91528 **LC_ALL** If set to a non-empty string value, override the values of all the other
 91529 internationalization variables.

91530 **LC_COLLATE**
 91531 (This variable has no affect on *localedef*; the POSIX locale is used for this category.)

91532 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 91533 characters (for example, single-byte as opposed to multi-byte characters in
 91534 arguments and input files). This variable has no affect on the processing of *localedef*
 91535 input data; the POSIX locale is used for this purpose, regardless of the value of this
 91536 variable.

91537 **LC_MESSAGES**
 91538 Determine the locale that should be used to affect the format and contents of
 91539 diagnostic messages written to standard error.

91540 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

ASYNCHRONOUS EVENTS

91541 Default.
 91542

91543 **STDOUT**

91544 The utility shall report all categories successfully processed, in an unspecified format.

91545 **STDERR**

91546 The standard error shall be used only for diagnostic messages.

91547 **OUTPUT FILES**91548 The format of the created output is unspecified. If the *name* operand does not contain a slash, the
91549 existence of an output file for the locale is unspecified.91550 **EXTENDED DESCRIPTION**91551 When the `-u` option is used, the *code_set_name* option-argument shall be interpreted as an
91552 implementation-defined name of a codeset to which the ISO/IEC 10646-1:2000 standard
91553 position constant values shall be converted via an implementation-defined method. Both the
91554 ISO/IEC 10646-1:2000 standard position constant values and other formats (decimal,
91555 hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset
91556 represented by the implementation-defined name can be any codeset that is supported by the
91557 implementation.91558 When conflicts occur between the *charmap* specification of `<code_set_name>`, `<mb_cur_max>`, or
91559 `<mb_cur_min>` and the implementation-defined interpretation of these respective items for the
91560 codeset represented by the `-u` option-argument *code_set_name*, the result is unspecified.91561 When conflicts occur between the *charmap* encoding values specified for symbolic names of
91562 characters of the portable character set and the implementation-defined assignment of character
91563 encoding values, the result is unspecified.91564 If a non-printable character in the *charmap* has a width specified that is not `-1`, the result will be
91565 undefined.91566 **EXIT STATUS**

91567 The following exit values shall be returned:

- 91568 0 No errors occurred and the locales were successfully created.
- 91569 1 Warnings occurred and the locales were successfully created.
- 91570 2 The locale specification exceeded implementation limits or the coded character set or sets
91571 used were not supported by the implementation, and no locale was created.
- 91572 3 The capability to create new locales is not supported by the implementation.
- 91573 >3 Warnings or errors occurred and no output was created.

91574 **CONSEQUENCES OF ERRORS**

91575 If an error is detected, no permanent output shall be created.

91576 If warnings occur, permanent output shall be created if the `-c` option was specified. The
91577 following conditions shall cause warning messages to be issued:

- 91578 • If a symbolic name not found in the *charmap* file is used for the descriptions of the
91579 *LC_CTYPE* or *LC_COLLATE* categories (for other categories, this shall be an error
91580 condition).
- 91581 • If the number of operands to the **order** keyword exceeds the `{COLL_WEIGHTS_MAX}`
91582 limit.
- 91583 • If optional keywords not supported by the implementation are present in the source.

91584 Other implementation-defined conditions may also cause warnings.

91585
91586
91587
91588
91589
91590
91591
91592

APPLICATION USAGE

The *charmap* definition is optional, and is contained outside the locale definition. This allows both completely self-defined source files, and generic sources (applicable to more than one codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the portable character set. As explained in XBD [Section 6.4](#) (on page 115), it is implementation-defined whether or not users or applications can provide additional character set description files. Therefore, the `-f` option might be operable only when an implementation-defined *charmap* is named.

91593
91594

EXAMPLES

None.

91595
91596
91597
91598

RATIONALE

The output produced by the *localedef* utility is implementation-defined. The *name* operand is used to identify the specific locale. (As a consequence, although several categories can be processed in one execution, only categories belonging to the same locale can be processed.)

91599
91600

FUTURE DIRECTIONS

None.

91610
91611

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/15 is applied, rewording text in the OPERANDS section describing the ability to create public locales.

91612
91613
91614

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/16 is applied, making the text consistent with the descriptions of **WIDTH** and **WIDTH_DEFAULT** in the Base Definitions volume of POSIX.1-200x.

91615
91616

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91617 **NAME**91618 `logger` — log messages91619 **SYNOPSIS**91620 `logger string...`91621 **DESCRIPTION**

91622 The *logger* utility saves a message, in an unspecified manner and format, containing the *string*
 91623 operands provided by the user. The messages are expected to be evaluated later by personnel
 91624 performing system administration tasks.

91625 It is implementation-defined whether messages written in locales other than the POSIX locale
 91626 are effective.

91627 **OPTIONS**

91628 None.

91629 **OPERANDS**

91630 The following operand shall be supported:

91631 *string* One of the string arguments whose contents are concatenated together, in the order
 91632 specified, separated by single <space>s.

91633 **STDIN**

91634 Not used.

91635 **INPUT FILES**

91636 None.

91637 **ENVIRONMENT VARIABLES**91638 The following environment variables shall affect the execution of *logger*:

91639 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 91640 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 91641 variables used to determine the values of locale categories.)

91642 *LC_ALL* If set to a non-empty string value, override the values of all the other
 91643 internationalization variables.

91644 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 91645 characters (for example, single-byte as opposed to multi-byte characters in
 91646 arguments).

91647 *LC_MESSAGES*

91648 Determine the locale that should be used to affect the format and contents of
 91649 diagnostic messages written to standard error. (This means diagnostics from *logger*
 91650 to the user or application, not diagnostic messages that the user is sending to the
 91651 system administrator.)

91652 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

91653 **ASYNCHRONOUS EVENTS**

91654 Default.

91655 **STDOUT**

91656 Not used.

91657 **STDERR**
 91658 The standard error shall be used only for diagnostic messages.

91659 **OUTPUT FILES**
 91660 Unspecified.

91661 **EXTENDED DESCRIPTION**
 91662 None.

91663 **EXIT STATUS**
 91664 The following exit values shall be returned:

91665 0 Successful completion.

91666 >0 An error occurred.

91667 **CONSEQUENCES OF ERRORS**
 91668 Default.

91669 **APPLICATION USAGE**
 91670 This utility allows logging of information for later use by a system administrator or programmer
 91671 in determining why non-interactive utilities have failed. The locations of the saved messages,
 91672 their format, and retention period are all unspecified. There is no method for a conforming
 91673 application to read messages, once written.

91674 **EXAMPLES**
 91675 A batch application, running non-interactively, tries to read a configuration file and fails; it may
 91676 attempt to notify the system administrator with:

91677 `logger myname: unable to read file foo. [timestamp]`

91678 **RATIONALE**
 91679 The standard developers believed strongly that some method of alerting administrators to errors
 91680 was necessary. The obvious example is a batch utility, running non-interactively, that is unable to
 91681 read its configuration files or that is unable to create or write its results file. However, the
 91682 standard developers did not wish to define the format or delivery mechanisms as they have
 91683 historically been (and will probably continue to be) very system-specific, as well as involving
 91684 functionality clearly outside the scope of this volume of POSIX.1-200x.

91685 The text with *LC_MESSAGES* about diagnostic messages means diagnostics from *logger* to the
 91686 user or application, not diagnostic messages that the user is sending to the system administrator.

91687 Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

91688 Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient
 91689 justification to exclude these utilities from this volume of POSIX.1-200x. It is also arguable that
 91690 they are, in fact, testable, but that the tests themselves are not portable.

91691 **FUTURE DIRECTIONS**
 91692 None.

91693 **SEE ALSO**
 91694 *lp*, *mailx*, *write*

91699

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

- 91700 **NAME**
- 91701 logname — return the user's login name
- 91702 **SYNOPSIS**
- 91703 logname
- 91704 **DESCRIPTION**
- 91705 The *logname* utility shall write the user's login name to standard output. The login name shall be
- 91706 the string that would be returned by the *getlogin()* function defined in the System Interfaces
- 91707 volume of POSIX.1-200x. Under the conditions where the *getlogin()* function would fail, the
- 91708 *logname* utility shall write a diagnostic message to standard error and exit with a non-zero exit
- 91709 status.
- 91710 **OPTIONS**
- 91711 None.
- 91712 **OPERANDS**
- 91713 None.
- 91714 **STDIN**
- 91715 Not used.
- 91716 **INPUT FILES**
- 91717 None.
- 91718 **ENVIRONMENT VARIABLES**
- 91719 The following environment variables shall affect the execution of *logname*:
- 91720 *LANG* Provide a default value for the internationalization variables that are unset or null. |
- 91721 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
- 91722 variables used to determine the values of locale categories.)
- 91723 *LC_ALL* If set to a non-empty string value, override the values of all the other
- 91724 internationalization variables.
- 91725 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
- 91726 characters (for example, single-byte as opposed to multi-byte characters in
- 91727 arguments).
- 91728 *LC_MESSAGES*
- 91729 Determine the locale that should be used to affect the format and contents of
- 91730 diagnostic messages written to standard error.
- 91731 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 91732 **ASYNCHRONOUS EVENTS**
- 91733 Default.
- 91734 **STDOUT**
- 91735 The *logname* utility output shall be a single line consisting of the user's login name:
- 91736 "%s\n", <login name>
- 91737 **STDERR**
- 91738 The standard error shall be used only for diagnostic messages.

CHANGE HISTORY

First released in Issue 2.

91765

NAME

91766

lp — send files to a printer

91767

SYNOPSIS

91768

lp [-c] [-d *dest*] [-n *copies*] [-msw] [-o *option*]... [-t *title*] [*file*...]

91769

DESCRIPTION

91770

The *lp* utility shall copy the input files to an output destination in an unspecified manner. The default output destination should be to a hardcopy device, such as a printer or microfilm recorder, that produces non-volatile, human-readable documents. If such a device is not available to the application, or if the system provides no such device, the *lp* utility shall exit with a non-zero exit status.

91771

91772

91773

91774

91775

The actual writing to the output device may occur some time after the *lp* utility successfully exits. During the portion of the writing that corresponds to each input file, the implementation shall guarantee exclusive access to the device.

91776

91777

91778

The *lp* utility shall associate a unique *request ID* with each request.

91779

Normally, a banner page is produced to separate and identify each print job. This page may be suppressed by implementation-defined conditions, such as an operator command or one of the *-o option* values.

