine the values of locale categories.)

79339 **LC_ALL** If set to a non-empty string value, override the values of all the other
79340 internationalization variables.

79341 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
79342 characters (for example, single-byte as opposed to multi-byte characters in
79343 arguments).

79344 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
79345 diagnostic messages written to standard error.
79346

79347 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

79348 ASYNCHRONOUS EVENTS

79349 Default.

79350 STDOUT

79351 Not used.

79352 STDERR

79353 The standard error shall be used only for diagnostic messages.

79354 **OUTPUT FILES**

79355 None.

79356 **EXTENDED DESCRIPTION**

79357 None.

79358 **EXIT STATUS**

79359 The following exit values shall be returned:

79360 0 The utility executed successfully and all requested changes were made.

79361 >0 An error occurred.

79362 **CONSEQUENCES OF ERRORS**

79363 Default.

79364 **APPLICATION USAGE**79365 Only the owner of a file or the user with appropriate privileges may change the owner or group
79366 of a file.79367 Some implementations restrict the use of *chown* to a user with appropriate privileges.79368 **EXAMPLES**

79369 None.

79370 **RATIONALE**79371 The System V and BSD versions use different exit status codes. Some implementations used the
79372 exit status as a count of the number of errors that occurred; this practice is unworkable since it
79373 can overflow the range of valid exit status values. These are masked by specifying only 0 and >0
79374 as exit values.79375 The functionality of *chown* is described substantially through references to functions in the
79376 System Interfaces volume of POSIX.1-200x. In this way, there is no duplication of effort required
79377 for describing the interactions of permissions, multiple groups, and so on.79378 The 4.3 BSD method of specifying both owner and group was included in this volume of
79379 POSIX.1-200x because:

- 79380 • There are cases where the desired end condition could not be achieved using the *chgrp* and
79381 *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the
79382 desired group and the desired owner is not a member of the current group, the *chown()*
79383 function could fail unless both owner and group are changed at the same time.)
- 79384 • Even if they could be changed independently, in cases where both are being changed, there
79385 is a 100% performance penalty caused by being forced to invoke both utilities.

79386 The BSD syntax *user[.group]* was changed to *user[:group]* in this volume of POSIX.1-200x because
79387 the period is a valid character in login names (as specified by the Base Definitions volume of
79388 POSIX.1-200x, login names consist of characters in the portable filename character set). The
79389 colon character was chosen as the replacement for the period character because it would never
79390 be allowed as a character in a user name or group name on historical implementations.

79391 The **-R** option is considered by some observers as an undesirable departure from the historical
79392 UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there
79393 seemed to be no good reason to require other tools to have to duplicate that functionality.
79394 However, the **-R** option was deemed an important user convenience, is far more efficient than
79395 forking a separate process for each element of the directory hierarchy, and is in widespread
79396 historical use.

XSH *chown*

CHANGE HISTORY

First released in Issue 2.

Issue 6

New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These options affect the processing of symbolic links.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS section to “Default.”.

The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group ownership shall not be changed”.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to make it clear that **-h** and **-R** are optional.

Issue 7

SD5-XCU-ERN-9 is applied, removing the **-R** from the first line of the SYNOPSIS.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79418 **NAME**

79419 cksum — write file checksums and sizes

79420 **SYNOPSIS**79421 cksum [*file*...]79422 **DESCRIPTION**

79423 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)
 79424 for each input file, and also write to standard output the number of octets in each file. The CRC
 79425 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996
 79426 standard (Ethernet).

79427 The encoding for the CRC checksum is defined by the generating polynomial:

$$79428 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

79429 Mathematically, the CRC value corresponding to a given file shall be defined by the following
 79430 procedure:

- 79431 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial
 79432 *M(x)* of degree *n*−1. These *n* bits are the bits from the file, with the most significant bit
 79433 being the most significant bit of the first octet of the file and the last bit being the least
 79434 significant bit of the last octet, padded with zero bits (if necessary) to achieve an integral
 79435 number of octets, followed by one or more octets representing the length of the file as a
 79436 binary value, least significant octet first. The smallest number of octets capable of
 79437 representing this integer shall be used.
- 79438 2. *M(x)* is multiplied by x^{32} (that is, shifted left 32 bits) and divided by *G(x)* using mod 2
 79439 division, producing a remainder *R(x)* of degree ≤ 31.
- 79440 3. The coefficients of *R(x)* are considered to be a 32-bit sequence.
- 79441 4. The bit sequence is complemented and the result is the CRC.

79442 **OPTIONS**

79443 None.

79444 **OPERANDS**

79445 The following operand shall be supported:

79446 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard
 79447 input shall be used.

79448 **STDIN**

79449 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES
 79450 section.

79451 **INPUT FILES**

79452 The input files can be any file type.

79453 **ENVIRONMENT VARIABLES**79454 The following environment variables shall affect the execution of *cksum*:

79455 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 79456 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 79457 variables used to determine the values of locale categories.)

79458 *LC_ALL* If set to a non-empty string value, override the values of all the other
 79459 internationalization variables.

79460 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 79461 characters (for example, single-byte as opposed to multi-byte characters in
 79462 arguments).

79463 *LC_MESSAGES*
 79464 Determine the locale that should be used to affect the format and contents of
 79465 diagnostic messages written to standard error.

79466 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

79467 **ASYNCHRONOUS EVENTS**

79468 Default.

79469 **STDOUT**

79470 For each file processed successfully, the *cksum* utility shall write in the following format:

79471 "%u %d %s\n", <checksum>, <# of octets>, <pathname>

79472 If no *file* operand was specified, the pathname and its leading <space> shall be omitted.

79473 **STDERR**

79474 The standard error shall be used only for diagnostic messages.

79475 **OUTPUT FILES**

79476 None.

79477 **EXTENDED DESCRIPTION**

79478 None.

79479 **EXIT STATUS**

79480 The following exit values shall be returned:

79481 0 All files were processed successfully.

79482 >0 An error occurred.

79483 **CONSEQUENCES OF ERRORS**

79484 Default.

79485 **APPLICATION USAGE**

79486 The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of
 79487 the same, such as to ensure that files transmitted over noisy media arrive intact. However, this
 79488 comparison cannot be considered cryptographically secure. The chances of a damaged file
 79489 producing the same CRC as the original are small; deliberate deception is difficult, but probably
 79490 not impossible.

79491 Although input files to *cksum* can be any type, the results need not be what would be expected
 79492 on character special device files or on file types not described by the System Interfaces volume of
 79493 POSIX.1-200x. Since this volume of POSIX.1-200x does not specify the block size used when
 79494 doing input, checksums of character special files need not process all of the data in those files.

79495 The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted
 79496 between two systems and undergoes any data transformation (such as changing little-endian
 79497 byte ordering to big-endian), identical CRC values cannot be expected. Implementations
 79498 performing such transformations may extend *cksum* to handle such situations.

79499 **EXAMPLES**

79554**RATIONALE**

The following C-language program can be used as a model to describe the algorithm. It assumes that a **char** is one octet. It also assumes that the entire file is available for one pass through the function. This was done for simplicity in demonstrating the algorithm, rather than as an implementation model.

79559     };

79560     unsigned long memcrc(const unsigned char *b, size_t n)
79561     {
79562     /* Input arguments:
79563     * const char*   b == byte sequence to checksum
79564     * size_t       n == length of sequence
79565     */

79566         register unsigned   i, c, s = 0;

79567         for (i = n; i > 0; --i) {
79568             c = (unsigned)(*b++);
79569             s = (s << 8) ^ crctab[(s >> 24) ^ c];
79570         }

79571         /* Extend with the length of the string. */
79572         while (n != 0) {
79573             c = n & 0377;
79574             n >>= 8;
79575             s = (s << 8) ^ crctab[(s >> 24) ^ c];
79576         }

79577         return ~s;
79578     }

```

79579 The historical practice of writing the number of “blocks” has been changed to writing the
79580 number of octets, since the latter is not only more useful, but also since historical
79581 implementations have not been consistent in defining what a “block” meant.

79582 The algorithm used was selected to increase the operational robustness of *cksum*. Neither the
79583 System V nor BSD *sum* algorithm was selected. Since each of these was different and each was
79584 the default behavior on those systems, no realistic compromise was available if either were
79585 selected—some set of historical applications would break. Therefore, the name was changed to
79586 *cksum*. Although the historical *sum* commands will probably continue to be provided for many
79587 years, programs designed for portability across systems should use the new name.

79588 The algorithm selected is based on that used by the ISO/IEC 8802-3:1996 standard (Ethernet) for
79589 the frame check sequence field. The algorithm used does not match the technical definition of a
79590 *checksum*; the term is used for historical reasons. The length of the file is included in the CRC
79591 calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also
79592 because it guards against inadvertent collisions between files that begin with different series of
79593 zero octets. The chance that two different files produce identical CRCs is much greater when
79594 their lengths are not considered. Keeping the length and the checksum of the file itself separate
79595 would yield a slightly more robust algorithm, but historical usage has always been that a single
79596 number (the checksum as printed) represents the signature of the file. It was decided that
79597 historical usage was the more important consideration.

79598 Early proposals contained modifications to the Ethernet algorithm that involved extracting table
79599 values whenever an intermediate result became zero. This was demonstrated to be less robust
79600 than the current method and mathematically difficult to describe or justify.

79601 The calculation used is identical to that given in pseudo-code in the referenced Sarwate article.
79602 The pseudo-code rendition is:

```

79603     X <- 0; Y <- 0;

```

```

79604     for i <- m -1 step -1 until 0 do
79605         begin
79606             T <- X(1) ^ A[i];
79607             X(1) <- X(0); X(0) <- Y(1); Y(1) <- Y(0); Y(0) <- 0;
79608             comment: f[T] and f'[T] denote the T-th words in the
79609                 table f and f' ;
79610             X <- X ^ f[T]; Y <- Y ^ f'[T];
79611         end

```

79612 The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]**
79613 represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables
79614 **f** and **f'** are a single table containing 32-bit values.

79615 The referenced Sarwate article also discusses generating the table.

79616 **FUTURE DIRECTIONS**

79617 None.

79618 **SEE ALSO**

79619 XBD [Chapter 8](#) (on page 159)

79620 **CHANGE HISTORY**

79621 First released in Issue 4.

79622 **Issue 7**

79623 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79624 **NAME**

79625 cmp — compare two files

79626 **SYNOPSIS**

79627 cmp [-l|-s] file1 file2

79628 **DESCRIPTION**

79629 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the
 79630 same. Under default options, if they differ, it shall write to standard output the byte and line
 79631 number at which the first difference occurred. Bytes and lines shall be numbered beginning with
 79632 1.

79633 **OPTIONS**79634 The *cmp* utility shall conform to XBD Section 12.2 (on page 201).

79635 The following options shall be supported:

79636 **-l** (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for
 79637 each difference.

79638 **-s** Write nothing for differing files; return exit status only.

79639 **OPERANDS**

79640 The following operands shall be supported:

79641 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall
 79642 be used.

79643 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input
 79644 shall be used.

79645 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or
 79646 character special file, the results are undefined.

79647 **STDIN**

79648 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the
 79649 INPUT FILES section.

79650 **INPUT FILES**

79651 The input files can be any file type.

79652 **ENVIRONMENT VARIABLES**79653 The following environment variables shall affect the execution of *cmp*:

79654 **LANG** Provide a default value for the internationalization variables that are unset or null.
 79655 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 79656 variables used to determine the values of locale categories.)

79657 **LC_ALL** If set to a non-empty string value, override the values of all the other
 79658 internationalization variables.

79659 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 79660 characters (for example, single-byte as opposed to multi-byte characters in
 79661 arguments).

79662 **LC_MESSAGES**

79663 Determine the locale that should be used to affect the format and contents of
 79664 diagnostic messages written to standard error and informative messages written to
 79665 standard output.

79666 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

79667 ASYNCHRONOUS EVENTS

79668 Default.

79669 STDOUT

79670 In the POSIX locale, results of the comparison shall be written to standard output. When no
79671 options are used, the format shall be:

79672 "%s %s differ: char %d, line %d\n", *file1*, *file2*,
79673 <*byte number*>, <*line number*>

79674 When the *-l* option is used, the format shall be:

79675 "%d %o %o\n", <*byte number*>, <*differing byte*>,
79676 <*differing byte*>

79677 for each byte that differs. The first <*differing byte*> number is from *file1* while the second is from
79678 *file2*. In both cases, <*byte number*> shall be relative to the beginning of the file, beginning with 1.

79679 No output shall be written to standard output when the *-s* option is used.

79680 STDERR

79681 The standard error shall be used only for diagnostic messages. If the *-l* option is used and *file1*
79682 and *file2* differ in length, or if the *-s* option is not used and *file1* and *file2* are identical for the
79683 entire length of the shorter file, in the POSIX locale the following diagnostic message shall be
79684 written:

79685 "cmp: EOF on %s%s\n", <*name of shorter file*>, <*additional info*>

79686 The <*additional info*> field shall either be null or a string that starts with a <blank> and contains
79687 no <newline>s. Some implementations report on the number of lines in this case.

79688 OUTPUT FILES

79689 None.

79690 EXTENDED DESCRIPTION

79691 None.

79692 EXIT STATUS

79693 The following exit values shall be returned:

79694 0 The files are identical.

79695 1 The files are different; this includes the case where one file is identical to the first part of the
79696 other.

79697 >1 An error occurred.

79698 CONSEQUENCES OF ERRORS

79699 Default.

79700 APPLICATION USAGE

79701 Although input files to *cmp* can be any type, the results might not be what would be expected on
79702 character special device files or on file types not described by the System Interfaces volume of
79703 POSIX.1-200x. Since this volume of POSIX.1-200x does not specify the block size used when
79704 doing input, comparisons of character special files need not compare all of the data in those files.

79705 For files which are not text files, line numbers simply reflect the presence of a <newline>,
79706 without any implication that the file is organized into lines.

79729
79730
79731
79732
79733
79734
79735
79736

EXAMPLES

None.

RATIONALE

The global language in [Section 1.4](#) (on page 2235) indicates that using two mutually-exclusive options together produces unspecified results. Some System V implementations consider the option usage:

```
cmp -l -s ...
```

to be an error. They also treat:

```
cmp -s -l ...
```

as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

The word **char** in the standard output format comes from historical usage, even though it is actually a byte number. When *cmp* is supported in other locales, implementations are encouraged to use the word *byte* or its equivalent in another language. Users should not interpret this difference to indicate that the functionality of the utility changed between locales.

Some implementations report on the number of lines in the identical-but-shorter file case. This is allowed by the inclusion of the *<additional info>* fields in the output format. The restriction on having a leading *<blank>* and no *<newline>*s is to make parsing for the filename easier. It is recognized that some filenames containing white-space characters make parsing difficult anyway, but the restriction does aid programs used on systems where the names are predominantly well behaved.

FUTURE DIRECTIONS

None.

+

CHANGE HISTORY

First released in Issue 2.

Issue 7

SD5-XCU-ERN-96 is applied, updating the STDERR section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

79737 **NAME**
 79738 comm — select or reject lines common to two files

79739 **SYNOPSIS**
 79740 comm [-123] *file1 file2*

79741 **DESCRIPTION**
 79742 The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating
 79743 sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and
 79744 lines in both files.

79745 If the lines in both files are not ordered according to the collating sequence of the current locale,
 79746 the results are unspecified.

79747 **OPTIONS**
 79748 The *comm* utility shall conform to XBD [Section 12.2](#) (on page 201).

79749 The following options shall be supported:

- 79750 -1 Suppress the output column of lines unique to *file1*.
- 79751 -2 Suppress the output column of lines unique to *file2*.
- 79752 -3 Suppress the output column of lines duplicated in *file1* and *file2*.

79753 **OPERANDS**
 79754 The following operands shall be supported:

79755 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall
 79756 be used.

79757 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input
 79758 shall be used.

79759 If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or
 79760 character special file, the results are undefined.

79761 **STDIN**
 79762 The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input.
 79763 See the INPUT FILES section.

79764 **INPUT FILES**
 79765 The input files shall be text files.

79766 **ENVIRONMENT VARIABLES**
 79767 The following environment variables shall affect the execution of *comm*:

79768 *LANG* Provide a default value for the internationalization variables that are unset or null.
 79769 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 79770 variables used to determine the values of locale categories.)

79771 *LC_ALL* If set to a non-empty string value, override the values of all the other
 79772 internationalization variables.

79773 *LC_COLLATE*
 79774 Determine the locale for the collating sequence *comm* expects to have been used
 79775 when the input files were sorted.

79776 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 79777 characters (for example, single-byte as opposed to multi-byte characters in
 79778 arguments and input files).

79779 *LC_MESSAGES*
 79780 Determine the locale that should be used to affect the format and contents of
 79781 diagnostic messages written to standard error.

79782 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

79783 ASYNCHRONOUS EVENTS

79784 Default.

79785 STDOUT

79786 The *comm* utility shall produce output depending on the options selected. If the *-1*, *-2*, and *-3*
 79787 options are all selected, *comm* shall write nothing to standard output.

79788 If the *-1* option is not selected, lines contained only in *file1* shall be written using the format:

79789 "%s\n", <line in file1>

79790 If the *-2* option is not selected, lines contained only in *file2* are written using the format:

79791 "%s%s\n", <lead>, <line in file2>

79792 where the string <lead> is as follows:

79793 <tab> The *-1* option is not selected.

79794 null string The *-1* option is selected.

79795 If the *-3* option is not selected, lines contained in both files shall be written using the format:

79796 "%s%s\n", <lead>, <line in both>

79797 where the string <lead> is as follows:

79798 <tab><tab> Neither the *-1* nor the *-2* option is selected.

79799 <tab> Exactly one of the *-1* and *-2* options is selected.

79800 null string Both the *-1* and *-2* options are selected.

79801 If the input files were ordered according to the collating sequence of the current locale, the lines
 79802 written shall be in the collating sequence of the original lines.

79803 STDERR

79804 The standard error shall be used only for diagnostic messages.

79805 OUTPUT FILES

79806 None.

79807 EXTENDED DESCRIPTION

79808 None.

79809 EXIT STATUS

79810 The following exit values shall be returned:

79811 0 All input files were successfully output as specified.

79812 >0 An error occurred.

79813 CONSEQUENCES OF ERRORS

79814 Default.

79815 **APPLICATION USAGE**79816 If the input files are not properly presorted, the output of *comm* might not be useful.79817 **EXAMPLES**79818 If a file named **xcu** contains a sorted list of the utilities in this volume of POSIX.1-200x, a file
79819 named **xpg3** contains a sorted list of the utilities specified in the X/Open Portability Guide, Issue
79820 3, and a file named **svid89** contains a sorted list of the utilities in the System V Interface
79821 Definition Third Edition:79822 `comm -23 xcu xpg3 | comm -23 - svid89`79823 would print a list of utilities in this volume of POSIX.1-200x not specified by either of the other
79824 documents:79825 `comm -12 xcu xpg3 | comm -12 - svid89`

79826 would print a list of utilities specified by all three documents, and:

79827 `comm -12 xpg3 svid89 | comm -23 - xcu`79828 would print a list of utilities specified by both XPG3 and the SVID, but not specified in this
79829 volume of POSIX.1-200x.79830 **RATIONALE**

79831 None.

79832 **FUTURE DIRECTIONS**

79833 None.

79834 **SEE ALSO**79835 *cmp, diff, sort, uniq*79836 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +79837 **CHANGE HISTORY**

79838 First released in Issue 2.

79839 **Issue 6**

79840 The normative text is reworded to avoid use of the term “must” for application requirements.

79841 **NAME**
 79842 `command` — execute a simple command

79843 **SYNOPSIS**
 79844 `command [-p] command_name [argument...]`
 79845 `command [-v|-V] command_name`

79846 **DESCRIPTION**
 79847 The *command* utility shall cause the shell to treat the arguments as a simple command,
 79848 suppressing the shell function lookup that is described in [Section 2.9.1.1](#) (on page 2264), item 1b.

79849 If the *command_name* is the same as the name of one of the special built-in utilities, the special
 79850 properties in the enumerated list at the beginning of [Section 2.14](#) (on page 2280) shall not occur.
 79851 In every other respect, if *command_name* is not the name of a function, the effect of *command*
 79852 (with no options) shall be the same as omitting *command*.

79853 When the `-v` or `-V` option is used, the *command* utility shall provide information concerning
 79854 how a command name is interpreted by the shell.

79855 **OPTIONS**
 79856 The *command* utility shall conform to XBD [Section 12.2](#) (on page 201).

79857 The following options shall be supported:

79858 `-p` Perform the command search using a default value for *PATH* that is guaranteed to
 79859 find all of the standard utilities.

79860 `-v` Write a string to standard output that indicates the pathname or command that
 79861 will be used by the shell, in the current shell execution environment (see [Section](#)
 79862 [2.12](#), on page 2277), to invoke *command_name*, but do not invoke *command_name*.

79863 • Utilities, regular built-in utilities, *command_names* including a slash character,
 79864 and any implementation-defined functions that are found using the *PATH*
 79865 variable (as described in [Section 2.9.1.1](#), on page 2264), shall be written as
 79866 absolute pathnames.

79867 • Shell functions, special built-in utilities, regular built-in utilities not
 79868 associated with a *PATH* search, and shell reserved words shall be written as
 79869 just their names.

79870 • An alias shall be written as a command line that represents its alias
 79871 definition.

79872 • Otherwise, no output shall be written and the exit status shall reflect that the
 79873 name was not found.

79874 `-V` Write a string to standard output that indicates how the name given in the
 79875 *command_name* operand will be interpreted by the shell, in the current shell
 79876 execution environment (see [Section 2.12](#), on page 2277), but do not invoke
 79877 *command_name*. Although the format of this string is unspecified, it shall indicate
 79878 in which of the following categories *command_name* falls and shall include the
 79879 information stated:

79880 • Utilities, regular built-in utilities, and any implementation-defined functions
 79881 that are found using the *PATH* variable (as described in [Section 2.9.1.1](#), on
 79882 page 2264), shall be identified as such and include the absolute pathname in
 79883 the string.

- 79884 • Other shell functions shall be identified as functions.
- 79885 • Aliases shall be identified as aliases and their definitions included in the
- 79886 string.
- 79887 • Special built-in utilities shall be identified as special built-in utilities.
- 79888 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 79889 as regular built-in utilities. (The term “regular” need not be used.)
- 79890 • Shell reserved words shall be identified as reserved words.

OPERANDS

The following operands shall be supported:

- 79893 *argument* One of the strings treated as an argument to *command_name*.
- 79894 *command_name*
- 79895 The name of a utility or a special built-in utility.

STDIN

Not used.

INPUT FILES

None.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *command*:

- 79902 *LANG* Provide a default value for the internationalization variables that are unset or null. |
79903 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
79904 variables used to determine the values of locale categories.)
- 79905 *LC_ALL* If set to a non-empty string value, override the values of all the other
79906 internationalization variables.
- 79907 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
79908 characters (for example, single-byte as opposed to multi-byte characters in
79909 arguments).
- 79910 *LC_MESSAGES*
- 79911 Determine the locale that should be used to affect the format and contents of
79912 diagnostic messages written to standard error and informative messages written to
79913 standard output.
- 79914 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 79915 *PATH* Determine the search path used during the command search described in [Section](#)
79916 [2.9.1.1](#) (on page 2264), except as described under the **-p** option.

ASYNCHRONOUS EVENTS

Default.

STDOUT

When the **-v** option is specified, standard output shall be formatted as:

79921 "%s\n", *<pathname or command>*

When the **-V** option is specified, standard output shall be formatted as:

79923 "%s\n", *<unspecified>*

79924 **STDERR**

79925 The standard error shall be used only for diagnostic messages.

79926 **OUTPUT FILES**

79927 None.

79928 **EXTENDED DESCRIPTION**

79929 None.

79930 **EXIT STATUS**79931 When the `-v` or `-V` options are specified, the following exit values shall be returned:

79932 0 Successful completion.

79933 >0 The *command_name* could not be found or an error occurred.

79934 Otherwise, the following exit values shall be returned:

79935 126 The utility specified by *command_name* was found but could not be invoked.79936 127 An error occurred in the *command* utility or the utility specified by *command_name* could not
79937 be found.79938 Otherwise, the exit status of *command* shall be that of the simple command specified by the
79939 arguments to *command*.79940 **CONSEQUENCES OF ERRORS**

79941 Default.

79942 **APPLICATION USAGE**79943 The order for command search allows functions to override regular built-ins and path searches.
79944 This utility is necessary to allow functions that have the same name as a utility to call the utility
79945 (instead of a recursive call to the function).79946 The system default path is available using *getconf*; however, since *getconf* may need to have the
79947 *PATH* set up before it can be called itself, the following can be used:79948 `command -p getconf PATH`79949 There are some advantages to suppressing the special characteristics of special built-ins on
79950 occasion. For example:79951 `command exec > unwritable-file`79952 does not cause a non-interactive script to abort, so that the output status can be checked by the
79953 script.79954 The *command*, *env*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an
79955 error occurs so that applications can distinguish “failure to find a utility” from “invoked utility
79956 exited with an error indication”. The value 127 was chosen because it is not commonly used for
79957 other meanings; most utilities use small values for “normal error conditions” and the values
79958 above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen
79959 in a similar manner to indicate that the utility could be found, but not invoked. Some scripts
79960 produce meaningful error messages differentiating the 126 and 127 cases. The distinction
79961 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to
79962 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for
79963 any other reason.79964 Since the `-v` and `-V` options of *command* produce output in relation to the current shell execution
79965 environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell
79966 or separate utility execution environment, such as one of the following:79967 `(PATH=foo command -v)`79968 `nohup command -v`

79969
79970
79971

it does not necessarily produce correct results. For example, when called with *nohup* or an *exec* function, in a separate utility execution environment, most implementations are not able to identify aliases, functions, or special built-ins.

79972
79973
79974
79975
79976
79977
79978
79979
79980

Two types of regular built-ins could be encountered on a system and these are described separately by *command*. The description of command search in [Section 2.9.1.1](#) (on page 2264) allows for a standard utility to be implemented as a regular built-in as long as it is found in the appropriate place in a *PATH* search. So, for example, *command -v true* might yield */bin/true* or some similar pathname. Other implementation-defined utilities that are not defined by this volume of POSIX.1-200x might exist only as built-ins and have no pathname associated with them. These produce output identified as (regular) built-ins. Applications encountering these are not able to count on *execing* them, using them with *nohup*, overriding them with a different *PATH*, and so on.

79981

EXAMPLES

79982

1. Make a version of *cd* that always prints out the new working directory exactly once:

79983
79984
79985
79986

```
cd() {
    command cd "$@" >/dev/null
    pwd
}
```

79987

2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

79988
79989
79990
79991
79992
79993
79994
79995
79996
79997
79998
79999
80000

```
IFS='
# The preceding value should be <space><tab><newline>.
# Set IFS to its default value.

\unalias -a
# Unset all possible aliases.
# Note that unalias is escaped to prevent an alias
# being used for unalias.

unset -f command
# Ensure command is not a user function.

PATH="$(command -p getconf PATH):$PATH"
# Put on a reliable PATH prefix.

# ...
```

80001
80002
80003
80004
80005
80006
80007

At this point, given correct permissions on the directories called by *PATH*, the script has the ability to ensure that any utility it calls is the intended one. It is being very cautious because it assumes that implementation extensions may be present that would allow user functions to exist when it is invoked; this capability is not specified by this volume of POSIX.1-200x, but it is not prohibited as an extension. For example, the *ENV* variable precedes the invocation of the script with a user start-up script. Such a script could define functions to spoof the application.

80008

RATIONALE

80009

Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

80010
80011

There is nothing in the description of *command* that implies the command line is parsed any differently from that of any other simple command. For example:

80012

```
command a | b ; c
```

80013
80014

is not parsed in any special way that causes ' | ' or ' ; ' to be treated other than a pipe operator or semicolon or that prevents function lookup on **b** or **c**.

80015 The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since
 80016 *command* also goes to the file system to search for utilities, the name *builtin* would not be
 80017 intuitive.

80018 The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special
 80019 built-in for the following reasons:

- 80020 • The removal of exportable functions made the special precedence of a special built-in
 80021 unnecessary.
- 80022 • A special built-in has special properties (see [Section 2.14](#), on page 2280) that were
 80023 inappropriate for invoking other utilities. For example, two commands such as:

80024 `date > unwritable-file`

80025 `command date > unwritable-file`

80026 would have entirely different results; in a non-interactive script, the former would
 80027 continue to execute the next command, the latter would abort. Introducing this semantic
 80028 difference along with suppressing functions was seen to be non-intuitive.

80029 The `-p` option is present because it is useful to be able to ensure a safe path search that finds all
 80030 the standard utilities. This search might not be identical to the one that occurs through one of the
 80031 *exec* functions (as defined in the System Interfaces volume of POSIX.1-200x) when *PATH* is unset.
 80032 At the very least, this feature is required to allow the script to access the correct version of *getconf*
 80033 so that the value of the default path can be accurately retrieved.

80034 The *command* `-v` and `-V` options were added to satisfy requirements from users that are
 80035 currently accomplished by three different historical utilities: *type* in the System V shell, *whence* in
 80036 the KornShell, and *which* in the C shell. Since there is no historical agreement on how and what
 80037 to accomplish here, the POSIX *command* utility was enhanced and the historical utilities were left
 80038 unmodified. The C shell *which* merely conducts a path search. The KornShell *whence* is more
 80039 elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases,
 80040 exported aliases, and undefined functions.

80041 The output format of `-V` was left mostly unspecified because human users are its only audience.
 80042 Applications should not be written to care about this information; they can use the output of `-v`
 80043 to differentiate between various types of commands, but the additional information that may be
 80044 emitted by the more verbose `-V` is not needed and should not be arbitrarily constrained in its
 80045 verbosity or localization for application parsing reasons.

80046 FUTURE DIRECTIONS

80047 None.

80052 CHANGE HISTORY

80053 First released in Issue 4.

80054 Issue 7

80055 The *command* utility is moved from the User Portability Utilities option to the Base. User
 80056 Portability Utilities is now an option for interactive utilities.

80057 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80058 The APPLICATION USAGE and EXAMPLES are revised to replace the non-standard +
 80059 *getconf_CS_PATH* with *getconf PATH*.

80060 **NAME**80061 `compress` — compress data80062 **SYNOPSIS**80063 XSI `compress [-fv] [-b bits] [file...]`80064 `compress [-cfv] [-b bits] [file]`80065 **DESCRIPTION**80066 The *compress* utility shall attempt to reduce the size of the named files by using adaptive Lempel-
80067 Ziv coding algorithm.80068 **Note:** Lempel-Ziv is US Patent 4464650, issued to William Eastman, Abraham Lempel, Jacob Ziv,
80069 Martin Cohn on August 7th, 1984, and assigned to Sperry Corporation.80070 Lempel-Ziv-Welch compression is covered by US Patent 4558302, issued to Terry A. Welch on
80071 December 10th, 1985, and assigned to Sperry Corporation.80072 On systems not supporting adaptive Lempel-Ziv coding algorithm, the input files shall not be
80073 changed and an error value greater than two shall be returned. Except when the output is to the
80074 standard output, each file shall be replaced by one with the extension *.Z*. If the invoking process
80075 has appropriate privileges, the ownership, modes, access time, and modification time of the
80076 original file are preserved. If appending the *.Z* to the filename would make the name exceed
80077 {NAME_MAX} bytes, the command shall fail. If no files are specified, the standard input shall be
80078 compressed to the standard output.80079 **OPTIONS**80080 The *compress* utility shall conform to XBD [Section 12.2](#) (on page 201).

80081 The following options shall be supported:

80082 **-b *bits*** Specify the maximum number of bits to use in a code. For a conforming
80083 application, the *bits* argument shall be:80084 $9 \leq bits \leq 14$ 80085 The implementation may allow *bits* values of greater than 14. The default is 14, 15,
80086 or 16.80087 **-c** Cause *compress* to write to the standard output; the input file is not changed, and
80088 no *.Z* files are created.80089 **-f** Force compression of *file*, even if it does not actually reduce the size of the file, or if
80090 the corresponding *file.Z* file already exists. If the **-f** option is not given, and the
80091 process is not running in the background, the user is prompted as to whether an
80092 existing *file.Z* file should be overwritten.80093 **-v** Write the percentage reduction of each file to standard error.80094 **OPERANDS**

80095 The following operand shall be supported:

80096 *file* A pathname of a file to be compressed.80097 **STDIN**80098 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.

80099 **INPUT FILES**80100 If *file* operands are specified, the input files contain the data to be compressed.80101 **ENVIRONMENT VARIABLES**80102 The following environment variables shall affect the execution of *compress*:80103 *LANG* Provide a default value for the internationalization variables that are unset or null. |
80104 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
80105 variables used to determine the values of locale categories.)80106 *LC_ALL* If set to a non-empty string value, override the values of all the other
80107 internationalization variables.80108 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
80109 characters (for example, single-byte as opposed to multi-byte characters in
80110 arguments).80111 *LC_MESSAGES*80112 Determine the locale that should be used to affect the format and contents of
80113 diagnostic messages written to standard error.80114 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.80115 **ASYNCHRONOUS EVENTS**

80116 Default.

80117 **STDOUT**80118 If no *file* operands are specified, or if a *file* operand is '-', or if the *-c* option is specified, the
80119 standard output contains the compressed output.80120 **STDERR**80121 The standard error shall be used only for diagnostic and prompt messages and the output from
80122 *-v*.80123 **OUTPUT FILES**80124 The output files shall contain the compressed output. The format of compressed files is
80125 unspecified and interchange of such files between implementations (including access via
80126 unspecified file sharing mechanisms) is not required by POSIX.1-200x.80127 **EXTENDED DESCRIPTION**

80128 None.

80129 **EXIT STATUS**

80130 The following exit values shall be returned:

80131 0 Successful completion.

80132 1 An error occurred.

80133 2 One or more files were not compressed because they would have increased in size (and the
80134 *-f* option was not specified).

80135 >2 An error occurred.

80136 **CONSEQUENCES OF ERRORS**

80137 The input file shall remain unmodified.

80138 **APPLICATION USAGE**

80139 The amount of compression obtained depends on the size of the input, the number of *bits* per
 80140 code, and the distribution of common substrings. Typically, text such as source code or English is
 80141 reduced by 50-60%. Compression is generally much better than that achieved by Huffman
 80142 coding or adaptive Huffman coding (*compact*), and takes less time to compute.

80143 Although *compress* strictly follows the default actions upon receipt of a signal or when an error
 80144 occurs, some unexpected results may occur. In some implementations it is likely that a partially
 80145 compressed file is left in place, alongside its uncompressed input file. Since the general
 80146 operation of *compress* is to delete the uncompressed file only after the *.Z* file has been
 80147 successfully filled, an application should always carefully check the exit status of *compress* before
 80148 arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

80149 The limit of 14 on the *bits* option-argument is to achieve portability to all systems (within the
 80150 restrictions imposed by the lack of an explicit published file format). Some implementations
 80151 based on 16-bit architectures cannot support 15 or 16-bit uncompression.

80152 **EXAMPLES**

80153 None.

80154 **RATIONALE**

80155 None.

80156 **FUTURE DIRECTIONS**

80157 None.

80158 **SEE ALSO**

NAME

cp — copy files

SYNOPSIS

```
cp [-Pfp] source_file target_file
cp [-Pfp] source_file... target
cp -R [-H|-L|-P] [-fip] source_file... target
```

DESCRIPTION

The first synopsis form is denoted by two operands, neither of which are existing files of type directory. The *cp* utility shall copy the contents of *source_file* (or, if *source_file* is a file of type symbolic link, the contents of the file referenced by *source_file*) to the destination path named by *target_file*.

The second synopsis form is denoted by two or more operands where the **-R** option is not specified and the first synopsis form is not applicable. It shall be an error if any *source_file* is a file of type directory, if *target* does not exist, or if *target* does not name a directory. The *cp* utility shall copy the contents of each *source_file* (or, if *source_file* is a file of type symbolic link, the contents of the file referenced by *source_file*) to the destination path named by the concatenation of *target*, a slash character, and the last component of *source_file*.

The third and fourth synopsis forms are denoted by two or more operands where the **-R** option is specified. The *cp* utility shall copy each file in the file hierarchy rooted in each *source_file* to a destination path named as follows:

- If *target* exists and names an existing directory, the name of the corresponding destination path for each file in the file hierarchy shall be the concatenation of *target*, a slash character, and the pathname of the file relative to the directory containing *source_file*.
- If *target* does not exist and two operands are specified, the name of the corresponding destination path for *source_file* shall be *target*; the name of the corresponding destination path for all other files in the file hierarchy shall be the concatenation of *target*, a slash character, and the pathname of the file relative to *source_file*.

It shall be an error if *target* does not exist and more than two operands are specified, or if *target* exists and does not name a directory.

In the following description, the term *dest_file* refers to the file named by the destination path. The term *source_file* refers to the file that is being copied, whether specified as an operand or a file in a file hierarchy rooted in a *source_file* operand. If *source_file* is a file of type symbolic link:

- If the **-R** option was not specified, *cp* shall take actions based on the type and contents of the file referenced by the symbolic link, and not by the symbolic link itself, unless the **-P** option was specified.
- If the **-R** option was specified:
 - If none of the options **-H**, **-L**, nor **-P** were specified, it is unspecified which of **-H**, **-L**, or **-P** will be used as a default.
 - If the **-H** option was specified, *cp* shall take actions based on the type and contents of the file referenced by any symbolic link specified as a *source_file* operand.
 - If the **-L** option was specified, *cp* shall take actions based on the type and contents of the file referenced by any symbolic link specified as a *source_file* operand or any symbolic links encountered during traversal of a file hierarchy.

80211 — If the `-P` option was specified, *cp* shall copy any symbolic link specified as a
 80212 *source_file* operand and any symbolic links encountered during traversal of a file
 80213 hierarchy, and shall not follow any symbolic links.

80214 For each *source_file*, the following steps shall be taken:

- 80215 1. If *source_file* references the same file as *dest_file*, *cp* may write a diagnostic message to
 80216 standard error; it shall do nothing more with *source_file* and shall go on to any remaining
 80217 files.
- 80218 2. If *source_file* is of type directory, the following steps shall be taken:
 - 80219 a. If the `-R` option was not specified, *cp* shall write a diagnostic message to standard
 80220 error, do nothing more with *source_file*, and go on to any remaining files.
 - 80221 b. If *source_file* was not specified as an operand and *source_file* is dot or dot-dot, *cp*
 80222 shall do nothing more with *source_file* and go on to any remaining files.
 - 80223 c. If *dest_file* exists and it is a file type not specified by the System Interfaces volume
 80224 of POSIX.1-200x, the behavior is implementation-defined.
 - 80225 d. If *dest_file* exists and it is not of type directory, *cp* shall write a diagnostic message
 80226 to standard error, do nothing more with *source_file* or any files below *source_file* in
 80227 the file hierarchy, and go on to any remaining files.
 - 80228 e. If the directory *dest_file* does not exist, it shall be created with file permission bits
 80229 set to the same value as those of *source_file*, modified by the file creation mask of
 80230 the user if the `-p` option was not specified, and then bitwise-inclusively OR'ed
 80231 with `S_IRWXU`. If *dest_file* cannot be created, *cp* shall write a diagnostic message to
 80232 standard error, do nothing more with *source_file*, and go on to any remaining files.
 80233 It is unspecified if *cp* attempts to copy files in the file hierarchy rooted in *source_file*.
 - 80234 f. The files in the directory *source_file* shall be copied to the directory *dest_file*, taking
 80235 the four steps (1 to 4) listed here with the files as *source_files*.
 - 80236 g. If *dest_file* was created, its file permission bits shall be changed (if necessary) to be
 80237 the same as those of *source_file*, modified by the file creation mask of the user if the
 80238 `-p` option was not specified.
 - 80239 h. The *cp* utility shall do nothing more with *source_file* and go on to any remaining
 80240 files.
- 80241 3. If *source_file* is of type regular file, the following steps shall be taken:
 - 80242 a. If *dest_file* exists, the following steps shall be taken:
 - 80243 i. If the `-i` option is in effect, the *cp* utility shall write a prompt to the standard
 80244 error and read a line from the standard input. If the response is not
 80245 affirmative, *cp* shall do nothing more with *source_file* and go on to any
 80246 remaining files.
 - 80247 ii. A file descriptor for *dest_file* shall be obtained by performing actions
 80248 equivalent to the `open()` function defined in the System Interfaces volume of
 80249 POSIX.1-200x called using *dest_file* as the *path* argument, and the bitwise-
 80250 inclusive OR of `O_WRONLY` and `O_TRUNC` as the *oflag* argument.
 - 80251 iii. If the attempt to obtain a file descriptor fails and the `-f` option is in effect, *cp*
 80252 shall attempt to remove the file by performing actions equivalent to the
 80253 `unlink()` function defined in the System Interfaces volume of POSIX.1-200x
 80254 called using *dest_file* as the *path* argument. If this attempt succeeds, *cp* shall
 80255 continue with step 3b.

- 80256 b. If *dest_file* does not exist, a file descriptor shall be obtained by performing actions
 80257 equivalent to the *open()* function defined in the System Interfaces volume of
 80258 POSIX.1-200x called using *dest_file* as the *path* argument, and the bitwise-inclusive
 80259 OR of *O_WRONLY* and *O_CREAT* as the *oflag* argument. The file permission bits
 80260 of *source_file* shall be the *mode* argument.
- 80261 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to
 80262 standard error, do nothing more with *source_file*, and go on to any remaining files.
- 80263 d. The contents of *source_file* shall be written to the file descriptor. Any write errors
 80264 shall cause *cp* to write a diagnostic message to standard error and continue to step
 80265 3e.
- 80266 e. The file descriptor shall be closed.
- 80267 f. The *cp* utility shall do nothing more with *source_file*. If a write error occurred in
 80268 step 3d, it is unspecified if *cp* continues with any remaining files. If no write error
 80269 occurred in step 3d, *cp* shall go on to any remaining files.
- 80270 4. Otherwise, the following steps shall be taken:
- 80271 a. If the **-R** option was specified, the following steps shall be taken:
- 80272 i. The *dest_file* shall be created with the same file type as *source_file*.
- 80273 ii. If *source_file* is a file of type FIFO, the file permission bits shall be the same
 80274 as those of *source_file*, modified by the file creation mask of the user if the **-p**
 80275 option was not specified. Otherwise, the permissions, owner ID, and group
 80276 ID of *dest_file* are implementation-defined.
- 80277 If this creation fails for any reason, *cp* shall write a diagnostic message to
 80278 standard error, do nothing more with *source_file*, and go on to any
 80279 remaining files.
- 80280 iii. If *source_file* is a file of type symbolic link, and the options require the
 80281 symbolic link itself to be acted upon, the pathname contained in *dest_file*
 80282 shall be the same as the pathname contained in *source_file*.
- 80283 If this fails for any reason, *cp* shall write a diagnostic message to standard
 80284 error, do nothing more with *source_file*, and go on to any remaining files.

80285 If the implementation provides additional or alternate access control mechanisms (see XBD
 80286 Section 4.4, on page 96), their effect on copies of files is implementation-defined.

80287 OPTIONS

80288 The *cp* utility shall conform to XBD Section 12.2 (on page 201).

80289 The following options shall be supported:

- 80290 **-f** If a file descriptor for a destination file cannot be obtained, as described in step
 80291 3.a.ii., attempt to unlink the destination file and proceed.
- 80292 **-H** Take actions based on the type and contents of the file referenced by any symbolic
 80293 link specified as a *source_file* operand.
- 80294 **-i** Write a prompt to standard error before copying to any existing non-directory
 80295 destination file. If the response from the standard input is affirmative, the copy
 80296 shall be attempted; otherwise, it shall not.
- 80297 **-L** Take actions based on the type and contents of the file referenced by any symbolic
 80298 link specified as a *source_file* operand or any symbolic links encountered during
 80299 traversal of a file hierarchy.

- 80300 **-P** Take actions on any symbolic link specified as a *source_file* operand or any
80301 symbolic link encountered during traversal of a file hierarchy.
- 80302 **-p** Duplicate the following characteristics of each source file in the corresponding
80303 destination file:
- 80304 1. The time of last data modification and time of last access. If this duplication
80305 fails for any reason, *cp* shall write a diagnostic message to standard error.
 - 80306 2. The user ID and group ID. If this duplication fails for any reason, it is
80307 unspecified whether *cp* writes a diagnostic message to standard error.
 - 80308 3. The file permission bits and the S_ISUID and S_ISGID bits. Other,
80309 implementation-defined, bits may be duplicated as well. If this duplication
80310 fails for any reason, *cp* shall write a diagnostic message to standard error.
- 80311 If the user ID or the group ID cannot be duplicated, the file permission bits
80312 S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but
80313 are not duplicated in the destination file, it is unspecified whether *cp* writes a
80314 diagnostic message to standard error.
- 80315 The order in which the preceding characteristics are duplicated is unspecified. The
80316 *dest_file* shall not be deleted if these characteristics cannot be preserved.
- 80317 **-R** Copy file hierarchies.
- 80318 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be
80319 considered an error. The last option specified shall determine the behavior of the utility.

OPERANDS

80320 The following operands shall be supported:

- 80321 *source_file* A pathname of a file to be copied.
- 80322 *target_file* A pathname of an existing or nonexistent file, used for the output when a single
80323 file is copied.
- 80324 *target* A pathname of a directory to contain the copied files.

STDIN

80325 The standard input shall be used to read an input line in response to each prompt specified in
80326 the STDERR section. Otherwise, the standard input shall not be used.

INPUT FILES

80327 The input files specified as operands may be of any file type.

ENVIRONMENT VARIABLES

80328 The following environment variables shall affect the execution of *cp*:

- 80329 **LANG** Provide a default value for the internationalization variables that are unset or null. |
80330 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
80331 variables used to determine the values of locale categories.)
- 80332 **LC_ALL** If set to a non-empty string value, override the values of all the other
80333 internationalization variables.
- 80334 **LC_COLLATE** Determine the locale for the behavior of ranges, equivalence classes, and multi-
80335 character collating elements used in the extended regular expression defined for
80336 the **yesexpr** locale keyword in the **LC_MESSAGES** category.
- 80337 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
80338 characters (for example, single-byte as opposed to multi-byte characters in
80339 arguments and input files) and the behavior of character classes used in the
80340 |
80341 |
80342 |
80343 |
80344 |

- 80345 extended regular expression defined for the **yesexpr** locale keyword in the
80346 *LC_MESSAGES* category.
- 80347 *LC_MESSAGES*
80348 Determine the locale for the processing of affirmative responses that should be
80349 used to affect the format and contents of diagnostic messages written to standard
80350 error.
- 80351 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 80352 **ASYNCHRONOUS EVENTS**
80353 Default.
- 80354 **STDOUT**
80355 Not used.
- 80356 **STDERR**
80357 A prompt shall be written to standard error under the conditions specified in the *DESCRIPTION*
80358 section. The prompt shall contain the destination pathname, but its format is otherwise
80359 unspecified. Otherwise, the standard error shall be used only for diagnostic messages.
- 80360 **OUTPUT FILES**
80361 The output files may be of any type.
- 80362 **EXTENDED DESCRIPTION**
80363 None.
- 80364 **EXIT STATUS**
80365 The following exit values shall be returned:
80366 0 All files were copied successfully.
80367 >0 An error occurred.
- 80368 **CONSEQUENCES OF ERRORS**
80369 If *cp* is prematurely terminated by a signal or error, files or file hierarchies may be only partially
80370 copied and files and directories may have incorrect permissions or access and modification
80371 times.
- 80372 **APPLICATION USAGE**
80373 The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to
80374 prevent users from creating programs that are set-user-ID or set-group-ID to them when copying
80375 files or to make set-user-ID or set-group-ID files accessible to new groups of users. For example,
80376 if a file is set-user-ID and the copy has a different group ID than the source, a new group of users
80377 has execute permission to a set-user-ID program than did previously. In particular, this is a
80378 problem for superusers copying users' trees.
- 80379 **EXAMPLES**
80380 None.
- 80381 **RATIONALE**
80382 The **-i** option exists on BSD systems, giving applications and users a way to avoid accidentally
80383 removing files when copying. Although the 4.3 BSD version does not prompt if the standard
80384 input is not a terminal, the standard developers decided that use of **-i** is a request for
80385 interaction, so when the destination path exists, the utility takes instructions from whatever
80386 responds on standard input.

80387 The exact format of the interactive prompts is unspecified. Only the general nature of the
80388 contents of prompts are specified because implementations may desire more descriptive
80389 prompts than those used on historical implementations. Therefore, an application using the **-i**
80390 option relies on the system to provide the most suitable dialog directly with the user, based on
80391 the behavior specified.

80392 The `-p` option is historical practice on BSD systems, duplicating the time of last data
 80393 modification and time of last access. This volume of POSIX.1-200x extends it to preserve the user
 80394 and group IDs, as well as the file permissions. This requirement has obvious problems in that
 80395 the directories are almost certainly modified after being copied. This volume of POSIX.1-200x
 80396 requires that the modification times be preserved. The statement that the order in which the
 80397 characteristics are duplicated is unspecified is to permit implementations to provide the
 80398 maximum amount of security for the user. Implementations should take into account the
 80399 obvious security issues involved in setting the owner, group, and mode in the wrong order or
 80400 creating files with an owner, group, or mode different from the final value.

80401 It is unspecified whether `cp` writes diagnostic messages when the user and group IDs cannot be
 80402 set due to the widespread practice of users using `-p` to duplicate some portion of the file
 80403 characteristics, indifferent to the duplication of others. Historic implementations only write
 80404 diagnostic messages on errors other than [E`PERM`].

80405 Earlier versions of this standard included support for the `-r` option to copy file hierarchies. The
 80406 `-r` option is historical practice on BSD and BSD-derived systems. This option is no longer
 80407 specified by POSIX.1-200x but may be present in some implementations. The `-R` option was
 80408 added as a close synonym to the `-r` option, selected for consistency with all other options in this
 80409 volume of POSIX.1-200x that do recursive directory descent.

80410 The difference between `-R` and the removed `-r` option is in the treatment by `cp` of file types other
 80411 than regular and directory. It was implementation-defined how the `-` option treated special files
 80412 to allow both historical implementations and those that chose to support `-r` with the same
 80413 abilities as `-R` defined by this volume of POSIX.1-200x. The original `-r` flag, for historic reasons,
 80414 did not handle special files any differently from regular files, but always read the file and copied
 80415 its contents. This had obvious problems in the presence of special file types; for example,
 80416 character devices, FIFOs, and sockets.

80417 When a failure occurs during the copying of a file hierarchy, `cp` is required to attempt to copy
 80418 files that are on the same level in the hierarchy or above the file where the failure occurred. It is
 80419 unspecified if `cp` shall attempt to copy files below the file where the failure occurred (which
 80420 cannot succeed in any case).

80421 Permissions, owners, and groups of created special file types have been deliberately left as
 80422 implementation-defined. This is to allow systems to satisfy special requirements (for example,
 80423 allowing users to create character special devices, but requiring them to be owned by a certain
 80424 group). In general, it is strongly suggested that the permissions, owner, and group be the same
 80425 as if the user had run the historical `mknod`, `ln`, or other utility to create the file. It is also probable
 80426 that additional privileges are required to create block, character, or other implementation-
 80427 defined special file types.

80428 Additionally, the `-p` option explicitly requires that all set-user-ID and set-group-ID permissions
 80429 be discarded if any of the owner or group IDs cannot be set. This is to keep users from
 80430 unintentionally giving away special privilege when copying programs.

80431 When creating regular files, historical versions of `cp` use the mode of the source file as modified
 80432 by the file mode creation mask. Other choices would have been to use the mode of the source file
 80433 unmodified by the creation mask or to use the same mode as would be given to a new file
 80434 created by the user (plus the execution bits of the source file) and then modify it by the file mode
 80435 creation mask. In the absence of any strong reason to change historic practice, it was in large part
 80436 retained.

80437 When creating directories, historical versions of `cp` use the mode of the source directory, plus
 80438 read, write, and search bits for the owner, as modified by the file mode creation mask. This is
 80439 done so that `cp` can copy trees where the user has read permission, but the owner does not. A
 80440 side effect is that if the file creation mask denies the owner permissions, `cp` fails. Also, once the
 80441 copy is done, historical versions of `cp` set the permissions on the created directory to be the same

80442 as the source directory, unmodified by the file creation mask.

80443 This behavior has been modified so that *cp* is always able to create the contents of the directory,
80444 regardless of the file creation mask. After the copy is done, the permissions are set to be the same
80445 as the source directory, as modified by the file creation mask. This latter change from historical
80446 behavior is to prevent users from accidentally creating directories with permissions beyond
80447 those they would normally set and for consistency with the behavior of *cp* in creating files.

80448 It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations
80449 are strongly encouraged to do so. Historical implementations have detected the attempt in most
80450 cases.

80451 There are two methods of copying subtrees in this volume of POSIX.1-200x. The other method is
80452 described as part of the *pax* utility (see *pax*). Both methods are historical practice. The *cp* utility
80453 provides a simpler, more intuitive interface, while *pax* offers a finer granularity of control. Each
80454 provides additional functionality to the other; in particular, *pax* maintains the hard-link structure
80455 of the hierarchy, while *cp* does not. It is the intention of the standard developers that the results
80456 be similar (using appropriate option combinations in both utilities). The results are not required
80457 to be identical; there seemed insufficient gain to applications to balance the difficulty of
80458 implementations having to guarantee that the results would be exactly identical.

80459 The wording allowing *cp* to copy a directory to implementation-defined file types not specified
80460 by the System Interfaces volume of POSIX.1-200x is provided so that implementations
80461 supporting symbolic links are not required to prohibit copying directories to symbolic links.
80462 Other extensions to the System Interfaces volume of POSIX.1-200x file types may need to use
80463 this loophole as well.

80464 FUTURE DIRECTIONS

80465 None.

80470 CHANGE HISTORY

80471 First released in Issue 2.

80472 Issue 6

80473 The **-r** option is marked obsolescent.

80474 The new options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These
80475 options affect the processing of symbolic links.

80476 IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the **-P** option.

80477 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the
80478 SEE ALSO section.

80479 Issue 7

80480 SD5-XCU-ERN-31 and SD5-XCU-ERN-42 are applied, updating the DESCRIPTION.

80481 The obsolescent **-r** option is removed.

80482 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80483 SD5-XCU-ERN-102 is applied, clarifying the **-i** option within the OPTIONS section.

80484 The **-P** option is added to the SYNOPSIS and to the DESCRIPTION with respect to the **-R** +
80485 option.

80486 **NAME**
 80487 `crontab` — schedule periodic background work

80488 **SYNOPSIS**
 80489 `crontab` [*file*]

80490 UP `crontab` [**-e** | **-l** | **-r**]

80491 DESCRIPTION

80492 UP The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of
 80493 commands and the times at which they shall be executed. The new crontab entry can be input by
 80494 specifying *file* or input from standard input if no *file* operand is specified, or by using an editor,
 80495 if **-e** is specified.

80496 Upon execution of a command from a crontab entry, the implementation shall supply a default
 80497 environment, defining at least the following environment variables:

80498 *HOME* A pathname of the user's home directory.

80499 *LOGNAME* The user's login name.

80500 *PATH* A string representing a search path guaranteed to find all of the standard utilities.

80501 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by
 80502 this volume of POSIX.1-200x, the value shall be a pathname for *sh*.

80503 The values of these variables when *crontab* is invoked as specified by this volume of
 80504 POSIX.1-200x shall not affect the default values provided when the scheduled command is run.

80505 If standard output and standard error are not redirected by commands executed from the
 80506 crontab entry, any generated output or errors shall be mailed, via an implementation-defined
 80507 method, to the user.

80508 XSI Users shall be permitted to use *crontab* if their names appear in the file **cron.allow** which is
 80509 located in an implementation-defined directory. If that file does not exist, the file **cron.deny**,
 80510 which is located in an implementation-defined directory, shall be checked to determine whether
 80511 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate
 80512 privileges shall be allowed to submit a job. If only **cron.deny** exists and is empty, global usage
 80513 shall be permitted. The **cron.allow** and **cron.deny** files shall consist of one user name per line.

80514 OPTIONS

80515 The *crontab* utility shall conform to XBD [Section 12.2](#) (on page 201).

80516 The following options shall be supported:

80517 UP **-e** Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if
 80518 the crontab entry does not exist. When editing is complete, the entry shall be
 80519 installed as the user's crontab entry.

80520 **-l** (The letter ell.) List the invoking user's crontab entry.

80521 **-r** Remove the invoking user's crontab entry.

80522 OPERANDS

80523 The following operand shall be supported:

80524 *file* The pathname of a file that contains specifications, in the format defined in the
 80525 INPUT FILES section, for crontab entries.

80526 **STDIN**

80527 See the INPUT FILES section.

80528 **INPUT FILES**80529 In the POSIX locale, the user or application shall ensure that a crontab entry is a text file
80530 consisting of lines of six fields each. The fields shall be separated by <blank>s. The first five
80531 fields shall be integer patterns that specify the following:

- 80532 1. Minute [0,59]
- 80533 2. Hour [0,23]
- 80534 3. Day of the month [1,31]
- 80535 4. Month of the year [1,12]
- 80536 5. Day of the week ([0,6] with 0=Sunday)

80537 Each of these patterns can be either an asterisk (meaning all valid values), an element, or a list of
80538 elements separated by commas. An element shall be either a number or two numbers separated
80539 by a hyphen (meaning an inclusive range). The specification of days can be made by two fields
80540 (day of the month and day of the week). If month, day of month, and day of week are all
80541 asterisks, every day shall be matched. If either the month or day of month is specified as an
80542 element or list, but the day of week is an asterisk, the month and day of month fields shall
80543 specify the days that match. If both month and day of month are specified as an asterisk, but day
80544 of week is an element or list, then only the specified days of the week match. Finally, if either the
80545 month or day of month is specified as an element or list, and the day of week is also specified as
80546 an element or list, then any day matching either the month and day of month, or the day of
80547 week, shall be matched.

80548 The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified
80549 times. A percent sign character in this field shall be translated to a <newline>. Any character
80550 preceded by a backslash (including the '%') shall cause that character to be treated literally.
80551 Only the first line (up to a '%' or end-of-line) of the command field shall be executed by the
80552 command interpreter. The other lines shall be made available to the command as standard input.

80553 Blank lines and those whose first non-<blank> is '#' shall be ignored.

80554 XSI The text files **cron.allow** and **cron.deny**, which are located in an implementation-defined
80555 directory, shall contain zero or more user names, one per line, of users who are, respectively,
80556 authorized or denied access to the service underlying the *crontab* utility.

80557 **ENVIRONMENT VARIABLES**80558 The following environment variables shall affect the execution of *crontab*:

80559 **EDITOR** Determine the editor to be invoked when the **-e** option is specified. The default
80560 editor shall be *vi*.

80561 **LANG** Provide a default value for the internationalization variables that are unset or null. |
80562 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
80563 variables used to determine the values of locale categories.)

80564 **LC_ALL** If set to a non-empty string value, override the values of all the other
80565 internationalization variables.

80566 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
80567 characters (for example, single-byte as opposed to multi-byte characters in
80568 arguments and input files).

80569 **LC_MESSAGES**

80570 Determine the locale that should be used to affect the format and contents of
80571 diagnostic messages written to standard error.

80572 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

80573 **ASYNCHRONOUS EVENTS**

80574 Default.

80575 **STDOUT**

80576 If the `-l` option is specified, the crontab entry shall be written to the standard output.

80577 **STDERR**

80578 The standard error shall be used only for diagnostic messages.

80579 **OUTPUT FILES**

80580 None.

80581 **EXTENDED DESCRIPTION**

80582 None.

80583 **EXIT STATUS**

80584 The following exit values shall be returned:

80585 0 Successful completion.

80586 >0 An error occurred.

80587 **CONSEQUENCES OF ERRORS**

80588 UP The user's crontab entry is not submitted, removed, **edited**, or listed.

80589 **APPLICATION USAGE**

80590 The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other
80591 cultures may be supported with substantially different interfaces, although implementations are
80592 encouraged to provide comparable levels of functionality.

80593 The default settings of the *HOME*, *LOGNAME*, *PATH*, and *SHELL* variables that are given to the
80594 scheduled job are not affected by the settings of those variables when *crontab* is run; as stated,
80595 they are defaults. The text about "invoked as specified by this volume of POSIX.1-200x" means
80596 that the implementation may provide extensions that allow these variables to be affected at
80597 runtime, but that the user has to take explicit action in order to access the extension, such as give
80598 a new option flag or modify the format of the crontab entry.

80599 A typical user error is to type only *crontab*; this causes the system to wait for the new crontab
80600 entry on standard input. If end-of-file is typed (generally <control>-D), the crontab entry is
80601 replaced by an empty file. In this case, the user should type the interrupt character, which
80602 prevents the crontab entry from being replaced.

80603 **EXAMPLES**

80604 1. Clean up **core** files every weekday morning at 3:15 am:

80605 `15 3 * * 1-5 find "$HOME" -name core -exec rm -f {} + 2>/dev/null` |

80606 2. Mail a birthday greeting:

80607 `0 12 14 2 * mailx john%Happy Birthday!%Time for lunch.`

80608 3. As an example of specifying the two types of days:

80609 `0 0 1,15 * 1`

80610 would run a command on the first and fifteenth of each month, as well as on every
80611 Monday. To specify days by only one field, the other field should be set to `'*'`; for
80612 example:

80613 `0 0 * * 1`

80614 would run a command only on Mondays.

80615 **RATIONALE**

80616 All references to a *cron* daemon and to *cron files* have been omitted. Although historical
80617 implementations have used this arrangement, there is no reason to limit future implementations.

80618 This description of *crontab* is designed to support only users with normal privileges. The format
80619 of the input is based on the System V *crontab*; however, there is no requirement here that the
80620 actual system database used by the *cron* daemon (or a similar mechanism) use this format
80621 internally. For example, systems derived from BSD are likely to have an additional field
80622 appended that indicates the user identity to be used when the job is submitted.

80623 The `-e` option was adopted from the SVID as a user convenience, although it does not exist in all
80624 historical implementations.

80625 **FUTURE DIRECTIONS**

80626 None.

80627 **SEE ALSO**

80628 *at*

80629 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +

80630 **CHANGE HISTORY**

80631 First released in Issue 2.

80632 **Issue 6**

80633 This utility is marked as part of the User Portability Utilities option.

80634 The normative text is reworded to avoid use of the term “must” for application requirements.

80635 **Issue 7**

80636 The *crontab* utility (except for the `-e` option) is moved from the User Portability Utilities option
80637 to the Base. User Portability Utilities is now an option for interactive utilities.

80638 SD5-XCU-ERN-95 is applied, removing the references to fixed locations for the files referenced
80639 by the *crontab* utility.

80640 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80641 The first example is changed to remove the unreliable use of `find | xargs`. +

80642 **NAME**

80643 csplit — split files based on context

80644 **SYNOPSIS**80645 csplit [-ks] [-f *prefix*] [-n *number*] *file arg...*80646 **DESCRIPTION**80647 The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into
80648 other files as directed by the *arg* operands, and write the sizes of the files.80649 **OPTIONS**80650 The *csplit* utility shall conform to XBD Section 12.2 (on page 201).

80651 The following options shall be supported:

80652 **-f *prefix*** Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is *xx00* ... *xxn*. If
80653 the *prefix* argument would create a filename exceeding {NAME_MAX} bytes, an
80654 error shall result, *csplit* shall exit with a diagnostic message, and no files shall be
80655 created.80656 **-k** Leave previously created files intact. By default, *csplit* shall remove created files if
80657 an error occurs.80658 **-n *number*** Use *number* decimal digits to form filenames for the file pieces. The default shall be
80659 2.80660 **-s** Suppress the output of file size messages.80661 **OPERANDS**

80662 The following operands shall be supported:

80663 ***file*** The pathname of a text file to be split. If *file* is '-', the standard input shall be
80664 used.80665 Each *arg* operand can be one of the following:80666 ***/rexp/[offset]***
80667 A file shall be created using the content of the lines from the current line up to, but
80668 not including, the line that results from the evaluation of the regular expression
80669 with *offset*, if any, applied. The regular expression *rexp* shall follow the rules for
80670 basic regular expressions described in XBD Section 9.3 (on page 169). The
80671 application shall use the sequence "\/" to specify a slash character within the *rexp*.
80672 The optional offset shall be a positive or negative integer value representing a
80673 number of lines. A positive integer value can be preceded by '+'. If the selection
80674 of lines from an *offset* expression of this type would create a file with zero lines, or
80675 one with greater than the number of lines left in the input file, the results are
80676 unspecified. After the section is created, the current line shall be set to the line that
80677 results from the evaluation of the regular expression with any offset applied. If the
80678 current line is the first line in the file and a regular expression operation has not yet
80679 been performed, the pattern match of *rexp* shall be applied from the current line to
80680 the end of the file. Otherwise, the pattern match of *rexp* shall be applied from the
80681 line following the current line to the end of the file.80682 ***%rexp%[offset]***80683 Equivalent to */rexp/[offset]*, except that no file shall be created for the selected
80684 section of the input file. The application shall use the sequence "%%" to specify a
80685 percent-sign character within the *rexp*.

80686 *line_no* Create a file from the current line up to (but not including) the line number *line_no*.
 80687 Lines in the file shall be numbered starting at one. The current line becomes
 80688 *line_no*.

80689 {*num*} Repeat operand. This operand can follow any of the operands described
 80690 previously. If it follows a *rexp* type operand, that operand shall be applied *num*
 80691 more times. If it follows a *line_no* operand, the file shall be split every *line_no* lines,
 80692 *num* times, from that point.

80693 An error shall be reported if an operand does not reference a line between the current position
 80694 and the end of the file.

STDIN

80695 See the INPUT FILES section.

INPUT FILES

80697 The input file shall be a text file.

ENVIRONMENT VARIABLES

80700 The following environment variables shall affect the execution of *csplit*:

80701 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 80702 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 80703 variables used to determine the values of locale categories.)

80704 *LC_ALL* If set to a non-empty string value, override the values of all the other
 80705 internationalization variables.

80706 *LC_COLLATE*

80707 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 80708 character collating elements within regular expressions.

80709 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 80710 characters (for example, single-byte as opposed to multi-byte characters in
 80711 arguments and input files) and the behavior of character classes within regular
 80712 expressions.

80713 *LC_MESSAGES*

80714 Determine the locale that should be used to affect the format and contents of
 80715 diagnostic messages written to standard error.

80716 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

80717 If the *-k* option is specified, created files shall be retained. Otherwise, the default action occurs.

STDOUT

80720 Unless the *-s* option is used, the standard output shall consist of one line per file created, with a
 80721 format as follows:

80722 "%d\n", <file size in bytes>

STDERR

80724 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

80726 The output files shall contain portions of the original input file; otherwise, unchanged.

EXTENDED DESCRIPTION

80728 None.

80729 **EXIT STATUS**

80730 The following exit values shall be returned:

80731 0 Successful completion.

80732 >0 An error occurred.

80733 **CONSEQUENCES OF ERRORS**80734 By default, created files shall be removed if an error occurs. When the `-k` option is specified,
80735 created files shall not be removed if an error occurs.80736 **APPLICATION USAGE**

80737 None.

80738 **EXAMPLES**80739 1. This example creates four files, **cobol00** ... **cobol03**:80740 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

80741 After editing the split files, they can be recombined as follows:

80742 `cat cobol0[0-3] > file`

80743 Note that this example overwrites the original file.

80744 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up
80745 to 9999 lines; this is because lines in the file are numbered from 1 rather than zero, for
80746 historical reasons:80747 `csplit -k file 100 {99}`80748 3. Assuming that **prog.c** follows the C-language coding convention of ending routines with
80749 a `'}'` at the beginning of the line, this example creates a file containing each separate C
80750 routine (up to 21) in **prog.c**:80751 `csplit -k prog.c '%main(%' '/^}'+1' {20}`80752 **RATIONALE**80753 The `-n` option was added to extend the range of filenames that could be handled.80754 Consideration was given to adding a `-a` flag to use the alphabetic filename generation used by
80755 the historical *split* utility, but the functionality added by the `-n` option was deemed to make
80756 alphabetic naming unnecessary.80757 **FUTURE DIRECTIONS**

80758 None.

80759 **SEE ALSO**80760 *sed*, *split*80761 XBD [Chapter 8](#) (on page 159), [Section 9.3](#) (on page 169), [Section 12.2](#) (on page 201) +80762 **CHANGE HISTORY**

80763 First released in Issue 2.

80764 **Issue 5**

80765 The FUTURE DIRECTIONS section is added.

80766 **Issue 6**

80767 This utility is marked as part of the User Portability Utilities option.

80768 The APPLICATION USAGE section is added.

80769 The description of regular expression operands is changed to align with the IEEE P1003.2b draft
80770 standard.

80771 The normative text is reworded to avoid use of the term “must” for application requirements.

80772 **Issue 7**

80773 The *csplit* utility is moved from the User Portability Utilities option to the Base. User Portability
80774 Utilities is now an option for interactive utilities.

80775 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80776 The SYNOPSIS and OPERANDS sections are revised to use a single *arg* to split a file into two +
80777 pieces.

80778 **NAME**
 80779 ctags — create a tags file (**DEVELOPMENT, FORTRAN**)

80780 **SYNOPSIS**
 80781 SD ctags [-a] [-f *tagsfile*] *pathname...*
 80782 ctags -x *pathname...*

80783 **DESCRIPTION**
 80784 The *ctags* utility shall be provided on systems that support the the Software Development
 80785 Utilities option, and either or both of the C-Language Development Utilities option and
 80786 FORTRAN Development Utilities option. On other systems, it is optional.

80787 The *ctags* utility shall write a *tagsfile* or an index of objects from C-language or FORTRAN source
 80788 files specified by the *pathname* operands. The *tagsfile* shall list the locators of language-specific
 80789 objects within the source files. A locator consists of a name, pathname, and either a search
 80790 pattern or a line number that can be used in searching for the object definition. The objects that
 80791 shall be recognized are specified in the EXTENDED DESCRIPTION section.

80792 **OPTIONS**
 80793 The *ctags* utility shall conform to XBD [Section 12.2](#) (on page 201).

80794 The following options shall be supported:

80795 **-a** Append to *tagsfile*.
 80796 **-f *tagsfile*** Write the object locator lists into *tagsfile* instead of the default file named **tags** in the
 80797 current directory.
 80798 **-x** Produce a list of object names, the line number, and filename in which each is
 80799 defined, as well as the text of that line, and write this to the standard output. A
 80800 *tagsfile* shall not be created when **-x** is specified.

80801 **OPERANDS**
 80802 The following *pathname* operands are supported:

80803 ***file.c*** Files with basenames ending with the **.c** suffix shall be treated as C-language
 80804 source code. Such files that are not valid input to *c99* produce unspecified results.
 80805 ***file.h*** Files with basenames ending with the **.h** suffix shall be treated as C-language
 80806 source code. Such files that are not valid input to *c99* produce unspecified results.
 80807 ***file.f*** Files with basenames ending with the **.f** suffix shall be treated as FORTRAN-
 80808 language source code. Such files that are not valid input to *fort77* produce
 80809 unspecified results.

80810 The handling of other files is implementation-defined.

80811 **STDIN**
 80812 See the INPUT FILES section.

80813 **INPUT FILES**
 80814 The input files shall be text files containing source code in the language indicated by the
 80815 operand filename suffixes.

80816 **ENVIRONMENT VARIABLES**80817 The following environment variables shall affect the execution of *ctags*:80818 *LANG* Provide a default value for the internationalization variables that are unset or null. |
80819 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
80820 variables used to determine the values of locale categories.)80821 *LC_ALL* If set to a non-empty string value, override the values of all the other
80822 internationalization variables.80823 *LC_COLLATE*
80824 Determine the order in which output is sorted for the *-x* option. The POSIX locale
80825 determines the order in which the *tagsfile* is written.80826 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
80827 characters (for example, single-byte as opposed to multi-byte characters in
80828 arguments and input files). When processing C-language source code, if the locale
80829 is not compatible with the C locale described by the ISO C standard, the results are
80830 unspecified.80831 *LC_MESSAGES*
80832 Determine the locale that should be used to affect the format and contents of
80833 diagnostic messages written to standard error.80834 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.80835 **ASYNCHRONOUS EVENTS**

80836 Default.

80837 **STDOUT**80838 The list of object name information produced by the *-x* option shall be written to standard
80839 output in the following format:80840 "%s %d %s %s", *<object-name>*, *<line-number>*, *<filename>*, *<text>*80841 where *<text>* is the text of line *<line-number>* of file *<filename>*.80842 **STDERR**

80843 The standard error shall be used only for diagnostic messages.

80844 **OUTPUT FILES**80845 When the *-x* option is not specified, the format of the output file shall be:80846 "%s\t%s\t/%s\n", *<identifier>*, *<filename>*, *<pattern>*80847 where *<pattern>* is a search pattern that could be used by an editor to find the defining instance
80848 of *<identifier>* in *<filename>* (where *defining instance* is indicated by the declarations listed in the
80849 EXTENDED DESCRIPTION).80850 An optional circumflex (*'^'*) can be added as a prefix to *<pattern>*, and an optional dollar sign
80851 can be appended to *<pattern>* to indicate that the pattern is anchored to the beginning (end) of a
80852 line of text. Any slash or backslash characters in *<pattern>* shall be preceded by a backslash
80853 character. The anchoring circumflex, dollar sign, and escaping backslash characters shall not be
80854 considered part of the search pattern. All other characters in the search pattern shall be
80855 considered literal characters.

80856 An alternative format is:

80857 "%s\t%s\t?%s?\n", *<identifier>*, *<filename>*, *<pattern>*80858 which is identical to the first format except that slashes in *<pattern>* shall not be preceded by
80859 escaping backslash characters, and question mark characters in *<pattern>* shall be preceded by
80860 backslash characters.

80861 A second alternative format is:
 80862 "%s\t%s\t%d\n", <identifier>, <filename>, <lineno>

80863 where <lineno> is a decimal line number that could be used by an editor to find <identifier> in
 80864 <filename>.

80865 Neither alternative format shall be produced by *ctags* when it is used as described by
 80866 POSIX.1-200x, but the standard utilities that process tags files shall be able to process those
 80867 formats as well as the first format.

80868 In any of these formats, the file shall be sorted by identifier, based on the collation sequence in
 80869 the POSIX locale.

80870 EXTENDED DESCRIPTION

80871 If the operand identifies C-language source, the *ctags* utility shall attempt to produce an output
 80872 line for each of the following objects:

- 80873 • Function definitions
- 80874 • Type definitions
- 80875 • Macros with arguments

80876 It may also produce output for any of the following objects:

- 80877 • Function prototypes
- 80878 • Structures
- 80879 • Unions
- 80880 • Global variable definitions
- 80881 • Enumeration types
- 80882 • Macros without arguments
- 80883 • **#define** statements
- 80884 • **#line** statements

80885 Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C
 80886 programs. The tag formed shall be created by prefixing **M** to the name of the file, with the
 80887 trailing **.c**, and leading pathname components (if any) removed.

80888 On systems that do not support the C-Language Development Utilities option, *ctags* produces
 80889 unspecified results for C-language source code files. It should write to standard error a message
 80890 identifying this condition and cause a non-zero exit status to be produced.

80891 If the operand identifies FORTRAN source, the *ctags* utility shall produce an output line for each
 80892 function definition. It may also produce output for any of the following objects:

- 80893 • Subroutine definitions
- 80894 • COMMON statements
- 80895 • PARAMETER statements
- 80896 • DATA and BLOCK DATA statements
- 80897 • Statement numbers

80898 On systems that do not support the FORTRAN Development Utilities option, *ctags* produces
 80899 unspecified results for FORTRAN source code files. It should write to standard error a message
 80900 identifying this condition and cause a non-zero exit status to be produced.

80901 It is implementation-defined what other objects (including duplicate identifiers) produce output.

80902 **EXIT STATUS**

80903 The following exit values shall be returned:

80904 0 Successful completion.

80905 >0 An error occurred.

80906 **CONSEQUENCES OF ERRORS**

80907 Default.

80908 **APPLICATION USAGE**

80909 The output with `-x` is meant to be a simple index that can be written out as an off-line readable
 80910 function index. If the input files to `ctags` (such as `.c` files) were not created using the same locale
 80911 as that in effect when `ctags -x` is run, results might not be as expected.

80912 The description of C-language processing says “attempts to” because the C language can be
 80913 greatly confused, especially through the use of `#defines`, and this utility would be of no use if
 80914 the real C preprocessor were run to identify them. The output from `ctags` may be fooled and
 80915 incorrect for various constructs.

80916 **EXAMPLES**

80917 None.

80918 **RATIONALE**

80919 The option list was significantly reduced from that provided by historical implementations. The
 80920 `-F` option was omitted as redundant, since it is the default. The `-B` option was omitted as being
 80921 of very limited usefulness. The `-t` option was omitted since the recognition of `typedefs` is now
 80922 required for C source files. The `-u` option was omitted because the update function was judged
 80923 to be not only inefficient, but also rarely needed.

80924 An early proposal included a `-w` option to suppress warning diagnostics. Since the types of such
 80925 diagnostics could not be described, the option was omitted as being not useful.

80926 The text for `LC_CTYPE` about compatibility with the C locale acknowledges that the ISO C
 80927 standard imposes requirements on the locale used to process C source. This could easily be a
 80928 superset of that known as “the C locale” by way of implementation extensions, or one of a few
 80929 alternative locales for systems supporting different codesets. No statement is made for
 80930 FORTRAN because the ANSI X3.9-1978 standard (FORTRAN 77) does not (yet) define a similar
 80931 locale concept. However, a general rule in this volume of POSIX.1-200x is that any time that
 80932 locales do not match (preparing a file for one locale and processing it in another), the results are
 80933 suspect.

80934 The collation sequence of the tags file is not affected by `LC_COLLATE` because it is typically not
 80935 used by human readers, but only by programs such as `vi` to locate the tag within the source files.
 80936 Using the POSIX locale eliminates some of the problems of coordinating locales between the
 80937 `ctags` file creator and the `vi` file reader.

80938 Historically, the tags file has been used only by `ex` and `vi`. However, the format of the tags file
 80939 has been published to encourage other programs to use the tags in new ways. The format allows
 80940 either patterns or line numbers to find the identifiers because the historical `vi` recognizes either.
 80941 The `ctags` utility does not produce the format using line numbers because it is not useful
 80942 following any source file changes that add or delete lines. The documented search patterns
 80943 match historical practice. It should be noted that literal leading circumflex or trailing dollar-sign
 80944 characters in the search pattern will only behave correctly if anchored to the beginning of the
 80945 line or end of the line by an additional circumflex or dollar-sign character.

80946 Historical implementations also understand the objects used by the languages Pascal and
 80947 sometimes LISP, and they understand the C source output by `lex` and `yacc`. The `ctags` utility is not
 80948 required to accommodate these languages, although implementors are encouraged to do so.

80949 The following historical option was not specified, as `vgrind` is not included in this volume of

80950
80951
80952
80953
80954
80955
80956
80957
80958
80959
80960
80961
80962
80963
80964
80965
80966
80967
80968
80969
80970
80971
80972
80973
80974
80975

POSIX.1-200x:

-v If the **-v** flag is given, an index of the form expected by *vgrind* is produced on the standard output. This listing contains the function name, filename, and page number (assuming 64-line pages). Since the output is sorted into lexicographic order, it may be desired to run the output through *sort -f*. Sample use:

```
ctags -v files | sort -f > index vgrind -x index
```

The special treatment of the tag **main** makes the use of *ctags* practical in directories with more than one program.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

Issue 5

The FUTURE DIRECTIONS section is added.

Issue 6

This utility is marked as part of the User Portability Utilities option.

The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the DESCRIPTION.

Issue 7

The *ctags* utility is no longer dependent on support for the User Portability Utilities option.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

80976 **NAME**
 80977 `cut` — cut out selected fields of each line of a file

80978 **SYNOPSIS**
 80979 `cut -b list [-n] [file...]`
 80980 `cut -c list [file...]`
 80981 `cut -f list [-d delim] [-s] [file...]`

80982 **DESCRIPTION**
 80983 The `cut` utility shall cut out bytes (`-b` option), characters (`-c` option), or character-delimited fields
 80984 (`-f` option) from each line in one or more files, concatenate them, and write them to standard
 80985 output.

80986 **OPTIONS**
 80987 The `cut` utility shall conform to XBD [Section 12.2](#) (on page 201).

80988 The application shall ensure that the option-argument *list* (see options `-b`, `-c`, and `-f` below) is a
 80989 comma-separated list or <blank>-separated list of positive numbers and ranges. Ranges can be
 80990 in three forms. The first is two positive numbers separated by a hyphen (*low-high*), which
 80991 represents all fields from the first number to the second number. The second is a positive
 80992 number preceded by a hyphen (*-high*), which represents all fields from field number 1 to that
 80993 number. The third is a positive number followed by a hyphen (*low-*), which represents that
 80994 number to the last field, inclusive. The elements in *list* can be repeated, can overlap, and can be
 80995 specified in any order, but the bytes, characters, or fields selected shall be written in the order of
 80996 the input data. If an element appears in the selection list more than once, it shall be written
 80997 exactly once.

80998 The following options shall be supported:

80999 `-b list` Cut based on a *list* of bytes. Each selected byte shall be output unless the `-n` option
 81000 is also specified. It shall not be an error to select bytes not present in the input line.

81001 `-c list` Cut based on a *list* of characters. Each selected character shall be output. It shall
 81002 not be an error to select characters not present in the input line.

81003 `-d delim` Set the field delimiter to the character *delim*. The default is the <tab>.

81004 `-f list` Cut based on a *list* of fields, assumed to be separated in the file by a delimiter
 81005 character (see `-d`). Each selected field shall be output. Output fields shall be
 81006 separated by a single occurrence of the field delimiter character. Lines with no field
 81007 delimiters shall be passed through intact, unless `-s` is specified. It shall not be an
 81008 error to select fields not present in the input line.

81009 `-n` Do not split characters. When specified with the `-b` option, each element in *list* of
 81010 the form *low-high* (hyphen-separated numbers) shall be modified as follows:

- 81011 • If the byte selected by *low* is not the first byte of a character, *low* shall be
 81012 decremented to select the first byte of the character originally selected by *low*.
 81013 If the byte selected by *high* is not the last byte of a character, *high* shall be
 81014 decremented to select the last byte of the character prior to the character
 81015 originally selected by *high*, or zero if there is no prior character. If the
 81016 resulting range element has *high* equal to zero or *low* greater than *high*, the list
 81017 element shall be dropped from *list* for that input line without causing an
 81018 error.

81019 Each element in *list* of the form *low-* shall be treated as above with *high* set to the
 81020 number of bytes in the current line, not including the terminating <newline>. Each

81021 element in *list* of the form *-high* shall be treated as above with *low* set to 1. Each
 81022 element in *list* of the form *num* (a single number) shall be treated as above with *low*
 81023 set to *num* and *high* set to *num*.

81024 **-s** Suppress lines with no delimiter characters, when used with the **-f** option. Unless
 81025 specified, lines with no delimiters shall be passed through untouched.

81026 OPERANDS

81027 The following operand shall be supported:

81028 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is
 81029 *'-'*, the standard input shall be used.

81030 STDIN

81031 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.
 81032 See the INPUT FILES section.

81033 INPUT FILES

81034 The input files shall be text files, except that line lengths shall be unlimited.

81035 ENVIRONMENT VARIABLES

81036 The following environment variables shall affect the execution of *cut*:

81037 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 81038 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 81039 variables used to determine the values of locale categories.)

81040 *LC_ALL* If set to a non-empty string value, override the values of all the other
 81041 internationalization variables.

81042 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 81043 characters (for example, single-byte as opposed to multi-byte characters in
 81044 arguments and input files).

81045 *LC_MESSAGES*
 81046 Determine the locale that should be used to affect the format and contents of
 81047 diagnostic messages written to standard error.

81048 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

81049 ASYNCHRONOUS EVENTS

81050 Default.

81051 STDOUT

81052 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of
 81053 the following):

81054 "%s\n", <concatenation of bytes>

81055 "%s\n", <concatenation of characters>

81056 "%s\n", <concatenation of fields and field delimiters>

81057 STDERR

81058 The standard error shall be used only for diagnostic messages.

81059 OUTPUT FILES

81060 None.

81061 EXTENDED DESCRIPTION

81062 None.

81063 **EXIT STATUS**

81064 The following exit values shall be returned:

81065 0 All input files were output successfully.

81066 >0 An error occurred.

81067 **CONSEQUENCES OF ERRORS**

81068 Default.

81069 **APPLICATION USAGE**

81070 Earlier versions of the *cut* utility worked in an environment where bytes and characters were
 81071 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In
 81072 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option
 81073 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The
 81074 algorithm specified for **-n** guarantees that:

81075 `cut -b 1-500 -n file > file1`81076 `cut -b 501- -n file > file2`

81077 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,
 81078 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

81079 **EXAMPLES**

81080 Examples of the option qualifier list:

81081 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

81082 1-3,8 Equivalent to 1,2,3,8.

81083 -5,10 Equivalent to 1,2,3,4,5,10.

81084 3- Equivalent to third to last, inclusive.

81085 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte
 81086 characters; see the description of **-n**.

81087 The following command:

81088 `cut -d : -f 1,6 /etc/passwd`

81089 reads the System V password file (user database) and produces lines of the form:

81090 `<user ID>:<home directory>`

81091 Most utilities in this volume of POSIX.1-200x work on text files. The *cut* utility can be used to
 81092 turn files with arbitrary line lengths into a set of text files containing the same data. The *paste*
 81093 utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**
 81094 contains long lines:

81095 `cut -b 1-500 -n file > file1`81096 `cut -b 501- -n file > file2`

81097 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that
 81098 contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in
 81099 **file** that are longer than 500 + {LINE_MAX} bytes.) The original file can be recreated from **file1**
 81100 and **file2** using the command:

81101 `paste -d "\0" file1 file2 > file`81102 **RATIONALE**

81103 Some historical implementations do not count <backspace>s in determining character counts
 81104 with the **-c** option. This may be useful for using *cut* for processing *nroff* output. It was
 81105 deliberately decided not to have the **-c** option treat either <backspace>s or <tab>s in any special
 81106 fashion. The *fold* utility does treat these characters specially.

81107 Unlike other utilities, some historical implementations of *cut* exit after not finding an input file,
 81108 rather than continuing to process the remaining *file* operands. This behavior is prohibited by this
 81109 volume of POSIX.1-200x, where only the exit status is affected by this problem.

81110 The behavior of *cut* when provided with either mutually-exclusive options or options that do
 81111 not work logically together has been deliberately left unspecified in favor of global wording in
 81112 [Section 1.4](#) (on page 2235).

81113 The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The
 81114 change represents historical practice on all known systems. The original standard was
 81115 ambiguous on the nature of the output.

81116 The *list* option-arguments are historically used to select the portions of the line to be written, but
 81117 do not affect the order of the data. For example:

```
81118 echo abcdefghi | cut -c6,2,4-7,1
```

81119 yields "abdefg".

81120 A proposal to enhance *cut* with the following option:

81121 **-o** Preserve the selected field order. When this option is specified, each byte, character, or field
 81122 (or ranges of such) shall be written in the order specified by the *list* option-argument, even if
 81123 this requires multiple outputs of the same bytes, characters, or fields.

81124 was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft
 81125 standard.

81126 FUTURE DIRECTIONS

81127 None.

81128 SEE ALSO

81129 [Section 2.5](#) (on page 2249), *grep*, *paste*

81130 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

81131 CHANGE HISTORY

81132 First released in Issue 2.

81133 Issue 6

81134 The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

81135 The normative text is reworded to avoid use of the term “must” for application requirements.

81136 Issue 7

81137 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81138 **NAME**81139 cxref — generate a C-language program cross-reference table (**DEVELOPMENT**)81140 **SYNOPSIS**81141 XSI `cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...`
81142 `[-U name]... file...`81143 **DESCRIPTION**81144 The *cxref* utility shall analyze a collection of C-language *files* and attempt to build a cross-
81145 reference table. Information from **#define** lines shall be included in the symbol table. A sorted
81146 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*
81147 separately, or with the `-c` option, in combination. Each symbol shall contain an asterisk before
81148 the declaring reference.81149 **OPTIONS**81150 The *cxref* utility shall conform to XBD [Section 12.2](#) (on page 201), except that the order of the `-D`,
81151 `-I`, and `-U` options (which are identical to their interpretation by *c99*) is significant. The
81152 following options shall be supported:

- 81153 `-c` Write a combined cross-reference of all input files.
- 81154 `-s` Operate silently; do not print input filenames.
- 81155 `-o file` Direct output to named *file*.
- 81156 `-w num` Format output no wider than *num* (decimal) columns. This option defaults to 80 if
81157 *num* is not specified or is less than 51.
- 81158 `-D` Equivalent to *c99*.
- 81159 `-I` Equivalent to *c99*.
- 81160 `-U` Equivalent to *c99*.

81161 **OPERANDS**

81162 The following operand shall be supported:

- 81163
- file*
- A pathname of a C-language source file.

81164 **STDIN**

81165 Not used.

81166 **INPUT FILES**

81167 The input files are C-language source files.

81168 **ENVIRONMENT VARIABLES**81169 The following environment variables shall affect the execution of *cxref*:

- 81170 *LANG* Provide a default value for the internationalization variables that are unset or null.
81171 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
81172 variables used to determine the values of locale categories.)
- 81173 *LC_ALL* If set to a non-empty string value, override the values of all the other
81174 internationalization variables.
- 81175 *LC_COLLATE*
81176 Determine the locale for the ordering of the output.

81177 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 81178 characters (for example, single-byte as opposed to multi-byte characters in
 81179 arguments and input files).

81180 **LC_MESSAGES**
 81181 Determine the locale that should be used to affect the format and contents of
 81182 diagnostic messages written to standard error.

81183 **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

81184 ASYNCHRONOUS EVENTS

81185 Default.

81186 STDOUT

81187 The standard output shall be used for the cross-reference listing, unless the **-o** option is used to
 81188 select a different output file.

81189 The format of standard output is unspecified, except that the following information shall be
 81190 included:

- 81191 • If the **-c** option is not specified, each portion of the listing shall start with the name of the
 81192 input file on a separate line.
- 81193 • The name line shall be followed by a sorted list of symbols, each with its associated
 81194 location pathname, the name of the function in which it appears (if it is not a function
 81195 name itself), and line number references.
- 81196 • Each line number may be preceded by an asterisk (**'*'**) flag, meaning that this is the
 81197 declaring reference. Other single-character flags, with implementation-defined meanings,
 81198 may be included.

81199 STDERR

81200 The standard error shall be used only for diagnostic messages.

81201 OUTPUT FILES

81202 The output file named by the **-o** option shall be used instead of standard output.

81203 EXTENDED DESCRIPTION

81204 None.

81205 EXIT STATUS

81206 The following exit values shall be returned:

- 81207 0 Successful completion.
- 81208 >0 An error occurred.

81209 CONSEQUENCES OF ERRORS

81210 Default.

81211 APPLICATION USAGE

81212 None.

81213 EXAMPLES

81214 None.

81215 RATIONALE

81216 None.

81217 FUTURE DIRECTIONS

81218 None.

- 81219 **SEE ALSO**
- 81220 [c99](#)
- 81221 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +
- 81222 **CHANGE HISTORY**
- 81223 First released in Issue 2.
- 81224 **Issue 5**
- 81225 In the SYNOPSIS, [-U *dir*] is changed to [-U *name*].
- 81226 **Issue 6**
- 81227 The APPLICATION USAGE section is added.
- 81228 **Issue 7**
- 81229 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81230 **NAME**

81231 date — write the date and time

81232 **SYNOPSIS**

81233 date [-u] [+format]

81234 XSI date [-u] *mmddhhmm*[[*cc*]*yy*]81235 **DESCRIPTION**

81236 XSI The *date* utility shall write the date and time to standard output or attempt to set the system
 81237 date and time. By default, the current date and time shall be written. If an operand beginning
 81238 with '+' is specified, the output format of *date* shall be controlled by the conversion
 81239 specifications and other text in the operand.

81240 **OPTIONS**81241 The *date* utility shall conform to XBD Section 12.2 (on page 201).

81242 The following option shall be supported:

81243 **-u** Perform operations as if the *TZ* environment variable was set to the string "UTC0",
 81244 or its equivalent historical value of "GMT0". Otherwise, *date* shall use the timezone
 81245 indicated by the *TZ* environment variable or the system default if that variable is
 81246 unset or null.

81247 **OPERANDS**

81248 The following operands shall be supported:

81249 **+format** When the format is specified, each conversion specifier shall be replaced in the
 81250 standard output by its corresponding value. All other characters shall be copied to
 81251 the output without change. The output shall always be terminated with a
 81252 <newline>.

81253 **Conversion Specifications**

81254 %a Locale's abbreviated weekday name.
 81255 %A Locale's full weekday name.
 81256 %b Locale's abbreviated month name.
 81257 %B Locale's full month name.
 81258 %c Locale's appropriate date and time representation.
 81259 %C Century (a year divided by 100 and truncated to an integer) as a decimal
 81260 number [00,99].
 81261 %d Day of the month as a decimal number [01,31].
 81262 %D Date in the format *mm/dd/yy*.
 81263 %e Day of the month as a decimal number [1,31] in a two-digit field with
 81264 leading space character fill.
 81265 %h A synonym for %b.
 81266 %H Hour (24-hour clock) as a decimal number [00,23].
 81267 %I Hour (12-hour clock) as a decimal number [01,12].

81268	%j	Day of the year as a decimal number [001,366].
81269	%m	Month as a decimal number [01,12].
81270	%M	Minute as a decimal number [00,59].
81271	%n	A <newline>.
81272	%P	Locale's equivalent of either AM or PM.
81273	%r	12-hour clock time [01,12] using the AM/PM notation; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
81274		
81275	%S	Seconds as a decimal number [00,60].
81276	%t	A <tab>.
81277	%T	24-hour clock time [00,23] in the format <i>HH:MM:SS</i> .
81278	%u	Weekday as a decimal number [1,7] (1=Monday).
81279	%U	Week of the year (Sunday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Sunday shall be considered to be in week 0.
81280		
81281		
81282	%V	Week of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing January 1 has four or more days in the new year, then it shall be considered week 1; otherwise, it shall be the last week of the previous year, and the next week shall be week 1.
81283		
81284		
81285		
81286	%w	Weekday as a decimal number [0,6] (0=Sunday).
81287	%W	Week of the year (Monday as the first day of the week) as a decimal number [00,53]. All days in a new year preceding the first Monday shall be considered to be in week 0.
81288		
81289		
81290	%x	Locale's appropriate date representation.
81291	%X	Locale's appropriate time representation.
81292	%y	Year within century [00,99].
81293	%Y	Year with century as a decimal number.
81294	%Z	Timezone name, or no characters if no timezone is determinable.
81295	%%	A percent sign character.
81296		See XBD Section 7.3.5 (on page 144) for the conversion specifier values in the
81297		POSIX locale.

Modified Conversion Specifications

Some conversion specifiers can be modified by the **E** and **O** modifier characters to indicate a different format or specification as specified in the *LC_TIME* locale description (see XBD [Section 7.3.5](#), on page 144). If the corresponding keyword (see **era**, **era_year**, **era_d_fmt**, and **alt_digits** in XBD [Section 7.3.5](#), on page 144) is not specified or not supported for the current locale, the unmodified conversion specifier value shall be used.

81305	%Ec	Locale's alternative appropriate date and time representation.
81306	%EC	The name of the base year (period) in the locale's alternative representation.
81307		

81308	%Ex	Locale's alternative date representation.
81309	%EX	Locale's alternative time representation.
81310	%Ey	Offset from %EC (year only) in the locale's alternative representation.
81311	%EY	Full alternative year representation.
81312	%Od	Day of month using the locale's alternative numeric symbols.
81313	%Oe	Day of month using the locale's alternative numeric symbols.
81314	%OH	Hour (24-hour clock) using the locale's alternative numeric symbols.
81315	%OI	Hour (12-hour clock) using the locale's alternative numeric symbols.
81316	%Om	Month using the locale's alternative numeric symbols.
81317	%OM	Minutes using the locale's alternative numeric symbols.
81318	%OS	Seconds using the locale's alternative numeric symbols.
81319	%Ou	Weekday as a number in the locale's alternative representation (Monday = 1).
81320		
81321	%OU	Week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.
81322		
81323	%OV	Week number of the year (Monday as the first day of the week, rules corresponding to %V), using the locale's alternative numeric symbols.
81324		
81325	%Ow	Weekday as a number in the locale's alternative representation (Sunday = 0).
81326		
81327	%OW	Week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
81328		
81329	%Oy	Year (offset from %C) in alternative representation.

81330	XSI	<code>mmdhmm[[cc]yy]</code>
81331		Attempt to set the system date and time from the value given in the operand. This is only possible if the user has appropriate privileges and the system permits the setting of the system date and time. The first <i>mm</i> is the month (number); <i>dd</i> is the day (number); <i>hh</i> is the hour (number, 24-hour system); the second <i>mm</i> is the minute (number); <i>cc</i> is the century and is the first two digits of the year (this is optional); <i>yy</i> is the last two digits of the year and is optional. If century is not specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The current year is the default if <i>yy</i> is omitted.

81340	Note:	It is expected that in a future version of this standard the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
81341		
81342		

81343	STDIN	
81344		Not used.

81345	INPUT FILES	
81346		None.

81347	ENVIRONMENT VARIABLES	
81348		The following environment variables shall affect the execution of <i>date</i> :

81349	LANG	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)
81350		
81351		

- 81352 *LC_ALL* If set to a non-empty string value, override the values of all the other
81353 internationalization variables.
- 81354 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
81355 characters (for example, single-byte as opposed to multi-byte characters in
81356 arguments).
- 81357 *LC_MESSAGES*
81358 Determine the locale that should be used to affect the format and contents of
81359 diagnostic messages written to standard error.
- 81360 *LC_TIME* Determine the format and contents of date and time strings written by *date*.
- 81361 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 81362 *TZ* Determine the timezone in which the time and date are written, unless the *-u*
81363 option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an
81364 unspecified system default timezone is used.

ASYNCHRONOUS EVENTS

- 81365 Default.

STDOUT

- 81368 When no formatting operand is specified, the output in the POSIX locale shall be equivalent to
81369 specifying:
81370 *date* "+%a %b %e %H:%M:%S %Z %Y"

STDERR

- 81372 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

- 81374 None.

EXTENDED DESCRIPTION

- 81376 None.

EXIT STATUS

- 81378 The following exit values shall be returned:
- 81379 0 The date was written successfully.
- 81380 >0 An error occurred.

CONSEQUENCES OF ERRORS

- 81382 Default.

APPLICATION USAGE

- 81384 Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can
81385 contain <newline>s in some locales, so it may be difficult to use the format shown in standard
81386 output for parsing the output of *date* in those locales.
- 81387 The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap
81388 second.
- 81389 Although certain of the conversion specifiers in the POSIX locale (such as the name of the
81390 month) are shown with initial capital letters, this need not be the case in other locales. Programs
81391 using these fields may need to adjust the capitalization if the output is going to be used at the
81392 beginning of a sentence.
- 81393 The date string formatting capabilities are intended for use in Gregorian-style calendars,
81394 possibly with a different starting year (or years). The %x and %c conversion specifications,
81395 however, are intended for local representation; these may be based on a different, non-Gregorian
81396 calendar.

81397 The %C conversion specification was introduced to allow a fallback for the %EC (alternative year
 81398 format base year); it can be viewed as the base of the current subdivision in the Gregorian
 81399 calendar. The century number is calculated as the year divided by 100 and truncated to an
 81400 integer; it should not be confused with the use of ordinal numbers for centuries (for example,
 81401 "twenty-first century".) Both the %Ey and %y can then be viewed as the offset from %EC and %C,
 81402 respectively.

81403 The E and O modifiers modify the traditional conversion specifiers, so that they can always be
 81404 used, even if the implementation (or the current locale) does not support the modifier.

81405 The E modifier supports alternative date formats, such as the Japanese Emperor's Era, as long as
 81406 these are based on the Gregorian calendar system. Extending the E modifiers to other date
 81407 elements may provide an implementation-defined extension capable of supporting other
 81408 calendar systems, especially in combination with the O modifier.

81409 The O modifier supports time and date formats using the locale's alternative numerical symbols,
 81410 such as Kanji or Hindi digits or ordinal number representation.

81411 Non-European locales, whether they use Latin digits in computational items or not, often have
 81412 local forms of the digits for use in date formats. This is not totally unknown even in Europe; a
 81413 variant of dates uses Roman numerals for the months: the third day of September 1991 would be
 81414 written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking
 81415 countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %y conversion
 81416 specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O
 81417 modifier was introduced to support the use for display purposes of non-Latin digits. In the
 81418 LC_TIME category in *localedef*, the optional **alt_digits** keyword is intended for this purpose. As
 81419 an example, assume the following (partial) *localedef* source:

```
81420 alt_digits  " "; "I"; "II"; "III"; "IV"; "V"; "VI"; "VII"; "VIII" \
81421            "IX"; "X"; "XI"; "XII"
81422 d_fmt      "%e.%Om.%Y"
```

81423 With the above date, the command:

```
81424 date "+%x"
```

81425 would yield 3.IX.1991. With the same **d_fmt**, but without the **alt_digits**, the command would
 81426 yield 3.9.1991.

81427 EXAMPLES

- 81428 1. The following are input/output examples of *date* used at arbitrary times in the POSIX
 81429 locale:

```
81430 $ date
81431 Tue Jun 26 09:58:10 PDT 1990
81432 $ date "+DATE: %m/%d/%y%nTIME: %H:%M:%S"
81433 DATE: 11/02/91
81434 TIME: 13:36:16
```

```
81435 $ date "+TIME: %r"
81436 TIME: 01:36:32 PM
```

- 81437 2. Examples for Denmark, where the default date and time format is %a %d %b %Y %T %Z:

```
81438 $ LANG=da_DK.iso_8859-1 date
81439 ons 02 okt 1991 15:03:32 CET
81440 $ LANG=da_DK.iso_8859-1 \
81441     date "+DATO: %A den %e. %B %Y%nKLOKKEN: %H:%M:%S"
81442 DATO: onsdag den 2. oktober 1991
```

81443 **KLOKKEN: 15:03:56**

81444 3. Examples for Germany, where the default date and time format is %a %d.%h.%Y, %T %Z:

81445 \$ LANG=De_DE.88591 date

81446 **Mi 02.Okt.1991, 15:01:21 MEZ**

81447 \$ LANG=De_DE.88591 date "+DATUM: %A, %d. %B %Y%nZEIT: %H:%M:%S"

81448 **DATUM: Mittwoch, 02. Oktober 1991**

81449 **ZEIT: 15:02:02**

81450 4. Examples for France, where the default date and time format is %a %d %h %Y %Z %T:

81451 \$ LANG=Fr_FR.88591 date

81452 **Mer 02 oct 1991 MET 15:03:32**

81453 \$ LANG=Fr_FR.88591 date "+JOUR: %A %d %B %Y%nHEURE: %H:%M:%S"

81454 **JOUR: Mercredi 02 octobre 1991**

81455 **HEURE: 15:03:56**

81456 RATIONALE

81457 Some of the new options for formatting are from the ISO C standard. The `-u` option was
 81458 introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is
 81459 allowed as an equivalent TZ value to be compatible with all of the systems using the BSD
 81460 implementation, where this option originated.

81461 The %e format conversion specification (adopted from System V) was added because the ISO C
 81462 standard conversion specifications did not provide any way to produce the historical default
 81463 *date* output during the first nine days of any month.

81464 There are two varieties of day and week numbering supported (in addition to any others created
 81465 with the locale-dependent %E and %O modifier characters):

- 81466 • The historical variety in which Sunday is the first day of the week and the weekdays
 81467 preceding the first Sunday of the year are considered week 0. These are represented by %w
 81468 and %U. A variant of this is %W, using Monday as the first day of the week, but still
 81469 referring to week 0. This view of the calendar was retained because so many historical
 81470 applications depend on it and the ISO C standard *strptime()* function, on which many *date*
 81471 implementations are based, was defined in this way.
- 81472 • The international standard, based on the ISO 8601:2000 standard where Monday is the first
 81473 weekday and the algorithm for the first week number is more complex: If the week
 81474 (Monday to Sunday) containing January 1 has four or more days in the new year, then it is
 81475 week 1; otherwise, it is week 53 of the previous year, and the next week is week 1. These
 81476 are represented by the new conversion specifications %u and %v, added as a result of
 81477 international comments.

81478 FUTURE DIRECTIONS

81479 None.

81483 CHANGE HISTORY

81484 First released in Issue 2.

81485

Issue 5

81486

Changes are made for Year 2000 alignment.

81487

Issue 6

81488

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

81489

- The %EX modified conversion specification is added.

81490

The Open Group Corrigendum U048/2 is applied, correcting the examples.

81491

81492

The DESCRIPTION is updated to refer to conversion specifications, instead of field descriptors for consistency with the *LC_TIME* category.

81493

81494

A clarification is made such that the current year is the default if the *yy* argument is omitted when setting the system date and time.

81495

81496

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/19 is applied, correcting the CHANGE HISTORY section.

81497

81498 **NAME**
 81499 dd — convert and copy a file

81500 **SYNOPSIS**
 81501 dd [*operand* . . .]

81502 **DESCRIPTION**
 81503 The *dd* utility shall copy the specified input file to the specified output file with possible
 81504 conversions using specific input and output block sizes. It shall read the input one block at a
 81505 time, using the specified input block size; it shall then process the block of data actually
 81506 returned, which could be smaller than the requested block size. It shall apply any conversions
 81507 that have been specified and write the resulting data to the output in blocks of the specified
 81508 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,
 81509 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a
 81510 separate output block; if the read returns less than a full block and the **sync** conversion is not
 81511 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**
 81512 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the
 81513 input shall be processed and collected into full-sized output blocks until the end of the input is
 81514 reached.

81515 The processing order shall be as follows:

- 81516 1. An input block is read.
- 81517 2. If the input block is shorter than the specified input block size and the **sync** conversion is
 81518 specified, null bytes shall be appended to the input data up to the specified size. (If either
 81519 **block** or **unblock** is also specified, <space>s shall be appended instead of null bytes.) The
 81520 remaining conversions and output shall include the pad characters as if they had been
 81521 read from the input.
- 81522 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is
 81523 requested, the resulting data shall be written to the output as a single block, and the
 81524 remaining steps are omitted.
- 81525 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If
 81526 there is an odd number of bytes in the input block, the last byte in the input record shall
 81527 not be swapped.
- 81528 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These
 81529 conversions shall operate on the input data independently of the input blocking; an input
 81530 or output fixed-length record may span block boundaries.
- 81531 6. The data resulting from input or conversion or both shall be aggregated into output
 81532 blocks of the specified size. After the end of input is reached, any remaining output shall
 81533 be written as a block without padding if **conv=sync** is not specified; thus, the final output
 81534 block may be shorter than the output block size.

81535 **OPTIONS**
 81536 None.

81537 **OPERANDS**
 81538 All of the operands shall be processed before any input is read. The following operands shall be
 81539 supported:

81540 **if=file** Specify the input pathname; the default is standard input.

81541		of=file	Specify the output pathname; the default is standard output. If the seek=expr conversion is not also specified, the output file shall be truncated before the copy begins if an explicit of=file operand is specified, unless conv=notrunc is specified. If seek=expr is specified, but conv=notrunc is not, the effect of the copy shall be to preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of the output file shall be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file shall be shortened by the copy. If the input file is empty and either the size of the seek is greater than the previous size of the output file or the output file did not previously exist, the size of the output file shall be set to the file offset after the seek.)
81542			
81543			
81544			
81545			
81546			
81547			
81548			
81549			
81550			
81551			
81552		ibs=expr	Specify the input block size, in bytes, by <i>expr</i> (default is 512).
81553		obs=expr	Specify the output block size, in bytes, by <i>expr</i> (default is 512).
81554		bs=expr	Set both input and output block sizes to <i>expr</i> bytes, superseding ibs= and obs= . If no conversion other than sync , noerror , and notrunc is specified, each input block shall be copied to the output as a single block without aggregating short blocks.
81555			
81556			
81557		cbs=expr	Specify the conversion block size for block and unblock in bytes by <i>expr</i> (default is zero). If cbs= is omitted or given a value of zero, using block or unblock produces unspecified results.
81558			
81559			
81560	XSI		The application shall ensure that this operand is also specified if the conv= operand is specified with a value of ascii , ebcdic , or ibm . For a conv= operand with an ascii value, the input is handled as described for the unblock value, except that characters are converted to ASCII before any trailing <space>s are deleted. For conv= operands with ebcdic or ibm values, the input is handled as described for the block value except that the characters are converted to EBCDIC or IBM EBCDIC, respectively, after any trailing <space>s are added.
81561			
81562			
81563			
81564			
81565			
81566			
81567		skip=n	Skip <i>n</i> input blocks (using the specified input block size) before starting to copy. On seekable files, the implementation shall read the blocks or seek past them; on non-seekable files, the blocks shall be read and the data shall be discarded.
81568			
81569			
81570		seek=n	Skip <i>n</i> blocks (using the specified output block size) from the beginning of the output file before copying. On non-seekable files, existing blocks shall be read and space from the current end-of-file to the specified offset, if any, filled with null bytes; on seekable files, the implementation shall seek to the specified offset or read the blocks as described for non-seekable files.
81571			
81572			
81573			
81574			
81575		count=n	Copy only <i>n</i> input blocks.
81576		conv=value[,value ...]	
81577			Where <i>values</i> are comma-separated symbols from the following list:
81578	XSI	ascii	Convert EBCDIC to ASCII; see Table 4-6 (on page 2520).
81579	XSI	ebcdic	Convert ASCII to EBCDIC; see Table 4-6 (on page 2520).
81580	XSI	ibm	Convert ASCII to a different EBCDIC set; see Table 4-7 (on page 2521).
81581			
81582			The ascii , ebcdic , and ibm values are mutually-exclusive.
81583		block	Treat the input as a sequence of <newline>-terminated or end-of-file-terminated variable-length records independent of the input block boundaries. Each record shall be converted to a record with a fixed length specified by the conversion block size. Any <newline> shall be removed from the input line; <space>s shall be appended to lines
81584			
81585			
81586			
81587			

81588		that are shorter than their conversion block size to fill the block. Lines
81589		that are longer than the conversion block size shall be truncated to
81590		the largest number of characters that fit into that size; the number of
81591		truncated lines shall be reported (see the STDERR section).
81592		The block and unblock values are mutually-exclusive.
81593	unblock	Convert fixed-length records to variable length. Read a number of
81594		bytes equal to the conversion block size (or the number of bytes
81595		remaining in the input, if less than the conversion block size), delete
81596		all trailing <space>s, and append a <newline>.
81597	lcase	Map uppercase characters specified by the <i>LC_CTYPE</i> keyword
81598		tolower to the corresponding lowercase character. Characters for
81599		which no mapping is specified shall not be modified by this
81600		conversion.
81601		The lcase and ucase symbols are mutually-exclusive.
81602	ucase	Map lowercase characters specified by the <i>LC_CTYPE</i> keyword
81603		toupper to the corresponding uppercase character. Characters for
81604		which no mapping is specified shall not be modified by this
81605		conversion.
81606	swab	Swap every pair of input bytes.
81607	noerror	Do not stop processing on an input error. When an input error
81608		occurs, a diagnostic message shall be written on standard error,
81609		followed by the current input and output block counts in the same
81610		format as used at completion (see the STDERR section). If the sync
81611		conversion is specified, the missing input shall be replaced with null
81612		bytes and processed normally; otherwise, the input block shall be
81613		omitted from the output.
81614	notrunc	Do not truncate the output file. Preserve blocks in the output file not
81615		explicitly written by this invocation of the <i>dd</i> utility. (See also the
81616		preceding of=file operand.)
81617	sync	Pad every input block to the size of the ibs= buffer, appending null
81618		bytes. (If either block or unblock is also specified, append <space>s,
81619		rather than null bytes.)

81620 The behavior is unspecified if operands other than **conv=** are specified more than once.

81621 For the **bs=**, **cbs=**, **ibs=**, and **obs=** operands, the application shall supply an expression
81622 specifying a size in bytes. The expression, *expr*, can be:

- 81623 1. A positive decimal number
- 81624 2. A positive decimal number followed by *k*, specifying multiplication by 1 024
- 81625 3. A positive decimal number followed by *b*, specifying multiplication by 512
- 81626 4. Two or more positive decimal numbers (with or without *k* or *b*) separated by *x*, specifying
81627 the product of the indicated values

81628 All of the operands are processed before any input is read.

81629 XSI The following two tables display the octal number character values used for the **ascii** and **ebcdic**
81630 conversions (first table) and for the **ibm** conversion (second table). In both tables, the ASCII
81631 values are the row and column headers and the EBCDIC values are found at their intersections.
81632 For example, ASCII 0012 (LF) is the second row, third column, yielding 0045 in EBCDIC. The
81633 inverted tables (for EBCDIC to ASCII conversion) are not shown, but are in one-to-one

correspondence with these tables. The differences between the two tables are highlighted by small boxes drawn around five entries.

Table 4-6 ASCII to EBCDIC Conversion

STDIN
If no `if=` operand is specified, the standard input shall be used. See the `INPUT FILES` section.

81640 **INPUT FILES**

81641 The input file can be any file type.

81642 **ENVIRONMENT VARIABLES**81643 The following environment variables shall affect the execution of *dd*:81644 *LANG* Provide a default value for the internationalization variables that are unset or null. |
81645 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
81646 variables used to determine the values of locale categories.)81647 *LC_ALL* If set to a non-empty string value, override the values of all the other
81648 internationalization variables.81649 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
81650 characters (for example, single-byte as opposed to multi-byte characters in
81651 arguments and input files), the classification of characters as uppercase or
81652 lowercase, and the mapping of characters from one case to the other.81653 *LC_MESSAGES*81654 Determine the locale that should be used to affect the format and contents of
81655 diagnostic messages written to standard error and informative messages written to
81656 standard output.81657 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.81658 **ASYNCHRONOUS EVENTS**81659 For SIGINT, the *dd* utility shall interrupt its current processing, write status information to
81660 standard error, and exit as though terminated by SIGINT. It shall take the standard action for all
81661 other signals; see the ASYNCHRONOUS EVENTS section in [Section 1.4](#) (on page 2235).81662 **STDOUT**81663 If no *of=* operand is specified, the standard output shall be used. The nature of the output
81664 depends on the operands selected.81665 **STDERR**81666 On completion, *dd* shall write the number of input and output blocks to standard error. In the
81667 POSIX locale the following formats shall be used:81668 "%u+%u records in\n", <number of whole input blocks>,
81669 <number of partial input blocks>81670 "%u+%u records out\n", <number of whole output blocks>,
81671 <number of partial output blocks>81672 A partial input block is one for which *read()* returned less than the input block size. A partial
81673 output block is one that was written with fewer bytes than specified by the output block size.81674 In addition, when there is at least one truncated block, the number of truncated blocks shall be
81675 written to standard error. In the POSIX locale, the format shall be:81676 "%u truncated %s\n", <number of truncated blocks>, "record" (if
81677 <number of truncated blocks> is one) "records" (otherwise)

81678 Diagnostic messages may also be written to standard error.

81679 **OUTPUT FILES**81680 If the *of=* operand is used, the output shall be the same as described in the STDOUT section.81681 **EXTENDED DESCRIPTION**

81682 None.

81683 **EXIT STATUS**

81684 The following exit values shall be returned:

81685 0 The input file was copied successfully.

81686 >0 An error occurred.

81687 **CONSEQUENCES OF ERRORS**81688 If an input error is detected and the **noerror** conversion has not been specified, any partial
81689 output block shall be written to the output file, a diagnostic message shall be written, and the
81690 copy operation shall be discontinued. If some other error is detected, a diagnostic message shall
81691 be written and the copy operation shall be discontinued.81692 **APPLICATION USAGE**

81693 The input and output block size can be specified to take advantage of raw physical I/O.

81694 There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions
81695 specified for the *dd* utility perform conversions for the version specified by the tables.81696 **EXAMPLES**

81697 The following command:

81698 `dd if=/dev/rmt0h of=/dev/rmt1h`

81699 copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

81700 The following command:

81701 `dd ibs=10 skip=1`

81702 strips the first 10 bytes from standard input.

81703 This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the
81704 ASCII file *x*:81705 `dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase`81706 **RATIONALE**81707 The **OPTIONS** section is listed as “None” because there are no options recognized by historical
81708 *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax
81709 Guidelines, which would have resulted in the classic hyphenated option letters. In this version
81710 of this volume of POSIX.1-200x, *dd* retains its curious JCL-like syntax due to the large number of
81711 applications that depend on the historical implementation.81712 A suggested implementation technique for **conv=noerror, sync** is to zero (or <space>-fill, if
81713 **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input
81714 buffer to the output even after an error. In this manner, any data transferred to the input buffer
81715 before the error was detected is preserved. Another point is that a failed read on a regular file or
81716 a disk generally does not increment the file offset, and *dd* must then seek past the block on which
81717 the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic
81718 tape, however, the tape normally has passed the block containing the error when the error is
81719 reported, and thus no seek is necessary.81720 The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely
81721 portable) scripts that assume these values. If they were left unspecified, unusual results could
81722 occur if an implementation chose an odd block size.81723 Historical implementations of *dd* used *creat()* when processing **of=file**. This makes the **seek=**
81724 operand unusable except on special files. The **conv=notrunc** feature was added because more
81725 recent BSD-based implementations use *open()* (without **O_TRUNC**) instead of *creat()*, but they
81726 fail to delete output file contents after the data copied.81727 The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to

81728 mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of
81729 POSIX.1-200x.

81730 Standard EBCDIC does not have the characters '[' and ']'. The values used in the table are
81731 taken from a common print train that does contain them. Other than those characters, the print
81732 train values are not filled in, but appear to provide some of the motivation for the historical
81733 choice of translations reflected here.

81734 The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.

81735 The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ
81736 in such a way that:

- 81737 1. EBCDIC 0112 ('ϕ') and 0152 (broken pipe) do not appear in the table.
- 81738 2. EBCDIC 0137 ('¬') translates to/from ASCII 0236 ('^'). In the standard table, EBCDIC
81739 0232 (no graphic) is used.
- 81740 3. EBCDIC 0241 ('~') translates to/from ASCII 0176 ('~'). In the standard table, EBCDIC
81741 0137 ('¬') is used.
- 81742 4. 0255 ('[') and 0275 (']') appear twice, once in the same place as for the standard table
81743 and once in place of 0112 ('ϕ') and 0241 ('~').

81744 In net result:

81745 EBCDIC 0275 (']') displaced EBCDIC 0241 ('~') in cell 0345.

81746 That displaced EBCDIC 0137 ('¬') in cell 0176.

81747 That displaced EBCDIC 0232 (no graphic) in cell 0136.

81748 That replaced EBCDIC 0152 (broken pipe) in cell 0313.

81749 EBCDIC 0255 ('[') replaced EBCDIC 0112 ('ϕ').

81750 This translation, however, reflects historical practice that (ASCII) '~' and '¬' were often
81751 mapped to each other, as were '[' and 'ϕ'; and ']' and (EBCDIC) '~'.

81752 The **cbs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the
81753 **ascii** operand, the input is handled as described for the **unblock** operand except that characters
81754 are converted to ASCII before the trailing <space>s are deleted. For the **ebcdic** and **ibm**
81755 operands, the input is handled as described for the **block** operand except that the characters are
81756 converted to EBCDIC or IBM EBCDIC after the trailing <space>s are added.

81757 The **block** and **unblock** keywords are from historical BSD practice.

81758 The consistent use of the word **record** in standard error messages matches most historical
81759 practice. An earlier version of System V used **block**, but this has been updated in more recent
81760 releases.

81761 Early proposals only allowed two numbers separated by x to be used in a product when
81762 specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of
81763 allowing multiple numbers in the product as provided by Version 7 and all releases of System V
81764 and BSD.

81765 A change to the **swab** conversion is required to match historical practice and is the result of IEEE
81766 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.

81767 A change to the handling of SIGINT is required to match historical practice and is the result of
81768 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.

+

CHANGE HISTORY

First released in Issue 2.

Issue 5

The second paragraph of the **cbs=** description is reworded and marked EX.

The FUTURE DIRECTIONS section is added.

Issue 6

Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b draft standard.

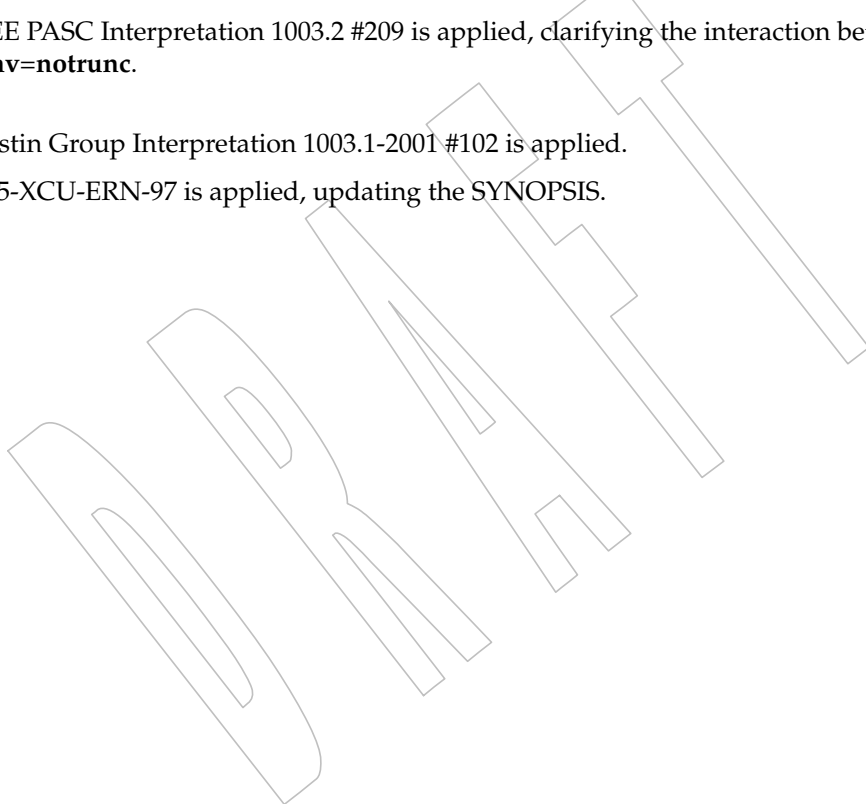

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between **dd of=file** and **conv=notrunc**.

Issue 7

Austin Group Interpretation 1003.1-2001 #102 is applied.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81788 **NAME**
 81789 delta — make a delta (change) to an SCCS file (**DEVELOPMENT**)

81790 **SYNOPSIS**
 81791 XSI `delta [-nps] [-g list] [-m mrlist] [-r SID] [-y[comment]] file...`

81792 **DESCRIPTION**
 81793 The *delta* utility shall be used to permanently introduce into the named SCCS files changes that
 81794 were made to the files retrieved by *get* (called the *g-files*, or generated files).

81795 **OPTIONS**
 81796 The *delta* utility shall conform to XBD Section 12.2 (on page 201), except that the `-y` option has an
 81797 optional option-argument. This optional option-argument shall not be presented as a separate
 81798 argument.

81799 The following options shall be supported:

81800 `-r SID` Uniquely identify which delta is to be made to the SCCS file. The use of this option
 81801 shall be necessary only if two or more outstanding *get* commands for editing (*get*
 81802 `-e`) on the same SCCS file were done by the same person (login name). The SID
 81803 value specified with the `-r` option can be either the SID specified on the *get*
 81804 command line or the SID to be made as reported by the *get* utility; see *get* (on page
 81805 2693).

81806 `-s` Suppress the report to standard output of the activity associated with each *file*. See
 81807 the `STDOUT` section.

81808 `-n` Specify retention of the edited *g-file* (normally removed at completion of delta
 81809 processing).

81810 `-g list` Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when
 81811 the file is accessed at the change level (SID) created by this delta.

81812 `-m mrlist` Specify a modification request (MR) number that the application shall supply as
 81813 the reason for creating the new delta. This shall be used if the SCCS file has the `v`
 81814 flag set; see *admin*.

81815 If `-m` is not used and `'-'` is not specified as a file argument, and the standard
 81816 input is a terminal, the prompt described in the `STDOUT` section shall be written
 81817 to standard output before the standard input is read; if the standard input is not a
 81818 terminal, no prompt shall be issued.

81819 MRs in a list shall be separated by `<blank>s` or escaped `<newline>s`. An
 81820 unescaped `<newline>` shall terminate the MR list. The escape character is
 81821 `<backslash>`.

81822 If the `v` flag has a value, it shall be taken to be the name of a program which
 81823 validates the correctness of the MR numbers. If a non-zero exit status is returned
 81824 from the MR number validation program, the *delta* utility shall terminate. (It is
 81825 assumed that the MR numbers were not all valid.)

81826 `-y[comment]` Describe the reason for making the delta. The *comment* shall be an arbitrary group
 81827 of lines that would meet the definition of a text file. Implementations shall support
 81828 *comments* from zero to 512 bytes and may support longer values. A null string
 81829 (specified as either `-y`, `-y" "`, or in response to a prompt for a comment) shall be
 81830 considered a valid *comment*.

81831 If `-y` is not specified and `'-'` is not specified as a file argument, and the standard

81832 input is a terminal, the prompt described in the STDOUT section shall be written
 81833 to standard output before the standard input is read; if the standard input is not a
 81834 terminal, no prompt shall be issued. An unescaped <newline> shall terminate the
 81835 comment text. The escape character is <backslash>.

81836 The `-y` option shall be required if the *file* operand is specified as `'-'`.

81837 **-p** Write (to standard output) the SCCS file differences before and after the delta is
 81838 applied in *diff* format; see *diff*.

81839 OPERANDS

81840 The following operand shall be supported:

81841 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*
 81842 utility shall behave as though each file in the directory were specified as a named
 81843 file, except that non-SCCS files (last component of the pathname does not begin
 81844 with **s**.) and unreadable files shall be silently ignored.

81845 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;
 81846 each line of the standard input shall be taken to be the name of an SCCS file to be
 81847 processed. Non-SCCS files and unreadable files shall be silently ignored.

81848 STDIN

81849 The standard input shall be a text file used only in the following cases:

- 81850 • To read an *mrlist* or a *comment* (see the `-m` and `-y` options).
- 81851 • A *file* operand shall be specified as `'-'`. In this case, the `-y` option must be used to specify
 81852 the comment, and if the SCCS file has the **v** flag set, the `-m` option must also be used to
 81853 specify the MR list.

81854 INPUT FILES

81855 Input files shall be text files whose data is to be included in the SCCS files. If the first character of
 81856 any line of an input file is <SOH> in the POSIX locale, the results are unspecified. If this file
 81857 contains more than 99999 lines, the number of lines recorded in the header for this file shall be
 81858 99999 for this delta.

81859 ENVIRONMENT VARIABLES

81860 The following environment variables shall affect the execution of *delta*:

81861 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 81862 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 81863 variables used to determine the values of locale categories.)

81864 *LC_ALL* If set to a non-empty string value, override the values of all the other
 81865 internationalization variables.

81866 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 81867 characters (for example, single-byte as opposed to multi-byte characters in
 81868 arguments and input files).

81869 *LC_MESSAGES*

81870 Determine the locale that should be used to affect the format and contents of
 81871 diagnostic messages written to standard error, and informative messages written
 81872 to standard output.

81873 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

81874 *TZ* Determine the timezone in which the time and date are written in the SCCS file. If
 81875 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

81876 **ASYNCHRONOUS EVENTS**

81877 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit
 81878 code. The standard action shall be taken for all other signals; see [Section 1.4](#) (on page 2235).

81879 **STDOUT**

81880 The standard output shall be used only for the following messages in the POSIX locale:

- 81881 • Prompts (see the **-m** and **-y** options) in the following formats:

81882 "MRs? "

81883 "comments? "

81884 The MR prompt, if written, shall always precede the comments prompt.

- 81885 • A report of each file's activities (unless the **-s** option is specified) in the following format:

81886 "%s\n%d inserted\n%d deleted\n%d unchanged\n", <New SID> ,
 81887 <number of lines inserted> , <number of lines deleted> ,
 81888 <number of lines unchanged>

81889 **STDERR**

81890 The standard error shall be used only for diagnostic messages.

81891 **OUTPUT FILES**

81892 Any SCCS files updated shall be files of an unspecified format.

81893 **EXTENDED DESCRIPTION**81894 **System Date and Time**

81895 When a *delta* is added to an SCCS file, the system date and time shall be recorded for the new
 81896 delta. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the
 81897 behavior is unspecified.

81898 **EXIT STATUS**

81899 The following exit values shall be returned:

81900 0 Successful completion.

81901 >0 An error occurred.

81902 **CONSEQUENCES OF ERRORS**

81903 Default.

81904 **APPLICATION USAGE**

81905 Problems can arise if the system date and time have been modified (for example, put forward
 81906 and then back again, or unsynchronized clocks across a network) and can also arise when
 81907 different values of the *TZ* environment variable are used.

81908 Problems of a similar nature can also arise for the operation of the *get* utility, which records the
 81909 date and time in the file body.

81910 **EXAMPLES**

81911 None.

81912 **RATIONALE**

CHANGE HISTORY

First released in Issue 2.

Issue 5

The output format description in the STDOUT section is corrected.

Issue 6

The APPLICATION USAGE section is added.

The normative text is reworded to avoid use of the term “must” for application requirements.

The Open Group Base Resolution bwg2001-007 is applied as follows:

- The use of ‘-’ as a file argument is clarified.
- The use of STDIN is added.
- The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement that implementations re-signal themselves when catching a normally fatal signal.
- New text is added to the INPUT FILES section warning that the maximum lines recorded in the file is 99 999.

New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections regarding how the system date and time may be taken into account, and the TZ environment variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base Resolution bwg2001-007.

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

81939 **NAME**

81940 df — report free disk space

81941 **SYNOPSIS**81942 XSI df [-k] [-P|-t] [*file...*]81943 **DESCRIPTION**

81944 XSI The *df* utility shall write the amount of available space and file slots for file systems on which
 81945 the invoking user has appropriate read access. File systems shall be specified by the *file*
 81946 operands; when none are specified, information shall be written for all file systems. The format
 81947 of the default output from *df* is unspecified, but all space figures are reported in 512-byte units,
 81948 unless the *-k* option is specified. This output shall contain at least the file system names, amount
 81949 of available space on each of these file systems, and the number of free file slots, or *inodes*,
 81950 available; when *-t* is specified, the output shall contain the total allocated space as well.

81951 **OPTIONS**81952 The *df* utility shall conform to XBD Section 12.2 (on page 201).

81953 The following options shall be supported:

81954 *-k* Use 1024-byte units, instead of the default 512-byte units, when writing space
 81955 figures.

81956 *-P* Produce output in the format described in the STDOUT section.

81957 XSI *-t* Include total allocated-space figures in the output.

81958 **OPERANDS**

81959 The following operand shall be supported:

81960 *file* A pathname of a file within the hierarchy of the desired file system. If a file other
 81961 XSI than a FIFO, a regular file, a directory, or a special file representing the device
 81962 containing the file system (for example, */dev/dsk/0s1*) is specified, the results are
 81963 unspecified. If the *file* operand names a file other than a special file containing a file
 81964 system, *df* shall write the amount of free space in the file system containing the
 81965 XSI specified *file* operand. Otherwise, *df* shall write the amount of free space in that
 81966 file system.

81967 **STDIN**

81968 Not used.

81969 **INPUT FILES**

81970 None.

81971 **ENVIRONMENT VARIABLES**81972 The following environment variables shall affect the execution of *df*:

81973 *LANG* Provide a default value for the internationalization variables that are unset or null.
 81974 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 81975 variables used to determine the values of locale categories.)

81976 *LC_ALL* If set to a non-empty string value, override the values of all the other
 81977 internationalization variables.

81978 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 81979 characters (for example, single-byte as opposed to multi-byte characters in
 81980 arguments).

81981 *LC_MESSAGES*
 81982 Determine the locale that should be used to affect the format and contents of
 81983 diagnostic messages written to standard error and informative messages written to
 81984 standard output.

81985 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

81986 ASYNCHRONOUS EVENTS

81987 Default.

81988 STDOUT

81989 When both the *-k* and *-P* options are specified, the following header line shall be written (in the
 81990 POSIX locale):

81991 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"

81992 When the *-P* option is specified without the *-k* option, the following header line shall be written
 81993 (in the POSIX locale):

81994 "Filesystem 512-blocks Used Available Capacity Mounted on\n"

81995 The implementation may adjust the spacing of the header line and the individual data lines so
 81996 that the information is presented in orderly columns.

81997 The remaining output with *-P* shall consist of one line of information for each specified file
 81998 system. These lines shall be formatted as follows:

81999 "%s %d %d %d %d%% %s\n", *<file system name>*, *<total space>*,
 82000 *<space used>*, *<space free>*, *<percentage used>*,
 82001 *<file system root>*

82002 In the following list, all quantities expressed in 512-byte units (1024-byte when *-k* is specified)
 82003 shall be rounded up to the next higher unit. The fields are:

82004 *<file system name>*

82005 The name of the file system, in an implementation-defined format.

82006 *<total space>* The total size of the file system in 512-byte units. The exact meaning of this figure
 82007 is implementation-defined, but should include *<space used>*, *<space free>*, plus any
 82008 space reserved by the system not normally available to a user.

82009 *<space used>* The total amount of space allocated to existing files in the file system, in 512-byte
 82010 units.

82011 *<space free>* The total amount of space available within the file system for the creation of new
 82012 files by unprivileged users, in 512-byte units. When this figure is less than or equal
 82013 to zero, it shall not be possible to create any new files on the file system without
 82014 first deleting others, unless the process has appropriate privileges. The figure
 82015 written may be less than zero.

82016 *<percentage used>*

82017 The percentage of the normally available space that is currently allocated to all files
 82018 on the file system. This shall be calculated using the fraction:

82019
$$\frac{\textit{<space used>}}{\textit{<space used> + <space free>}}$$

82020 expressed as a percentage. This percentage may be greater than 100 if *<space free>*
 82021 is less than zero. The percentage value shall be expressed as a positive integer, with
 82022 any fractional result causing it to be rounded to the next highest integer.

82023 *<file system root>*

82024 The directory below which the file system hierarchy appears.

82025 XSI The output format is unspecified when `-t` is used.

82026 **STDERR**

82027 The standard error shall be used only for diagnostic messages.

82028 **OUTPUT FILES**

82029 None.

82030 **EXTENDED DESCRIPTION**

82031 None.

82032 **EXIT STATUS**

82033 The following exit values shall be returned:

82034 0 Successful completion.

82035 >0 An error occurred.

82036 **CONSEQUENCES OF ERRORS**

82037 Default.

82038 **APPLICATION USAGE**

82039 On most systems, the “name of the file system, in an implementation-defined format” is the
82040 special file on which the file system is mounted.

82041 On large file systems, the calculation specified for percentage used can create huge rounding
82042 errors.

82043 **EXAMPLES**

82044 1. The following example writes portable information about the `/usr` file system:

82045 `df -P /usr`

82046 2. Assuming that `/usr/src` is part of the `/usr` file system, the following produces the same
82047 output as the previous example:

82048 `df -P /usr/src`

82049 **RATIONALE**

82050 The behavior of `df` with the `-P` option is the default action of the 4.2 BSD `df` utility. The uppercase
82051 `-P` was selected to avoid collision with a known industry extension using `-p`.

82052 Historical `df` implementations vary considerably in their default output. It was therefore
82053 necessary to describe the default output in a loose manner to accommodate all known historical
82054 implementations and to add a portable option (`-P`) to provide information in a portable format.

82055 The use of 512-byte units is historical practice and maintains compatibility with `ls` and other
82056 utilities in this volume of POSIX.1-200x. This does not mandate that the file system itself be
82057 based on 512-byte blocks. The `-k` option was added as a compromise measure. It was agreed by
82058 the standard developers that 512 bytes was the best default unit because of its complete
82059 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and
82060 that a `-k` option to switch to 1024-byte units was a good compromise. Users who prefer the
82061 more logical 1024-byte quantity can easily alias `df` to `df -k` without breaking many historical
82062 scripts relying on the 512-byte units.

82063 It was suggested that `df` and the various related utilities be modified to access a `BLOCKSIZE`
82064 environment variable to achieve consistency and user acceptance. Since this is not historical
82065 practice on any system, it is left as a possible area for system extensions and will be re-evaluated
82066 in a future version if it is widely implemented.

CHANGE HISTORY

First released in Issue 2.

Issue 6

This utility is marked as part of the User Portability Utilities option.

Issue 7

Austin Group Interpretation 1003.1-2001 #099 is applied.

The *df* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82081 **NAME**
 82082 diff — compare two files

82083 **SYNOPSIS**
 82084 diff [-c|-e|-f|-u|-C n|-U n] [-br] file1 file2

82085 **DESCRIPTION**
 82086 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of
 82087 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be
 82088 produced if the files are identical.

82089 **OPTIONS**
 82090 The *diff* utility shall conform to XBD [Section 12.2](#) (on page 201).

82091 The following options shall be supported:

- 82092 **-b** Cause any amount of white space at the end of a line to be treated as a single
 82093 <newline> (that is, the white-space characters preceding the <newline> are
 82094 ignored) and other strings of white-space characters, not including <newline>s, to
 82095 compare equal.
- 82096 **-c** Produce output in a form that provides three lines of copied context.
- 82097 **-C n** Produce output in a form that provides *n* lines of copied context (where *n* shall be
 82098 interpreted as a positive decimal integer).
- 82099 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be used
 82100 to convert *file1* into *file2*.
- 82101 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to
 82102 be suitable as input for the *ed* utility, and in the opposite order.
- 82103 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*
 82104 are both directories.

 82105 The *diff* utility shall detect infinite loops; that is, entering a previously visited
 82106 directory that is an ancestor of the last file encountered. When it detects an infinite
 82107 loop, *diff* shall write a diagnostic message to standard error and shall either recover
 82108 its position in the hierarchy or terminate.
- 82109 **-u** Produce output in a form that provides three lines of unified context.
- 82110 **-U n** Produce output in a form that provides *n* lines of unified context (where *n* shall be
 82111 interpreted as a non-negative decimal integer).

82112 **OPERANDS**
 82113 The following operands shall be supported:

82114 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is '-', the
 82115 standard input shall be used in its place.

82116 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special
 82117 files, or FIFO special files to any files and shall not compare regular files to directories. Further
 82118 details are as specified in [Diff Directory Comparison Format](#) (on page 2535). The behavior of *diff*
 82119 on other file types is implementation-defined when found in directories.

82120 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file
 82121 contained in the directory file with a filename that is the same as the last component of the non-
 82122 directory file.

82123 **STDIN**

82124 The standard input shall be used only if one of the *file1* or *file2* operands references standard
 82125 input. See the INPUT FILES section.

82126 **INPUT FILES**

82127 The input files may be of any type.

82128 **ENVIRONMENT VARIABLES**

82129 The following environment variables shall affect the execution of *diff*:

82130 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 82131 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 82132 variables used to determine the values of locale categories.)

82133 **LC_ALL** If set to a non-empty string value, override the values of all the other
 82134 internationalization variables.

82135 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 82136 characters (for example, single-byte as opposed to multi-byte characters in
 82137 arguments and input files).

82138 **LC_MESSAGES**

82139 Determine the locale that should be used to affect the format and contents of
 82140 diagnostic messages written to standard error and informative messages written to
 82141 standard output.

82142 **LC_TIME** Determine the locale for affecting the format of file timestamps written with the **-C**
 82143 and **-c** options.

82144 **XSI NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

82145 **TZ** Determine the timezone used for calculating file timestamps written with a context
 82146 format. If **TZ** is unset or null, an unspecified default timezone shall be used.

82147 **ASYNCHRONOUS EVENTS**

82148 Default.

82149 **STDOUT**82150 **Diff Directory Comparison Format**

82151 If both *file1* and *file2* are directories, the following output formats shall be used.

82152 In the POSIX locale, each file that is present in only one directory shall be reported using the
 82153 following format:

82154 "Only in %s: %s\n", <directory pathname>, <filename>

82155 In the POSIX locale, subdirectories that are common to the two directories may be reported with
 82156 the following format:

82157 "Common subdirectories: %s and %s\n", <directory1 pathname>,
 82158 <directory2 pathname>

82159 For each file common to the two directories, if the two files are not to be compared: if the two
 82160 files have the same device ID and file serial number, or are both block special files that refer to
 82161 the same device, or are both character special files that refer to the same device, in the POSIX
 82162 locale the output format is unspecified. Otherwise, in the POSIX locale an unspecified format
 82163 shall be used that contains the pathnames of the two files.

82164 For each file common to the two directories, if the files are compared and are identical, no
 82165 output shall be written. If the two files differ, the following format is written:

82166 "diff %s %s %s\n", <diff_options>, <filename1>, <filename2>

82167 where *<diff_options>* are the options as specified on the command line.

82168 All directory pathnames listed in this section shall be relative to the original command line
82169 arguments. All other names of files listed in this section shall be filenames (pathname
82170 components).

82171 Diff Binary Output Format

82172 In the POSIX locale, if one or both of the files being compared are not text files, an unspecified
82173 format shall be used that contains the pathnames of two files being compared and the string
82174 "differ".

82175 If both files being compared are text files, depending on the options specified, one of the
82176 following formats shall be used to write the differences.

82177 Diff Default Output Format

82178 The default (without *-e*, *-f*, *-c*, *-C*, *-u*, or *-U* options) *diff* utility output shall contain lines of
82179 these forms:

82180 "%da%d\n", *<num1>*, *<num2>*

82181 "%da%d,%d\n", *<num1>*, *<num2>*, *<num3>*

82182 "%dd%d\n", *<num1>*, *<num2>*

82183 "%d,%dd%d\n", *<num1>*, *<num2>*, *<num3>*

82184 "%dc%d\n", *<num1>*, *<num2>*

82185 "%d,%dc%d\n", *<num1>*, *<num2>*, *<num3>*

82186 "%dc%d,%d\n", *<num1>*, *<num2>*, *<num3>*

82187 "%d,%dc%d,%d\n", *<num1>*, *<num2>*, *<num3>*, *<num4>*

82188 These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the
82189 action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d*
82190 and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in
82191 *ed*, identical pairs (where *num1=num2*) are abbreviated as a single number.

82192 Following each of these lines, *diff* shall write to standard output all lines affected in the first file
82193 using the format:

82194 "<Δ%s", *<line>*

82195 and all lines affected in the second file using the format:

82196 ">Δ%s", *<line>*

82197 If there are lines affected in both *file1* and *file2* (as with the *c* subcommand), the changes are
82198 separated with a line consisting of three hyphens:

82199 "---\n"

82200 **Diff -e Output Format**

82201 With the `-e` option, a script shall be produced that shall, when provided as input to `ed`, along
 82202 with an appended `w` (write) command, convert *file1* into *file2*. Only the `a` (append), `c` (change), `d`
 82203 (delete), `i` (insert), and `s` (substitute) commands of `ed` shall be used in this script. Text lines,
 82204 except those consisting of the single character period (`' . '`), shall be output as they appear in the
 82205 file.

82206 **Diff -f Output Format**

82207 With the `-f` option, an alternative format of script shall be produced. It is similar to that
 82208 produced by `-e`, with the following differences:

- 82209 1. It is expressed in reverse sequence; the output of `-e` orders changes from the end of the
 82210 file to the beginning; the `-f` from beginning to end.
- 82211 2. The command form `<lines> <command-letter>` used by `-e` is reversed. For example,
 82212 `10c` with `-e` would be `c10` with `-f`.
- 82213 3. The form used for ranges of line numbers is `<space>`-separated, rather than comma-
 82214 separated.

82215 **Diff -c or -C Output Format**

82216 With the `-c` or `-C` option, the output format shall consist of affected lines along with
 82217 surrounding lines of context. The affected lines shall show which ones need to be deleted or
 82218 changed in *file1*, and those added from *file2*. With the `-c` option, three lines of context, if
 82219 available, shall be written before and after the affected lines. With the `-C` option, the user can
 82220 specify how many lines of context are written. The exact format follows.

82221 The name and last modification time of each file shall be output in the following format:

```
82222 "*** %s %s\n", file1, <file1 timestamp>
82223 "--- %s %s\n", file2, <file2 timestamp>
```

82224 Each `<file>` field shall be the pathname of the corresponding file being compared. The pathname
 82225 written for standard input is unspecified.

82226 In the POSIX locale, each `<timestamp>` field shall be equivalent to the output from the following
 82227 command:

```
82228 date "+%a %b %e %T %Y"
```

82229 without the trailing `<newline>`, executed at the time of last modification of the corresponding
 82230 file (or the current time, if the file is standard input).

82231 Then, the following output formats shall be applied for every set of changes.

82232 First, a line shall be written in the following format:

```
82233 "*****\n"
```

82234 Next, the range of lines in *file1* shall be written in the following format if the range contains two
 82235 or more lines:

```
82236 "*** %d,%d ****\n", <beginning line number>, <ending line number>
```

82237 and the following format otherwise:

```
82238 "*** %d ****\n", <ending line number>
```

82239 The ending line number of an empty range shall be the number of the preceding line, or 0 if the
 82240 range is at the start of the file.

82241 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected

82242 lines shall be written in the following format:

82243 " Δ %s", <unaffected_line>

82244 Deleted lines shall be written as:

82245 "- Δ %s", <deleted_line>

82246 Changed lines shall be written as:

82247 "! Δ %s", <changed_line>

82248 Next, the range of lines in *file2* shall be written in the following format if the range contains two

82249 or more lines:

82250 "--- %d,%d ----\n", <beginning line number>, <ending line number>

82251 and the following format otherwise:

82252 "--- %d ----\n", <ending line number>

82253 Then, lines of context and changed lines shall be written as described in the previous formats.

82254 Lines added from *file2* shall be written in the following format:

82255 "+ Δ %s", <added_line>

82256 **Diff -u or -U Output Format**

82257 The -u or -U options behave like the -c or -C options, except that the context lines are not

82258 repeated; instead, the context, deleted, and added lines are shown together, interleaved. The

82259 exact format follows.

82260 The name and last modification time of each file shall be output in the following format:

82261 "--- Δ %s%s%s Δ %s0, file1, <file1 timestamp>, <file1 frac>, <file1 zone>

82262 "+++ Δ %s%s%s Δ %s0, file2, <file2 timestamp>, <file2 frac>, <file2 zone>

82263 Each <file> field shall be the pathname of the corresponding file being compared, or the single

82264 character '-' if standard input is being compared. However, if the pathname contains a <tab>

82265 or a <newline>, or if it does not consist entirely of characters taken from the portable character

82266 set, the behavior is implementation-defined.

82267 Each <timestamp> field shall be equivalent to the output from the following command:

82268 date '+%Y-%m-%d Δ %H:%M:%S'

82269 without the trailing <newline>, executed at the time of last modification of the corresponding

82270 file (or the current time, if the file is standard input).

82271 Each <frac> field shall be either empty, or a decimal point followed by at least one decimal digit,

82272 indicating the fractional-seconds part (if any) of the file timestamp. The number of fractional

82273 digits shall be at least the number needed to represent the file's timestamp without loss of

82274 information.

82275 Each <zone> field shall be of the form "shhmm", where "shh" is a signed two-digit decimal

82276 number in the range -24 through +25, and "mm" is an unsigned two-digit decimal number in the

82277 range 00 through 59. It represents the timezone of the timestamp as the number of hours (hh)

82278 and minutes (mm) east (+) or west (-) of UTC for the timestamp. If the hours and minutes are

82279 both zero, the sign shall be '+'. However, if the timezone is not an integral number of minutes

82280 away from UTC, the <zone> field is implementation-defined.

82281 Then, the following output formats shall be applied for every set of changes.

82282 First, the range of lines in each file shall be written in the following format:

82283 "@@Δ-%sΔ+%sΔ@" , <file1 range> , <file2 range>

82284 Each <range> field shall be of the form:

82285 "%1d" , <beginning line number>

82286 if the range contains exactly one line, and:

82287 "%1d,%1d" , <beginning line number> , <number of lines>

82288 otherwise. If a range is empty, its beginning line number shall be the number of the line just
82289 before the range, or 0 if the empty range starts the file.

82290 Next, the affected lines along with lines of context shall be written. Each non-empty unaffected
82291 line shall be written in the following format:

82292 "Δ%s" , <unaffected_line>

82293 where the contents of the unaffected line shall be taken from *file1*. It is implementation-defined
82294 whether an empty unaffected line is written as an empty line or a line containing a single
82295 <space> character. This line also represents the same line of *file2*, even though *file2*'s line may
82296 contain different contents due to the **-b**. Deleted lines shall be written as:

82297 "-%s" , <deleted_line>

82298 Added lines shall be written as:

82299 "+%s" , <added_line>

82300 The order of lines written shall be the same as that of the corresponding file. A deleted line shall
82301 never be written immediately after an added line.

82302 If **-U n** is specified, the output shall contain no more than *n* consecutive unaffected lines; and if
82303 the output contains an affected line and this line is adjacent to up to *n* consecutive unaffected
82304 lines in the corresponding file, the output shall contain these unaffected lines. **-u** shall act like
82305 **-U3**.

82306 **STDERR**

82307 The standard error shall be used only for diagnostic messages.

82308 **OUTPUT FILES**

82309 None.

82310 **EXTENDED DESCRIPTION**

82311 None.

82312 **EXIT STATUS**

82313 The following exit values shall be returned:

82314 0 No differences were found.

82315 1 Differences were found.

82316 >1 An error occurred.

82317 **CONSEQUENCES OF ERRORS**

APPLICATION USAGE

If lines at the end of a file are changed and other lines are added, *diff* output may show this as a delete and add, as a change, or as a change and add; *diff* is not expected to know which happened and users should not care about the difference in output as long as it clearly shows the differences between the files.

EXAMPLES

If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**, the command:

```
diff -r dir1 dir2
```

could produce output similar to:

```
Common subdirectories: dir1/x and dir2/x
Only in dir2/x: y
diff -r dir1/x/date.out dir2/x/date.out
1c1
< Mon Jul  2 13:12:16 PDT 1990
---
> Tue Jun 19 21:41:39 PDT 1990
```

RATIONALE

The **-h** option was omitted because it was insufficiently specified and does not add to applications portability.

Historical implementations employ algorithms that do not always produce a minimum list of differences; the current language about making every effort is the best this volume of POSIX.1-200x can do, as there is no metric that could be employed to judge the quality of implementations against any and all file contents. The statement “This list should be minimal” clearly implies that implementations are not expected to provide the following output when comparing two 100-line files that differ in only one character on a single line:

```
1,100c1,100
all 100 lines from file1 preceded with "< "
---
all 100 lines from file2 preceded with "> "
```

The “Only in” messages required when the **-r** option is specified are not used by most historical implementations if the **-e** option is also specified. It is required here because it provides useful information that must be provided to update a target directory hierarchy to match a source hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when the **-r** option is specified. They are allowed here but are not required because they are reporting on something that is the same, not reporting a difference, and are not needed to update a target hierarchy.

The **-c** option, which writes output in a format using lines of context, has been included. The format is useful for a variety of reasons, among them being much improved readability and the ability to understand difference changes when the target file has line numbers that differ from another similar, but slightly different, copy. The *patch* utility is most valuable when working with difference listings using a context format. The BSD version of **-c** takes an optional argument specifying the amount of context. Rather than overloading **-c** and breaking the Utility Syntax Guidelines for *diff*, the standard developers decided to add a separate option for specifying a context diff with a specified amount of context (**-C**). Also, the format for context *diffs* was extended slightly in 4.3 BSD to allow multiple changes that are within context lines from each other to be merged together. The output format contains an additional four asterisks after the range of affected lines in the first filename. This was to provide a flag for old programs (like old versions of *patch*) that only understand the old context format. The version of context

82369 described here does not require that multiple changes within context lines be merged, but it does
 82370 not prohibit it either. The extension is upwards-compatible, so any vendors that wish to retain
 82371 the old version of *diff* can do so by adding the extra four asterisks (that is, utilities that currently
 82372 use *diff* and understand the new merged format will also understand the old unmerged format,
 82373 but not *vice versa*).

82374 The **-u** and **-U** options of GNU *diff* have been included. Their output format, designed by
 82375 Wayne Davison, takes up less space than **-c** and **-C** format, and in many cases is easier to read.
 82376 The format's timestamps do not vary by locale, so *LC_TIME* does not affect it. The format's line
 82377 numbers are rendered with the `%1d` format, not `%d`, because the file format notation rules would
 82378 allow extra `<blank>`s to appear around the numbers.

82379 The substitute command was added as an additional format for the **-e** option. This was added
 82380 to provide implementations with a way to fix the classic "dot alone on a line" bug present in
 82381 many versions of *diff*. Since many implementations have fixed this bug, the standard developers
 82382 decided not to standardize broken behavior, but rather to provide the necessary tool for fixing
 82383 the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then
 82384 terminate the append command with a period, and then use the substitute command to convert
 82385 the two periods into one period.

82386 The BSD-derived **-r** option was added to provide a mechanism for using *diff* to compare two file
 82387 system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not
 82388 easily reproducible with the *find* utility.

82389 The requirement that *diff* not compare files in some circumstances, even though they have the
 82390 same name, is based on the actual output of historical implementations. The specified behavior
 82391 precludes the problems arising from running into FIFOs and other files that would cause *diff* to
 82392 hang waiting for input with no indication to the user that *diff* was hung. An earlier version of
 82393 this standard specified the output format more precisely, but in practice this requirement was
 82394 widely ignored and the benefit of standardization seemed small, so it is now unspecified. In
 82395 most common usage, *diff -r* should indicate differences in the file hierarchies, not the difference
 82396 of contents of devices pointed to by the hierarchies.

82397 Many early implementations of *diff* require seekable files. Since the System Interfaces volume of
 82398 POSIX.1-200x supports named pipes, the standard developers decided that such a restriction
 82399 was unreasonable. Note also that the allowed filename – almost always refers to a pipe.

82400 No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in
 82401 that it prints out all of the differences at the current level, including the statements about all
 82402 common subdirectories before recursing into those subdirectories.

82403 The message:

82404 `"diff %s %s %s\n", <diff_options>, <filename1>, <filename2>`

82405 does not vary by locale because it is the representation of a command, not an English sentence.

82406 FUTURE DIRECTIONS

82407 None.

82411 CHANGE HISTORY

82412 First released in Issue 2.

82413	Issue 5	
82414		The FUTURE DIRECTIONS section is added.
82415	Issue 6	
82416		The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
82417		
82418		<ul style="list-style-type: none"> • The <code>-f</code> option is added.
82419		The output format for <code>-c</code> or <code>-C</code> format is changed to align with changes to the IEEE P1003.2b draft standard resulting from IEEE PASC Interpretation 1003.2 #71.
82420		
82421		The normative text is reworded to avoid use of the term “must” for application requirements.
82422		IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT section. This changes the specification of <i>diff</i> <code>-c</code> so that it agrees with existing practice when contexts contain zero lines or one line.
82423		
82424		
82425	Issue 7	
82426		Austin Group Interpretation 1003.1-2001 #115 and #114 are applied. +
82427		SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
82428		SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the <code>-u</code> option. -

DRAFT

82429 **NAME**
 82430 `dirname` — return the directory portion of a pathname

82431 **SYNOPSIS**
 82432 `dirname string`

82433 **DESCRIPTION**
 82434 The *string* operand shall be treated as a pathname, as defined in XBD [Section 3.265](#) (on page 70).
 82435 The string *string* shall be converted to the name of the directory containing the filename
 82436 corresponding to the last pathname component in *string*, performing actions equivalent to the
 82437 following steps in order:

- 82438 1. If *string* is `//`, skip steps 2 to 5.
- 82439 2. If *string* consists entirely of slash characters, *string* shall be set to a single slash character.
 82440 In this case, skip steps 3 to 8.
- 82441 3. If there are any trailing slash characters in *string*, they shall be removed.
- 82442 4. If there are no slash characters remaining in *string*, *string* shall be set to a single period
 82443 character. In this case, skip steps 5 to 8.
- 82444 5. If there are any trailing non-slash characters in *string*, they shall be removed.
- 82445 6. If the remaining *string* is `//`, it is implementation-defined whether steps 7 and 8 are
 82446 skipped or processed.
- 82447 7. If there are any trailing slash characters in *string*, they shall be removed.
- 82448 8. If the remaining *string* is empty, *string* shall be set to a single slash character.

82449 The resulting string shall be written to standard output.

82450 **OPTIONS**
 82451 None.

82452 **OPERANDS**
 82453 The following operand shall be supported:

82454 *string* A string.

82455 **STDIN**
 82456 Not used.

82457 **INPUT FILES**
 82458 None.

82459 **ENVIRONMENT VARIABLES**
 82460 The following environment variables shall affect the execution of *dirname*:

- | | | |
|-------|-----------------|--|
| 82461 | <i>LANG</i> | Provide a default value for the internationalization variables that are unset or null.
(See XBD Section 8.2 (on page 160) for the precedence of internationalization
variables used to determine the values of locale categories.) |
| 82462 | | |
| 82463 | | |
| 82464 | <i>LC_ALL</i> | If set to a non-empty string value, override the values of all the other
internationalization variables. |
| 82465 | | |
| 82466 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as
characters (for example, single-byte as opposed to multi-byte characters in
arguments). |
| 82467 | | |
| 82468 | | |

dirname

Utilities

82469 *LC_MESSAGES*
 82470 Determine the locale that should be used to affect the format and contents of
 82471 diagnostic messages written to standard error.

82472 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

82473
 82474 Default.

STDOUT

82475 The *dirname* utility shall write a line to the standard output in the following format:

82476 "%s\n", *<resulting string>*
 82477

STDERR

82478 The standard error shall be used only for diagnostic messages.
 82479

OUTPUT FILES

82480 None.
 82481

EXTENDED DESCRIPTION

82482 None.
 82483

EXIT STATUS

82484 The following exit values shall be returned:
 82485

82486 0 Successful completion.

82487 >0 An error occurred.

CONSEQUENCES OF ERRORS

82488 Default.
 82489

APPLICATION USAGE

82490 The definition of *pathname* specifies implementation-defined behavior for pathnames starting
 82491 with two slash characters. Therefore, applications shall not arbitrarily add slashes to the
 82492 beginning of a pathname unless they can ensure that there are more or less than two or are
 82493 prepared to deal with the implementation-defined consequences.
 82494

EXAMPLES

Command	Results
<i>dirname /</i>	/
<i>dirname //</i>	/ or //
<i>dirname /a/b/</i>	/a
<i>dirname //a//b//</i>	//a
<i>dirname</i>	Unspecified
<i>dirname a</i>	.(\$? = 0)
<i>dirname ""</i>	.(\$? = 0)
<i>dirname /a</i>	/
<i>dirname /a/b</i>	/a
<i>dirname a/b</i>	a

RATIONALE

82507 The *dirname* utility originated in System III. It has evolved through the System V releases to a
 82508 version that matches the requirements specified in this description in System V Release 3. 4.3
 82509 BSD and earlier versions did not include *dirname*.
 82510

82511 The behaviors of *basename* and *dirname* in this volume of POSIX.1-200x have been coordinated so
 82512 that when *string* is a valid pathname:

82513 $\$(basename \textit{string})$

82514 would be a valid filename for the file in the directory:

82515 `$(dirname "string")`

82516 This would not work for the versions of these utilities in early proposals due to the way
82517 processing of trailing slashes was specified. Consideration was given to leaving processing
82518 unspecified if there were trailing slashes, but this cannot be done; XBD [Section 3.265](#) (on page
82519 70) allows trailing slashes. The *basename* and *dirname* utilities have to specify consistent handling
82520 for all valid pathnames.

82521 FUTURE DIRECTIONS

82522 None.

82523 SEE ALSO

82524 [Section 2.5](#) (on page 2249), *basename*

82525 XBD [Section 3.265](#) (on page 70), [Chapter 8](#) (on page 159)

82526 CHANGE HISTORY

82527 First released in Issue 2.

82528 **NAME**
 82529 du — estimate file space usage

82530 **SYNOPSIS**
 82531 du [-a|-s] [-kx] [-H|-L] [*file*...]

82532 **DESCRIPTION**
 82533 By default, the *du* utility shall write to standard output the size of the file space allocated to, and
 82534 the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the
 82535 specified files. By default, when a symbolic link is encountered on the command line or in the
 82536 file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the
 82537 link), and shall not follow the link to another portion of the file hierarchy. The size of the file
 82538 space allocated to a file of type directory shall be defined as the sum total of space allocated to
 82539 all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

82540 When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the
 82541 final exit status is affected. Files with multiple links shall be counted and written for only one
 82542 entry. The directory entry that is selected in the report is unspecified. By default, file sizes shall
 82543 be written in 512-byte units, rounded up to the next 512-byte unit.

82544 **OPTIONS**
 82545 The *du* utility shall conform to XBD Section 12.2 (on page 201).

82546 The following options shall be supported:

82547 **-a** In addition to the default output, report the size of each file not of type directory in
 82548 the file hierarchy rooted in the specified file. Regardless of the presence of the **-a**
 82549 option, non-directories given as *file* operands shall always be listed.

82550 **-H** If a symbolic link is specified on the command line, *du* shall count the size of the
 82551 file or file hierarchy referenced by the link.

82552 **-k** Write the files sizes in units of 1 024 bytes, rather than the default 512-byte units.

82553 **-L** If a symbolic link is specified on the command line or encountered during the
 82554 traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy
 82555 referenced by the link.

82556 **-s** Instead of the default output, report only the total sum for each of the specified
 82557 files.

82558 **-x** When evaluating file sizes, evaluate only those files that have the same device as
 82559 the file specified by the *file* operand.

82560 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered
 82561 an error. The last option specified shall determine the behavior of the utility.

82562 **OPERANDS**
 82563 The following operand shall be supported:

82564 *file* The pathname of a file whose size is to be written. If no *file* is specified, the current
 82565 directory shall be used.

82566 **STDIN**
 82567 Not used.

82568 **INPUT FILES**

82569 None.

82570 **ENVIRONMENT VARIABLES**82571 The following environment variables shall affect the execution of *du*:

82572 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 82573 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 82574 variables used to determine the values of locale categories.)

82575 **LC_ALL** If set to a non-empty string value, override the values of all the other
 82576 internationalization variables.

82577 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 82578 characters (for example, single-byte as opposed to multi-byte characters in
 82579 arguments).

82580 **LC_MESSAGES**

82581 Determine the locale that should be used to affect the format and contents of
 82582 diagnostic messages written to standard error.

82583 **XSI NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

82584 **ASYNCHRONOUS EVENTS**

82585 Default.

82586 **STDOUT**

82587 The output from *du* shall consist of the amount of space allocated to a file and the name of the
 82588 file, in the following format:

82589 "%d %s\n", <size>, <pathname>

82590 **STDERR**

82591 The standard error shall be used only for diagnostic messages.

82592 **OUTPUT FILES**

82593 None.

82594 **EXTENDED DESCRIPTION**

82595 None.

82596 **EXIT STATUS**

82597 The following exit values shall be returned:

82598 0 Successful completion.

82599 >0 An error occurred.

82600 **CONSEQUENCES OF ERRORS**

82601 Default.

82602 **APPLICATION USAGE**

82603 None.

82604 **EXAMPLES**

82605 None.

82606 **RATIONALE**

82607 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other
 82608 utilities in this volume of POSIX.1-200x. This does not mandate that the file system itself be
 82609 based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed by
 82610 the standard developers that 512 bytes was the best default unit because of its complete
 82611 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and
 82612 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the

- 82613 1 024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts
82614 relying on the 512-byte units.
- 82615 The **-b** option was added to an early proposal to provide a resolution to the situation where
82616 System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-
82617 defined concept. (In common usage, the block size is 512 bytes for System V and 1 024 bytes for
82618 BSD systems.) However, **-b** was later deleted, since the default was eventually decided as
82619 512-byte units.
- 82620 Historical file systems provided no way to obtain exact figures for the space allocation given to
82621 files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks*
82622 being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is
82623 space used by the file system in the storage of the file, but that need not be counted in the space
82624 allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position
82625 beyond the end of the file and data has subsequently been written at that point. A file system
82626 need not allocate all the intervening zero-filled blocks to such a file. It is up to the
82627 implementation to define exactly how accurate its methods are.
- 82628 The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell
82629 and Utilities description is implied by the language in the SVID where **-s** is described as causing
82630 “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly
82631 Conforming POSIX Shell and Utilities Application cannot use that combination.
- 82632 The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not
82633 listing non-directories explicitly given as operands, unless the **-a** option is specified, was
82634 considered a bug; the BSD-based behavior (report for all operands) is mandated. The default
82635 behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no
82636 messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and
82637 Utilities default behavior shall be to produce such messages. These messages can be turned off
82638 with shell redirection to achieve the System V behavior.
- 82639 The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of
82640 POSIX.1-200x because there was no other historical method of limiting the *du* search to a single
82641 file hierarchy. This limitation of the search is necessary to make it possible to obtain file space
82642 usage information about a file system on which other file systems are mounted, without having
82643 to resort to a lengthy *find* and *awk* script.
- 82644 **FUTURE DIRECTIONS**
- 82645 None.

- 82651 First released in Issue 2.
- 82652 **Issue 6**
- 82653 This utility is marked as part of the User Portability Utilities option.
- 82654 The APPLICATION USAGE section is added.
- 82655 The obsolescent **-r** option is removed.
- 82656 The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had
82657 incorrectly been marked LEGACY in Issue 5.
- 82658 The **-H** and **-L** options for symbolic links are added as described in the IEEE P1003.2b draft
82659 standard.

82660

Issue 7

82661

The *du* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

82662

82663

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

82664 **NAME**
 82665 echo — write arguments to standard output

82666 **SYNOPSIS**
 82667 echo [*string...*]

82668 **DESCRIPTION**
 82669 The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are
 82670 no arguments, only the <newline> is written.

82671 **OPTIONS**
 82672 The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10
 82673 of XBD [Section 12.2](#) (on page 201); "--" shall be recognized as a string operand.
 82674 Implementations shall not support any options.

82675 **OPERANDS**
 82676 The following operands shall be supported:

82677 *string* A string to be written to standard output. If the first operand is *-n*, or if any of the
 82678 operands contain a backslash ('**') character, the results are implementation-
 82679 defined.

82680 XSI On XSI-conformant systems, if the first operand is *-n*, it shall be treated as a string,
 82681 not an option. The following character sequences shall be recognized on XSI-
 82682 conformant systems within any of the arguments:

82683	<i>\a</i>	Write an <alert>.
82684	<i>\b</i>	Write a <backspace>.
82685	<i>\c</i>	Suppress the <newline> that otherwise follows the final argument in the output. All characters following the ' <i>\c</i> ' in the arguments shall be ignored.
82688	<i>\f</i>	Write a <form-feed>.
82689	<i>\n</i>	Write a <newline>.
82690	<i>\r</i>	Write a <carriage-return>.
82691	<i>\t</i>	Write a <tab>.
82692	<i>\v</i>	Write a <vertical-tab>.
82693	<i>\\</i>	Write a backslash character.
82694	<i>\0num</i>	Write an 8-bit value that is the zero, one, two, or three-digit octal number <i>num</i> .
82695		

82696 **STDIN**
 82697 Not used.

82698 **INPUT FILES**
 82699 None.

82700 **ENVIRONMENT VARIABLES**
 82701 The following environment variables shall affect the execution of *echo*:

82702 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 82703 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 82704 variables used to determine the values of locale categories.)

82705 *LC_ALL* If set to a non-empty string value, override the values of all the other
 82706 internationalization variables.

82707 XSI *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 82708 characters (for example, single-byte as opposed to multi-byte characters in
 82709 arguments).

82710 *LC_MESSAGES*
 82711 Determine the locale that should be used to affect the format and contents of
 82712 diagnostic messages written to standard error.

82713 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

82714 **ASYNCHRONOUS EVENTS**

82715 Default.

82716 **STDOUT**

82717 The *echo* utility arguments shall be separated by single <space>s and a <newline> shall follow
 82718 XSI the last argument. Output transformations shall occur based on the escape sequences in the
 82719 input. See the OPERANDS section.

82720 **STDERR**

82721 The standard error shall be used only for diagnostic messages.

82722 **OUTPUT FILES**

82723 None.

82724 **EXTENDED DESCRIPTION**

82725 None.

82726 **EXIT STATUS**

82727 The following exit values shall be returned:

82728 0 Successful completion.

82729 >0 An error occurred.

82730 **CONSEQUENCES OF ERRORS**

82731 Default.

82732 **APPLICATION USAGE**

82733 It is not possible to use *echo* portably across all POSIX systems unless both *-n* (as the first
 82734 argument) and escape sequences are omitted.

82735 The *printf* utility can be used portably to emulate any of the traditional behaviors of the *echo*
 82736 utility as follows (assuming that *IFS* has its standard value or is unset):

- 82737 • The historic System V *echo* and the requirements on XSI implementations in this volume of
 82738 POSIX.1-200x are equivalent to:

```
82739            printf "%b\n" "$*"

```

- 82740 • The BSD *echo* is equivalent to:

```
82741            if [ "$1" = "X-n" ]

```

```
82742            then

```

```
82743                shift

```

```
82744                printf "%s" "$*"

```

```
82745            else

```

```
82746                printf "%s\n" "$*"

```

82747 f i
82748 New applications are encouraged to use *printf* instead of *echo*.

EXAMPLES

82749 None.
82750

RATIONALE

82751 The *echo* utility has not been made obsolescent because of its extremely widespread use in
82752 historical applications. Conforming applications that wish to do prompting without <newline>s
82753 or that could possibly be expecting to echo a *-n*, should use the *printf* utility derived from the
82754 Ninth Edition system.
82755

82756 As specified, *echo* writes its arguments in the simplest of ways. The two different historical
82757 versions of *echo* vary in fatally incompatible ways.

82758 The BSD *echo* checks the first argument for the string *-n* which causes it to suppress the
82759 <newline> that would otherwise follow the final argument in the output.

82760 The System V *echo* does not support any options, but allows escape sequences within its
82761 operands, as described for XSI implementations in the OPERANDS section.

82762 The *echo* utility does not support Utility Syntax Guideline 10 because historical applications
82763 depend on *echo* to echo *all* of its arguments, except for the *-n* option in the BSD version.

FUTURE DIRECTIONS

82764 None.

CHANGE HISTORY

82769 First released in Issue 2.
82770

Issue 5

82771 In the OPTIONS section, the last sentence is changed to indicate that implementations “do not”
82772 support any options; in the previous issue this said “need not”.
82773

Issue 6

82774 The following new requirements on POSIX implementations derive from alignment with the
82775 Single UNIX Specification:
82776

- 82777 • A set of character sequences is defined as *string* operands.
- 82778 • *LC_CTYPE* is added to the list of environment variables affecting *echo*.
- 82779 • In the OPTIONS section, implementations shall not support any options.

82780 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can
82781 accommodate historical BSD behavior.

Issue 7

82782 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
82783

82784 **NAME**

82785 ed — edit text

82786 **SYNOPSIS**82787 ed [-p *string*] [-s] [*file*]82788 **DESCRIPTION**

82789 The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*. In
 82790 command mode the input characters shall be interpreted as commands, and in input mode they
 82791 shall be interpreted as text. See the EXTENDED DESCRIPTION section.

82792 If an operand is '-', the results are unspecified.

82793 **OPTIONS**

82794 The *ed* utility shall conform to XBD Section 12.2 (on page 201), except for the unspecified usage
 82795 of '-'.

82796 The following options shall be supported:

82797 **-p *string*** Use *string* as the prompt string when in command mode. By default, there shall be
 82798 no prompt string.

82799 **-s** Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the '!'
 82800 prompt after a *!command*.

82801 **OPERANDS**

82802 The following operand shall be supported:

82803 ***file*** If the *file* argument is given, *ed* shall simulate an **e** command on the file named by
 82804 the pathname, *file*, before accepting commands from the standard input.

82805 **STDIN**

82806 The standard input shall be a text file consisting of commands, as described in the EXTENDED
 82807 DESCRIPTION section.

82808 **INPUT FILES**

82809 The input files shall be text files.

82810 **ENVIRONMENT VARIABLES**82811 The following environment variables shall affect the execution of *ed*:

82812 **HOME** Determine the pathname of the user's home directory.

82813 **LANG** Provide a default value for the internationalization variables that are unset or null.
 82814 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 82815 variables used to determine the values of locale categories.)

82816 **LC_ALL** If set to a non-empty string value, override the values of all the other
 82817 internationalization variables.

82818 **LC_COLLATE**

82819 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 82820 character collating elements within regular expressions.

82821 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 82822 characters (for example, single-byte as opposed to multi-byte characters in
 82823 arguments and input files) and the behavior of character classes within regular
 82824 expressions.

82825 *LC_MESSAGES*
 82826 Determine the locale that should be used to affect the format and contents of
 82827 diagnostic messages written to standard error and informative messages written to
 82828 standard output.

82829 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

82830 ASYNCHRONOUS EVENTS

82831 The *ed* utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS
 82832 section in [Section 1.4](#), on page 2235) with the following exceptions:

82833 SIGINT The *ed* utility shall interrupt its current activity, write the string "?\n" to standard
 82834 output, and return to command mode (see the EXTENDED DESCRIPTION
 82835 section).

82836 SIGHUP If the buffer is not empty and has changed since the last write, the *ed* utility shall
 82837 attempt to write a copy of the buffer in a file. First, the file named **ed.hup** in the
 82838 current directory shall be used; if that fails, the file named **ed.hup** in the directory
 82839 named by the *HOME* environment variable shall be used. In any case, the *ed* utility
 82840 shall exit without writing the file to the currently remembered pathname and
 82841 without returning to command mode.

82842 SIGQUIT The *ed* utility shall ignore this event.

82843 STDOUT

82844 Various editing commands and the prompting feature (see **-p**) write to standard output, as
 82845 described in the EXTENDED DESCRIPTION section.

82846 STDERR

82847 The standard error shall be used only for diagnostic messages.

82848 OUTPUT FILES

82849 The output files shall be text files whose formats are dependent on the editing commands given.

82850 EXTENDED DESCRIPTION

82851 The *ed* utility shall operate on a copy of the file it is editing; changes made to the copy shall have
 82852 no effect on the file until a **w** (write) command is given. The copy of the text is called the *buffer*.

82853 Commands to *ed* have a simple and regular structure: zero, one, or two *addresses* followed by a
 82854 single-character *command*, possibly followed by parameters to that command. These addresses
 82855 specify one or more lines in the buffer. Every command that requires addresses has default
 82856 addresses, so that the addresses very often can be omitted. If the **-p** option is specified, the
 82857 prompt string shall be written to standard output before each command is read.

82858 In general, only one command can appear on a line. Certain commands allow text to be input.
 82859 This text is placed in the appropriate place in the buffer. While *ed* is accepting text, it is said to be
 82860 in *input mode*. In this mode, no commands shall be recognized; all input is merely collected.
 82861 Input mode is terminated by entering a line consisting of two characters: a period ('.')
 82862 followed by a <newline>. This line is not considered part of the input text.

82863 Regular Expressions in ed

82864 The *ed* utility shall support basic regular expressions, as described in XBD [Section 9.3](#) (on page
 82865 169). Since regular expressions in *ed* are always matched against single lines (excluding the
 82866 terminating <newline>s), never against any larger section of text, there is no way for a regular
 82867 expression to match a <newline>.

82868 A null RE shall be equivalent to the last RE encountered.

82869 Regular expressions are used in addresses to specify lines, and in some commands (for example,
 82870 the **s** substitute command) to specify portions of a line to be substituted.

82871

Addresses in ed

82872

Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. If the edit buffer is not empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

82873

82874

Addresses shall be constructed as follows:

82876

1. The period character (' . ') shall address the current line.

82877

2. The dollar sign character (' \$ ') shall address the last line of the edit buffer.

82878

3. The positive decimal number *n* shall address the *n*th line of the edit buffer.

82879

4. The apostrophe-x character pair (" ' x ") shall address the line marked with the mark name character *x*, which shall be a lowercase letter from the portable character set. It shall be an error if the character has not been set to mark a line or if the line that was marked is not currently present in the edit buffer.

82880

82881

82882

82883

5. A BRE enclosed by slash characters (' / ') shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of slash characters shall address the next line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second slash can be omitted at the end of a command line. Within the BRE, a backslash-slash pair (" \ / ") shall represent a literal slash instead of the BRE delimiter. If necessary, the search shall wrap around to the beginning of the buffer and continue up to and including the current line, so that the entire buffer is searched.

82884

82885

82886

82887

82888

82889

82900

82901

82902

6. A BRE enclosed by question-mark characters (' ? ') shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of question-mark characters (" ?? ") shall address the previous line for which the line excluding the terminating <newline> matches the last BRE encountered. In addition, the second question-mark can be omitted at the end of a command line. Within the BRE, a backslash-question-mark pair (" \ ? ") shall represent a literal question mark instead of the BRE delimiter. If necessary, the search shall wrap around to the end of the buffer and continue up to and including the current line, so that the entire buffer is searched.

82893

82894

82895

82896

82897

82898

82899

82900

82901

82902

7. A plus-sign (' + ') or hyphen character (' - ') followed by a decimal number shall address the current line plus or minus the number. A plus-sign or hyphen character not followed by a decimal number shall address the current line plus or minus 1.

82903

82904

82905

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

82906

82907

82908

- A plus-sign or hyphen character followed by a decimal number shall add or subtract, respectively, the indicated number of lines to or from the address. A plus-sign or hyphen character not followed by a decimal number shall add or subtract 1 to or from the address.

82909

82910

- A decimal number shall add the indicated number of lines to the address.

82911

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a matching line.

82912

82913

82914

82915

82916

Commands accept zero, one, or two addresses. If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more

82917

82918 than the required number of addresses are provided to a command, the addresses specified first
82919 shall be evaluated and then discarded until the maximum number of valid addresses remain, for
82920 the specified command.

82921 Addresses shall be separated from each other by a comma (',') or semicolon character (';').
82922 In the case of a semicolon separator, the current line ('.') shall be set to the first address, and
82923 only then will the second address be calculated. This feature can be used to determine the
82924 starting line for forwards and backwards searches; see rules 5. and 6.

82925 Addresses can be omitted on either side of the comma or semicolon separator, in which case the
82926 resulting address pairs shall be as follows:

Specified	Resulting
,	1 , \$
, addr	1 , addr
addr ,	addr , addr
;	. ; \$
; addr	. ; addr
addr ;	addr ; addr

82934 Any <blank>s included between addresses, address separators, or address offsets shall be
82935 ignored.

82936 Commands in ed

82937 In the following list of *ed* commands, the default addresses are shown in parentheses. The
82938 number of addresses shown in the default shall be the number expected by the command. The
82939 parentheses are not part of the address; they show that the given addresses are the default.

82940 It is generally invalid for more than one command to appear on a line. However, any command
82941 (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for
82942 the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be
82943 written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used
82944 with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but
82945 it is unspecified whether the suffix writes the current line again in the requested format or
82946 whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l**
82947 suffix) shall either write just the current line or write it twice—once as specified for **p** and once
82948 as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

82949 Each address component can be preceded by zero or more <blank>s. The command letter can
82950 be preceded by zero or more <blank>s. If a suffix letter (**l**, **n**, or **p**) is given, the application shall
82951 ensure that it immediately follows the command.

82952 The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the
82953 command letter by one or more <blank>s.

82954 If changes have been made in the buffer since the last **w** command that wrote the entire buffer, *ed*
82955 shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands.
82956 The *ed* utility shall write the string:

82957 " ?\n "

82958 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to
82959 standard output and shall continue in command mode with the current line number unchanged.
82960 If the **e** or **q** command is repeated with no intervening command, it shall take effect.

82961 If a terminal disconnect (see XBD Chapter 11 (on page 185), Modem Disconnect and Closing a
82962 Device Terminal), is detected:

- 82963
- If accompanied by a SIGHUP signal, the *ed* utility shall operate as described in the ASYNCHRONOUS EVENTS section for a SIGHUP signal.
- 82964
- 82965
- If not accompanied by a SIGHUP signal, the *ed* utility shall act as if an end-of-file had been detected on standard input.
- 82966

82967 If an end-of-file is detected on standard input:

- 82968
- If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command mode. It is unspecified if any partially entered lines (that is, input text without a terminating <newline>) are discarded from the input text.
- 82969
- 82970
- If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.
- 82971

82972 If the closing delimiter of an RE or of a replacement string (for example, ' / ') in a **g**, **G**, **s**, **v**, or **V**

82973 command would be the last character before a <newline>, that delimiter can be omitted, in

82974 which case the addressed line shall be written. For example, the following pairs of commands

82975 are equivalent:

82976 `s/s1/s2` `s/s1/s2/p`

82977 `g/s1` `g/s1/p`

82978 `?s1` `?s1?`

82979 If an invalid command is entered, *ed* shall write the string:

82980 `"?\n"`

82981 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to

82982 standard output and shall continue in command mode with the current line number unchanged.

82983 Append Command

82984 *Synopsis:* `(.)a`

82985 `<text>`

82986 `.`

82987 The **a** command shall read the given text and append it after the addressed line; the current line

82988 number shall become the address of the last inserted line or, if there were none, the addressed

82989 line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at

82990 the beginning of the buffer.

82991 Change Command

82992 *Synopsis:* `(.,.)c`

82993 `<text>`

82994 `.`

82995 The **c** command shall delete the addressed lines, then accept input text that replaces these lines;

82996 the current line shall be set to the address of the last line input; or, if there were none, at the line

82997 after the last line deleted; if the lines deleted were originally at the end of the buffer, the current

82998 line number shall be set to the address of the new last line; if no lines remain in the buffer, the

82999 current line number shall be set to zero. Address 0 shall be valid for this command; it shall be

83000 interpreted as if address 1 were specified.

83001

Delete Command

83002

Synopsis: (. , .)d

83003

The **d** command shall delete the addressed lines from the buffer. The address of the line after the last line deleted shall become the current line number; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero.

83004

83005

83006

83007

Edit Command

83008

Synopsis: e [*file*]

83009

The **e** command shall delete the entire contents of the buffer and then read in the file named by the pathname *file*. The current line number shall be set to the address of the last line of the buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **f** command). The number of bytes read shall be written to standard output, unless the **-s** option was specified, in the following format:

83010

83011

83012

83013

83014

"%d\n", <number of bytes read>

83015

The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**, and **w** commands. If *file* is replaced by **'!'**, the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current *file*. All marks shall be discarded upon the completion of a successful **e** command. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

83016

83017

83018

83019

83020

83021

Edit Without Checking Command

83022

Synopsis: E [*file*]

83023

The **E** command shall possess all properties and restrictions of the **e** command except that the editor shall not check to see whether any changes have been made to the buffer since the last **w** command.

83024

83025

83026

Filename Command

83027

Synopsis: f [*file*]

83028

If *file* is given, the **f** command shall change the currently remembered pathname to *file*; whether the name is changed or not, it shall then write the (possibly new) currently remembered pathname to the standard output in the following format:

83029

83030

83031

"%s\n", <pathname>

83032

The current line number shall be unchanged.

83033

Global Command

83034

Synopsis: (1,\$)g/RE/command list

83035

In the **g** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, going sequentially from the beginning of the file to the end of the file, the given *command list* shall be executed for each marked line, with the current line number set to the address of that line. Any line modified by the *command list* shall be unmarked. When the **g** command completes, the current line number shall have the value assigned by the last command in the *command list*. If there were no matching lines, the current line number shall not be changed. A single command or the first of a list of commands shall appear on the same line as the global command. All lines of a multi-line list except the last line shall be ended with a backslash preceding the terminating <newline>; the **a**, **i**, and **c**

83036

83037

83038

83039

83040

83041

83042

83043

83044 commands and associated input are permitted. The `'.'` terminating input mode can be omitted
 83045 if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the `p`
 83046 command. The use of the `g`, `G`, `v`, `V`, and `!` commands in the *command list* produces undefined
 83047 results. Any character other than `<space>` or `<newline>` can be used instead of a slash to delimit
 83048 the RE. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by
 83049 a backslash.

83050 Interactive Global Command

83051 *Synopsis:* `(1, $)G/RE/`

83052 In the `G` command, the first step shall be to mark every line for which the line excluding the
 83053 terminating `<newline>` matches the given RE. Then, for every such line, that line shall be
 83054 written, the current line number shall be set to the address of that line, and any one command
 83055 (other than one of the `a`, `c`, `i`, `g`, `G`, `v`, and `V` commands) shall be read and executed. A `<newline>`
 83056 shall act as a null command (causing no action to be taken on the current line); an `'&'` shall
 83057 cause the re-execution of the most recent non-null command executed within the current
 83058 invocation of `G`. Note that the commands input as part of the execution of the `G` command can
 83059 address and affect any lines in the buffer. Any line modified by the command shall be
 83060 unmarked. The final value of the current line number shall be the value set by the last command
 83061 successfully executed. (Note that the last command successfully executed shall be the `G`
 83062 command itself if a command fails or the null command is specified.) If there were no matching
 83063 lines, the current line number shall not be changed. The `G` command can be terminated by a
 83064 SIGINT signal. Any character other than `<space>` or `<newline>` can be used instead of a slash to
 83065 delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a
 83066 literal character if it is preceded by a backslash.

83067 Help Command

83068 *Synopsis:* `h`

83069 The `h` command shall write a short message to standard output that explains the reason for the
 83070 most recent `'?'` notification. The current line number shall be unchanged.

83071 Help-Mode Command

83072 *Synopsis:* `H`

83073 The `H` command shall cause *ed* to enter a mode in which help messages (see the `h` command)
 83074 shall be written to standard output for all subsequent `'?'` notifications. The `H` command
 83075 alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on,
 83076 the `H` command also explains the previous `'?'` notification, if there was one. The current line
 83077 number shall be unchanged.

83078 Insert Command

83079 *Synopsis:* `(.)i`
 83080 `<text>`
 83081 `.`

83082 The `i` command shall insert the given text before the addressed line; the current line is set to the
 83083 last inserted line or, if there was none, to the addressed line. This command differs from the `a`
 83084 command only in the placement of the input text. Address 0 shall be valid for this command; it
 83085 shall be interpreted as if address 1 were specified.

83086

Join Command

83087

Synopsis: (. , . +1) j

83088

83089

83090

83091

The **j** command shall join contiguous lines by removing the appropriate <newline>s. If exactly one address is given, this command shall do nothing. If lines are joined, the current line number shall be set to the address of the joined line; otherwise, the current line number shall be unchanged.

83092

Mark Command

83093

Synopsis: (.) kx

83094

83095

83096

The **k** command shall mark the addressed line with name *x*, which the application shall ensure is a lowercase letter from the portable character set. The address " 'x'" shall then refer to this line; the current line number shall be unchanged.

83097

List Command

83098

Synopsis: (. , .) l

83099

83100

83101

83102

83103

83104

The **l** command shall write to standard output the addressed lines in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 108) (' \ ' , ' \ a ' , ' \ b ' , ' \ f ' , ' \ r ' , ' \ t ' , ' \ v ') shall be written as the corresponding escape sequence; the ' \ n ' in that table is not applicable. Non-printable characters not in the table shall be written as one three-digit octal number (with a preceding backslash character) for each byte in the character (most significant byte first).

83105

83106

83107

83108

83109

83110

Long lines shall be folded, with the point of folding indicated by <newline> preceded by a backslash; the length at which folding occurs is unspecified, but should be appropriate for the output device. The end of each line shall be marked with a ' \$ ' , and ' \$ ' characters within the text shall be written with a preceding backslash. An **l** command can be appended to any other command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**. The current line number shall be set to the address of the last line written.

83111

Move Command

83112

Synopsis: (. , .) maddress

83113

83114

83115

83116

The **m** command shall reposition the addressed lines after the line addressed by *address*. Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning of the buffer. It shall be an error if *address* falls within the range of moved lines. The current line number shall be set to the address of the last line moved.

83117

Number Command

83118

Synopsis: (. , .) n

83119

83120

83121

The **n** command shall write to standard output the addressed lines, preceding each line by its line number and a <tab>; the current line number shall be set to the address of the last line written. The **n** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

83122 **Print Command**83123 *Synopsis:* (. , .)p

83124 The **p** command shall write to standard output the addressed lines; the current line number shall
 83125 be set to the address of the last line written. The **p** command can be appended to any command
 83126 other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

83127 **Prompt Command**83128 *Synopsis:* P

83129 The **P** command shall cause *ed* to prompt with an asterisk ('*') (or *string*, if **-p** is specified) for
 83130 all subsequent commands. The **P** command alternatively shall turn this mode on and off; it shall
 83131 be initially on if the **-p** option is specified; otherwise, off. The current line number shall be
 83132 unchanged.

83133 **Quit Command**83134 *Synopsis:* q

83135 The **q** command shall cause *ed* to exit. If the buffer has changed since the last time the entire
 83136 buffer was written, the user shall be warned, as described previously.

83137 **Quit Without Checking Command**83138 *Synopsis:* Q

83139 The **Q** command shall cause *ed* to exit without checking whether changes have been made in the
 83140 buffer since the last **w** command.

83141 **Read Command**83142 *Synopsis:* (\$)r [*file*]

83143 The **r** command shall read in the file named by the pathname *file* and append it after the
 83144 addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be
 83145 used (see the **e** and **f** commands). The currently remembered pathname shall not be changed
 83146 unless there is no remembered pathname. Address 0 shall be valid for **r** and shall cause the file
 83147 to be read at the beginning of the buffer. If the read is successful, and **-s** was not specified, the
 83148 number of bytes read shall be written to standard output in the following format:

83149 "%d\n", <number of bytes read>

83150 The current line number shall be set to the address of the last line read in. If *file* is replaced by
 83151 '!', the rest of the line shall be taken to be a shell command line whose output is to be read.
 83152 Such a shell command line shall not be remembered as the current pathname.

83153 **Substitute Command**83154 *Synopsis:* (. , .)s/RE/replacement/flags

83155 The **s** command shall search each addressed line for an occurrence of the specified RE and
 83156 replace either the first or all (non-overlapped) matched strings with the *replacement*; see the
 83157 following description of the **g** suffix. It is an error if the substitution fails on every addressed
 83158 line. Any character other than <space> or <newline> can be used instead of a slash to delimit the
 83159 RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character
 83160 if it is preceded by a backslash. The current line shall be set to the address of the last line on
 83161 which a substitution occurred.

83162 An ampersand ('&') appearing in the *replacement* shall be replaced by the string matching the
 83163 RE on the current line. The special meaning of '&' in this context can be suppressed by

83164 preceding it by backslash. As a more general feature, the characters ' $\backslash n$ ', where n is a digit,
 83165 shall be replaced by the text matched by the corresponding back-reference expression. If the
 83166 corresponding back-reference expression does not match, then the characters ' $\backslash n$ ' shall be
 83167 replaced by the empty string. When the character ' $\%$ ' is the only character in the *replacement*, the
 83168 *replacement* used in the most recent substitute command shall be used as the *replacement* in the
 83169 current substitute command; if there was no previous substitute command, the use of ' $\%$ ' in this
 83170 manner shall be an error. The ' $\%$ ' shall lose its special meaning when it is in a replacement
 83171 string of more than one character or is preceded by a backslash. For each backslash (' \backslash ')
 83172 encountered in scanning *replacement* from beginning to end, the following character shall lose its
 83173 special meaning (if any). It is unspecified what special meaning is given to any character other
 83174 than '&', ' \backslash ', ' $\%$ ', or digits.

83175 A line can be split by substituting a <newline> into it. The application shall ensure it escapes the
 83176 <newline> in the *replacement* by preceding it by backslash. Such substitution cannot be done as
 83177 part of a **g** or **v** *command list*. The current line number shall be set to the address of the last line
 83178 on which a substitution is performed. If no substitution is performed, the current line number
 83179 shall be unchanged. If a line is split, a substitution shall be considered to have been performed
 83180 on each of the new lines for the purpose of determining the new current line number. A
 83181 substitution shall be considered to have been performed even if the replacement string is
 83182 identical to the string that it replaces.

83183 The application shall ensure that the value of *flags* is zero or more of:

- 83184 *count* Substitute for the *count*th occurrence only of the RE found on each addressed line.
- 83185 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first
 83186 one. If both **g** and *count* are specified, the results are unspecified.
- 83187 **l** Write to standard output the final line in which a substitution was made. The line shall
 83188 be written in the format specified for the **l** command.
- 83189 **n** Write to standard output the final line in which a substitution was made. The line shall
 83190 be written in the format specified for the **n** command.
- 83191 **p** Write to standard output the final line in which a substitution was made. The line shall
 83192 be written in the format specified for the **p** command.

83193 Copy Command

83194 *Synopsis:* (*. . .*)*taddress*

83195 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines
 83196 shall be placed after address *address* (which can be 0); the current line number shall be set to the
 83197 address of the last line added.

83198 Undo Command

83199 *Synopsis:* **u**

83200 The **u** command shall nullify the effect of the most recent command that modified anything in
 83201 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes
 83202 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no
 83203 changes were made by the global command (such as with **g/RE/p**), the **u** command shall have
 83204 no effect. The current line number shall be set to the value it had immediately before the
 83205 command being undone started.

83206

Global Non-Matched Command

83207

Synopsis: (1,\$)v/RE/command list

83208

This command shall be equivalent to the global command **g** except that the lines that are marked during the first step shall be those for which the line excluding the terminating <newline> does not match the RE.

83209

83210

83211

Interactive Global Not-Matched Command

83212

Synopsis: (1,\$)V/RE/

83213

This command shall be equivalent to the interactive global command **G** except that the lines that are marked during the first step shall be those for which the line excluding the terminating <newline> does not match the RE.

83214

83215

83216

Write Command

83217

Synopsis: (1,\$)w [file]

83218

The **w** command shall write the addressed lines into the file named by the pathname *file*. The command shall create the file, if it does not exist, or shall replace the contents of the existing file. The currently remembered pathname shall not be changed unless there is no remembered pathname. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **e** and **f** commands); the current line number shall be unchanged. If the command is successful, the number of bytes written shall be written to standard output, unless the **-s** option was specified, in the following format:

83219

83220

83221

83222

83223

83224

83225

"%d\n", <number of bytes written>

83226

If *file* begins with **'!'**, the rest of the line shall be taken to be a shell command line whose standard input shall be the addressed lines. Such a shell command line shall not be remembered as the current pathname. This usage of the write command with **'!'** shall not be considered as a "last **w** command that wrote the entire buffer", as described previously; thus, this alone shall not prevent the warning to the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands.

83227

83228

83229

83230

83231

83232

Line Number Command

83233

Synopsis: (\$) =

83234

The line number of the addressed line shall be written to standard output in the following format:

83235

83236

"%d\n", <line number>

83237

The current line number shall be unchanged by this command.

83238

Shell Escape Command

83239

Synopsis: !command

83240

The remainder of the line after the **'!'** shall be sent to the command interpreter to be interpreted as a shell command line. Within the text of that shell command line, the unescaped character **'%'** shall be replaced with the remembered pathname; if a **'!'** appears as the first character of the command, it shall be replaced with the text of the previous shell command executed via **'!'**. Thus, **"!!"** shall repeat the previous **!command**. If any replacements of **'%'** or **'!'** are performed, the modified line shall be written to the standard output before *command* is executed. The **!** command shall write:

83241

83242

83243

83244

83245

83246

83247

"! \n"

83248 to standard output upon completion, unless the `-s` option is specified. The current line number
83249 shall be unchanged.

83250 Null Command

83251 *Synopsis:* (`. +1`)

83252 An address alone on a line shall cause the addressed line to be written. A `<newline>` alone shall
83253 be equivalent to `" +1p"`. The current line number shall be set to the address of the written line.

83254 EXIT STATUS

83255 The following exit values shall be returned:

- 83256 0 Successful completion without any file or command errors.
- 83257 >0 An error occurred.

83258 CONSEQUENCES OF ERRORS

83259 When an error in the input script is encountered, or when an error is detected that is a
83260 consequence of the data (not) present in the file or due to an external condition such as a read or
83261 write error:

- 83262 • If the standard input is a terminal device file, all input shall be flushed, and a new
83263 command read.
- 83264 • If the standard input is a regular file, *ed* shall terminate with a non-zero exit status.

83265 APPLICATION USAGE

83266 Because of the extremely terse nature of the default error messages, the prudent script writer
83267 begins the *ed* input commands with an **H** command, so that if any errors do occur at least some
83268 clue as to the cause is made available.

83269 In earlier versions of this standard, an obsolescent `-` option was described. This is no longer
83270 specified. Applications should use the `-s` option. Using `-` as a *file* operand now produces
83271 unspecified results. This allows implementations to continue to support the former required
83272 behavior.

83273 EXAMPLES

83274 None.

83275 RATIONALE

83276 The initial description of this utility was adapted from the SVID. It contains some features not
83277 found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and
83278 BSD *ed* utilities include, but need not be limited to:

- 83279 • The BSD `-` option does not suppress the `' ! '` prompt after a `!` command.
- 83280 • BSD does not support the special meanings of the `' % '` and `' ! '` characters within a `!`
83281 command.
- 83282 • BSD does not support the *addresses* `' ; '` and `' , '`.
- 83283 • BSD allows the command/suffix pairs **pp**, **ll**, and so on, which are unspecified in this
83284 volume of POSIX.1-200x.
- 83285 • BSD does not support the `' ! '` character part of the **e**, **r**, or **w** commands.
- 83286 • A failed **g** command in BSD sets the line number to the last line searched if there are no
83287 matches.
- 83288 • BSD does not default the *command list* to the **p** command.

- 83289 • BSD does not support the **G**, **h**, **H**, **n**, or **V** commands.
- 83290 • On BSD, if there is no inserted text, the insert command changes the current line to the
- 83291 referenced line `-1`; that is, the line before the specified line.
- 83292 • On BSD, the `join` command with only a single address changes the current line to that
- 83293 address.
- 83294 • BSD does not support the **P** command; moreover, in BSD it is synonymous with the **p**
- 83295 command.
- 83296 • BSD does not support the `undo` of the commands **j**, **m**, **r**, **s**, or **t**.
- 83297 • The Version 7 `ed` command **W**, and the BSD `ed` commands **W**, **wq**, and **z** are not present in
- 83298 this volume of POSIX.1-200x.

83299 The `-s` option was added to allow the functionality of the removed `-` option in a manner |
 83300 compatible with the Utility Syntax Guidelines.

83301 In early proposals there was a limit, `{ED_FILE_MAX}`, that described the historical limitations of
 83302 some `ed` utilities in their handling of large files; some of these have had problems with files
 83303 larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a
 83304 `split` command in this volume of POSIX.1-200x. Since this limit was removed, this volume of
 83305 POSIX.1-200x requires that implementations document the file size limits imposed by `ed` in the
 83306 conformance document. The limit `{ED_LINE_MAX}` was also removed; therefore, the global
 83307 limit `{LINE_MAX}` is used for input and output lines.

83308 The manner in which the `I` command writes non-printable characters was changed to avoid the
 83309 historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous
 83310 because most terminals simply replace overstruck characters, making the `I` format not useful for
 83311 its intended purpose of unambiguously understanding the content of the line. The historical
 83312 backslash escapes were also ambiguous. (The string `"a\0011"` could represent a line containing
 83313 those six characters or a line containing the three characters `'a'`, a byte with a binary value of 1,
 83314 and a 1.) In the format required here, a backslash appearing in the line is written as `"\\"` so that
 83315 the output is truly unambiguous. The method of marking the ends of lines was adopted from
 83316 the `ex` editor and is required for any line ending in `<space>s`; the `'$'` is placed on all lines so
 83317 that a real `'$'` at the end of a line cannot be misinterpreted.

83318 Earlier versions of this standard allowed for implementations with bytes other than eight bits, |
 83319 but this has been modified in this version.

83320 The description of how a NUL is written was removed. The NUL character cannot be in text
 83321 files, and this volume of POSIX.1-200x should not dictate behavior in the case of undefined,
 83322 erroneous input.

83323 Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands
 83324 are not patterns.

83325 Early proposals stated that the `-p` option worked only when standard input was associated with
 83326 a terminal device. This has been changed to conform to historical implementations, thereby
 83327 allowing applications to interpose themselves between a user and the `ed` utility.

83328 The form of the substitute command that uses the **n** suffix was limited in some historical
 83329 documentation (where this was described incorrectly as “backreferencing”). This limit has been
 83330 omitted because there is no reason why an editor processing lines of `{LINE_MAX}` length should
 83331 have this restriction. The command `s/x/X/2047` should be able to substitute the 2 047th occurrence
 83332 of `'x'` on a line.

83333 The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made
 83334 unspecified because BSD-based systems allow this, whereas System V does not.

83335 Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file

83336 have been deleted. Since this volume of POSIX.1-200x refers to the **q** command in this instance,
83337 such behavior is not allowed.

83338 Some historical implementations returned exit status zero even if command errors had occurred;
83339 this is not allowed by this volume of POSIX.1-200x.

83340 Some historical implementations contained a bug that allowed a single period to be entered in
83341 input mode as `<backslash> <period> <newline>`. This is not allowed by *ed* because there is no
83342 description of escaping any of the characters in input mode; backslashes are entered into the
83343 buffer exactly as typed. The typical method of entering a single period has been to precede it
83344 with another character and then use the substitute command to delete that character.

83345 It is difficult under some modes of some versions of historical operating system terminal drivers
83346 to distinguish between an end-of-file condition and terminal disconnect. POSIX.1-200x does not
83347 require implementations to distinguish between the two situations, which permits historical
83348 implementations of the *ed* utility on historical platforms to conform. Implementations are
83349 encouraged to distinguish between the two, if possible, and take appropriate action on terminal
83350 disconnect.

83351 Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the
83352 start of the edit buffer. When the buffer was empty the command `.=` returned zero. POSIX.1-200x
83353 requires conformance to historical practice.

83354 For consistency with the **a** and **r** commands and better user functionality, the **i** and **c** commands
83355 must also accept an address of 0, in which case `0i` is treated as `1i` and likewise for the **c**
83356 command.

83357 All of the following are valid addresses:

83358	<code>+++</code>	Three lines after the current line.
83359	<code>/pattern/-</code>	One line before the next occurrence of pattern.
83360	<code>-2</code>	Two lines before the current line.
83361	<code>3 ---- 2</code>	Line one (note the intermediate negative address).
83362	<code>1 2 3</code>	Line six.

83363 Any number of addresses can be provided to commands taking addresses; for example,
83364 `"1,2,3,4,5p"` prints lines 4 and 5, because two is the greatest valid number of addresses
83365 accepted by the **print** command. This, in combination with the semicolon delimiter, permits
83366 users to create commands based on ordered patterns in the file. For example, the command
83367 `"3;/foo/;+2p"` will display the first line after line 3 that contains the pattern *foo*, plus the next
83368 two lines. Note that the address `"3;"` must still be evaluated before being discarded, because
83369 the search origin for the `"/foo/"` command depends on this.

83370 Historically, *ed* disallowed address chains, as discussed above, consisting solely of comma or
83371 semicolon separators; for example, `","` or `";;"` were considered an error. For consistency of
83372 address specification, this restriction is removed. The following table lists some of the address
83373 forms now possible:

	Address	Addr1	Addr2	Status	Comment
83374	7,	7	7	Historical	
83375	7,5,	5	5	Historical	
83376	7,5,9	5	9	Historical	
83377	7,9	7	9	Historical	
83378	7,+	7	8	Historical	
83379	,	1	\$	Historical	
83380	,7	1	7	Extension	
83381	,,	\$	\$	Extension	
83382	,i	\$	\$	Extension	
83383	7i	7	7	Historical	
83384	7i5i	5	5	Historical	
83385	7i5i9	5	9	Historical	
83386	7i5,9	5	9	Historical	
83387	7i\$;4	\$	4	Historical	Valid, but erroneous.
83388	7i9	7	9	Historical	
83389	7i+	7	8	Historical	
83390	i	.	\$	Historical	
83391	i7	.	7	Extension	
83392	ii	\$	\$	Extension	
83393	i,	\$	\$	Extension	
83394					

Historically, values could be added to addresses by including them after one or more <blank>s; for example, "3 - 5p" wrote the seventh line of the file, and "/foo/ 5" was the same as "5 /foo/". However, only absolute values could be added; for example, "5 /foo/" was an error. POSIX.1-200x requires conformance to historical practice.

Historically, *ed* accepted the '^' character as an address, in which case it was identical to the hyphen character. POSIX.1-200x does not require or prohibit this behavior.

FUTURE DIRECTIONS

None.

[Section 1.4](#) (on page 2235), *ex*, *sed*, *sh*, *vi*

[XBD Table 5-1](#) (on page 108), [Chapter 8](#) (on page 159), [Section 9.3](#) (on page 169), [Chapter 11](#) (on page 185), [Section 12.2](#) (on page 201)

CHANGE HISTORY

First released in Issue 2.

Issue 5

In the OPTIONS section, the meaning of `-s` and `-` is clarified.

A second FUTURE DIRECTION is added.

Issue 6

The obsolescent single-minus form is removed.

A second APPLICATION USAGE note is added.

The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.

The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition of the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing when end-of-file is detected and when terminal disconnect is detected.

The normative text is reworded to avoid use of the term "must" for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: "Any line

83421

modified by the *command list* shall be unmarked.” to the **G** command. This change corresponds to a similar change made to the **g** command in the first version of this standard.

83422

83423

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/7 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

83424

83425

Issue 7

83426

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is ‘-’.

83427

83428

Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.

83429

SD5-XCU-ERN-94 is applied, updating text in the EXTENDED DESCRIPTION where a terminal disconnect is detected (in Commands in *ed*).

83430

83431

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

83432 **NAME**83433 `env` — set the environment for command invocation83434 **SYNOPSIS**83435 `env [-i] [name=value]... [utility [argument...]]`83436 **DESCRIPTION**83437 The `env` utility shall obtain the current environment, modify it according to its arguments, then
83438 invoke the utility named by the `utility` operand with the modified environment.83439 Optional arguments shall be passed to `utility`.83440 If no `utility` operand is specified, the resulting environment shall be written to the standard
83441 output, with one `name=value` pair per line.83442 If the first argument is `'-'`, the results are unspecified.83443 **OPTIONS**83444 The `env` utility shall conform to XBD Section 12.2 (on page 201), except for the unspecified usage
83445 of `'-'`.

83446 The following options shall be supported:

83447 **-i** Invoke `utility` with exactly the environment specified by the arguments; the
83448 inherited environment shall be ignored completely.83449 **OPERANDS**

83450 The following operands shall be supported:

83451 `name=value` Arguments of the form `name=value` shall modify the execution environment, and
83452 shall be placed into the inherited environment before the `utility` is invoked.83453 `utility` The name of the utility to be invoked. If the `utility` operand names any of the
83454 special built-in utilities in Section 2.14 (on page 2280), the results are undefined.83455 `argument` A string to pass as an argument for the invoked utility.83456 **STDIN**

83457 Not used.

83458 **INPUT FILES**

83459 None.

83460 **ENVIRONMENT VARIABLES**83461 The following environment variables shall affect the execution of `env`:83462 `LANG` Provide a default value for the internationalization variables that are unset or null.
83463 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
83464 variables used to determine the values of locale categories.)83465 `LC_ALL` If set to a non-empty string value, override the values of all the other
83466 internationalization variables.83467 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as
83468 characters (for example, single-byte as opposed to multi-byte characters in
83469 arguments).83470 `LC_MESSAGES`83471 Determine the locale that should be used to affect the format and contents of
83472 diagnostic messages written to standard error.

env*Utilities*

83473 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

83474 **PATH** Determine the location of the *utility*, as described in XBD Chapter 8 (on page 159).
 83475 If *PATH* is specified as a *name=value* operand to *env*, the *value* given shall be used in
 83476 the search for *utility*.

ASYNCHRONOUS EVENTS

83477 Default.

STDOUT

83480 If no *utility* operand is specified, each *name=value* pair in the resulting environment shall be
 83481 written in the form:

83482 "%s=%s\n", <name>, <value>

83483 If the *utility* operand is specified, the *env* utility shall not write to standard output.

STDERR

83484 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

83486 None.

EXTENDED DESCRIPTION

83488 None.

EXIT STATUS

83491 If *utility* is invoked, the exit status of *env* shall be the exit status of *utility*; otherwise, the *env*
 83492 utility shall exit with one of the following values:

83493 0 The *env* utility completed successfully.

83494 1–125 An error occurred in the *env* utility.

83495 126 The utility specified by *utility* was found but could not be invoked.

83496 127 The utility specified by *utility* could not be found.

CONSEQUENCES OF ERRORS

83497 Default.

APPLICATION USAGE

83500 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if
 83501 an error occurs so that applications can distinguish “failure to find a utility” from “invoked
 83502 utility exited with an error indication”. The value 127 was chosen because it is not commonly
 83503 used for other meanings; most utilities use small values for “normal error conditions” and the
 83504 values above 128 can be confused with termination due to receipt of a signal. The value 126 was
 83505 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some
 83506 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction
 83507 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to
 83508 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for
 83509 any other reason.

83510 Historical implementations of the *env* utility use the *execvp()* or *execlp()* functions defined in the
 83511 System Interfaces volume of POSIX.1-200x to invoke the specified utility; this provides better
 83512 performance and keeps users from having to escape characters with special meaning to the shell.
 83513 Therefore, shell functions, special built-ins, and built-ins that are only provided by the shell are
 83514 not found.

EXAMPLES

The following command:

```
env -i PATH=/mybin:"$PATH" $(getconf V7_ENV) mygrep xyz myfile
```

invokes the command *mygrep* with a new *PATH* value as the only entry in its environment other than any variables required by the implementation for conformance. In this case, *PATH* is used to locate *mygrep*, which is expected to reside in **/mybin**.

RATIONALE

As with all other utilities that invoke other utilities, this volume of POSIX.1-200x only specifies what *env* does with standard input, standard output, standard error, input files, and output files. If a utility is executed, it is not constrained by the specification of input and output by *env*.

The *-i* option was added to allow the functionality of the removed *-* option in a manner compatible with the Utility Syntax Guidelines. It is possible to create a non-conforming environment using the *-i* option, as it may remove environment variables required by the implementation for conformance. The following will preserve these environment variables as well as preserve the *PATH* for conforming utilities:

```
IFS='
# The preceding value should be <space><tab><newline>.
# Set IFS to its default value.

set -f
# disable pathname expansion

\unalias -a
# Unset all possible aliases.
# Note that unalias is escaped to prevent an alias
# being used for unalias.
# This step is not strictly necessary, since aliases are not inherited,
# and the ENV environment variable is only used by interactive shells,
# the only way any aliases can exist in a script is if it defines them
# itself.

unset -f env getconf
# Ensure env and getconf are not user functions.

env -i $(getconf V7_ENV) PATH="$(getconf PATH)" command
```

Some have suggested that *env* is redundant since the same effect is achieved by:

```
name=value ... utility [ argument ... ]
```

The example is equivalent to *env* when an environment variable is being added to the environment of the command, but not when the environment is being set to the given value. The *env* utility also writes out the current environment if invoked without arguments. There is sufficient functionality beyond what the example provides to justify inclusion of *env*.

FUTURE DIRECTIONS

None.

83566**CHANGE HISTORY**

First released in Issue 2.

Issue 7

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first argument is '- '.

Austin Group Interpretation 1003.1-2001 #047 is applied, providing RATIONALE on how to use the *env* utility to preserve a conforming environment.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

The EXAMPLES section is revised to change the use of *env* -i.

+

83567 **NAME**
 83568 `ex` — text editor

83569 **SYNOPSIS**
 83570 UP `ex [-rR] [-s|-v] [-c command] [-t tagstring] [-w size] [file...]`

83571 DESCRIPTION

83572 The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and
 83573 visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**
 83574 and **visual** commands and in *vi*.

83575 If an operand is `'-'`, the results are unspecified.

83576 This section uses the term *edit buffer* to describe the current working text. No specific
 83577 implementation is implied by this term. All editing changes are performed on the edit buffer,
 83578 and no changes to it shall affect any file until an editor command writes the file.

83579 Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,
 83580 such as the full-screen editing commands (*visual mode* or *open mode*). When these commands
 83581 cannot be supported on such terminals, this condition shall not produce an error message such
 83582 as “not an editor command” or report a syntax error. The implementation may either accept the
 83583 commands and produce results on the screen that are the result of an unsuccessful attempt to
 83584 meet the requirements of this volume of POSIX.1-200x or report an error describing the terminal-
 83585 related deficiency.

83586 OPTIONS

83587 The *ex* utility shall conform to XBD [Section 12.2](#) (on page 201), except for the unspecified usage
 83588 of `'-'`, and that `'+'` may be recognized as an option delimiter as well as `'-'`.

83589 The following options shall be supported:

83590 `-c command` Specify an initial command to be executed in the first edit buffer loaded from an
 83591 existing file (see the EXTENDED DESCRIPTION section). Implementations may
 83592 support more than a single `-c` option. In such implementations, the specified
 83593 commands shall be executed in the order specified on the command line.

83594 `-r` Recover the named files (see the EXTENDED DESCRIPTION section). Recovery
 83595 information for a file shall be saved during an editor or system crash (for example,
 83596 when the editor is terminated by a signal which the editor can catch), or after the
 83597 use of an *ex* **preserve** command.

83598 A *crash* in this context is an unexpected failure of the system or utility that requires
 83599 restarting the failed system or utility. A system crash implies that any utilities
 83600 running at the time also crash. In the case of an editor or system crash, the number
 83601 of changes to the edit buffer (since the most recent **preserve** command) that will be
 83602 recovered is unspecified.

83603 If no *file* operands are given and the `-t` option is not specified, all other options, the
 83604 *EXINIT* variable, and any *.exrc* files shall be ignored; a list of all recoverable files
 83605 available to the invoking user shall be written, and the editor shall exit normally
 83606 without further action.

83607 `-R` Set **readonly** edit option.

83608 `-s` Prepare *ex* for batch use by taking the following actions:

- 83609 • Suppress writing prompts and informational (but not diagnostic) messages.
- 83610 • Ignore the value of *TERM* and any implementation default terminal type and
- 83611 assume the terminal is a type incapable of supporting open or visual modes;
- 83612 see the **visual** command and the description of *vi*.
- 83613 • Suppress the use of the *EXINIT* environment variable and the reading of any
- 83614 **.exrc** file; see the EXTENDED DESCRIPTION section.
- 83615 • Suppress autoindentation, ignoring the value of the **autoindent** edit option.
- 83616 **-t tagstring** Edit the file containing the specified *tagstring*; see *ctags*. The tags feature
- 83617 represented by **-t tagstring** and the **tag** command is optional. It shall be provided
- 83618 on any system that also provides a conforming implementation of *ctags*; otherwise,
- 83619 the use of **-t** produces undefined results. On any system, it shall be an error to
- 83620 specify more than a single **-t** option.
- 83621 **-v** Begin in visual mode (see *vi*).
- 83622 **-w size** Set the value of the *window* editor option to *size*.

OPERANDS

The following operand shall be supported:

- 83623 *file* A pathname of a file to be edited.

STDIN

The standard input consists of a series of commands and input text, as described in the EXTENDED DESCRIPTION section. The implementation may limit each line of standard input to a length of {LINE_MAX}.

If the standard input is not a terminal device, it shall be as if the **-s** option had been specified.

If a read from the standard input returns an error, or if the editor detects an end-of-file condition from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

INPUT FILES

Input files shall be text files or files that would be text files except for an incomplete last line that is not longer than {LINE_MAX}-1 bytes in length and contains no NUL characters. By default, any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other forms of files may optionally be allowed by *ex* implementations.

The **.exrc** files and source files shall be text files consisting of *ex* commands; see the EXTENDED DESCRIPTION section.

By default, the editor shall read lines from the files to be edited without interpreting any of those lines as any form of editor command.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *ex*:

- 83644 **COLUMNS** Override the system-selected horizontal screen size. See XBD Chapter 8 (on page |
- 83645 159) for valid values and results when it is unset or null.
- 83646 **EXINIT** Determine a list of *ex* commands that are executed on editor start-up. See the |
- 83647 EXTENDED DESCRIPTION section for more details of the initialization phase.
- 83648 **HOME** Determine a pathname of a directory that shall be searched for an editor start-up |
- 83649 file named **.exrc**; see the EXTENDED DESCRIPTION section.
- 83650 **LANG** Provide a default value for the internationalization variables that are unset or null. |
- 83651 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
- 83652 variables used to determine the values of locale categories.)

83653		<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
83654			
83655		<i>LC_COLLATE</i>	Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.
83656			
83657			
83658		<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the classification of characters as uppercase or lowercase letters, the case conversion of letters, and the detection of word boundaries.
83659			
83660			
83661			
83662			
83663		<i>LC_MESSAGES</i>	Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
83664			
83665			
83666		<i>LINES</i>	Override the system-selected vertical screen size, used as the number of lines in a screenful and the vertical screen size in visual mode. See XBD Chapter 8 (on page 159) for valid values and results when it is unset or null.
83667			
83668			
83669	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
83670		<i>PATH</i>	Determine the search path for the shell command specified in the <i>ex</i> editor commands ! , shell , read , and write , and the open and visual mode command ! ; see the description of command search and execution in Section 2.9.1.1 (on page 2264).
83671			
83672			
83673		<i>SHELL</i>	Determine the preferred command line interpreter for use as the default value of the shell edit option.
83674			
83675		<i>TERM</i>	Determine the name of the terminal type. If this variable is unset or null, an unspecified default terminal type shall be used.
83676			

ASYNCHRONOUS EVENTS

The following term is used in this and following sections to specify command and asynchronous event actions:

complete write

A complete write is a write of the entire contents of the edit buffer to a file of a type other than a terminal device, or the saving of the edit buffer caused by the user executing the *ex* **preserve** command. Writing the contents of the edit buffer to a temporary file that will be removed when the editor exits shall not be considered a complete write.

The following actions shall be taken upon receipt of signals:

SIGINT If the standard input is not a terminal device, *ex* shall not write the file or return to command or text input mode, and shall exit with a non-zero exit status.

Otherwise, if executing an open or visual text input mode command, *ex* in receipt of **SIGINT** shall behave identically to its receipt of the <ESC> character.

Otherwise:

1. If executing an *ex* text input mode command, all input lines that have been completely entered shall be resolved into the edit buffer, and any partially entered line shall be discarded.
2. If there is a currently executing command, it shall be aborted and a message displayed. Unless otherwise specified by the *ex* or *vi* command descriptions, it is unspecified whether any lines modified by the executing command appear modified, or as they were before being modified by the executing command, in the buffer.

- 83700 If the currently executing command was a motion command, its associated
83701 command shall be discarded.
- 83702 3. If in open or visual command mode, the terminal shall be alerted.
- 83703 4. The editor shall then return to command mode.
- 83704 SIGCONT The screen shall be refreshed if in open or visual mode.
- 83705 SIGHUP If the edit buffer has been modified since the last complete write, *ex* shall attempt
83706 to save the edit buffer so that it can be recovered later using the **-r** option or the *ex*
83707 **recover** command. The editor shall not write the file or return to command or text
83708 input mode, and shall terminate with a non-zero exit status.
- 83709 SIGTERM Refer to SIGHUP.
- 83710 The action taken for all other signals is unspecified.

STDOUT

83711 The standard output shall be used only for writing prompts to the user, for informational
83712 messages, and for writing lines from the file.
83713

STDERR

83714 The standard error shall be used only for diagnostic messages.
83715

OUTPUT FILES

83716 The output from *ex* shall be text files.
83717

EXTENDED DESCRIPTION

83718 Only the *ex* mode of the editor is described in this section. See *vi* for additional editing
83719 capabilities available in *ex*.
83720

83721 When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such
83722 as inverse video), the message shall be written in standout mode. If the terminal does not
83723 support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the
83724 error message.

83725 By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the
83726 **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;
83727 it can be exited (and command mode re-entered) by typing a period (**.**) alone at the beginning
83728 of a line.

Initialization in *ex* and *vi*

83729 The following symbols are used in this and following sections to specify locations in the edit
83730 buffer:
83731

alternate and current pathnames

83732 Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex*
83733 commands that take filenames as arguments shall set them as follows:
83734

- 83735 1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag**
83736 command replaces the contents of the edit buffer.
- 83737 a. If the command replaces the contents of the edit buffer, the current pathname
83738 shall be set to the *file* argument or the file indicated by the tag, and the
83739 alternate pathname shall be set to the previous value of the current pathname.
- 83740 b. Otherwise, the alternate pathname shall be set to the *file* argument.
- 83741 2. If a *file* argument is specified to the *ex* **next** command:

- 83742 a. If the command replaces the contents of the edit buffer, the current pathname
83743 shall be set to the first *file* argument, and the alternate pathname shall be set to
83744 the previous value of the current pathname.
- 83745 3. If a *file* argument is specified to the *ex file* command, the current pathname shall be
83746 set to the *file* argument, and the alternate pathname shall be set to the previous value
83747 of the current pathname.
- 83748 4. If a *file* argument is specified to the *ex read* and *write* commands (that is, when
83749 reading or writing a file, and not to the program named by the *shell* edit option), or a
83750 *file* argument is specified to the *ex xit* command:
- 83751 a. If the current pathname has no value, the current pathname shall be set to the
83752 *file* argument.
- 83753 b. Otherwise, the alternate pathname shall be set to the *file* argument.

83754 If the alternate pathname is set to the previous value of the current pathname when the
83755 current pathname had no previous value, then the alternate pathname shall have no value
83756 as a result.

83757 *current line*

83758 The line of the edit buffer referenced by the cursor. Each command description specifies the
83759 current line after the command has been executed, as the *current line value*. When the edit
83760 buffer contains no lines, the current line shall be zero; see [Addressing in ex](#) (on page 2579).

83761 *current column*

83762 The current display line column occupied by the cursor. (The columns shall be numbered
83763 beginning at 1.) Each command description specifies the current column after the command
83764 has been executed, as the *current column value*. This column is an *ideal* column that is
83765 remembered over the lifetime of the editor. The actual display line column upon which the
83766 cursor rests may be different from the current column; see the cursor positioning discussion
83767 in [Command Descriptions in vi](#) (on page 3216).

83768 *set to non-<blank>*

83769 A description for a current column value, meaning that the current column shall be set to
83770 the last display line column on which is displayed any part of the first non-<blank> of the
83771 line. If the line has no non-<blank> non-<newline>s, the current column shall be set to the
83772 last display line column on which is displayed any part of the last non-<newline> in the
83773 line. If the line is empty, the current column shall be set to column position 1.

83774 The length of lines in the edit buffer may be limited to {LINE_MAX} bytes. In open and visual
83775 mode, the length of lines in the edit buffer may be limited to the number of characters that will
83776 fit in the display. If either limit is exceeded during editing, an error message shall be written. If
83777 either limit is exceeded by a line read in from a file, an error message shall be written and the
83778 edit session may be terminated.

83779 If the editor stops running due to any reason other than a user command, and the edit buffer has
83780 been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous
83781 event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.

83782 During initialization (before the first file is copied into the edit buffer or any user commands
83783 from the terminal are processed) the following shall occur:

- 83784 1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands
83785 contained in that variable.
- 83786 2. If the *EXINIT* variable is not set, and all of the following are true:

- 83787 a. The *HOME* environment variable is not null and not empty.
- 83788 b. The file *.exrc* in the directory referred to by the *HOME* environment variable:
- 83789 1. Exists
- 83790 2. Is owned by the same user ID as the real user ID of the process or the
- 83791 process has appropriate privileges
- 83792 3. Is not writable by anyone other than the owner

83793 the editor shall execute the *ex* commands contained in that file.

- 83794 3. If and only if all of the following are true:
- 83795 a. The current directory is not referred to by the *HOME* environment variable.
- 83796 b. A command in the *EXINIT* environment variable or a command in the *.exrc* file in
- 83797 the directory referred to by the *HOME* environment variable sets the editor option
- 83798 **exrc**.
- 83799 c. The *.exrc* file in the current directory:
- 83800 1. Exists
- 83801 2. Is owned by the same user ID as the real user ID of the process, or by one of
- 83802 a set of implementation-defined user IDs
- 83803 3. Is not writable by anyone other than the owner

83804 the editor shall attempt to execute the *ex* commands contained in that file.

83805 Lines in any *.exrc* file that are blank lines shall be ignored. If any *.exrc* file exists, but is not read

83806 for ownership or permission reasons, it shall be an error.

83807 After the *EXINIT* variable and any *.exrc* files are processed, the first file specified by the user

83808 shall be edited, as follows:

- 83809 1. If the user specified the **-t** option, the effect shall be as if the *ex tag* command was entered
- 83810 with the specified argument, with the exception that if tag processing does not result in a
- 83811 file to edit, the effect shall be as described in step 3. below.
- 83812 2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if
- 83813 the *ex edit* command was entered with the first of those arguments as its *file* argument.
- 83814 3. Otherwise, the effect shall be as if the *ex edit* command was entered with a nonexistent
- 83815 filename as its *file* argument. It is unspecified whether this action shall set the current
- 83816 pathname. In an implementation where this action does not set the current pathname, any
- 83817 editor command using the current pathname shall fail until an editor command sets the
- 83818 current pathname.

83819 If the **-r** option was specified, the first time a file in the initial argument list or a file specified by

83820 the **-t** option is edited, if recovery information has previously been saved about it, that

83821 information shall be recovered and the editor shall behave as if the contents of the edit buffer

83822 have already been modified. If there are multiple instances of the file to be recovered, the one

83823 most recently saved shall be recovered, and an informational message that there are previous

83824 versions of the file that can be recovered shall be written. If no recovery information about a file

83825 is available, an informational message to this effect shall be written, and the edit shall proceed as

83826 usual.

83827 If the **-c** option was specified, the first time a file that already exists (including a file that might

83828 not exist but for which recovery information is available, when the **-r** option is specified)

83829 replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of

83830 the edit buffer, the current column shall be set to non-<blank>, and the *ex* commands specified

83831 with the `-c` option shall be executed. In this case, the current line and current column shall not
 83832 be set as described for the command associated with the replacement or initialization of the edit
 83833 buffer contents. However, if the `-t` option or a **tag** command is associated with this action, the `-c`
 83834 option commands shall be executed and then the movement to the tag shall be performed.

83835 The current argument list shall initially be set to the filenames specified by the user on the
 83836 command line. If no filenames are specified by the user, the current argument list shall be empty.
 83837 If the `-t` option was specified, it is unspecified whether any filename resulting from tag
 83838 processing shall be prepended to the current argument list. In the case where the filename is
 83839 added as a prefix to the current argument list, the current argument list reference shall be set to
 83840 that filename. In the case where the filename is not added as a prefix to the current argument
 83841 list, the current argument list reference shall logically be located before the first of the filenames
 83842 specified on the command line (for example, a subsequent *ex next* command shall edit the first
 83843 filename from the command line). If the `-t` option was not specified, the current argument list
 83844 reference shall be to the first of the filenames on the command line.

83845 Addressing in *ex*

83846 Addressing in *ex* relates to the current line and the current column; the address of a line is its
 83847 1-based line number, the address of a column is its 1-based count from the beginning of the line.
 83848 Generally, the current line is the last line affected by a command. The current line number is the
 83849 address of the current line. In each command description, the effect of the command on the
 83850 current line number and the current column is described.

83851 Addresses are constructed as follows:

- 83852 1. The character `'.'` (period) shall address the current line.
- 83853 2. The character `'$'` shall address the last line of the edit buffer.
- 83854 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 83855 4. The address `"'x"` refers to the line marked with the mark name character `'x'`, which
 83856 shall be a lowercase letter from the portable character set or one of the characters `'\'` or
 83857 `'\''`. It shall be an error if the line that was marked is not currently present in the edit
 83858 buffer or the mark has not been set. Lines can be marked with the *ex mark* or *k*
 83859 commands, or the *vi m* command.
- 83860 5. A regular expression enclosed by slashes (`'/'`) shall address the first line found by
 83861 searching forwards from the line following the current line toward the end of the edit
 83862 buffer and stopping at the first line for which the line excluding the terminating
 83863 `<newline>` matches the regular expression. As stated in [Regular Expressions in *ex*](#) (on
 83864 page 2608), an address consisting of a null regular expression delimited by slashes `"/"`
 83865 shall address the next line for which the line excluding the terminating `<newline>`
 83866 matches the last regular expression encountered. In addition, the second slash can be
 83867 omitted at the end of a command line. If the **wrapsan** edit option is set, the search shall
 83868 wrap around to the beginning of the edit buffer and continue up to and including the
 83869 current line, so that the entire edit buffer is searched. Within the regular expression, the
 sequence `"\"` shall represent a literal slash instead of the regular expression delimiter.
- 83871 6. A regular expression enclosed in question marks (`'?'`) shall address the first line found
 83872 by searching backwards from the line preceding the current line toward the beginning of
 83873 the edit buffer and stopping at the first line for which the line excluding the terminating
 83874 `<newline>` matches the regular expression. An address consisting of a null regular
 83875 expression delimited by question marks `"??"` shall address the previous line for which
 83876 the line excluding the terminating `<newline>` matches the last regular expression
 83877 encountered. In addition, the second question mark can be omitted at the end of a
 83878 command line. If the **wrapsan** edit option is set, the search shall wrap around from the
 83879 beginning of the edit buffer to the end of the edit buffer and continue up to and including

83880 the current line, so that the entire edit buffer is searched. Within the regular expression,
83881 the sequence "\?" shall represent a literal question mark instead of the RE delimiter.

83882 7. A plus sign ('+') or a minus sign ('-') followed by a decimal number shall address the
83883 current line plus or minus the number. A '+' or '-' not followed by a decimal number
83884 shall address the current line plus or minus 1.

83885 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.
83886 Address offsets are constructed as follows:

- 83887 1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the
83888 indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal
83889 number shall add (subtract) 1 to (from) the address.
- 83890 2. A decimal number shall add the indicated number of lines to the address.

83891 It shall not be an error for an intermediate address value to be less than zero or greater than the
83892 last line in the edit buffer. It shall be an error for the final address value to be less than zero or
83893 greater than the last line in the edit buffer.

83894 Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in
83895 [Command Descriptions in ex](#) (on page 2586). If more than the required number of addresses are
83896 provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than
83897 the required number of addresses are provided to a command, the addresses specified first shall
83898 be evaluated and then discarded until the maximum number of valid addresses remain.

83899 Addresses shall be separated from each other by a comma (',') or a semicolon (';'). If no
83900 address is specified before or after a comma or semicolon separator, it shall be as if the address
83901 of the current line was specified before or after the separator. In the case of a semicolon
83902 separator, the current line ('.') shall be set to the first address, and only then will the next
83903 address be calculated. This feature can be used to determine the starting line for forwards and
83904 backwards searches (see rules 5. and 6.).

83905 A percent sign ('%') shall be equivalent to entering the two addresses "1,\$".

83906 Any delimiting <blank>s between addresses, address separators, or address offsets shall be
83907 discarded.

83908 **Command Line Parsing in ex**

83909 The following symbol is used in this and following sections to describe parsing behavior:

83910 *escape* If a character is referred to as "backslash-escaped" or "<control>-V-escaped," it
83911 shall mean that the character acquired or lost a special meaning by virtue of being
83912 preceded, respectively, by a backslash or <control>-V character. Unless otherwise
83913 specified, the escaping character shall be discarded at that time and shall not be
83914 further considered for any purpose.

83915 Command-line parsing shall be done in the following steps. For each step, characters already
83916 evaluated shall be ignored; that is, the phrase "leading character" refers to the next character
83917 that has not yet been evaluated.

- 83918 1. Leading colon characters shall be skipped.
- 83919 2. Leading <blank>s shall be skipped.
- 83920 3. If the leading character is a double-quote character, the characters up to and including the
83921 next non-backslash-escaped <newline> shall be discarded, and any subsequent characters
83922 shall be parsed as a separate command.

- 83923 4. Leading characters that can be interpreted as addresses shall be evaluated; see
83924 [Addressing in ex](#) (on page 2579).
- 83925 5. Leading <blank>s shall be skipped.
- 83926 6. If the next character is a vertical-line character or a <newline>:
- 83927 a. If the next character is a <newline>:
- 83928 1. If *ex* is in open or visual mode, the current line shall be set to the last
83929 address specified, if any.
- 83930 2. Otherwise, if the last command was terminated by a vertical-line character,
83931 no action shall be taken; for example, the command "| |<newline>" shall
83932 execute two implied commands, not three.
- 83933 3. Otherwise, step 6.b. shall apply.
- 83934 b. Otherwise, the implied command shall be the **print** command. The last #, **p**, and **I**
83935 flags specified to any *ex* command shall be remembered and shall apply to this
83936 implied command. Executing the *ex* **number**, **print**, or **list** command shall set the
83937 remembered flags to #, nothing, and **I**, respectively, plus any other flags specified
83938 for that execution of the **number**, **print**, or **list** command.
- 83939 If *ex* is not currently performing a **global** or **v** command, and no address or count
83940 is specified, the current line shall be incremented by 1 before the command is
83941 executed. If incrementing the current line would result in an address past the last
83942 line in the edit buffer, the command shall fail, and the increment shall not happen.
- 83943 c. The <newline> or vertical-line character shall be discarded and any subsequent
83944 characters shall be parsed as a separate command.
- 83945 7. The command name shall be comprised of the next character (if the character is not
83946 alphabetic), or the next character and any subsequent alphabetic characters (if the
83947 character is alphabetic), with the following exceptions:
- 83948 a. Commands that consist of any prefix of the characters in the command name
83949 **delete**, followed immediately by any of the characters 'l', 'p', '+', '-', or '#'
83950 shall be interpreted as a **delete** command, followed by a <blank>, followed by the
83951 characters that were not part of the prefix of the **delete** command. The maximum
83952 number of characters shall be matched to the command name **delete**; for example,
83953 "de1" shall not be treated as "de" followed by the flag **I**.
- 83954 b. Commands that consist of the character 'k', followed by a character that can be
83955 used as the name of a mark, shall be equivalent to the mark command followed by
83956 a <blank>, followed by the character that followed the 'k'.
- 83957 c. Commands that consist of the character 's', followed by characters that could be
83958 interpreted as valid options to the **s** command, shall be the equivalent of the **s**
83959 command, without any pattern or replacement values, followed by a <blank>,
83960 followed by the characters after the 's'.
- 83961 8. The command name shall be matched against the possible command names, and a
83962 command name that contains a prefix matching the characters specified by the user shall
83963 be the executed command. In the case of commands where the characters specified by the
83964 user could be ambiguous, the executed command shall be as follows:

83965
83966
83967
83968
83969
83970

a	append	n	next	t	t
c	change	p	print	u	undo
ch	change	pr	print	un	undo
e	edit	r	read	v	v
m	move	re	read	w	write
ma	mark	s	s		

83971
83972
83973

Implementation extensions with names causing similar ambiguities shall not be checked for a match until all possible matches for commands specified by POSIX.1-200x have been checked.

83974
83975
83976
83977
83978

9. If the command is a **!** command, or if the command is a **read** command followed by zero or more `<blank>s` and a **!**, or if the command is a **write** command followed by one or more `<blank>s` and a **!**, the rest of the command shall include all characters up to a non-backslash-escaped `<newline>`. The `<newline>` shall be discarded and any subsequent characters shall be parsed as a separate *ex* command.

83979
83980

10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while in open or visual mode, the next part of the command shall be parsed as follows:

83981
83982

- a. Any `'!'` character immediately following the command shall be skipped and be part of the command.

83983

- b. Any leading `<blank>s` shall be skipped and be part of the command.

83984
83985
83986

- c. If the next character is a `'+'`, characters up to the first non-backslash-escaped `<newline>` or non-backslash-escaped `<blank>` shall be skipped and be part of the command.

83987
83988

- d. The rest of the command shall be determined by the steps specified in paragraph 12.

83989
83990

11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the command shall be parsed as follows:

83991

- a. Any leading `<blank>s` shall be skipped and be part of the command.

83992
83993

- b. If the next character is not an alphanumeric, double-quote, `<newline>`, backslash, or vertical-line character:

83994

1. The next character shall be used as a command delimiter.

83995
83996
83997

2. If the command is a **global**, **open**, or **v** command, characters up to the first non-backslash-escaped `<newline>`, or first non-backslash-escaped delimiter character, shall be skipped and be part of the command.

83998
83999
84000

3. If the command is an **s** command, characters up to the first non-backslash-escaped `<newline>`, or second non-backslash-escaped delimiter character, shall be skipped and be part of the command.

84001
84002

- c. If the command is a **global** or **v** command, characters up to the first non-backslash-escaped `<newline>` shall be skipped and be part of the command.

84003
84004

- d. Otherwise, the rest of the command shall be determined by the steps specified in paragraph 12.

84005

12. Otherwise:

84006
84007
84008

- a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command, characters up to the first non-`<control>-V`-escaped `<newline>`, vertical-line, or double-quote character shall be skipped and be part of the command.

- 84009 b. Otherwise, characters up to the first non-backslash-escaped <newline>, vertical-
84010 line, or double-quote character shall be skipped and be part of the command.
- 84011 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.
84012 ended at a vertical-line character, any subsequent characters, up to the next non-
84013 backslash-escaped <newline> shall be used as input text to the command.
- 84014 d. If the command was ended by a double-quote character, all subsequent characters,
84015 up to the next non-backslash-escaped <newline>, shall be discarded.
- 84016 e. The terminating <newline> or vertical-line character shall be discarded and any
84017 subsequent characters shall be parsed as a separate *ex* command.

84018 Command arguments shall be parsed as described by the Synopsis and Description of each
84019 individual *ex* command. This parsing shall not be <blank>-sensitive, except for the **!** argument,
84020 which must follow the command name without intervening <blank>s, and where it would
84021 otherwise be ambiguous. For example, *count* and *flag* arguments need not be <blank>-separated
84022 because "d22p" is not ambiguous, but *file* arguments to the *ex next* command must be separated
84023 by one or more <blank>s. Any <blank> in command arguments for the **abbreviate**,
84024 **unabbreviate**, **map**, and **unmap** commands can be <control>-V-escaped, in which case the
84025 <blank> shall not be used as an argument delimiter. Any <blank> in the command argument for
84026 any other command can be backslash-escaped, in which case that <blank> shall not be used as
84027 an argument delimiter.

84028 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,
84029 any character can be <control>-V-escaped. All such escaped characters shall be treated literally
84030 and shall have no special meaning. Within command arguments for all other *ex* commands that
84031 are not regular expressions or replacement strings, any character that would otherwise have a
84032 special meaning can be backslash-escaped. Escaped characters shall be treated literally, without
84033 special meaning as shell expansion characters or **'!'**, **'%'**, and **'#'** expansion characters. See
84034 [Regular Expressions in ex](#) (on page 2608) and [Replacement Strings in ex](#) (on page 2608) for
84035 descriptions of command arguments that are regular expressions or replacement strings.

84036 Non-backslash-escaped **'%'** characters appearing in *file* arguments to any *ex* command shall be
84037 replaced by the current pathname; unescaped **'#'** characters shall be replaced by the alternate
84038 pathname. It shall be an error if **'%'** or **'#'** characters appear unescaped in an argument and
84039 their corresponding values are not set.

84040 Non-backslash-escaped **'!'** characters in the arguments to either the *ex !* command or the open
84041 and visual mode **!** command, or in the arguments to the *ex read* command, where the first
84042 non-<blank> after the command name is a **'!'** character, or in the arguments to the *ex write*
84043 command where the command name is followed by one or more <blank>s and the first
84044 non-<blank> after the command name is a **'!'** character, shall be replaced with the arguments
84045 to the last of those three commands as they appeared after all unescaped **'%'**, **'#'**, and **'!'**
84046 characters were replaced. It shall be an error if **'!'** characters appear unescaped in one of these
84047 commands and there has been no previous execution of one of these commands.

84048 If an error occurs during the parsing or execution of an *ex* command:

- 84049 • An informational message to this effect shall be written. Execution of the *ex* command shall
84050 stop, and the cursor (for example, the current line and column) shall not be further
84051 modified.
- 84052 • If the *ex* command resulted from a map expansion, all characters from that map expansion
84053 shall be discarded, except as otherwise specified by the **map** command.
- 84054 • Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment
84055 variable, a **.exrc** file, a **:source** command, a **-c** option, or a **+command** specified to an *ex edit*,
84056 *ex next*, or *visual* command, no further commands from the source of the commands shall
84057 be executed.

- 84058 • Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v**
- 84059 command, no further commands caused by the execution of the buffer or the **global** or **v**
- 84060 command shall be executed.
- 84061 • Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and
- 84062 including the next non-backslash-escaped <newline> shall be discarded.

84063

Input Editing in *ex*

84064

The following symbol is used in this and the following sections to specify command actions:

84065

word In the POSIX locale, a word consists of a maximal sequence of letters, digits, and underscores, delimited at both ends by characters other than letters, digits, or underscores, or by the beginning or end of a line or the edit buffer.

84066

84067

84068

When accepting input characters from the user, in either *ex* command mode or *ex* text input mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces volume of POSIX.1-200x.

84069

84070

84071

If in *ex* text input mode:

84072

1. If the **number** edit option is set, *ex* shall prompt for input using the line number that would be assigned to the line if it is entered, in the format specified for the *ex* **number** command.

84073

84074

84075

2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters, as described by the **autoindent** edit option. **autoindent** characters shall follow the line number, if any.

84076

84077

84078

If in *ex* command mode:

84079

1. If the **prompt** edit option is set, input shall be prompted for using a single ' : ' character; otherwise, there shall be no prompt.

84080

84081

The input characters in the following sections shall have the following effects on the input line.

84082

Scroll

84083

Synopsis: eof

84084

See the description of the *stty* eof character in *stty*.

84085

If in *ex* command mode:

84086

If the eof character is the first character entered on the line, the line shall be evaluated as if it contained two characters: a <control>-D and a <newline>.

84087

84088

Otherwise, the eof character shall have no special meaning.

84089

If in *ex* text input mode:

84090 If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be
 84091 modified so that a part of the next text input character will be displayed on the first
 84092 column in the line after the previous **shiftwidth** edit option column boundary, and the
 84093 user shall be prompted again for input for the same line.

84094 Otherwise, if the cursor follows a '0', which follows an **autoindent** character, and the '0'
 84095 was the previous text input character, the '0' and all **autoindent** characters in the line
 84096 shall be discarded, and the user shall be prompted again for input for the same line.

84097 Otherwise, if the cursor follows a '^', which follows an **autoindent** character, and the '^'
 84098 was the previous text input character, the '^' and all **autoindent** characters in the line
 84099 shall be discarded, and the user shall be prompted again for input for the same line. In
 84100 addition, the **autoindent** level for the next input line shall be derived from the same line
 84101 from which the **autoindent** level for the current input line was derived.

84102 Otherwise, if there are no **autoindent** or text input characters in the line, the *eof* character
 84103 shall be discarded.

84104 Otherwise, the *eof* character shall have no special meaning.

84105 <newline>

84106 *Synopsis:* <newline>
 84107 <control>-J

84108 If in *ex* command mode:

84109 Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for
 84110 this purpose.

84111 If in *ex* text input mode:

84112 Terminate the current line. If there are no characters other than **autoindent** characters on
 84113 the line, all characters on the line shall be discarded.

84114 Prompt for text input on a new line after the current line. If the **autoindent** edit option is
 84115 set, an appropriate number of **autoindent** characters shall be added as a prefix to the line
 84116 as described by the *ex* **autoindent** edit option.

84117 <backslash>

84118 *Synopsis:* <backslash>

84119 Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any
 84120 special meaning that it may have to the editor during text input mode. The backslash character
 84121 shall be retained and evaluated when the command line is parsed, or retained and included
 84122 when the input text becomes part of the edit buffer.

84123 <control>-V

84124 *Synopsis:* <control>-V

84125 Allow the entry of any subsequent character as a literal character, removing any special meaning
 84126 that it may have to the editor during text input mode. The <control>-V character shall be
 84127 discarded before the command line is parsed or the input text becomes part of the edit buffer.

84128 If the "literal next" functionality is performed by the underlying system, it is implementation-
 84129 defined whether a character other than <control>-V performs this function.

84130

<control>-W

84131

Synopsis: <control>-W

84132

84133

84134

84135

Discard the <control>-W, and the word previous to it in the input line, including any <blank>s following the word and preceding the <control>-W. If the “word erase” functionality is performed by the underlying system, it is implementation-defined whether a character other than <control>-W performs this function.

84136

Command Descriptions in ex

84137

84138

The following symbols are used in this section to represent command modifiers. Some of these modifiers can be omitted, in which case the specified defaults shall be used.

84139

84140

1addr A single line address, given in any of the forms described in [Addressing in ex](#) (on page 2579); the default shall be the current line (‘.’), unless otherwise specified.

84141

84142

If the line address is zero, it shall be an error, unless otherwise specified in the following command descriptions.

84143

84144

84145

If the edit buffer is empty, and the address is specified with a command other than **=**, **append**, **insert**, **open**, **put**, **read**, or **visual**, or the address is not zero, it shall be an error.

84146

84147

84148

84149

84150

2addr Two addresses specifying an inclusive range of lines. If no addresses are specified, the default for *2addr* shall be the current line only (“.”), unless otherwise specified in the following command descriptions. If one address is specified, *2addr* shall specify that line only, unless otherwise specified in the following command descriptions.

84151

It shall be an error if the first address is greater than the second address.

84152

84153

84154

If the edit buffer is empty, and the two addresses are specified with a command other than the **!**, **write**, **wq**, or **xit** commands, or either address is not zero, it shall be an error.

84155

84156

84157

84158

count A positive decimal number. If *count* is specified, it shall be equivalent to specifying an additional address to the command, unless otherwise specified by the following command descriptions. The additional address shall be equal to the last address specified to the command (either explicitly or by default) plus *count*−1.

84159

84160

If this would result in an address greater than the last line of the edit buffer, it shall be corrected to equal the last line of the edit buffer.

84161

84162

84163

84164

flags One or more of the characters ‘+’, ‘-’, ‘#’, ‘p’, or ‘l’ (ell). The flag characters can be <blank>-separated, and in any order or combination. The characters ‘#’, ‘p’, and ‘l’ shall cause lines to be written in the format specified by the **print** command with the specified *flags*.

84165

The lines to be written are as follows:

84166

84167

84168

84169

84170

1. All edit buffer lines written during the execution of the *ex* **&**, **~**, **list**, **number**, **open**, **print**, **s**, **visual**, and **z** commands shall be written as specified by *flags*.
2. After the completion of an *ex* command with a flag as an argument, the current line shall be written as specified by *flags*, unless the current line was the last line written by the command.

84171

84172

84173

84174

The characters ‘+’ and ‘-’ cause the value of the current line after the execution of the *ex* command to be adjusted by the offset address as described in [Addressing in ex](#) (on page 2579). This adjustment shall occur before the current line is written as described in 2. above.

84175 The default for *flags* shall be none.

84176 *buffer* One of a number of named areas for holding text. The named buffers are specified
84177 by the alphanumeric characters of the POSIX locale. There shall also be one
84178 “unnamed” buffer. When no buffer is specified for editor commands that use a
84179 buffer, the unnamed buffer shall be used. Commands that store text into buffers
84180 shall store the text as it was before the command took effect, and shall store text
84181 occurring earlier in the file before text occurring later in the file, regardless of how
84182 the text region was specified. Commands that store text into buffers shall store the
84183 text into the unnamed buffer as well as any specified buffer.

84184 In *ex* commands, buffer names are specified as the name by itself. In open or visual
84185 mode commands the name is preceded by a double quote (' " ') character.

84186 If the specified buffer name is an uppercase character, and the buffer contents are
84187 to be modified, the buffer shall be appended to rather than being overwritten. If
84188 the buffer is not being modified, specifying the buffer name in lowercase and
84189 uppercase shall have identical results.

84190 There shall also be buffers named by the numbers 1 through 9. In open and visual
84191 mode, if a region of text including characters from more than a single line is being
84192 modified by the *vi* *c* or *d* commands, the motion character associated with the *c* or
84193 *d* commands specifies that the buffer text shall be in line mode, or the commands
84194 *%*, *'*, */*, *?*, *(*, *)*, *N*, *n*, *{*, or *}* are used to define a region of text for the *c* or *d*
84195 commands, the contents of buffers 1 through 8 shall be moved into the buffer named by the
84196 next numerically greater value, the contents of buffer 9 shall be discarded, and the
84197 region of text shall be copied into buffer 1. This shall be in addition to copying the
84198 text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can
84199 be specified as a source buffer for open and visual mode commands; however,
84200 specifying a numeric buffer as the write target of an open or visual mode
84201 command shall have unspecified results.

84202 The text of each buffer shall have the characteristic of being in either line or
84203 character mode. Appending text to a non-empty buffer shall set the mode to match
84204 the characteristic of the text being appended. Appending text to a buffer shall
84205 cause the creation of at least one additional line in the buffer. All text stored into
84206 buffers by *ex* commands shall be in line mode. The *ex* commands that use buffers
84207 as the source of text specify individually how buffers of different modes are
84208 handled. Each open or visual mode command that uses buffers for any purpose
84209 specifies individually the mode of the text stored into the buffer and how buffers
84210 of different modes are handled.

84211 *file* Command text used to derive a pathname. The default shall be the current
84212 pathname, as defined previously, in which case, if no current pathname has yet
84213 been established it shall be an error, except where specifically noted in the
84214 individual command descriptions that follow. If the command text contains any of
84215 the characters *'* *~*, *'* *{*, *'* *[*, *'* ***, *'* *?*, *'* *\$*, *'* *'*, *'* *'*, *'* *"*, and *'* **, it shall be
84216 subjected to the process of “shell expansions”, as described below; if more than a
84217 single pathname results and the command expects only one, it shall be an error.

84218 The process of shell expansions in the editor shall be done as follows. The *ex* utility
84219 shall pass two arguments to the program named by the shell edit option; the first
84220 shall be *-c*, and the second shall be the string “echo” and the command text as a
84221 single argument. The standard output and standard error of that command shall
84222 replace the command text.

84223 ! A character that can be appended to the command name to modify its operation,
 84224 as detailed in the individual command descriptions. With the exception of the *ex*
 84225 **read**, **write**, and **!** commands, the '!' character shall only act as a modifier if there
 84226 are no <blank>s between it and the command name.

84227 *remembered search direction*

84228 The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in
 84229 the edit buffer based on a remembered search direction, which is initially unset,
 84230 and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* / and ? commands.

84231 Abbreviate

84232 *Synopsis:* ab[*breviate*][*lhs rhs*]

84233 If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.

84234 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable
 84235 characters and <blank>s shall not be restricted. Additional restrictions shall be implementation-
 84236 defined.

84237 In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the character
 84238 shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.

84239 In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a
 84240 <control>-V character is entered after a word character, a check shall be made for a set of
 84241 characters matching *lhs*, in the text input entered during this command. If it is found, the effect
 84242 shall be as if *rhs* was entered instead of *lhs*.

84243 The set of characters that are checked is defined as follows:

- 84244 1. If there are no characters inserted before the word and non-word or <ESC> characters
 84245 that triggered the check, the set of characters shall consist of the word character.
- 84246 2. If the character inserted before the word and non-word or <ESC> characters that
 84247 triggered the check is a word character, the set of characters shall consist of the characters
 84248 inserted immediately before the triggering characters that are word characters, plus the
 84249 triggering word character.
- 84250 3. If the character inserted before the word and non-word or <ESC> characters that
 84251 triggered the check is not a word character, the set of characters shall consist of the
 84252 characters that were inserted before the triggering characters that are neither <blank>s
 84253 nor word characters, plus the triggering word character.

84254 It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate**
 84255 commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the
 84256 effect of the command shall be as if the replacement had not occurred.

84257 *Current line:* Unchanged.

84258 *Current column:* Unchanged.

84259 Append

84260 *Synopsis:* [*laddr*] a[*ppend*][!]

84261 Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is
 84262 specified, the text shall be placed at the beginning of the edit buffer.

84263 This command shall be affected by the **number** and **autoindent** edit options; following the
 84264 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the
 84265 duration of this command only.

84266 *Current line:* Set to the last input line; if no lines were input, set to the specified line, or to the first

84267 line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.

84268 *Current column*: Set to non-<blank>.

84269 Arguments

84270 *Synopsis*: ar[gs]

84271 Write the current argument list, with the current argument-list entry, if any, between ' [' and
84272 '] ' characters.

84273 *Current line*: Unchanged.

84274 *Current column*: Unchanged.

84275 Change

84276 *Synopsis*: [2addr] c[hange][!][count]

84277 Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall
84278 be copied into the unnamed buffer, which shall become a line mode buffer.

84279 This command shall be affected by the **number** and **autoindent** edit options; following the
84280 command name with ' ! ' shall cause the **autoindent** edit option setting to be toggled for the
84281 duration of this command only.

84282 *Current line*: Set to the last input line; if no lines were input, set to the line before the first
84283 address, or to the first line of the edit buffer if there are no lines preceding the first address, or to
84284 zero if the edit buffer is empty.

84285 *Current column*: Set to non-<blank>.

84286 Change Directory

84287 *Synopsis*: chd[ir][!][directory]

84288 cd[!][directory]

84289 Change the current working directory to *directory*.

84290 If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null
84291 and non-empty value, *directory* shall default to the value named in the *HOME* environment
84292 variable. If the *HOME* environment variable is empty or is undefined, the default value of
84293 *directory* is implementation-defined.

84294 If no ' ! ' is appended to the command name, and the edit buffer has been modified since the
84295 last complete write, and the current pathname does not begin with a ' / ', it shall be an error.

84296 *Current line*: Unchanged.

84297 *Current column*: Unchanged.

84298 Copy

84299 *Synopsis*: [2addr] co[py] 1addr [flags]

84300 [2addr] t 1addr [flags]

84301 Copy the specified lines after the specified destination line; line zero specifies that the lines shall
84302 be placed at the beginning of the edit buffer.

84303 *Current line*: Set to the last line copied.

84304 *Current column*: Set to non-<blank>.

84305 **Delete**
 84306 *Synopsis:* `[2addr] d[delete][buffer][count][flags]`

84307 Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a
 84308 line-mode buffer.

84309 Flags can immediately follow the command name; see [Command Line Parsing in ex](#) (on page
 84310 2580).

84311 *Current line:* Set to the line following the deleted lines, or to the last line in the edit buffer if that
 84312 line is past the end of the edit buffer, or to zero if the edit buffer is empty.

84313 *Current column:* Set to non-<blank>.

84314 **Edit**

84315 *Synopsis:* `e[dit][!][+command][file]`
 84316 `ex[!][+command][file]`

84317 If no '!' is appended to the command name, and the edit buffer has been modified since the
 84318 last complete write, it shall be an error.

84319 If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*,
 84320 and set the current pathname to *file*. If *file* is not specified, replace the current contents of the
 84321 edit buffer with the current contents of the file named by the current pathname. If for any reason
 84322 the current contents of the file cannot be accessed, the edit buffer shall be empty.

84323 The *+command* option shall be <blank>-delimited; <blank>s within *+command* can be escaped by
 84324 preceding them with a backslash character. The *+command* shall be interpreted as an *ex*
 84325 command immediately after the contents of the edit buffer have been replaced and the current
 84326 line and column have been set.

84327 If the edit buffer is empty:

84328 *Current line:* Set to 0.

84329 *Current column:* Set to 1.

84330 Otherwise, if executed while in *ex* command mode or if the *+command* argument is specified:

84331 *Current line:* Set to the last line of the edit buffer.

84332 *Current column:* Set to non-<blank>.

84333 Otherwise, if *file* is omitted or results in the current pathname:

84334 *Current line:* Set to the first line of the edit buffer.

84335 *Current column:* Set to non-<blank>.

84336 Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if
 84337 the file was previously edited, the line and column may be set as follows:

84338 *Current line:* Set to the last value held when that file was last edited. If this value is not a valid
 84339 line in the new edit buffer, set to the first line of the edit buffer.

84340 *Current column:* If the current line was set to the last value held when the file was last edited, set
 84341 to the last value held when the file was last edited. Otherwise, or if the last value is not a valid
 84342 column in the new edit buffer, set to non-<blank>.

84343 Otherwise:

84344 *Current line:* Set to the first line of the edit buffer.

84345 *Current column:* Set to non-<blank>.

84346 **File**84347 *Synopsis:* `f[file][file]`84348 If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and
84349 the current pathname shall be set to *file*.84350 Write an informational message. If the file has a current pathname, it shall be included in this
84351 message; otherwise, the message shall indicate that there is no current pathname. If the edit
84352 buffer contains lines, the current line number and the number of lines in the edit buffer shall be
84353 included in this message; otherwise, the message shall indicate that the edit buffer is empty. If
84354 the edit buffer has been modified since the last complete write, this fact shall be included in this
84355 message. If the **readonly** edit option is set, this fact shall be included in this message. The
84356 message may contain other unspecified information.84357 *Current line:* Unchanged.84358 *Current column:* Unchanged.84359 **Global**84360 *Synopsis:* `[2addr] g[lobal] /pattern/ [commands]`84361 `[2addr] v /pattern/ [commands]`84362 The optional **'!'** character after the **global** command shall be the same as executing the **v**
84363 command.84364 If *pattern* is empty (for example, `"/"/`) or not specified, the last regular expression used in the
84365 editor command shall be used as the *pattern*. The *pattern* can be delimited by slashes (shown in
84366 the Synopsis), as well as any non-alphanumeric or non-`<blank>` other than backslash, vertical
84367 line, double quote, or `<newline>`.

84368 If no lines are specified, the lines shall default to the entire file.

84369 The **global** and **v** commands are logically two-pass operations. First, mark the lines within the
84370 specified lines for which the line excluding the terminating `<newline>` matches (**global**) or does
84371 not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by
84372 *commands*, with the current line (`'.'`) set to each marked line. If an error occurs during this
84373 process, or the contents of the edit buffer are replaced (for example, by the *ex* **:edit** command) an
84374 error message shall be written and no more commands resulting from the execution of this
84375 command shall be processed.84376 Multiple *ex* commands can be specified by entering multiple commands on a single line using a
84377 vertical line to delimit them, or one per line, by escaping each `<newline>` with a backslash.

84378 If no commands are specified:

- 84379
1. If in *ex* command mode, it shall be as if the **print** command were specified.
 2. Otherwise, no command shall be executed.
- 84380

84381 For the **append**, **change**, and **insert** commands, the input text shall be included as part of the
84382 command, and the terminating period can be omitted if the command ends the list of
84383 commands. The **open** and **visual** commands can be specified as one of the commands, in which
84384 case each marked line shall cause the editor to enter open or visual mode. If open or visual mode
84385 is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open
84386 or visual mode reentered, until the list of marked lines is exhausted.84387 The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted
84388 by commands executed for lines occurring earlier in the file than the marked lines. In this case,
84389 no commands shall be executed for the deleted lines.84390 If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

84391 The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v**
84392 command.

84393 *Current line*: If no commands executed, set to the last marked line. Otherwise, as specified for the
84394 executed *ex* commands.

84395 *Current column*: If no commands are executed, set to non-<blank>; otherwise, as specified for the
84396 individual *ex* commands.

84397 **Insert**

84398 *Synopsis*: `[1addr] i[nsert][!]`

84399 Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero
84400 or 1, the text shall be placed at the beginning of the edit buffer.

84401 This command shall be affected by the **number** and **autoindent** edit options; following the
84402 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the
84403 duration of this command only.

84404 *Current line*: Set to the last input line; if no lines were input, set to the line before the specified
84405 line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero
84406 if the edit buffer is empty.

84407 *Current column*: Set to non-<blank>.

84408 **Join**

84409 *Synopsis*: `[2addr] j[oin][!][count][flags]`

84410 If *count* is specified:

84411 If no address was specified, the **join** command shall behave as if *2addr* were the current
84412 line and the current line plus *count* ($.. + count$).

84413 If one address was specified, the **join** command shall behave as if *2addr* were the specified
84414 address and the specified address plus *count* ($addr, addr + count$).

84415 If two addresses were specified, the **join** command shall behave as if an additional
84416 address, equal to the last address plus *count* -1 ($addr1, addr2, addr2 + count - 1$), was
84417 specified.

84418 If this would result in a second address greater than the last line of the edit buffer, it shall
84419 be corrected to be equal to the last line of the edit buffer.

84420 If no *count* is specified:

84421 If no address was specified, the **join** command shall behave as if *2addr* were the current
84422 line and the next line ($.. + 1$).

84423 If one address was specified, the **join** command shall behave as if *2addr* were the specified
84424 address and the next line ($addr, addr + 1$).

84425 Join the text from the specified lines together into a single line, which shall replace the specified
84426 lines.

84427 If a '!' character is appended to the command name, the **join** shall be without modification of
84428 any line, independent of the current locale.

84429 Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for
84430 each subsequent line, proceed as follows:

- 84431 1. Discard leading <space>s from the line to be joined.
- 84432 2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
- 84433 3. If the current line ends in a <blank>, or the first character of the line to be joined is a ') ' character, join the lines without further modification.
- 84434
- 84435 4. If the last character of the current line is a ' . ' , join the lines with two <space>s between
- 84436 them.
- 84437 5. Otherwise, join the lines with a single <space> between them.

84438 *Current line*: Set to the first line specified.

84439 *Current column*: Set to non-<blank>.

84440 **List**

84441 *Synopsis*: `[2addr] l[ist][count][flags]`

84442 This command shall be equivalent to the *ex* command:

84443 `[2addr] p[rint][count] l[flags]`

84444 See [Print](#) (on page 2597).

84445 **Map**

84446 *Synopsis*: `map[!][lhs rhs]`

84447 If *lhs* and *rhs* are not specified:

- 84448 1. If ' ! ' is specified, write the current list of text input mode maps.
- 84449 2. Otherwise, write the current list of command mode maps.
- 84450 3. Do nothing more.

84451 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable characters and <blank>s shall not be restricted. Additional restrictions shall be implementation-defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V, in which case the character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be discarded.

84452

84453

84454 If the character ' ! ' is appended to the **map** command name, the mapping shall be effective during open or visual text input mode rather than **open** or **visual** command mode. This allows *lhs* to have two different **map** definitions at the same time: one for command mode and one for text input mode.

84455

84460 For command mode mappings:

84461 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as
84462 part of the arguments to the command), the action shall be as if the corresponding *rhs* had
84463 been entered.

84464 If any character in the command, other than the first, is escaped using a <control>-V
84465 character, that character shall not be part of a match to an *lhs*.

84466 It is unspecified whether implementations shall support **map** commands where the *lhs* is
84467 more than a single character in length, where the first character of the *lhs* is printable.

84468 If *lhs* contains more than one character and the first character is '#', followed by a
84469 sequence of digits corresponding to a numbered function key, then when this function key
84470 is typed it shall be mapped to *rhs*. Characters other than digits following a '#' character
84471 also represent the function key named by the characters in the *lhs* following the '#' and
84472 may be mapped to *rhs*. It is unspecified how function keys are named or what function
84473 keys are supported.

84474 For text input mode mappings:

84475 When the *lhs* is entered as any part of text entered in open or visual text input modes, the
84476 action shall be as if the corresponding *rhs* had been entered.

84477 If any character in the input text is escaped using a <control>-V character, that character
84478 shall not be part of a match to an *lhs*.

84479 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is
84480 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or
84481 not the display appears as if the corresponding *rhs* text was entered, the effect of the
84482 command shall be as if the *lhs* text was entered.

84483 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,
84484 possibly matching characters before treating the already entered characters as not matching the
84485 *lhs*.

84486 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the
84487 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those
84488 characters shall not be remapped.

84489 On block-mode terminals, the mapping need not occur immediately (for example, it may occur
84490 after the terminal transmits a group of characters to the system), but it shall achieve the same
84491 results as if it occurred immediately.

84492 *Current line*: Unchanged.

84493 *Current column*: Unchanged.

84494 **Mark**

84495 *Synopsis*: `[laddr] ma[rk] character`

84496 `[laddr] k character`

84497 Implementations shall support *character* values of a single lowercase letter of the POSIX locale
84498 and the characters '' and '''; support of other characters is implementation-defined.

84499 If executing the *vi m* command, set the specified mark to the current line and 1-based numbered
84500 character referenced by the current column, if any; otherwise, column position 1.

84501 Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank>
84502 non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any;
84503 otherwise, column position 1.

84504 The mark shall remain associated with the line until the mark is reset or the line is deleted. If a

84505 deleted line is restored by a subsequent **undo** command, any marks previously associated with
 84506 the line, which have not been reset, shall be restored as well. Any use of a mark not associated
 84507 with a current line in the edit buffer shall be an error.

84508 The marks ' and ' shall be set as described previously, immediately before the following events
 84509 occur in the editor:

- 84510 1. The use of '\$' as an *ex* address
- 84511 2. The use of a positive decimal number as an *ex* address
- 84512 3. The use of a search command as an *ex* address
- 84513 4. The use of a mark reference as an *ex* address
- 84514 5. The use of the following open and visual mode commands: <control>-], %, (,), [,], {, }
- 84515 6. The use of the following open and visual mode commands: ', **G**, **H**, **L**, **M**, **z** if the current
 84516 line will change as a result of the command
- 84517 7. The use of the open and visual mode commands: /, ?, **N**, ', **n** if the current line or column
 84518 will change as a result of the command
- 84519 8. The use of the *ex* mode commands: **z**, **undo**, **global**, **v**

84520 For rules 1., 2., 3., and 4., the ' and ' marks shall not be set if the *ex* command is parsed as
 84521 specified by rule 6.a. in [Command Line Parsing in ex](#) (on page 2580).

84522 For rules 5., 6., and 7., the ' and ' marks shall not be set if the commands are used as motion
 84523 commands in open and visual mode.

84524 For rules 1., 2., 3., 4., 5., 6., 7., and 8., the ' and ' marks shall not be set if the command fails.

84525 The ' and ' marks shall be set as described previously, each time the contents of the edit buffer
 84526 are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex**
 84527 mode and the edit buffer is not empty, before any commands or movements (including
 84528 commands or movements specified by the **-c** or **-t** options or the **+command** argument) are
 84529 executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the **vi**
 84530 **m** command; otherwise, as if executing the **ex mark** command.

84531 When changing from **ex** mode to open or visual mode, if the ' and ' marks are not already set,
 84532 the ' and ' marks shall be set as described previously.

84533 *Current line*: Unchanged.

84534 *Current column*: Unchanged.

84535 **Move**

84536 *Synopsis*: `[2addr] m[ove] 1addr [flags]`

84537 Move the specified lines after the specified destination line. A destination of line zero specifies
 84538 that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the
 84539 destination line is within the range of lines to be moved.

84540 *Current line*: Set to the last of the moved lines.

84541 *Current column*: Set to non-<blank>.

84542

Next

84543

Synopsis: n[ext][!][+command][file ...]

84544

84545

84546

If no `'!'` is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

84547

If one or more files is specified:

84548

1. Set the argument list to the specified filenames.

84549

2. Set the current argument list reference to be the first entry in the argument list.

84550

3. Set the current pathname to the first filename specified.

84551

Otherwise:

84552

1. It shall be an error if there are no more filenames in the argument list after the filename currently referenced.

84553

84554

2. Set the current pathname and the current argument list reference to the filename after the filename currently referenced in the argument list.

84555

84556

84557

84558

Replace the contents of the edit buffer with the contents of the file named by the current pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be empty.

84559

This command shall be affected by the **autowrite** and **wriean** edit options.

84560

84561

84562

84563

The `+command` option shall be `<blank>`-delimited; `<blank>`s can be escaped by preceding them with a backslash character. The `+command` shall be interpreted as an `ex` command immediately after the contents of the edit buffer have been replaced and the current line and column have been set.

84564

Current line: Set as described for the **edit** command.

84565

Current column: Set as described for the **edit** command.

84566

Number

84567

Synopsis: [2addr] nu[mber][count][flags]

84568

[2addr] #[count][flags]

84569

These commands shall be equivalent to the `ex` command:

84570

[2addr] p[rint][count] #[flags]

84571

See [Print](#) (on page 2597).

84572

Open

84573

Synopsis: [1addr] o[pen] /pattern/ [flags]

84574

84575

84576

This command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

84577

Enter open mode.

84578

84579

84580

84581

84582

The trailing delimiter can be omitted from `pattern` at the end of the command line. If `pattern` is empty (for example, `"/ /"`) or not specified, the last regular expression used in the editor shall be used as the pattern. The pattern can be delimited by slashes (shown in the Synopsis), as well as any alphanumeric, or non-`<blank>` other than backslash, vertical line, double quote, or `<newline>`.

84583 *Current line*: Set to the specified line.

84584 *Current column*: Set to non-<blank>.

84585 **Preserve**

84586 *Synopsis*: `pre[serve]`

84587 Save the edit buffer in a form that can later be recovered by using the `-r` option or by using the
84588 *ex* **recover** command. After the file has been preserved, a mail message shall be sent to the user.
84589 This message shall be readable by invoking the *mailx* utility. The message shall contain the name
84590 of the file, the time of preservation, and an *ex* command that could be used to recover the file.
84591 Additional information may be included in the mail message.

84592 *Current line*: Unchanged.

84593 *Current column*: Unchanged.

84594 **Print**

84595 *Synopsis*: `[2addr] p[rint][count][flags]`

84596 Write the addressed lines. The behavior is unspecified if the number of columns on the display is
84597 less than the number of columns required to write any single character in the lines being written.

84598 Non-printable characters, except for the <tab>, shall be written as implementation-defined
84599 multi-character sequences.

84600 If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line
84601 number in the following format:

84602 `"%6dΔΔ", <line number>`

84603 If the l flag is specified or the **list** edit option is set:

- 84604 1. The characters listed in XBD Table 5-1 (on page 108) shall be written as the corresponding
84605 escape sequence.
- 84606 2. Non-printable characters not in XBD Table 5-1 (on page 108) shall be written as one three-
84607 digit octal number (with a preceding backslash) for each byte in the character (most
84608 significant byte first).
- 84609 3. The end of each line shall be marked with a '\$', and literal '\$' characters within the line
84610 shall be written with a preceding backslash.

84611 Long lines shall be folded; the length at which folding occurs is unspecified, but should be
84612 appropriate for the output terminal, considering the number of columns of the terminal.

84613 If a line is folded, and the l flag is not specified and the **list** edit option is not set, it is unspecified
84614 whether a multi-column character at the folding position is separated; it shall not be discarded.

84615 *Current line*: Set to the last written line.

84616 *Current column*: Unchanged if the current line is unchanged; otherwise, set to non-<blank>.

84617

Put

84618

Synopsis: [laddr] pu[t][buffer]

84619

Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

84620

84621

84622

Current line: Set to the last line entered into the edit buffer.

84623

Current column: Set to non-<blank>.

84624

Quit

84625

Synopsis: q[uit][!]

84626

If no '!' is appended to the command name:

84627

1. If the edit buffer has been modified since the last complete write, it shall be an error.

84628

2. If there are filenames in the argument list after the filename currently referenced, and the last command was not a **quit**, **wq**, **xit**, or **ZZ** (see [Exit](#), on page 3248) command, it shall be an error.

84629

84630

84631

Otherwise, terminate the editing session.

84632

Read

84633

Synopsis: [laddr] r[ead][!][file]

84634

If '!' is not the first non-<blank> to follow the command name, a copy of the specified file shall be appended into the edit buffer after the specified line; line zero specifies that the copy shall be placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If no *file* is named, the current pathname shall be the default. If there is no current pathname, then *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be an error. Specifying a *file* that is not of type regular shall have unspecified results.

84635

84636

84637

84638

84639

84640

Otherwise, if *file* is preceded by '!', the rest of the line after the '!' shall have '%', '#', and '!' characters expanded as described in [Command Line Parsing in ex](#) (on page 2580).

84641

84642

The *ex* utility shall then pass two arguments to the program named by the shell edit option; the first shall be **-c** and the second shall be the expanded arguments to the **read** command as a single argument. The standard input of the program shall be set to the standard input of the *ex* program when it was invoked. The standard error and standard output of the program shall be appended into the edit buffer after the specified line.

84643

84644

84645

84646

84647

Each line in the copied file or program output (as delimited by <newline>s or the end of the file or output if it is not immediately preceded by a <newline>), shall be a separate line in the edit buffer. Any occurrences of <carriage-return> and <newline> pairs in the output shall be treated as single <newline>s.

84648

84649

84650

84651

The special meaning of the '!' following the **read** command can be overridden by escaping it with a backslash character.

84652

84653

Current line: If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into the edit buffer.

84654

84655

84656

Current column: Set to non-<blank>.

84657

Recover

84658

Synopsis: `rec[over][!] file`

84659

If no `'!'` is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

84660

84661

If no *file* operand is specified, then the current pathname shall be used. If there is no current pathname or *file* operand, it shall be an error.

84662

84663

If no recovery information has previously been saved about *file*, the **recover** command shall behave identically to the **edit** command, and an informational message to this effect shall be written.

84664

84665

84666

Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous versions of the file that can be recovered shall be written. The editor shall behave as if the contents of the edit buffer have already been modified.

84667

84668

84669

84670

84671

Current file: Set as described for the **edit** command.

84672

Current column: Set as described for the **edit** command.

84673

Rewind

84674

Synopsis: `rew[ind][!]`

84675

If no `'!'` is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

84676

84677

84678

If the argument list is empty, it shall be an error.

84679

The current argument list reference and the current pathname shall be set to the first filename in the argument list.

84680

84681

Replace the contents of the edit buffer with the contents of the file named by the current pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be empty.

84682

84683

84684

This command shall be affected by the **autowrite** and **wriean** edit options.

84685

Current line: Set as described for the **edit** command.

84686

Current column: Set as described for the **edit** command.

84687

Set

84688

Synopsis: `se[t][option[=value]] ...][nooption ...][option? ...][all]`

84689

When no arguments are specified, write the value of the **term** edit option and those options whose values have been changed from the default settings; when the argument *all* is specified, write all of the option values.

84690

84691

84692

Giving an option name followed by the character `'?'` shall cause the current value of that option to be written. The `'?'` can be separated from the option name by zero or more `<blank>`s. The `'?'` shall be necessary only for Boolean valued options. Boolean options can be given values by the form **set option** to turn them on or **set nooption** to turn them off; string and numeric options can be assigned by the form **set option=*value***. Any `<blank>`s in strings can be included as is by preceding each `<blank>` with an escaping backslash. More than one option can be set or listed by a single set command by specifying multiple arguments, each separated from the next by one or more `<blank>`s.

84693

84694

84695

84696

84697

84698

84699

84700 See [Edit Options in ex](#) (on page 2609) for details about specific options.

84701 *Current line*: Unchanged.

84702 *Current column*: Unchanged.

84703 Shell

84704 *Synopsis*: `sh[ell]`

84705 Invoke the program named in the **shell** edit option with the single argument **-i** (interactive
84706 mode). Editing shall be resumed when the program exits.

84707 *Current line*: Unchanged.

84708 *Current column*: Unchanged.

84709 Source

84710 *Synopsis*: `so[urce] file`

84711 Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.

84712 *Current line*: As specified for the individual *ex* commands.

84713 *Current column*: As specified for the individual *ex* commands.

84714 Substitute

84715 *Synopsis*: `[2addr] s[substitute][/pattern/repl][options][count][flags]`

84716 `[2addr] &[options][count][flags]`

84717 `[2addr] ~[options][count][flags]`

84718 Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See
84719 [Regular Expressions in ex](#) (on page 2608) and [Replacement Strings in ex](#) (on page 2608).) Any
84720 non-alphabetic, non-`<blank>` delimiter other than `'\'`, `'|'`, double quote, or `<newline>` can be
84721 used instead of `'/'`. Backslash characters can be used to escape delimiters, backslash
84722 characters, and other special characters.

84723 The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If
84724 both *pattern* and *repl* are not specified or are empty (for example, `"/"/`), the last **s** command
84725 shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in
84726 the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be
84727 replaced by nothing. If the entire replacement pattern is `'%'`, the last replacement pattern to an
84728 **s** command shall be used.

84729 Entering a `<carriage-return>` in *repl* (which requires an escaping backslash in *ex* mode and an
84730 escaping `<control>-V` in open or *vi* mode) shall split the line at that point, creating a new line in
84731 the edit buffer. The `<carriage-return>` shall be discarded.

84732 If *options* includes the letter **'g'** (**global**), all non-overlapping instances of the pattern in the line
84733 shall be replaced.

84734 If *options* includes the letter **'c'** (**confirm**), then before each substitution the line shall be written;
84735 the written line shall reflect all previous substitutions. On the following line, `<space>`s shall be
84736 written beneath the characters from the line that are before the *pattern* to be replaced, and `'^'`
84737 characters written beneath the characters included in the *pattern* to be replaced. The *ex* utility
84738 shall then wait for a response from the user. An affirmative response shall cause the substitution
84739 to be done, while any other input shall not make the substitution. An affirmative response shall
84740 consist of a line with the affirmative response (as defined by the current locale) at the beginning
84741 of the line. This line shall be subject to editing in the same way as the *ex* command line.

84742 If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the

84743 user shall be preserved in the edit buffer after the interrupt.

84744 If the remembered search direction is not set, the **s** command shall set it to forward.

84745 In the second Synopsis, the **&** command shall repeat the previous substitution, as if the **&**
84746 command were replaced by:

84747 *s/pattern/repl/*

84748 where *pattern* and *repl* are as specified in the previous **s**, **&**, or **~** command.

84749 In the third Synopsis, the **~** command shall repeat the previous substitution, as if the '**~**' were
84750 replaced by:

84751 *s/pattern/repl/*

84752 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from
84753 the previous substitution (including **&** and **~**) command.

84754 These commands shall be affected by the *LC_MESSAGES* environment variable.

84755 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no substitution
84756 occurred.

84757 *Current column*: Set to non-<blank>.

84758 Suspend

84759 *Synopsis:* **su**[*suspend*][!]

84760 **st**[*op*][!]

84761 Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the
84762 SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell
84763 (see the description of **set -m**).

84764 These commands shall be affected by the **autowrite** and **writeany** edit options.

84765 The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

84766 Tag

84767 *Synopsis:* **ta**[*g*][!] *tagstring*

84768 The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see
84769 *ctags*) description.

84770 The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in
84771 the order they are specified, until a reference to *tagstring* is found. Files shall be searched from
84772 beginning to end. If no reference is found, it shall be an error and an error message to this effect
84773 shall be written. If the reference is not found, or if an error occurs while processing a file referred
84774 to in the **tag** edit option, it shall be an error, and an error message shall be written at the first
84775 occurrence of such an error.

84776 Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression
84777 used in the editor; for example, for the purposes of the **s** command.

84778 If the *tagstring* is in a file with a different name than the current pathname, set the current
84779 pathname to the name of that file, and replace the contents of the edit buffer with the contents of
84780 that file. In this case, if no '**!**' is appended to the command name, and the edit buffer has been
84781 modified since the last complete write, it shall be an error, unless the file is successfully written
84782 as specified by the **autowrite** option.

84783 This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

84784 *Current line*: If the tags file contained a line number, set to that line number. If the line number is

84785 larger than the last line in the edit buffer, an error message shall be written and the current line
84786 shall be set as specified for the **edit** command.

84787 If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no
84788 matching pattern is found, an error message shall be written and the current line shall be set as
84789 specified for the **edit** command.

84790 *Current column*: If the tags file contained a line-number reference and that line-number was not
84791 larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern
84792 was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

84793 **Unabbreviate**

84794 *Synopsis*: `una[bbrev] lhs`

84795 If *lhs* is not an entry in the current list of abbreviations (see [Abbreviate](#), on page 2588), it shall be
84796 an error. Otherwise, delete *lhs* from the list of abbreviations.

84797 *Current line*: Unchanged.

84798 *Current column*: Unchanged.

84799 **Undo**

84800 *Synopsis*: `u[ndo]`

84801 Reverse the changes made by the last command that modified the contents of the edit buffer,
84802 including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands
84803 resulting from buffer executions and mapped character expansions, are considered single
84804 commands.

84805 If no action that can be undone preceded the **undo** command, it shall be an error.

84806 If the **undo** command restores lines that were marked, the mark shall also be restored unless it
84807 was reset subsequent to the deletion of the lines.

84808 *Current line*:

- 84809 1. If lines are added or changed in the file, set to the first line added or changed.
- 84810 2. Set to the line before the first line deleted, if it exists.
- 84811 3. Set to 1 if the edit buffer is not empty.
- 84812 4. Set to zero.

84813 *Current column*: Set to non-<blank>.

84814 **Unmap**

84815 *Synopsis*: `unm[ap][!] lhs`

84816 If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode
84817 map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map
84818 definitions.

84819 If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command
84820 mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode
84821 map definitions.

84822 *Current line*: Unchanged.

84823 *Current column*: Unchanged.

84824

Version

84825

Synopsis: `ve[rsion]`

84826

Write a message containing version information for the editor. The format of the message is unspecified.

84827

84828

Current line: Unchanged.

84829

Current column: Unchanged.

84830

Visual

84831

Synopsis: `[laddr] vi[sual][type][count][flags]`

84832

If *ex* is currently in open or visual mode, the *Synopsis* and behavior of the visual command shall be the same as the **edit** command, as specified by **Edit** (on page 2590).

84833

84834

Otherwise, this command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

84835

84836

84837

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window**, on page 2615). If the '^' type character was also specified, the **window** edit option shall be set before being used by the type character.

84838

84839

84840

Enter visual mode. If *type* is not specified, it shall be as if a *type* of '+' was specified. The *type* shall cause the following effects:

84841

84842

+ Place the beginning of the specified line at the top of the display.

84843

- Place the end of the specified line at the bottom of the display.

84844

. Place the beginning of the specified line in the middle of the display.

84845

^ If the specified line is less than or equal to the value of the **window** edit option, set the line to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place the beginning of this line as close to the bottom of the displayed lines as possible, while still displaying the value of the **window** edit option number of lines.

84846

84847

84848

84849

Current line: Set to the specified line.

84850

Current column: Set to non-<blank>.

84851

Write

84852

Synopsis: `[2addr] w[rite][!][>>][file]`

84853

`[2addr] w[rite][!][file]`

84854

`[2addr] wq[!][>>][file]`

84855

If no lines are specified, the lines shall default to the entire file.

84856

The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!** shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the **quit** shall not be attempted.

84857

84858

84859

If the command name is not followed by one or more <blank>s, or *file* is not preceded by a '!' character, the **write** shall be to a file.

84860

84861

1. If the >> argument is specified, and the file already exists, the lines shall be appended to the file instead of replacing its contents. If the >> argument is specified, and the file does not already exist, it is unspecified whether the write shall proceed as if the >> argument had not been specified or if the write shall fail.

84862

84863

84864

- 84865 2. If the **readonly** edit option is set (see [readonly](#), on page 2612), the **write** shall fail.
- 84866 3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
- 84867 4. If *file* is not specified, the current pathname shall be used. If there is no current pathname,
84868 the **write** command shall fail.
- 84869 5. If the current pathname is used, and the current pathname has been changed by the **file**
84870 or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,
84871 subsequent **writes** shall not fail for this reason (unless the current pathname is changed
84872 again).
- 84873 6. If the whole edit buffer is not being written, and the file to be written exists, the **write**
84874 shall fail.

84875 For rules 1., 2., 3., and 5., the **write** can be forced by appending the character '**!**' to the
84876 command name.

84877 For rules 2., 3., and 5., the **write** can be forced by setting the **wri~~te~~any** edit option.

84878 Additional, implementation-defined tests may cause the **write** to fail.

84879 If the edit buffer is empty, a file without any contents shall be written.

84880 An informational message shall be written noting the number of lines and bytes written.

84881 Otherwise, if the command is followed by one or more <blank>s, and the file is preceded by
84882 '**!**', the rest of the line after the '**!**' shall have '%', '#', and '**!**' characters expanded as
84883 described in [Command Line Parsing in ex](#) (on page 2580).

84884 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the
84885 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a
84886 single argument. The specified lines shall be written to the standard input of the command. The
84887 standard error and standard output of the program, if any, shall be written as described for the
84888 **print** command. If the last character in that output is not a <newline>, a <newline> shall be
84889 written at the end of the output.

84890 The special meaning of the '**!**' following the **write** command can be overridden by escaping it
84891 with a backslash character.

84892 *Current line*: Unchanged.

84893 *Current column*: Unchanged.

84894 **Write and Exit**

84895 *Synopsis*: [*2addr*] **x[it][!][file]**

84896 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to
84897 the **quit** command, or if a '**!**' is appended to the command name, to **quit!**.

84898 Otherwise, **xit** shall be equivalent to the **wq** command, or if a '**!**' is appended to the command
84899 name, to **wq!**.

84900 *Current line*: Unchanged.

84901 *Current column*: Unchanged.

84902 **Yank**84903 *Synopsis:* `[2addr] ya[nk][buffer][count]`84904 Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall
84905 become a line-mode buffer.84906 *Current line:* Unchanged.84907 *Current column:* Unchanged.84908 **Adjust Window**84909 *Synopsis:* `[1addr] z[!][type ...][count][flags]`84910 If no line is specified, the current line shall be the default; if *type* is omitted as well, the current
84911 line value shall first be incremented by 1. If incrementing the current line would cause it to be
84912 greater than the last line in the edit buffer, it shall be an error.84913 If there are <blank>s between the *type* argument and the preceding *z* command name or
84914 optional '!' character, it shall be an error.84915 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in
84916 **window**, on page 2615). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit
84917 option, or if ! was specified, the number of lines in the display minus 1.84918 If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise,
84919 *count* lines starting with the line specified by the *type* argument shall be written.84920 The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

84921 – The specified line shall be decremented by the following value:

84922 $((\text{number of ``-'' characters}) \times \text{count}) - 1$ 84923 If the calculation would result in a number less than 1, it shall be an error. Write lines from
84924 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit
84925 buffer has been written.

84926 + The specified line shall be incremented by the following value:

84927 $((\text{number of ``+'' characters}) - 1) \times \text{count} + 1$ 84928 If the calculation would result in a number greater than the last line in the edit buffer, it
84929 shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count*
84930 lines or the last line in the edit buffer has been written.84931 =, . If more than a single '.' or '=' is specified, it shall be an error. The following steps shall
84932 be taken:84933 1. If *count* is zero, nothing shall be written.84934 2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count*
84935 or '!' was specified, *N* shall be:84936 $(\text{count} - 1) / 2$ 84937 Otherwise, *N* shall be:84938 $(\text{count} - 3) / 2$ 84939 If *N* is a number less than 3, no lines shall be written.84940 3. If '=' was specified as the type character, write a line consisting of the smaller of the
84941 number of columns in the display divided by two, or 40 '-' characters.

- 84942 4. Write the current line.
- 84943 5. Repeat step 3.
- 84944 6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall
- 84945 be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count*
- 84946 is less than 3, no lines shall be written.

84947 \wedge The specified line shall be decremented by the following value:

84948 $((\text{number of ``^`` characters}) + 1) \times \text{count} - 1$

84949 If the calculation would result in a number less than 1, it shall be an error. Write lines from

84950 the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit

84951 buffer has been written.

84952 *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified

84953 line.

84954 *Current column*: Set to non-<blank>.

84955 Escape

84956 *Synopsis*: ! *command*

84957 [*addr*] ! *command*

84958 The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as

84959 described in [Command Line Parsing in ex](#) (on page 2580). If the expansion causes the text of the

84960 line to change, it shall be redisplayed, preceded by a single '!' character.

84961 The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two

84962 arguments to the program; the first shall be **-c**, and the second shall be the expanded arguments

84963 to the ! command as a single argument.

84964 If no lines are specified, the standard input, standard output, and standard error of the program

84965 shall be set to the standard input, standard output, and standard error of the *ex* program when it

84966 was invoked. In addition, a warning message shall be written if the edit buffer has been

84967 modified since the last complete write, and the **warn** edit option is set.

84968 If lines are specified, they shall be passed to the program as standard input, and the standard

84969 output and standard error of the program shall replace those lines in the edit buffer. Each line in

84970 the program output (as delimited by <newline>s or the end of the output if it is not immediately

84971 preceded by a <newline>), shall be a separate line in the edit buffer. Any occurrences of

84972 <carriage-return> and <newline> pairs in the output shall be treated as single <newline>s. The

84973 specified lines shall be copied into the unnamed buffer before they are replaced, and the

84974 unnamed buffer shall become a line-mode buffer.

84975 If in *ex* mode, a single '!' character shall be written when the program completes.

84976 This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this

84977 command shall be affected by the **autowrite** and **writeany** edit options. If lines are specified, this

84978 command shall be affected by the **autoprint** edit option.

84979 *Current line*:

- 84980 1. If no lines are specified, unchanged.
- 84981 2. Otherwise, set to the last line read in, if any lines are read in.
- 84982 3. Otherwise, set to the line before the first line of the lines specified, if that line exists.
- 84983 4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.

84984 5. Otherwise, set to zero.

84985 *Current column*: If no lines are specified, unchanged. Otherwise, set to non-<blank>.

84986 **Shift Left**

84987 *Synopsis*: `[2addr] <[< ...][count][flags]`

84988 Shift the specified lines to the start of the line; the number of column positions to be shifted shall
84989 be the number of command characters times the value of the **shiftwidth** edit option. Only
84990 leading <blank>s shall be deleted or changed into other <blank>s in shifting; other characters
84991 shall not be affected.

84992 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode
84993 buffer.

84994 This command shall be affected by the **autoprint** edit option.

84995 *Current line*: Set to the last line in the lines specified.

84996 *Current column*: Set to non-<blank>.

84997 **Shift Right**

84998 *Synopsis*: `[2addr] >[> ...][count][flags]`

84999 Shift the specified lines away from the start of the line; the number of column positions to be
85000 shifted shall be the number of command characters times the value of the **shiftwidth** edit
85001 option. The shift shall be accomplished by adding <blank>s as a prefix to the line or changing
85002 leading <blank>s into other <blank>s. Empty lines shall not be changed.

85003 Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode
85004 buffer.

85005 This command shall be affected by the **autoprint** edit option.

85006 *Current line*: Set to the last line in the lines specified.

85007 *Current column*: Set to non-<blank>.

85008 **<control>-D**

85009 *Synopsis*: `<control>-D`

85010 Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the
85011 number of lines after the current line in the edit buffer. If the current line is the last line of the
85012 edit buffer it shall be an error.

85013 *Current line*: Set to the last line written.

85014 *Current column*: Set to non-<blank>.

85015 **Write Line Number**

85016 *Synopsis*: `[1addr] = [flags]`

85017 If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of
85018 the specified line.

85019 *Current line*: Unchanged.

85020 *Current column*: Unchanged.

85021

Execute

85022

Synopsis: [2addr] @ buffer

85023

[2addr] * buffer

85024

If no buffer is specified or is specified as '@' or '*', the last buffer executed shall be used. If no previous buffer has been executed, it shall be an error.

85025

85026

For each line specified by the addresses, set the current line ('.') to the specified line, and execute the contents of the named *buffer* (as they were at the time the @ command was executed) as *ex* commands. For each line of a line-mode buffer, and all but the last line of a character-mode buffer, the *ex* command parser shall behave as if the line was terminated by a <newline>.

85027

85028

85029

85030

If an error occurs during this process, or a line specified by the addresses does not exist when the current line would be set to it, or more than a single line was specified by the addresses, and the contents of the edit buffer are replaced (for example, by the *ex* :edit command) an error message shall be written, and no more commands resulting from the execution of this command shall be processed.

85031

85032

85033

85034

85035

Current line: As specified for the individual *ex* commands.

85036

Current column: As specified for the individual *ex* commands.

85037

Regular Expressions in ex

85038

The *ex* utility shall support regular expressions that are a superset of the basic regular expressions described in XBD [Section 9.3](#) (on page 169). A null regular expression ("//") shall be equivalent to the last regular expression encountered.

85039

85040

85041

Regular expressions can be used in addresses to specify lines and, in some commands (for example, the **substitute** command), to specify portions of a line to be substituted.

85042

85043

The following constructs can be used to enhance the basic regular expressions:

85044

\< Match the beginning of a *word*. (See the definition of *word* at the beginning of [Command Descriptions in ex](#) (on page 2586).)

85045

85046

\> Match the end of a *word*.

85047

~ Match the replacement part of the last **substitute** command. The tilde ('~') character can be escaped in a regular expression to become a normal character with no special meaning. The backslash shall be discarded.

85048

85049

85050

When the editor option **magic** is not set, the only characters with special meanings shall be '^' at the beginning of a pattern, '\$' at the end of a pattern, and '\'. The characters '.', '*', '[', and '~' shall be treated as ordinary characters unless preceded by a '\'; when preceded by a '\' they shall regain their special meaning, or in the case of backslash, be handled as a single backslash. Backslashes used to escape other characters shall be discarded.

85051

85052

85053

85054

85055

Replacement Strings in ex

85056

The character '&' ('\&' if the editor option **magic** is not set) in the replacement string shall stand for the text matched by the pattern to be replaced. The character '~' ('\~' if **magic** is not set) shall be replaced by the replacement part of the previous **substitute** command. The sequence '\n', where *n* is an integer, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters '\n' shall be replaced by the empty string.

85057

85058

85059

85060

85061

85062

The strings '\l', '\u', '\L', and '\U' can be used to modify the case of elements in the replacement string (using the '&' or "\"digit) notation. The string '\l' ('\u') shall cause the character that follows to be converted to lowercase (uppercase). The string '\L' ('\U') shall cause all characters subsequent to it to be converted to lowercase (uppercase) as they are

85063

85064

85065

85066 inserted by the substitution until the string '`\e`' or '`\E`', or the end of the replacement string,
85067 is encountered.

85068 Otherwise, any character following a backslash shall be treated as that literal character, and the
85069 escaping backslash shall be discarded.

85070 An example of case conversion with the `s` command is as follows:

```
85071 :p
85072 The cat sat on the mat.
85073 :s/\<.at\>/\u&/gp
85074 The Cat Sat on the Mat.
85075 :s/S\(.*\)M/S\U\1\eM/p
85076 The Cat SAT ON THE Mat.
```

85077 Edit Options in ex

85078 The `ex` utility has a number of options that modify its behavior. These options have default
85079 settings, which can be changed using the `set` command.

85080 Options are Boolean unless otherwise specified.

85081 **autoindent, ai**

85082 [Default *unset*]

85083 If **autoindent** is set, each line in input mode shall be indented (using first as many `<tab>`s as
85084 possible, as determined by the editor option **tabstop**, and then using `<space>`s) to align with
85085 another line, as follows:

- 85086 1. If in open or visual mode and the text input is part of a line-oriented command (see the
85087 EXTENDED DESCRIPTION in *vi*), align to the first column.
- 85088 2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
 - 85089 a. If a line was previously inserted as part of this command, it shall be set to the
85090 indentation of the last inserted line by default, or as otherwise specified for the
85091 `<control>-D` character in *Input Mode Commands in vi* (on page 3248).
 - 85092 b. Otherwise, it shall be set to the indentation of the previous current line, if any;
85093 otherwise, to the first column.
- 85094 3. For the `ex a`, `i`, and `c` commands, indentation for each line shall be set as follows:
 - 85095 a. If a line was previously inserted as part of this command, it shall be set to the
85096 indentation of the last inserted line by default, or as otherwise specified for the `eof`
85097 character in *Scroll* (on page 2584).
 - 85098 b. Otherwise, if the command is the `ex a` command, it shall be set to the line
85099 appended after, if any; otherwise to the first column.
 - 85100 c. Otherwise, if the command is the `ex i` command, it shall be set to the line inserted
85101 before, if any; otherwise to the first column.
 - 85102 d. Otherwise, if the command is the `ex c` command, it shall be set to the indentation of
85103 the line replaced.

85104

autoprint, ap

85105

[Default *set*]

85106

If **autoprint** is set, the current line shall be written after each *ex* command that modifies the contents of the current edit buffer, and after each **tag** command for which the tag search pattern was found or tag line number was valid, unless:

85107

85108

85109

1. The command was executed while in open or visual mode.

85110

2. The command was executed as part of a **global** or **v** command or **@** buffer execution.

85111

3. The command was the form of the **read** command that reads a file into the edit buffer.

85112

4. The command was the **append**, **change**, or **insert** command.

85113

5. The command was not terminated by a <newline>.

85114

6. The current line shall be written by a flag specified to the command; for example, **delete #** shall write the current line as specified for the flag modifier to the **delete** command, and not as specified by the **autoprint** edit option.

85115

85116

85117

autowrite, aw

85118

[Default *unset*]

85119

If **autowrite** is set, and the edit buffer has been modified since it was last completely written to any file, the contents of the edit buffer shall be written as if the *ex* **write** command had been specified without arguments, before each command affected by the **autowrite** edit option is executed. Appending the character **'!'** to the command name of any of the *ex* commands except **'!'** shall prevent the write. If the write fails, it shall be an error and the command shall not be executed.

85120

85121

85122

85123

85124

85125

beautify, bf

85126

XSI

[Default *unset*]

85127

If **beautify** is set, all non-printable characters, other than <tab>s, <newline>s, and <form-feed>s, shall be discarded from text read in from files.

85128

85129

directory, dir

85130

[Default *implementation-defined*]

85131

The value of this option specifies the directory in which the editor buffer is to be placed. If this directory is not writable by the user, the editor shall quit.

85132

85133

edcompatible, ed

85134

[Default *unset*]

85135

Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled by repeating the suffixes.

85136

85137 **errorbells, eb**

85138 [Default *unset*]

85139 If the editor is in *ex* mode, and the terminal does not support a standout mode (such as inverse
85140 video), and **errorbells** is set, error messages shall be preceded by alerting the terminal.

85141 **exrc**

85142 [Default *unset*]

85143 If **exrc** is set, *ex* shall access any **.exrc** file in the current directory, as described in [Initialization in
85144 *ex* and *vi*](#) (on page 2576). If **exrc** is not set, *ex* shall ignore any **.exrc** file in the current directory
85145 during initialization, unless the current directory is that named by the *HOME* environment
85146 variable.

85147 **ignorecase, ic**

85148 [Default *unset*]

85149 If **ignorecase** is set, characters that have uppercase and lowercase representations shall have
85150 those representations considered as equivalent for purposes of regular expression comparison.

85151 The **ignorecase** edit option shall affect all remembered regular expressions; for example,
85152 unsetting the **ignorecase** edit option shall cause a subsequent *vi n* command to search for the
85153 last basic regular expression in a case-sensitive fashion.

85154 **list**

85155 [Default *unset*]

85156 If **list** is set, edit buffer lines written while in *ex* command mode shall be written as specified for
85157 the **print** command with the **l** flag specified. In open or visual mode, each edit buffer line shall
85158 be displayed as specified for the *ex print* command with the **l** flag specified. In open or visual
85159 text input mode, when the cursor does not rest on any character in the line, it shall rest on the
85160 ' \$ ' marking the end of the line.

85161 **magic**

85162 [Default *set*]

85163 If **magic** is set, modify the interpretation of characters in regular expressions and substitution
85164 replacement strings (see [Regular Expressions in *ex*](#) (on page 2608) and [Replacement Strings in
85165 *ex*](#), on page 2608).

85166 **mesg**

85167 [Default *set*]

85168 If **mesg** is set, the permission for others to use the **write** or **talk** commands to write to the
85169 terminal shall be turned on while in open or visual mode. The shell-level command *mesg n* shall
85170 take precedence over any setting of the *ex mesg* option; that is, if **mesg y** was issued before the
85171 editor started (or in a shell escape), such as:

85172 : !mesg y

85173 the **mesg** option in *ex* shall suppress incoming messages, but the **mesg** option shall not enable
85174 incoming messages if **mesg n** was issued.

85175

number, nu

85176

[Default *unset*]

85177

If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line numbers, in the format specified by the **print** command with the **#** flag specified. In *ex* text input mode, each line shall be preceded by the line number it will have in the file.

85178

85179

85180

In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in the format specified by the *ex* **print** command with the **#** flag specified. This line number shall not be considered part of the line for the purposes of evaluating the current column; that is, column position 1 shall be the first column position after the format specified by the **print** command.

85181

85182

85183

85184

85185

paragraphs, para

85186

[Default in the POSIX locale `IPLPPPQPP LIpplpipbp`]

85187

The **paragraphs** edit option shall define additional paragraph boundaries for the open and visual mode commands. The **paragraphs** edit option can be set to a character string consisting of zero or more character pairs. It shall be an error to set it to an odd number of characters.

85188

85189

85190

prompt

85191

[Default *set*]

85192

If **prompt** is set, *ex* command mode input shall be prompted for with a colon (':'); when unset, no prompt shall be written.

85193

85194

readonly

85195

[Default *see text*]

85196

If the **readonly** edit option is set, read-only mode shall be enabled (see [Write](#), on page 2603). The **readonly** edit option shall be initialized to set if either of the following conditions are true:

85197

85198

- The command-line option `-R` was specified.
- Performing actions equivalent to the `access()` function called with the following arguments indicates that the file lacks write permission:

85199

85200

1. The current pathname is used as the *path* argument.

85201

2. The constant `W_OK` is used as the *amode* argument.

85202

85203

The **readonly** edit option may be initialized to set for other, implementation-defined reasons. The **readonly** edit option shall not be initialized to unset based on any special privileges of the user or process. The **readonly** edit option shall be reinitialized each time that the contents of the edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again be reinitialized each time that the contents of the edit buffer are replaced.

85204

85205

85206

85207

85208

85209

redraw

85210

[Default *unset*]

85211

The editor simulates an intelligent terminal on a dumb terminal. (Since this is likely to require a large amount of output to the terminal, it is useful only at high transmission speeds.)

85212

85213

remap

85214

[Default *set*]

85215

If **remap** is set, map translation shall allow for maps defined in terms of other maps; translation shall continue until a final product is obtained. If unset, only a one-step translation shall be done.

85216

85216

85217

85218

report

85219

[Default 5]

85220

The value of this **report** edit option specifies what number of lines being added, copied, deleted, or modified in the edit buffer will cause an informational message to be written to the user. The following conditions shall cause an informational message. The message shall contain the number of lines added, copied, deleted, or modified, but is otherwise unspecified.

85221

85222

85223

85224

- An *ex* or *vi* editor command, other than **open**, **undo**, or **visual**, that modifies at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.

85225

85226

85227

- An *ex* **yank** or *vi* **y** or **Y** command, that copies at least the value of the **report** edit option plus 1 number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written.

85228

85229

85230

- An *ex* **global**, **v**, **open**, **undo**, or **visual** command or *ex* or *vi* buffer execution, that adds or deletes a total of at least the value of the **report** edit option number of lines, and which is not part of an *ex* **global** or **v** command, or *ex* or *vi* buffer execution, shall cause an informational message to be written. (For example, if 3 lines were added and 8 lines deleted during an *ex* **visual** command, 5 would be the number compared against the **report** edit option after the command completed.)

85231

85232

85233

85234

85235

85236

scroll, scr

85237

[Default (number of lines in the display -1)/2]

85238

The value of the **scroll** edit option shall determine the number of lines scrolled by the *ex* <control>-D and **z** commands. For the *vi* <control>-D and <control>-U commands, it shall be the initial number of lines to scroll when no previous <control>-D or <control>-U command has been executed.

85239

85240

85241

85242

sections

85243

[Default in the POSIX locale *NHSHH HUnhsh*]

85244

The **sections** edit option shall define additional section boundaries for the open and visual mode commands. The **sections** edit option can be set to a character string consisting of zero or more character pairs; it shall be an error to set it to an odd number of characters.

85245

85246

85247

shell, sh

85248

[Default from the environment variable *SHELL*]

85249

The value of this option shall be a string. The default shall be taken from the *SHELL* environment variable. If the *SHELL* environment variable is null or empty, the *sh* (see *sh*) utility shall be the default.

85250

85251

85252

shiftwidth, sw

85253

[Default 8]

85254

The value of this option shall give the width in columns of an indentation level used during autoindentation and by the shift commands (< and >).

85255

85256

showmatch, sm

85257

[Default *unset*]

85258

The functionality described for the **showmatch** edit option need not be supported on block-mode terminals or terminals with insufficient capabilities.

85259

85260

If **showmatch** is set, in open or visual mode, when a ') ' or ' } ' is typed, if the matching ' (' or ' { ' is currently visible on the display, the matching ' (' or ' { ' shall be flagged moving the cursor to its location for an unspecified amount of time.

85261

85262

85263

showmode

85264

[Default *unset*]

85265

If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be displayed on the last line of the display. Command mode and text input mode shall be differentiated; other unspecified modes and implementation-defined information may be displayed.

85266

85267

85268

85269

slowopen

85270

[Default *unset*]

85271

If **slowopen** is set during open and visual text input modes, the editor shall not update portions of the display other than those display line columns that display the characters entered by the user (see [Input Mode Commands in vi](#), on page 3248).

85272

85273

85274

tabstop, ts

85275

[Default 8]

85276

The value of this edit option shall specify the column boundary used by a <tab> in the display (see [autoprint, ap](#) (on page 2610) and [Input Mode Commands in vi](#), on page 3248).

85277

85278

taglength, tl

85279

[Default zero]

85280

The value of this edit option shall specify the maximum number of characters that are considered significant in the user-specified tag name and in the tag name from the tags file. If the value is zero, all characters in both tag names shall be significant.

85281

85282

85283

tags

85284

[Default *see text*]

85285

The value of this edit option shall be a string of <blank>-delimited pathnames of files used by the **tag** command. The default value is unspecified.

85286

85287

term

85288

[Default from the environment variable *TERM*]

85289

85290

85291

85292

The value of this edit option shall be a string. The default shall be taken from the *TERM* variable in the environment. If the *TERM* environment variable is empty or null, the default is unspecified. The editor shall use the value of this edit option to determine the type of the display device.

85293

85294

The results are unspecified if the user changes the value of the term edit option after editor initialization.

85295

terse

85296

[Default *unset*]

85297

85298

85299

If **terse** is set, error messages may be less verbose. However, except for this caveat, error messages are unspecified. Furthermore, not all error messages need change for different settings of this option.

85300

warn

85301

[Default *set*]

85302

85303

85304

If **warn** is set, and the contents of the edit buffer have been modified since they were last completely written, the editor shall write a warning message before certain ! commands (see [Escape](#), on page 2606).

85305

window

85306

[Default *see text*]

85307

85308

A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in visual mode, to specify the number of lines displayed when the screen is repainted.

85309

85310

85311

If the **-w** command-line option is not specified, the default value shall be set to the value of the *LINES* environment variable. If the *LINES* environment variable is empty or null, the default shall be the number of lines in the display minus 1.

85312

85313

85314

Setting the **window** edit option to zero or to a value greater than the number of lines in the display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable) shall cause the **window** edit option to be set to the number of lines in the display minus 1.

85315

The baud rate of the terminal line may change the default in an implementation-defined manner.

85316

wrapmargin, wm

85317

[Default 0]

85318

If the value of this edit option is zero, it shall have no effect.

85319

If not in the POSIX locale, the effect of this edit option is implementation-defined.

85320

Otherwise, it shall specify a number of columns from the ending margin of the terminal.

85321

85322

85323

During open and visual text input modes, for each character for which any part of the character is displayed in a column that is less than **wrapmargin** columns from the ending margin of the display line, the editor shall behave as follows:

85324

85325

85326

85327

1. If the character triggering this event is a <blank>, it, and all immediately preceding <blank>s on the current line entered during the execution of the current text input command, shall be discarded, and the editor shall behave as if the user had entered a single <newline> instead. In addition, if the next user-entered character is a <space>, it

85328 shall be discarded as well.

85329 2. Otherwise, if there are one or more <blank>s on the current line immediately preceding
85330 the last group of inserted non-<blank>s which was entered during the execution of the
85331 current text input command, the <blank>s shall be replaced as if the user had entered a
85332 single <newline> instead.

85333 If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any
85334 <blank>s at or after the cursor in the current line shall be discarded.

85335 The ending margin shall be determined by the system or overridden by the user, as described for
85336 *COLUMNS* in the ENVIRONMENT VARIABLES section and XBD [Chapter 8](#) (on page 159).

85337 **wrapsan, ws**

85338 [Default *set*]

85339 If **wrapsan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, N, and n
85340 commands) shall wrap around the beginning or end of the edit buffer; when unset, searches
85341 shall stop at the beginning or end of the edit buffer.

85342 **writeany, wa**

85343 [Default *unset*]

85344 If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be
85345 inhibited, as described in editor option **autowrite**.

85346 EXIT STATUS

85347 The following exit values shall be returned:

85348 0 Successful completion.

85349 >0 An error occurred.

85350 CONSEQUENCES OF ERRORS

85351 When any error is encountered and the standard input is not a terminal device file, *ex* shall not
85352 write the file or return to command or text input mode, and shall terminate with a non-zero exit
85353 status.

85354 Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP
85355 asynchronous event.

85356 Otherwise, when an error is encountered, the editor shall behave as specified in [Command Line
85357 Parsing in ex](#) (on page 2580).

85358 APPLICATION USAGE

85359 If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.

85360 The **next** command can accept more than one file, so usage such as:

85361 `next `ls [abc]*``

85362 is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect
85363 only one file and unspecified results occur.

85364 EXAMPLES

85365 None.

85366 RATIONALE

85367 The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V
85368 implementations of *ex* and *vi*.

85369 A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and

85370 rejected for inclusion. Neither option provided the level of security that users might expect.

85371 It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to
 85372 implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor
 85373 addressing; thus, it is not a mandatory requirement that such features should work on all
 85374 terminals. It is the intention, however, that an *ex* implementation should provide the full set of
 85375 capabilities on all terminals capable of supporting them.

85376 Options

85377 The `-c` replacement for `+command` was inspired by the `-e` option of *sed*. Historically, all such
 85378 commands (see **edit** and **next** as well) were executed from the last line of the edit buffer. This
 85379 meant, for example, that `"/pattern"` would fail unless the **wrapsan** option was set.
 85380 POSIX.1-200x requires conformance to historical practice. The `+command` option is no longer
 85381 specified by POSIX.1-200x but may be present in some implementations. Historically, some
 85382 implementations restricted the *ex* commands that could be listed as part of the command line
 85383 arguments. For consistency, POSIX.1-200x does not permit these restrictions.

85384 In historical implementations of the editor, the `-R` option (and the **readonly** edit option) only
 85385 prevented overwriting of files; appending to files was still permitted, mapping loosely into the
 85386 *cs*h **noclobber** variable. Some implementations, however, have not followed this semantic, and
 85387 **readonly** does not permit appending either. POSIX.1-200x follows the latter practice, believing
 85388 that it is a more obvious and intuitive meaning of **readonly**.

85389 The `-s` option suppresses all interactive user feedback and is useful for editing scripts in batch
 85390 jobs. The list of specific effects is historical practice. The terminal type "incapable of supporting
 85391 open and visual modes" has historically been named "dumb".

85392 The `-t` option was required because the *ctags* utility appears in POSIX.1-200x and the option is
 85393 available in all historical implementations of *ex*.

85394 Historically, the *ex* and *vi* utilities accepted a `-x` option, which did encryption based on the
 85395 algorithm found in the historical *crypt* utility. The `-x` option for encryption, and the associated
 85396 *crypt* utility, were omitted because the algorithm used was not specifiable and the export control
 85397 laws of some nations make it difficult to export cryptographic technology. In addition, it did not
 85398 historically provide the level of security that users might expect.

85399 Standard Input

85400 An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file
 85401 character, `<control>-D`, is historically an *ex* command.

85402 There was no maximum line length in historical implementations of *ex*. Specifically, as it was
 85403 parsed in chunks, the addresses had a different maximum length than the filenames. Further, the
 85404 maximum line buffer size was declared as `BUFSIZ`, which was different lengths on different
 85405 systems. This version selected the value of `{LINE_MAX}` to impose a reasonable restriction on
 85406 portable usage of *ex* and to aid test suite writers in their development of realistic tests that
 85407 exercise this limit.

85408 Input Files

85409 It was an explicit decision by the standard developers that a `<newline>` be added to any file
 85410 lacking one. It was believed that this feature of *ex* and *vi* was relied on by users in order to make
 85411 text files lacking a trailing `<newline>` more portable. It is recognized that this will require a user-
 85412 specified option or extension for implementations that permit *ex* and *vi* to edit files of type other
 85413 than text if such files are not otherwise identified by the system. It was agreed that the ability to
 85414 edit files of arbitrary type can be useful, but it was not considered necessary to mandate that an
 85415 *ex* or *vi* implementation be required to handle files other than text files.

85416 The paragraph in the INPUT FILES section, "By default, ...", is intended to close a long-
 85417 standing security problem in *ex* and *vi*; that of the "modeline" or "modelines" edit option. This
 85418 feature allows any line in the first or last five lines of the file containing the strings "ex:" or
 85419 "vi:" (and, apparently, "ei:" or "vx:") to be a line containing editor commands, and *ex*
 85420 interprets all the text up to the next ':' or <newline> as a command. Consider the
 85421 consequences, for example, of an unsuspecting user using *ex* or *vi* as the editor when replying to
 85422 a mail message in which a line such as:

```
85423 ex:! rm -rf :
```

85424 appeared in the signature lines. The standard developers believed strongly that an editor should
 85425 not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from
 85426 their implementations of *ex* and *vi*.

85427 Asynchronous Events

85428 The intention of the phrase "complete write" is that the entire edit buffer be written to stable
 85429 storage. The note regarding temporary files is intended for implementations that use temporary
 85430 files to back edit buffers unnamed by the user.

85431 Historically, SIGQUIT was ignored by *ex*, but was the equivalent of the **Q** command in visual
 85432 mode; that is, it exited visual mode and entered *ex* mode. POSIX.1-200x permits, but does not
 85433 require, this behavior. Historically, SIGINT was often used by *vi* users to terminate text input
 85434 mode (<control>-C is often easier to enter than <ESC>). Some implementations of *vi* alerted the
 85435 terminal on this event, and some did not. POSIX.1-200x requires that SIGINT behave identically
 85436 to <ESC>, and that the terminal not be alerted.

85437 Historically, suspending the *ex* editor during text input mode was similar to SIGINT, as
 85438 completed lines were retained, but any partial line discarded, and the editor returned to
 85439 command mode. POSIX.1-200x is silent on this issue; implementations are encouraged to follow
 85440 historical practice, where possible.

85441 Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore
 85442 impossible to suspend the editor in visual text input mode. There are two major reasons for this.
 85443 The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where
 85444 the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if
 85445 SIGTSTP was delivered to the process group in the default manner. The second was that most
 85446 implementations of the UNIX *curses* package are not reentrant, and the receipt of SIGTSTP at the
 85447 wrong time will cause them to crash. POSIX.1-200x is silent on this issue; implementations are
 85448 encouraged to treat suspension as an asynchronous event if possible.

85449 Historically, modifications to the edit buffer made before SIGINT interrupted an operation were
 85450 retained; that is, anywhere from zero to all of the lines to be modified might have been modified
 85451 by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT.
 85452 POSIX.1-200x permits this behavior, noting that the **undo** command is required to be able to
 85453 undo these partially completed commands.

85454 The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is
 85455 unspecified because some implementations attempt to save the edit buffer in a useful state when
 85456 other signals are received.

85457

Standard Error85458
85459
85460
85461

For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination condition. Diagnostic messages should not be confused with the error messages generated by inappropriate or illegal user commands.

85462

Initialization in ex and vi85463
85464

If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the alternate and current pathnames will be set. Informally, they are set as follows:

85465
85466
85467
85468

1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the current pathname will be set to the filename argument (the first filename argument in the case of the **next** command) and the alternate pathname will be set to the previous current pathname, if there was one.

85469
85470

2. In the case of the file read/write forms of the **read** and **write** commands, if there is no current pathname, the current pathname will be set to the filename argument.

85471

3. Otherwise, the alternate pathname will be set to the filename argument.

85472
85473
85474
85475
85476
85477
85478
85479
85480

For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there was a previous current pathname, the alternate pathname. The commands **:write**, **!command**, and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for some reason, the alternate pathname would be set. The **read** and **write** commands set the alternate pathname to their *file* argument, unless the current pathname is not set, in which case they set the current pathname to their *file* arguments. The alternate pathname was not historically set by the **:source** command. POSIX.1-200x requires conformance to historical practice. Implementations adding commands that take filenames as arguments are encouraged to set the alternate pathname as described here.

85481
85482

Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed in the *\$HOME* directory. POSIX.1-200x prohibits this behavior.

85483
85484
85485
85486
85487

Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local **.exrc** files if they were owned by the real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was a security problem because it is possible to put normal UNIX system commands inside a **.exrc** file. POSIX.1-200x does not specify the **sourceany** option, and historical implementations are encouraged to delete it.

85488
85489
85490

The **.exrc** files must be owned by the real ID of the user, and not writable by anyone other than the owner. The appropriate privileges exception is intended to permit users to acquire special privileges, but continue to use the **.exrc** files in their home directories.

85491
85492
85493
85494
85495
85496
85497
85498

System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is that local **.exrc** files are read-only if the **exrc** option is set. The default for the **exrc** option was off, so by default, local **.exrc** files were not read. The problem this was intended to solve was that System V permitted users to give away files, so there is no possible ownership or writeability test to ensure that the file is safe. This is still a security problem on systems where users can give away files, but there is nothing additional that POSIX.1-200x can do. The implementation-defined exception is intended to permit groups to have local **.exrc** files that are shared by users, by creating pseudo-users to own the shared files.

85499
85500
85501
85502
85503
85504

POSIX.1-200x does not mention system-wide *ex* and *vi* start-up files. While they exist in several implementations of *ex* and *vi*, they are not present in any implementations considered historical practice by POSIX.1-200x. Implementations that have such files should use them only if they are owned by the real user ID or an appropriate user (for example, root on UNIX systems) and if they are not writable by any user other than their owner. System-wide start-up files should be read before the *EXINIT* variable, *\$HOME/.exrc*, or local **.exrc** files are evaluated.

85505 Historically, any *ex* command could be entered in the *EXINIT* variable or the *.exrc* file, although
 85506 ones requiring that the edit buffer already contain lines of text generally caused historical
 85507 implementations of the editor to drop **core**. POSIX.1-200x requires that any *ex* command be
 85508 permitted in the *EXINIT* variable and *.exrc* files, for simplicity of specification and consistency,
 85509 although many of them will obviously fail under many circumstances.

85510 The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with
 85511 regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded
 85512 during the initialization phase not be lost; that is, loading the edit buffer should fail if the *.exrc*
 85513 file read in the contents of a file and did not subsequently write the edit buffer. An additional
 85514 intent of this phrase is to specify that the initial current line and column is set as specified for the
 85515 individual *ex* commands.

85516 Historically, the *-t* option behaved as if the tag search were a *+command*; that is, it was executed
 85517 from the last line of the file specified by the tag. This resulted in the search failing if the pattern
 85518 was a forward search pattern and the **wraps**can edit option was not set. POSIX.1-200x does not
 85519 permit this behavior, requiring that the search for the tag pattern be performed on the entire file,
 85520 and, if not found, that the current line be set to a more reasonable location in the file.

85521 Historically, the empty edit buffer presented for editing when a file was not specified by the user
 85522 was unnamed. This is permitted by POSIX.1-200x; however, implementations are encouraged to
 85523 provide users a temporary filename for this buffer because it permits them the use of *ex*
 85524 commands that use the current pathname during temporary edit sessions.

85525 Historically, the file specified using the *-t* option was not part of the current argument list. This
 85526 practice is permitted by POSIX.1-200x; however, implementations are encouraged to include its
 85527 name in the current argument list for consistency.

85528 Historically, the *-c* command was generally not executed until a file that already exists was
 85529 edited. POSIX.1-200x requires conformance to this historical practice. Commands that could
 85530 cause the *-c* command to be executed include the *ex* commands **edit**, **next**, **recover**, **rewind**, and
 85531 **tag**, and the *vi* commands *<control>-^* and *<control>-]*. Historically, reading a file into an edit
 85532 buffer did not cause the *-c* command to be executed (even though it might set the current
 85533 pathname) with the exception that it did cause the *-c* command to be executed if: the editor was
 85534 in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read
 85535 commands had yet been attempted. For consistency and simplicity of specification,
 85536 POSIX.1-200x does not permit this behavior.

85537 Historically, the *-r* option was the same as a normal edit session if there was no recovery
 85538 information available for the file. This allowed users to enter:

```
85539 vi -r *.c
```

85540 and recover whatever files were recoverable. In some implementations, recovery was attempted
 85541 only on the first file named, and the file was not entered into the argument list; in others,
 85542 recovery was attempted for each file named. In addition, some historical implementations
 85543 ignored *-r* if *-t* was specified or did not support command line *file* arguments with the *-t* option.
 85544 For consistency and simplicity of specification, POSIX.1-200x disallows these special cases, and
 85545 requires that recovery be attempted the first time each file is edited.

85546 Historically, *vi* initialized the ‘ and ’ marks, but *ex* did not. This meant that if the first command
 85547 in *ex* mode was **visual** or if an *ex* command was executed first (for example, *vi +10 file*), *vi*
 85548 was entered without the marks being initialized. Because the standard developers believed the marks
 85549 to be generally useful, and for consistency and simplicity of specification, POSIX.1-200x requires
 85550 that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is
 85551 not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however,
 85552 it has always been possible to set (and use) marks in empty edit buffers in open and visual mode
 85553 edit sessions.

85554

Addressing

85555

Historically, *ex* and *vi* accepted the additional addressing forms '`\/'` and '`\?'`'. They were equivalent to '`/'`' and '`??'`', respectively. They are not required by POSIX.1-200x, mostly because nobody can remember whether they ever did anything different historically.

85556

85557

85558

Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the % address in empty files for others. For consistency, POSIX.1-200x requires support for the former in the few commands where it makes sense, and disallows it otherwise. In addition, because POSIX.1-200x requires that % be logically equivalent to "`1, $`", it is also supported where it makes sense and disallowed otherwise.

85559

85560

85561

85562

85563

Historically, the % address could not be followed by further addresses. For consistency and simplicity of specification, POSIX.1-200x requires that additional addresses be supported.

85564

85565

All of the following are valid *addresses*:

85566

`+++` Three lines after the current line.

85567

`/re/-` One line before the next occurrence of *re*.

85568

`-2` Two lines before the current line.

85569

`3 ---- 2` Line one (note intermediate negative address).

85570

`1 2 3` Line six.

85571

Any number of addresses can be provided to commands taking addresses; for example, "`1, 2, 3, 4, 5p`" prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the **print** command. This, in combination with the semicolon delimiter, permits users to create commands based on ordered patterns in the file. For example, the command **3;/foo/;+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next two lines. Note that the address **3;** must be evaluated before being discarded because the search origin for the **/foo/** command depends on this.

85572

85573

85574

85575

85576

85577

85578

Historically, values could be added to addresses by including them after one or more <blank>s; for example, **3 - 5p** wrote the seventh line of the file, and **/foo/ 5** was the same as **/foo/+5**. However, only absolute values could be added; for example, **5 /foo/** was an error. POSIX.1-200x requires conformance to historical practice. Address offsets are separately specified from addresses because they could historically be provided to visual mode search commands.

85579

85580

85581

85582

85583

Historically, any missing addresses defaulted to the current line. This was true for leading and trailing comma-delimited addresses, and for trailing semicolon-delimited addresses. For consistency, POSIX.1-200x requires it for leading semicolon addresses as well.

85584

85585

85586

Historically, *ex* and *vi* accepted the '`^`' character as both an address and as a flag offset for commands. In both cases it was identical to the '`-`' character. POSIX.1-200x does not require or prohibit this behavior.

85587

85588

85589

Historically, the enhancements to basic regular expressions could be used in addressing; for example, '`~`', '`\<`', and '`\>`'. POSIX.1-200x requires conformance to historical practice; that is, that regular expression usage be consistent, and that regular expression enhancements be supported wherever regular expressions are used.

85590

85591

85592

85593

Command Line Parsing in ex

85594

85595

85596

85597

85598

85599

85600

Historical *ex* command parsing was even more complex than that described here. POSIX.1-200x requires the subset of the command parsing that the standard developers believed was documented and that users could reasonably be expected to use in a portable fashion, and that was historically consistent between implementations. (The discarded functionality is obscure, at best.) Historical implementations will require changes in order to comply with POSIX.1-200x; however, users are not expected to notice any of these changes. Most of the complexity in *ex* parsing is to handle three special termination cases:

85601

85602

1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by `<newline>s` (they can contain vertical-line characters that are usually shell pipes).

85603

85604

2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands, optionally containing vertical-line characters, as their first arguments.

85605

85606

3. The **s** command takes a regular expression as its first argument, and uses the delimiting characters to delimit the command.

85607

85608

85609

85610

Historically, vertical-line characters in the *+command* argument of the **ex**, **edit**, **next**, **vi**, and **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did not delimit the command at all. For example, the following commands are all valid:

85611

85612

85613

85614

85615

```
:edit +25 | s/abc/ABC/ file.c
:s/ | /PIPE/
:read !spell % | columnate
:global/pattern/p | l
:s/a/b/ | s/c/d | set
```

85616

85617

85618

85619

Historically, empty or `<blank>` filled lines in **.exrc** files and **sourced** files (as well as *EXINIT* variables and *ex* command scripts) were treated as default commands; that is, **print** commands. POSIX.1-200x specifically requires that they be ignored when encountered in **.exrc** and **sourced** files to eliminate a common source of new user error.

85620

85621

85622

85623

85624

85625

85626

Historically, *ex* commands with multiple adjacent (or `<blank>`-separated) vertical lines were handled oddly when executed from *ex* mode. For example, the command `||| <carriage-return>`, when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `|` would only display the line after the next line, instead of the next two lines. The former worked more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. POSIX.1-200x requires the *vi* behavior; that is, a single default command and line number increment for each command separator, and trailing `<newline>s` after vertical-line separators are discarded.

85627

85628

85629

Historically, *ex* permitted a single extra colon as a leading command character; for example, **:g/pattern/:p** was a valid command. POSIX.1-200x generalizes this to require that any number of leading colon characters be stripped.

85630

85631

85632

Historically, any prefix of the **delete** command could be followed without intervening `<blank>s` by a flag character because in the command **d p**, *p* is interpreted as the buffer *p*. POSIX.1-200x requires conformance to historical practice.

85633

85634

Historically, the **k** command could be followed by the mark name without intervening `<blank>s`. POSIX.1-200x requires conformance to historical practice.

85635

85636

85637

85638

85639

85640

Historically, the **s** command could be immediately followed by flag and option characters; for example, **s/e/E/l s |sgc3p** was a valid command. However, flag characters could not stand alone; for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would succeed. (Obviously, the `'#'` flag character was used as a delimiter character if it followed the command.) Another issue was that option characters had to precede flag characters even when the command was fully specified; for example, the command **s/e/E/pg** would fail, while the

85641 command **s/e/E/gp** would succeed. POSIX.1-200x requires conformance to historical practice.

85642 Historically, the first command name that had a prefix matching the input from the user was the
85643 executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command.
85644 Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**.
85645 POSIX.1-200x requires conformance to historical practice. The restriction on command search
85646 order for implementations with extensions is to avoid the addition of commands such that the
85647 historical prefixes would fail to work portably.

85648 Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands,
85649 separated by vertical-line characters, that entered or exited visual mode or the editor. Because
85650 implementations of *vi* exist that do not exhibit this failure mode, POSIX.1-200x does not permit
85651 it.

85652 The requirement that alphabetic command names consist of all following alphabetic characters
85653 up to the next non-alphabetic character means that alphabetic command names must be
85654 separated from their arguments by one or more non-alphabetic characters, normally a <blank>
85655 or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

85656 Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*,
85657 <newline>, <carriage-return>) erased any prompting character and displayed the next lines
85658 without scrolling the terminal; that is, immediately below any previously displayed lines. This
85659 provided a cleaner presentation of the lines in the file for the user. POSIX.1-200x does not require
85660 this behavior because it may be impossible in some situations; however, implementations are
85661 strongly encouraged to provide this semantic if possible.

85662 Historically, it was possible to change files in the middle of a command, and have the rest of the
85663 command executed in the new file; for example:

```
85664 :edit +25 file.c | s/abc/ABC/ | 1
```

85665 was a valid command, and the substitution was attempted in the newly edited file.
85666 POSIX.1-200x requires conformance to historical practice. The following commands are
85667 examples that exercise the *ex* parser:

```
85668 echo 'foo | bar' > file1; echo 'foo/bar' > file2;
```

```
85669 vi
```

```
85670 :edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\/SLASH/ | wq
```

85671 Historically, there was no protection in editor implementations to avoid *ex* **global**, **v**, **@**, or *****
85672 commands changing edit buffers during execution of their associated commands. Because this
85673 would almost invariably result in catastrophic failure of the editor, and implementations exist
85674 that do exhibit these problems, POSIX.1-200x requires that changing the edit buffer during a
85675 **global** or **v** command, or during a **@** or ***** command for which there will be more than a single
85676 execution, be an error. Implementations supporting multiple edit buffers simultaneously are
85677 strongly encouraged to apply the same semantics to switching between buffers as well.

85678 The *ex* command quoting required by POSIX.1-200x is a superset of the quoting in historical
85679 implementations of the editor. For example, it was not historically possible to escape a <blank>
85680 in a filename; for example, **:edit foo\\\ bar** would report that too many filenames had been
85681 entered for the edit command, and there was no method of escaping a <blank> in the first
85682 argument of an **edit**, **ex**, **next**, or **visual** command at all. POSIX.1-200x extends historical
85683 practice, requiring that quoting behavior be made consistent across all *ex* commands, except for
85684 the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V
85685 instead of backslashes for quoting. For those four commands, POSIX.1-200x requires
85686 conformance to historical practice.

85687 Backslash quoting in *ex* is non-intuitive. Backslash escapes are ignored unless they escape a
85688 special character; for example, when performing *file* argument expansion, the string "\\%" is
85689 equivalent to '\%', not "\<current pathname>". This can be confusing for users because

85690 backslash is usually one of the characters that causes shell expansion to be performed, and
 85691 therefore shell quoting rules must be taken into consideration. Generally, quoting characters are
 85692 only considered if they escape a special character, and a quoting character must be provided for
 85693 each layer of parsing for which the character is special. As another example, only a single
 85694 backslash is necessary for the '\1' sequence in substitute replacement patterns, because the
 85695 character '1' is not special to any parsing layer above it.

85696 <control>-V quoting in *ex* is slightly different from backslash quoting. In the four commands
 85697 where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character
 85698 may be escaped by a <control>-V whether it would have a special meaning or not. POSIX.1-200x
 85699 requires conformance to historical practice.

85700 Historical implementations of the editor did not require delimiters within character classes to be
 85701 escaped; for example, the command **s/[/]/** on the string "xxx/yyy" would delete the '/' from
 85702 the string. POSIX.1-200x disallows this historical practice for consistency and because it places a
 85703 large burden on implementations by requiring that knowledge of regular expressions be built
 85704 into the editor parser.

85705 Historically, quoting <newline>s in *ex* commands was handled inconsistently. In most cases, the
 85706 <newline> always terminated the command, regardless of any preceding escape character,
 85707 because backslash characters did not escape <newline>s for most *ex* commands. However, some
 85708 *ex* commands (for example, **s**, **map**, and **abbreviation**) permitted <newline>s to be escaped
 85709 (although in the case of **map** and **abbreviation**, <control>-V characters escaped them instead of
 85710 backslashes). This was true in not only the command line, but also **.exrc** and **sourced** files. For
 85711 example, the command:

```
85712 map = foo<control-V><newline>bar
```

85713 would succeed, although it was sometimes difficult to get the <control>-V and the inserted
 85714 <newline> passed to the *ex* parser. For consistency and simplicity of specification, POSIX.1-200x
 85715 requires that it be possible to escape <newline>s in *ex* commands at all times, using backslashes
 85716 for most *ex* commands, and using <control>-V characters for the **map** and **abbreviation**
 85717 commands. For example, the command **print<newline>list** is required to be parsed as the single
 85718 command **print<newline>list**. While this differs from historical practice, POSIX.1-200x
 85719 developers believed it unlikely that any script or user depended on the historical behavior.

85720 Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c**
 85721 commands to be discarded. POSIX.1-200x disallows this for consistency with mapped keys, the
 85722 **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc** files.

85723 Input Editing in *ex*

85724 One of the common uses of the historical *ex* editor is over slow network connections. Editors that
 85725 run in canonical mode can require far less traffic to and from, and far less processing on, the host
 85726 machine, as well as more easily supporting block-mode terminals. For these reasons,
 85727 POSIX.1-200x requires that *ex* be implemented using canonical mode input processing, as was
 85728 done historically.

85729 POSIX.1-200x does not require the historical 4 BSD input editing characters "word erase" or
 85730 "literal next". For this reason, it is unspecified how they are handled by *ex*, although they must
 85731 have the required effect. Implementations that resolve them after the line has been ended using a
 85732 <newline> or <control>-M character, and implementations that rely on the underlying system
 85733 terminal support for this processing, are both conforming. Implementations are strongly urged
 85734 to use the underlying system functionality, if at all possible, for compatibility with other system
 85735 text input interfaces.

85736 Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor
 85737 moved to display the new end of the **autoindent** characters, but did not move the cursor to a
 85738 new line, nor did it erase the <control>-D character from the line. POSIX.1-200x does not specify

85739 that the cursor remain on the same line or that the rest of the line is erased; however,
 85740 implementations are strongly encouraged to provide the best possible user interface; that is, the
 85741 cursor should remain on the same line, and any <control>-D character on the line should be
 85742 erased.

85743 POSIX.1-200x does not require the historical 4 BSD input editing character “reprint”,
 85744 traditionally <control>-R, which redisplayed the current input from the user. For this reason,
 85745 and because the functionality cannot be implemented after the line has been terminated by the
 85746 user, POSIX.1-200x makes no requirements about this functionality. Implementations are
 85747 strongly urged to make this historical functionality available, if possible.

85748 Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*.
 85749 POSIX.1-200x requires conformance to historical practice to avoid breaking historical *ex* scripts
 85750 and *.exrc* files.

85751 **eof**

85752 Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left
 85753 unspecified so that implementations can conform in the presence of systems that do not support
 85754 this functionality. Implementations are encouraged to modify the line and redisplay it
 85755 immediately, if possible.

85756 The specification of the handling of the *eof* character differs from historical practice only in that
 85757 *eof* characters are not discarded if they follow normal characters in the text input. Historically,
 85758 they were always discarded.

85759 **Command Descriptions in ex**

85760 Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and
 85761 **~**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit
 85762 addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or
 85763 command execution in an empty file, make sense only for commands that add new text to the
 85764 edit buffer or write commands (because users may wish to write empty files). POSIX.1-200x
 85765 requires this behavior for such commands and disallows it otherwise, for consistency and
 85766 simplicity of specification.

85767 A count to an *ex* command has been historically corrected to be no greater than the last line in a
 85768 file; for example, in a five-line file, the command **1,6print** would fail, but the command
 85769 **1print300** would succeed. POSIX.1-200x requires conformance to historical practice.

85770 Historically, the use of flags in *ex* commands could be obscure. General historical practice was as
 85771 described by POSIX.1-200x, but there were some special cases. For instance, the **list**, **number**,
 85772 and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line
 85773 3, and 3 would be the current line after the execution of the command. The **open** and **visual**
 85774 commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the
 85775 **open** and **visual** commands interacted badly with the **list** edit option, and setting and then
 85776 unsetting it during the open/visual session would cause *vi* to stop displaying lines in the
 85777 specified format. For consistency and simplicity of specification, POSIX.1-200x does not permit
 85778 any of these exceptions to the general rule.

85779 POSIX.1-200x uses the word *copy* in several places when discussing buffers. This is not intended
 85780 to imply implementation.

85781 Historically, *ex* users could not specify numeric buffers because of the ambiguity this would
 85782 cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a
 85783 *count*. POSIX.1-200x requires conformance to historical practice by default, but does not
 85784 preclude extensions.

85785 Historically, the contents of the unnamed buffer were frequently discarded after commands that

85786 did not explicitly affect it; for example, when using the **edit** command to switch files. For
85787 consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

85788 The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting
85789 lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user
85790 switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric
85791 buffers would not have changed. POSIX.1-200x requires conformance to historical practice.
85792 Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a
85793 single location in POSIX.1-200x.

85794 The metacharacters that trigger shell expansion in *file* arguments match historical practice, as
85795 does the method for doing shell expansion. Implementations wishing to provide users with the
85796 flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit
85797 option.

85798 Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to
85799 do so; for example, **!date > /dev/null** does not require a screen refresh because the output of
85800 the UNIX *date* command requires only a single line of the screen. POSIX.1-200x requires that the
85801 screen be refreshed if it has been overwritten, but makes no requirements as to how an
85802 implementation should make that determination. Implementations may prompt and refresh the
85803 screen regardless.

85804 Abbreviate

85805 Historical practice was that characters that were entered as part of an abbreviation replacement
85806 were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions,
85807 and so on; that is, they were logically pushed onto the terminal input queue, and were not a
85808 simple replacement. POSIX.1-200x requires conformance to historical practice. Historical
85809 practice was that whenever a non-word character (that had not been escaped by a <control>-V)
85810 was entered after a word character, *vi* would check for abbreviations. The check was based on
85811 the type of the character entered before the word character of the word/non-word pair that
85812 triggered the check. The word character of the word/non-word pair that triggered the check and
85813 all characters entered before the trigger pair that were of that type were included in the check,
85814 with the exception of <blank>s, which always delimited the abbreviation.

85815 This means that, for the abbreviation to work, the *lhs* must end with a word character, there can
85816 be no transitions from word to non-word characters (or *vice versa*) other than between the last
85817 and next-to-last characters in the *lhs*, and there can be no <blank>s in the *lhs*. In addition,
85818 because of the historical quoting rules, it was impossible to enter a literal <control>-V in the *lhs*.
85819 POSIX.1-200x requires conformance to historical practice. Historical implementations did not
85820 inform users when abbreviations that could never be used were entered; implementations are
85821 strongly encouraged to do so.

85822 For example, the following abbreviations will work:

```
85823 :ab (p REPLACE
85824 :ab p REPLACE
85825 :ab ((p REPLACE
```

85826 The following abbreviations will not work:

```
85827 :ab ( REPLACE
85828 :ab (pp REPLACE
```

85829 Historical practice is that words on the *vi* colon command line were subject to abbreviation
85830 expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev**
85831 command. Because there are implementations that do not do abbreviation expansion for the first
85832 argument to those commands, this is permitted, but not required, by POSIX.1-200x. However,
85833 the following sequence:

85834 :ab foo bar

85835 :ab foo baz

85836 resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and
85837 the sequence:

85838 :ab foo1 bar

85839 :ab foo2 bar

85840 :unabbreviate foo2

85841 deleted the abbreviation "foo1", not "foo2". These behaviors are not permitted by
85842 POSIX.1-200x because they clearly violate the expectations of the user.

85843 It was historical practice that <control>-V, not backslash, characters be interpreted as escaping
85844 subsequent characters in the **abbreviate** command. POSIX.1-200x requires conformance to
85845 historical practice; however, it should be noted that an abbreviation containing a <blank> will
85846 never work.

85847 **Append**

85848 Historically, any text following a vertical-line command separator after an **append**, **change**, or
85849 **insert** command became part of the insert text. For example, in the command:

85850 :g/pattern/append|stuff1

85851 a line containing the text "stuff1" would be appended to each line matching pattern. It was
85852 also historically valid to enter:

85853 :append|stuff1

85854 stuff2

85855 .

85856 and the text on the *ex* command line would be appended along with the text inserted after it.
85857 There was an historical bug, however, that the user had to enter two terminating lines (the ' . '
85858 lines) to terminate text input mode in this case. POSIX.1-200x requires conformance to historical
85859 practice, but disallows the historical need for multiple terminating lines.

85860 **Change**

85861 See the RATIONALE for the **append** command. Historical practice for cursor positioning after
85862 the change command when no text is input, is as described in POSIX.1-200x. However, one
85863 System V implementation is known to have been modified such that the cursor is positioned on
85864 the first address specified, and not on the line before the first address. POSIX.1-200x disallows
85865 this modification for consistency.

85866 Historically, the **change** command did not support buffer arguments, although some
85867 implementations allow the specification of an optional buffer. This behavior is neither required
85868 nor disallowed by POSIX.1-200x.

85869 **Change Directory**

85870 A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as
85871 prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have
85872 ' . ' or " . ." as their first component. Elements in the **cdpath** edit option are colon-separated.
85873 The initial value of the **cdpath** edit option is the value of the shell *CDPATH* environment
85874 variable. This feature was not included in POSIX.1-200x because it does not exist in any of the
85875 implementations considered historical practice.

85876

Copy

85877

85878

85879

Historical implementations of *ex* permitted copies to lines inside of the specified range; for example, **:2,5copy3** was a valid command. POSIX.1-200x requires conformance to historical practice.

85880

Delete

85881

85882

POSIX.1-200x requires support for the historical parsing of a **delete** command followed by flags, without any intervening <blank>s. For example:

85883

1dp Deletes the first line and prints the line that was second.

85884

1delep As for **1dp**.

85885

1d Deletes the first line, saving it in buffer *p*.

85886

85887

1d p1l (Pee-one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was second.

85888

Edit

85889

85890

85891

85892

Historically, any *ex* command could be entered as a *+command* argument to the **edit** command, although some (for example, **insert** and **append**) were known to confuse historical implementations. For consistency and simplicity of specification, POSIX.1-200x requires that any command be supported as an argument to the **edit** command.

85893

85894

85895

Historically, the command argument was executed with the current line set to the last line of the file, regardless of whether the **edit** command was executed from visual mode or not. POSIX.1-200x requires conformance to historical practice.

85896

85897

85898

Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first <blank>, and there was no way to quote them. For consistency, POSIX.1-200x requires that the usual *ex* backslash quoting be provided.

85899

85900

85901

Historically, specifying the *+command* argument to the edit command required a filename to be specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of specification, POSIX.1-200x does not permit this usage to fail for that reason.

85902

85903

85904

Historically, only the cursor position of the last file edited was remembered by the editor. POSIX.1-200x requires that this be supported; however, implementations are permitted to remember and restore the cursor position for any file previously edited.

85905

File

85906

85907

85908

85909

85910

Historical versions of the *ex* editor **file** command displayed a current line and number of lines in the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a current line and number of lines in the edit buffer of 1 in the same situation. POSIX.1-200x does not permit this discrepancy, instead requiring that a message be displayed indicating that the file is empty.

85911

Global

85912

85913

The two-pass operation of the **global** and **v** commands is not intended to imply implementation, only the required result of the operation.

85914

85915

85916

The current line and column are set as specified for the individual *ex* commands. This requirement is cumulative; that is, the current line and column must track across all the commands executed by the **global** or **v** commands.

85917

Insert

85918

See the RATIONALE for the **append** command.

85919

85920

85921

Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer was empty. POSIX.1-200x requires that this command behave consistently with the **append** command.

85922

Join

85923

85924

85925

The action of the **join** command in relation to the special characters is only defined for the POSIX locale because the correct amount of white space after a period varies; in Japanese none is required, in French only a single space, and so on.

85926

List

85927

85928

85929

The historical output of the **list** command was potentially ambiguous. The standard developers believed correcting this to be more important than adhering to historical practice, and POSIX.1-200x requires unambiguous output.

85930

Map

85931

85932

85933

85934

85935

85936

85937

85938

85939

Historically, command mode maps only applied to command names; for example, if the character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y' character. POSIX.1-200x requires this behavior. Historically, entering <control>-V as the first character of a *vi* command was an error. Several implementations have extended the semantics of *vi* such that <control>-V means that the subsequent command character is not mapped. This is permitted, but not required, by POSIX.1-200x. Regardless, using <control>-V to escape the second or later character in a sequence of characters that might match a **map** command, or any character in text input mode, is historical practice, and stops the entered keys from matching a map. POSIX.1-200x requires conformance to historical practice.

85940

85941

Historical implementations permitted digits to be used as a **map** command *lhs*, but then ignored the map. POSIX.1-200x requires that the mapped digits not be ignored.

85942

85943

85944

The historical implementation of the **map** command did not permit **map** commands that were more than a single character in length if the first character was printable. This behavior is permitted, but not required, by POSIX.1-200x.

85945

85946

Historically, mapped characters were remapped unless the **remap** edit option was not set, or the prefix of the mapped characters matched the mapping characters; for example, in the **map**:

85947

```
:map ab abcd
```

85948

85949

85950

the characters "ab" were used as is and were not remapped, but the characters "cd" were mapped if appropriate. This can cause infinite loops in the *vi* mapping mechanisms. POSIX.1-200x requires conformance to historical practice, and that such loops be interruptible.

85951

85952

85953

85954

Text input maps had the same problems with expanding the *lhs* for the *ex* **map!** and **unmap!** command as did the *ex* **abbreviate** and **unabbreviate** commands. See the RATIONALE for the *ex* **abbreviate** command. POSIX.1-200x requires similar modification of some historical practice for the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.

85955

85956

Historically, **maps** that were subsets of other **maps** behaved differently depending on the order in which they were defined. For example:

85957

85958

```
:map! ab      short
```

```
:map! abc     long
```

85959

85960

would always translate the characters "ab" to "short", regardless of how fast the characters "abc" were entered. If the entry order was reversed:

```
85961      :map! abc      long
85962      :map! ab       short
```

85963 the characters "ab" would cause the editor to pause, waiting for the completing 'c' character,
85964 and the characters might never be mapped to "short". For consistency and simplicity of
85965 specification, POSIX.1-200x requires that the shortest match be used at all times.

85966 The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified
85967 because the timing capabilities of systems are often inexact and variable, and it may depend on
85968 other factors such as the speed of the connection. The time should be long enough for the user to
85969 be able to complete the sequence, but not long enough for the user to have to wait. Some
85970 implementations of *vi* have added a **keytime** option, which permits users to set the number of
85971 0,1 seconds the editor waits for the completing characters. Because mapped terminal function
85972 and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input
85973 mode, **maps** starting with <ESC> characters are generally exempted from this timeout period,
85974 or, at least timed out differently.

85975 **Mark**

85976 Historically, users were able to set the "previous context" marks explicitly. In addition, the *ex*
85977 commands " and " and the *vi* commands ", ", ", and " all referred to the same mark. In addition,
85978 the previous context marks were not set if the command, with which the address setting the
85979 mark was associated, failed. POSIX.1-200x requires conformance to historical practice.
85980 Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the
85981 change was undone. POSIX.1-200x requires conformance to historical practice.

85982 The description of the special events that set the ' and ' marks matches historical practice. For
85983 example, historically the command */a,/b/* did not set the ' and ' marks, but the command
85984 */a,/b/delete* did.

85985 **Next**

85986 Historically, any *ex* command could be entered as a *+command* argument to the **next** command,
85987 although some (for example, **insert** and **append**) were known to confuse historical
85988 implementations. POSIX.1-200x requires that any command be permitted and that it behave as
85989 specified. The **next** command can accept more than one file, so usage such as:

```
85990 next `ls [abc] `
```

85991 is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect
85992 only one filename.

85993 Historically, the **next** command behaved differently from the **:rewind** command in that it
85994 ignored the force flag if the **autowrite** flag was set. For consistency, POSIX.1-200x does not
85995 permit this behavior.

85996 Historically, the **next** command positioned the cursor as if the file had never been edited before,
85997 regardless. POSIX.1-200x does not permit this behavior, for consistency with the **edit** command.

85998 Implementations wanting to provide a counterpart to the **next** command that edited the
85999 previous file have used the command **prev[ious]**, which takes no *file* argument. POSIX.1-200x
86000 does not require this command.

86001

Open

86002

86003

86004

86005

Historically, the **open** command would fail if the **open** edit option was not set. POSIX.1-200x does not mention the **open** edit option and does not require this behavior. Some historical implementations do not permit entering open mode from open or visual mode, only from *ex* mode. For consistency, POSIX.1-200x does not permit this behavior.

86006

86007

86008

Historically, entering open mode from the command line (that is, *vi* **+open**) resulted in anomalous behaviors; for example, the *ex* file and *set* commands, and the *vi* command <control>-G did not work. For consistency, POSIX.1-200x does not permit this behavior.

86009

86010

86011

Historically, the **open** command only permitted ' / ' characters to be used as the search pattern delimiter. For consistency, POSIX.1-200x requires that the search delimiters used by the **s**, **global**, and **v** commands be accepted as well.

86012

Preserve

86013

86014

86015

The **preserve** command does not historically cause the file to be considered unmodified for the purposes of future commands that may exit the editor. POSIX.1-200x requires conformance to historical practice.

86016

86017

86018

Historical documentation stated that mail was not sent to the user when preserve was executed; however, historical implementations did send mail in this case. POSIX.1-200x requires conformance to the historical implementations.

86019

Print

86020

86021

86022

The writing of NUL by the **print** command is not specified as a special case because the standard developers did not want to require *ex* to support NUL characters. Historically, characters were displayed using the ARPA standard mappings, which are as follows:

86023

1. Printable characters are left alone.

86024

86025

2. Control characters less than \177 are represented as '^' followed by the character offset from the '@' character in the ASCII map; for example, \007 is represented as '^G'.

86026

3. \177 is represented as '^?' followed by '? '.

86027

86028

86029

86030

86031

The display of characters having their eighth bit set was less standard. Existing implementations use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their eighth bit set as the two characters "M-" followed by the seven-bit display as described above.) The latter probably has the best claim to historical practice because it was used for the **-v** option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

86032

No specific display format is required by POSIX.1-200x.

86033

86034

86035

86036

86037

Explicit dependence on the ASCII character set has been avoided where possible, hence the use of the phrase an "implementation-defined multi-character sequence" for the display of non-printable characters in preference to the historical usage of, for instance, "^I" for the <tab>. Implementations are encouraged to conform to historical practice in the absence of any strong reason to diverge.

86038

86039

86040

86041

Historically, all *ex* commands beginning with the letter 'p' could be entered using capitalized versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command names. POSIX.1-200x permits, but does not require, this historical practice because capital forms of the commands are used by some implementations for other purposes.

86042

Put86043
86044
86045
86046
86047
86048
86049
86050
86051
86052

Historically, an *ex* **put** command, executed from open or visual mode, was the same as the open or visual mode **P** command, if the buffer was named and was cut in character mode, and the same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer was the source of the text, the entire line from which the text was taken was usually **put**, and the buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior. In addition, using the **Q** command to switch into *ex* mode, and then doing a **put** often resulted in errors as well, such as appending text that was unrelated to the (supposed) contents of the buffer. For consistency and simplicity of specification, POSIX.1-200x does not permit these behaviors. All *ex* **put** commands are required to operate in line mode, and the contents of the buffers are not altered by changing the mode of the editor.

86053

Read86054
86055
86056
86057
86058

Historically, an *ex* **read** command executed from open or visual mode, executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior. Historically, a **read** in open or visual mode from a program left the cursor at the last line read in, not the first. For consistency, POSIX.1-200x does not permit this behavior.

86059
86060

Historical implementations of *ex* were unable to undo **read** commands that read from the output of a program. For consistency, POSIX.1-200x does not permit this behavior.

86061
86062
86063
86064
86065

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified “characters”, not “bytes”. POSIX.1-200x requires that the number of bytes be displayed, not the number of characters, because it may be difficult in multi-byte implementations to determine the number of characters read. Implementations are encouraged to clarify the message displayed to the user.

86066
86067
86068
86069

Historically, reads were not permitted on files other than type regular, except that FIFO files could be read (probably only because they did not exist when *ex* and *vi* were originally written). Because the historical *ex* evaluated **read!** and **read !** equivalently, there can be no optional way to force the read. POSIX.1-200x permits, but does not require, this behavior.

86070

Recover86071
86072
86073
86074

Some historical implementations of the editor permitted users to recover the edit buffer contents from a previous edit session, and then exit without saving those contents (or explicitly discarding them). The intent of POSIX.1-200x in requiring that the edit buffer be treated as already modified is to prevent this user error.

86075

Rewind86076
86077
86078

Historical implementations supported the **rewind** command when the user was editing the first file in the list; that is, the file that the **rewind** command would edit. POSIX.1-200x requires conformance to historical practice.

86079

Substitute86080
86081
86082
86083
86084

Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the last regular expression used in any command as the pattern, the same as the **~** command. The **r** option is not required by POSIX.1-200x. Historically, the **c** and **g** options were toggled; for example, the command **:s/abc/def/** was the same as **s/abc/def/ccccggg**. For simplicity of specification, POSIX.1-200x does not permit this behavior.

86085
86086

The tilde command is often used to replace the last search RE. For example, in the sequence:

```
s/red/blue/
```

86087 /green
86088 ~

86089 the ~ command is equivalent to:

86090 s/green/blue/

86091 Historically, *ex* accepted all of the following forms:

86092 s/abc/def/

86093 s/abc/def

86094 s/abc/

86095 s/abc

86096 POSIX.1-200x requires conformance to this historical practice.

86097 The *s* command presumes that the '^' character only occupies a single column in the display.
86098 Much of the *ex* and *vi* specification presumes that the <space> only occupies a single column in
86099 the display. There are no known character sets for which this is not true.

86100 Historically, the final column position for the substitute commands was based on previous
86101 column movements; a search for a pattern followed by a substitution would leave the column
86102 position unchanged, while a *0* command followed by a substitution would change the column
86103 position to the first non-<blank>. For consistency and simplicity of specification, POSIX.1-200x
86104 requires that the final column position always be set to the first non-<blank>.

86105 Set

86106 Historical implementations redisplayed all of the options for each occurrence of the **all** keyword.
86107 POSIX.1-200x permits, but does not require, this behavior.

86108 Tag

86109 No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry.
86110 Historical practice has been to look for the path found in the **tags** file, based on the current
86111 directory. A useful extension found in some implementations is to look based on the directory
86112 containing the tags file that held the entry, as well. No requirement is made as to which reference
86113 for the tag in the tags file is used. This is deliberate, in order to permit extensions such as
86114 multiple entries in a tags file for a tag.

86115 Because users often specify many different tags files, some of which need not be relevant or exist
86116 at any particular time, POSIX.1-200x requires that error messages about problem tags files be
86117 displayed only if the requested tag is not found, and then, only once for each time that the **tag**
86118 edit option is changed.

86119 The requirement that the current edit buffer be unmodified is only necessary if the file indicated
86120 by the tag entry is not the same as the current file (as defined by the current pathname).
86121 Historically, the file would be reloaded if the filename had changed, as well as if the filename
86122 was different from the current pathname. For consistency and simplicity of specification,
86123 POSIX.1-200x does not permit this behavior, requiring that the name be the only factor in the
86124 decision.

86125 Historically, *vi* only searched for tags in the current file from the current cursor to the end of the
86126 file, and therefore, if the **wrapsan** option was not set, tags occurring before the current cursor
86127 were not found. POSIX.1-200x considers this a bug, and implementations are required to search
86128 for the first occurrence in the file, regardless.

86129

Undo

86130

The **undo** description deliberately uses the word “modified”. The **undo** command is not intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**, or **recover**.

86131

86132

86133

Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and sometimes, in the presence of maps, placing the cursor on the last line added or changed instead of the first. POSIX.1-200x requires a simplified behavior for consistency and simplicity of specification.

86134

86135

86136

86137

86138

Version

86139

The **version** command cannot be exactly specified since there is no widely-accepted definition of what the version information should contain. Implementations are encouraged to do something reasonably intelligent.

86140

86141

86142

Write

86143

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified “characters”, not “bytes”. POSIX.1-200x requires that the number of bytes be displayed, not the number of characters because it may be difficult in multi-byte implementations to determine the number of characters written. Implementations are encouraged to clarify the message displayed to the user.

86144

86145

86146

86147

86148

Implementation-defined tests are permitted so that implementations can make additional checks; for example, for locks or file modification times.

86149

86150

Historically, attempting to append to a nonexistent file caused an error. It has been left unspecified in POSIX.1-200x to permit implementations to let the **write** succeed, so that the append semantics are similar to those of the historical *csht*.

86151

86152

86153

Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote them as files of a single, empty line. POSIX.1-200x does not permit this behavior.

86154

86155

86156

Historically, *ex* restored standard output and standard error to their values as of when *ex* was invoked, before writes to programs were performed. This could disturb the terminal configuration as well as be a security issue for some terminals. POSIX.1-200x does not permit this, requiring that the program output be captured and displayed as if by the *ex* **print** command.

86157

86158

86159

86160

86161

Adjust Window

86162

Historically, the line count was set to the value of the **scroll** option if the type character was end-of-file. This feature was broken on most historical implementations long ago, however, and is not documented anywhere. For this reason, POSIX.1-200x is resolutely silent.

86163

86164

86165

Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+** and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =** were historically invalid.) POSIX.1-200x requires conformance to this historical practice.

86166

86167

86168

Historically, the **z** command was further <blank>-sensitive in that the *count* could not be <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the *count* is not ambiguous with respect to either the type character or the flags, this is not permitted by POSIX.1-200x.

86169

86170

86171

86172

Escape86173
86174
86175
86176

Historically, *ex* filter commands only read the standard output of the commands, letting standard error appear on the terminal as usual. The *vi* utility, however, read both standard output and standard error. POSIX.1-200x requires the latter behavior for both *ex* and *vi*, for consistency.

86177

Shift Left and Shift Right86178
86179
86180

Historically, it was possible to add shift characters to increase the effect of the command; for example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default 1. POSIX.1-200x requires conformance to historical practice.

86181

<control>-D86182
86183
86184
86185

Historically, the <control>-D command erased the prompt, providing the user with an unbroken presentation of lines from the edit buffer. This is not required by POSIX.1-200x; implementations are encouraged to provide it if possible. Historically, the <control>-D command took, and then ignored, a *count*. POSIX.1-200x does not permit this behavior.

86186

Write Line Number86187
86188
86189

Historically, the *ex* = command, when executed in *ex* mode in an empty edit buffer, reported 0, and from open or visual mode, reported 1. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

86190

Execute86191
86192
86193

Historically, *ex* did not correctly handle the inclusion of text input commands (that is, **append**, **insert**, and **change**) in executed buffers. POSIX.1-200x does not permit this exclusion for consistency.

86194
86195
86196

Historically, the logical contents of the buffer being executed did not change if the buffer itself were modified by the commands being executed; that is, buffer execution did not support self-modifying code. POSIX.1-200x requires conformance to historical practice.

86197
86198
86199

Historically, the @ command took a range of lines, and the @ buffer was executed once per line, with the current line (' . ') set to each specified line. POSIX.1-200x requires conformance to historical practice.

86200
86201
86202
86203
86204

Some historical implementations did not notice if errors occurred during buffer execution. This, coupled with the ability to specify a range of lines for the *ex* @ command, makes it trivial to cause them to drop **core**. POSIX.1-200x requires that implementations stop buffer execution if any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer itself are replaced (for example, the buffer executes the *ex* :**edit** command).

86205

Regular Expressions in ex86206
86207
86208
86209
86210

Historical practice is that the characters in the replacement part of the last **s** command—that is, those matched by entering a '~' in the regular expression—were not further expanded by the regular expression engine. So, if the characters contained the string "a.," they would match 'a' followed by ".," and not 'a' followed by any character. POSIX.1-200x requires conformance to historical practice.

86258

Edit Options in ex

The following paragraphs describe the historical behavior of some edit options that were not, for whatever reason, included in POSIX.1-200x. Implementations are strongly encouraged to only use these names if the functionality described here is fully supported.

- extended** The **extended** edit option has been used in some implementations of *vi* to provide extended regular expressions instead of basic regular expressions. This option was omitted from POSIX.1-200x because it is not widespread historical practice.
- flash** The **flash** edit option historically caused the screen to flash instead of beeping on error. This option was omitted from POSIX.1-200x because it is not found in some historical implementations.
- hardtabs** The **hardtabs** edit option historically defined the number of columns between hardware tab settings. This option was omitted from POSIX.1-200x because it was believed to no longer be generally useful.
- modeline** The **modeline** (sometimes named **modelines**) edit option historically caused *ex* or *vi* to read the five first and last lines of the file for editor commands. This option is a security problem, and vendors are strongly encouraged to delete it from historical implementations.
- open** The **open** edit option historically disallowed the *ex* **open** and **visual** commands. This edit option was omitted because these commands are required by POSIX.1-200x.
- optimize** The **optimize** edit option historically expedited text throughput by setting the terminal to not do automatic <carriage-return>s when printing more than one logical line of output. This option was omitted from POSIX.1-200x because it was intended for terminals without addressable cursors, which are rarely, if ever, still used.
- ruler** The **ruler** edit option has been used in some implementations of *vi* to present a current row/column ruler for the user. This option was omitted from POSIX.1-200x because it is not widespread historical practice.
- sourceany** The **sourceany** edit option historically caused *ex* or *vi* to source start-up files that were owned by users other than the user running the editor. This option is a security problem, and vendors are strongly encouraged to remove it from their implementations.
- timeout** The **timeout** edit option historically enabled the (now standard) feature of only waiting for a short period before returning keys that could be part of a macro. This feature was omitted from POSIX.1-200x because its behavior is now standard, it is not widely useful, and it was rarely documented.
- verbose** The **verbose** edit option has been used in some implementations of *vi* to cause *vi* to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical *vi* only alerted the terminal and presented no message for such errors. The historical editor option **terse** did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from POSIX.1-200x because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users.
- wraplen** The **wraplen** edit option has been used in some implementations of *vi* to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This

86259 option was omitted from POSIX.1-200x because it is not widespread historical
86260 practice; however, implementors are encouraged to use it if they add this
86261 functionality.

86262 **autoindent, ai**

86263 Historically, the command **0a** did not do any autoindentation, regardless of the current
86264 indentation of line 1. POSIX.1-200x requires that any indentation present in line 1 be used.

86265 **autoprint, ap**

86266 Historically, the **autoprint** edit option was not completely consistent or based solely on
86267 modifications to the edit buffer. Exceptions were the **read** command (when reading from a file,
86268 but not from a filter), the **append, change, insert, global,** and **v** commands, all of which were not
86269 affected by **autoprint**, and the **tag** command, which was affected by **autoprint**. POSIX.1-200x
86270 requires conformance to historical practice.

86271 Historically, the **autoprint** option only applied to the last of multiple commands entered using
86272 vertical-bar delimiters; for example, **delete <newline>** was affected by **autoprint**, but
86273 **delete | version <newline>** was not. POSIX.1-200x requires conformance to historical practice.

86274 **autowrite, aw**

86275 Appending the '!' character to the *ex* **next** command to avoid performing an automatic write
86276 was not supported in historical implementations. POSIX.1-200x requires that the behavior match
86277 the other *ex* commands for consistency.

86278 **ignorecase, ic**

86279 Historical implementations of case-insensitive matching (the **ignorecase** edit option) lead to
86280 counterintuitive situations when uppercase characters were used in range expressions.
86281 Historically, the process was as follows:

- 86282 1. Take a line of text from the edit buffer.
- 86283 2. Convert uppercase to lowercase in text line.
- 86284 3. Convert uppercase to lowercase in regular expressions, except in character class
86285 specifications.
- 86286 4. Match regular expressions against text.

86287 This would mean that, with **ignorecase** in effect, the text:

86288 The cat sat on the mat

86289 would be matched by

86290 /[^]the/

86291 but not by:

86292 /[^][A-Z]he/

86293 For consistency with other commands implementing regular expressions, POSIX.1-200x does not
86294 permit this behavior.

86295

paragraphs, para

86296

86297

86298

86299

86300

86301

The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options implementation-defined, arguing they were historically oriented to the UNIX system *troff* text formatter, and a “portable user” could use the {, }, [[,]], (, and) commands in open or visual mode and have the cursor stop in unexpected places. POSIX.1-200x specifies their values in the POSIX locale because the unusual grouping (they only work when grouped into two characters at a time) means that they cannot be used for general-purpose movement, regardless.

86302

readonly

86303

86304

86305

86306

Implementations are encouraged to provide the best possible information to the user as to the read-only status of the file, with the exception that they should not consider the current special privileges of the process. This provides users with a safety net because they must force the overwrite of read-only files, even when running with additional privileges.

86307

86308

86309

86310

86311

The **readonly** edit option specification largely conforms to historical practice. The only difference is that historical implementations did not notice that the user had set the **readonly** edit option in cases where the file was already marked read-only for some reason, and would therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were replaced. This behavior is disallowed by POSIX.1-200x.

86312

report

86313

86314

86315

The requirement that lines copied to a buffer interact differently than deleted lines is historical practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be written, but 4 lines must be copied before a report is written.

86316

86317

86318

86319

86320

86321

86322

86323

86324

The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based on the total number of lines added or deleted during the command execution, and that commands executed by the **global** and **v** commands not present reports, is historical practice. POSIX.1-200x extends historical practice by requiring that buffer execution be treated similarly. The reasons for this are two-fold. Historically, only the report by the last command executed from the buffer would be seen by the user, as each new report would overwrite the last. In addition, the standard developers believed that buffer execution had more in common with **global** and **v** commands than it did with other *ex* commands, and should behave similarly, for consistency and simplicity of specification.

86325

showmatch, sm

86326

86327

86328

86329

86330

The length of time the cursor spends on the matching character is unspecified because the timing capabilities of systems are often inexact and variable. The time should be long enough for the user to notice, but not long enough for the user to become annoyed. Some implementations of *vi* have added a **matchtime** option that permits users to set the number of 0,1 second intervals the cursor pauses on the matching character.

86331

showmode

86332

86333

86334

86335

86336

86337

86338

86339

86340

The **showmode** option has been used in some historical implementations of *ex* and *vi* to display the current editing mode when in open or visual mode. The editing modes have generally included “command” and “input”, and sometimes other modes such as “replace” and “change”. The string was usually displayed on the bottom line of the screen at the far right-hand corner. In addition, a preceding ‘*’ character often denoted whether the contents of the edit buffer had been modified. The latter display has sometimes been part of the **showmode** option, and sometimes based on another option. This option was not available in the 4 BSD historical implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is required by POSIX.1-200x.

86341 The **smd** shorthand for the **showmode** option was not present in all historical implementations
86342 of the editor. POSIX.1-200x requires it, for consistency.

86343 Not all historical implementations of the editor displayed a mode string for command mode,
86344 differentiating command mode from text input mode by the absence of a mode string.
86345 POSIX.1-200x permits this behavior for consistency with historical practice, but implementations
86346 are encouraged to provide a display string for both modes.

86347 **slowopen**

86348 Historically the **slowopen** option was automatically set if the terminal baud rate was less than
86349 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen**
86350 option had two effects. First, when inserting characters in the middle of a line, characters after
86351 the cursor would not be pushed ahead, but would appear to be overwritten. Second, when
86352 creating a new line of text, lines after the current line would not be scrolled down, but would
86353 appear to be overwritten. In both cases, ending text input mode would cause the screen to be
86354 refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently
86355 intelligent caused the editor to ignore the **slowopen** option. POSIX.1-200x permits most
86356 historical behavior, extending historical practice to require **slowopen** behaviors if the edit option
86357 is set by the user.

86358 **tags**

86359 The default path for tags files is left unspecified as implementations may have their own **tags**
86360 implementations that do not correspond to the historical ones. The default **tags** option value
86361 should probably at least include the file **./tags**.

86362 **term**

86363 Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial
86364 terminal information was loaded. This is permitted by POSIX.1-200x; however, implementations
86365 are encouraged to permit the user to modify their terminal type at any time.

86366 **terse**

86367 Historically, the **terse** edit option optionally provided a shorter, less descriptive error message,
86368 for some error messages. This is permitted, but not required, by POSIX.1-200x. Historically, most
86369 common visual mode errors (for example, trying to move the cursor past the end of a line) did
86370 not result in an error message, but simply alerted the terminal. Implementations wishing to
86371 provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not
86372 **terse**.

86373 **window**

86374 In historical implementations, the default for the **window** edit option was based on the baud
86375 rate as follows:

- 86376 1. If the baud rate was less than 1 200, the **edit** option **w300** set the window value; for
86377 example, the line:
86378

```
set w300=12
```

86379 would set the window option to 12 if the baud rate was less than 1 200.
- 86380 2. If the baud rate was equal to 1 200, the **edit** option **w1200** set the window value.
- 86381 3. If the baud rate was greater than 1 200, the **edit** option **w9600** set the window value.

86382 The **w300**, **w1200**, and **w9600** options do not appear in POSIX.1-200x because of their
86383 dependence on specific baud rates.

86384 In historical implementations, the size of the window displayed by various commands was
 86385 related to, but not necessarily the same as, the **window** edit option. For example, the size of the
 86386 window was set by the *ex* command **visual 10**, but it did not change the value of the **window**
 86387 edit option. However, changing the value of the **window** edit option did change the number of
 86388 lines that were displayed when the screen was repainted. POSIX.1-200x does not permit this
 86389 behavior in the interests of consistency and simplicity of specification, and requires that all
 86390 commands that change the number of lines that are displayed do it by setting the value of the
 86391 **window** edit option.

86392 **wrapmargin, wm**

86393 Historically, the **wrapmargin** option did not affect maps inserting characters that also had
 86394 associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used
 86395 maps that depend on this behavior. For consistency and simplicity of specification,
 86396 POSIX.1-200x does not permit this behavior.

86397 Historically, **wrapmargin** was calculated using the column display width of all characters on the
 86398 screen. For example, an implementation using "**^I**" to represent <tab>s when the **list** edit
 86399 option was set, where '**^**' and '**I**' each took up a single column on the screen, would calculate
 86400 the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option similarly
 86401 changed the effective length of the line as well. POSIX.1-200x requires conformance to historical
 86402 practice.

86403 Earlier versions of this standard allowed for implementations with bytes other than eight bits,
 86404 but this has been modified in this version.

86405 **FUTURE DIRECTIONS**

86406 None.

86412 **CHANGE HISTORY**

86413 First released in Issue 2.

86414 **Issue 5**

86415 The FUTURE DIRECTIONS section is added.

86416 **Issue 6**

86417 This utility is marked as part of the User Portability Utilities option.

86418 The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

86419 The following new requirements on POSIX implementations derive from alignment with the
 86420 Single UNIX Specification:

- 86421 • In the **map** command description, the sequence *#digit* is added.
- 86422 • The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.

86423 The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This
 86424 includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52,
 86425 #55, #56, #57, #61, #62, #63, #64, #65, and #78.

86426 The **-l** option is removed.

86427 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.

- 86428 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/8 is applied, making an editorial
86429 correction in the EXTENDED DESCRIPTION.
- 86430 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/9 is applied, removing text describing
86431 behavior on systems with bytes consisting of more than eight bits.
- 86432 **Issue 7**
- 86433 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if an operand is
86434 '–'.
- 86435 Austin Group Interpretation 1003.1-2001 #036 is applied, clarifying the behavior for BREs.
- 86436 Austin Group Interpretation 1003.1-2001 #121 is applied, clarifying the *ex write* command. +
- 86437 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86438 **NAME**86439 `expand` — convert tabs to spaces86440 **SYNOPSIS**86441 `expand [-t tablist] [file...]`86442 **DESCRIPTION**

86443 The *expand* utility shall write files or the standard input to the standard output with `<tab>`s
 86444 replaced with one or more `<space>`s needed to pad to the next tab stop. Any `<backspace>`s shall
 86445 be copied to the output and cause the column position count for tab stop calculations to be
 86446 decremented; the column position count shall not be decremented below zero.

86447 **OPTIONS**86448 The *expand* utility shall conform to XBD [Section 12.2](#) (on page 201). |

86449 The following option shall be supported:

86450 `-t tablist` Specify the tab stops. The application shall ensure that the argument *tablist* consists
 86451 of either a single positive decimal integer or a list of tabstops. If a single number is
 86452 given, tabs shall be set that number of column positions apart instead of the
 86453 default 8.

86454 If a list of tabstops is given, the application shall ensure that it consists of a list of
 86455 two or more positive decimal integers, separated by `<blank>`s or commas, in
 86456 ascending order. The tabs shall be set at those specific column positions. Each tab
 86457 stop *N* shall be an integer value greater than zero, and the list is in strictly
 86458 ascending order. This is taken to mean that, from the start of a line of output,
 86459 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th
 86460 column position on that line.

86461 In the event of *expand* having to process a `<tab>` at a position beyond the last of
 86462 those specified in a multiple tab-stop list, the `<tab>` shall be replaced by a single
 86463 `<space>` in the output.

86464 **OPERANDS**

86465 The following operand shall be supported:

86466 `file` The pathname of a text file to be used as input.86467 **STDIN**

86468 See the INPUT FILES section.

86469 **INPUT FILES**

86470 Input files shall be text files.

86471 **ENVIRONMENT VARIABLES**86472 The following environment variables shall affect the execution of *expand*:

86473 `LANG` Provide a default value for the internationalization variables that are unset or null. |
 86474 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 86475 variables used to determine the values of locale categories.)

86476 `LC_ALL` If set to a non-empty string value, override the values of all the other
 86477 internationalization variables.

86478 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as
 86479 characters (for example, single-byte as opposed to multi-byte characters in
 86480 arguments and input files), the processing of `<tab>`s and `<space>`s, and for the
 86481 determination of the width in column positions each character would occupy on

86482 an output device.

86483 *LC_MESSAGES*

86484 Determine the locale that should be used to affect the format and contents of
86485 diagnostic messages written to standard error.

86486 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

86487 ASYNCHRONOUS EVENTS

86488 Default.

86489 STDOUT

86490 The standard output shall be equivalent to the input files with <tab>s converted into the
86491 appropriate number of <space>s.

86492 STDERR

86493 The standard error shall be used only for diagnostic messages.

86494 OUTPUT FILES

86495 None.

86496 EXTENDED DESCRIPTION

86497 None.

86498 EXIT STATUS

86499 The following exit values shall be returned:

86500 0 Successful completion

86501 >0 An error occurred.

86502 CONSEQUENCES OF ERRORS

86503 The *expand* utility shall terminate with an error message and non-zero exit status upon
86504 encountering difficulties accessing one of the *file* operands.

86505 APPLICATION USAGE

86506 None.

86507 EXAMPLES

86508 None.

86509 RATIONALE

86510 The *expand* utility is useful for preprocessing text files (before sorting, looking at specific
86511 columns, and so on) that contain <tab>s.

86512 See XBD [Section 3.102](#) (on page 47). |

86513 The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8
86514 mandates that *expand* shall accept the integers (within the single argument) separated using
86515 either commas or <blank>s.

86516 Earlier versions of this standard allowed the following form in the SYNOPSIS:

86517 `expand [-tabstop][-tab1,tab2,...,tabn][file ...]`

86518 This form is no longer specified by POSIX.1-200x but may be present in some implementations. |

86519 FUTURE DIRECTIONS

86520 None.

86521 SEE ALSO

86522 *tabs*, *unexpand*

86524

CHANGE HISTORY

86525

First released in Issue 4.

86526

Issue 6

86527

This utility is marked as part of the User Portability Utilities option.

86528

The APPLICATION USAGE section is added.

86529

The obsolescent SYNOPSIS is removed.

86530

The *LC_CTYPE* environment variable description is updated to align with the IEEE P1003.2b draft standard.

86531

86532

The normative text is reworded to avoid use of the term “must” for application requirements.

86533

Issue 7

86534

Austin Group Interpretation 1003.1-2001 #027 is applied.

86535

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS. +

86536

The *expand* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities. -

86537

86538 **NAME**
 86539 `expr` — evaluate arguments as an expression

86540 **SYNOPSIS**
 86541 `expr operand...`

86542 **DESCRIPTION**
 86543 The `expr` utility shall evaluate an expression and write the result to standard output.

86544 **OPTIONS**
 86545 None.

86546 **OPERANDS**
 86547 The single expression evaluated by `expr` shall be formed from the `operand` operands, as described
 86548 in the EXTENDED DESCRIPTION section. The application shall ensure that each of the
 86549 expression operator symbols:

86550 () | & = > >= < <= != + - * / % :

86551 and the symbols `integer` and `string` in the table are provided as separate arguments to `expr`.

86552 **STDIN**
 86553 Not used.

86554 **INPUT FILES**
 86555 None.

86556 **ENVIRONMENT VARIABLES**
 86557 The following environment variables shall affect the execution of `expr`:

86558 `LANG` Provide a default value for the internationalization variables that are unset or null.
 86559 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 86560 variables used to determine the values of locale categories.)

86561 `LC_ALL` If set to a non-empty string value, override the values of all the other
 86562 internationalization variables.

86563 `LC_COLLATE`
 86564 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 86565 character collating elements within regular expressions and by the string
 86566 comparison operators.

86567 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as
 86568 characters (for example, single-byte as opposed to multi-byte characters in
 86569 arguments) and the behavior of character classes within regular expressions.

86570 `LC_MESSAGES`
 86571 Determine the locale that should be used to affect the format and contents of
 86572 diagnostic messages written to standard error.

86573 XSI `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

86574 **ASYNCHRONOUS EVENTS**
 86575 Default.

86576 **STDOUT**
 86577 The `expr` utility shall evaluate the expression and write the result, followed by a <newline>, to
 86578 standard output.

86579 **STDERR**
 86580 The standard error shall be used only for diagnostic messages.

86581 **OUTPUT FILES**
 86582 None.

86583 EXTENDED DESCRIPTION

86584 The formation of the expression to be evaluated is shown in the following table. The symbols
 86585 *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the
 86586 expression operator symbols (all separate arguments) by recursive application of the constructs
 86587 described in the table. The expressions are listed in order of increasing precedence, with equal-
 86588 precedence operators grouped between horizontal lines. All of the operators shall be left-
 86589 associative.

Expression	Description
<i>expr1</i> <i>expr2</i>	Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.
<i>expr1</i> & <i>expr2</i>	Returns the evaluation of <i>expr1</i> if neither expression evaluates to null or zero; otherwise, returns zero.
<i>expr1</i> = <i>expr2</i> <i>expr1</i> > <i>expr2</i> <i>expr1</i> >= <i>expr2</i> <i>expr1</i> < <i>expr2</i> <i>expr1</i> <= <i>expr2</i> <i>expr1</i> != <i>expr2</i>	Returns the result of a decimal integer comparison if both arguments are integers; otherwise, returns the result of a string comparison using the locale-specific collation sequence. The result of each comparison is 1 if the specified relationship is true, or 0 if the relationship is false. Equal. Greater than. Greater than or equal. Less than. Less than or equal. Not equal.
<i>expr1</i> + <i>expr2</i> <i>expr1</i> - <i>expr2</i>	Addition of decimal integer-valued arguments. Subtraction of decimal integer-valued arguments.
<i>expr1</i> * <i>expr2</i> <i>expr1</i> / <i>expr2</i> <i>expr1</i> % <i>expr2</i>	Multiplication of decimal integer-valued arguments. Integer division of decimal integer-valued arguments, producing an integer result. Remainder of integer division of decimal integer-valued arguments.
<i>expr1</i> : <i>expr2</i>	Matching expression; see below.
(<i>expr</i>)	Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.
<i>integer</i>	An argument consisting only of an (optional) unary minus followed by digits.
<i>string</i>	A string argument; see below.

86621

Matching Expression86622
86623
86624
86625
86626
86627
86628
86629
86630
86631

The `' : '` matching operator shall compare the string resulting from the evaluation of *expr1* with the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax shall be that defined in XBD [Section 9.3](#) (on page 169), except that all patterns are anchored to the beginning of the string (that is, only sequences starting at the first character of a string are matched by the regular expression) and, therefore, it is unspecified whether `' ^ '` is a special character in that context. Usually, the matching operator shall return a string representing the number of characters matched (`' 0 '` on failure). Alternatively, if the pattern contains at least one regular expression subexpression `"[\(\.\.\.\)"]`, the string matched by the back-reference expression `"\1"` shall be returned. If the back-reference expression `"\1"` does not match, then the null string shall be returned.

86632

String Operand86633
86634

A string argument is an argument that cannot be identified as an *integer* argument or as one of the expression operator symbols shown in the OPERANDS section.

86635

The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

86636

EXIT STATUS

86637

The following exit values shall be returned:

86638

0 The *expression* evaluates to neither null nor zero.

86639

1 The *expression* evaluates to null or zero.

86640

2 Invalid *expression*.

86641

>2 An error occurred.

86642

CONSEQUENCES OF ERRORS

86643

Default.

86644

APPLICATION USAGE

86645

After argument processing by the shell, *expr* is not required to be able to tell the difference between an operator and an operand except by the value. If `"$a"` is `' = '`, the command:

86646

```
expr $a = '='
```

86648

looks like:

86649

```
expr = = =
```

86650

as the arguments are passed to *expr* (and they all may be taken as the `' = '` operator). The following works reliably:

86651

```
expr X$a = X=
```

86652

86653

Also note that this volume of POSIX.1-200x permits implementations to extend utilities. The *expr* utility permits the integer arguments to be preceded with a unary minus. This means that an integer argument could look like an option. Therefore, the conforming application must employ the `"--"` construct of Guideline 10 of XBD [Section 12.2](#) (on page 201) to protect its operands if there is any chance the first operand might be a negative integer (or any string with a leading minus).

86654

86655

86656

86657

86658

86659

EXAMPLES

86660

The *expr* utility has a rather difficult syntax:

86661

- Many of the operators are also shell control operators or reserved words, so they have to be escaped on the command line.

86662

- Each part of the expression is composed of separate arguments, so liberal usage of <blank>s is required. For example:

Invalid	Valid
<code>expr 1+2</code>	<code>expr 1 + 2</code>
<code>expr "1 + 2"</code>	<code>expr 1 + 2</code>
<code>expr 1 + (2 * 3)</code>	<code>expr 1 + \(2 * 3 \)</code>

In many cases, the arithmetic and string features provided as part of the shell command language are easier to use than their equivalents in *expr*. Newly written scripts should avoid *expr* in favor of the new features within the shell; see [Section 2.5](#) (on page 2249) and [Section 2.6.4](#) (on page 2257).

The following command:

```
a=$(expr $a + 1)
```

adds 1 to the variable *a*.

The following command, for "*\$a*" equal to either */usr/abc/file* or just *file*:

```
expr $a : '.*\/(.*)' \| $a
```

returns the last segment of a pathname (that is, *file*). Applications should avoid the character */* used alone as an argument; *expr* may interpret it as the division operator.

The following command:

```
expr "//$a" : '.*\/(.*)'
```

is a better representation of the previous example. The addition of the *///* characters eliminates any ambiguity about the division operator and simplifies the whole expression. Also note that pathnames may contain characters contained in the *IFS* variable and should be quoted to avoid having "*\$a*" expand into multiple arguments.

The following command:

```
expr "$VAR" : '.*'
```

returns the number of characters in *VAR*.

RATIONALE

In an early proposal, EREs were used in the matching expression syntax. This was changed to BREs to avoid breaking historical applications.

The use of a leading circumflex in the BRE is unspecified because many historical implementations have treated it as a special character, despite their system documentation. For example:

```
expr foo : ^foo      expr ^foo : ^foo
```

return 3 and 0, respectively, on those systems; their documentation would imply the reverse. Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on this undocumented feature.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

86757

First released in Issue 2.

86758

Issue 6

86759

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR section from “None.” to “Not used.” for alignment with [Section 1.4](#) (on page 2235).

86760

86761 **NAME**
86762 `fc` — process the command history list

86763 **SYNOPSIS**

86764 UP `fc [-r] [-e editor] [first [last]]`
86765 `fc -l [-nr] [first [last]]`
86766 `fc -s [old=new] [first]`

86767 **DESCRIPTION**

86768 The `fc` utility shall list, or shall edit and re-execute, commands previously entered to an
86769 interactive `sh`.

86770 The command history list shall reference commands by number. The first number in the list is
86771 selected arbitrarily. The relationship of a number to its command shall not change except when
86772 the user logs in and no other process is accessing the list, at which time the system may reset the
86773 numbering to start the oldest retained command at another number (usually 1). When the
86774 number reaches an implementation-defined upper limit, which shall be no smaller than the
86775 value in `HISTSIZE` or 32767 (whichever is greater), the shell may wrap the numbers, starting the
86776 next command with a lower number (usually 1). However, despite this optional wrapping of
86777 numbers, `fc` shall maintain the time-ordering sequence of the commands. For example, if four
86778 commands in sequence are given the numbers 32766, 32767, 1 (wrapped), and 2 as they are
86779 executed, command 32767 is considered the command previous to 1, even though its number is
86780 higher.

86781 When commands are edited (when the `-l` option is not specified), the resulting lines shall be
86782 entered at the end of the history list and then re-executed by `sh`. The `fc` command that caused the
86783 editing shall not be entered into the history list. If the editor returns a non-zero exit status, this
86784 shall suppress the entry into the history list and the command re-execution. Any command line
86785 variable assignments or redirection operators used with `fc` shall affect both the `fc` command itself
86786 as well as the command that results; for example:

86787 `fc -s -- -l 2>/dev/null`

86788 reinvokes the previous command, suppressing standard error for both `fc` and the previous
86789 command.

86790 **OPTIONS**

86791 The `fc` utility shall conform to XBD [Section 12.2](#) (on page 201).

86792 The following options shall be supported:

86793 `-e editor` Use the editor named by `editor` to edit the commands. The `editor` string is a utility
86794 name, subject to search via the `PATH` variable (see XBD [Chapter 8](#), on page 159).
86795 The value in the `FCEDIT` variable shall be used as a default when `-e` is not
86796 specified. If `FCEDIT` is null or unset, `ed` shall be used as the editor.

86797 `-l` (The letter ell.) List the commands rather than invoking an editor on them. The
86798 commands shall be written in the sequence indicated by the `first` and `last` operands,
86799 as affected by `-r`, with each command preceded by the command number.

86800 `-n` Suppress command numbers when listing with `-l`.

86801 `-r` Reverse the order of the commands listed (with `-l`) or edited (with neither `-l` nor
86802 `-s`).

86803 -s Re-execute the command without invoking an editor.

86804 OPERANDS

86805 The following operands shall be supported:

86806 *first, last* Select the commands to list or edit. The number of previous commands that can be
86807 accessed shall be determined by the value of the *HISTSIZE* variable. The value of
86808 *first* or *last* or both shall be one of the following:

86809 [+]*number* A positive number representing a command number; command
86810 numbers can be displayed with the -l option.

86811 -*number* A negative decimal number representing the command that was
86812 executed *number* of commands previously. For example, -1 is the
86813 immediately previous command.

86814 *string* A string indicating the most recently entered command that begins
86815 with that string. If the *old=new* operand is not also specified with -s,
86816 the string form of the *first* operand cannot contain an embedded
86817 equal sign.

86818 When the synopsis form with -s is used:

86819 • If *first* is omitted, the previous command shall be used.

86820 For the synopsis forms without -s:

86821 • If *last* is omitted, *last* shall default to the previous command when -l is
86822 specified; otherwise, it shall default to *first*.

86823 • If *first* and *last* are both omitted, the previous 16 commands shall be listed or
86824 the previous single command shall be edited (based on the -l option).

86825 • If *first* and *last* are both present, all of the commands from *first* to *last* shall be
86826 edited (without -l) or listed (with -l). Editing multiple commands shall be
86827 accomplished by presenting to the editor all of the commands at one time,
86828 each command starting on a new line. If *first* represents a newer command
86829 than *last*, the commands shall be listed or edited in reverse sequence,
86830 equivalent to using -r. For example, the following commands on the first
86831 line are equivalent to the corresponding commands on the second:

86832 fc -r 10 20 fc 30 40
86833 fc 20 10 fc -r 40 30

86834 • When a range of commands is used, it shall not be an error to specify *first* or
86835 *last* values that are not in the history list; *fc* shall substitute the value
86836 representing the oldest or newest command in the list, as appropriate. For
86837 example, if there are only ten commands in the history list, numbered 1 to 10:

86838 fc -l
86839 fc 1 99

86840 shall list and edit, respectively, all ten commands.

86841 *old=new* Replace the first occurrence of string *old* in the commands to be re-executed by the
86842 string *new*.

86843 STDIN

86844 Not used.

86845 **INPUT FILES**

86846 None.

86847 **ENVIRONMENT VARIABLES**86848 The following environment variables shall affect the execution of *fc*:

86849 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for
 86850 the *-e editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be
 86851 used as the editor.

86852 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is
 86853 not set, the shell may attempt to access or create a file *.sh_history* in the directory
 86854 referred to by the *HOME* environment variable. If the shell cannot obtain both read
 86855 and write access to, or create, the history file, it shall use an unspecified
 86856 mechanism that allows the history to operate properly. (References to history "file"
 86857 in this section shall be understood to mean this unspecified mechanism in such
 86858 cases.) An implementation may choose to access this variable only when
 86859 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt
 86860 to retrieve entries from, or add entries to, the file, as the result of commands issued
 86861 by the user, the file named by the *ENV* variable, or implementation-defined system
 86862 start-up files. In some historical shells, the history file is initialized just after the
 86863 *ENV* file has been processed. Therefore, it is implementation-defined whether
 86864 changes made to *HISTFILE* after the history file has been initialized are effective.
 86865 Implementations may choose to disable the history list mechanism for users with
 86866 appropriate privileges who do not set *HISTFILE*; the specific circumstances under
 86867 which this occurs are implementation-defined. If more than one instance of the
 86868 shell is using the same history file, it is unspecified how updates to the history file
 86869 from those shells interact. As entries are deleted from the history file, they shall be
 86870 deleted oldest first. It is unspecified when history file entries are physically
 86871 removed from the history file.

86872 *HISTSIZE* Determine a decimal number representing the limit to the number of previous
 86873 commands that are accessible. If this variable is unset, an unspecified default
 86874 greater than or equal to 128 shall be used. The maximum number of commands in
 86875 the history list is unspecified, but shall be at least 128. An implementation may
 86876 choose to access this variable only when initializing the history file, as described
 86877 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*
 86878 after the history file has been initialized are effective.

86879 *LANG* Provide a default value for the internationalization variables that are unset or null.
 86880 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 86881 variables used to determine the values of locale categories.)

86882 *LC_ALL* If set to a non-empty string value, override the values of all the other
 86883 internationalization variables.

86884 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 86885 characters (for example, single-byte as opposed to multi-byte characters in
 86886 arguments and input files).

86887 *LC_MESSAGES*

86888 Determine the locale that should be used to affect the format and contents of
 86889 diagnostic messages written to standard error.

86890 *XSHELL* *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

86891 **ASYNCHRONOUS EVENTS**

86892 Default.

86893 **STDOUT**86894 When the `-l` option is used to list commands, the format of each command in the list shall be as
86895 follows:86896 "`%d\t%s\n`", *<line number>*, *<command>*86897 If both the `-l` and `-n` options are specified, the format of each command shall be:86898 "`\t%s\n`", *<command>*86899 If the *<command>* consists of more than one line, the lines after the first shall be displayed as:86900 "`\t%s\n`", *<continued-command>*86901 **STDERR**

86902 The standard error shall be used only for diagnostic messages.

86903 **OUTPUT FILES**

86904 None.

86905 **EXTENDED DESCRIPTION**

86906 None.

86907 **EXIT STATUS**

86908 The following exit values shall be returned:

86909 0 Successful completion of the listing.

86910 >0 An error occurred.

86911 Otherwise, the exit status shall be that of the commands executed by *fc*.86912 **CONSEQUENCES OF ERRORS**

86913 Default.

86914 **APPLICATION USAGE**86915 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file
86916 descriptors as part of the *fc* command can produce unexpected results. For example, if *vi* is the
86917 *FCEDIT* editor, the command:86918 `fc -s | more`

86919 does not work correctly on many systems.

86920 Users on windowing systems may want to have separate history files for each window by
86921 setting *HISTFILE* as follows:86922 `HISTFILE=$HOME/.sh_hist$$`86923 **EXAMPLES**

86924 None.

86925 **RATIONALE**86926 This utility is based on the *fc* built-in of the KornShell.86927 An early proposal specified the `-e` option as [`-e editor [old= new]`], which is not historical
86928 practice. Historical practice in *fc* of either [`-e editor`] or [`-e - [old= new]`] is acceptable, but not
86929 both together. To clarify this, a new option `-s` was introduced replacing the [`-e -`]. This resolves
86930 the conflict and makes *fc* conform to the Utility Syntax Guidelines.86931 *HISTFILE* Some implementations of the KornShell check for the superuser and do not create
86932 a history file unless *HISTFILE* is set. This is done primarily to avoid creating
86933 unlinked files in the root file system when logging in during single-user mode.

86934 *HISTFILE* must be set for the superuser to have history.

86935 *HISTSIZE* Needed to limit the size of history files. It is the intent of the standard developers
86936 that when two shells share the same history file, commands that are entered in one
86937 shell shall be accessible by the other shell. Because of the difficulties of
86938 synchronization over a network, the exact nature of the interaction is unspecified.

86939 The initialization process for the history file can be dependent on the system start-up files, in
86940 that they may contain commands that effectively preempt the settings the user has for *HISTFILE*
86941 and *HISTSIZE*. For example, function definition commands are recorded in the history file. If
86942 the system administrator includes function definitions in some system start-up file called before
86943 the *ENV* file, the history file is initialized before the user can influence its characteristics. In some
86944 historical shells, the history file is initialized just after the *ENV* file has been processed. Because
86945 of these situations, the text requires the initialization process to be implementation-defined.

86946 Consideration was given to omitting the *fc* utility in favor of the command line editing feature in
86947 *sh*. For example, in *vi* editing mode, typing "<ESC> v" is equivalent to:

86948 EDITOR=vi fc

86949 However, the *fc* utility allows the user the flexibility to edit multiple commands simultaneously
86950 (such as *fc* 10 20) and to use editors other than those supported by *sh* for command line editing.

86951 In the KornShell, the alias *r* ("re-do") is preset to *fc -e -* (equivalent to the POSIX *fc -s*). This is
86952 probably an easier command name to remember than *fc* ("fix command"), but it does not meet
86953 the Utility Syntax Guidelines. Renaming *fc* to *hist* or *redo* was considered, but since this
86954 description closely matches historical KornShell practice already, such a renaming was seen as
86955 gratuitous. Users are free to create aliases whenever odd historical names such as *fc*, *awk*, *cat*,
86956 *grep*, or *yacc* are standardized by POSIX.

86957 Command numbers have no ordering effects; they are like serial numbers. The *-r* option and
86958 *-number* operand address the sequence of command execution, regardless of serial numbers. So,
86959 for example, if the command number wrapped back to 1 at some arbitrary point, there would be
86960 no ambiguity associated with traversing the wrap point. For example, if the command history
86961 were:

```
86962 32766: echo 1
86963 32767: echo 2
86964 1: echo 3
```

86965 the number *-2* refers to command 32767 because it is the second previous command, regardless
86966 of serial number.

86967 FUTURE DIRECTIONS

86968 None.

86972 CHANGE HISTORY

86973 First released in Issue 4.

86974 Issue 5

86975 The FUTURE DIRECTIONS section is added.

86976 Issue 6

86977 This utility is marked as part of the User Portability Utilities option.

86978 In the ENVIRONMENT VARIABLES section, the text "user's home directory" is updated to
86979 "directory referred to by the *HOME* environment variable".

86980

Issue 7

86981

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

86982 **NAME**

86983 fg — run jobs in the foreground

86984 **SYNOPSIS**86985 UP fg [*job_id*]86986 **DESCRIPTION**86987 If job control is enabled (see the description of *set -m*), the *fg* utility shall move a background job
86988 from the current environment (see [Section 2.12](#), on page 2277) into the foreground.86989 Using *fg* to place a job into the foreground shall remove its process ID from the list of those
86990 “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page 2266).86991 **OPTIONS**

86992 None.

86993 **OPERANDS**

86994 The following operand shall be supported:

86995 *job_id* Specify the job to be run as a foreground job. If no *job_id* operand is given, the
86996 *job_id* for the job that was most recently suspended, placed in the background, or
86997 run as a background job shall be used. The format of *job_id* is described in XBD
86998 [Section 3.202](#) (on page 61).86999 **STDIN**

87000 Not used.

87001 **INPUT FILES**

87002 None.

87003 **ENVIRONMENT VARIABLES**87004 The following environment variables shall affect the execution of *fg*:87005 *LANG* Provide a default value for the internationalization variables that are unset or null.
87006 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
87007 variables used to determine the values of locale categories.)87008 *LC_ALL* If set to a non-empty string value, override the values of all the other
87009 internationalization variables.87010 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
87011 characters (for example, single-byte as opposed to multi-byte characters in
87012 arguments).87013 *LC_MESSAGES*
87014 Determine the locale that should be used to affect the format and contents of
87015 diagnostic messages written to standard error.87016 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.87017 **ASYNCHRONOUS EVENTS**

87018 Default.

87019 **STDOUT**87020 The *fg* utility shall write the command line of the job to standard output in the following format:

87021 "%s\n", <command>

87022 **STDERR**

87023 The standard error shall be used only for diagnostic messages.

87024 **OUTPUT FILES**

87025 None.

87026 **EXTENDED DESCRIPTION**

87027 None.

87028 **EXIT STATUS**

87029 The following exit values shall be returned:

87030 0 Successful completion.

87031 >0 An error occurred.

87032 **CONSEQUENCES OF ERRORS**87033 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the
87034 foreground.87035 **APPLICATION USAGE**87036 The *fg* utility does not work as expected when it is operating in its own utility execution
87037 environment because that environment has no applicable jobs to manipulate. See the
87038 APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell
87039 regular built-in.87040 **EXAMPLES**

87041 None.

87042 **RATIONALE**87043 The extensions to the shell specified in this volume of POSIX.1-200x have mostly been based on
87044 features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also
87045 based on the KornShell. The standard developers examined the characteristics of the C shell
87046 versions of these utilities and found that differences exist. Despite widespread use of the C shell,
87047 the KornShell versions were selected for this volume of POSIX.1-200x to maintain a degree of
87048 uniformity with the rest of the KornShell features selected (such as the very popular command
87049 line editing features).87050 **FUTURE DIRECTIONS**

87051 None.

87052 **SEE ALSO**87053 [Section 2.9.3.1](#) (on page 2266), [Section 2.12](#) (on page 2277), *bg*, *kill*, *jobs*, *wait*87054 XBD [Section 3.202](#) (on page 61), [Chapter 8](#) (on page 159) +87055 **CHANGE HISTORY**

87056 First released in Issue 4.

87057 **Issue 6**

87058 This utility is marked as part of the User Portability Utilities option.

87059 The APPLICATION USAGE section is added.

87060 The JC marking is removed from the SYNOPSIS since job control is mandatory in this version. |

87061 **NAME**

87062 file — determine file type

87063 **SYNOPSIS**

87064 file [-dh] [-M file] [-m file] file...

87065 file -i [-h] file...

87066 **DESCRIPTION**87067 The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to
87068 classify it:

- 87069 1. If *file* does not exist, cannot be read, or its file status could not be determined, the output
87070 shall indicate that the file was processed, but that its type could not be determined.
- 87071 2. If the file is not a regular file, its file type shall be identified. The file types directory,
87072 FIFO, socket, block special, and character special shall be identified as such. Other
87073 implementation-defined file types may also be identified. If *file* is a symbolic link, by
87074 default the link shall be resolved and *file* shall test the type of file referenced by the
87075 symbolic link. (See the **-h** and **-i** options below.)
- 87076 3. If the length of *file* is zero, it shall be identified as an empty file.
- 87077 4. The *file* utility shall examine an initial segment of *file* and shall make a guess at
87078 identifying its contents based on position-sensitive tests. (The answer is not guaranteed to
87079 be correct; see the **-d**, **-M**, and **-m** options below.)
- 87080 5. The *file* utility shall examine *file* and make a guess at identifying its contents based on
87081 context-sensitive default system tests. (The answer is not guaranteed to be correct.)
- 87082 6. The file shall be identified as a data file.

87083 If *file* does not exist, cannot be read, or its file status could not be determined, the output shall
87084 indicate that the file was processed, but that its type could not be determined.87085 If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file
87086 referenced by the symbolic link.87087 **OPTIONS**87088 The *file* utility shall conform to XBD [Section 12.2](#) (on page 201), except that the order of the **-m**,
87089 **-d**, and **-M** options shall be significant.

87090 The following options shall be supported by the implementation:

- 87091 **-d** Apply any position-sensitive default system tests and context-sensitive default
87092 system tests to the file. This is the default if no **-M** or **-m** option is specified.
- 87093 **-h** When a symbolic link is encountered, identify the file as a symbolic link. If **-h** is
87094 not specified and *file* is a symbolic link that refers to a nonexistent file, *file* shall
87095 identify the file as a symbolic link, as if **-h** had been specified.
- 87096 **-i** If a file is a regular file, do not attempt to classify the type of the file further, but
87097 identify the file as specified in the **STDOUT** section.
- 87098 **-M file** Specify the name of a file containing position-sensitive tests that shall be applied to
87099 a file in order to classify it (see the **EXTENDED DESCRIPTION**). No position-
87100 sensitive default system tests nor context-sensitive default system tests shall be
87101 applied unless the **-d** option is also specified.

87102 **-m file** Specify the name of a file containing position-sensitive tests that shall be applied to
87103 a file in order to classify it (see the EXTENDED DESCRIPTION).

87104 If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-
87105 sensitive default system tests shall be applied after the position-sensitive tests specified by the
87106 **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**
87107 option is specified with the **-d** option, the concatenation of the position-sensitive tests specified
87108 by these options shall be applied in the order specified by the appearance of these options. If a
87109 **-M** or **-m file** option-argument is **-**, the results are unspecified.

87110 OPERANDS

87111 The following operand shall be supported:

87112 *file* A pathname of a file to be tested.

87113 STDIN

87114 Not used.

87115 INPUT FILES

87116 The *file* can be any file type.

87117 ENVIRONMENT VARIABLES

87118 The following environment variables shall affect the execution of *file*:

87119 **LANG** Provide a default value for the internationalization variables that are unset or null. |
87120 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
87121 variables used to determine the values of locale categories.)

87122 **LC_ALL** If set to a non-empty string value, override the values of all the other
87123 internationalization variables.

87124 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
87125 characters (for example, single-byte as opposed to multi-byte characters in
87126 arguments and input files).

87127 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
87128 diagnostic messages written to standard error and informative messages written to
87129 standard output.
87130

87131 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

87132 ASYNCHRONOUS EVENTS

87133 Default.

87134 STDOUT

87135 In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

87136 "**%s: %s\n**", *<file>*, *<type>*

87137 The values for *<type>* are unspecified, except that in the POSIX locale, if *file* is identified as one
87138 of the types listed in the following table, *<type>* shall contain (but is not limited to) the
87139 corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or
87140 **-m** option. Each space shown in the strings shall be exactly one *<space>*.

87141

Table 4-8 File Utility Output Strings

87142

	If <i>file</i> is:	<type> shall contain the string:	Notes
87143	Nonexistent	cannot open	
87144	Block special	block special	1
87145	Character special	character special	1
87146	Directory	directory	1
87147	FIFO	fifo	1
87148	Socket	socket	1
87149	Symbolic link	symbolic link to	1
87150	Regular file	regular file	1,2
87151	Empty regular file	empty	3
87152	Regular file that cannot be read	cannot open	3
87153	Executable binary	executable	3,4,6
87154	<i>ar</i> archive library (see <i>ar</i>)	archive	3,4,6
87155	Extended <i>cpio</i> format (see <i>pax</i>)	<i>cpio</i> archive	3,4,6
87156	Extended <i>tar</i> format (see ustar in <i>pax</i>)	<i>tar</i> archive	3,4,6
87157	Shell script	commands text	3,5,6
87158	C-language source	c program text	3,5,6
87159	FORTRAN source	fortran program text	3,5,6
87160	Regular file whose type cannot be determined	data	3

87161

Notes:

87162

1. This is a file type test.

87163

2. This test is applied only if the **-i** option is specified.

87164

3. This test is applied only if the **-i** option is not specified.

87165

4. This is a position-sensitive default system test.

87166

5. This is a context-sensitive default system test.

87167

6. Position-sensitive default system tests and context-sensitive default system tests are not applied if the **-M** option is specified unless the **-d** option is also specified.

87168

87169

In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following alternative output format shall be used:

87170

```
"%s: %s %s\n", <file>, <type>, <contents of link>"
```

87171

87172

If the file named by the *file* operand does not exist, cannot be read, or the type of the file named by the *file* operand cannot be determined, this shall not be considered an error that affects the exit status.

87173

87174

87175

STDERR

87176

The standard error shall be used only for diagnostic messages.

87177

OUTPUT FILES

87178

None.

87179

EXTENDED DESCRIPTION

87180

A file specified as an option-argument to the **-m** or **-M** options shall contain one position-sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of the line shall be printed and no further tests shall be applied, with the exception that tests on immediately following lines beginning with a single **'>'** character shall be applied.

87181

87182

87183

87184

Each line shall be composed of the following four <tab>-separated fields. (Implementations may

87185		allow any combination of one or more white space characters other than <newline> to act as
87186		field separators.)
87187	<i>offset</i>	An unsigned number (optionally preceded by a single ' > ' character) specifying
87188		the <i>offset</i> , in bytes, of the value in the file that is to be compared against the <i>value</i>
87189		field of the line. If the file is shorter than the specified offset, the test shall fail.
87190		If the <i>offset</i> begins with the character ' > ', the test contained in the line shall not be
87191		applied to the file unless the test on the last line for which the <i>offset</i> did not begin
87192		with a ' > ' was successful. By default, the <i>offset</i> shall be interpreted as an unsigned
87193		decimal number. With a leading 0x or 0X, the <i>offset</i> shall be interpreted as a
87194		hexadecimal number; otherwise, with a leading 0, the <i>offset</i> shall be interpreted as
87195		an octal number.
87196	<i>type</i>	The type of the value in the file to be tested. The type shall consist of the type
87197		specification characters d, s, and u, specifying signed decimal, string, and
87198		unsigned decimal, respectively.
87199		The <i>type</i> string shall be interpreted as the bytes from the file starting at the
87200		specified <i>offset</i> and including the same number of bytes specified by the <i>value</i> field.
87201		If insufficient bytes remain in the file past the <i>offset</i> to match the <i>value</i> field, the test
87202		shall fail.
87203		The type specification characters d and u can be followed by an optional unsigned
87204		decimal integer that specifies the number of bytes represented by the type. The
87205		type specification characters d and u can be followed by an optional C, S, I, or L,
87206		indicating that the value is of type char , short , int , or long , respectively.
87207		The default number of bytes represented by the type specifiers d, f, and u shall
87208		correspond to their respective C-language types as follows. If the system claims
87209		conformance to the C-Language Development Utilities option, those specifiers
87210		shall correspond to the default sizes used in the <i>c99</i> utility. Otherwise, the default
87211		sizes shall be implementation-defined.
87212		For the type specifier characters d and u, the default number of bytes shall
87213		correspond to the size of a basic integer type of the implementation. For these
87214		specifier characters, the implementation shall support values of the optional
87215		number of bytes to be converted corresponding to the number of bytes in the C-
87216		language types char , short , int , or long . These numbers can also be specified by an
87217		application as the characters C, S, I, and L, respectively. The byte order used when
87218		interpreting numeric values is implementation-defined, but shall correspond to the
87219		order in which a constant of the corresponding type is stored in memory on the
87220		system.
87221		All type specifiers, except for s, can be followed by a mask specifier of the form
87222		&number. The mask value shall be AND'ed with the value of the input file before
87223		the comparison with the <i>value</i> field of the line is made. By default, the mask shall
87224		be interpreted as an unsigned decimal number. With a leading 0x or 0X, the mask
87225		shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading
87226		0, the mask shall be interpreted as an unsigned octal number.
87227		The strings byte , short , long , and string shall also be supported as type fields,
87228		being interpreted as dC, dS, dL, and s, respectively.
87229	<i>value</i>	The <i>value</i> to be compared with the value from the file.
87230		If the specifier from the type field is s or string , then interpret the value as a string.
87231		Otherwise, interpret it as a number. If the value is a string, then the test shall
87232		succeed only when a string value exactly matches the bytes from the file.

87233

If the *value* is a string, it can contain the following sequences:

87234

\character The backslash-escape sequences as specified in XBD Table 5-1 (on page 108) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequence '\ ' (the <backslash> character followed by a <space> character) shall be recognized to represent a <space> character. The results of using any other character, other than an octal digit, following the backslash are unspecified.

87241

\octal Octal sequences that can be used to represent characters with specific coded values. An octal sequence shall consist of a backslash followed by the longest sequence of one, two, or three octal-digit characters (01234567).

87242

87243

87244

87245

87246

87247

87248

By default, any value that is not a string shall be interpreted as a signed decimal number. Any such value, with a leading 0x or 0X, shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading zero, the value shall be interpreted as an unsigned octal number.

87249

87250

87251

If the value is not a string, it can be preceded by a character indicating the comparison to be performed. Permissible characters and the comparisons they specify are as follows:

87252

= The test shall succeed if the value from the file equals the *value* field.

87253

< The test shall succeed if the value from the file is less than the *value* field.

87254

> The test shall succeed if the value from the file is greater than the *value* field.

87255

87256

& The test shall succeed if all of the set bits in the *value* field are set in the value from the file.

87257

87258

^ The test shall succeed if at least one of the set bits in the *value* field is not set in the value from the file.

87259

87260

x The test shall succeed if the file is large enough to contain a value of the type specified starting at the offset specified.

87261

message

The *message* to be printed if the test succeeds. The *message* shall be interpreted using the notation for the *printf* formatting specification; see *printf*. If the *value* field was a string, then the value from the file shall be the argument for the *printf* formatting specification; otherwise, the value from the file shall be the argument.

87262

87263

87264

EXIT STATUS

87265

The following exit values shall be returned:

87266

0 Successful completion.

87267

>0 An error occurred.

87268

APPLICATION USAGE

The *file* utility can only be required to guess at many of the file types because only exhaustive testing can determine some types with certainty. For example, binary data on some implementations might match the initial segment of an executable or a *tar* archive.

Note that the table indicates that the output contains the stated string. Systems may add text before or after the string. For executables, as an example, the machine architecture and various facts about how the file was link-edited may be included. Note also that on systems that recognize shell script files starting with "#!" as executable files, these may be identified as executable binary files rather than as shell scripts.

EXAMPLES

Determine whether an argument is a binary executable file:

```
file -- "$1" | grep -q ':. *executable' &&
  printf "%s is executable.\n" "$1"
```

RATIONALE

The `-f` option was omitted because the same effect can (and should) be obtained using the *xargs* utility.

Historical versions of the *file* utility attempt to identify the following types of files: symbolic link, directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler source, *nroff*/*troff*/*eqn*/*tbl* source *troff* output, shell script, C shell script, English text, ASCII text, various executables, APL workspace, compiled terminfo entries, and CURSES screen images. Only those types that are reasonably well specified in POSIX or are directly related to POSIX utilities are listed in the table.

Historical systems have used a "magic file" named `/etc/magic` to help identify file types. Because it is generally useful for users and scripts to be able to identify special file types, the `-m` flag and a portable format for user-created magic files has been specified. No requirement is made that an implementation of *file* use this method of identifying files, only that users be permitted to add their own classifying tests.

In addition, three options have been added to historical practice. The `-d` flag has been added to permit users to cause their tests to follow any default system tests. The `-i` flag has been added to permit users to test portably for regular files in shell scripts. The `-M` flag has been added to permit users to ignore any default system tests.

The POSIX.1-200x description of default system tests and the interaction between the `-d`, `-M`, and `-m` options did not clearly indicate that there were two types of "default system tests". The "position-sensitive tests" determine file types by looking for certain string or binary values at specific offsets in the file being examined. These position-sensitive tests were implemented in historical systems using the magic file described above. Some of these tests are now built into the *file* utility itself on some implementations so the output can provide more detail than can be provided by magic files. For example, a magic file can easily identify a **core** file on most implementations, but cannot name the program file that dropped the core. A magic file could produce output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1
```

but by building the test into the *file* utility, you could get output such as:

```
/home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'
```

These extended built-in tests are still to be treated as position-sensitive default system tests even if they are not listed in `/etc/magic` or any other magic file.

The context-sensitive default system tests were always built into the *file* utility. These tests looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and

87319 other computer language source files, and even plain text files. With the addition of the `-m` and
 87320 `-M` options the distinction between position-sensitive and context-sensitive default system tests
 87321 became important because the order of testing is important. The context-sensitive system default
 87322 tests should never be applied before any position-sensitive tests even if the `-d` option is specified
 87323 before a `-m` option or `-M` option due to the high probability that the context-sensitive system
 87324 default tests will incorrectly identify arbitrary text files as text files before position-sensitive tests
 87325 specified by the `-m` or `-M` option would be applied to give a more accurate identification.

87326 Leaving the meaning of `-M` – and `-m` – unspecified allows an existing prototype of these
 87327 options to continue to work in a backwards-compatible manner. (In that implementation, `-M` –
 87328 was roughly equivalent to `-d` in POSIX.1-200x.)

87329 The historical `-c` option was omitted as not particularly useful to users or portable shell scripts.
 87330 In addition, a reasonable implementation of the *file* utility would report any errors found each
 87331 time the magic file is read.

87332 The historical format of the magic file was the same as that specified by the Rationale in the
 87333 ISO POSIX-2:1993 standard for the *offset*, *value*, and *message* fields; however, it used less precise
 87334 type fields than the format specified by the current normative text. The new type field values are
 87335 a superset of the historical ones.

87336 The following is an example magic file:

```
87337 0 short      070707      cpio archive
87338 0 short      0143561    Byte-swapped cpio archive
87339 0 string     070707      ASCII cpio archive
87340 0 long       0177555    Very old archive
87341 0 short      0177545    Old archive
87342 0 short      017437     Old packed data
87343 0 string     \037\036   Packed data
87344 0 string     \377\037   Compacted data
87345 0 string     \037\235   Compressed data
87346 >2 byte&0x80 >0      Block compressed
87347 >2 byte&0x1f x        %d bits
87348 0 string     \032\001   Compiled Terminfo Entry
87349 0 short      0433       Curses screen image
87350 0 short      0434       Curses screen image
87351 0 string     <ar>       System V Release 1 archive
87352 0 string     !<arch>\n__SYMDEF Archive random library
87353 0 string     !<arch>    Archive
87354 0 string     ARF_BEGARF PHIGS clear text archive
87355 0 long       0x137A2950 Scalable OpenFont binary
87356 0 long       0x137A2951 Encrypted scalable OpenFont binary
```

87357 The use of a basic integer data type is intended to allow the implementation to choose a word
 87358 size commonly used by applications on that architecture.

87359 Earlier versions of this standard allowed for implementations with bytes other than eight bits,
 87360 but this has been modified in this version.

87361 FUTURE DIRECTIONS

87362 None.

87366

CHANGE HISTORY

87367

First released in Issue 4.

87368

Issue 6

87369

This utility is marked as part of the User Portability Utilities option.

87370

Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft standard.

87371

87372

IEEE PASC Interpretations 1003.2 #192 and #178 are applied.

87373

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to address ambiguities raised in defect reports.

87374

87375

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the Utility Syntax Guidelines.

87376

87377

87378

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/10 is applied, clarifying the specification characters.

87379

87380

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/11 is applied, allowing application developers to create portable magic files that can match characters in strings, and allowing common extensions found in existing implementations.

87381

87382

87383

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/12 is applied, removing text describing behavior on systems with bytes consisting of more than eight bits.

87384

87385

Issue 7

87386

SD5-XCU-ERN-4 is applied, adding further entries in the Notes column in [Table 4-8](#).

87387

The *file* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

87388

87389

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

87390

The EXAMPLES section is revised to correct an error with the pathname "\$1".

+

87391 **NAME**
87392 find — find files

87393 **SYNOPSIS**
87394 find [-H|-L] *path...* [*operand_expression...*]

87395 **DESCRIPTION**
87396 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,
87397 evaluating a Boolean expression composed of the primaries described in the OPERANDS section
87398 for each file encountered.

87399 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail
87400 due to path length limitations (unless a *path* operand specified by the application exceeds
87401 {PATH_MAX} requirements).

87402 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an
87403 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a
87404 diagnostic message to standard error and shall either recover its position in the hierarchy or
87405 terminate.

87406 **OPTIONS**
87407 The *find* utility shall conform to XBD [Section 12.2](#) (on page 201).

87408 The following options shall be supported by the implementation:

87409 **-H** Cause the file information and file type evaluated for each symbolic link
87410 encountered on the command line to be those of the file referenced by the link, and
87411 not the link itself. If the referenced file does not exist, the file information and type
87412 shall be for the link itself. File information for all symbolic links not on the
87413 command line shall be that of the link itself.

87414 **-L** Cause the file information and file type evaluated for each symbolic link to be
87415 those of the file referenced by the link, and not the link itself. If the referenced file
87416 does not exist, the file information and type shall be for the link itself.

87417 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered
87418 an error. The last option specified shall determine the behavior of the utility.

87419 **OPERANDS**
87420 The following operands shall be supported:

87421 The *path* operand is a pathname of a starting point in the directory hierarchy.

87422 The first operand that starts with a '-', or is a '!' or a '(', and all subsequent arguments shall
87423 be interpreted as an *expression* made up of the following primaries and operators. In the
87424 descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal
87425 integer optionally preceded by a plus ('+') or minus ('-') sign, as follows:

87426 **+n** More than *n*.

87427 **n** Exactly *n*.

87428 **-n** Less than *n*.

87429 The following primaries shall be supported:

87430 **-name** *pattern*

87431 The primary shall evaluate as true if the basename of the current pathname
87432 matches *pattern* using the pattern matching notation described in [Section 2.13](#) (on
87433 page 2278). The additional rules in [Section 2.13.3](#) (on page 2279) do not apply as +

- 87434 this is a matching operation, not an expansion.
- 87435 **-path** *pattern*
- 87436 The primary shall evaluate as true if the current pathname matches *pattern* using +
 87437 the pattern matching notation described in Section 2.13 (on page 2278). The +
 87438 additional rules in Section 2.13.3 (on page 2279) do not apply as this is a matching +
 87439 operation, not an expansion.
- 87440 **-nouser** The primary shall evaluate as true if the file belongs to a user ID for which the
 87441 *getpwuid()* function defined in the System Interfaces volume of POSIX.1-200x (or
 87442 equivalent) returns NULL.
- 87443 **-nogroup** The primary shall evaluate as true if the file belongs to a group ID for which the
 87444 *getgrgid()* function defined in the System Interfaces volume of POSIX.1-200x (or
 87445 equivalent) returns NULL.
- 87446 **-xdev** The primary shall always evaluate as true; it shall cause *find* not to continue
 87447 descending past directories that have a different device ID (*st_dev*, see the *stat()*
 87448 function defined in the System Interfaces volume of POSIX.1-200x). If any **-xdev**
 87449 primary is specified, it shall apply to the entire expression even if the **-xdev**
 87450 primary would not normally be evaluated.
- 87451 **-prune** The primary shall always evaluate as true; it shall cause *find* not to descend the
 87452 current pathname if it is a directory. If the **-depth** primary is specified, the **-prune**
 87453 primary shall have no effect.
- 87454 **-perm** [-]*mode*
- 87455 The *mode* argument is used to represent file mode bits. It shall be identical in
 87456 format to the *symbolic_mode* operand described in *chmod*, and shall be interpreted
 87457 as follows. To start, a template shall be assumed with all file mode bits cleared. An
 87458 *op* symbol of '+' shall set the appropriate mode bits in the template; '-' shall
 87459 clear the appropriate bits; '=' shall set the appropriate mode bits, without regard
 87460 to the contents of the file mode creation mask of the process. The *op* symbol of '-'
 87461 cannot be the first character of *mode*; this avoids ambiguity with the optional
 87462 leading hyphen. Since the initial mode is all bits off, there are not any symbolic
 87463 modes that need to use '-' as the first character.
- 87464 If the hyphen is omitted, the primary shall evaluate as true when the file
 87465 permission bits exactly match the value of the resulting template.
- 87466 Otherwise, if *mode* is prefixed by a hyphen, the primary shall evaluate as true if at
 87467 least all the bits in the resulting template are set in the file permission bits.
- 87468 **-perm** [-]*onum*
- 87469 If the hyphen is omitted, the primary shall evaluate as true when the file mode bits
 87470 exactly match the value of the octal number *onum* (see the description of the octal
 87471 *mode* in *chmod*). Otherwise, if *onum* is prefixed by a hyphen, the primary shall
 87472 evaluate as true if at least all of the bits specified in *onum* are set. In both cases, the
 87473 behavior is unspecified when *onum* exceeds 07777.
- 87474 **-type** *c*
- 87475 The primary shall evaluate as true if the type of the file is *c*, where *c* is 'b', 'c',
 87476 'd', 'l', 'p', 'f', or 's' for block special file, character special file, directory,
 symbolic link, FIFO, regular file, or socket, respectively.
- 87477 **-links** *n*
- 87478 The primary shall evaluate as true if the file has *n* links.
- 87479 **-user** *uname*
- 87480 The primary shall evaluate as true if the file belongs to the user *uname*. If *uname* is
 a decimal integer and the *getpwnam()* (or equivalent) function does not return a
 valid user name, *uname* shall be interpreted as a user ID.

- 87481 **-group** *gname*
- 87482 The primary shall evaluate as true if the file belongs to the group *gname*. If *gname*
- 87483 is a decimal integer and the *getgrnam()* (or equivalent) function does not return a
- 87484 valid group name, *gname* shall be interpreted as a group ID.
- 87485 **-size** *n*[*c*]
- 87486 The primary shall evaluate as true if the file size in bytes, divided by 512 and
- 87487 rounded up to the next integer, is *n*. If *n* is followed by the character '*c*', the size
- shall be in bytes.
- 87488 **-atime** *n*
- 87489 The primary shall evaluate as true if the file access time subtracted from the
- initialization time, divided by 86 400 (with any remainder discarded), is *n*.
- 87490 **-ctime** *n*
- 87491 The primary shall evaluate as true if the time of last change of file status
- 87492 information subtracted from the initialization time, divided by 86 400 (with any
- remainder discarded), is *n*.
- 87493 **-mtime** *n*
- 87494 The primary shall evaluate as true if the file modification time subtracted from the
- initialization time, divided by 86 400 (with any remainder discarded), is *n*.
- 87495 **-exec** *utility_name* [*argument ...*];
- 87496 **-exec** *utility_name* [*argument ...*] {} +
- 87497 The end of the primary expression shall be punctuated by a semicolon or by a plus
- 87498 sign. Only a plus sign that follows an argument containing the two characters
- 87499 "{}" shall punctuate the end of the primary expression. Other uses of the plus
- 87500 sign shall not be treated as special.
- 87501 If the primary expression is punctuated by a semicolon, the utility *utility_name*
- 87502 shall be invoked once for each pathname and the primary shall evaluate as true if
- 87503 the utility returns a zero value as exit status. A *utility_name* or *argument* containing
- 87504 only the two characters "{}" shall be replaced by the current pathname.
- 87505 If the primary expression is punctuated by a plus sign, the primary shall always
- 87506 evaluate as true, and the pathnames for which the primary is evaluated shall be
- 87507 aggregated into sets. The utility *utility_name* shall be invoked once for each set of
- 87508 aggregated pathnames. Each invocation shall begin after the last pathname in the
- 87509 set is aggregated, and shall be completed before the *find* utility exits and before the
- 87510 first pathname in the next set (if any) is aggregated for this primary, but it is
- 87511 otherwise unspecified whether the invocation occurs before, during, or after the
- 87512 evaluations of other primaries. If any invocation returns a non-zero value as exit
- 87513 status, the *find* utility shall return a non-zero exit status. An argument containing
- 87514 only the two characters "{}" shall be replaced by the set of aggregated
- 87515 pathnames, with each pathname passed as a separate argument to the invoked
- 87516 utility in the same order that it was aggregated. The size of any set of two or more
- 87517 pathnames shall be limited such that execution of the utility does not cause the
- 87518 system's {ARG_MAX} limit to be exceeded. If more than one argument containing
- 87519 only the two characters "{}" is present, the behavior is unspecified.
- 87520 If a *utility_name* or *argument* string contains the two characters "{}", but not just
- 87521 the two characters "{}", it is implementation-defined whether *find* replaces those
- 87522 two characters or uses the string without change. The current directory for the
- 87523 invocation of *utility_name* shall be the same as the current directory when the *find*
- 87524 utility was started. If the *utility_name* names any of the special built-in utilities (see
- 87525 Section 2.14, on page 2280), the results are undefined.
- 87526 **-ok** *utility_name* [*argument ...*];
- 87527 The **-ok** primary shall be equivalent to **-exec**, except that the use of a plus sign to
- 87528 punctuate the end of the primary expression need not be supported, and *find* shall
- 87529 request affirmation of the invocation of *utility_name* using the current file as an
- 87530 argument by writing to standard error as described in the STDERR section. If the

- 87531 response on standard input is affirmative, the utility shall be invoked. Otherwise,
87532 the command shall not be invoked and the value of the **-ok** operand shall be false.
- 87533 **-print** The primary shall always evaluate as true; it shall cause the current pathname to
87534 be written to standard output.
- 87535 **-newer file** The primary shall evaluate as true if the modification time of the current file is
87536 more recent than the modification time of the file named by the pathname *file*.
- 87537 **-depth** The primary shall always evaluate as true; it shall cause descent of the directory
87538 hierarchy to be done so that all entries in a directory are acted on before the
87539 directory itself. If a **-depth** primary is not specified, all entries in a directory shall
87540 be acted on after the directory itself. If any **-depth** primary is specified, it shall
87541 apply to the entire expression even if the **-depth** primary would not normally be
87542 evaluated.

87543 The primaries can be combined using the following operators (in order of decreasing
87544 precedence):

87545 (*expression*) True if *expression* is true.

87546 **!expression** Negation of a primary; the unary NOT operator.

87547 *expression* [**-a**] *expression*

87548 Conjunction of primaries; the AND operator is implied by the juxtaposition of two
87549 primaries or made explicit by the optional **-a** operator. The second expression shall
87550 not be evaluated if the first expression is false.

87551 *expression* **-o** *expression*

87552 Alternation of primaries; the OR operator. The second expression shall not be
87553 evaluated if the first expression is true.

87554 If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given
87555 expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression
87556 shall be effectively replaced by:

87557 (*given_expression*) **-print**

87558 The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only
87559 once.

87560 STDIN

87561 If the **-ok** primary is used, the response shall be read from the standard input. An entire line
87562 shall be read as the response. Otherwise, the standard input shall not be used.

87563 INPUT FILES

87564 None.

87565 ENVIRONMENT VARIABLES

87566 The following environment variables shall affect the execution of *find*:

87567 **LANG** Provide a default value for the internationalization variables that are unset or null. |
87568 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
87569 variables used to determine the values of locale categories.)

87570 **LC_ALL** If set to a non-empty string value, override the values of all the other
87571 internationalization variables.

87572 **LC_COLLATE**

87573 Determine the locale for the behavior of ranges, equivalence classes, and multi-
87574 character collating elements used in the pattern matching notation for the **-n**
87575 option and in the extended regular expression defined for the **yesexpr** locale
87576 keyword in the **LC_MESSAGES** category.

87577 *LC_CTYPE* This variable determines the locale for the interpretation of sequences of bytes of
 87578 text data as characters (for example, single-byte as opposed to multi-byte
 87579 characters in arguments), the behavior of character classes within the pattern
 87580 matching notation used for the **-n** option, and the behavior of character classes
 87581 within regular expressions used in the extended regular expression defined for the
 87582 **yesexpr** locale keyword in the *LC_MESSAGES* category.

87583 *LC_MESSAGES*
 87584 Determine the locale for the processing of affirmative responses that should be
 87585 used to affect the format and contents of diagnostic messages written to standard
 87586 error.

87587 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

87588 *PATH* Determine the location of the *utility_name* for the **-exec** and **-ok** primaries, as
 87589 described in XBD [Chapter 8](#) (on page 159).

87590 ASYNCHRONOUS EVENTS

87591 Default.

87592 STDOUT

87593 The **-print** primary shall cause the current pathnames to be written to standard output. The
 87594 format shall be:

87595 "%s\n", <path>

87596 STDERR

87597 The **-ok** primary shall write a prompt to standard error containing at least the *utility_name* to be
 87598 invoked and the current pathname. In the POSIX locale, the last non-<blank> in the prompt shall
 87599 be ' ? '. The exact format used is unspecified.

87600 Otherwise, the standard error shall be used only for diagnostic messages.

87601 OUTPUT FILES

87602 None.

87603 EXTENDED DESCRIPTION

87604 None.

87605 EXIT STATUS

87606 The following exit values shall be returned:

87607 0 All *path* operands were traversed successfully.

87608 >0 An error occurred.

87609 CONSEQUENCES OF ERRORS

87610 Default.

87611 APPLICATION USAGE

87612 When used in operands, pattern matching notation, semicolons, opening parentheses, and
 87613 closing parentheses are special to the shell and must be quoted (see [Section 2.2](#), on page 2246).

87614 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary
 87615 using the octal number argument form. Since this bit is not defined by this volume of
 87616 POSIX.1-200x, applications must not assume that it actually refers to the traditional sticky bit.

87617 EXAMPLES

87618 1. The following commands are equivalent:

87619 find .

87620 find . -print

- 87621 They both write out the entire directory hierarchy from the current directory.
- 87622 2. The following command:
- 87623 `find / \(-name tmp -o -name '*.xx' \) -atime +7 -exec rm {} \;`
- 87624 removes all files named **tmp** or ending in **.xx** that have not been accessed for seven or
- 87625 more 24-hour periods.
- 87626 3. The following command:
- 87627 `find . -perm -o+w,+s`
- 87628 prints (**-print** is assumed) the names of all files in or below the current directory, with all
- 87629 of the file permission bits **S_ISUID**, **S_ISGID**, and **S_IWOTH** set.
- 87630 4. The following command:
- 87631 `find . -name SCCS -prune -o -print`
- 87632 recursively prints pathnames of all files in the current directory and below, but skips
- 87633 directories named **SCCS** and files in them.
- 87634 5. The following command:
- 87635 `find . -print -name SCCS -prune`
- 87636 behaves as in the previous example, but prints the names of the **SCCS** directories.
- 87637 6. The following command is roughly equivalent to the **-nt** extension to *test*:
- 87638 `if [-n "$(find file1 -prune -newer file2)"]; then`
- 87639 `printf %s\\n "file1 is newer than file2"`
- 87640 `fi`
- 87641 7. The descriptions of **-atime**, **-ctime**, and **-mtime** use the terminology *n* “86 400 second
- 87642 periods (days)”. For example, a file accessed at 23:59 is selected by:
- 87643 `find . -atime -1 -print`
- 87644 at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight
- 87645 boundary between days has no effect on the 24-hour calculation.
- 87646 8. The following command:
- 87647 `find . ! -name . -prune -name '*.old' -exec \`
- 87648 `sh -c 'mv "$@" ../old/' sh {} +`
- 87649 performs the same task as:
- 87650 `mv /*.old ../old`
- 87651 while avoiding an “Argument list too long” error if there are a large number of files
- 87652 ending with **.old** (and avoiding “No such file or directory” errors if no files match **/*.old**
- 87653 or **/*.old**).
- 87654 The alternative:
- 87655 `find . ! -name . -prune -name '*.old' -exec mv {} ../old/ \;`
- 87656 is less efficient if there are many files to move because it executes one *mv* command per
- 87657 file.
- 87658 9. On systems configured to mount removable media on directories under **/media**, the +
- 87659 following command searches the file hierarchy for files larger than 100 000 KB without +
- 87660 searching any mounted removable media: +
- 87661 `find / -path /media -prune -o -size +200000 -print` +

RATIONALE

87662

87663

87664

The **-a** operator was retained as an optional operator for compatibility with historical shell scripts, even though it is redundant with expression concatenation.

87665

87666

87667

87668

87669

The descriptions of the **'-'** modifier on the *mode* and *onum* arguments to the **-perm** primary agree with historical practice on BSD and System V implementations. System V and BSD documentation both describe it in terms of checking additional bits; in fact, it uses the same bits, but checks for having at least all of the matching bits set instead of having exactly the matching bits set.

87670

87671

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because:

87672

87673

- Implementations may desire more descriptive prompts than those used on historical implementations.

87674

87675

- Since the historical prompt strings do not terminate with <newline>s, there is no portable way for another program to interact with the prompts of this utility via pipes.

87676

87677

Therefore, an application using this prompting option relies on the system to provide the most suitable dialog directly with the user, based on the general guidelines specified.

87678

87679

The **-name** *file* operand was changed to use the shell pattern matching notation so that *find* is consistent with other utilities using pattern matching.

87680

87681

87682

87683

The **-size** operand refers to the size of a file, rather than the number of blocks it may occupy in the file system. The intent is that the *st_size* field defined in the System Interfaces volume of POSIX.1-200x should be used, not the *st_blocks* found in historical implementations. There are at least two reasons for this:

87684

87685

87686

1. In both System V and BSD, *find* only uses *st_size* in size calculations for the operands specified by this volume of POSIX.1-200x. (BSD uses *st_blocks* only when processing the **-ls** primary.)

87687

87688

87689

87690

2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls* utility for the output from the **-l** option. (In both System V and BSD, *ls* uses *st_size* for the **-l** option size field and uses *st_blocks* for the *ls -s* calculations. This volume of POSIX.1-200x does not specify *ls -s*.)

87691

87692

87693

87694

87695

87696

The descriptions of **-atime**, **-ctime**, and **-mtime** were changed from the SVID description of *n* "days" to *n* being the result of the integer division of the time difference in seconds by 86 400. The description is also different in terms of the exact timeframe for the *n* case (*versus* the *+n* or *-n*), but it matches all known historical implementations. It refers to one 86 400 second period in the past, not any time from the beginning of that period to the current time. For example, **-atime 2** is true if the file was accessed any time in the period from 72 hours to 48 hours ago.

87697

87698

87699

87700

87701

87702

Historical implementations do not modify "`{ }`" when it appears as a substring of an **-exec** or **-ok** *utility_name* or argument string. There have been numerous user requests for this extension, so this volume of POSIX.1-200x allows the desired behavior. At least one recent implementation does support this feature, but encountered several problems in managing memory allocation and dealing with multiple occurrences of "`{ }`" in a string while it was being developed, so it is not yet required behavior.

87703

87704

87705

87706

87707

Assuming the presence of **-print** was added to correct a historical pitfall that plagues novice users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers agreed that adding **-print** as a default expression was the correct decision and have added the fast *find* functionality within a new utility called *locate*.

87708

87709

Historically, the **-L** option was implemented using the primary **-follow**. The **-H** and **-L** options were added for two reasons. First, they offer a finer granularity of control and consistency with

87710 other programs that walk file hierarchies. Second, the **-follow** primary always evaluated to true.
 87711 As they were historically really global variables that took effect before the traversal began, some
 87712 valid expressions had unexpected results. An example is the expression **-print -o -follow**.
 87713 Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow**
 87714 would never be evaluated. This was never the case. Historical practice for the **-follow** primary,
 87715 however, is not consistent. Some implementations always follow symbolic links on the
 87716 command line whether **-follow** is specified or not. Others follow symbolic links on the
 87717 command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L**
 87718 options, but scripts using the current **-follow** primary would be broken if the **-follow** option is
 87719 specified to work either way.

87720 Since the **-L** option resolves all symbolic links and the **-type l** primary is true for symbolic links
 87721 that still exist after symbolic links have been resolved, the command:

```
87722 find -L . -type l
```

87723 prints a list of symbolic links reachable from the current directory that do not resolve to
 87724 accessible files.

87725 A feature of SVR4's *find* utility was the **-exec** primary's **+** terminator. This allowed filenames
 87726 containing special characters (especially <newline>s) to be grouped together without the
 87727 problems that occur if such filenames are piped to *xargs*. Other implementations have added
 87728 other ways to get around this problem, notably a **-print0** primary that wrote filenames with a
 87729 null byte terminator. This was considered here, but not adopted. Using a null terminator meant
 87730 that any utility that was going to process *find*'s **-print0** output had to add a new option to parse
 87731 the null terminators it would now be reading.

87732 The "**-exec ... { } +**" syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210.
 87733 It should be noted that this is an incompatible change to the ISO/IEC 9899:1999 standard. For
 87734 example, the following command prints all files with a '-' after their name if they are regular
 87735 files, and a '+' otherwise:

```
87736 find / -type f -exec echo { } - ';' -o -exec echo { } + ';' |
```

87737 The change invalidates usage like this. Even though the previous standard stated that this usage
 87738 would work, in practice many did not support it and the standard developers felt it better to
 87739 now state that this was not allowable.

87740 FUTURE DIRECTIONS

87741 None.

87747 CHANGE HISTORY

87748 First released in Issue 2.

87749 Issue 5

87750 The FUTURE DIRECTIONS section is added.

87751 Issue 6

87752 The following new requirements on POSIX implementations derive from alignment with the
 87753 Single UNIX Specification:

- 87754 • The **-perm [-]onum** primary is supported.

87755 The *find* utility is aligned with the IEEE P1003.2b draft standard, to include processing of

87756	symbolic links and changes to the description of the atime , ctime , and mtime operands.	
87757	IEEE PASC Interpretation 1003.2 #210 is applied, extending the -exec operand.	
87758	IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/13 is applied, updating the RATIONALE	
87759	section to be consistent with the normative text.	
87760	Issue 7	
87761	SD5-XCU-ERN-48 is applied, clarifying the -L option in the case that the referenced file does not	
87762	exist.	
87763	SD5-XCU-ERN-89 is applied, updating the OPERANDS section.	
87764	SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.	
87765	SD5-XCU-ERN-117 is applied, clarifying the -perm operand.	
87766	SD5-XCU-ERN-122 is applied, adding a new EXAMPLE.	
87767	The description of the -name primary is revised and a new example added.	+

87768 **NAME**
 87769 fold — filter for folding lines

87770 **SYNOPSIS**
 87771 fold [-bs] [-w *width*] [*file...*]

87772 **DESCRIPTION**
 87773 The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a
 87774 maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be
 87775 broken by the insertion of a <newline> such that each output line (referred to later in this section
 87776 as a *segment*) is the maximum width possible that does not exceed the specified number of
 87777 column positions (or bytes). A line shall not be broken in the middle of a character. The behavior
 87778 is undefined if *width* is less than the number of columns any single character in the input would
 87779 occupy.

87780 If the <carriage-return>s, <backspace>s, or <tab>s are encountered in the input, and the **-b**
 87781 option is not specified, they shall be treated specially:

87782 <backspace> The current count of line width shall be decremented by one, although the count
 87783 never shall become negative. The *fold* utility shall not insert a <newline>
 87784 immediately before or after any <backspace>.

87785 <carriage-return>
 87786 The current count of line width shall be set to zero. The *fold* utility shall not insert a
 87787 <newline> immediately before or after any <carriage-return>.

87788 <tab> Each <tab> encountered shall advance the column position pointer to the next tab
 87789 stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

87790 **OPTIONS**
 87791 The *fold* utility shall conform to XBD [Section 12.2](#) (on page 201).

87792 The following options shall be supported:

87793 **-b** Count *width* in bytes rather than column positions.

87794 **-s** If a segment of a line contains a <blank> within the first *width* column positions (or
 87795 bytes), break the line after the last such <blank> meeting the width constraints. If
 87796 there is no <blank> meeting the requirements, the **-s** option shall have no effect for
 87797 that output segment of the input line.

87798 **-w *width*** Specify the maximum line length, in column positions (or bytes if **-b** is specified).
 87799 The results are unspecified if *width* is not a positive decimal number. The default
 87800 value shall be 80.

87801 **OPERANDS**
 87802 The following operand shall be supported:

87803 *file* A pathname of a text file to be folded. If no *file* operands are specified, the standard
 87804 input shall be used.

87805 **STDIN**
 87806 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES
 87807 section.

87808 **INPUT FILES**

87809 If the **-b** option is specified, the input files shall be text files except that the lines are not limited
 87810 to {LINE_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

87811 **ENVIRONMENT VARIABLES**

87812 The following environment variables shall affect the execution of *fold*:

87813 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 87814 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 87815 variables used to determine the values of locale categories.)

87816 **LC_ALL** If set to a non-empty string value, override the values of all the other
 87817 internationalization variables.

87818 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 87819 characters (for example, single-byte as opposed to multi-byte characters in
 87820 arguments and input files), and for the determination of the width in column
 87821 positions each character would occupy on a constant-width font output device.

87822 **LC_MESSAGES**
 87823 Determine the locale that should be used to affect the format and contents of
 87824 diagnostic messages written to standard error.

87825 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

87826 **ASYNCHRONOUS EVENTS**

87827 Default.

87828 **STDOUT**

87829 The standard output shall be a file containing a sequence of characters whose order shall be
 87830 preserved from the input files, possibly with inserted <newline>s.

87831 **STDERR**

87832 The standard error shall be used only for diagnostic messages.

87833 **OUTPUT FILES**

87834 None.

87835 **EXTENDED DESCRIPTION**

87836 None.

87837 **EXIT STATUS**

87838 The following exit values shall be returned:

87839 0 All input files were processed successfully.

87840 >0 An error occurred.

87841 **CONSEQUENCES OF ERRORS**

87842 Default.

87843 **APPLICATION USAGE**

87844 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths.
 87845 The *cut* utility should be used when the number of lines (or records) needs to remain constant.
 87846 The *fold* utility should be used when the contents of long lines need to be kept contiguous.

87847 The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines
 87848 wider than the printer is able to print (usually 80 or 132 column positions).

87849 **EXAMPLES**

87850 An example invocation that submits a file of possibly long lines to the printer (under the
87851 assumption that the user knows the line width of the printer to be assigned by *lp*):

87852 `fold -w 132 bigfile | lp`

87853 **RATIONALE**

87854 Although terminal input in canonical processing mode requires the erase character (frequently
87855 set to <backspace>) to erase the previous character (not byte or column position), terminal
87856 output is not buffered and is extremely difficult, if not impossible, to parse correctly; the
87857 interpretation depends entirely on the physical device that actually displays/prints/stores the
87858 output. In all known internationalized implementations, the utilities producing output for
87859 mixed column-width output assume that a <backspace> backs up one column position and
87860 outputs enough <backspace>s to return to the start of the character when <backspace> is used to
87861 provide local line motions to support underlining and boldening operations. Since *fold*
87862 without the **-b** option is dealing with these same constraints, <backspace> is always treated as
87863 backing up one column position rather than backing up one character.

87864 Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column
87865 position when written out. This is no longer always true. Since the most common usage of *fold* is
87866 believed to be folding long lines for output to limited-length output devices, this capability was
87867 preserved as the default case. The **-b** option was added so that applications could *fold* files with
87868 arbitrary length lines into text files that could then be processed by the standard utilities. Note
87869 that although the width for the **-b** option is in bytes, a line is never split in the middle of a
87870 character. (It is unspecified what happens if a width is specified that is too small to hold a single
87871 character found in the input followed by a <newline>.)

87872 The tab stops are hardcoded to be every eighth column to meet historical practice. No new
87873 method of specifying other tab stops was invented.

87874 **FUTURE DIRECTIONS**

87875 None.

87885

NAME

87886

fort77 — FORTRAN compiler (**FORTRAN**)

87887

SYNOPSIS

87888

FD `fort77 [-c] [-g] [-L directory]... [-O optlevel] [-o outfile] [-s]`

87889

`[-w] operand...`

87890

DESCRIPTION

87891

The *fort77* utility is the interface to the FORTRAN compilation system; it shall accept the full FORTRAN-77 language defined by the ANSI X3.9-1978 standard. The system conceptually consists of a compiler and link editor. The files referenced by *operands* are compiled and linked to produce an executable file. It is unspecified whether the linking occurs entirely within the operation of *fort77*; some implementations may produce objects that are not fully resolved until the file is executed.

87892

87893

87894

87895

87896

87897

If the `-c` option is present, for all pathname operands of the form *file.f*, the files:

87898

```
$(basename pathname.f) .o
```

87899

shall be created or overwritten as the result of successful compilation. If the `-c` option is not specified, it is unspecified whether such `.o` files are created or deleted for the *file.f* operands.

87900

87901

If there are no options that prevent link editing (such as `-c`) and all operands compile and link without error, the resulting executable file shall be written into the file named by the `-o` option (if present) or to the file **a.out**. The executable file shall be created as specified in the System Interfaces volume of POSIX.1-200x, except that the file permissions shall be set to:

87902

87903

87904

87905

```
S_IRWXO | S_IRWXG | S_IRWXU
```

87906

and that the bits specified by the *umask* of the process shall be cleared.

87907

OPTIONS

87908

The *fort77* utility shall conform to XBD [Section 12.2](#) (on page 201), except that:

87909

- The `-l` *library* operands have the format of options, but their position within a list of operands affects the order in which libraries are searched.

87910

87911

- The order of specifying the multiple `-L` options is significant.

87912

- Conforming applications shall specify each option separately; that is, grouping option letters (for example, `-cg`) need not be recognized by all implementations.

87913

87914

The following options shall be supported:

87915

`-c` Suppress the link-edit phase of the compilation, and do not remove any object files that are produced.

87916

87917

`-g` Produce symbolic information in the object or executable files; the nature of this information is unspecified, and may be modified by implementation-defined interactions with other options.

87918

87919

87920

`-s` Produce object or executable files, or both, from which symbolic and other information not required for proper execution using the *exec* family of functions defined in the System Interfaces volume of POSIX.1-200x has been removed (stripped). If both `-g` and `-s` options are present, the action taken is unspecified.

87921

87922

87923

87924

`-o outfile` Use the pathname *outfile*, instead of the default **a.out**, for the executable file produced. If the `-o` option is present with `-c`, the result is unspecified.

87925

- 87926 **-L *directory*** Change the algorithm of searching for the libraries named in **-I** operands to look in
87927 the directory named by the *directory* pathname before looking in the usual places.
87928 Directories named in **-L** options shall be searched in the specified order. At least
87929 ten instances of this option shall be supported in a single *fort77* command
87930 invocation. If a directory specified by a **-L** option contains a file named **libf.a**, the
87931 results are unspecified.
- 87932 **-O *optlevel*** Specify the level of code optimization. If the *optlevel* option-argument is the digit
87933 '0', all special code optimizations shall be disabled. If it is the digit '1', the
87934 nature of the optimization is unspecified. If the **-O** option is omitted, the nature of
87935 the system's default optimization is unspecified. It is unspecified whether code
87936 generated in the presence of the **-O 0** option is the same as that generated when
87937 **-O** is omitted. Other *optlevel* values may be supported.
- 87938 **-w** Suppress warnings.
- 87939 Multiple instances of **-L** options can be specified.

OPERANDS

87941 An *operand* is either in the form of a pathname or the form **-I *library***. At least one operand of the
87942 pathname form shall be specified. The following operands shall be supported:

- 87943 ***file.f*** The pathname of a FORTRAN source file to be compiled and optionally passed to
87944 the link editor. The filename operand shall be of this form if the **-c** option is used.
- 87945 ***file.a*** A library of object files typically produced by *ar*, and passed directly to the link
87946 editor. Implementations may recognize implementation-defined suffixes other
87947 than **.a** as denoting object file libraries.
- 87948 ***file.o*** An object file produced by *fort77 -c* and passed directly to the link editor.
87949 Implementations may recognize implementation-defined suffixes other than **.o** as
87950 denoting object files.

87951 The processing of other files is implementation-defined.

- 87952 **-I *library*** (The letter ell.) Search the library named:
87953 **lib*library*.a**
- 87954 A library is searched when its name is encountered, so the placement of a **-I**
87955 operand is significant. Several standard libraries can be specified in this manner, as
87956 described in the EXTENDED DESCRIPTION section. Implementations may
87957 recognize implementation-defined suffixes other than **.a** as denoting libraries.

STDIN

87958 Not used.

INPUT FILES

87961 The input file shall be one of the following: a text file containing FORTRAN source code; an
87962 object file in the format produced by *fort77 -c*; or a library of object files, in the format produced
87963 by archiving zero or more object files, using *ar*. Implementations may supply additional utilities
87964 that produce files in these formats. Additional input files are implementation-defined.

87965 A **<tab>** encountered within the first six characters on a line of source code shall cause the
87966 compiler to interpret the following character as if it were the seventh character on the line (that
87967 is, in column 7).

ENVIRONMENT VARIABLES

87968 The following environment variables shall affect the execution of *fort77*:

87970		<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)
87971			
87972			
87973		<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
87974			
87975		<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).
87976			
87977			
87978		<i>LC_MESSAGES</i>	
87979			Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
87980			
87981	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
87982		<i>TMPDIR</i>	Determine the pathname that should override the default directory for temporary files, if any.
87983			

ASYNCHRONOUS EVENTS

Default.

STDOUT

Not used.

STDERR

The standard error shall be used only for diagnostic messages. If more than one *file* operand ending in *.f* (or possibly other unspecified suffixes) is given, for each such file:

"%s:\n", <file>

may be written to allow identification of the diagnostic message with the appropriate input file.

This utility may produce warning messages about certain conditions that do not warrant returning an error (non-zero) exit value.

OUTPUT FILES

Object files, listing files, and executable files shall be produced in unspecified formats.

EXTENDED DESCRIPTION**Standard Libraries**

The *fort77* utility shall recognize the following *-l* operand for the standard library:

-l f This library contains all functions referenced in the ANSI X3.9-1978 standard. This operand shall not be required to be present to cause a search of this library.

In the absence of options that inhibit invocation of the link editor, such as *-c*, the *fort77* utility shall cause the equivalent of a *-l f* operand to be passed to the link editor as the last *-l* operand, causing it to be searched after all other object files and libraries are loaded.

It is unspecified whether the library *libf.a* exists as a regular file. The implementation may accept as *-l* operands names of objects that do not exist as regular files.

88007

External Symbols

88008

The FORTRAN compiler and link editor shall support the significance of external symbols up to a length of at least 31 bytes; case folding is permitted. The action taken upon encountering symbols exceeding the implementation-defined maximum symbol length is unspecified.

88009

88010

88011

The compiler and link editor shall support a minimum of 511 external symbols per source or object file, and a minimum of 4095 external symbols total. A diagnostic message is written to standard output if the implementation-defined limit is exceeded; other actions are unspecified.

88012

88013

88014

EXIT STATUS

88015

The following exit values shall be returned:

88016

0 Successful compilation or link edit.

88017

>0 An error occurred.

88018

CONSEQUENCES OF ERRORS

88019

When *fort77* encounters a compilation error, it shall write a diagnostic to standard error and continue to compile other source code operands. It shall return a non-zero exit status, but it is implementation-defined whether an object module is created. If the link edit is unsuccessful, a diagnostic message shall be written to standard error, and *fort77* shall exit with a non-zero status.

88020

88021

88022

88023

APPLICATION USAGE

88024

None.

88025

EXAMPLES

88026

The following usage example compiles **xyz.f** and creates the executable file **foo**:

88027

```
fort77 -o foo xyz.f
```

88028

The following example compiles **xyz.f** and creates the object file **xyz.o**:

88029

```
fort77 -c xyz.f
```

88030

The following example compiles **xyz.f** and creates the executable file **a.out**:

88031

```
fort77 xyz.f
```

88032

The following example compiles **xyz.f**, links it with **b.o**, and creates the executable **a.out**:

88033

```
fort77 xyz.f b.o
```

88034

RATIONALE

88035

The name of this utility was chosen as *fort77* to parallel the renaming of the C compiler. The name *f77* was not chosen to avoid problems with historical implementations. The ANSI X3.9-1978 standard was selected as a normative reference because the ISO/IEC version of FORTRAN-77 has been superseded by the ISO/IEC 1539:1990 standard (Fortran-90).

88036

88037

88038

88039

The file inclusion and symbol definition **#define** mechanisms used by the *c99* utility were not included in this volume of POSIX.1-200x—even though they are commonly implemented—since there is no requirement that the FORTRAN compiler use the C preprocessor.

88040

88041

88042

The **-onetrip** option was not included in this volume of POSIX.1-200x, even though many historical compilers support it, because it is derived from FORTRAN-66; it is an anachronism that should not be perpetuated.

88043

88044

88045

Some implementations produce compilation listings. This aspect of FORTRAN has been left unspecified because there was controversy concerning the various methods proposed for implementing it: a **-V** option overlapped with historical vendor practice and a naming convention of creating files with **.I** suffixes collided with historical *lex* file naming practice.

88046

88047

88048

88049

There is no **-I** option in this version of this volume of POSIX.1-200x to specify a directory for file inclusion. An **INCLUDE** directive has been a part of the Fortran-90 discussions, but an interface

88050

88051 supporting that standard is not in the current scope.

88052 It is noted that many FORTRAN compilers produce an object module even when compilation
88053 errors occur; during a subsequent compilation, the compiler may patch the object module rather
88054 than recompiling all the code. Consequently, it is left to the implementor whether or not an
88055 object file is created.

88056 A reference to MIL-STD-1753 was removed from an early proposal in response to a request from
88057 the POSIX FORTRAN-binding standard developers. It was not the intention of the standard
88058 developers to require certification of the FORTRAN compiler, and IEEE Std 1003.9-1992 does not
88059 specify the military standard or any special preprocessing requirements. Furthermore, use of
88060 that document would have been inappropriate for an international standard.

88061 The specification of optimization has been subject to changes through early proposals. At one
88062 time, `-O` and `-N` were Booleans: optimize and do not optimize (with an unspecified default).
88063 Some historical practice led this to be changed to:

88064 `-O 0` No optimization.

88065 `-O 1` Some level of optimization.

88066 `-O n` Other, unspecified levels of optimization.

88067 It is not always clear whether “good code generation” is the same thing as optimization. Simple
88068 optimizations of local actions do not usually affect the semantics of a program. The `-O 0` option
88069 has been included to accommodate the very particular nature of scientific calculations in a
88070 highly optimized environment; compilers make errors. Some degree of optimization is expected,
88071 even if it is not documented here, and the ability to shut it off completely could be important
88072 when porting an application. An implementation may treat `-O 0` as “do less than normal” if it
88073 wishes, but this is only meaningful if any of the operations it performs can affect the semantics
88074 of a program. It is highly dependent on the implementation whether doing less than normal is
88075 logical. It is not the intent of the `-O 0` option to ask for inefficient code generation, but rather to
88076 assure that any semantically visible optimization is suppressed.

88077 The specification of standard library access is consistent with the C compiler specification.
88078 Implementations are not required to have `/usr/lib/libf.a`, as many historical implementations do,
88079 but if not they are required to recognize `f` as a token.

88080 External symbol size limits are in normative text; conforming applications need to know these
88081 limits. However, the minimum maximum symbol length should be taken as a constraint on a
88082 conforming application, not on an implementation, and consequently the action taken for a
88083 symbol exceeding the limit is unspecified. The minimum size for the external symbol table was
88084 added for similar reasons.

88085 The CONSEQUENCES OF ERRORS section clearly specifies the behavior of the compiler when
88086 compilation or link-edit errors occur. The behavior of several historical implementations was
88087 examined, and the choice was made to be silent on the status of the executable, or `a.out`, file in
88088 the face of compiler or linker errors. If a linker writes the executable file, then links it on disk
88089 with `lseek()`s and `write()`s, the partially linked executable file can be left on disk and its execute
88090 bits turned off if the link edit fails. However, if the linker links the image in memory before
88091 writing the file to disk, it need not touch the executable file (if it already exists) because the link
88092 edit fails. Since both approaches are historical practice, a conforming application shall rely on
88093 the exit status of `fort77`, rather than on the existence or mode of the executable file.

88094 The `-g` and `-s` options are not specified as mutually-exclusive. Historically these two options
88095 have been mutually-exclusive, but because both are so loosely specified, it seemed appropriate
88096 to leave their interaction unspecified.

88097 The requirement that conforming applications specify compiler options separately is to reserve
88098 the multi-character option name space for vendor-specific compiler options, which are known to

88099 exist in many historical implementations. Implementations are not required to recognize, for
88100 example, `-gc` as if it were `-g -c`; nor are they forbidden from doing so. The SYNOPSIS shows all
88101 of the options separately to highlight this requirement on applications.

88102 Echoing filenames to standard error is considered a diagnostic message because it would
88103 otherwise be difficult to associate an error message with the erring file. They are described with
88104 “may” to allow implementations to use other methods of identifying files and to parallel the
88105 description in *c99*.

88106 FUTURE DIRECTIONS

88107 A compilation system based on the ISO/IEC 1539:1990 standard (Fortran-90) may be considered
88108 for a future version; it may have a different utility name from *fort77*.

88113 CHANGE HISTORY

88114 First released in Issue 4.

88115 Issue 6

88116 This utility is marked as part of the FORTRAN Development Utilities option.

88117 The normative text is reworded to avoid use of the term “must” for application requirements.

88118 Issue 7

88119 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88120 **NAME**88121 `fuser` — list process IDs of all processes that have one or more files open88122 **SYNOPSIS**88123 XSI `fuser [-cfu] file...`88124 **DESCRIPTION**88125 The *fuser* utility shall write to standard output the process IDs of processes running on the local
88126 system that have one or more named files open. For block special devices, all processes using
88127 any file on that device are listed.88128 The *fuser* utility shall write to standard error additional information about the named files
88129 indicating how the file is being used.

88130 Any output for processes running on remote systems that have a named file open is unspecified.

88131 A user may need appropriate privilege to invoke the *fuser* utility.88132 **OPTIONS**88133 The *fuser* utility shall conform to XBD [Section 12.2](#) (on page 201).

88134 The following options shall be supported:

88135 `-c` The file is treated as a mount point and the utility shall report on any files open in
88136 the file system.88137 `-f` The report shall be only for the named files.88138 `-u` The user name, in parentheses, associated with each process ID written to standard
88139 output shall be written to standard error.88140 **OPERANDS**

88141 The following operand shall be supported:

88142 *file* A pathname on which the file or file system is to be reported.88143 **STDIN**

88144 Not used.

88145 **INPUT FILES**

88146 The user database.

88147 **ENVIRONMENT VARIABLES**88148 The following environment variables shall affect the execution of *fuser*:88149 *LANG* Provide a default value for the internationalization variables that are unset or null.
88150 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
88151 variables used to determine the values of locale categories.)88152 *LC_ALL* If set to a non-empty string value, override the values of all the other
88153 internationalization variables.88154 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
88155 characters (for example, single-byte as opposed to multi-byte characters in
88156 arguments).88157 *LC_MESSAGES*88158 Determine the locale that should be used to affect the format and contents of
88159 diagnostic messages written to standard error.

88160 `NLSPATH` Determine the location of message catalogs for the processing of `LC_MESSAGES`.

88161 ASYNCHRONOUS EVENTS

88162 Default.

88163 STDOUT

88164 The *fuser* utility shall write the process ID for each process using each file given as an operand to
88165 standard output in the following format:

88166 `"%d", <process_id>`

88167 STDERR

88168 The *fuser* utility shall write diagnostic messages to standard error.

88169 The *fuser* utility also shall write the following to standard error:

- 88170 • The pathname of each named file is written followed immediately by a colon.
- 88171 • For each process ID written to standard output, the character 'c' shall be written to
88172 standard error if the process is using the file as its current directory and the character 'r'
88173 shall be written to standard error if the process is using the file as its root directory.
88174 Implementations may write other alphabetic characters to indicate other uses of files.
- 88175 • When the `-u` option is specified, characters indicating the use of the file shall be followed
88176 immediately by the user name, in parentheses, corresponding to the real user ID of the
88177 process. If the user name cannot be resolved from the real user ID of the process, the real
88178 user ID of the process shall be written instead of the user name.

88179 When standard output and standard error are directed to the same file, the output shall be
88180 interleaved so that the filename appears at the start of each line, followed by the process ID and
88181 characters indicating the use of the file. Then, if the `-u` option is specified, the user name or user
88182 ID for each process using that file shall be written.

88183 A `<newline>` shall be written to standard error after the last output described above for each *file*
88184 operand.

88185 OUTPUT FILES

88186 None.

88187 EXTENDED DESCRIPTION

88188 None.

88189 EXIT STATUS

88190 The following exit values shall be returned:

88191 0 Successful completion.

88192 >0 An error occurred.

88193 CONSEQUENCES OF ERRORS

88194 Default.

88195 APPLICATION USAGE

88196 None.

88197 EXAMPLES

88198 The command:

88199 `fuser -fu .`

88200 writes to standard output the process IDs of processes that are using the current directory and
88201 writes to standard error an indication of how those processes are using the directory and the
88202 user names associated with the processes that are using the current directory.

88203 `fuser -c <mount point>`

88204 writes to standard output the process IDs of processes that are using any file in the file system
88205 which is mounted on *<mount point>* and writes to standard error an indication of how those
88206 processes are using the files.

88207 `fuser <mount point>`

88208 writes to standard output the process IDs of processes that are using the file which is named by
88209 *<mount point>* and writes to standard error an indication of how those processes are using the
88210 file.

88211 `fuser <block device>`

88212 writes to standard output the process IDs of processes that are using any file which is on the
88213 device named by *<block device>* and writes to standard error an indication of how those
88214 processes are using the file.

88215 `fuser --f <block device>`

88216 writes to standard output the process IDs of processes that are using the file *<block device>* itself
88217 and writes to standard error an indication of how those processes are using the file.

88218 **RATIONALE**

88219 The definition of the *fuser* utility follows existing practice.

88220 **FUTURE DIRECTIONS**

88221 None.

88222 **SEE ALSO**

88223 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

88224 **CHANGE HISTORY**

88225 First released in Issue 5.

88226 **Issue 7**

88227 SD5-XCU-ERN-90 is applied, updating the EXAMPLES section.

88228 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88229 **NAME**

88230 gencat — generate a formatted message catalog

88231 **SYNOPSIS**88232 gencat *catfile* *msgfile*...88233 **DESCRIPTION**

88234 The *gencat* utility shall merge the message text source file *msgfile* into a formatted message
 88235 catalog *catfile*. The file *catfile* shall be created if it does not already exist. If *catfile* does exist, its
 88236 messages shall be included in the new *catfile*. If set and message numbers collide, the new
 88237 message text defined in *msgfile* shall replace the old message text currently contained in *catfile*.

88238 **OPTIONS**

88239 None.

88240 **OPERANDS**

88241 The following operands shall be supported:

88242 *catfile* A pathname of the formatted message catalog. If '-' is specified, standard output
 88243 shall be used. The format of the message catalog produced is unspecified.

88244 *msgfile* A pathname of a message text source file. If '-' is specified for an instance of
 88245 *msgfile*, standard input shall be used. The format of message text source files is
 88246 defined in the EXTENDED DESCRIPTION section.

88247 **STDIN**88248 The standard input shall not be used unless a *msgfile* operand is specified as '-'.88249 **INPUT FILES**

88250 The input files shall be text files.

88251 **ENVIRONMENT VARIABLES**88252 The following environment variables shall affect the execution of *gencat*:

88253 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 88254 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 88255 variables used to determine the values of locale categories.)

88256 *LC_ALL* If set to a non-empty string value, override the values of all the other
 88257 internationalization variables.

88258 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 88259 characters (for example, single-byte as opposed to multi-byte characters in
 88260 arguments and input files).

88261 *LC_MESSAGES*

88262 Determine the locale that should be used to affect the format and contents of
 88263 diagnostic messages written to standard error.

88264 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

88265 **ASYNCHRONOUS EVENTS**

88266 Default.

88267 **STDOUT**88268 The standard output shall not be used unless the *catfile* operand is specified as '-'.

88269 **STDERR**
 88270 The standard error shall be used only for diagnostic messages.

88271 **OUTPUT FILES**
 88272 None.

88273 EXTENDED DESCRIPTION

88274 The content of a message text file shall be in the format defined as follows. Note that the fields of
 88275 a message text source line are separated by a single <blank>. Any other <blank>s are
 88276 considered to be part of the subsequent field.

88277 **\$set** *n comment*
 88278 This line specifies the set identifier of the following messages until the next **\$set** or
 88279 end-of-file appears. The *n* denotes the set identifier, which is defined as a number
 88280 in the range [1, {NL_SETMAX}] (see the <limits.h> header defined in the Base
 88281 Definitions volume of POSIX.1-200x). The application shall ensure that set
 88282 identifiers are presented in ascending order within a single source file, but need
 88283 not be contiguous. Any string following the set identifier shall be treated as a
 88284 comment. If no **\$set** directive is specified in a message text source file, all messages
 88285 shall be located in an implementation-defined default message set NL_SETD (see
 88286 the <nl_types.h> header defined in the Base Definitions volume of POSIX.1-200x).

88287 **\$delset** *n comment*
 88288 This line deletes message set *n* from an existing message catalog. The *n* denotes the
 88289 set number [1, {NL_SETMAX}]. Any string following the set number shall be
 88290 treated as a comment.

88291 **\$** *comment* A line beginning with ' \$ ' followed by a <blank> shall be treated as a comment.

88292 *m message-text*
 88293 The *m* denotes the message identifier, which is defined as a number in the range [1,
 88294 {NL_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the
 88295 message catalog with the set identifier specified by the last **\$set** directive, and with
 88296 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is
 88297 present, an empty string shall be stored in the message catalog. If a message source
 88298 line has a message number, but neither a field separator nor *message-text*, the
 88299 existing message with that number (if any) shall be deleted from the catalog. The
 88300 application shall ensure that message identifiers are in ascending order within a
 88301 single set, but need not be contiguous. The application shall ensure that the length
 88302 of *message-text* is in the range [0, {NL_TEXTMAX}] (see the <limits.h> header).

88303 **\$quote** *n* This line specifies an optional quote character *c*, which can be used to surround
 88304 *message-text* so that trailing spaces or null (empty) messages are visible in a
 88305 message source line. By default, or if an empty **\$quote** directive is supplied, no
 88306 quoting of *message-text* shall be recognized.

88307 Empty lines in a message text source file shall be ignored. The effects of lines starting with any
 88308 character other than those defined above are implementation-defined.

88309 Text strings can contain the special characters and escape sequences defined in the following
 88310 table:

88311
88312
88313
88314
88315
88316
88317
88318
88319

Description	Symbol	Sequence
<newline>	NL(LF)	\n
Horizontal-tab	HT	\t
<vertical-tab>	VT	\v
<backspace>	BS	\b
<carriage-return>	CR	\r
<form-feed>	FF	\f
Backslash	\	\\
Bit pattern	ddd	\ddd

88320
88321
88322

The escape sequence "\ddd" consists of backslash followed by one, two, or three octal digits, which shall be taken to specify the value of the desired character. If the character following a backslash is not one of those specified, the backslash shall be ignored.

88323
88324

Backslash ('\'') followed by a <newline> is also used to continue a string on the following line. Thus, the following two lines describe a single message string:

88325
88326

```
1 This line continues \  
to the next line
```

88327

which shall be equivalent to:

88328

```
1 This line continues to the next line
```

88329

EXIT STATUS

88330

The following exit values shall be returned:

88331

0 Successful completion.

88332

>0 An error occurred.

88333

CONSEQUENCES OF ERRORS

88334

Default.

88335

APPLICATION USAGE

88336

Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot be guaranteed between different types of machine. Thus, just as C programs need to be recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

XBD Chapter 8 (on page 159), <limits.h>, <nl_types.h>

88348

CHANGE HISTORY

88349

First released in Issue 3.

88350

Issue 6

88351

The normative text is reworded to avoid use of the term “must” for application requirements.

88352

Issue 7

88353

The *gencat* utility is moved from the XSI option to the Base.