91780

91781

91782

OPTIONS

91783

The *lp* utility shall conform to XBD [Section 12.2](#) (on page 201).

91784

The following options shall be supported:

91785

-c

Exit only after further access to any of the input files is no longer required. The application can then safely delete or modify the files without affecting the output operation. Normally, files are not copied, but are linked whenever possible. If the *-c* option is not given, then the user should be careful not to remove any of the files before the request has been printed in its entirety. It should also be noted that in the absence of the *-c* option, any changes made to the named files after the request is made but before it is printed may be reflected in the printed output. On some implementations, *-c* may be on by default.

91786

91787

91788

91789

91790

91791

91792

91793

-d *dest*

Specify a string that names the destination (*dest*). If *dest* is a printer, the request shall be printed only on that specific printer. If *dest* is a class of printers, the request shall be printed on the first available printer that is a member of the class. Under certain conditions (printer unavailability, file space limitation, and so on), requests for specific destinations need not be accepted. Destination names vary between systems.

91794

91795

91796

91797

91798

91799

If *-d* is not specified, and neither the *LPDEST* nor *PRINTER* environment variable is set, an unspecified destination is used. The *-d dest* option shall take precedence over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are undefined when *dest* contains a value that is not a valid destination name.

91800

91801

91802

91803

-m

Send mail (see [mailx](#)) after the files have been printed. By default, no mail is sent upon normal completion of the print request.

91804

91805

-n *copies*

Write *copies* number of copies of the files, where *copies* is a positive decimal integer. The methods for producing multiple copies and for arranging the multiple copies when multiple *file* operands are used are unspecified, except that each file shall be output as an integral whole, not interleaved with portions of other files.

91806

91807

91808

- 91809 **-o option** Specify printer-dependent or class-dependent *options*. Several such *options* may be
91810 collected by specifying the **-o** option more than once.
- 91811 **-s** Suppress messages from *lp*.
- 91812 **-t title** Write *title* on the banner page of the output.
- 91813 **-w** Write a message on the user's terminal after the files have been printed. If the user
91814 is not logged in, then mail shall be sent instead.

OPERANDS

91815 The following operand shall be supported:

- 91816 *file* A pathname of a file to be output. If no *file* operands are specified, or if a *file*
91817 operand is '-', the standard input shall be used. If a *file* operand is used, but the
91818 **-c** option is not specified, the process performing the writing to the output device
91819 may have user and group permissions that differ from that of the process invoking
91820 *lp*.
91821

STDIN

91822 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.
91823 See the INPUT FILES section.
91824

INPUT FILES

91825 The input files shall be text files.
91826

ENVIRONMENT VARIABLES

91827 The following environment variables shall affect the execution of *lp*:

- 91829 **LANG** Provide a default value for the internationalization variables that are unset or null. |
91830 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
91831 variables used to determine the values of locale categories.)
- 91832 **LC_ALL** If set to a non-empty string value, override the values of all the other
91833 internationalization variables.
- 91834 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
91835 characters (for example, single-byte as opposed to multi-byte characters in
91836 arguments and input files).
- 91837 **LC_MESSAGES** Determine the locale that should be used to affect the format and contents of
91838 diagnostic messages written to standard error and informative messages written to
91839 standard output.
91840
- 91841 **LC_TIME** Determine the format and contents of date and time strings displayed in the *lp*
91842 banner page, if any.
- 91843 **LPDEST** Determine the destination. If the **LPDEST** environment variable is not set, the
91844 **PRINTER** environment variable shall be used. The **-d dest** option takes precedence
91845 over **LPDEST**. Results are undefined when **-d** is not specified and **LPDEST**
91846 contains a value that is not a valid destination name.
- 91847 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.
- 91848 **PRINTER** Determine the output device or destination. If the **LPDEST** and **PRINTER**
91849 environment variables are not set, an unspecified output device is used. The **-d**
91850 **dest** option and the **LPDEST** environment variable shall take precedence over
91851 **PRINTER**. Results are undefined when **-d** is not specified, **LPDEST** is unset, and
91852 **PRINTER** contains a value that is not a valid device or destination name.

91853 TZ Determine the timezone used to calculate date and time strings displayed in the *lp*
 91854 banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be
 91855 used.

91856 **ASYNCHRONOUS EVENTS**

91857 Default.

91858 **STDOUT**

91859 The *lp* utility shall write a *request ID* to the standard output, unless *-s* is specified. The format of
 91860 the message is unspecified. The request ID can be used on systems supporting the historical
 91861 *cancel* and *lpstat* utilities.

91862 **STDERR**

91863 The standard error shall be used only for diagnostic messages.

91864 **OUTPUT FILES**

91865 None.

91866 **EXTENDED DESCRIPTION**

91867 None.

91868 **EXIT STATUS**

91869 The following exit values shall be returned:

91870 0 All input files were processed successfully.

91871 >0 No output device was available, or an error occurred.

91872 **CONSEQUENCES OF ERRORS**

91873 Default.

91874 **APPLICATION USAGE**

91875 The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's
 91876 default page size.

91877 A conforming application can use one of the *file* operands only with the *-c* option or if the file is
 91878 publicly readable and guaranteed to be available at the time of printing. This is because
 91879 POSIX.1-200x gives the implementation the freedom to queue up the request for printing at
 91880 some later time by a different process that might not be able to access the file.

91881 **EXAMPLES**

91882 1. To print file *file*:

91883 `lp -c file`

91884 2. To print multiple files with headers:

91885 `pr file1 file2 | lp`

91886 **RATIONALE**

91887 The *lp* utility was designed to be a basic version of a utility that is already available in many
 91888 historical implementations. The standard developers considered that it should be implementable
 91889 simply as:

91890 `cat "$@" > /dev/lp`

91891 after appropriate processing of options, if that is how the implementation chose to do it and if
 91892 exclusive access could be granted (so that two users did not write to the device simultaneously).
 91893 Although in the future the standard developers may add other options to this utility, it should
 91894 always be able to execute with no options or operands and send the standard input to an
 91895 unspecified output device.

91896 This volume of POSIX.1-200x makes no representations concerning the format of the printed

91897 output, except that it must be “human-readable” and “non-volatile”. Thus, writing by default to
 91898 a disk or tape drive or a display terminal would not qualify. (Such destinations are not
 91899 prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)

91900 This volume of POSIX.1-200x is worded such that a “print job” consisting of multiple input files,
 91901 possibly in multiple copies, is guaranteed to print so that any one file is not intermixed with
 91902 another, but there is no statement that all the files or copies have to print out together.

91903 The `-c` option may imply a spooling operation, but this is not required. The utility can be
 91904 implemented to wait until the printer is ready and then wait until it is finished. Because of that,
 91905 there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).

91906 On some historical systems, the request ID reported on the `STDOUT` can be used to later cancel
 91907 or find the status of a request using utilities not defined in this volume of POSIX.1-200x.

91908 Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality,
 91909 they used different names for the environment variable specifying the destination printer. Since
 91910 the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence
 91911 over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one
 91912 or the other environment variable, the `lp` utility is required to recognize both. If this was not
 91913 done, many applications would send output to unexpected output devices when users moved
 91914 from system to system.

91915 Some have commented that `lp` has far too little functionality to make it worthwhile. Requests
 91916 have proposed additional options or operands or both that added functionality. The requests
 91917 included:

- 91918 • Wording *requiring* the output to be “hardcopy”
- 91919 • A requirement for multiple printers
- 91920 • Options for supporting various page-description languages

91921 Given that a compliant system is not required to even have a printer, placing further restrictions
 91922 upon the behavior of the printer is not useful. Since hardcopy format is so application-
 91923 dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that
 91924 should be required on all compliant systems.

91925 The term *unspecified* is used in this section in lieu of *implementation-defined* as most known
 91926 implementations would not be able to make definitive statements in their conformance
 91927 documents; the existence and usage of printers is very dependent on how the system
 91928 administrator configures each individual system.

91929 Since the default destination, device type, queuing mechanisms, and acceptable forms of input
 91930 are all unspecified, usage guidelines for what a conforming application can do are as follows:

- 91931 • Use the command in a pipeline, or with `-c`, so that there are no permission problems and
 91932 the files can be safely deleted or modified.
- 91933 • Limit output to text files of reasonable line lengths and printable characters and include no
 91934 device-specific formatting information, such as a page description language. The meaning
 91935 of “reasonable” in this context can only be answered as a quality-of-implementation issue,
 91936 but it should be apparent from historical usage patterns in the industry and the locale. The
 91937 `pr` and `fold` utilities can be used to achieve reasonable formatting for the default page size
 91938 of the implementation.

91939 Alternatively, the application can arrange its installation in such a way that it requires the system
 91940 administrator or operator to provide the appropriate information on `lp` options and environment
 91941 variable values.

91942 At a minimum, having this utility in this volume of POSIX.1-200x tells the industry that
 91943 conforming applications require a means to print output and provides at least a command name

91944 and *LPDEST* routing mechanism that can be used for discussions between vendors, application
 91945 developers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent
 91946 of the standard developers, even if they cannot mandate that all systems (such as laptops) have
 91947 printers.

91948 This volume of POSIX.1-200x does not specify what the ownership of the process performing the
 91949 writing to the output device may be. If *-c* is not used, it is unspecified whether the process
 91950 performing the writing to the output device has permission to read *file* if there are any
 91951 restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the
 91952 results of deleting *file* before it is printed are unspecified.

91953 FUTURE DIRECTIONS

91954 None.

91957 XBD Chapter 8 (on page 159), Section 12.2 (on page 201)

91958 CHANGE HISTORY

91959 First released in Issue 2.

91960 Issue 6

91961 The following new requirements on POSIX implementations derive from alignment with the
 91962 Single UNIX Specification:

- 91963 • In the DESCRIPTION, the requirement to associate a unique request ID, and the normal
 91964 generation of a banner page is added.
- 91965 • In the OPTIONS section:
 - 91966 — The *-d dest* description is expanded, but references to *lpstat* are removed.
 - 91967 — The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- 91968 • In the ENVIRONMENT VARIABLES section, *LC_TIME* may now affect the execution.
- 91969 • The STDOUT section is added.

91970 The normative text is reworded to avoid use of the term “must” for application requirements.

91971 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

91972 Issue 7

91973 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

91974 **NAME**

91975 ls — list directory contents

91976 **SYNOPSIS**

91977 xSI ls [-ACFRSacdilmnpqrtl] [-H|-L] [-fgos] [file...]

91978 **DESCRIPTION**

91979 For each operand that names a file of a type other than directory or symbolic link to a directory,
 91980 *ls* shall write the name of the file as well as any requested, associated information. For each
 91981 operand that names a file of type directory, *ls* shall write the names of files contained within the
 91982 directory as well as any requested, associated information. Filenames beginning with a period
 91983 ('.') and any associated information shall not be written out unless explicitly referenced, the
 91984 **-A** or **-a** option is supplied, or an implementation-defined condition causes them to be written.
 91985 If one of the **-d**, **-F**, or **-l** options are specified, and one of the **-H** or **-L** options are not specified,
 91986 for each operand that names a file of type symbolic link to a directory, *ls* shall write the name of
 91987 the file as well as any requested, associated information. If none of the **-d**, **-F**, or **-l** options are
 91988 specified, or the **-H** or **-L** options are specified, for each operand that names a file of type
 91989 symbolic link to a directory, *ls* shall write the names of files contained within the directory as
 91990 well as any requested, associated information.

91991 If no operands are specified, *ls* shall write the contents of the current directory. If more than one
 91992 operand is specified, *ls* shall write non-directory operands first; it shall sort directory and non-
 91993 directory operands separately according to the collating sequence in the current locale.

91994 The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an
 91995 ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic
 91996 message to standard error and shall either recover its position in the hierarchy or terminate.

91997 **OPTIONS**91998 The *ls* utility shall conform to XBD [Section 12.2](#) (on page 201).

91999 The following options shall be supported:

- 92000 **-A** Write out all directory entries, including those whose names begin with a period
 92001 ('.') but excluding the entries dot and dot-dot (if they exist).
- 92002 **-C** Write multi-text-column output with entries sorted down the columns, according
 92003 to the collating sequence. The number of text columns and the column separator
 92004 characters are unspecified, but should be adapted to the nature of the output
 92005 device.
- 92006 **-F** Do not follow symbolic links named as operands unless the **-H** or **-L** options are
 92007 specified. Write a slash ('/') immediately after each pathname that is a directory,
 92008 an asterisk ('*') after each that is executable, a vertical bar ('|') after each that is
 92009 a FIFO, and an at sign ('@') after each that is a symbolic link. For other file types,
 92010 other symbols may be written.
- 92011 **-H** If a symbolic link referencing a file of type directory is specified on the command
 92012 line, *ls* shall evaluate the file information and file type to be those of the file
 92013 referenced by the link, and not the link itself; however, *ls* shall write the name of
 92014 the link itself and not the file referenced by the link.
- 92015 **-L** Evaluate the file information and file type for all symbolic links (whether named
 92016 on the command line or encountered in a file hierarchy) to be those of the file
 92017 referenced by the link, and not the link itself; however, *ls* shall write the name of
 92018 the link itself and not the file referenced by the link. When **-L** is used with **-l**, write
 92019 the contents of symbolic links in the long format (see the STDOUT section).

92020		-R	Recursively list subdirectories encountered.
92021		-S	Sort with the primary key being file size (in decreasing order) and the secondary key being filename in the collating sequence (in increasing order).
92022			
92023		-a	Write out all directory entries, including those whose names begin with a period ('.').
92024			
92025		-c	Use time of last modification of the file status information (see <code><sys/stat.h></code> in the System Interfaces volume of POSIX.1-200x) instead of last modification of the file itself for sorting (-t) or writing (-l).
92026			
92027			
92028		-d	Do not follow symbolic links named as operands unless the -H or -L options are specified. Do not treat directories differently than other types of files. The use of -d with -R produces unspecified results.
92029			
92030			
92031		-f	List the entries in directory operands in the order they appear in the directory. The behavior for non-directory operands is unspecified. This option shall turn off -l , -t , -S , -s , and -r , and shall turn on -a .
92032			
92033			
92034	XSI	-g	The same as -l , except that the owner shall not be written.
92035		-i	For each file, write the file's file serial number (see <code>stat()</code> in the System Interfaces volume of POSIX.1-200x).
92036			
92037		-k	Set the block size for the -s option and the per-directory block count written for the -l , -n , -s , -g , and -o options (see the STDOUT section) to 1 024 bytes.
92038	XSI		
92039		-l	(The letter ell.) Do not follow symbolic links named as operands unless the -H or -L options are specified. Write out in long format (see the STDOUT section). When -l (ell) is specified, -1 (one) shall be assumed.
92040			
92041			
92042		-m	Stream output format; list files across the page, separated by commas.
92043		-n	The same as -l , except that the owner's UID and GID numbers shall be written, rather than the associated character strings.
92044			
92045	XSI	-o	The same as -l , except that the group shall not be written.
92046		-p	Write a slash ('/') after each filename if that file is a directory.
92047		-q	Force each instance of non-printable filename characters and <code><tab></code> s to be written as the question-mark ('?') character. Implementations may provide this option by default if the output is to a terminal device.
92048			
92049			
92050		-r	Reverse the order of the sort to get reverse collating sequence oldest first, or smallest file size first depending on the other options given.
92051			
92052		-s	Indicate the total number of file system blocks consumed by each file displayed. If the -k option is also specified, the block size shall be 1 024 bytes; otherwise, the block size is implementation-defined.
92053			
92054			
92055		-t	Sort with the primary key being time modified (most recently modified first) and the secondary key being filename in the collating sequence.
92056			
92057		-u	Use time of last access (see <code><sys/stat.h></code>) instead of last modification of the file for sorting (-t) or writing (-l).
92058			
92059		-x	The same as -C , except that the multi-text-column output is produced with entries sorted across, rather than down, the columns.
92060			
92061		-1	(The numeric digit one.) Force output to be one entry per line.
92062			Specifying more than one of the options in the following mutually-exclusive pairs shall not be considered an error: -C and -l (ell), -m and -l (ell), -x and -l (ell), -C and -1 (one), -H and -L ,
92063			

92064 -c and -u, -t and -S. The last option specified in each pair shall determine the output format.

92065 OPERANDS

92066 The following operand shall be supported:

92067 *file* A pathname of a file to be written. If the file specified is not found, a diagnostic
92068 message shall be output on standard error.

92069 STDIN

92070 Not used.

92071 INPUT FILES

92072 None.

92073 ENVIRONMENT VARIABLES

92074 The following environment variables shall affect the execution of *ls*:

92075 *COLUMNS* Determine the user's preferred column position width for writing multiple text-
92076 column output. If this variable contains a string representing a decimal integer, the
92077 *ls* utility shall calculate how many pathname text columns to write (see -C) based
92078 on the width provided. If *COLUMNS* is not set or invalid, an implementation-
92079 defined number of column positions shall be assumed, based on the
92080 implementation's knowledge of the output device. The column width chosen to
92081 write the names of files in any given directory shall be constant. Filenames shall
92082 not be truncated to fit into the multiple text-column output.

92083 *LANG* Provide a default value for the internationalization variables that are unset or null. |
92084 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
92085 variables used to determine the values of locale categories.)

92086 *LC_ALL* If set to a non-empty string value, override the values of all the other
92087 internationalization variables.

92088 *LC_COLLATE* Determine the locale for character collation information in determining the
92089 pathname collation sequence.

92091 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
92092 characters (for example, single-byte as opposed to multi-byte characters in
92093 arguments) and which characters are defined as printable (character class **print**).

92094 *LC_MESSAGES* Determine the locale that should be used to affect the format and contents of
92095 diagnostic messages written to standard error.
92096

92097 *LC_TIME* Determine the format and contents for date and time strings written by *ls*.

92098 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

92099 *TZ* Determine the timezone for date and time strings written by *ls*. If *TZ* is unset or
92100 null, an unspecified default timezone shall be used.

92101 ASYNCHRONOUS EVENTS

92102 Default.

92103 STDOUT

92104 The default format shall be to list one entry per line to standard output; the exceptions are to
92105 terminals or when one of the -C, -m, or -x options is specified. If the output is to a terminal, the
92106 format is implementation-defined.

92107 When -m is specified, the format used shall be:

92108 "%s, %s, ...\n", <filename1>, <filename2>

- 92109 where the largest number of filenames shall be written without exceeding the length of the line.
- 92110 If the `-i` option is specified, the file's file serial number (see `<sys/stat.h>`) shall be written in the
92111 following format before any other output for the corresponding entry:
- 92112 `%u ", <file serial number>`
- 92113 If the `-l` option is specified without `-L`, the following information shall be written:
- 92114 `"%s %u %s %s %u %s %s\n", <file mode>, <number of links>, <owner name>, <group name>, <number of bytes in the file>, <date and time>, <pathname>`
92115
92116
- 92117 If the file is a symbolic link, this information shall be about the link itself and the `<pathname>`
92118 field shall be of the form:
- 92119 `"%s -> %s", <pathname of link>, <contents of link>`
- 92120 If both `-l` and `-L` are specified, the following information shall be written:
- 92121 `"%s %u %s %s %u %s %s\n", <file mode>, <number of links>, <owner name>, <group name>, <number of bytes in the file>, <date and time>, <pathname of link>`
92122
92123
- 92124 where all fields except `<pathname of link>` shall be for the file resolved from the symbolic link.
- 92125 XSI The `-n`, `-g`, and `-o` options use the same format as `-l`, but with omitted items and their
92126 associated `<blank>`s. See the OPTIONS section.
- 92127 In both the preceding `-l` forms, if `<owner name>` or `<group name>` cannot be determined, or if `-n`
92128 is given, they shall be replaced with their associated numeric values using the format `%u`.
- 92129 The `<date and time>` field shall contain the appropriate date and timestamp of when the file was
92130 last modified. In the POSIX locale, the field shall be the equivalent of the output of the following
92131 `date` command:
- 92132 `date "+%b %e %H:%M"`
- 92133 if the file has been modified in the last six months, or:
- 92134 `date "+%b %e %Y"`
- 92135 (where two `<space>`s are used between `%e` and `%Y`) if the file has not been modified in the last
92136 six months or if the modification date is in the future, except that, in both cases, the final
92137 `<newline>` produced by `date` shall not be included and the output shall be as if the `date`
92138 command were executed at the time of the last modification date of the file rather than the
92139 current time. When the `LC_TIME` locale category is not set to the POSIX locale, a different format
92140 and order of presentation of this field may be used.
- 92141 If the file is a character special or block special file, the size of the file may be replaced with
92142 implementation-defined information associated with the device in question.
- 92143 If the pathname was specified as a *file* operand, it shall be written as specified.
- 92144 XSI The file mode written under the `-l`, `-n`, `-g`, and `-o` options shall consist of the following format:
92145 `"%c%s%s%s", <entry type>, <owner permissions>, <group permissions>, <other permissions>, <optional alternate access method flag>`
92146
92147
- 92148 The `<optional alternate access method flag>` shall be the empty string if there is no alternate or
92149 additional access control method associated with the file; otherwise, it shall be a string
92150 containing a single printable character that is not a `<blank>`.
- 92151 The `<entry type>` character shall describe the type of file, as follows:

92152 d Directory.