88354 **NAME**
 88355 `get` — get a version of an SCCS file (**DEVELOPMENT**)

88356 **SYNOPSIS**
 88357 `get [-begkmnlpst] [-c cutoff] [-i list] [-r SID] [-x list] file...`

88358 **DESCRIPTION**
 88359 The `get` utility shall generate a text file from each named SCCS *file* according to the specifications
 88360 given by its options.

88361 The generated text shall normally be written into a file called the **g-file** whose name is derived
 88362 from the SCCS filename by simply removing the leading "s. ".

88363 **OPTIONS**
 88364 The `get` utility shall conform to XBD [Section 12.2](#) (on page 201).

88365 The following options shall be supported:

88366 **-r *SID*** Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file
 88367 to be retrieved. The table shows, for the most useful cases, what version of an
 88368 SCCS file is retrieved (as well as the SID of the version to be eventually created by
 88369 *delta* if the **-e** option is also used), as a function of the SID specified.

88370 **-c *cutoff*** Indicate the *cutoff* date-time, in the form:

88371 `YY[MM[DD[HH[MM[SS]]]]]`

88372 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999
 88373 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.

88374 **Note:** It is expected that in a future version of this standard the default century inferred
 88375 from a 2-digit year will change. (This would apply to all commands accepting a
 88376 2-digit year as input.)

88377 No changes (deltas) to the SCCS file that were created after the specified *cutoff*
 88378 date-time shall be included in the generated text file. Units omitted from the date-
 88379 time default to their maximum possible values; for example, **-c 7502** is equivalent
 88380 to **-c 750228235959**.

88381 Any number of non-numeric characters may separate the various 2-digit pieces of
 88382 the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:
 88383 **-c "77/2/2 9:22:25"**.

88384 **-e** Indicate that the `get` is for the purpose of editing or making a change (delta) to the
 88385 SCCS file via a subsequent use of *delta*. The **-e** option used in a `get` for a particular
 88386 version (SID) of the SCCS file shall prevent further `get` commands from editing on
 88387 the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.
 88388 Concurrent use of `get -e` for different SIDs is always allowed.

88389 If the **g-file** generated by `get` with a **-e** option is accidentally ruined in the process
 88390 of editing, it may be regenerated by re-executing the `get` command with the **-k**
 88391 option in place of the **-e** option.

88392 SCCS file protection specified via the ceiling, floor, and authorized user list stored
 88393 in the SCCS file shall be enforced when the **-e** option is used.

88394 **-b** Use with the **-e** option to indicate that the new delta should have an SID in a new
 88395 branch as shown in the table below. This option shall be ignored if the **b** flag is not
 88396 present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that

- 88397 has no successors on the SCCS file tree.)
- 88398 **Note:** A branch delta may always be created from a non-leaf delta.
- 88399 **-i list** Indicate a *list* of deltas to be included (forced to be applied) in the creation of the
88400 generated file. The *list* has the following syntax:
- 88401 `<list> ::= <range> | <list> , <range>`
88402 `<range> ::= SID | SID - SID`
- 88403 SID, the SCCS Identification of a delta, may be in any form shown in the "SID
88404 Specified" column of the table in the EXTENDED DESCRIPTION section, except
88405 that the result of supplying a partial SID is unspecified. A diagnostic message shall
88406 be written if the first SID in the range is not an ancestor of the second SID in the
88407 range.
- 88408 **-x list** Indicate a *list* of deltas to be excluded (forced not to be applied) in the creation of
88409 the generated file. See the **-i** option for the *list* format.
- 88410 **-k** Suppress replacement of identification keywords (see below) in the retrieved text
88411 by their value. The **-k** option shall be implied by the **-e** option.
- 88412 **-l** Write a delta summary into an **l-file**.
- 88413 **-L** Write a delta summary to standard output. All informative output that normally is
88414 written to standard output shall be written to standard error instead, unless the **-s**
88415 option is used, in which case it shall be suppressed.
- 88416 **-p** Write the text retrieved from the SCCS file to the standard output. No **g-file** shall
88417 be created. All informative output that normally goes to the standard output shall
88418 go to standard error instead, unless the **-s** option is used, in which case it shall
88419 disappear.
- 88420 **-s** Suppress all informative output normally written to standard output. However,
88421 fatal error messages (which shall always be written to the standard error) shall
88422 remain unaffected.
- 88423 **-m** Precede each text line retrieved from the SCCS file by the SID of the delta that
88424 inserted the text line in the SCCS file. The format shall be:
- 88425 `"%s\t%s", <SID>, <text line>`
- 88426 **-n** Precede each generated text line with the **%M%** identification keyword value (see
88427 below). The format shall be:
- 88428 `"%s\t%s", <%M% value>, <text line>`
- 88429 When both the **-m** and **-n** options are used, the `<text line>` shall be replaced by the
88430 **-m** option-generated format.
- 88431 **-g** Suppress the actual retrieval of text from the SCCS file. It is primarily used to
88432 generate an **l-file**, or to verify the existence of a particular SID.
- 88433 **-t** Use to access the most recently created (top) delta in a given release (for example,
88434 **-r 1**), or release and level (for example, **-r 1.2**).

88435 **OPERANDS**

88436 The following operands shall be supported:

88437 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get*
 88438 utility shall behave as though each file in the directory were specified as a named
 88439 file, except that non-SCCS files (last component of the pathname does not begin
 88440 with **s**.) and unreadable files shall be silently ignored.

88441 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;
 88442 each line of the standard input is taken to be the name of an SCCS file to be
 88443 processed. Non-SCCS files and unreadable files shall be silently ignored.

88444 **STDIN**

88445 The standard input shall be a text file used only if the *file* operand is specified as *'-'*. Each line
 88446 of the text file shall be interpreted as an SCCS pathname.

88447 **INPUT FILES**

88448 The SCCS files shall be files of an unspecified format.

88449 **ENVIRONMENT VARIABLES**88450 The following environment variables shall affect the execution of *get*:

88451 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 88452 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 88453 variables used to determine the values of locale categories.)

88454 *LC_ALL* If set to a non-empty string value, override the values of all the other
 88455 internationalization variables.

88456 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 88457 characters (for example, single-byte as opposed to multi-byte characters in
 88458 arguments and input files).

88459 *LC_MESSAGES*
 88460 Determine the locale that should be used to affect the format and contents of
 88461 diagnostic messages written to standard error, and informative messages written
 88462 to standard output (or standard error, if the *-p* option is used).

88463 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

88464 *TZ* Determine the timezone in which the times and dates written in the SCCS file are
 88465 evaluated. If the *TZ* variable is unset or NULL, an unspecified system default
 88466 timezone is used.

88467 **ASYNCHRONOUS EVENTS**

88468 Default.

88469 **STDOUT**

88470 For each file processed, *get* shall write to standard output the SID being accessed and the
 88471 number of lines retrieved from the SCCS file, in the following format:

88472 "%s\n%d lines\n", <SID>, <number of lines>

88473 If the *-e* option is used, the SID of the delta to be made shall appear after the SID accessed and
 88474 before the number of lines generated, in the POSIX locale:

88475 "%s\nnew delta %s\n%d lines\n", <SID accessed>,
 88476 <SID to be made>, <number of lines>

88477 If there is more than one named file or if a directory or standard input is named, each pathname
 88478 shall be written before each of the lines shown in one of the preceding formats:

88479 "\n%s:\n", <pathname>

88480 If the **-L** option is used, a delta summary shall be written following the format specified below
88481 for **l-files**.

88482 If the **-i** option is used, included deltas shall be listed following the notation, in the POSIX
88483 locale:

88484 "Included:\n"

88485 If the **-x** option is used, excluded deltas shall be listed following the notation, in the POSIX
88486 locale:

88487 "Excluded:\n"

88488 If the **-p** or **-L** options are specified, the standard output shall consist of the text retrieved from
88489 the SCCS file.

88490 STDERR

88491 The standard error shall be used only for diagnostic messages, except if the **-p** or **-L** options are
88492 specified, it shall include all informative messages normally sent to standard output.

88493 OUTPUT FILES

88494 Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-**
88495 **file**, **p-file**, and **z-file**. The letter before the hyphen is called the *tag*. An auxiliary filename shall
88496 be formed from the SCCS filename: the application shall ensure that the last component of all
88497 SCCS filenames is of the form *s.module-name*; the auxiliary files shall be named by replacing the
88498 leading *s* with the tag. The **g-file** shall be an exception to this scheme: the **g-file** is named by
88499 removing the *s*. prefix. For example, for *s.xyz.c*, the auxiliary filenames would be *xyz.c*, *l.xyz.c*,
88500 *p.xyz.c*, and *z.xyz.c*, respectively.

88501 The **g-file**, which contains the generated text, shall be created in the current directory (unless the
88502 **-p** option is used). A **g-file** shall be created in all cases, whether or not any lines of text were
88503 generated by the *get*. It shall be owned by the real user. If the **-k** option is used or implied, the
88504 **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be
88505 read-only. Only the real user need have write permission in the current directory.

88506 The **l-file** shall contain a table showing which deltas were applied in generating the retrieved
88507 text. The **l-file** shall be created in the current directory if the **-l** option is used; it shall be read-
88508 only and it is owned by the real user. Only the real user need have write permission in the
88509 current directory.

88510 Lines in the **l-file** shall have the following format:

88511 "%c%c%cΔ%s\t%sΔ%s\n", <code1>, <code2>, <code3>,
88512 <SID>, <date-time>, <login>

88513 where the entries are:

88514 <code1> A <space> if the delta was applied; ' * ' otherwise.

88515 <code2> A <space> if the delta was applied or was not applied and ignored; ' * ' if the delta
88516 was not applied and was not ignored.

88517 <code3> A character indicating a special reason why the delta was or was not applied:

88518 I Included.

88519 X Excluded.

88520 C Cut off (by a **-c** option).

88521 <date-time> Date and time (using the format of the *date* utility's %Y/%m/%d %T conversion
88522 specification format) of creation.

88523 <*login*> Login name of person who created *delta*.

88524 The comments and MR data shall follow on subsequent lines, indented one <tab>. A blank line
88525 shall terminate each entry.

88526 The **p-file** shall be used to pass information resulting from a *get* with a **-e** option along to *delta*.
88527 Its contents shall also be used to prevent a subsequent execution of *get* with a **-e** option for the
88528 same SID until *delta* is executed or the joint edit flag, **j**, is set in the SCCS file. The **p-file** shall be
88529 created in the directory containing the SCCS file and the application shall ensure that the
88530 effective user has write permission in that directory. It shall be writable by owner only, and
88531 owned by the effective user. Each line in the **p-file** shall have the following format:

```
88532 "%sΔ%sΔ%sΔ%s%s\n", <g-file SID>,  
88533           <SID of new delta>, <login-name of real user>,  
88534           <date-time>, <i-value>, <x-value>
```

88535 where <*i-value*> uses the format " " if no **-i** option was specified, and shall use the format:

```
88536 "Δ-i%s", <-i option option-argument>
```

88537 if a **-i** option was specified and <*x-value*> uses the format " " if no **-x** option was specified, and
88538 shall use the format:

```
88539 "Δ-x%s", <-x option option-argument>
```

88540 if a **-x** option was specified. There can be an arbitrary number of lines in the **p-file** at any time;
88541 no two lines shall have the same new delta SID.

88542 The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall
88543 be the binary process ID of the command (that is, *get*) that created it. The **z-file** shall be created
88544 in the directory containing the SCCS file for the duration of *get*. The same protection restrictions
88545 as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.

88546

EXTENDED DESCRIPTION

88547

Determination of SCCS Identification String				
SID* Specified	-b Keyletter Used†	Other Conditions	SID Retrieved	SID of Delta to be Created
none‡	no	R defaults to mR	mR.mL	mR.(mL+1)
none‡	yes	R defaults to mR	mR.mL	mR.mL.(mB+1).1
R	no	R > mR	mR.mL	R.1***
R	no	R = mR	mR.mL	mR.(mL+1)
R	yes	R > mR	mR.mL	mR.mL.(mB+1).1
R	yes	R = mR	mR.mL	mR.mL.(mB+1).1
R	-	R < mR and R does not exist	hR.mL**	hR.mL.(mB+1).1
R	-	Trunk successor in release > R and R exists	R.mL	R.mL.(mB+1).1
R.L	no	No trunk successor	R.L	R.(L+1)
R.L	yes	No trunk successor	R.L	R.L.(mB+1).1
R.L	-	Trunk successor in release ≥ R	R.L	R.L.(mB+1).1
R.L.B	no	No branch successor	R.L.B.mS	R.L.B.(mS+1)
R.L.B	yes	No branch successor	R.L.B.mS	R.L.(mB+1).1
R.L.B.S	no	No branch successor	R.L.B.S	R.L.B.(S+1)
R.L.B.S	yes	No branch successor	R.L.B.S	R.L.(mB+1).1
R.L.B.S	-	Branch successor	R.L.B.S	R.L.(mB+1).1

88569

* R, L, B, and S are the release, level, branch, and sequence components of the SID, respectively; m means maximum. Thus, for example, R.mL means "the maximum level number within release R"; R.L.(mB+1).1 means "the first sequence number on the new branch (that is, maximum branch number plus one) of level L within release R". Note that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified components shall exist.

88570

88571

88572

88573

88574

88575

** hR is the highest existing release that is lower than the specified, nonexistent, release R.

88576

*** This is used to force creation of the first delta in a new release.

88577

† The -b option is effective only if the b flag is present in the file. An entry of '-' means "irrelevant".

88578

88579

‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is present in the file, then the SID obtained from the d flag is interpreted as if it had been specified on the command line. Thus, one of the other cases in this table applies.

88580

88581

88582

System Date and Time

88583

When a g-file is generated, the creation time of deltas in the SCCS file may be taken into account. If any of these times are apparently in the future, the behavior is unspecified.

88584

88585

Identification Keywords

88586

Identifying information shall be inserted into the text retrieved from the SCCS file by replacing identification keywords with their value wherever they occur. The following keywords may be used in the text stored in an SCCS file:

88587

88588

88589

%M% Module name: either the value of the **m** flag in the file, or if absent, the name of the SCCS file with the leading **s**. removed.

88590

88591

%I% SCCS identification (SID) (**%R%.%L%** or **%R%.%L%.%B%.%S%**) of the retrieved text.

88592

88593

%R% Release.

88594

%L% Level.

88595

%B% Branch.

88596

%S% Sequence.

88597

%D% Current date (**YY/MM/DD**).

88598

%H% Current date (**MM/DD/YY**).

88599

%T% Current time (**HH:MM:SS**).

88600

%E% Date newest applied delta was created (**YY/MM/DD**).

88601

%G% Date newest applied delta was created (**MM/DD/YY**).

88602

%U% Time newest applied delta was created (**HH:MM:SS**).

88603

%Y% Module type: value of the **t** flag in the SCCS file.

88604

%F% SCCS filename.

88605

%P% SCCS absolute pathname.

88606

%Q% The value of the **q** flag in the file.

88607

%C% Current line number. This keyword is intended for identifying messages output by the program, such as "this should not have happened" type errors. It is not intended to be used on every line to provide sequence numbers.

88608

88609

88610

%Z% The four-character string "@(#)" recognizable by *what*.

88611

%W% A shorthand notation for constructing *what* strings:

88612

%W% = **%Z%** **%M%** <tab> **%I%**

88613

%A% Another shorthand notation for constructing *what* strings:

88614

%A% = **%Z%** **%Y%** **%M%** **%I%** **%Z%**

88615

EXIT STATUS

88616

The following exit values shall be returned:

88617

0 Successful completion.

88618

>0 An error occurred.

88619

CONSEQUENCES OF ERRORS

88620

Default.

88621 **APPLICATION USAGE**

88622 Problems can arise if the system date and time have been modified (for example, put forward
88623 and then back again, or unsynchronized clocks across a network) and can also arise when
88624 different values of the *TZ* environment variable are used.

88625 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares
88626 the previous file body against the working file as part of its normal operation.

88627 **EXAMPLES**

88628 None.

88629 **RATIONALE**

88630 None.

88631 **FUTURE DIRECTIONS**

88632 None.

88635 XBD Chapter 8 (on page 159), Section 12.2 (on page 201)

88636 **CHANGE HISTORY**

88637 First released in Issue 2.

88638 **Issue 5**

88639 A correction is made to the first format string in `STDOUT`.

88640 The interpretation of the *YY* component of the `-c cutoff` argument is noted.

88641 **Issue 6**

88642 The obsolescent `SYNOPSIS` is removed, removing the `-lp` option.

88643 The normative text is reworded to avoid use of the term “must” for application requirements.

88644 The Open Group Corrigendum U025/5 is applied, correcting text in the `OPTIONS` section.

88645 The Open Group Corrigendum U048/1 is applied.

88646 The Open Group Interpretation PIN4C.00014 is applied.

88647 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 88648 • The `EXTENDED DESCRIPTION` section is updated to make partial `SID` handling
88649 unspecified, reflecting common usage, and to clarify `SID` ranges.
- 88650 • New text is added to the `EXTENDED DESCRIPTION` and `APPLICATION USAGE` sections
88651 regarding how the system date and time may be taken into account.
- 88652 • The *TZ* environment variable is added to the `ENVIRONMENT VARIABLES` section.

88653 **Issue 7**

88654 `SD5-XCU-ERN-97` is applied, updating the `SYNOPSIS`.

88655 **NAME**88656 `getconf` — get configuration values88657 **SYNOPSIS**88658 `getconf [-v specification] system_var`88659 `getconf [-v specification] path_var pathname`88660 **DESCRIPTION**88661 In the first synopsis form, the `getconf` utility shall write to the standard output the value of the
88662 variable specified by the `system_var` operand.88663 In the second synopsis form, the `getconf` utility shall write to the standard output the value of the
88664 variable specified by the `path_var` operand for the path specified by the `pathname` operand.88665 The value of each configuration variable shall be determined as if it were obtained by calling the
88666 function from which it is defined to be available by this volume of POSIX.1-200x or by the
88667 System Interfaces volume of POSIX.1-200x (see the OPERANDS section). The value shall reflect
88668 conditions in the current operating environment.88669 **OPTIONS**88670 The `getconf` utility shall conform to XBD [Section 12.2](#) (on page 201).

88671 The following option shall be supported:

88672 **-v specification**88673 Indicate a specific specification and version for which configuration variables shall
88674 be determined. If this option is not specified, the values returned correspond to an
88675 implementation default conforming compilation environment.

88676 If the command:

88677 `getconf _POSIX_V7_ILP32_OFF32`88678 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of
88679 the form:88680 `getconf -v POSIX_V7_ILP32_OFF32 ...`88681 determine values for configuration variables corresponding to the
88682 `POSIX_V7_ILP32_OFF32` compilation environment specified in [c99](#), the
88683 EXTENDED DESCRIPTION.

88684 If the command:

88685 `getconf _POSIX_V7_ILP32_OFFBIG`88686 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of
88687 the form:88688 `getconf -v POSIX_V7_ILP32_OFFBIG ...`88689 determine values for configuration variables corresponding to the
88690 `POSIX_V7_ILP32_OFFBIG` compilation environment specified in [c99](#), the
88691 EXTENDED DESCRIPTION.

88692 If the command:

88693 `getconf _POSIX_V7_LP64_OFF64`88694 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of
88695 the form:

88696 `getconf -v POSIX_V7_LP64_OFF64 ...`

88697 determine values for configuration variables corresponding to the

88698 `POSIX_V7_LP64_OFF64` compilation environment specified in [c99](#), the

88699 EXTENDED DESCRIPTION.

88700 If the command:

88701 `getconf _POSIX_V7_LPBIG_OFFBIG`

88702 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of

88703 the form:

88704 `getconf -v POSIX_V7_LPBIG_OFFBIG ...`

88705 determine values for configuration variables corresponding to the

88706 `POSIX_V7_LPBIG_OFFBIG` compilation environment specified in [c99](#), the

88707 EXTENDED DESCRIPTION.

OPERANDS

88708 The following operands shall be supported:

88709 *path_var* A name of a configuration variable. All of the variables in the Variable column of

88710 the table in the DESCRIPTION of the `fpathconf()` function defined in the System

88711 Interfaces volume of POSIX.1-200x, without the enclosing braces, shall be

88712 supported. The implementation may add other local variables.

88713

88714 *pathname* A pathname for which the variable specified by *path_var* is to be determined.

88715 *system_var* A name of a configuration variable. All of the following variables shall be

88716 supported:

- 88717 • The names in the Variable column of the table in the DESCRIPTION of the
- 88718 `sysconf()` function in the System Interfaces volume of POSIX.1-200x, except
- 88719 for the entries corresponding to `_SC_CLK_TCK`, `_SC_GETGR_R_SIZE_MAX`,
- 88720 and `_SC_GETPW_R_SIZE_MAX`, without the enclosing braces.

88721 For compatibility with earlier versions, the following variable names shall

88722 also be supported:

88723 `POSIX2_C_BIND`

88724 `POSIX2_C_DEV`

88725 `POSIX2_CHAR_TERM`

88726 `POSIX2_FORT_DEV`

88727 `POSIX2_FORT_RUN`

88728 `POSIX2_LOCALEDEF`

88729 `POSIX2_SW_DEV`

88730 `POSIX2_UPE`

88731 `POSIX2_VERSION`

88732 and shall be equivalent to the same name prefixed with an underscore. This

88733 requirement may be removed in a future version.

- 88734 • The names of the symbolic constants used as the *name* argument of the
- 88735 `confstr()` function in the System Interfaces volume of POSIX.1-200x, without
- 88736 the `_CS_` prefix.
- 88737 • The names of the symbolic constants listed under the headings “Maximum
- 88738 Values” and “Minimum Values” in the description of the `<limits.h>` header
- 88739 in the Base Definitions volume of POSIX.1-200x, without the enclosing
- 88740 braces.

88741 For compatibility with earlier versions, the following variable names shall
88742 also be supported:

88743 POSIX2_BC_BASE_MAX
88744 POSIX2_BC_DIM_MAX
88745 POSIX2_BC_SCALE_MAX
88746 POSIX2_BC_STRING_MAX
88747 POSIX2_COLL_WEIGHTS_MAX
88748 POSIX2_EXPR_NEST_MAX
88749 POSIX2_LINE_MAX
88750 POSIX2_RE_DUP_MAX

88751 and shall be equivalent to the same name prefixed with an underscore. This
88752 requirement may be removed in a future version.

88753 The implementation may add other local values.

88754 **STDIN**

88755 Not used.

88756 **INPUT FILES**

88757 None.

88758 **ENVIRONMENT VARIABLES**

88759 The following environment variables shall affect the execution of *getconf*:

88760 *LANG* Provide a default value for the internationalization variables that are unset or null. |
88761 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
88762 variables used to determine the values of locale categories.)

88763 *LC_ALL* If set to a non-empty string value, override the values of all the other
88764 internationalization variables.

88765 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
88766 characters (for example, single-byte as opposed to multi-byte characters in
88767 arguments).

88768 *LC_MESSAGES*
88769 Determine the locale that should be used to affect the format and contents of
88770 diagnostic messages written to standard error.

88771 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

88772 **ASYNCHRONOUS EVENTS**

88773 Default.

88774 **STDOUT**

88775 If the specified variable is defined on the system and its value is described to be available from
88776 the *confstr()* function defined in the System Interfaces volume of POSIX.1-200x, its value shall be
88777 written in the following format:

88778 "%s\n", <value>

88779 Otherwise, if the specified variable is defined on the system, its value shall be written in the
88780 following format:

88781 "%d\n", <value>

88782 If the specified variable is valid, but is undefined on the system, *getconf* shall write using the
88783 following format:

88784 "undefined\n"

88785 If the variable name is invalid or an error occurs, nothing shall be written to standard output.

88786 **STDERR**

88787 The standard error shall be used only for diagnostic messages.

88788 **OUTPUT FILES**

88789 None.

88790 **EXTENDED DESCRIPTION**

88791 None.

88792 **EXIT STATUS**

88793 The following exit values shall be returned:

88794 0 The specified variable is valid and information about its current state was written
88795 successfully.

88796 >0 An error occurred.

88797 **CONSEQUENCES OF ERRORS**

88798 Default.

88799 **APPLICATION USAGE**

88800 None.

88801 **EXAMPLES**

88802 The following example illustrates the value of {NGROUPS_MAX}:

88803 `getconf NGROUPS_MAX`

88804 The following example illustrates the value of {NAME_MAX} for a specific directory:

88805 `getconf NAME_MAX /usr`

88806 The following example shows how to deal more carefully with results that might be unspecified:

```
88807 if value=$(getconf PATH_MAX /usr); then
88808     if [ "$value" = "undefined" ]; then
88809         echo PATH_MAX in /usr is indeterminate.
88810     else
88811         echo PATH_MAX in /usr is $value.
88812     fi
88813 else
88814     echo Error in getconf.
88815 fi
```

88816 Note that:

88817 `sysconf(_SC_2_C_BIND);`

88818 and:

88819 `system("getconf _POSIX2_C_BIND");`

88820 in a C program could give different answers. The *sysconf()* call supplies a value that corresponds
88821 to the conditions when the program was either compiled or executed, depending on the
88822 implementation; the *system()* call to *getconf* always supplies a value corresponding to conditions
88823 when the program is executed.

88824 **RATIONALE**

88825 The original need for this utility, and for the *confstr()* function, was to provide a way of finding
88826 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be
88827 modified by the user to include directories that could contain utilities replacing the standard
88828 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable
88829 value that contains the correct search path for the standard utilities. It was later suggested that

88830 access to the other variables described in this volume of POSIX.1-200x could also be useful to
88831 applications.

88832 This functionality of *getconf* would not be adequately subsumed by another command such as:

88833 `grep var /etc/conf`

88834 because such a strategy would provide correct values for neither those variables that can vary at
88835 runtime, nor those that can vary depending on the path.

88836 Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid,
88837 but not defined on the system. The output string "undefined" is now used to specify this case
88838 with exit code 0 because so many things depend on an exit code of zero when an invoked utility
88839 is successful.

88840 FUTURE DIRECTIONS

88841 None.

88846 CHANGE HISTORY

88847 First released in Issue 4.

88848 Issue 5

88849 In the OPERANDS section:

- 88850 • {NL_MAX} is changed to {NL_NMAX}.
- 88851 • Entries beginning NL_ are deleted from the list of standard configuration variables.
- 88852 • The list of variables previously marked UX is merged with the list marked EX.
- 88853 • Operands are added to support new Option Groups.
- 88854 • Operands are added so that *getconf* can determine supported programming environments.

88855 Issue 6

88856 The Open Group Corrigendum U029/4 is applied, correcting the example command in the last
88857 paragraph of the OPTIONS section.

88858 The following new requirements on POSIX implementations derive from alignment with the
88859 Single UNIX Specification:

- 88860 • Operands are added to determine supported programming environments.

88861 This reference page is updated for alignment with the ISO/IEC 9899:1999 standard. Specifically,
88862 new macros for *c99* programming environments are introduced.

88863 XSI marked *system_var* (XBS5_*) values are marked LEGACY.

88864 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/27 is applied, correcting the descriptions
88865 of *path_var* and *system_var* in the OPERANDS section.

88866 Issue 7

88867 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

88868 The EXAMPLES section is corrected. +

88869 **NAME**88870 `getopts` — parse utility options88871 **SYNOPSIS**88872 `getopts optstring name [arg...]`88873 **DESCRIPTION**88874 The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall
88875 support the Utility Syntax Guidelines 3 to 10, inclusive, described in XBD [Section 12.2](#) (on page
88876 201).88877 Each time it is invoked, the *getopts* utility shall place the value of the next option in the shell
88878 variable specified by the *name* operand and the index of the next argument to be processed in the
88879 shell variable *OPTIND*. Whenever the shell is invoked, *OPTIND* shall be initialized to 1.88880 When the option requires an option-argument, the *getopts* utility shall place it in the shell
88881 variable *OPTARG*. If no option was found, or if the option that was found does not have an
88882 option-argument, *OPTARG* shall be unset.88883 If an option character not contained in the *optstring* operand is found where an option character
88884 is expected, the shell variable specified by *name* shall be set to the question-mark ('?') character.
88885 In this case, if the first character in *optstring* is a colon (':'), the shell variable *OPTARG* shall be
88886 set to the option character found, but no output shall be written to standard error; otherwise, the
88887 shell variable *OPTARG* shall be unset and a diagnostic message shall be written to standard
88888 error. This condition shall be considered to be an error detected in the way arguments were
88889 presented to the invoking application, but shall not be an error in *getopts* processing.

88890 If an option-argument is missing:

- 88891
- If the first character of *optstring* is a colon, the shell variable specified by *name* shall be set
88892 to the colon character and the shell variable *OPTARG* shall be set to the option character
88893 found.
 - Otherwise, the shell variable specified by *name* shall be set to the question-mark character,
88894 the shell variable *OPTARG* shall be unset, and a diagnostic message shall be written to
88895 standard error. This condition shall be considered to be an error detected in the way
88896 arguments were presented to the invoking application, but shall not be an error in *getopts*
88897 processing; a diagnostic message shall be written as stated, but the exit status shall be zero.
88898

88899 When the end of options is encountered, the *getopts* utility shall exit with a return value greater
88900 than zero; the shell variable *OPTIND* shall be set to the index of the first non-option-argument,
88901 where the first "--" argument is considered to be an option-argument if there are no other non-
88902 option-arguments appearing before it, or the value "\$#+1" if there are no non-option-
88903 arguments; the *name* variable shall be set to the question-mark character. Any of the following
88904 shall identify the end of options: the special option "--", finding an argument that does not
88905 begin with a '-', or encountering an error.88906 The shell variables *OPTIND* and *OPTARG* shall be local to the caller of *getopts* and shall not be
88907 exported by default.88908 The shell variable specified by the *name* operand, *OPTIND*, and *OPTARG* shall affect the current
88909 shell execution environment; see [Section 2.12](#) (on page 2277).88910 If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the
88911 current positional parameters or new *arg* values. Any other attempt to invoke *getopts* multiple
88912 times in a single shell execution environment with parameters (positional parameters or *arg*
88913 operands) that are not the same in all invocations, or with an *OPTIND* value modified to be a
88914 value other than 1, produces unspecified results.

88915 **OPTIONS**
88916 None.

88917 **OPERANDS**
88918 The following operands shall be supported:

88919 *optstring* A string containing the option characters recognized by the utility invoking *getopts*.
88920 If a character is followed by a colon, the option shall be expected to have an
88921 argument, which should be supplied as a separate argument. Applications should
88922 specify an option character and its option-argument as separate arguments, but
88923 *getopts* shall interpret the characters following an option character requiring
88924 arguments as an argument whether or not this is done. An explicit null option-
88925 argument need not be recognized if it is not supplied as a separate argument when
88926 *getopts* is invoked. (See also the *getopt()* function defined in the System Interfaces
88927 volume of POSIX.1-200x.) The characters question-mark and colon shall not be
88928 used as option characters by an application. The use of other option characters that
88929 are not alphanumeric produces unspecified results. If the option-argument is not
88930 supplied as a separate argument from the option character, the value in *OPTARG*
88931 shall be stripped of the option character and the '-'. The first character in
88932 *optstring* determines how *getopts* behaves if an option character is not known or an
88933 option-argument is missing.

88934 *name* The name of a shell variable that shall be set by the *getopts* utility to the option
88935 character that was found.

88936 The *getopts* utility by default shall parse positional parameters passed to the invoking shell
88937 procedure. If *args* are given, they shall be parsed instead of the positional parameters.

88938 **STDIN**
88939 Not used.

88940 **INPUT FILES**
88941 None.

88942 **ENVIRONMENT VARIABLES**
88943 The following environment variables shall affect the execution of *getopts*:

88944 *LANG* Provide a default value for the internationalization variables that are unset or null. |
88945 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
88946 variables used to determine the values of locale categories.)

88947 *LC_ALL* If set to a non-empty string value, override the values of all the other
88948 internationalization variables.

88949 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
88950 characters (for example, single-byte as opposed to multi-byte characters in
88951 arguments and input files).

88952 *LC_MESSAGES*
88953 Determine the locale that should be used to affect the format and contents of
88954 diagnostic messages written to standard error.

88955 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

88956 *OPTIND* This variable shall be used by the *getopts* utility as the index of the next argument
88957 to be processed.

88958 **ASYNCHRONOUS EVENTS**

88959 Default.

88960 **STDOUT**

88961 Not used.

88962 **STDERR**

88963 Whenever an error is detected and the first character in the *optstring* operand is not a colon
 88964 (' : '), a diagnostic message shall be written to standard error with the following information in
 88965 an unspecified format:

- 88966 • The invoking program name shall be identified in the message. The invoking program
 88967 name shall be the value of the shell special parameter 0 (see [Section 2.5.2](#), on page 2250) at
 88968 the time the *getopts* utility is invoked. A name equivalent to:

88969 `basename "$0"`

88970 may be used.

- 88971 • If an option is found that was not specified in *optstring*, this error is identified and the
 88972 invalid option character shall be identified in the message.

- 88973 • If an option requiring an option-argument is found, but an option-argument is not found,
 88974 this error shall be identified and the invalid option character shall be identified in the
 88975 message.

88976 **OUTPUT FILES**

88977 None.

88978 **EXTENDED DESCRIPTION**

88979 None.

88980 **EXIT STATUS**

88981 The following exit values shall be returned:

88982 `0` An option, specified or unspecified by *optstring*, was found.88983 `>0` The end of options was encountered or an error occurred.88984 **CONSEQUENCES OF ERRORS**

88985 Default.

88986 **APPLICATION USAGE**

88987 Since *getopts* affects the current shell execution environment, it is generally provided as a shell
 88988 regular built-in. If it is called in a subshell or separate utility execution environment, such as one
 88989 of the following:

88990 `(getopts abc value "$@")`88991 `nohup getopts ...`88992 `find . -exec getopts ... \;`

88993 it does not affect the shell variables in the caller's environment.

88994 Note that shell functions share *OPTIND* with the calling shell even though the positional
 88995 parameters are changed. If the calling shell and any of its functions uses *getopts* to parse
 88996 arguments, the results are unspecified.

88997 **EXAMPLES**

88998 The following example script parses and displays its arguments:

88999 `aflag=`89000 `bflag=`89001 `while getopts ab: name`89002 `do`

```

89003     case $name in
89004     a)     aflag=1;;
89005     b)     bflag=1
89006           bval="$OPTARG";;
89007     ?)    printf "Usage: %s: [-a] [-b value] args\n" $0
89008           exit 2;;
89009     esac
89010 done
89011 if [ ! -z "$aflag" ]; then
89012     printf "Option -a specified\n"
89013 fi
89014 if [ ! -z "$bflag" ]; then
89015     printf 'Option -b "%s" specified\n' "$bval"
89016 fi
89017 shift $(( $OPTIND - 1 ))
89018 printf "Remaining arguments are: %s\n" "$*"

```

RATIONALE

89019 The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles
 89020 option-arguments containing <blank>s.
 89021

89022 The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it
 89023 does not affect the execution of *getopts*; it is one of the few "output-only" variables used by the
 89024 standard utilities.

89025 The colon is not allowed as an option character because that is not historical behavior, and it
 89026 violates the Utility Syntax Guidelines. The colon is now specified to behave as in the KornShell
 89027 version of the *getopts* utility; when used as the first character in the *optstring* operand, it disables
 89028 diagnostics concerning missing option-arguments and unexpected option characters. This
 89029 replaces the use of the *OPTERR* variable that was specified in an early proposal.

89030 The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function
 89031 are not fully specified because implementations with superior ("friendlier") formats objected to
 89032 the formats used by some historical implementations. The standard developers considered it
 89033 important that the information in the messages used be uniform between *getopts* and *getopt()*.
 89034 Exact duplication of the messages might not be possible, particularly if a utility is built on
 89035 another system that has a different *getopt()* function, but the messages must have specific
 89036 information included so that the program name, invalid option character, and type of error can
 89037 be distinguished by a user.

89038 Only a rare application program intercepts a *getopts* standard error message and wants to parse
 89039 it. Therefore, implementations are free to choose the most usable messages they can devise. The
 89040 following formats are used by many historical implementations:

```

89041 "%s: illegal option -- %c\n", <program name>, <option character>
89042 "%s: option requires an argument -- %c\n", <program name>, \
89043     <option character>

```

89044 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,
 89045 frequently not even indicating the option character found in error.

FUTURE DIRECTIONS

89046 None.

89052

CHANGE HISTORY

89053

First released in Issue 4.

89054

Issue 6

89055

The normative text is reworded to avoid use of the term “must” for application requirements.

89056 **NAME**89057 `grep` — search a file for a pattern89058 **SYNOPSIS**89059 `grep [-E|-F] [-c|-l|-q] [-insvx] -e pattern_list`
89060 `[-e pattern_list...] [-f pattern_file]... [file...]`89061 `grep [-E|-F] [-c|-l|-q] [-insvx] [-e pattern_list]...`
89062 `-f pattern_file [-f pattern_file]... [file...]`89063 `grep [-E|-F] [-c|-l|-q] [-insvx] pattern_list [file...]`89064 **DESCRIPTION**89065 The *grep* utility shall search the input files, selecting lines matching one or more patterns; the
89066 types of patterns are controlled by the options specified. The patterns are specified by the `-e`
89067 option, `-f` option, or the *pattern_list* operand. The *pattern_list*'s value shall consist of one or more
89068 patterns separated by <newline>s; the *pattern_file*'s contents shall consist of one or more patterns
89069 terminated by <newline>. By default, an input line shall be selected if any pattern, treated as an
89070 entire basic regular expression (BRE) as described in XBD Section 9.3 (on page 169), matches any
89071 part of the line excluding the terminating <newline>; a null BRE shall match every line. By
89072 default, each selected input line shall be written to the standard output.89073 Regular expression matching shall be based on text lines. Since a <newline> separates or
89074 terminates patterns (see the `-e` and `-f` options below), regular expressions cannot contain a
89075 <newline>. Similarly, since patterns are matched against individual lines (excluding the
89076 terminating <newline>s) of the input, there is no way for a pattern to match a <newline> found
89077 in the input.89078 **OPTIONS**89079 The *grep* utility shall conform to XBD Section 12.2 (on page 201).

89080 The following options shall be supported:

89081 `-E` Match using extended regular expressions. Treat each pattern specified as an ERE,
89082 as described in XBD Section 9.4 (on page 174). If any entire ERE pattern matches
89083 some part of an input line excluding the terminating <newline>, the line shall be
89084 matched. A null ERE shall match every line.89085 `-F` Match using fixed strings. Treat each pattern specified as a string instead of a
89086 regular expression. If an input line contains any of the patterns as a contiguous
89087 sequence of bytes, the line shall be matched. A null string shall match every line.89088 `-c` Write only a count of selected lines to standard output.89089 `-e pattern_list`89090 Specify one or more patterns to be used during the search for input. The
89091 application shall ensure that patterns in *pattern_list* are separated by a <newline>.
89092 A null pattern can be specified by two adjacent <newline>s in *pattern_list*. Unless
89093 the `-E` or `-F` option is also specified, each pattern shall be treated as a BRE, as
89094 described in XBD Section 9.3 (on page 169). Multiple `-e` and `-f` options shall be
89095 accepted by the *grep* utility. All of the specified patterns shall be used when
89096 matching lines, but the order of evaluation is unspecified.89097 `-f pattern_file`89098 Read one or more patterns from the file named by the pathname *pattern_file*.
89099 Patterns in *pattern_file* shall be terminated by a <newline>. A null pattern can be
89100 specified by an empty line in *pattern_file*. Unless the `-E` or `-F` option is also
89101 specified, each pattern shall be treated as a BRE, as described in XBD Section 9.3

- 89102 (on page 169).
- 89103 **-i** Perform pattern matching in searches without regard to case; see XBD Section 9.2
89104 (on page 168).
- 89105 **-l** (The letter ell.) Write only the names of files containing selected lines to standard
89106 output. Pathnames shall be written once per file searched. If the standard input is
89107 searched, a pathname of "(standard input)" shall be written, in the POSIX
89108 locale. In other locales, "standard input" may be replaced by something more
89109 appropriate in those locales.
- 89110 **-n** Precede each output line by its relative line number in the file, each file starting at
89111 line 1. The line number counter shall be reset for each file processed.
- 89112 **-q** Quiet. Nothing shall be written to the standard output, regardless of matching
89113 lines. Exit with zero status if an input line is selected.
- 89114 **-s** Suppress the error messages ordinarily written for nonexistent or unreadable files.
89115 Other error messages shall not be suppressed.
- 89116 **-v** Select lines not matching any of the specified patterns. If the **-v** option is not
89117 specified, selected lines shall be those that match any of the specified patterns.
- 89118 **-x** Consider only input lines that use all characters in the line excluding the
89119 terminating <newline> to match an entire fixed string or regular expression to be
89120 matching lines.

OPERANDS

89121 The following operands shall be supported:

- 89123 *pattern_list* Specify one or more patterns to be used during the search for input. This operand
89124 shall be treated as if it were specified as **-e pattern_list**.
- 89125 *file* A pathname of a file to be searched for the patterns. If no *file* operands are
89126 specified, the standard input shall be used.

STDIN

89127 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES
89128 section.
89129

INPUT FILES

89130 The input files shall be text files.
89131

ENVIRONMENT VARIABLES

89132 The following environment variables shall affect the execution of *grep*:

- 89134 **LANG** Provide a default value for the internationalization variables that are unset or null.
89135 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
89136 variables used to determine the values of locale categories.)
- 89137 **LC_ALL** If set to a non-empty string value, override the values of all the other
89138 internationalization variables.
- 89139 **LC_COLLATE**
89140 Determine the locale for the behavior of ranges, equivalence classes, and multi-
89141 character collating elements within regular expressions.
- 89142 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
89143 characters (for example, single-byte as opposed to multi-byte characters in
89144 arguments and input files) and the behavior of character classes within regular
89145 expressions.

89146 *LC_MESSAGES*
 89147 Determine the locale that should be used to affect the format and contents of
 89148 diagnostic messages written to standard error.

89149 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

89150 Default.
 89151

STDOUT

89152 If the *-l* option is in effect, the following shall be written for each file containing at least one
 89153 selected input line:
 89154

89155 *%s\n*, *<file>*

89156 Otherwise, if more than one *file* argument appears, and *-q* is not specified, the *grep* utility shall
 89157 prefix each output line by:

89158 *%s:*, *<file>*

89159 The remainder of each output line shall depend on the other options specified:

- If the *-c* option is in effect, the remainder of each output line shall contain:

89161 *%d\n*, *<count>*

- Otherwise, if *-c* is not in effect and the *-n* option is in effect, the following shall be written to standard output:

89164 *%d:*, *<line number>*

- Finally, the following shall be written to standard output:

89166 *%s*, *<selected-line contents>*

STDERR

89167 The standard error shall be used only for diagnostic messages.
 89168

OUTPUT FILES

89169 None.
 89170

EXTENDED DESCRIPTION

89171 None.
 89172

EXIT STATUS

89173 The following exit values shall be returned:
 89174

89175 0 One or more lines were selected.

89176 1 No lines were selected.

89177 >1 An error occurred.

CONSEQUENCES OF ERRORS

89178 If the *-q* option is specified, the exit status shall be zero if an input line is selected, even if an
 89179 error was detected. Otherwise, default actions shall be performed.
 89180

APPLICATION USAGE

Care should be taken when using characters in *pattern_list* that may also be meaningful to the command interpreter. It is safest to enclose the entire *pattern_list* argument in single quotes:

```
' . . . '
```

The `-e pattern_list` option has the same effect as the *pattern_list* operand, but is useful when *pattern_list* begins with the hyphen delimiter. It is also useful when it is more convenient to provide multiple patterns as separate arguments.

Multiple `-e` and `-f` options are accepted and *grep* uses all of the patterns it is given while matching input text lines. (Note that the order of evaluation is not specified. If an implementation finds a null string as a pattern, it is allowed to use that pattern first, matching every line, and effectively ignore any other patterns.)

The `-q` option provides a means of easily determining whether or not a pattern (or string) exists in a group of files. When searching several files, it provides a performance improvement (because it can quit as soon as it finds the first match) and requires less care by the user in choosing the set of files to supply as arguments (because it exits zero if it finds a match even if *grep* detected an access or read error on earlier *file* operands).

EXAMPLES

1. To find all uses of the word "Posix" (in any case) in file **text.mm** and write with line numbers:

```
grep -i -n posix text.mm
```

2. To find all empty lines in the standard input:

```
grep ^$
```

or:

```
grep -v .
```

3. Both of the following commands print all lines containing strings "abc" or "def" or both:

```
grep -E 'abc|def'
```

```
grep -F 'abc
def'
```

4. Both of the following commands print all lines matching exactly "abc" or "def":

```
grep -E '^abc$|^def$'
```

```
grep -F -x 'abc
def'
```

RATIONALE

This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard developers to consolidate the three *greps* into a single command.

The old *egrep* and *fgrep* commands are likely to be supported for many years to come as implementation extensions, allowing historical applications to operate unmodified.

Historical implementations usually silently ignored all but one of multiply-specified `-e` and `-f` options, but were not consistent as to which specification was actually used.

The `-b` option was omitted from the OPTIONS section because block numbers are implementation-defined.

- 89224 The System V restriction on using `-` to mean standard input was omitted.
- 89225 A definition of action taken when given a null BRE or ERE is specified. This is an error
89226 condition in some historical implementations.
- 89227 The `-I` option previously indicated that its use was undefined when no files were explicitly
89228 named. This behavior was historical and placed an unnecessary restriction on future
89229 implementations. It has been removed.
- 89230 The historical BSD `grep -s` option practice is easily duplicated by redirecting standard output to
89231 `/dev/null`. The `-s` option required here is from System V.
- 89232 The `-x` option, historically available only with `fgrep`, is available here for all of the non-
89233 obsolescent versions.
- 89234 **FUTURE DIRECTIONS**
- 89235 None.
- 89236 **SEE ALSO**
- 89237 [*sed*](#)

- 89239 **CHANGE HISTORY**
- 89240 First released in Issue 2.
- 89241 **Issue 6**
- 89242 The Open Group Corrigendum U029/5 is applied, correcting the SYNOPSIS.
- 89243 The normative text is reworded to avoid use of the term “must” for application requirements.
- 89244 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/28 is applied, correcting the examples
89245 using the `grep -F` option which did not match the normative description of the `-F` option.
- 89246 **Issue 7**
- 89247 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
- 89248 SD5-XCU-ERN-98 is applied, updating the STDOUT section.

89249 **NAME**

89250 hash — remember or report utility locations

89251 **SYNOPSIS**89252 hash [*utility*. . .]

89253 hash -r

89254 **DESCRIPTION**

89255 The *hash* utility shall affect the way the current shell environment remembers the locations of
 89256 utilities found as described in [Section 2.9.1.1](#) (on page 2264). Depending on the arguments
 89257 specified, it shall add utility locations to its list of remembered locations or it shall purge the
 89258 contents of the list. When no arguments are specified, it shall report on the contents of the list.

89259 Utilities provided as built-ins to the shell shall not be reported by *hash*.89260 **OPTIONS**89261 The *hash* utility shall conform to XBD [Section 12.2](#) (on page 201).

89262 The following option shall be supported:

89263 -r Forget all previously remembered utility locations.

89264 **OPERANDS**

89265 The following operand shall be supported:

89266 *utility* The name of a utility to be searched for and added to the list of remembered
 89267 locations. If *utility* contains one or more slashes, the results are unspecified.

89268 **STDIN**

89269 Not used.

89270 **INPUT FILES**

89271 None.

89272 **ENVIRONMENT VARIABLES**89273 The following environment variables shall affect the execution of *hash*:

89274 *LANG* Provide a default value for the internationalization variables that are unset or null.
 89275 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 89276 variables used to determine the values of locale categories.)

89277 *LC_ALL* If set to a non-empty string value, override the values of all the other
 89278 internationalization variables.

89279 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 89280 characters (for example, single-byte as opposed to multi-byte characters in
 89281 arguments).

89282 *LC_MESSAGES*

89283 Determine the locale that should be used to affect the format and contents of
 89284 diagnostic messages written to standard error.

89285 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

89286 *PATH* Determine the location of *utility*, as described in XBD [Chapter 8](#) (on page 159).

89287 **ASYNCHRONOUS EVENTS**

89288 Default.

89289 **STDOUT**

89290 The standard output of *hash* shall be used when no arguments are specified. Its format is
 89291 unspecified, but includes the pathname of each utility in the list of remembered locations for the
 89292 current shell environment. This list shall consist of those utilities named in previous *hash*
 89293 invocations that have been invoked, and may contain those invoked and found through the
 89294 normal command search process.

89295 **STDERR**

89296 The standard error shall be used only for diagnostic messages.

89297 **OUTPUT FILES**

89298 None.

89299 **EXTENDED DESCRIPTION**

89300 None.

89301 **EXIT STATUS**

89302 The following exit values shall be returned:

89303 0 Successful completion.

89304 >0 An error occurred.

89305 **CONSEQUENCES OF ERRORS**

89306 Default.

89307 **APPLICATION USAGE**

89308 Since *hash* affects the current shell execution environment, it is always provided as a shell
 89309 regular built-in. If it is called in a separate utility execution environment, such as one of the
 89310 following:

```
89311 nohup hash -r
89312 find . -type f | xargs hash
```

89313 it does not affect the command search process of the caller's environment.

89314 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities
 89315 found through normal command search are not listed by the *hash* command.

89316 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the
 89317 simplest form, this can be:

89318 `PATH= "$PATH"`

89319 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a
 89320 performance improvement on a few implementations; normally, the hashing process is included
 89321 by default.

89322 **EXAMPLES**

89323 None.

89324 **RATIONALE**

89325 None.

89326 **FUTURE DIRECTIONS**

89327 None.

89331

CHANGE HISTORY

89332

First released in Issue 2.

89333

Issue 7

89334

The *hash* utility is moved from the XSI option to the Base.

89335 **NAME**

89336 head — copy the first part of files

89337 **SYNOPSIS**89338 head [*-n number*] [*file...*]89339 **DESCRIPTION**89340 The *head* utility shall copy its input files to the standard output, ending the output for each file at
89341 a designated point.89342 Copying shall end at the point in each input file indicated by the *-n number* option. The option-
89343 argument *number* shall be counted in units of lines.89344 **OPTIONS**89345 The *head* utility shall conform to XBD [Section 12.2](#) (on page 201).

89346 The following option shall be supported:

89347 *-n number* The first *number* lines of each input file shall be copied to standard output. The
89348 application shall ensure that the *number* option-argument is a positive decimal
89349 integer.89350 When a file contains less than *number* lines, it shall be copied to standard output in its entirety.
89351 This shall not be an error.89352 If no options are specified, *head* shall act as if *-n 10* had been specified.89353 **OPERANDS**

89354 The following operand shall be supported:

89355 *file* A pathname of an input file. If no *file* operands are specified, the standard input
89356 shall be used.89357 **STDIN**89358 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES
89359 section.89360 **INPUT FILES**

89361 Input files shall be text files, but the line length is not restricted to {LINE_MAX} bytes.

89362 **ENVIRONMENT VARIABLES**89363 The following environment variables shall affect the execution of *head*:89364 *LANG* Provide a default value for the internationalization variables that are unset or null.
89365 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
89366 variables used to determine the values of locale categories.)89367 *LC_ALL* If set to a non-empty string value, override the values of all the other
89368 internationalization variables.89369 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
89370 characters (for example, single-byte as opposed to multi-byte characters in
89371 arguments and input files).89372 *LC_MESSAGES*89373 Determine the locale that should be used to affect the format and contents of
89374 diagnostic messages written to standard error.89375 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

89376 **ASYNCHRONOUS EVENTS**

89377 Default.

89378 **STDOUT**

89379 The standard output shall contain designated portions of the input files.

89380 If multiple *file* operands are specified, *head* shall precede the output for each with the header:89381 "`\n==> %s <==\n`", *<pathname>*89382 except that the first header written shall not include the initial `<newline>`.89383 **STDERR**

89384 The standard error shall be used only for diagnostic messages.

89385 **OUTPUT FILES**

89386 None.

89387 **EXTENDED DESCRIPTION**

89388 None.

89389 **EXIT STATUS**

89390 The following exit values shall be returned:

89391 0 Successful completion.

89392 >0 An error occurred.

89393 **CONSEQUENCES OF ERRORS**

89394 Default.

89395 **APPLICATION USAGE**

89396 None.

89397 **EXAMPLES**

89398 To write the first ten lines of all files (except those with a leading period) in the directory:

89399 `head -- *`89400 **RATIONALE**89401 Although it is possible to simulate *head* with *sed* 10q for a single file, the standard developers
89402 decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside
89403 *tail*.89404 POSIX.1-200x version of *head* follows the Utility Syntax Guidelines. The `-n` option was added to
89405 this new interface so that *head* and *tail* would be more logically related. Earlier versions of this
89406 standard allowed a `-number` option. This form is no longer specified by POSIX.1-200x but may
89407 be present in some implementations.89408 There is no `-c` option (as there is in *tail*) because it is not historical practice and because other
89409 utilities in this volume of POSIX.1-200x provide similar functionality.89410 **FUTURE DIRECTIONS**

89411 None.

89412 **SEE ALSO**89413 *sed*, *tail*

89414 XBD Chapter 8 (on page 159), Section 12.2 (on page 201)

89415 **CHANGE HISTORY**

89416 First released in Issue 4.

89417	Issue 6		
89418		The obsolescent –number form is removed.	
89419		The normative text is reworded to avoid use of the term “must” for application requirements.	
89420		The DESCRIPTION is updated to clarify that when a file contains less than the number of lines requested, the entire file is copied to standard output.	
89421			
89422	Issue 7		
89423		Austin Group Interpretation 1003.1-2001 #027 is applied.	
89424		SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.	
89425		The APPLICATION USAGE section is removed and the EXAMPLES section is corrected.	+

89426 **NAME**

89427 iconv — codeset conversion

89428 **SYNOPSIS**89429 iconv [-cs] -f *frommap* -t *tomap* [*file...*]89430 iconv -f *fromcode* [-cs] [-t *tocode*] [*file...*]89431 iconv -t *tocode* [-cs] [-f *fromcode*] [*file...*]

89432 iconv -l

89433 **DESCRIPTION**89434 The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and
89435 write the results to standard output.89436 When the options indicate that charmap files are used to specify the codesets (see **OPTIONS**),
89437 the codeset conversion shall be accomplished by performing a logical join on the symbolic
89438 character names in the two charmaps. The implementation need not support the use of charmap
89439 files for codeset conversion unless the POSIX2_LOCALEDEF symbol is defined on the system.89440 **OPTIONS**89441 The *iconv* utility shall conform to XBD [Section 12.2](#) (on page 201).

89442 The following options shall be supported:

89443 **-c** Omit any characters that are invalid in the codeset of the input file from the
89444 output. When **-c** is not used, the results of encountering invalid characters in the
89445 input stream (either those that are not characters in the codeset of the input file or
89446 that have no corresponding character in the codeset of the output file) shall be
89447 specified in the system documentation. The presence or absence of **-c** shall not
89448 affect the exit status of *iconv*.89449 **-f** *fromcodeset*89450 Identify the codeset of the input file. The implementation shall recognize the
89451 following two forms of the *fromcodeset* option-argument:89452 *fromcode* The *fromcode* option-argument must not contain a slash character. It
89453 shall be interpreted as the name of one of the codeset descriptions
89454 provided by the implementation in an unspecified format. Valid
89455 values of *fromcode* are implementation-defined.89456 *frommap* The *frommap* option-argument must contain a slash character. It shall
89457 be interpreted as the pathname of a charmap file as defined in XBD
89458 [Section 6.4](#) (on page 115). If the pathname does not represent a valid,
89459 readable charmap file, the results are undefined.

89460 If this option is omitted, the codeset of the current locale shall be used.

89461 **-l** Write all supported *fromcode* and *tocode* values to standard output in an unspecified
89462 format.89463 **-s** Suppress any messages written to standard error concerning invalid characters.
89464 When **-s** is not used, the results of encountering invalid characters in the input
89465 stream (either those that are not valid characters in the codeset of the input file or
89466 that have no corresponding character in the codeset of the output file) shall be
89467 specified in the system documentation. The presence or absence of **-s** shall not
89468 affect the exit status of *iconv*.

- 89469 **-t tocodeset** Identify the codeset to be used for the output file. The implementation shall
89470 recognize the following two forms of the *tocodeset* option-argument:
- 89471 *tocode* The semantics shall be equivalent to the *-f fromcode* option.
- 89472 *tomap* The semantics shall be equivalent to the *tomap* option.
- 89473 If this option is omitted, the codeset of the current locale shall be used.
- 89474 If either *-f* or *-t* represents a charmap file, but the other does not (or is omitted), or both *-f* and
89475 *-t* are omitted, the results are undefined.

OPERANDS

89476 The following operand shall be supported:

- 89478 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is
89479 *'-'*, the standard input shall be used.

STDIN

89480 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.
89481

INPUT FILES

89482 The input file shall be a text file.
89483

ENVIRONMENT VARIABLES

89484 The following environment variables shall affect the execution of *iconv*:

- 89486 **LANG** Provide a default value for the internationalization variables that are unset or null. |
89487 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
89488 variables used to determine the values of locale categories.)
- 89489 **LC_ALL** If set to a non-empty string value, override the values of all the other
89490 internationalization variables.
- 89491 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
89492 characters (for example, single-byte as opposed to multi-byte characters in
89493 arguments). During translation of the file, this variable is superseded by the use of
89494 the *fromcode* option-argument.
- 89495 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
89496 diagnostic messages written to standard error.
89497
- 89498 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

89499 Default.
89500

STDOUT

89501 When the *-l* option is used, the standard output shall contain all supported *fromcode* and *tocode*
89502 values, written in an unspecified format.
89503

89504 When the *-l* option is not used, the standard output shall contain the sequence of characters
89505 read from the input files, translated to the specified codeset. Nothing else shall be written to the
89506 standard output.

STDERR

89507 The standard error shall be used only for diagnostic messages.
89508

OUTPUT FILES

89509 None.
89510

89511 **EXTENDED DESCRIPTION**

89512 None.

89513 **EXIT STATUS**

89514 The following exit values shall be returned:

89515 0 Successful completion.

89516 >0 An error occurred.

89517 **CONSEQUENCES OF ERRORS**

89518 Default.

89519 **APPLICATION USAGE**89520 The user must ensure that both charmap files use the same symbolic names for characters the
89521 two codesets have in common.89522 **EXAMPLES**89523 The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:2001
89524 standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file
89525 **mail.local**:89526 `iconv -f IS6937 -t IS8859 mail.x400 > mail.local`89527 **RATIONALE**89528 The *iconv* utility can be used portably only when the user provides two charmap files as option-
89529 arguments. This is because a single charmap provided by the user cannot reliably be joined with
89530 the names in a system-provided character set description. The valid values for *fromcode* and
89531 *tocode* are implementation-defined and do not have to have any relation to the charmap
89532 mechanisms. As an aid to interactive users, the **-I** option was adopted from the Plan 9 operating
89533 system. It writes information concerning these implementation-defined values. The format is
89534 unspecified because there are many possible useful formats that could be chosen, such as a
89535 matrix of valid combinations of *fromcode* and *tocode*. The **-I** option is not intended for shell script
89536 usage; conforming applications will have to use charmaps.89537 **FUTURE DIRECTIONS**

89538 None.

89539 **SEE ALSO**89540 *gencat*89541 XBD [Section 6.4](#) (on page 115), [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +89542 **CHANGE HISTORY**

89543 First released in Issue 3.

89544 **Issue 6**89545 This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the
89546 ability to use charmap files for conversion has been added.89547 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address
89548 inconsistencies with the *iconv()* function in the System Interfaces volume of POSIX.1-200x.89549 **Issue 7**

89550 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89551 **NAME**89552 `id` — return user identity89553 **SYNOPSIS**89554 `id` [*user*]89555 `id -G` [*-n*] [*user*]89556 `id -g` [*-nr*] [*user*]89557 `id -u` [*-nr*] [*user*]89558 **DESCRIPTION**

89559 If no *user* operand is provided, the *id* utility shall write the user and group IDs and the
 89560 corresponding user and group names of the invoking process to standard output. If the effective
 89561 and real IDs do not match, both shall be written. If multiple groups are supported by the
 89562 underlying system (see the description of {NGROUPS_MAX} in the System Interfaces volume of
 89563 POSIX.1-200x), the supplementary group affiliations of the invoking process shall also be
 89564 written.

89565 If a *user* operand is provided and the process has the appropriate privileges, the user and group
 89566 IDs of the selected user shall be written. In this case, effective IDs shall be assumed to be
 89567 identical to real IDs. If the selected user has more than one allowable group membership listed
 89568 in the group database, these shall be written in the same manner as the supplementary groups
 89569 described in the preceding paragraph.

89570 **OPTIONS**89571 The *id* utility shall conform to XBD [Section 12.2](#) (on page 201).

89572 The following options shall be supported:

89573 **-G** Output all different group IDs (effective, real, and supplementary) only, using the
 89574 format "*%u\n*". If there is more than one distinct group affiliation, output each
 89575 such affiliation, using the format " *%u*", before the <newline> is output.

89576 **-g** Output only the effective group ID, using the format "*%u\n*".

89577 **-n** Output the name in the format "*%s*" instead of the numeric ID using the format
 89578 "*%u*".

89579 **-r** Output the real ID instead of the effective ID.

89580 **-u** Output only the effective user ID, using the format "*%u\n*".

89581 **OPERANDS**

89582 The following operand shall be supported:

89583 *user* The login name for which information is to be written.

89584 **STDIN**

89585 Not used.

89586 **INPUT FILES**

89587 None.

89588 **ENVIRONMENT VARIABLES**89589 The following environment variables shall affect the execution of *id*:

89590 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 89591 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 89592 variables used to determine the values of locale categories.)

89593	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
89594		
89595	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
89596		
89597		
89598	<i>LC_MESSAGES</i>	
89599		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
89600		
89601		
89602	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .

ASYNCHRONOUS EVENTS

Default.

STDOUT

The following formats shall be used when the *LC_MESSAGES* locale category specifies the POSIX locale. In other locales, the strings *uid*, *gid*, *euid*, *egid*, and *groups* may be replaced with more appropriate strings corresponding to the locale.

```
"uid=%u(%s) gid=%u(%s)\n", <real user ID>, <user-name>,
  <real group ID>, <group-name>
```

If the effective and real user IDs do not match, the following shall be inserted immediately before the '\n' character in the previous format:

```
" euid=%u(%s) "
```

with the following arguments added at the end of the argument list:

```
<effective user ID>, <effective user-name>
```

If the effective and real group IDs do not match, the following shall be inserted directly before the '\n' character in the format string (and after any addition resulting from the effective and real user IDs not matching):

```
" egid=%u(%s) "
```

with the following arguments added at the end of the argument list:

```
<effective group-ID>, <effective group name>
```

If the process has supplementary group affiliations or the selected user is allowed to belong to multiple groups, the first shall be added directly before the <newline> in the format string:

```
" groups=%u(%s) "
```

with the following arguments added at the end of the argument list:

```
<supplementary group ID>, <supplementary group name>
```

and the necessary number of the following added after that for any remaining supplementary group IDs:

```
", %u(%s) "
```

and the necessary number of the following arguments added at the end of the argument list:

```
<supplementary group ID>, <supplementary group name>
```

If any of the user ID, group ID, effective user ID, effective group ID, or supplementary/multiple group IDs cannot be mapped by the system into printable user or group names, the corresponding "(%s)" and *name* argument shall be omitted from the corresponding format string.

89636 When any of the options are specified, the output format shall be as described in the OPTIONS
89637 section.

89638 **STDERR**

89639 The standard error shall be used only for diagnostic messages.

89640 **OUTPUT FILES**

89641 None.

89642 **EXTENDED DESCRIPTION**

89643 None.

89644 **EXIT STATUS**

89645 The following exit values shall be returned:

89646 0 Successful completion.

89647 >0 An error occurred.

89648 **CONSEQUENCES OF ERRORS**

89649 Default.

89650 **APPLICATION USAGE**

89651 Output produced by the `-G` option and by the default case could potentially produce very long
89652 lines on systems that support large numbers of supplementary groups. (On systems with user
89653 and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per
89654 name, 93 supplementary groups plus distinct effective and real group and user IDs could
89655 theoretically overflow the 2048-byte {LINE_MAX} text file line limit on the default output case.
89656 It would take about 186 supplementary groups to overflow the 2048-byte barrier using `id -G`.
89657 This is not expected to be a problem in practice, but in cases where it is a concern, applications
89658 should consider using `fold -s` before postprocessing the output of `id`.

89659 **EXAMPLES**

89660 None.

89661 **RATIONALE**

89662 The functionality provided by the 4 BSD `groups` utility can be simulated using:

89663 `id -Gn [user]`

89664 The 4 BSD command `groups` was considered, but it was not included because it did not provide
89665 the functionality of the `id` utility of the SVID. Also, it was thought that it would be easier to
89666 modify `id` to provide the additional functionality necessary to systems with multiple groups than
89667 to invent another command.

89668 The options `-u`, `-g`, `-n`, and `-r` were added to ease the use of `id` with shell commands
89669 substitution. Without these options it is necessary to use some preprocessor such as `sed` to select
89670 the desired piece of information. Since output such as that produced by:

89671 `id -u -n`

89672 is frequently wanted, it seemed desirable to add the options.

89673 **FUTURE DIRECTIONS**

89674 None.

89675 **SEE ALSO**

89676 [fold](#), [logname](#), [who](#)

CHANGE HISTORY

89680

First released in Issue 2.

89681

Issue 7

89682

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89683 **NAME**
 89684 ipcrm — remove an XSI message queue, semaphore set, or shared memory segment identifier

89685 **SYNOPSIS**
 89686 XSI ipcrm [-q msgid|-Q msgkey|-s semid|-S semkey|-m shmid|-M shmkey]...

89687 **DESCRIPTION**
 89688 The *ipcrm* utility shall remove zero or more message queues, semaphore sets, or shared memory
 89689 segments. The interprocess communication facilities to be removed are specified by the options.

89690 Only a user with appropriate privilege shall be allowed to remove an interprocess
 89691 communication facility that was not created by or owned by the user invoking *ipcrm*.

89692 **OPTIONS**
 89693 The *ipcrm* utility shall conform to XBD [Section 12.2](#) (on page 201).

89694 The following options shall be supported:

89695 **-q msgid** Remove the message queue identifier *msgid* from the system and destroy the
 89696 message queue and data structure associated with it.

89697 **-m shmid** Remove the shared memory identifier *shmid* from the system. The shared memory
 89698 segment and data structure associated with it shall be destroyed after the last
 89699 detach.

89700 **-s semid** Remove the semaphore identifier *semid* from the system and destroy the set of
 89701 semaphores and data structure associated with it.

89702 **-Q msgkey** Remove the message queue identifier, created with key *msgkey*, from the system
 89703 and destroy the message queue and data structure associated with it.

89704 **-M shmkey** Remove the shared memory identifier, created with key *shmkey*, from the system.
 89705 The shared memory segment and data structure associated with it shall be
 89706 destroyed after the last detach.

89707 **-S semkey** Remove the semaphore identifier, created with key *semkey*, from the system and
 89708 destroy the set of semaphores and data structure associated with it.

89709 **OPERANDS**
 89710 None.

89711 **STDIN**
 89712 Not used.

89713 **INPUT FILES**
 89714 None.

89715 **ENVIRONMENT VARIABLES**
 89716 The following environment variables shall affect the execution of *ipcrm*:

89717 **LANG** Provide a default value for the internationalization variables that are unset or null.
 89718 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 89719 variables used to determine the values of locale categories.)

89720 **LC_ALL** If set to a non-empty string value, override the values of all the other
 89721 internationalization variables.

89722 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 89723 characters (for example, single-byte as opposed to multi-byte characters in
 89724 arguments).

- 89725 *LC_MESSAGES*
- 89726 Determine the locale that should be used to affect the format and contents of
89727 diagnostic messages written to standard error.
- 89728 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 89729 **ASYNCHRONOUS EVENTS**
- 89730 Default.
- 89731 **STDOUT**
- 89732 Not used.
- 89733 **STDERR**
- 89734 The standard error shall be used only for diagnostic messages.
- 89735 **OUTPUT FILES**
- 89736 None.
- 89737 **EXTENDED DESCRIPTION**
- 89738 None.
- 89739 **EXIT STATUS**
- 89740 The following exit values shall be returned:
- 89741 0 Successful completion.
- 89742 >0 An error occurred.
- 89743 **CONSEQUENCES OF ERRORS**
- 89744 Default.
- 89745 **APPLICATION USAGE**
- 89746 None.
- 89747 **EXAMPLES**
- 89748 None.
- 89749 **RATIONALE**
- 89750 None.
- 89751 **FUTURE DIRECTIONS**
- 89752 None.

- 89754 *ipcs*
- 89755 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)
- 89756 XSH *msgctl()*, *semctl()*, *shmctl()*
- 89757 **CHANGE HISTORY**
- 89758 First released in Issue 5.
- 89759 **Issue 7**
- 89760 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

89761 **NAME**
 89762 `ipcs` — report XSI interprocess communication facilities status

89763 **SYNOPSIS**
 89764 XSI `ipcs [-qms] [-a|-bcopt]`

89765 **DESCRIPTION**
 89766 The `ipcs` utility shall write information about active interprocess communication facilities.
 89767 Without options, information shall be written in short format for message queues, shared
 89768 memory segments, and semaphore sets that are currently active in the system. Otherwise, the
 89769 information that is displayed is controlled by the options specified.

89770 **OPTIONS**
 89771 The `ipcs` utility shall conform to XBD [Section 12.2](#) (on page 201).

89772 The `ipcs` utility accepts the following options:

89773 `-q` Write information about active message queues.

89774 `-m` Write information about active shared memory segments.

89775 `-s` Write information about active semaphore sets.

89776 If `-q`, `-m`, or `-s` are specified, only information about those facilities shall be written. If none of
 89777 these three are specified, information about all three shall be written subject to the following
 89778 options:

89779 `-a` Use all print options. (This is a shorthand notation for `-b`, `-c`, `-o`, `-p`, and `-t`.)

89780 `-b` Write information on maximum allowable size. (Maximum number of bytes in
 89781 messages on queue for message queues, size of segments for shared memory, and
 89782 number of semaphores in each set for semaphores.)

89783 `-c` Write creator's user name and group name; see below.

89784 `-o` Write information on outstanding usage. (Number of messages on queue and total
 89785 number of bytes in messages on queue for message queues, and number of
 89786 processes attached to shared memory segments.)

89787 `-p` Write process number information. (Process ID of the last process to send a
 89788 message and process ID of the last process to receive a message on message
 89789 queues, process ID of the creating process, and process ID of the last process to
 89790 attach or detach on shared memory segments.)

89791 `-t` Write time information. (Time of the last control operation that changed the access
 89792 permissions for all facilities, time of the last `msgsnd()` and `msgrcv()` operations on
 89793 message queues, time of the last `shmat()` and `shmdt()` operations on shared
 89794 memory, and time of the last `semop()` operation on semaphores.)

89795 **OPERANDS**
 89796 None.

89797 **STDIN**
 89798 Not used.

89799 **INPUT FILES**

- 89800 • The group database
- 89801 • The user database

89802 **ENVIRONMENT VARIABLES**

89803 The following environment variables shall affect the execution of *ipcs*:

89804 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 89805 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 89806 variables used to determine the values of locale categories.)

89807 **LC_ALL** If set to a non-empty string value, override the values of all the other
 89808 internationalization variables.

89809 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 89810 characters (for example, single-byte as opposed to multi-byte characters in
 89811 arguments).

89812 **LC_MESSAGES**
 89813 Determine the locale that should be used to affect the format and contents of
 89814 diagnostic messages written to standard error.

89815 **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

89816 **TZ** Determine the timezone for the date and time strings written by *ipcs*. If *TZ* is unset
 89817 or null, an unspecified default timezone shall be used.

89818 **ASYNCHRONOUS EVENTS**

89819 Default.

89820 **STDOUT**

89821 An introductory line shall be written with the format:

89822 "IPC status from %s as of %s\n", <source>, <date>

89823 where <source> indicates the source used to gather the statistics and <date> is the information
 89824 that would be produced by the *date* command when invoked in the POSIX locale.

89825 The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options.
 89826 The first report shall indicate the status of message queues, the second report shall indicate the
 89827 status of shared memory segments, and the third report shall indicate the status of semaphore
 89828 sets.

89829 If the corresponding facility is not installed or has not been used since the last reboot, then the
 89830 report shall be written out in the format:

89831 "%s facility not in system.\n", <facility>

89832 where <facility> is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has
 89833 been installed and has been used since the last reboot, column headings separated by one or
 89834 more spaces and followed by a <newline> shall be written as indicated below followed by the
 89835 facility name written out using the format:

89836 "%s:\n", <facility>

89837 where <facility> is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second
 89838 and third reports the column headings need not be written if the last column headings written
 89839 already provide column headings for all information in that report.

89840 The column headings provided in the first column below and the meaning of the information in
 89841 those columns shall be given in order below; the letters in parentheses indicate the options that
 89842 shall cause the corresponding column to appear; "all" means that the column shall always

89843		appear. Each column is separated by one or more <space>s. Note that these options only
89844		determine what information is provided for each report; they do not determine which reports
89845		are written.
89846	T (all)	Type of facility:
89847		q Message queue.
89848		m Shared memory segment.
89849		s Semaphore.
89850		This field is a single character written using the format %c.
89851	ID (all)	The identifier for the facility entry. This field shall be written using the format
89852		%d.
89853	KEY (all)	The key used as an argument to <i>msgget()</i> , <i>semget()</i> , or <i>shmget()</i> to create the
89854		facility entry.
89855		Note: The key of a shared memory segment is changed to IPC_PRIVATE when the
89856		segment has been removed until all processes attached to the segment
89857		detach it.
89858		This field shall be written using the format 0x%x.
89859	MODE (all)	The facility access modes and flags. The mode shall consist of 11 characters
89860		that are interpreted as follows.
89861		The first character shall be:
89862		S If a process is waiting on a <i>msgsnd()</i> operation.
89863		– If the above is not true.
89864		The second character shall be:
89865		R If a process is waiting on a <i>msgrcv()</i> operation.
89866		C or – If the associated shared memory segment is to be cleared when the
89867		first attach operation is executed.
89868		– If none of the above is true.
89869		The next nine characters shall be interpreted as three sets of three bits each.
89870		The first set refers to the owner's permissions; the next to permissions of
89871		others in the usergroup of the facility entry; and the last to all others. Within
89872		each set, the first character indicates permission to read, the second character
89873		indicates permission to write or alter the facility entry, and the last character is
89874		a minus sign ('-').
89875		The permissions shall be indicated as follows:
89876		r If read permission is granted.
89877		w If write permission is granted.
89878		a If alter permission is granted.
89879		– If the indicated permission is not granted.
89880		The first character following the permissions specifies if there is an alternate or
89881		additional access control method associated with the facility. If there is no
89882		alternate or additional access control method associated with the facility, a
89883		single <space> shall be written; otherwise, another printable character is
89884		written.

89885	OWNER (all)	The user name of the owner of the facility entry. If the user name of the owner is found in the user database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the user ID of the owner shall be written using the format %d.
89886		
89887		
89888		
89889	GROUP (all)	The group name of the owner of the facility entry. If the group name of the owner is found in the group database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the group ID of the owner shall be written using the format %d.
89890		
89891		
89892		
89893	The following nine columns shall be only written out for message queues:	
89894	CREATOR (a,c)	The user name of the creator of the facility entry. If the user name of the creator is found in the user database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the user ID of the creator shall be written using the format %d.
89895		
89896		
89897		
89898	CGROUP (a,c)	The group name of the creator of the facility entry. If the group name of the creator is found in the group database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the group ID of the creator shall be written using the format %d.
89899		
89900		
89901		
89902	CBYTES (a,o)	The number of bytes in messages currently outstanding on the associated message queue. This field shall be written using the format %d.
89903		
89904	QNUM (a,o)	The number of messages currently outstanding on the associated message queue. This field shall be written using the format %d.
89905		
89906	QBYTES (a,b)	The maximum number of bytes allowed in messages outstanding on the associated message queue. This field shall be written using the format %d.
89907		
89908	LSPID (a,p)	The process ID of the last process to send a message to the associated queue. This field shall be written using the format:
89909		
89910		"%d", <pid>
89911		where <pid> is 0 if no message has been sent to the corresponding message queue; otherwise, <pid> shall be the process ID of the last process to send a message to the queue.
89912		
89913		
89914	LRPID (a,p)	The process ID of the last process to receive a message from the associated queue. This field shall be written using the format:
89915		
89916		"%d", <pid>
89917		where <pid> is 0 if no message has been received from the corresponding message queue; otherwise, <pid> shall be the process ID of the last process to receive a message from the queue.
89918		
89919		
89920	STIME (a,t)	The time the last message was sent to the associated queue. If a message has been sent to the corresponding message queue, the hour, minute, and second of the last time a message was sent to the queue shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format "no-entry" shall be written.
89921		
89922		
89923		
89924		
89925	RTIME (a,t)	The time the last message was received from the associated queue. If a message has been received from the corresponding message queue, the hour, minute, and second of the last time a message was received from the queue shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format "no-entry" shall be written.
89926		
89927		
89928		
89929		
89930	The following eight columns shall be only written out for shared memory segments.	