92153 b Block special file.

92154 c Character special file.

92155 l (ell) Symbolic link.

92156 p FIFO.

92157 – Regular file.

92158 Implementations may add other characters to this list to represent other implementation-defined
92159 file types.

92160 The next three fields shall be three characters each:

92161 <owner permissions>
92162 Permissions for the file owner class (see XBD [Section 4.4](#), on page 96).

92163 <group permissions>
92164 Permissions for the file group class.

92165 <other permissions>
92166 Permissions for the file other class.

92167 Each field shall have three character positions:

92168 1. If 'r', the file is readable; if '-', the file is not readable.

92169 2. If 'w', the file is writable; if '-', the file is not writable.

92170 3. The first of the following that applies:

92171 S If in <owner permissions>, the file is not executable and set-user-ID mode is set. If in
92172 <group permissions>, the file is not executable and set-group-ID mode is set.

92173 s If in <owner permissions>, the file is executable and set-user-ID mode is set. If in
92174 <group permissions>, the file is executable and set-group-ID mode is set.

92175 XSI T If in <other permissions> and the file is a directory, search permission is not granted to
92176 others, and the restricted deletion flag is set.

92177 XSI t If in <other permissions> and the file is a directory, search permission is granted to
92178 others, and the restricted deletion flag is set.

92179 x The file is executable or the directory is searchable.

92180 – None of the attributes of 'S', 's', 'T', 't', or 'x' applies.

92181 Implementations may add other characters to this list for the third character position.
92182 Such additions shall, however, be written in lowercase if the file is executable or
92183 searchable, and in uppercase if it is not.

92184 XSI If any of the **-l**, **-n**, **-s**, **-g**, or **-o** options is specified, each list of files within the directory shall be
92185 preceded by a status line indicating the number of file system blocks occupied by files in the
92186 directory in 512-byte units if the **-k** option is not specified, or 1 024-byte units of the **-k** option is
92187 specified, rounded up to the next integral number of units, if necessary. In the POSIX locale, the
92188 format shall be:

92189 "total %u\n", <number of units in the directory>

92190 If more than one directory, or a combination of non-directory files and directories are written,
92191 either as a result of specifying multiple operands, or the **-R** option, each list of files within a
92192 directory shall be preceded by:

92193 "\n%s:\n", <directory name>

92194 If this string is the first thing to be written, the first <newline> shall not be written. This output
92195 shall precede the number of units in the directory.

92196 If the `-s` option is given, each file shall be written with the number of blocks used by the file. -
92197 XSI Along with `-C`, `-l`, `-m`, or `-x`, the number and a <space> shall precede the filename; with `-l`, `-n`, -
92198 `-g`, or `-o`, they shall precede each line describing a file. +

STDERR

92199 The standard error shall be used only for diagnostic messages.
92200

OUTPUT FILES

92201 None.
92202

EXTENDED DESCRIPTION

92203 None.
92204

EXIT STATUS

92205 The following exit values shall be returned:
92206

92207 0 Successful completion.

92208 >0 An error occurred.

CONSEQUENCES OF ERRORS

92209 Default.
92210

APPLICATION USAGE

92211 Many implementations use the equal sign (`'='`) to denote sockets bound to the file system for
92212 the `-F` option. Similarly, many historical implementations use the `'s'` character to denote
92213 sockets as the entry type characters for the `-l` option.
92214

92215 It is difficult for an application to use every part of the file modes field of `ls -l` in a portable
92216 manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as
92217 implementations may have extensions. Applications can use this field to pass directly to a user
92218 printout or prompt, but actions based on its contents should generally be deferred, instead, to
92219 the *test* utility.

92220 The output of `ls` (with the `-l` and related options) contains information that logically could be
92221 used by utilities such as *chmod* and *touch* to restore files to a known state. However, this
92222 information is presented in a format that cannot be used directly by those utilities or be easily
92223 translated into a format that can be used. A character has been added to the end of the
92224 permissions string so that applications at least have an indication that they may be working in
92225 an area they do not understand instead of assuming that they can translate the permissions
92226 string into something that can be used. Future versions or related documents may define one or
92227 more specific characters to be used based on different standard additional or alternative access
92228 control mechanisms.

92229 As with many of the utilities that deal with filenames, the output of `ls` for multiple files or in one
92230 of the long listing formats must be used carefully on systems where filenames can contain
92231 embedded white space. Systems and system administrators should institute policies and user
92232 training to limit the use of such filenames.

92233 The number of disk blocks occupied by the file that it reports varies depending on underlying
92234 file system type, block size units reported, and the method of calculating the number of blocks.
92235 On some file system types, the number is the actual number of blocks occupied by the file
92236 (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the
92237 file size (usually making an allowance for indirect blocks, but ignoring holes).

EXAMPLES

An example of a small directory tree being fully listed with `ls -laRF a` in the POSIX locale:

```
total 11
drwxr-xr-x  3 fox      prog           64 Jul  4 12:07 ./
drwxrwxrwx  4 fox      prog          3264 Jul  4 12:09 ../
drwxr-xr-x  2 fox      prog           48 Jul  4 12:07 b/
-rwxr--r--  1 fox      prog           572 Jul  4 12:07 foo*

a/b:
total 4
drwxr-xr-x  2 fox      prog           48 Jul  4 12:07 ./
drwxr-xr-x  3 fox      prog           64 Jul  4 12:07 ../
-rw-r--r--  1 fox      prog           700 Jul  4 12:07 bar
```

RATIONALE

Some historical implementations of the `ls` utility show all entries in a directory except dot and dot-dot when a superuser invokes `ls` without specifying the `-a` option. When “normal” users invoke `ls` without specifying `-a`, they should not see information about any files with names beginning with a period unless they were named as *file* operands.

Implementations are expected to traverse arbitrary depths when processing the `-R` option. The only limitation on depth should be based on running out of physical storage for keeping track of untraversed directories.

The `-1` (one) option was historically found in BSD and BSD-derived implementations only. It is required in this volume of POSIX.1-200x so that conforming applications might ensure that output is one entry per line, even if the output is to a terminal.

The `-S` option was added in Issue 7, but had been provided by several implementations for many years. The description given in the standard documents historic practice, but does not match much of the documentation that described its behavior. Historical documentation typically described it as something like:

```
-S      Sort by size (largest size first) instead of by name. Special character devices (listed last) are sorted by name.
```

even though the file type was never considered when sorting the output. Character special files do typically sort close to the end of the list because their file size on most implementations is zero. But they are sorted alphabetically with any other files that happen to have the same file size (zero), not sorted separately and added to the end.

Generally, this volume of POSIX.1-200x is silent about what happens when options are given multiple times. In the cases of `-C`, `-l`, and `-1`, however, it does specify the results of these overlapping options. Since `ls` is one of the most aliased commands, it is important that the implementation perform intuitively. For example, if the alias were:

```
alias ls="ls -C"
```

and the user typed `ls -1`, single-text-column output should result, not an error.

Earlier versions of this standard did not describe the BSD `-A` option (like `-a`, but dot and dot-dot are not written out). It has been added due to widespread implementation.

Implementations may make `-q` the default for terminals to prevent trojan horse attacks on terminals with special escape sequences. This is not required because:

- Some control characters may be useful on some terminals; for example, a system might write them as `"\001"` or `"^A"`.

- Special behavior for terminals is not relevant to applications portability.

An early proposal specified that the *<optional alternate access method flag>* had to be '+' if there was an alternate access method used on the file or <space> if there was not. This was changed to be <space> if there is not and a single printable character if there is. This was done for three reasons:

1. There are historical implementations using characters other than '+'.
2. There are implementations that vary this character used in that position to distinguish between various alternate access methods in use.
3. The standard developers did not want to preclude future specifications that might need a way to specify more than one alternate access method.

Nonetheless, implementations providing a single alternate access method are encouraged to use '+'.

Earlier versions of this standard did not have the `-k` option, which meant that the `-s` option could not be used portably as its block size was implementation-defined, and the units used to specify the number of blocks occupied by files in a directory in an `ls -l` listing were fixed as 512-byte units. The `-k` option has been added to provide a way for the `-s` option to be used portably, and for consistency it also changes the aforementioned units from 512-byte to 1024-byte.

The *<date and time>* field in the `-l` format is specified only for the POSIX locale. As noted, the format can be different in other locales. No mechanism for defining this is present in this volume of POSIX.1-200x, as the appropriate vehicle is a messaging system; that is, the format should be specified as a "message".

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 5

A second FUTURE DIRECTION is added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the `-F` option, other symbols are allowed for other file types.

Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.

The Open Group Base Resolution bwg2001-010 is applied, adding the `T` and `t` fields as part of the `XSI` option.

Issue 7

Austin Group Interpretation 1003.1-2001 #101 is applied, clarifying the optional alternate access method flag in the `STDOUT` section.

SD5-XCU-ERN-50 is applied, adding the `-A` option.

SD5-XCU-ERN-97 is applied, updating the `SYNOPSIS`.

92327

92328

92329

92330

The **-S** option is added from The Open Group Technical Standard, 2006, Extended API Set Part 1.

The **-f**, **-m**, **-n**, **-p**, **-s**, and **-x** options are moved from the XSI option to the Base.

The description of the **-f** and **-s** options are revised and the **-k** option is added.

92331 **NAME**
 92332 m4 — macro processor

92333 **SYNOPSIS**
 92334 m4 [-s] [-D name[=val]]... [-U name]... file...

92335 **DESCRIPTION**
 92336 The *m4* utility is a macro processor that shall read one or more text files, process them according
 92337 to their included macro statements, and write the results to standard output.

92338 **OPTIONS**
 92339 The *m4* utility shall conform to XBD [Section 12.2](#) (on page 201), except that the order of the **-D**
 92340 and **-U** options shall be significant, and options can be interspersed with operands.

92341 The following options shall be supported:

92342 **-s** Enable line synchronization output for the *c99* preprocessor phase (that is, **#line**
 92343 directives).

92344 **-D name[=val]**
 92345 Define *name* to *val* or to null if *=val* is omitted.

92346 **-U name** Undefine *name*.

92347 **OPERANDS**
 92348 The following operand shall be supported:

92349 *file* A pathname of a text file to be processed. If no *file* is given, or if it is '-', the
 92350 standard input shall be read.

92351 **STDIN**
 92352 The standard input shall be a text file that is used if no *file* operand is given, or if it is '-'.

92353 **INPUT FILES**
 92354 The input file named by the *file* operand shall be a text file.

92355 **ENVIRONMENT VARIABLES**
 92356 The following environment variables shall affect the execution of *m4*:

92357 **LANG** Provide a default value for the internationalization variables that are unset or null.
 92358 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 92359 variables used to determine the values of locale categories.)

92360 **LC_ALL** If set to a non-empty string value, override the values of all the other
 92361 internationalization variables.

92362 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 92363 characters (for example, single-byte as opposed to multi-byte characters in
 92364 arguments and input files).

92365 **LC_MESSAGES**
 92366 Determine the locale that should be used to affect the format and contents of
 92367 diagnostic messages written to standard error.

92368 **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

92369 **ASYNCHRONOUS EVENTS**
 92370 Default.

92371 **STDOUT**

92372 The standard output shall be the same as the input files, after being processed for macro
92373 expansion.

92374 **STDERR**

92375 The standard error shall be used to display strings with the **errprint** macro, macro tracing
92376 enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for
92377 diagnostic messages.

92378 **OUTPUT FILES**

92379 None.

92380 **EXTENDED DESCRIPTION**

92381 The *m4* utility shall compare each token from the input against the set of built-in and user-
92382 defined macros. If the token matches the name of a macro, then the token shall be replaced by
92383 the macro's defining text, if any, and rescanned for matching macro names. Once no portion of
92384 the token matches the name of a macro, it shall be written to standard output. Macros may have
92385 arguments, in which case the arguments shall be substituted into the defining text before it is
92386 rescanned.

92387 Macro calls have the form:

92388 *name*(*arg1*, *arg2*, ..., *argn*)

92389 Macro names shall consist of letters, digits, and underscores, where the first character is not a
92390 digit. Tokens not of this form shall not be treated as macros.

92391 The application shall ensure that the left parenthesis immediately follows the name of the macro.
92392 If a token matching the name of a macro is not followed by a left parenthesis, it is handled as a
92393 use of that macro without arguments.

92394 If a macro name is followed by a left parenthesis, its arguments are the comma-separated tokens
92395 between the left parenthesis and the matching right parenthesis. Unquoted <blank>s and
92396 <newline>s preceding each argument shall be ignored. All other characters, including trailing
92397 <blank>s and <newline>s, are retained. Commas enclosed between left and right parenthesis
92398 characters do not delimit arguments.

92399 Arguments are positionally defined and referenced. The string "\$1" in the defining text shall be
92400 replaced by the first argument. Systems shall support at least nine arguments; only the first nine
92401 can be referenced, using the strings "\$1" to "\$9", inclusive. The string "\$0" is replaced with
92402 the name of the macro. The string "\$#" is replaced by the number of arguments as a string. The
92403 string "\$*" is replaced by a list of all of the arguments, separated by commas. The string "\$@"
92404 is replaced by a list of all of the arguments separated by commas, and each argument is quoted
92405 using the current left and right quoting strings. The string "\${" produces unspecified behavior.

92406 If fewer arguments are supplied than are in the macro definition, the omitted arguments are
92407 taken to be null. It is not an error if more arguments are supplied than are in the macro
92408 definition.

92409 No special meaning is given to any characters enclosed between matching left and right quoting
92410 strings, but the quoting strings are themselves discarded. By default, the left quoting string
92411 consists of a grave accent (`) and the right quoting string consists of an acute accent ('); see
92412 also the **changequote** macro.

92413 Comments are written but not scanned for matching macro names; by default, the begin-
92414 comment string consists of the number sign character and the end-comment string consists of a
92415 <newline>. See also the **changecom** and **dnl** macros.

92416 The *m4* utility shall make available the following built-in macros. They can be redefined, but
92417 once this is done the original meaning is lost. Their values shall be null unless otherwise stated.
92418 In the descriptions below, the term *defining text* refers to the value of the macro: the second

92419		argument to the define macro, among other things. Except for the first argument to the eval
92420		macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The
92421		string values produced as the defining text of the decr , divnum , incr , index , len , and sysval
92422		built-in macros shall be in the form of a decimal-constant as defined in the C language.
92423	changecom	The changecom macro shall set the begin-comment and end-comment strings.
92424		With no arguments, the comment mechanism shall be disabled. With a single non-
92425		null argument, that argument shall become the begin-comment and the <newline>
92426		shall become the end-comment string. With two non-null arguments, the first
92427		argument shall become the begin-comment string and the second argument shall
92428		become the end-comment string. The behavior is unspecified if either argument is
92429		provided but null. Systems shall support comment strings of at least five
92430		characters.
92431	changequote	The changequote macro shall set the begin-quote and end-quote strings. With no
92432		arguments, the quote strings shall be set to the default values (that is, ` `'). The
92433		behavior is unspecified if there is a single argument or either argument is null.
92434		With two non-null arguments, the first argument shall become the begin-quote
92435		string and the second argument shall become the end-quote string. Systems shall
92436		support quote strings of at least five characters.
92437	decr	The defining text of the decr macro shall be its first argument decremented by 1. It
92438		shall be an error to specify an argument containing any non-numeric characters. +
92439		The behavior is unspecified if decr is not immediately followed by a left +
92440		parenthesis.
92441	define	The second argument shall become the defining text of the macro whose name is
92442		the first argument. It is unspecified whether the define macro deletes all prior
92443		definitions of the macro named by its first argument or preserves all but the
92444		current definition of the macro. The behavior is unspecified if define is not +
92445		immediately followed by a left parenthesis.
92446	defn	The defining text of the defn macro shall be the quoted definition (using the
92447		current quoting strings) of its arguments. The behavior is unspecified if defn is not
92448		immediately followed by a left parenthesis.
92449	divert	The <i>m4</i> utility maintains nine temporary buffers, numbered 1 to 9, inclusive.
92450		When the last of the input has been processed, any output that has been placed in
92451		these buffers shall be written to standard output in buffer-numerical order. The
92452		divert macro shall divert future output to the buffer specified by its argument.
92453		Specifying no argument or an argument of 0 shall resume the normal output
92454		process. Output diverted to a stream with a negative number shall be discarded.
92455		Behavior is implementation-defined if a stream number larger than 9 is specified. It
92456		shall be an error to specify an argument containing any non-numeric characters.
92457	divnum	The defining text of the divnum macro shall be the number of the current output
92458		stream as a string.
92459	dnl	The dnl macro shall cause <i>m4</i> to discard all input characters up to and including
92460		the next <newline>.
92461	dumpdef	The dumpdef macro shall write the defined text to standard error for each of the
92462		macros specified as arguments, or, if no arguments are specified, for all macros.
92463	errprint	The errprint macro shall write its arguments to standard error. The behavior is
92464		unspecified if errprint is not immediately followed by a left parenthesis.
92465	eval	The eval macro shall evaluate its first argument as an arithmetic expression, using
92466		signed integer arithmetic with at least 32-bit precision. At least the following C-
92467		language operators shall be supported, with precedence, associativity, and

92468		behavior as described in Section 1.1.2.1 (on page 2231):	
92469		()	
92470		unary +	
92471		unary -	
92472		~	
92473		!	
92474		binary *	
92475		/	
92476		%	
92477		binary +	
92478		binary -	
92479		<<	
92480		>>	
92481		<	
92482		<=	
92483		>	
92484		>=	
92485		= =	
92486		!=	
92487		binary &	
92488		^	
92489			
92490		&&	
92491			
92492		Systems shall support octal and hexadecimal numbers as in the ISO C standard.	
92493		The second argument, if specified, shall set the radix for the result; if the argument	
92494		is blank or unspecified, the default is 10. Behavior is unspecified if the radix falls	
92495		outside the range 2 to 36, inclusive. The third argument, if specified, sets the	
92496		minimum number of digits in the result. Behavior is unspecified if the third	
92497		argument is less than zero. It shall be an error to specify the second or third	
92498		argument containing any non-numeric characters.	
92499	ifdef	If the first argument to the ifdef macro is defined, the defining text shall be the	
92500		second argument. Otherwise, the defining text shall be the third argument, if	
92501		specified, or the null string, if not. The behavior is unspecified if ifdef is not	
92502		immediately followed by a left parenthesis.	
92503	ifelse	The ifelse macro takes three or more arguments. If the first two arguments	
92504		compare as equal strings (after macro expansion of both arguments), the defining	
92505		text shall be the third argument. If the first two arguments do not compare as equal	
92506		strings and there are three arguments, the defining text shall be null. If the first two	
92507		arguments do not compare as equal strings and there are four or five arguments,	
92508		the defining text shall be the fourth argument. If the first two arguments do not	
92509		compare as equal strings and there are six or more arguments, the first three	
92510		arguments shall be discarded and processing shall restart with the remaining	
92511		arguments. The behavior is unspecified if ifelse is not immediately followed by a	
92512		left parenthesis.	
92513	include	The defining text for the include macro shall be the contents of the file named by	
92514		the first argument. It shall be an error if the file cannot be read. The behavior is	
92515		unspecified if include is not immediately followed by a left parenthesis.	
92516	incr	The defining text of the incr macro shall be its first argument incremented by 1. It	
92517		shall be an error to specify an argument containing any non-numeric characters.	+
92518		The behavior is unspecified if incr is not immediately followed by a left	+