89931	CREATOR (a,c)	The user of the creator of the facility entry. If the user name of the creator is found in the user database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the user ID of the creator shall be written using the format %d.
89932		
89933		
89934		
89935	CGROUP (a,c)	The group name of the creator of the facility entry. If the group name of the creator is found in the group database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the group ID of the creator shall be written using the format %d.
89936		
89937		
89938		
89939	NATTCH (a,o)	The number of processes attached to the associated shared memory segment. This field shall be written using the format %d.
89940		
89941	SEGSZ (a,b)	The size of the associated shared memory segment. This field shall be written using the format %d.
89942		
89943	CPID (a,p)	The process ID of the creator of the shared memory entry. This field shall be written using the format %d.
89944		
89945	LPID (a,p)	The process ID of the last process to attach or detach the shared memory segment. This field shall be written using the format:
89946		
89947		"%d", <pid>
89948		where <pid> is 0 if no process has attached the corresponding shared memory segment; otherwise, <pid> shall be the process ID of the last process to attach or detach the segment.
89949		
89950		
89951	ATIME (a,t)	The time the last attach on the associated shared memory segment was completed. If the corresponding shared memory segment has ever been attached, the hour, minute, and second of the last time the segment was attached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be written.
89952		
89953		
89954		
89955		
89956	DTIME (a,t)	The time the last detach on the associated shared memory segment was completed. If the corresponding shared memory segment has ever been detached, the hour, minute, and second of the last time the segment was detached shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be written.
89957		
89958		
89959		
89960		
89961		The following four columns shall be only written out for semaphore sets:
89962	CREATOR (a,c)	The user of the creator of the facility entry. If the user name of the creator is found in the user database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the user ID of the creator shall be written using the format %d.
89963		
89964		
89965		
89966	CGROUP (a,c)	The group name of the creator of the facility entry. If the group name of the creator is found in the group database, at least the first eight column positions of the name shall be written using the format %s. Otherwise, the group ID of the creator shall be written using the format %d.
89967		
89968		
89969		
89970	NSEMS (a,b)	The number of semaphores in the set associated with the semaphore entry. This field shall be written using the format %d.
89971		
89972	OTIME (a,t)	The time the last semaphore operation on the set associated with the semaphore entry was completed. If a semaphore operation has ever been performed on the corresponding semaphore set, the hour, minute, and second of the last semaphore operation on the semaphore set shall be written using the format %d:%2.2d:%2.2d. Otherwise, the format " no-entry" shall be written.
89973		
89974		
89975		
89976		
89977		

89978 The following column shall be written for all three reports when it is requested:

89979 **CTIME (a,t)** The time the associated entry was created or changed. The hour, minute, and
 89980 second of the time when the associated entry was created shall be written
 89981 using the format %d:%2 . 2d:%2 . 2d.

89982 **STDERR**

89983 The standard error shall be used only for diagnostic messages.

89984 **OUTPUT FILES**

89985 None.

89986 **EXTENDED DESCRIPTION**

89987 None.

89988 **EXIT STATUS**

89989 The following exit values shall be returned:

89990 0 Successful completion.

89991 >0 An error occurred.

89992 **CONSEQUENCES OF ERRORS**

89993 Default.

89994 **APPLICATION USAGE**

89995 Things can change while *ipcs* is running; the information it gives is guaranteed to be accurate
 89996 only when it was retrieved.

89997 **EXAMPLES**

89998 None.

89999 **RATIONALE**

90000 None.

90001 **FUTURE DIRECTIONS**

90002 None.

90003 **SEE ALSO**

90006 **CHANGE HISTORY**

90007 First released in Issue 5.

90008 **Issue 6**

90009 The Open Group Corrigendum U020/1 is applied, correcting the SYNOPSIS.

90010 The Open Group Corrigenda U032/1 and U032/2 are applied, clarifying the output format.

90011 The Open Group Base Resolution bwg98-004 is applied.

90012 **Issue 7**

90013 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90014 **NAME**
 90015 `jobs` — display status of jobs in the current session

90016 **SYNOPSIS**
 90017 UP `jobs [-l|-p] [job_id...]`

90018 **DESCRIPTION**
 90019 The *jobs* utility shall display the status of jobs that were started in the current shell environment;
 90020 see [Section 2.12](#) (on page 2277).

90021 When *jobs* reports the termination status of a job, the shell shall remove its process ID from the
 90022 list of those “known in the current shell execution environment”; see [Section 2.9.3.1](#) (on page
 90023 2266).

90024 **OPTIONS**
 90025 The *jobs* utility shall conform to XBD [Section 12.2](#) (on page 201).

90026 The following options shall be supported:

90027 `-l` (The letter ell.) Provide more information about each job listed. This information
 90028 shall include the job number, current job, process group ID, state, and the
 90029 command that formed the job.

90030 `-p` Display only the process IDs for the process group leaders of the selected jobs.

90031 By default, the *jobs* utility shall display the status of all stopped jobs, running background jobs
 90032 and all jobs whose status has changed and have not been reported by the shell.

90033 **OPERANDS**
 90034 The following operand shall be supported:

90035 *job_id* Specifies the jobs for which the status is to be displayed. If no *job_id* is given, the
 90036 status information for all jobs shall be displayed. The format of *job_id* is described
 90037 in XBD [Section 3.202](#) (on page 61).

90038 **STDIN**
 90039 Not used.

90040 **INPUT FILES**
 90041 None.

90042 **ENVIRONMENT VARIABLES**
 90043 The following environment variables shall affect the execution of *jobs*:

90044 *LANG* Provide a default value for the internationalization variables that are unset or null.
 90045 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 90046 variables used to determine the values of locale categories.)

90047 *LC_ALL* If set to a non-empty string value, override the values of all the other
 90048 internationalization variables.

90049 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 90050 characters (for example, single-byte as opposed to multi-byte characters in
 90051 arguments).

90052 *LC_MESSAGES*
 90053 Determine the locale that should be used to affect the format and contents of
 90054 diagnostic messages written to standard error and informative messages written to
 90055 standard output.

90056 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

90057 ASYNCHRONOUS EVENTS

90058 Default.

90059 STDOUT

90060 If the `-p` option is specified, the output shall consist of one line for each process ID:

90061 "`%d\n`", *<process ID>*

90062 Otherwise, if the `-l` option is not specified, the output shall be a series of lines of the form:

90063 "`[%d] %c %s %s\n`", *<job-number>*, *<current>*, *<state>*, *<command>*

90064 where the fields shall be as follows:

90065 *<current>* The character `'+'` identifies the job that would be used as a default for the *fg* or *bg*
 90066 utilities; this job can also be specified using the *job_id* `%+` or `"%%"`. The character
 90067 `'-'` identifies the job that would become the default if the current default job were
 90068 to exit; this job can also be specified using the *job_id* `%-`. For other jobs, this field is
 90069 a *<space>*. At most one job can be identified with `'+'` and at most one job can be
 90070 identified with `'-'`. If there is any suspended job, then the current job shall be a
 90071 suspended job. If there are at least two suspended jobs, then the previous job also
 90072 shall be a suspended job.

90073 *<job-number>* A number that can be used to identify the process group to the *wait*, *fg*, *bg*, and *kill*
 90074 utilities. Using these utilities, the job can be identified by prefixing the job number
 90075 with `'%'`.

90076 *<state>* One of the following strings (in the POSIX locale):

90077 **Running** Indicates that the job has not been suspended by a signal and has not
 90078 exited.

90079 **Done** Indicates that the job completed and returned exit status zero.

90080 **Done(*code*)** Indicates that the job completed normally and that it exited with the
 90081 specified non-zero exit status, *code*, expressed as a decimal number.

90082 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.

90083 **Stopped (SIGTSTP)**

90084 Indicates that the job was suspended by the SIGTSTP signal.

90085 **Stopped (SIGSTOP)**

90086 Indicates that the job was suspended by the SIGSTOP signal.

90087 **Stopped (SIGTTIN)**

90088 Indicates that the job was suspended by the SIGTTIN signal.

90089 **Stopped (SIGTTOU)**

90090 Indicates that the job was suspended by the SIGTTOU signal.

90091 The implementation may substitute the string **Suspended** in place of **Stopped**. If
 90092 the job was terminated by a signal, the format of *<state>* is unspecified, but it shall
 90093 be visibly distinct from all of the other *<state>* formats shown here and shall
 90094 indicate the name or description of the signal causing the termination.

90095 *<command>* The associated command that was given to the shell.

90096 If the `-l` option is specified, a field containing the process group ID shall be inserted before the
 90097 *<state>* field. Also, more processes in a process group may be output on separate lines, using
 90098 only the process ID and *<command>* fields.

90099 **STDERR**

90100 The standard error shall be used only for diagnostic messages.

90101 **OUTPUT FILES**

90102 None.

90103 **EXTENDED DESCRIPTION**

90104 None.

90105 **EXIT STATUS**

90106 The following exit values shall be returned:

90107 0 Successful completion.

90108 >0 An error occurred.

90109 **CONSEQUENCES OF ERRORS**

90110 Default.

90111 **APPLICATION USAGE**

90112 The `-p` option is the only portable way to find out the process group of a job because different
 90113 implementations have different strategies for defining the process group of the job. Usage such
 90114 as `$(jobs -p)` provides a way of referring to the process group of the job in an implementation-
 90115 independent way.

90116 The `jobs` utility does not work as expected when it is operating in its own utility execution
 90117 environment because that environment has no applicable jobs to manipulate. See the
 90118 APPLICATION USAGE section for `bg`. For this reason, `jobs` is generally implemented as a shell
 90119 regular built-in.

90120 **EXAMPLES**

90121 None.

90122 **RATIONALE**

90123 Both "`%%`" and "`%+`" are used to refer to the current job. Both forms are of equal validity—the
 90124 "`%%`" mirroring "`$$`" and "`%+`" mirroring the output of `jobs`. Both forms reflect historical
 90125 practice of the KornShell and the C shell with job control.

90126 The job control features provided by `bg`, `fg`, and `jobs` are based on the KornShell. The standard
 90127 developers examined the characteristics of the C shell versions of these utilities and found that
 90128 differences exist. Despite widespread use of the C shell, the KornShell versions were selected for
 90129 this volume of POSIX.1-200x to maintain a degree of uniformity with the rest of the KornShell
 90130 features selected (such as the very popular command line editing features).

90131 The `jobs` utility is not dependent on the job control option, as are the seemingly related `bg` and `fg`
 90132 utilities because `jobs` is useful for examining background jobs, regardless of the condition of job
 90133 control. When the user has invoked a `set +m` command and job control has been turned off, `jobs`
 90134 can still be used to examine the background jobs associated with that current session. Similarly,
 90135 `kill` can then be used to kill background jobs with `kill% <background job number>`.

90136 The output for terminated jobs is left unspecified to accommodate various historical systems.
 90137 The following formats have been witnessed:

- 90138 1. **Killed**(*signal name*)
- 90139 2. *signal name*
- 90140 3. *signal name*(**coredump**)
- 90141 4. *signal description*– **core dumped**

90142 Most users should be able to understand these formats, although it means that applications have
 90143 trouble parsing them.

90144 The calculation of job IDs was not described since this would suggest an implementation, which
 90145 may impose unnecessary restrictions.

90146 In an early proposal, a `-n` option was included to “Display the status of jobs that have changed,
 90147 exited, or stopped since the last status report”. It was removed because the shell always writes
 90148 any changed status of jobs before each prompt.

90149 FUTURE DIRECTIONS

90150 None.

90154 CHANGE HISTORY

90155 First released in Issue 4.

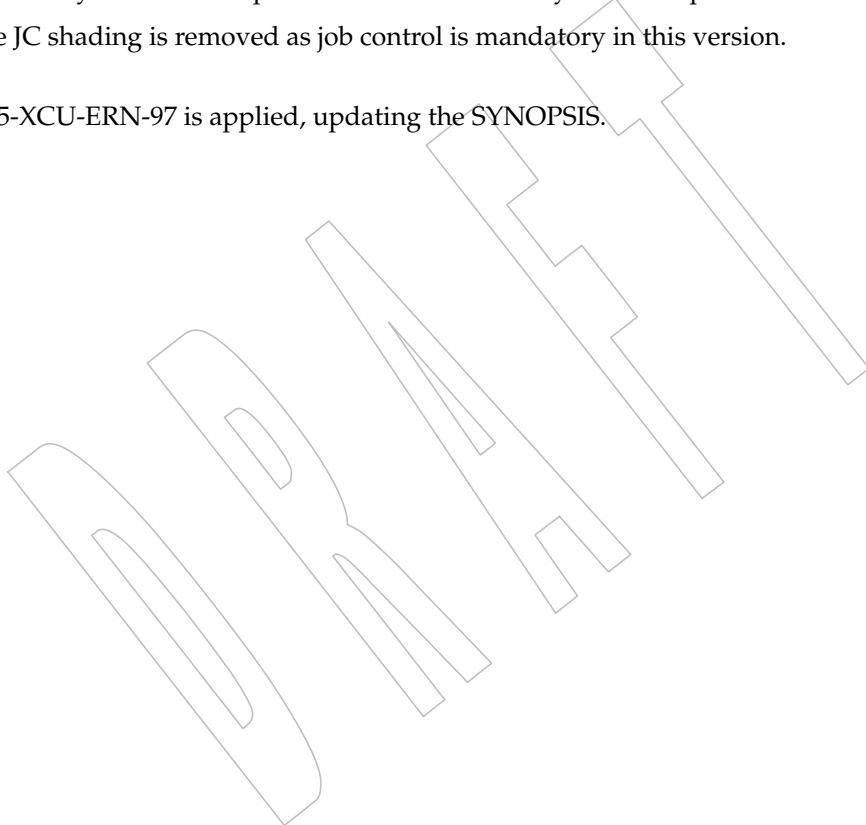

90156 Issue 6

90157 This utility is marked as part of the User Portability Utilities option.

90158 The JC shading is removed as job control is mandatory in this version. |

90159 Issue 7

90160 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90161 **NAME**
 90162 join — relational database operator

90163 **SYNOPSIS**
 90164 join [-a *file_number*|-v *file_number*] [-e *string*] [-o *list*] [-t *char*]
 90165 [-1 *field*] [-2 *field*] *file1 file2*

90166 **DESCRIPTION**
 90167 The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be
 90168 written to the standard output.

90169 The join field is a field in each file on which the files are compared. The *join* utility shall write
 90170 one line in the output for each pair of lines in *file1* and *file2* that have identical join fields. The
 90171 output line by default shall consist of the join field, then the remaining fields from *file1*, then the
 90172 remaining fields from *file2*. This format can be changed by using the **-o** option (see below). The
 90173 **-a** option can be used to add unmatched lines to the output. The **-v** option can be used to
 90174 output only unmatched lines.

90175 The files *file1* and *file2* shall be ordered in the collating sequence of *sort -b* on the fields on which
 90176 they shall be joined, by default the first in each line. All selected output shall be written in the
 90177 same collating sequence.

90178 The default input field separators shall be <blank>s. In this case, multiple separators shall count
 90179 as one field separator, and leading separators shall be ignored. The default output field
 90180 separator shall be a <space>.

90181 The field separator and collating sequence can be changed by using the **-t** option (see below).

90182 If the same key appears more than once in either file, all combinations of the set of remaining
 90183 fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines
 90184 encountered.

90185 If the input files are not in the appropriate collating sequence, the results are unspecified.

90186 **OPTIONS**
 90187 The *join* utility shall conform to XBD [Section 12.2](#) (on page 201).

90188 The following options shall be supported:

90189 **-a** *file_number*
 90190 Produce a line for each unpairable line in file *file_number*, where *file_number* is 1 or
 90191 2, in addition to the default output. If both **-a1** and **-a2** are specified, all unpairable
 90192 lines shall be output.

90193 **-e** *string* Replace empty output fields in the list selected by **-o** with the string *string*.

90194 **-o** *list* Construct the output line to comprise the fields specified in *list*, each element of
 90195 which shall have one of the following two forms:

- 90196 1. *file_number.field*, where *file_number* is a file number and *field* is a decimal
 90197 integer field number
- 90198 2. 0 (zero), representing the join field

90199 The elements of *list* shall be either comma-separated or <blank>-separated, as
 90200 specified in Guideline 8 of XBD [Section 12.2](#) (on page 201). The fields specified by
 90201 *list* shall be written for all selected output lines. Fields selected by *list* that do not
 90202 appear in the input shall be treated as empty output fields. (See the **-e** option.)
 90203 Only specifically requested fields shall be written. The application shall ensure that
 90204 *list* is a single command line argument.

- 90205 **-t** *char* Use character *char* as a separator, for both input and output. Every appearance of
90206 *char* in a line shall be significant. When this option is specified, the collating
90207 sequence shall be the same as *sort* without the **-b** option.
- 90208 **-v** *file_number* Instead of the default output, produce a line only for each unpairable line in
90209 *file_number*, where *file_number* is 1 or 2. If both **-v1** and **-v2** are specified, all
90210 unpairable lines shall be output.
- 90212 **-1** *field* Join on the *field*th field of file 1. Fields are decimal integers starting with 1.
- 90213 **-2** *field* Join on the *field*th field of file 2. Fields are decimal integers starting with 1.

OPERANDS

- 90214 The following operands shall be supported:
- 90215 *file1, file2* A pathname of a file to be joined. If either of the *file1* or *file2* operands is '-', the
90216 standard input shall be used in its place.

STDIN

- 90218 The standard input shall be used only if the *file1* or *file2* operand is '-'. See the INPUT FILES
90219 section.

INPUT FILES

- 90221 The input files shall be text files.

ENVIRONMENT VARIABLES

- 90222 The following environment variables shall affect the execution of *join*:
- 90223 **LANG** Provide a default value for the internationalization variables that are unset or null. |
90224 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
90225 variables used to determine the values of locale categories.)
- 90226 **LC_ALL** If set to a non-empty string value, override the values of all the other
90227 internationalization variables.
- 90228 **LC_COLLATE** Determine the locale of the collating sequence *join* expects to have been used when
90229 the input files were sorted.
- 90230 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
90231 characters (for example, single-byte as opposed to multi-byte characters in
90232 arguments and input files).
- 90233 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
90234 diagnostic messages written to standard error.
- 90235 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
90236 diagnostic messages written to standard error.
- 90237 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
90238 diagnostic messages written to standard error.
- 90239 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

- 90240 Default.

STDOUT

- 90242 The *join* utility output shall be a concatenation of selected character fields. When the **-o** option
90243 is not specified, the output shall be:
90244 "*%s%s%s\n*", *<join field>*, *<other file1 fields>*,
90245 *<other file2 fields>*
- 90246 If the join field is not the first field in a file, the *<other file fields>* for that file shall be:
90247 *<fields preceding join field>*, *<fields following join field>*
90248 *<fields preceding join field>*, *<fields following join field>*

90249 When the `-o` option is specified, the output format shall be:

90250 `"%s\n", <concatenation of fields>`

90251 where the concatenation of fields is described by the `-o` option, above.

90252 For either format, each field (except the last) shall be written with its trailing separator character.
90253 If the separator is the default (`<blank>s`), a single `<space>` shall be written after each field
90254 (except the last).

90255 **STDERR**

90256 The standard error shall be used only for diagnostic messages.

90257 **OUTPUT FILES**

90258 None.

90259 **EXTENDED DESCRIPTION**

90260 None.

90261 **EXIT STATUS**

90262 The following exit values shall be returned:

90263 0 All input files were output successfully.

90264 >0 An error occurred.

90265 **CONSEQUENCES OF ERRORS**

90266 Default.

90267 **APPLICATION USAGE**

90268 Pathnames consisting of numeric digits or of the form `string.string` should not be specified
90269 directly following the `-o` list.

90270 **EXAMPLES**

90271 The `-o 0` field essentially selects the union of the join fields. For example, given file **phone**:

```
90272 !Name           Phone Number
90273 Don             +1 123-456-7890
90274 Hal            +1 234-567-8901
90275 Yasushi        +2 345-678-9012
```

90276 and file **fax**:

```
90277 !Name           Fax Number
90278 Don             +1 123-456-7899
90279 Keith          +1 456-789-0122
90280 Yasushi        +2 345-678-9011
```

90281 (where the large expanses of white space are meant to each represent a single `<tab>`), the
90282 command:

```
90283 join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax
```

90284 would produce:

```
90285 !Name           Phone Number           Fax Number
90286 Don             +1 123-456-7890         +1 123-456-7899
90287 Hal            +1 234-567-8901         (unknown)
90288 Keith          (unknown)              +1 456-789-0122
90289 Yasushi        +2 345-678-9012         +2 345-678-9011
```

90290 Multiple instances of the same key will produce combinatorial results. The following:

```
90291 fa:
90292     a x
```

```

90293         a y
90294         a z
90295     fb:
90296         a p
90297
90297     will produce:
90298
90298     a x p
90299     a y p
90300     a z p
90301
90301     And the following:
90302
90302     fa:
90303         a b c
90304         a d e
90305     fb:
90306         a w x
90307         a y z
90308         a o p
90309
90309     will produce:
90310
90310     a b c w x
90311     a b c y z
90312     a b c o p
90313     a d e w x
90314     a d e y z
90315     a d e o p

```

RATIONALE

The `-e` option is only effective when used with `-o` because, unless specific fields are identified using `-o`, *join* is not aware of what fields might be empty. The exception to this is the join field, but identifying an empty join field with the `-e` string is not historical practice and some scripts might break if this were changed.

The 0 field in the `-o` list was adopted from the Tenth Edition version of *join* to satisfy international objections that the *join* in the base documents does not support the “full join” or “outer join” described in relational database literature. Although it has been possible to include a join field in the output (by default, or by field number using `-o`), the join field could not be included for an unpaired line selected by `-a`. The `-o 0` field essentially selects the union of the join fields.

This sort of outer join was not possible with the *join* commands in the base documents. The `-o 0` field was chosen because it is an upwards-compatible change for applications. An alternative was considered: have the join field represent the union of the fields in the files (where they are identical for matched lines, and one or both are null for unmatched lines). This was not adopted because it would break some historical applications.

The ability to specify *file2* as `-` is not historical practice; it was added for completeness.

The `-v` option is not historical practice, but was considered necessary because it permitted the writing of *only* those lines that do not match on the join field, as opposed to the `-a` option, which prints both lines that do and do not match. This additional facility is parallel with the `-v` option of *grep*.

Some historical implementations have been encountered where a blank line in one of the input files was considered to be the end of the file; the description in this volume of POSIX.1-200x does not cite this as an allowable case.

Earlier versions of this standard allowed `-j`, `-j1`, `-j2` options, and a form of the `-o` option that

90341 allowed the *list* option-argument to be multiple arguments. These forms are no longer specified |
 90342 by POSIX.1-200x but may be present in some implementations.

90343 FUTURE DIRECTIONS

90344 None.

90347 XBD Chapter 8 (on page 159), Section 12.2 (on page 201) +

90348 CHANGE HISTORY

90349 First released in Issue 2.

90350 Issue 6

90351 The obsolescent `-j` options and the multi-argument `-o` option are removed in this version. |

90352 The normative text is reworded to avoid use of the term “must” for application requirements.

90353 Issue 7

90354 Austin Group Interpretation 1003.1-2001 #027 is applied.

90355 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90356 **NAME**
 90357 kill — terminate or signal processes

90358 **SYNOPSIS**
 90359 kill *-s signal_name pid...*
 90360 kill *-l [exit_status]*
 90361 XSI kill *[-signal_name] pid...*
 90362 kill *[-signal_number] pid...*

90363 **DESCRIPTION**
 90364 The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.
 90365 For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function
 90366 defined in the System Interfaces volume of POSIX.1-200x called with the following arguments:

- 90367 • The value of the *pid* operand shall be used as the *pid* argument.
- 90368 • The *sig* argument is the value specified by the *-s* option, *-signal_number* option, or the
 90369 *-signal_name* option, or by SIGTERM, if none of these options is specified.

90370 **OPTIONS**
 90371 XSI The *kill* utility shall conform to XBD [Section 12.2](#) (on page 201), except that in the last two
 90372 SYNOPSIS forms, the *-signal_number* and *-signal_name* options are usually more than a single
 90373 character.

90374 The following options shall be supported:

90375 **-l** (The letter ell.) Write all values of *signal_name* supported by the implementation, if
 90376 no operand is given. If an *exit_status* operand is given and it is a value of the ' ? '
 90377 shell special parameter (see [Section 2.5.2](#) (on page 2250) and *wait*) corresponding to
 90378 a process that was terminated by a signal, the *signal_name* corresponding to the
 90379 signal that terminated the process shall be written. If an *exit_status* operand is
 90380 given and it is the unsigned decimal integer value of a signal number, the
 90381 *signal_name* (the symbolic constant name without the **SIG** prefix defined in the
 90382 Base Definitions volume of POSIX.1-200x) corresponding to that signal shall be
 90383 written. Otherwise, the results are unspecified.

90384 **-s signal_name**
 90385 Specify the signal to send, using one of the symbolic names defined in the
 90386 **<signal.h>** header. Values of *signal_name* shall be recognized in a case-independent
 90387 fashion, without the **SIG** prefix. In addition, the symbolic name 0 shall be
 90388 recognized, representing the signal value zero. The corresponding signal shall be
 90389 sent instead of SIGTERM.

90390 XSI **-signal_name**
 90391 Equivalent to *-s signal_name*.

90392 XSI **-signal_number**
 90393 Specify a non-negative decimal integer, *signal_number*, representing the signal to be
 90394 used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The
 90395 correspondence between integer values and the *sig* value used is shown in the
 90396 following list.
 90397 The effects of specifying any *signal_number* other than those listed below are
 90398 undefined.

90399	0	0
90400	1	SIGHUP
90401	2	SIGINT
90402	3	SIGQUIT
90403	6	SIGABRT
90404	9	SIGKILL
90405	14	SIGALRM
90406	15	SIGTERM

If the first argument is a negative integer, it shall be interpreted as a *-signal_number* option, not as a negative *pid* operand specifying a process group.

OPERANDS

The following operands shall be supported:

pid One of the following:

1. A decimal integer specifying a process or process group to be signaled. The process or processes selected by positive, negative, and zero values of the *pid* operand shall be as described for the *kill()* function. If process number 0 is specified, all processes in the current process group shall be signaled. For the effects of negative *pid* numbers, see the *kill()* function defined in the System Interfaces volume of POSIX.1-200x. If the first *pid* operand is negative, it should be preceded by "--" to keep it from being interpreted as an option.
2. A job control job ID (see XBD Section 3.202, on page 61) that identifies a background process group to be signaled. The job control job ID notation is applicable only for invocations of *kill* in the current shell execution environment; see Section 2.12 (on page 2277).

exit_status A decimal integer specifying a signal number or the exit status of a process terminated by a signal.

STDIN

Not used.

INPUT FILES

None.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *kill*:

LANG Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)

LC_ALL If set to a non-empty string value, override the values of all the other internationalization variables.

LC_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

LC_MESSAGES

Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

90443 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

90444 ASYNCHRONOUS EVENTS

90445 Default.

90446 STDOUT

90447 When the *-l* option is not specified, the standard output shall not be used.

90448 When the *-l* option is specified, the symbolic name of each signal shall be written in the
90449 following format:

90450 "%s%c", <signal_name>, <separator>

90451 where the <signal_name> is in uppercase, without the **SIG** prefix, and the <separator> shall be
90452 either a <newline> or a <space>. For the last signal written, <separator> shall be a <newline>.

90453 When both the *-l* option and *exit_status* operand are specified, the symbolic name of the
90454 corresponding signal shall be written in the following format:

90455 "%s\n", <signal_name>

90456 STDERR

90457 The standard error shall be used only for diagnostic messages.

90458 OUTPUT FILES

90459 None.

90460 EXTENDED DESCRIPTION

90461 None.

90462 EXIT STATUS

90463 The following exit values shall be returned:

90464 0 At least one matching process was found for each *pid* operand, and the specified signal was
90465 successfully processed for at least one matching process.

90466 >0 An error occurred.

90467 CONSEQUENCES OF ERRORS

90468 Default.

90469 APPLICATION USAGE

90470 Process numbers can be found by using *ps*.

90471 The job control job ID notation is not required to work as expected when *kill* is operating in its
90472 own utility execution environment. In either of the following examples:

90473 nohup kill %1 &
90474 system("kill %1");

90475 the *kill* operates in a different environment and does not share the shell's understanding of job
90476 numbers.

90477 EXAMPLES

90478 Any of the commands:

90479 kill -9 100 -165
90480 kill -s kill 100 -165
90481 kill -s KILL 100 -165

90482 sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose
90483 process group ID is 165, assuming the sending process has permission to send that signal to the
90484 specified processes, and that they exist.

90485 The System Interfaces volume of POSIX.1-200x and this volume of POSIX.1-200x do not require

90486 specific signal numbers for any *signal_names*. Even the *-signal_number* option provides symbolic
 90487 (although numeric) names for signals. If a process is terminated by a signal, its exit status
 90488 indicates the signal that killed it, but the exact values are not specified. The *kill -l* option,
 90489 however, can be used to map decimal signal numbers and exit status values into the name of a
 90490 signal. The following example reports the status of a terminated job:

```
90491 job
90492 stat=$?
90493 if [ $stat -eq 0 ]
90494 then
90495     echo job completed successfully.
90496 elif [ $stat -gt 128 ]
90497 then
90498     echo job terminated by signal SIG$(kill -l $stat).
90499 else
90500     echo job terminated with error code $stat.
90501 fi
```

90502 To send the default signal to a process group (say 123), an application should use a command
 90503 similar to one of the following:

```
90504 kill -TERM -123
90505 kill -- -123
```

90506 RATIONALE

90507 The *-l* option originated from the C shell, and is also implemented in the KornShell. The C shell
 90508 output can consist of multiple output lines because the signal names do not always fit on a
 90509 single line on some terminal screens. The KornShell output also included the implementation-
 90510 defined signal numbers and was considered by the standard developers to be too difficult for
 90511 scripts to parse conveniently. The specified output format is intended not only to accommodate
 90512 the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing
 90513 on systems for which this is appropriate.

90514 An early proposal invented the name *SIGNULL* as a *signal_name* for signal 0 (used by the System
 90515 Interfaces volume of POSIX.1-200x to test for the existence of a process without sending it a
 90516 signal). Since the *signal_name* 0 can be used in this case unambiguously, *SIGNULL* has been
 90517 removed.

90518 An early proposal also required symbolic *signal_names* to be recognized with or without the **SIG**
 90519 prefix. Historical versions of *kill* have not written the **SIG** prefix for the *-l* option and have not
 90520 recognized the **SIG** prefix on *signal_names*. Since neither applications portability nor ease-of-use
 90521 would be improved by requiring this extension, it is no longer required.

90522 To avoid an ambiguity of an initial negative number argument specifying either a signal number
 90523 or a process group, POSIX.1-200x mandates that it is always considered the former by
 90524 implementations that support the XSI option. It also requires that conforming applications
 90525 always use the "--" options terminator argument when specifying a process group, unless an
 90526 option is also specified.

90527 The *-s* option was added in response to international interest in providing some form of *kill* that
 90528 meets the Utility Syntax Guidelines.

90529 The job control job ID notation is not required to work as expected when *kill* is operating in its
 90530 own utility execution environment. In either of the following examples:

```
90531 nohup kill %1 &
90532 system("kill %1");
```

90533 the *kill* operates in a different environment and does not understand how the shell has managed
 90534 its job numbers.

90535

FUTURE DIRECTIONS

90536

None.

90541

CHANGE HISTORY

90542

First released in Issue 2.

90543

Issue 6

90544

The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI option, corresponding to a similar change in the *trap* special built-in.

90545

90546

Issue 7

90547

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

90548 **NAME**90549 lex — generate programs for lexical tasks (**DEVELOPMENT**)90550 **SYNOPSIS**90551 CD `lex [-t] [-n|-v] [file...]`90552 **DESCRIPTION**

90553 The *lex* utility shall generate C programs to be used in lexical processing of character input, and
 90554 that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code
 90555 and conform to the ISO C standard. Usually, the *lex* utility shall write the program it generates to
 90556 the file **lex.yy.c**; the state of this file is unspecified if *lex* exits with a non-zero exit status. See the
 90557 EXTENDED DESCRIPTION section for a complete description of the *lex* input language.

90558 **OPTIONS**90559 The *lex* utility shall conform to XBD [Section 12.2](#) (on page 201), except for Guideline 9. |

90560 The following options shall be supported:

90561 **-n** Suppress the summary of statistics usually written with the **-v** option. If no table
 90562 sizes are specified in the *lex* source code and the **-v** option is not specified, then **-n**
 90563 is implied.

90564 **-t** Write the resulting program to standard output instead of **lex.yy.c**.

90565 **-v** Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*
 90566 table sizes in [Definitions in lex](#) (on page 2753).) If the **-t** option is specified and **-n**
 90567 is not specified, this report shall be written to standard error. If table sizes are
 90568 specified in the *lex* source code, and if the **-n** option is not specified, the **-v** option
 90569 may be enabled.

90570 **OPERANDS**

90571 The following operand shall be supported:

90572 *file* A pathname of an input file. If more than one such *file* is specified, all files shall be
 90573 concatenated to produce a single *lex* program. If no *file* operands are specified, or if
 90574 a *file* operand is '-', the standard input shall be used.

90575 **STDIN**

90576 The standard input shall be used if no *file* operands are specified, or if a *file* operand is '-'. See
 90577 INPUT FILES.

90578 **INPUT FILES**

90579 The input files shall be text files containing *lex* source code, as described in the EXTENDED
 90580 DESCRIPTION section.

90581 **ENVIRONMENT VARIABLES**90582 The following environment variables shall affect the execution of *lex*:

90583 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 90584 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 90585 variables used to determine the values of locale categories.)

90586 **LC_ALL** If set to a non-empty string value, override the values of all the other
 90587 internationalization variables.

90588 **LC_COLLATE**

90589 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 90590 character collating elements within regular expressions. If this variable is not set to

90591 the POSIX locale, the results are unspecified.

90592 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 90593 characters (for example, single-byte as opposed to multi-byte characters in
 90594 arguments and input files), and the behavior of character classes within regular
 90595 expressions. If this variable is not set to the POSIX locale, the results are
 90596 unspecified.

90597 **LC_MESSAGES**

90598 Determine the locale that should be used to affect the format and contents of
 90599 diagnostic messages written to standard error.

90600 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

90601 ASYNCHRONOUS EVENTS

90602 Default.

90603 STDOUT

90604 If the **-t** option is specified, the text file of C source code output of *lex* shall be written to
 90605 standard output.

90606 If the **-t** option is not specified:

- 90607 • Implementation-defined informational, error, and warning messages concerning the
 90608 contents of *lex* source code input shall be written to either the standard output or standard
 90609 error.
- 90610 • If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
 90611 written to either the standard output or standard error, in an implementation-defined
 90612 format. These statistics may also be generated if table sizes are specified with a '%'
 90613 operator in the *Definitions* section, as long as the **-n** option is not specified.

90614 STDERR

90615 If the **-t** option is specified, implementation-defined informational, error, and warning messages
 90616 concerning the contents of *lex* source code input shall be written to the standard error.

90617 If the **-t** option is not specified:

- 90618 1. Implementation-defined informational, error, and warning messages concerning the
 90619 contents of *lex* source code input shall be written to either the standard output or
 90620 standard error.
- 90621 2. If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be
 90622 written to either the standard output or standard error, in an implementation-defined
 90623 format. These statistics may also be generated if table sizes are specified with a '%'
 90624 operator in the *Definitions* section, as long as the **-n** option is not specified.

90625 OUTPUT FILES

90626 A text file containing C source code shall be written to **lex.yy.c**, or to the standard output if the **-t**
 90627 option is present.

90628 EXTENDED DESCRIPTION

90629 Each input file shall contain *lex* source code, which is a table of regular expressions with
 90630 corresponding actions in the form of C program fragments.

90631 When **lex.yy.c** is compiled and linked with the *lex* library (using the **-ll** operand with *c99*), the
 90632 resulting program shall read character input from the standard input and shall partition it into
 90633 strings that match the given expressions.

90634 When an expression is matched, these actions shall occur:

- 90635 • The input string that was matched shall be left in *yytext* as a null-terminated string; *yytext*
- 90636 shall either be an external character array or a pointer to a character string. As explained in
- 90637 [Definitions in lex](#), the type can be explicitly selected using the `%array` or `%pointer`
- 90638 declarations, but the default is implementation-defined.
- 90639 • The external `int yyleng` shall be set to the length of the matching string.
- 90640 • The expression's corresponding program fragment, or action, shall be executed.

90641 During pattern matching, *lex* shall search the set of patterns for the single longest possible

90642 match. Among rules that match the same number of characters, the rule given first shall be

90643 chosen.

90644 The general format of *lex* source shall be:

```

90645     Definitions
90646     %%
90647     Rules
90648     %%
90649     UserSubroutines

```

90650 The first "%%" is required to mark the beginning of the rules (regular expressions and actions);

90651 the second "%%" is required only if user subroutines follow.

90652 Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program

90653 fragment and shall be copied to the external definition area of the `lex.yy.c` file. Similarly,

90654 anything in the *Definitions* section included between delimiter lines containing only "%{" and

90655 "%}" shall also be copied unchanged to the external definition area of the `lex.yy.c` file.

90656 Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing

90657 at the beginning of the *Rules* section before any rules are specified shall be written to `lex.yy.c`

90658 after the declarations of variables for the `yylex()` function and before the first line of code in

90659 `yylex()`. Thus, user variables local to `yylex()` can be declared here, as well as application code to

90660 execute upon entry to `yylex()`.

90661 The action taken by *lex* when encountering any input beginning with a <blank> or within "%{"

90662 and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is

90663 undefined. The presence of such input may result in an erroneous definition of the `yylex()`

90664 function.

90665 Definitions in lex

90666 *Definitions* appear before the first "%%" delimiter. Any line in this section not contained between

90667 "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex*

90668 substitution string. The format of these lines shall be:

```

90669 name substitute

```

90670 If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is

90671 undefined. The string *substitute* shall replace the string `{name}` when it is used in a rule. The *name*

90672 string shall be recognized in this context only when the braces are provided and when it does

90673 not appear within a bracket expression or within double-quotes.

90674 In the *Definitions* section, any line beginning with a '%' (percent sign) character and followed by

90675 an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions.

90676 Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall

90677 define a set of exclusive start conditions. When the generated scanner is in a %s state, patterns

90678 with no state specified shall be also active; in a %x state, such patterns shall not be active. The

90679 rest of the line, after the first word, shall be considered to be one or more <blank>-separated

90680 names of start conditions. Start condition names shall be constructed in the same way as

90681 definition names. Start conditions can be used to restrict the matching of regular expressions to
90682 one or more states as described in [Regular Expressions in lex](#) (on page 2755).

90683 Implementations shall accept either of the following two mutually-exclusive declarations in the
90684 *Definitions* section:

90685 **%array** Declare the type of *yytext* to be a null-terminated character array.

90686 **%pointer** Declare the type of *yytext* to be a pointer to a null-terminated character string.

90687 The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of
90688 the scanner source file (that is, via an **extern**), the application shall include the appropriate
90689 **%array** or **%pointer** declaration in the scanner source file.

90690 Implementations shall accept declarations in the *Definitions* section for setting certain internal
90691 table sizes. The declarations are shown in the following table.

90692 **Table 4-9** Table Size Declarations in *lex*

Declaration	Description	Minimum Value
90693 %p <i>n</i>	Number of positions	2 500
90694 %n <i>n</i>	Number of states	500
90695 %a <i>n</i>	Number of transitions	2 000
90696 %e <i>n</i>	Number of parse tree nodes	1 000
90697 %k <i>n</i>	Number of packed character classes	1 000
90698 %o <i>n</i>	Size of the output array	3 000

90700 In the table, *n* represents a positive decimal integer, preceded by one or more <blank>s. The
90701 exact meaning of these table size numbers is implementation-defined. The implementation shall
90702 document how these numbers affect the *lex* utility and how they are related to any output that
90703 may be generated by the implementation should limitations be encountered during the
90704 execution of *lex*. It shall be possible to determine from this output which of the table size values
90705 needs to be modified to permit *lex* to successfully generate tables for the input language. The
90706 values in the column Minimum Value represent the lowest values conforming implementations
90707 shall provide.

90708 Rules in *lex*

90709 The rules in *lex* source files are a table in which the left column contains regular expressions and
90710 the right column contains actions (C program fragments) to be executed when the expressions
90711 are recognized.

90712 *ERE action*

90713 *ERE action*

90714 ...

90715 The extended regular expression (ERE) portion of a row shall be separated from *action* by one or
90716 more <blank>s. A regular expression containing <blank>s shall be recognized under one of the
90717 following conditions:

- 90718 • The entire expression appears within double-quotes.
- 90719 • The <blank>s appear within double-quotes or square brackets.
- 90720 • Each <blank> is preceded by a backslash character.

90721

User Subroutines in lex

90722

Anything in the user subroutines section shall be copied to `lex.yy.c` following `yylex()`.

90723

Regular Expressions in lex

90724

The `lex` utility shall support the set of extended regular expressions (see XBD [Section 9.4](#), on page 174), with the following additions and exceptions to the syntax:

90725

90726

" . . . " Any string enclosed in double-quotes shall represent the characters within the double-quotes as themselves, except that backslash escapes (which appear in the following table) shall be recognized. Any backslash-escape sequence shall be terminated by the closing quote. For example, `"\01"1` represents a single string: the octal value 1 followed by the character `'1'`.

90727

90728

90729

90730

90731

`<state>r, <state1,state2,...>r`

90732

90733

90734

90735

90736

90737

The regular expression `r` shall be matched only when the program is in one of the start conditions indicated by `state`, `state1`, and so on; see [Actions in lex](#) (on page 2757). (As an exception to the typographical conventions of the rest of this volume of POSIX.1-200x, in this case `<state>` does not represent a metavariable, but the literal angle-bracket characters surrounding a symbol.) The start condition shall be recognized as such only at the beginning of a regular expression.

90738

`r/x`

90739

90740

90741

90742

90743

90744

90745

90746

The regular expression `r` shall be matched only if it is followed by an occurrence of regular expression `x` (`x` is the instance of trailing context, further defined below). The token returned in `yytext` shall only match `r`. If the trailing portion of `r` matches the beginning of `x`, the result is unspecified. The `r` expression cannot include further trailing context or the `'$'` (match-end-of-line) operator; `x` cannot include the `'^'` (match-beginning-of-line) operator, nor trailing context, nor the `'$'` operator. That is, only one occurrence of trailing context is allowed in a `lex` regular expression, and the `'^'` operator only can be used at the beginning of such an expression.

90747

`{name}`

90748

90749

90750

90751

When `name` is one of the substitution symbols from the *Definitions* section, the string, including the enclosing braces, shall be replaced by the `substitute` value. The `substitute` value shall be treated in the extended regular expression as if it were enclosed in parentheses. No substitution shall occur if `{name}` occurs within a bracket expression or within double-quotes.

90752

Within an ERE, a backslash character shall be considered to begin an escape sequence as specified in the table in XBD [Chapter 5](#) (on page 107) (`'\\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`). In addition, the escape sequences in the following table shall be recognized.

90753

90754

90755

A literal `<newline>` cannot occur within an ERE; the escape sequence `'\n'` can be used to represent a `<newline>`. A `<newline>` shall not be matched by a period operator.

90780

90781

Escape Sequence	Description	Meaning
<code>\digits</code>	A backslash character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <code>'\'</code> for each byte.
<code>\xdigits</code>	A backslash character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the hexadecimal integer.
<code>\c</code>	A backslash character followed by any character not described in this table or in the table in XBD Chapter 5 (on page 107) (<code>'\'</code> , <code>'\a'</code> , <code>'\b'</code> , <code>'\f'</code> , <code>'\n'</code> , <code>'\r'</code> , <code>'\t'</code> , <code>'\v'</code>).	The character <code>'c'</code> , unchanged.

90782

90783

90784

Note: If a `'\x'` sequence needs to be immediately followed by a hexadecimal digit character, a sequence such as `"\x1" "1"` can be used, which represents a character containing the value 1, followed by the character `'1'`.

90785

90786

90787

The order of precedence given to extended regular expressions for *lex* differs from that specified in XBD Section 9.4 (on page 174). The order of precedence for *lex* shall be as shown in the following table, from high to low.

90788

90789

90790

90791

90792

Note: The escaped characters entry is not meant to imply that these are operators, but they are included in the table to show their relationships to the true operators. The start condition, trailing context, and anchoring notations have been omitted from the table because of the placement restrictions described in this section; they can only appear at the beginning or ending of an ERE.

90793

Table 4-11 ERE Precedence in *lex*

90794

90795

90796

90797

90798

90799

90800

90801

90802

90803

90804

Extended Regular Expression	Precedence
<i>collation-related bracket symbols</i>	<code>[= =]</code> <code>[: :]</code> <code>[. .]</code>
<i>escaped characters</i>	<code>\<special character></code>
<i>bracket expression</i>	<code>[]</code>
<i>quoting</i>	<code>"..."</code>
<i>grouping</i>	<code>()</code>
<i>definition</i>	<code>{name}</code>
<i>single-character RE duplication</i>	<code>* + ?</code>
<i>concatenation</i>	
<i>interval expression</i>	<code>{m,n}</code>
<i>alternation</i>	<code> </code>

90805

The ERE anchoring operators `'^'` and `'$'` do not appear in the table. With *lex* regular

90806 expressions, these operators are restricted in their use: the '^' operator can only be used at the
 90807 beginning of an entire regular expression, and the '\$' operator only at the end. The operators
 90808 apply to the entire regular expression. Thus, for example, the pattern "(^abc)|(def\$)" is
 90809 undefined; it can instead be written as two separate rules, one with the regular expression
 90810 "^abc" and one with "def\$", which share a common action via the special '|' action (see
 90811 below). If the pattern were written "^abc|def\$", it would match either "abc" or "def" on a
 90812 line by itself.

90813 Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex*
 90814 implementations. An example of embedded anchoring would be for patterns such as
 90815 "(^|)foo(|\$)" to match "foo" when it exists as a complete word. This functionality can
 90816 be obtained using existing *lex* features:

```
90817 ^foo/[ \n]      |  
90818 " foo"/[ \n]    /* Found foo as a separate word. */
```

90819 Note also that '\$' is a form of trailing context (it is equivalent to "/\n") and as such cannot be
 90820 used with regular expressions containing another instance of the operator (see the preceding
 90821 discussion of trailing context).

90822 The additional regular expressions trailing-context operator '/' can be used as an ordinary
 90823 character if presented within double-quotes, "/"; preceded by a backslash, "\/"; or within a
 90824 bracket expression, "[/]". The start-condition '<' and '>' operators shall be special only in a
 90825 start condition at the beginning of a regular expression; elsewhere in the regular expression they
 90826 shall be treated as ordinary characters.

90827 Actions in lex

90828 The action to be taken when an ERE is matched can be a C program fragment or the special
 90829 actions described below; the program fragment can contain one or more C statements, and can
 90830 also include special actions. The empty C statement ';' shall be a valid action; any string in the
 90831 *lex.yy.c* input that matches the pattern portion of such a rule is effectively ignored or skipped.
 90832 However, the absence of an action shall not be valid, and the action *lex* takes in such a condition
 90833 is undefined.

90834 The specification for an action, including C statements and special actions, can extend across
 90835 several lines if enclosed in braces:

```
90836 ERE <one or more blanks> { program statement  
90837                          program statement }
```

90838 The default action when a string in the input to a *lex.yy.c* program is not matched by any
 90839 expression shall be to copy the string to the output. Because the default behavior of a program
 90840 generated by *lex* is to read the input and copy it to the output, a minimal *lex* source program that
 90841 has just "%%" shall generate a C program that simply copies the input to the output unchanged.

90842 Four special actions shall be available:

```
90843 | ECHO; REJECT; BEGIN
```

90844 | The action '|' means that the action for the next rule is the action for this rule.
 90845 Unlike the other three actions, '|' cannot be enclosed in braces or be semicolon-
 90846 terminated; the application shall ensure that it is specified alone, with no other
 90847 actions.

90848 **ECHO;** Write the contents of the string *yytext* on the output.

90849 **REJECT;** Usually only a single expression is matched by a given string in the input.
 90850 **REJECT** means "continue to the next expression that matches the current input",
 90851 and shall cause whatever rule was the second choice after the current rule to be
 90852 executed for the same input. Thus, multiple rules can be matched and executed for

90853 one input string or overlapping input strings. For example, given the regular
 90854 expressions "xyz" and "xy" and the input "xyz", usually only the regular
 90855 expression "xyz" would match. The next attempted match would start after **z**. If
 90856 the last action in the "xyz" rule is **REJECT**, both this rule and the "xy" rule
 90857 would be executed. The **REJECT** action may be implemented in such a fashion that
 90858 flow of control does not continue after it, as if it were equivalent to a **goto**
 90859 to another part of *yylex()*. The use of **REJECT** may result in somewhat larger and
 90860 slower scanners.

90861 **BEGIN** The action:

90862 `BEGIN newstate;`

90863 switches the state (start condition) to *newstate*. If the string *newstate* has not been
 90864 declared previously as a start condition in the *Definitions* section, the results are
 90865 unspecified. The initial state is indicated by the digit '0' or the token **INITIAL**.

90866 The functions or macros described below are accessible to user code included in the *lex* input. It
 90867 is unspecified whether they appear in the C code output of *lex*, or are accessible only through the
 90868 `-l l` operand to *c99* (the *lex* library).

90869 **int *yylex*(void)**

90870 Performs lexical analysis on the input; this is the primary function generated by the *lex*
 90871 utility. The function shall return zero when the end of input is reached; otherwise, it shall
 90872 return non-zero values (tokens) determined by the actions that are selected.

90873 **int *yymore*(void)**

90874 When called, indicates that when the next input string is recognized, it is to be appended to
 90875 the current value of *yytext* rather than replacing it; the value in *yylen* shall be adjusted
 90876 accordingly.

90877 **int *yyless*(int *n*)**

90878 Retains *n* initial characters in *yytext*, NUL-terminated, and treats the remaining characters as
 90879 if they had not been read; the value in *yylen* shall be adjusted accordingly.

90880 **int *input*(void)**

90881 Returns the next character from the input, or zero on end-of-file. It shall obtain input from
 90882 the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning
 90883 has begun, the effect of altering the value of *yyin* is undefined. The character read shall be
 90884 removed from the input stream of the scanner without any processing by the scanner.

90885 **int *unput*(int *c*)**

90886 Returns the character '*c*' to the input; *yytext* and *yylen* are undefined until the next
 90887 expression is matched. The result of using *unput()* for more characters than have been input
 90888 is unspecified.

90889 The following functions shall appear only in the *lex* library accessible through the `-l l` operand;
 90890 they can therefore be redefined by a conforming application:

90891 **int *yywrap*(void)**

90892 Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application
 90893 requires *yylex()* to continue processing with another source of input, then the application
 90894 can include a function *yywrap()*, which associates another file with the external variable
 90895 `FILE *yyin` and shall return a value of zero.

90896 **int *main*(int *argc*, char **argv*[])**

90897 Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to
 90898 perform application-specific operations, calling *yylex()* as applicable.

90899 Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin
 90900 with the prefix **yy** or **YY**.

90901 **EXIT STATUS**

90902 The following exit values shall be returned:

90903 0 Successful completion.

90904 >0 An error occurred.

90905 **CONSEQUENCES OF ERRORS**

90906 Default.

90907 **APPLICATION USAGE**90908 Conforming applications are warned that in the *Rules* section, an ERE without an action is not
90909 acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or
90910 runtime errors.90911 The purpose of *input()* is to take characters off the input stream and discard them as far as the
90912 lexical analysis is concerned. A common use is to discard the body of a comment once the
90913 beginning of a comment is recognized.90914 The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex*
90915 source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer
90916 interpret the regular expressions given in the *lex* source according to the environment specified
90917 when the lexical analyzer is executed, but this is not possible with the current *lex* technology.
90918 Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the
90919 lexical requirements of the input language being described, which is frequently locale-specific
90920 anyway. (For example, writing an analyzer that is used for French text is not automatically
90921 useful for processing other languages.)90922 **EXAMPLES**90923 The following is an example of a *lex* program that implements a rudimentary scanner for a
90924 Pascal-like syntax:

```

90925 %{
90926 /* Need this for the call to atof() below. */
90927 #include <math.h>
90928 /* Need this for printf(), fopen(), and stdin below. */
90929 #include <stdio.h>
90930 %}
90931
90932 DIGIT    [0-9]
90933 ID       [a-z][a-z0-9]*
90934
90935 %%
90936 {DIGIT}+ {
90937     printf("An integer: %s (%d)\n", yytext,
90938         atoi(yytext));
90939 }
90940 {DIGIT}+"."{DIGIT}* {
90941     printf("A float: %s (%g)\n", yytext,
90942         atof(yytext));
90943 }
90944 if|then|begin|end|procedure|function {
90945     printf("A keyword: %s\n", yytext);
90946 }
90947 {ID}    printf("An identifier: %s\n", yytext);
90948 "+"|"-"|"*"|"/"    printf("An operator: %s\n", yytext);
90949 {"^[^}\n]*"} /* Eat up one-line comments. */

```

```

90948 [ \t\n]+      /* Eat up white space. */
90949 . printf("Unrecognized character: %s\n", yytext);
90950 %%
90951 int main(int argc, char *argv[])
90952 {
90953     ++argv, --argc; /* Skip over program name. */
90954     if (argc > 0)
90955         yyin = fopen(argv[0], "r");
90956     else
90957         yyin = stdin;
90958     yylex();
90959 }

```

RATIONALE

Even though the `-c` option and references to the C language are retained in this description, *lex* may be generalized to other languages, as was done at one time for EFL, the Extended FORTRAN Language. Since the *lex* input specification is essentially language-independent, versions of this utility could be written to produce Ada, Modula-2, or Pascal code, and there are known historical implementations that do so.

The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex* source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is assumed to be presented in the POSIX locale, but input and output are in the locale specified by the environment variables), then the tables in the lexical analyzer produced by *lex* would interpret EREs specified in the *lex* source in terms of the environment variables specified when *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs given in the *lex* source according to the environment specified when the lexical analyzer is executed, but this is not possible with the current *lex* technology.

The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard use of escape sequences.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

There is no detailed output format specification. The observed behavior of *lex* under four different historical implementations was that none of these implementations consistently reported the line numbers for error and warning messages. Furthermore, there was a desire that *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified avoids these formatting questions and problems with internationalization.

Although the `%x` specifier for *exclusive* start conditions is not historical practice, it is believed to be a minor change to historical implementations and greatly enhances the usability of *lex* programs since it permits an application to obtain the expected functionality with fewer statements.

The `%array` and `%pointer` declarations were added as a compromise between historical systems. The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements are available for some scanners. Most historical programs should require no change in porting from one system to another because the string being referenced is null-terminated in both cases. (The method used by *flex* in its case is to null-terminate the token in place by remembering the character that used to come right after the token and replacing it before continuing on to the next scan.) Multi-file programs with external references to *yytext* outside the scanner source file should continue to operate on their historical systems, but would require one of the new declarations to be considered strictly portable.

- 90997 The description of EREs avoids unnecessary duplication of ERE details because their meanings
90998 within a *lex* ERE are the same as that for the ERE in this volume of POSIX.1-200x.
- 90999 The reason for the undefined condition associated with text beginning with a <blank> or within
91000 "%{ " and "%}" delimiter lines appearing in the *Rules* section is historical practice. Both the BSD
91001 and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the
91002 beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break*
91003 statement). In some cases, the System V *lex* generates an error message or a syntax error,
91004 depending on the form of indented input.
- 91005 The intention in breaking the list of functions into those that may appear in *lex.yy.c* versus those
91006 that only appear in *libl.a* is that only those functions in *libl.a* can be reliably redefined by a
91007 conforming application.
- 91008 The descriptions of standard output and standard error are somewhat complicated because
91009 historical *lex* implementations chose to issue diagnostic messages to standard output (unless *-t*
91010 was given). POSIX.1-200x allows this behavior, but leaves an opening for the more expected
91011 behavior of using standard error for diagnostics. Also, the System V behavior of writing the
91012 statistics when any table sizes are given is allowed, while BSD-derived systems can avoid it. The
91013 programmer can always precisely obtain the desired results by using either the *-t* or *-n* options.
- 91014 The OPERANDS section does not mention the use of *-* as a synonym for standard input; not all
91015 historical implementations support such usage for any of the *file* operands.
- 91016 A description of the *translation table* was deleted from early proposals because of its relatively
91017 low usage in historical applications.
- 91018 The change to the definition of the *input()* function that allows buffering of input presents the
91019 opportunity for major performance gains in some applications.
- 91020 The following examples clarify the differences between *lex* regular expressions and regular
91021 expressions appearing elsewhere in this volume of POSIX.1-200x. For regular expressions of the
91022 form "*r/x*", the string matching *r* is always returned; confusion may arise when the beginning
91023 of *x* matches the trailing portion of *r*. For example, given the regular expression "*a*b/cc*" and
91024 the input "*aaabcc*", *ytext* would contain the string "*aaab*" on this match. But given the
91025 regular expression "*x*/xy*" and the input "*xxxxy*", the token *xxx*, not *xx*, is returned by some
91026 implementations because *xxx* matches "*x**".
- 91027 In the rule "*ab*/bc*", the "*b**" at the end of *r* extends *r*'s match into the beginning of the
91028 trailing context, so the result is unspecified. If this rule were "*ab/bc*", however, the rule
91029 matches the text "*ab*" when it is followed by the text "*bc*". In this latter case, the matching of *r*
91030 cannot extend into the beginning of *x*, so the result is specified.
- 91031 **FUTURE DIRECTIONS**
- 91032 None.

- 91107 XBD [Chapter 8](#) (on page 159)
- 91108 XSH *link*
- 91109 **CHANGE HISTORY**
- 91110 First released in Issue 5.

91111 **NAME**91112 `ln` — link files91113 **SYNOPSIS**91114 `ln [-fs] source_file target_file`91115 `ln [-fs] source_file... target_dir`91116 **DESCRIPTION**

91117 In the first synopsis form, the `ln` utility shall create a new directory entry (link) at the destination
 91118 path specified by the `target_file` operand. If the `-s` option is specified, a symbolic link shall be
 91119 created for the file specified by the `source_file` operand. This first synopsis form shall be assumed
 91120 when the final operand does not name an existing directory; if more than two operands are
 91121 specified and the final is not an existing directory, an error shall result.

91122 In the second synopsis form, the `ln` utility shall create a new directory entry (link), or if the `-s`
 91123 option is specified a symbolic link, for each file specified by a `source_file` operand, at a
 91124 destination path in the existing directory named by `target_dir`.

91125 If the last operand specifies an existing file of a type not specified by the System Interfaces
 91126 volume of POSIX.1-200x, the behavior is implementation-defined.

91127 The corresponding destination path for each `source_file` shall be the concatenation of the target
 91128 directory pathname, a slash character, and the last pathname component of the `source_file`. The
 91129 second synopsis form shall be assumed when the final operand names an existing directory.

91130 For each `source_file`:

- 91131 1. If the destination path exists:
- 91132 a. If the `-f` option is not specified, `ln` shall write a diagnostic message to standard
 91133 error, do nothing more with the current `source_file`, and go on to any remaining
 91134 `source_files`.
 - 91135 b. Actions shall be performed equivalent to the `unlink()` function defined in the
 91136 System Interfaces volume of POSIX.1-200x, called using `destination` as the `path`
 91137 argument. If this fails for any reason, `ln` shall write a diagnostic message to
 91138 standard error, do nothing more with the current `source_file`, and go on to any
 91139 remaining `source_files`.
- 91140 2. If the `-s` option is specified, `ln` shall create a symbolic link named by the destination path
 91141 and containing as its pathname `source_file`. The `ln` utility shall do nothing more with
 91142 `source_file` and shall go on to any remaining files.
- 91143 3. If `source_file` is a symbolic link, actions shall be performed equivalent to the `link()` function
 91144 using the object that `source_file` references as the `path1` argument and the destination path
 91145 as the `path2` argument. The `ln` utility shall do nothing more with `source_file` and shall go on
 91146 to any remaining files.
- 91147 4. Actions shall be performed equivalent to the `link()` function defined in the System
 91148 Interfaces volume of POSIX.1-200x using `source_file` as the `path1` argument, and the
 91149 destination path as the `path2` argument.

91150 **OPTIONS**91151 The `ln` utility shall conform to XBD [Section 12.2](#) (on page 201).

91152 The following option shall be supported:

91153 **-f** Force existing destination pathnames to be removed to allow the link.

91154 **-s** Create symbolic links instead of hard links.

OPERANDS

91155 The following operands shall be supported:

91157 *source_file* A pathname of a file to be linked. If the **-s** option is specified, no restrictions on the type of file or on its existence shall be made. If the **-s** option is not specified, whether a directory can be linked is implementation-defined.

91160 *target_file* The pathname of the new directory entry to be created.

91161 *target_dir* A pathname of an existing directory in which the new directory entries are created.

STDIN

91162 Not used.

INPUT FILES

91163 None.

ENVIRONMENT VARIABLES

91164 The following environment variables shall affect the execution of *ln*:

91168 **LANG** Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)

91171 **LC_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

91173 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

91176 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

91179 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

ASYNCHRONOUS EVENTS

91180 Default.

STDOUT

91182 Not used.

STDERR

91183 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

91184 None.

EXTENDED DESCRIPTION

91185 None.

EXIT STATUS

91186 The following exit values shall be returned:

91191 0 All the specified files were linked successfully.

91192 >0 An error occurred.

91194 **CONSEQUENCES OF ERRORS**

91195 Default.

91196 **APPLICATION USAGE**

91197 None.

91198 **EXAMPLES**

91199 None.

91200 **RATIONALE**91201 The CONSEQUENCES OF ERRORS section does not require *ln -f a b* to remove *b* if a
91202 subsequent link operation would fail.91203 Some historic versions of *ln* (including the one specified by the SVID) unlink the destination file,
91204 if it exists, by default. If the mode does not permit writing, these versions prompt for
91205 confirmation before attempting the unlink. In these versions the *-f* option causes *ln* not to
91206 attempt to prompt for confirmation.91207 This allows *ln* to succeed in creating links when the target file already exists, even if the file itself
91208 is not writable (although the directory must be). Early proposals specified this functionality.91209 This volume of POSIX.1-200x does not allow the *ln* utility to unlink existing destination paths by
91210 default for the following reasons:

- 91211 • The *ln* utility has historically been used to provide locking for shell applications, a usage
- 91212 that is incompatible with *ln* unlinking the destination path by default. There was no
- 91213 corresponding technical advantage to adding this functionality.
- 91214 • This functionality gave *ln* the ability to destroy the link structure of files, which changes
- 91215 the historical behavior of *ln*.
- 91216 • This functionality is easily replicated with a combination of *rm* and *ln*.
- 91217 • It is not historical practice in many systems; BSD and BSD-derived systems do not support
- 91218 this behavior. Unfortunately, whichever behavior is selected can cause scripts written
- 91219 expecting the other behavior to fail.
- 91220 • It is preferable that *ln* perform in the same manner as the *link()* function, which does not
- 91221 permit the target to exist already.

91222 This volume of POSIX.1-200x retains the *-f* option to provide support for shell scripts depending
91223 on the SVID semantics. It seems likely that shell scripts would not be written to handle
91224 prompting by *ln* and would therefore have specified the *-f* option.91225 The *-f* option is an undocumented feature of many historical versions of the *ln* utility, allowing
91226 linking to directories. These versions require modification.91227 Early proposals of this volume of POSIX.1-200x also required a *-i* option, which behaved like the
91228 *-i* options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This was not
91229 historical practice for the *ln* utility and has been omitted.91230 **FUTURE DIRECTIONS**

91231 None.

91232 **SEE ALSO**91233 *chmod*, *find*, *pax*, *rm*

CHANGE HISTORY

91237

First released in Issue 2.

91238

Issue 6

91239

The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b draft standard.

91240

91241

Issue 7

91242

SD5-XCU-ERN-27 is applied, adding a new paragraph to the RATIONALE.

91243

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91244 **NAME**
 91245 locale — get locale-specific information

91246 **SYNOPSIS**
 91247 locale [-a|-m]

91248 locale [-ck] *name*...

91249 DESCRIPTION

91250 The *locale* utility shall write information about the current locale environment, or all public
 91251 locales, to the standard output. For the purposes of this section, a *public locale* is one provided by
 91252 the implementation that is accessible to the application.

91253 When *locale* is invoked without any arguments, it shall summarize the current locale
 91254 environment for each locale category as determined by the settings of the environment variables
 91255 defined in XBD [Chapter 7](#) (on page 121).

91256 When invoked with operands, it shall write values that have been assigned to the keywords in
 91257 the locale categories, as follows:

- 91258 • Specifying a keyword name shall select the named keyword and the category containing
 91259 that keyword.
- 91260 • Specifying a category name shall select the named category and all keywords in that
 91261 category.

91262 OPTIONS

91263 The *locale* utility shall conform to XBD [Section 12.2](#) (on page 201).

91264 The following options shall be supported:

- 91265 **-a** Write information about all available public locales. The available locales shall
 91266 include **POSIX**, representing the POSIX locale. The manner in which the
 91267 implementation determines what other locales are available is implementation-
 91268 defined.
- 91269 **-c** Write the names of selected locale categories; see the **STDOUT** section. The **-c**
 91270 option increases readability when more than one category is selected (for example,
 91271 via more than one keyword name or via a category name). It is valid both with
 91272 and without the **-k** option.
- 91273 **-k** Write the names and values of selected keywords. The implementation may omit
 91274 values for some keywords; see the **OPERANDS** section.
- 91275 **-m** Write names of available charmaps; see XBD [Section 6.1](#) (on page 111).

91276 OPERANDS

91277 The following operand shall be supported:

- 91278 *name* The name of a locale category as defined in XBD [Chapter 7](#) (on page 121), the name
 91279 of a keyword in a locale category, or the reserved name **charmap**. The named
 91280 category or keyword shall be selected for output. If a single *name* represents both a
 91281 locale category name and a keyword name in the current locale, the results are
 91282 unspecified. Otherwise, both category and keyword names can be specified as
 91283 *name* operands, in any sequence. It is implementation-defined whether any
 91284 keyword values are written for the categories *LC_CTYPE* and *LC_COLLATE*.

locale

Utilities

91285 **STDIN**

91286 Not used.

91287 **INPUT FILES**

91288 None.

91289 **ENVIRONMENT VARIABLES**91290 The following environment variables shall affect the execution of *locale*:

91291 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 91292 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 91293 variables used to determine the values of locale categories.)

91294 **LC_ALL** If set to a non-empty string value, override the values of all the other |
 91295 internationalization variables.

91296 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as |
 91297 characters (for example, single-byte as opposed to multi-byte characters in |
 91298 arguments and input files).

91299 **LC_MESSAGES**

91300 Determine the locale that should be used to affect the format and contents of |
 91301 diagnostic messages written to standard error.

91302 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

91303 **XSI** The application shall ensure that the *LANG*, *LC_**, and *NLSPATH* environment variables specify |
 91304 the current locale environment to be written out; they shall be used if the **-a** option is not |
 91305 specified.

91306 **ASYNCHRONOUS EVENTS**

91307 Default.

91308 **STDOUT**91309 The *LANG* variable shall be written first using the format:91310 "LANG=%s\n", *<value>*91311 If *LANG* is not set or is an empty string, the value is the empty string.

91312 If *locale* is invoked without any options or operands, the names and values of the *LC_** |
 91313 environment variables described in this volume of POSIX.1-200x shall be written to the standard |
 91314 output, one variable per line, and each line using the following format. Only those variables set |
 91315 in the environment and not overridden by *LC_ALL* shall be written using this format:

91316 "%s=%s\n", *<variable_name>*, *<value>*

91317 The names of those *LC_** variables associated with locale categories defined in this volume of |
 91318 POSIX.1-200x that are not set in the environment or are overridden by *LC_ALL* shall be written |
 91319 in the following format:

91320 "%s=\"%s\" \n", *<variable_name>*, *<implied value>*

91321 The *<implied value>* shall be the name of the locale that has been selected for that category by the |
 91322 implementation, based on the values in *LANG* and *LC_ALL*, as described in XBD [Chapter 8](#) (on |
 91323 page 159).

91324 The *<value>* and *<implied value>* shown above shall be properly quoted for possible later reentry |
 91325 to the shell. The *<value>* shall not be quoted using double-quotes (so that it can be distinguished |
 91326 by the user from the *<implied value>* case, which always requires double-quotes).

91327 The *LC_ALL* variable shall be written last, using the first format shown above. If it is not set, it |
 91328 shall be written as:

91329 "LC_ALL=\n"

91330 If any arguments are specified:

91331 1. If the `-a` option is specified, the names of all the public locales shall be written, each in the
91332 following format:

91333 "%s\n", <locale name>

91334 2. If the `-c` option is specified, the names of all selected categories shall be written, each in
91335 the following format:

91336 "%s\n", <category name>

91337 If keywords are also selected for writing (see following items), the category name output
91338 shall precede the keyword output for that category.

91339 If the `-c` option is not specified, the names of the categories shall not be written; only the
91340 keywords, as selected by the <name> operand, shall be written.

91341 3. If the `-k` option is specified, the names and values of selected keywords shall be written.
91342 If a value is non-numeric and is not a compound keyword value, it shall be written in the
91343 following format:

91344 "%s=\"%s\"\\n", <keyword name>, <keyword value>

91345 If a value is a non-numeric compound keyword value, it shall either be written in the
91346 format:

91347 "%s=\"%s\"\\n", <keyword name>, <keyword value>

91348 where the <keyword value> is a single string of values separated by semicolons, or it shall
91349 be written in the format:

91350 "%s=%s\\n", <keyword name>, <keyword value>

91351 where the <keyword value> is encoded as a set of strings, each enclosed in double-
91352 quotation marks, separated by semicolons.

91353 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the
91354 `localedef -f` option when the locale was created shall be written, with the word **charmap** as
91355 <keyword name>.

91356 If a value is numeric, it shall be written in one of the following formats:

91357 "%s=%d\\n", <keyword name>, <keyword value>

91358 "%s=%c%o\\n", <keyword name>, <escape character>, <keyword value>

91359 "%s=%cx%x\\n", <keyword name>, <escape character>, <keyword value>

91360 where the <escape character> is that identified by the **escape_char** keyword in the current
91361 locale; see XBD [Section 7.3](#) (on page 122).

91362 Compound keyword values (list entries) shall be separated in the output by semicolons.
91363 When included in keyword values, the semicolon, the double-quote, the backslash, and
91364 any control character shall be preceded (escaped) with the escape character.

91365 4. If the `-k` option is not specified, selected keyword values shall be written, each in the
91366 following format:

91367 "%s\\n", <keyword value>

91368 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the
91369 `localedef -f` option when the locale was created shall be written.

- 91370 5. If the `-m` option is specified, then a list of all available charmaps shall be written, each in
91371 the format:

91372 "%s\n", <charmap>

91373 where <charmap> is in a format suitable for use as the option-argument to the `localedef -f`
91374 option.

91375 **STDERR**

91376 The standard error shall be used only for diagnostic messages.

91377 **OUTPUT FILES**

91378 None.

91379 **EXTENDED DESCRIPTION**

91380 None.

91381 **EXIT STATUS**

91382 The following exit values shall be returned:

91383 0 All the requested information was found and output successfully.

91384 >0 An error occurred.

91385 **CONSEQUENCES OF ERRORS**

91386 Default.

91387 **APPLICATION USAGE**

91388 If the `LANG` environment variable is not set or set to an empty value, or one of the `LC_*`
91389 environment variables is set to an unrecognized value, the actual locales assumed (if any) are
91390 implementation-defined as described in XBD [Chapter 8](#) (on page 159).

91391 Implementations are not required to write out the actual values for keywords in the categories
91392 `LC_CTYPE` and `LC_COLLATE`; however, they must write out the categories (allowing an
91393 application to determine, for example, which character classes are available).

91394 **EXAMPLES**

91395 In the following examples, the assumption is that locale environment variables are set as
91396 follows:

91397 LANG=locale_x
91398 LC_COLLATE=locale_y

91399 The command `locale` would result in the following output:

91400 LANG=locale_x
91401 LC_CTYPE="locale_x"
91402 LC_COLLATE=locale_y
91403 LC_TIME="locale_x"
91404 LC_NUMERIC="locale_x"
91405 LC_MONETARY="locale_x"
91406 LC_MESSAGES="locale_x"
91407 LC_ALL=

91408 The order of presentation of the categories is not specified by this volume of POSIX.1-200x.

91409 The command:

91410 LC_ALL=POSIX locale -ck decimal_point

91411 would produce:

91412 LC_NUMERIC
91413 decimal_point="."

91414 The following command shows an application of *locale* to determine whether a user-supplied
91415 response is affirmative:

```
91416 if printf "%s\n" "$response" | grep -Eq "$(locale yesexpr)"
91417 then
91418     affirmative processing goes here
91419 else
91420     non-affirmative processing goes here
91421 fi
```

91422 RATIONALE

91423 The output for categories *LC_CTYPE* and *LC_COLLATE* has been made implementation-defined
91424 because there is a questionable value in having a shell script receive an entire array of characters.
91425 It is also difficult to return a logical collation description, short of returning a complete *localedef*
91426 source.

91427 The **-m** option was included to allow applications to query for the existence of charmaps. The
91428 output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the
91429 system.

91430 The **-c** option was included for readability when more than one category is selected (for
91431 example, via more than one keyword name or via a category name). It is valid both with and
91432 without the **-k** option.

91433 The **charmap** keyword, which returns the name of the charmap (if any) that was used when the
91434 current locale was created, was included to allow applications needing the information to
91435 retrieve it.

91436 FUTURE DIRECTIONS

91437 None.

91438 SEE ALSO

91439 *localedef*

91440 XBD [Section 6.1](#) (on page 111), [Chapter 7](#) (on page 121), [Chapter 8](#) (on page 159), [Section 12.2](#) (on
91441 page 201)

91442 CHANGE HISTORY

91443 First released in Issue 4.

91444 Issue 5

91445 The FUTURE DIRECTIONS section is added.

91446 Issue 6

91447 The normative text is reworded to avoid use of the term “must” for application requirements.

91448 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error
91449 in the STDOUT section.

91450 Issue 7

91451 Austin Group Interpretations 1003.1-2001 #017, #021, and #088 are applied, clarifying the
91452 standard output for the **-k** option when *LANG* is not set or is an empty string.

91453 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91454 **NAME**

91455 localedef — define locale environment

91456 **SYNOPSIS**91457 localedef [-c] [-f *charmap*] [-i *sourcefile*] [-u *code_set_name*] *name*91458 **DESCRIPTION**

91459 The *localedef* utility shall convert source definitions for locale categories into a format usable by
 91460 the functions and utilities whose operational behavior is determined by the setting of the locale
 91461 environment variables defined in XBD [Chapter 7](#) (on page 121). It is implementation-defined
 91462 whether users have the capability to create new locales, in addition to those supplied by the
 91463 implementation. If the symbolic constant POSIX2_LOCALEDEF is defined, the system supports
 91464 XSI the creation of new locales. On XSI-conformant systems, the symbolic constant
 91465 POSIX2_LOCALEDEF shall be defined.

91466 The utility shall read source definitions for one or more locale categories belonging to the same
 91467 locale from the file named in the *-i* option (if specified) or from standard input.

91468 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or
 91469 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may
 91470 restrict the capability to create or modify public locales to users with the appropriate privileges.

91471 Each category source definition shall be identified by the corresponding environment variable
 91472 name and terminated by an **END** *category-name* statement. The following categories shall be
 91473 supported. In addition, the input may contain source for implementation-defined categories.

91474 *LC_CTYPE* Defines character classification and case conversion.

91475 *LC_COLLATE*
 91476 Defines collation rules.

91477 *LC_MONETARY*
 91478 Defines the format and symbols used in formatting of monetary information.

91479 *LC_NUMERIC*
 91480 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary
 91481 numeric editing.

91482 *LC_TIME* Defines the format and content of date and time information.

91483 *LC_MESSAGES*
 91484 Defines the format and values of affirmative and negative responses.

91485 **OPTIONS**

91486 The *localedef* utility shall conform to XBD [Section 12.2](#) (on page 201).

91487 The following options shall be supported:

91488 *-c* Create permanent output even if warning messages have been issued.

91489 *-f charmap* Specify the pathname of a file containing a mapping of character symbols and
 91490 collating element symbols to actual character encodings. The format of the
 91491 *charmap* is described in XBD [Section 6.4](#) (on page 115). The application shall ensure
 91492 that this option is specified if symbolic names (other than collating symbols
 91493 defined in a **collating-symbol** keyword) are used. If the *-f* option is not present, an
 91494 implementation-defined character mapping shall be used.

91495 *-i inputfile* The pathname of a file containing the source definitions. If this option is not
 91496 present, source definitions shall be read from standard input. The format of the
 91497 *inputfile* is described in XBD [Section 7.3](#) (on page 122).

91498 **-u** *code_set_name*
 91499 Specify the name of a codeset used as the target mapping of character symbols and
 91500 collating element symbols whose encoding values are defined in terms of the
 91501 ISO/IEC 10646-1: 2000 standard position constant values.

OPERANDS

91502 The following operand shall be supported:

91503 *name* Identifies the locale; see XBD [Chapter 7](#) (on page 121) for a description of the use of
 91504 this name. If the name contains one or more slash characters, *name* shall be
 91505 interpreted as a pathname where the created locale definitions shall be stored. If
 91506 *name* does not contain any slash characters, the interpretation of the name is
 91507 implementation-defined and the locale shall be public. The ability to create public
 91508 locales in this way may be restricted to users with appropriate privileges. (As a
 91509 consequence of specifying one *name*, although several categories can be processed
 91510 in one execution, only categories belonging to the same locale can be processed.)
 91511

STDIN

91512 Unless the **-i** option is specified, the standard input shall be a text file containing one or more
 91513 locale category source definitions, as described in XBD [Section 7.3](#) (on page 122). When lines are
 91514 continued using the escape character mechanism, there is no limit to the length of the
 91515 accumulated continued line.
 91516

INPUT FILES

91517 The character set mapping file specified as the *charmap* option-argument is described in XBD
 91518 [Section 6.4](#) (on page 115). If a locale category source definition contains a **copy** statement, as
 91519 defined in XBD [Chapter 7](#) (on page 121), and the **copy** statement names a valid, existing locale,
 91520 then *localedef* shall behave as if the source definition had contained a valid category source
 91521 definition for the named locale.
 91522

ENVIRONMENT VARIABLES

91523 The following environment variables shall affect the execution of *localedef*:

91524 **LANG** Provide a default value for the internationalization variables that are unset or null.
 91525 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 91526 variables used to determine the values of locale categories.)
 91527