92519		parenthesis.	
92520	index	The defining text of the index macro shall be the first character position (as a string) in the first argument where a string matching the second argument begins (zero origin), or -1 if the second argument does not occur. The behavior is unspecified if index is not immediately followed by a left parenthesis.	+
92521			
92522			
92523			
92524	len	The defining text of the len macro shall be the length (as a string) of the first argument. The behavior is unspecified if len is not immediately followed by a left parenthesis.	+
92525			
92526			
92527	m4exit	Exit from the <i>m4</i> utility. If the first argument is specified, it is the exit code. The default is zero. It shall be an error to specify an argument containing any non-numeric characters.	
92528			
92529			
92530	m4wrap	The first argument shall be processed when EOF is reached. If the m4wrap macro is used multiple times, the arguments specified shall be processed in the order in which the m4wrap macros were processed. The behavior is unspecified if m4wrap is not immediately followed by a left parenthesis.	
92531			
92532			
92533			
92534	OB maketemp	The defining text shall be the first argument, with any trailing 'X' characters replaced with the current process ID as a string. The behavior is unspecified if maketemp is not immediately followed by a left parenthesis.	+
92535			
92536			
92537	mkstemp	The first argument shall be taken as a template for creating an empty file, with trailing 'X' characters replaced with characters from the portable filename character set. The behavior is unspecified if the first argument does not end in at least six 'X' characters. If a temporary file is successfully created, then the defining text of the macro shall be the name of the new file. The user ID of the file shall be set to the effective user ID of the process. The group ID of the file shall be set to the group ID of the file's parent directory or to the effective group ID of the process. The file access permission bits are set such that only the owner can both read and write the file, regardless of the current <i>umask</i> of the process. If a file could not be created, the defining text of the macro shall be the empty string.	+
92538			
92539			
92540			
92541			
92542			
92543			
92544			
92545			
92546			
92547	popdef	The popdef macro shall delete the current definition of its arguments, replacing that definition with the previous one. If there is no previous definition, the macro is undefined. The behavior is unspecified if popdef is not immediately followed by a left parenthesis.	
92548			
92549			
92550			
92551	pushdef	The pushdef macro shall be equivalent to the define macro with the exception that it shall preserve any current definition for future retrieval using the popdef macro. The behavior is unspecified if pushdef is not immediately followed by a left parenthesis.	
92552			
92553			
92554			
92555	shift	The defining text for the shift macro shall be all of its arguments except for the first one. The behavior is unspecified if shift is not immediately followed by a left parenthesis.	+
92556			
92557			
92558	sinclude	The sinclude macro shall be equivalent to the include macro, except that it shall not be an error if the file is inaccessible. The behavior is unspecified if sinclude is not immediately followed by a left parenthesis.	+
92559			
92560			
92561	substr	The defining text for the substr macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. The	+
92562			
92563			
92564			
92565			
92566			
92567			

92568		behavior is unspecified if substr is not immediately followed by a left parenthesis.
92569	syscmd	The syscmd macro shall interpret its first argument as a shell command line. The defining text shall be the string result of that command. The string result shall not be rescanned for macros while setting the defining text. No output redirection shall be performed by the <i>m4</i> utility. The exit status value from the command can be retrieved using the sysval macro. The behavior is unspecified if syscmd is not immediately followed by a left parenthesis.
92570		
92571		
92572		
92573		
92574		
92575	sysval	The defining text of the sysval macro shall be the exit value of the utility last invoked by the syscmd macro (as a string).
92576		
92577	traceon	The traceon macro shall enable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros. The trace output shall be written to standard error in an unspecified format.
92578		
92579		
92580	traceoff	The traceoff macro shall disable tracing for the macros specified as arguments, or, if no arguments are specified, for all macros.
92581		
92582	translit	The defining text of the translit macro shall be the first argument with every character that occurs in the second argument replaced with the corresponding character from the third argument. The behavior is unspecified if the '-' character appears within the second or third argument anywhere besides the first or last character. The behavior is unspecified if translit is not immediately followed by a left parenthesis.
92583		
92584		
92585		
92586		
92587		
92588	undefine	The undefine macro shall delete all definitions (including those preserved using the pushdef macro) of the macros named by its arguments. The behavior is unspecified if undefine is not immediately followed by a left parenthesis.
92589		
92590		
92591	undivert	The undivert macro shall cause immediate output of any text in temporary buffers named as arguments, or all temporary buffers if no arguments are specified. Buffers can be undiverted into other temporary buffers. Undiverting shall discard the contents of the temporary buffer. The behavior is unspecified if an argument contains any non-numeric characters.
92592		
92593		
92594		
92595		

EXIT STATUS

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred

If the **m4exit** macro is used, the exit value can be specified by the input file.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

The **defn** macro is useful for renaming macros, especially built-ins.

Since **eval** defers to the ISO C standard, some operations have undefined behavior. In some implementations, division or remainder by zero cause a fatal signal, even if the division occurs on the short-circuited branch of "&&" or "||". Any operation that overflows in signed arithmetic produces undefined behavior. Likewise, using the **shift** operators with a shift amount that is not positive and smaller than the precision is undefined, as is shifting a negative number to the right. Historically, not all implementations obeyed C-language precedence rules: '^' and '!' were lower than '=='; '==' and '!=' were not lower than '<'; and '|' was not lower than '^'; the liberal use of "(" can force the desired precedence even with these non-compliant implementations. Furthermore, some traditional implementations treated '^' as an exponentiation operator, although most implementations now use "***" as an extension for this

92615 purpose. +

92616 When a macro has been multiply defined via the **pushdef** macro, it is unspecified whether the

92617 **define** macro will alter only the most recent definition (as though by **popdef** and **pushdef**), or

92618 replace the entire stack of definitions with a single definition (as though by **undefine** and

92619 **pushdef**). An application desiring particular behavior for the **define** macro in this case can

92620 redefine it accordingly.

92621 Applications should use the **mkstemp** macro instead of the obsolescent **maketemp** macro for +

92622 creating temporary files.

92623 EXAMPLES

92624 If the file **m4src** contains the lines:

```
92625 The value of `VER' is "VER".
92626 #ifdef `VER', `VER' is defined to be VER., VER is not defined.)
92627 #ifndef `VER', 1, `VER' is `VER'.)
92628 #ifndef `VER', 2, `VER' is `VER'., `VER' is not 2.)
92629 #endif
```

92630 then the command

```
92631 m4 m4src
```

92632 or the command:

```
92633 m4 -U VER m4src
```

92634 produces the output:

```
92635 The value of VER is "VER".
92636 VER is not defined.
92637 VER is not 2.
92638 #endif
```

92639 The command:

```
92640 m4 -D VER m4src
```

92641 produces the output:

```
92642 The value of VER is ".
92643 VER is defined to be .
92644 VER is not 2.
92645 #endif
```

92646 The command:

```
92647 m4 -D VER=1 m4src
```

92648 produces the output:

```
92649 The value of VER is "1".
92650 VER is defined to be 1.
92651 VER is 1.
92652 VER is not 2.
92653 #endif
```

92654 The command:

```
92655 m4 -D VER=2 m4src
```

92656 produces the output:

92657 The value of VER is "2".
 92658 VER is defined to be 2.
 92659 VER is 2.
 92660 end

RATIONALE

92661 Historic System V-based behavior treated "\${" in a macro definition as two literal characters.
 92662 However, this sequence is left unspecified so that implementations may offer extensions such as
 92663 "\${11}" meaning the eleventh positional parameter. Macros can still be defined with
 92664 appropriate uses of nested quoting to result in a literal "\${" in the output after rescanning
 92665 removes the nested quotes.
 92666

92667 In the **translit** built-in, historic System V-based behavior treated '-' as a literal; GNU behavior
 92668 treats it as a range. This version of the standard allows either behavior.

FUTURE DIRECTIONS

92669 None.

SEE ALSO

 92673 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

CHANGE HISTORY

92674 First released in Issue 2.

Issue 5

92676 The phrase "the defined text for macros written by the **dumpdef** macro" is added to the
 92677 description of STDERR, and the description of **dumpdef** is updated to indicate that output is
 92678 written to standard error. The description of **eval** is updated to indicate that the list of excluded
 92679 C operators excludes unary '&' and '.'. In the description of **ifdef**, the phrase "and it is not
 92680 defined to be zero" is deleted.
 92681

Issue 6

92682 In the EXTENDED DESCRIPTION, the **eval** text is updated to include a '&' character in the
 92683 excepted list.
 92684
 92685 The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion
 92686 buffers.
 92687 The normative text is reworded to avoid use of the term "must" for application requirements.
 92688 The Open Group Base Resolution bwg2000-006 is applied.
 92689 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES
 92690 section.

Issue 7

92691 Austin Group Interpretation 1003.1-2001 #117 is applied, marking the **maketemp** macro
 92692 obsolescent and adding a new **mkstemp** macro.
 92693
 92694 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not
 92695 apply (options can be interspersed with operands).
 92696 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
 92697 SD5-XCU-ERN-99 is applied, clarifying the definition of the **divert** macro in the EXTENDED
 92698 DESCRIPTION.
 92699 SD5-XCU-ERN-100 is applied, clarifying the definition of the **syscmd** macro in the EXTENDED
 92700 DESCRIPTION.
 92701 SD5-XCU-ERN-101 is applied, clarifying the definition of the **undivert** macro in the EXTENDED

92702	DESCRIPTION.	
92703	SD5-XCU-ERN-111 is applied to the EXTENDED DESCRIPTION, clarifying that the string "\${"	
92704	produces unspecified behavior.	
92705	SD5-XCU-ERN-112 is applied, updating the changequote macro.	
92706	SD5-XCU-ERN-118 is applied, clarifying the definition of the define macro in the EXTENDED	
92707	DESCRIPTION and APPLICATION USAGE sections.	
92708	SD5-XCU-ERN-118 is applied, clarifying the definition of the translit macro in the EXTENDED	
92709	DESCRIPTION and RATIONALE sections.	
92710	SD5-XCU-ERN-130, SD5-XCU-ERN-131, and SD5-XCU-ERN-137 are applied.	
92711	The <i>m4</i> utility is moved from the XSI option to the Base.	

92712 **NAME**

92713 mailx — process messages

92714 **SYNOPSIS**92715 **Send Mode**92716 mailx [-s *subject*] *address...*92717 **Receive Mode**

92718 UP mailx -e

92719 mailx [-HiNn] [-F] [-u *user*]92720 mailx -f [-HiNn] [-F] [*file*]92721 **DESCRIPTION**92722 The *mailx* utility provides a message sending and receiving facility. It has two major modes,
92723 selected by the options used: Send Mode and Receive Mode.92724 On systems that do not support the User Portability Utilities option, an application using *mailx*
92725 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first
92726 character of one or more lines is tilde ('~'), all characters in the input message shall appear in
92727 the delivered message, but additional characters may be inserted in the message before it is
92728 retrieved.92729 UP On systems supporting the User Portability Utilities option, mail-receiving capabilities and other
92730 interactive features, Receive Mode, described below, also shall be enabled.92731 **Send Mode**92732 Send Mode can be used by applications or users to send messages from the text in standard
92733 input.92734 UP **Receive Mode**92735 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this
92736 interactive mode.92737 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to
92738 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the
92739 message as it is entered.92740 Incoming mail shall be stored in one or more unspecified locations for each user, collectively
92741 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system
92742 mailbox shall be the default place to find new mail. As messages are read, they shall be marked
92743 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is
92744 called the **mbox** and is normally located in the directory referred to by the *HOME* environment
92745 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).
92746 Messages shall remain in this file until explicitly removed. When the -f option is used to read
92747 mail messages from secondary files, messages shall be retained in those files unless specifically
92748 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred
92749 to in this section as simply “mailboxes”, unless more specific identification is required.

92750 **OPTIONS**92751 The *mailx* utility shall conform to XBD [Section 12.2](#) (on page 201).92752 The following options shall be supported. (Only the `-s subject` option shall be required on all
92753 systems. The other options are required only on systems supporting the User Portability Utilities
92754 option.)92755 UP `-e` Test for the presence of mail in the system mailbox. The *mailx* utility shall write
92756 nothing and exit with a successful return code if there is mail to read.92757 UP `-f` Read messages from the file named by the *file* operand instead of the system
92758 mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox**
92759 instead of the system mailbox.92760 UP `-F` Record the message in a file named after the first recipient. The name is the login-
92761 name portion of the address found first on the **To:** line in the mail header.
92762 Overrides the **record** variable, if set (see [Internal Variables in mailx](#), on page 2813).92763 UP `-H` Write a header summary only.92764 UP `-i` Ignore interrupts. (See also **ignore**.)92765 UP `-n` Do not initialize from the system default start-up file. See the EXTENDED
92766 DESCRIPTION section.92767 UP `-N` Do not write an initial header summary.92768 `-s subject` Set the **Subject** header field to *subject*. All characters in the *subject* string shall
92769 appear in the delivered message. The results are unspecified if *subject* is longer
92770 than {LINE_MAX} – 10 bytes or contains a <newline>.92771 UP `-u user` Read the system mailbox of the login name *user*. This shall only be successful if
92772 the invoking user has the appropriate privileges to read the system mailbox of that
92773 user.92774 **OPERANDS**

92775 The following operands shall be supported:

92776 *address* Addressee of message. When `-n` is specified and no user start-up files are accessed
92777 (see the EXTENDED DESCRIPTION section), the user or application shall ensure
92778 this is an address to pass to the mail delivery system. Any system or user start-up
92779 files may enable aliases (see **alias** under [Commands in mailx](#), on page 2816) that
92780 may modify the form of *address* before it is passed to the mail delivery system.92781 UP *file* A pathname of a file to be read instead of the system mailbox when `-f` is specified.
92782 The meaning of the *file* option-argument shall be affected by the contents of the
92783 **folder** internal variable; see [Internal Variables in mailx](#) (on page 2813).92784 **STDIN**92785 When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the
92786 message to be delivered to the specified addresses. When in Receive Mode, user commands
92787 shall be accepted from *stdin*. If the User Portability Utilities option is not supported, standard
92788 input lines beginning with a tilde ('~') character produce unspecified results.92789 UP If the User Portability Utilities option is supported, then in both Send and Receive Modes,
92790 standard input lines beginning with the escape character (usually tilde ('~')) shall affect
92791 processing as described in [Command Escapes in mailx](#) (on page 2824).

92792 INPUT FILES

92793 When *mailx* is used as described by this volume of POSIX.1-200x, the *file* option-argument (see
 92794 the **-f** option) and the **mbox** shall be text files containing mail messages, formatted as described
 92795 in the OUTPUT FILES section. The nature of the system mailbox is unspecified; it need not be a
 92796 file.

92797 ENVIRONMENT VARIABLES

92798 UP Some of the functionality described in this section shall be provided on implementations that
 92799 support the User Portability Utilities option as described in the text, and is not further shaded
 92800 for this option.

92801 The following environment variables shall affect the execution of *mailx*:

92802 *DEAD* Determine the pathname of the file in which to save partial messages in case of
 92803 interrupts or delivery errors. The default shall be **dead.letter** in the directory
 92804 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is
 92805 unspecified if the User Portability Utilities option is not supported and *DEAD* is
 92806 not defined with the value **/dev/null**.

92807 *EDITOR* Determine the name of a utility to invoke when the **edit** (see [Commands in mailx](#),
 92808 on page 2816) or **~e** (see [Command Escapes in mailx](#), on page 2824) command is
 92809 XSI used. The default editor is unspecified. [On XSI-conformant systems it is *ed*.](#) The
 92810 effects of this variable are unspecified if the User Portability Utilities option is not
 92811 supported.

92812 *HOME* Determine the pathname of the user's home directory.

92813 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 92814 (See [XBD Section 8.2](#) (on page 160) for the precedence of internationalization |
 92815 variables used to determine the values of locale categories.)

92816 *LC_ALL* If set to a non-empty string value, override the values of all the other
 92817 internationalization variables.

92818 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 92819 characters (for example, single-byte as opposed to multi-byte characters in
 92820 arguments and input files) and the handling of case-insensitive address and
 92821 header-field comparisons.

92822 *LC_TIME* This variable may determine the format and contents of the date and time strings
 92823 written by *mailx*. This volume of POSIX.1-200x specifies the effects of this variable
 92824 only for systems supporting the User Portability Utilities option.

92825 *LC_MESSAGES*

92826 Determine the locale that should be used to affect the format and contents of
 92827 diagnostic messages written to standard error and informative messages written to
 92828 standard output.

92829 *LISTER* Determine a string representing the command for writing the contents of the
 92830 **folder** directory to standard output when the **folders** command is given (see
 92831 **folders** in [Commands in mailx](#), on page 2816). Any string acceptable as a
 92832 *command_string* operand to the *sh -c* command shall be valid. If this variable is null
 92833 or not set, the output command shall be *ls*. The effects of this variable are
 92834 unspecified if the User Portability Utilities option is not supported.

92835 *MAILRC* Determine the pathname of the start-up file. The default shall be **.mailrc** in the
 92836 directory referred to by the *HOME* environment variable. The behavior of *mailx* is
 92837 unspecified if the User Portability Utilities option is not supported and *MAILRC* is
 92838 not defined with the value **/dev/null**.

92839		<i>MBOX</i>	Determine a pathname of the file to save messages from the system mailbox that have been read. The exit command shall override this function, as shall saving the message explicitly in another file. The default shall be mbox in the directory named by the <i>HOME</i> variable. The effects of this variable are unspecified if the User Portability Utilities option is not supported.
92840			
92841			
92842			
92843			
92844	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
92845		<i>PAGER</i>	Determine a string representing an output filtering or pagination command for writing the output to the terminal. Any string acceptable as a <i>command_string</i> operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal device, the message output shall be piped through the command if the <i>mailx</i> internal variable crf is set to a value less the number of lines in the message; see Internal Variables in mailx (on page 2813). If the <i>PAGER</i> variable is null or not set, the paginator shall be either <i>more</i> or another paginator utility documented in the system documentation. The effects of this variable are unspecified if the User Portability Utilities option is not supported.
92846			
92847			
92848			
92849			
92850			
92851			
92852			
92853			
92854		<i>SHELL</i>	Determine the name of a preferred command interpreter. The default shall be <i>sh</i> . The effects of this variable are unspecified if the User Portability Utilities option is not supported.
92855			
92856			
92857		<i>TERM</i>	If the internal variable screen is not specified, determine the name of the terminal type to indicate in an unspecified manner the number of lines in a screenful of headers. If <i>TERM</i> is not set or is set to null, an unspecified default terminal type shall be used and the value of a screenful is unspecified. The effects of this variable are unspecified if the User Portability Utilities option is not supported.
92858			
92859			
92860			
92861			
92862		<i>TZ</i>	This variable may determine the timezone used to calculate date and time strings written by <i>mailx</i> . If <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
92863			
92864			
92865		<i>VISUAL</i>	Determine a pathname of a utility to invoke when the visual command (see Commands in mailx , on page 2816) or ~v command-escape (see Command Escapes in mailx , on page 2824) is used. If this variable is null or not set, the full-screen editor shall be <i>vi</i> . The effects of this variable are unspecified if the User Portability Utilities option is not supported.
92866			
92867			
92868			
92869			
92870		ASYNCHRONOUS EVENTS	
92871			When <i>mailx</i> is in Send Mode and standard input is not a terminal, it shall take the standard action for all signals.
92872			
92873	UP	In Receive Mode, or in	Send Mode when standard input is a terminal, if a SIGINT signal is received:
92874			
92875	UP	1. If in command mode, the current command, if there is one, shall be aborted, and a	command-mode prompt shall be written.
92876			
92877		2. If in input mode:	
92878	UP	a. If <i>ignore</i> is set, <i>mailx</i> shall write "@\n", discard the current input line, and	continue processing, bypassing the message-abort mechanism described in item
92879			2b.
92880			
92881	UP	b. If the interrupt was received while sending mail, either when in Receive Mode or	in Send Mode, a message shall be written, and another subsequent interrupt, with
92882			no other intervening characters typed, shall be required to abort the mail message.
92883			
92884	UP	If in Receive Mode and another interrupt is received, a command-mode prompt	shall be written. If in Send Mode and another interrupt is received, <i>mailx</i> shall
92885			terminate with a non-zero status.
92886			

92887 In both cases listed in item b, if the message is not empty:

- 92888 UP i. If **save** is enabled and the file named by *DEAD* can be created, the message
92889 shall be written to the file named by *DEAD*. If the file exists, the message
92890 shall be written to replace the contents of the file.
- 92891 UP ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the
92892 message shall not be saved.

92893 The *mailx* utility shall take the standard action for all other signals.

92894 STDOUT

92895 In command and input modes, all output, including prompts and messages, shall be written to
92896 standard output.

92897 STDERR

92898 The standard error shall be used only for diagnostic messages.

92899 OUTPUT FILES

92900 Various *mailx* commands and command escapes can create or add to files, including the **mbox**,
92901 the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of
92902 POSIX.1-200x, these files shall be text files, formatted as follows:

92903 line beginning with **From**<space>
92904 [one or more *header-lines*; see [Commands in mailx](#) (on page 2816)]
92905 *empty line*
92906 [zero or more *body lines*
92907 *empty line*]
92908 [line beginning with **From**<space>...]

92909 where each message begins with the **From** <space> line shown, preceded by the beginning of
92910 the file or an empty line. (The **From** <space> line is considered to be part of the message header,
92911 but not one of the header-lines referred to in [Commands in mailx](#) (on page 2816); thus, it shall
92912 not be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the
92913 **From** <space> line and any additional header lines are unspecified, except that none shall be
92914 empty. The format of a message body line is also unspecified, except that no line following an
92915 empty line shall start with **From** <space>; *mailx* shall modify any such user-entered message
92916 body lines (following an empty line and beginning with **From** <space>) by adding one or more
92917 characters to precede the 'F'; it may add these characters to **From** <space> lines that are not
92918 preceded by an empty line.

92919 When a message from the system mailbox or entered by the user is not a text file, it is
92920 implementation-defined how such a message is stored in files written by *mailx*.

92921 EXTENDED DESCRIPTION

92922 UP The functionality in the entire EXTENDED DESCRIPTION section shall be provided on
92923 implementations supporting the User Portability Utilities option. The functionality described in
92924 this section shall be provided on implementations that support the User Portability Utilities
92925 option (and the rest of this section is not further shaded for this option).

92926 The *mailx* utility need not support for all character encodings in all circumstances. For example,
92927 inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data need not
92928 be portable to non-internationalized systems, and so on. Under these circumstances, it is
92929 recommended that only characters defined in the ISO/IEC 646:1991 standard International
92930 Reference Version (equivalent to ASCII) 7-bit range of characters be used.

92931 When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of
92932 header-summary lines (if **-N** was not specified and there are messages, see below), followed by
92933 a prompt indicating that *mailx* can accept regular commands (see [Commands in mailx](#), on page
92934 2816); this is termed *command mode*. The page of header-summary lines shall contain the first

92935 new message if there are new messages, or the first unread message if there are unread
 92936 messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and
 92937 standard input is a terminal, if no subject is specified on the command line and the **asksub**
 92938 variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input
 92939 mode. This input mode shall also be entered when using one of the Receive Mode synopsis
 92940 forms and a reply or new message is composed using the **reply**, **Reply**, **followup**, **Followup**, or
 92941 **mail** commands and standard input is a terminal. When the message is typed and the end of the
 92942 message is encountered, the message shall be passed to the mail delivery software. Commands
 92943 can be entered by beginning a line with the escape character (by default, tilde ('~')) followed by
 92944 a single command letter and optional arguments. See [Commands in mailx](#) (on page 2816) for a
 92945 summary of these commands. It is unspecified what effect these commands will have if standard
 92946 input is not a terminal when a message is entered using either the Send Mode synopsis, or the
 92947 Read Mode commands **reply**, **Reply**, **followup**, **Followup**, or **mail**.

92948 **Note:** For notational convenience, this section uses the default escape character, tilde, in all references
 92949 and examples.

92950 At any time, the behavior of *mailx* shall be governed by a set of environmental and internal
 92951 variables. These are flags and valued parameters that can be set and cleared via the *mailx* **set**
 92952 and **unset** commands.

92953 Regular commands are of the form:

92954 `[command] [msglist] [argument ...]`

92955 If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands
 92956 shall be recognized by the escape character, and lines not treated as commands shall be taken as
 92957 input for the message.

92958 In command mode, each message shall be assigned a sequential number, starting with 1.

92959 All messages have a state that shall affect how they are displayed in the header summary and
 92960 how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a
 92961 *current* message, which shall be marked by a '>' at the beginning of a line in the header
 92962 summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current
 92963 message shall be the first new message, if there is a new message, or the first unread message if
 92964 there is an unread message, or the first message if there are any messages, or unspecified if there
 92965 are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*)
 92966 or an optional single message (*message*) on which to operate shall leave the current message set
 92967 to the highest-numbered message of the messages specified, unless the command deletes
 92968 messages, in which case the current message shall be set to the first undeleted message (that is, a
 92969 message not in the deleted state) after the highest-numbered message deleted by the command,
 92970 if one exists, or the first undeleted message before the highest-numbered message deleted by the
 92971 command, if one exists, or to an unspecified value if there are no remaining undeleted messages.
 92972 All messages shall be in one of the following states:

92973 *new* The message is present in the system mailbox and has not been viewed by the user
 92974 or moved to any other state. Messages in state *new* when *mailx* quits shall be
 92975 retained in the system mailbox.

92976 *unread* The message has been present in the system mailbox for more than one invocation
 92977 of *mailx* and has not been viewed by the user or moved to any other state.
 92978 Messages in state *unread* when *mailx* quits shall be retained in the system mailbox.

92979 *read* The message has been processed by one of the following commands: **f**, **m**, **F**, **M**,
 92980 **copy**, **mbox**, **next**, **pipe**, **print**, **Print**, **top**, **type**, **Type**, **undelete**. The **delete**, **dp**,
 92981 and **dt** commands may also cause the next message to be marked as *read*,
 92982 depending on the value of the **autoprint** variable. Messages that are in the system
 92983 mailbox and in state *read* when *mailx* quits shall be saved in the **mbox**, unless the
 92984 internal variable **hold** was set. Messages that are in the **mbox** or in a secondary

- 92985 mailbox and in state *read* when *mailx* quits shall be retained in their current
92986 location.
- 92987 *deleted* The message has been processed by one of the following commands: **delete**, **dp**, **dt**.
92988 Messages in state *deleted* when *mailx* quits shall be deleted. Deleted messages shall
92989 be ignored until *mailx* quits or changes mailboxes or they are specified to the
92990 undelete command; for example, the message specification */string* shall only
92991 search the subject lines of messages that have not yet been deleted, unless the
92992 command operating on the list of messages is **undelete**. No deleted message or
92993 deleted message header shall be displayed by any *mailx* command other than
92994 **undelete**.
- 92995 *preserved* The message has been processed by a **preserve** command. When *mailx* quits, the
92996 message shall be retained in its current location.
- 92997 *saved* The message has been processed by one of the following commands: **save** or **write**.
92998 If the current mailbox is the system mailbox, and the internal variable **keepsave** is
92999 set, messages in the state *saved* shall be saved to the file designated by the *MBOX*
93000 variable (see the ENVIRONMENT VARIABLES section). If the current mailbox is
93001 the system mailbox, messages in the state *saved* shall be deleted from the current
93002 mailbox, when the **quit** or **file** command is used to exit the current mailbox.
- 93003 The header-summary line for each message shall indicate the state of the message.
- 93004 Many commands take an optional list of messages (*msglist*) on which to operate, which defaults
93005 to the current message. A *msglist* is a list of message specifications separated by <blank>s, which
93006 can include:
- 93007 *n* Message number *n*.
- 93008 **+** The next undeleted message, or the next deleted message for the **undelete** command.
- 93009 **-** The next previous undeleted message, or the next previous deleted message for the
93010 **undelete** command.
- 93011 **.** The current message.
- 93012 **^** The first undeleted message, or the first deleted message for the **undelete** command.
- 93013 **\$** The last message.
- 93014 ***** All messages.
- 93015 *n-m* An inclusive range of message numbers.
- 93016 *address* All messages from *address*; any address as shown in a header summary shall be
93017 matchable in this form.
- 93018 */string* All messages with *string* in the subject line (case ignored).
- 93019 **:c** All messages of type *c*, where *c* shall be one of:
- 93020 **d** Deleted messages.
- 93021 **n** New messages.
- 93022 **o** Old messages (any not in state *read* or *new*).
- 93023 **r** Read messages.
- 93024 **u** Unread messages.
- 93025 Other commands take an optional message (*message*) on which to operate, which defaults to the
93026 current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more
93027 than one message is specified, only the first shall be operated on.

93028 Other arguments are usually arbitrary strings whose usage depends on the command involved.

93029 **Start-Up in mailx**

93030 At start-up time, *mailx* shall take the following steps in sequence:

- 93031 1. Establish all variables at their stated default values.
- 93032 2. Process command line options, overriding corresponding default values.
- 93033 3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables
93034 that are present in the environment, overriding the corresponding default values.
- 93035 4. Read *mailx* commands from an unspecified system start-up file, unless the `-n` option is
93036 given, to initialize any internal *mailx* variables and aliases.
- 93037 5. Process the start-up file of *mailx* commands named in the user *MAILRC* variable.

93038 Most regular *mailx* commands are valid inside start-up files, the most common use being to set
93039 up initial display options and alias lists. The following commands shall be invalid in the start-up
93040 file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**.
93041 Any errors in the start-up file shall either cause *mailx* to terminate with a diagnostic message and
93042 a non-zero status or to continue after writing a diagnostic message, ignoring the remainder of
93043 the lines in the start-up file.

93044 A blank line in a start-up file shall be ignored.

93045 **Internal Variables in mailx**

93046 The following variables are internal *mailx* variables. Each internal variable can be set via the
93047 *mailx set* command at any time. The **unset** and **set no name** commands can be used to erase
93048 variables.

93049 In the following list, variables shown as:

93050 `variable`

93051 represent Boolean values. Variables shown as:

93052 `variable=value`

93053 shall be assigned string or numeric values. For string values, the rules in [Commands in mailx](#)
93054 (on page 2816) concerning filenames and quoting shall also apply.

93055 The defaults specified here may be changed by the unspecified system start-up file unless the
93056 user specifies the `-n` option.

93057 **allnet** All network names whose login name components match shall be treated as
93058 identical. This shall cause the *msglist* message specifications to behave similarly.
93059 The default shall be **noallnet**. See also the **alternates** command and the **metoo**
93060 variable.

93061 **append** Append messages to the end of the **mbox** file upon termination instead of placing
93062 them at the beginning. The default shall be **noappend**. This variable shall not
93063 affect the **save** command when saving to **mbox**.

93064 **ask**, **asksub** Prompt for a subject line on outgoing mail if one is not specified on the command
93065 line with the `-s` option. The **ask** and **asksub** forms are synonyms; the system shall
93066 refer to **asksub** and **noasksub** in its messages, but shall accept **ask** and **noask** as
93067 user input to mean **asksub** and **noasksub**. It shall not be possible to set both **ask**
93068 and **noasksub**, or **noask** and **asksub**. The default shall be **asksub**, but no
93069 prompting shall be done if standard input is not a terminal.

93070	askbcc	Prompt for the blind copy list. The default shall be noaskbcc .
93071	askcc	Prompt for the copy list. The default shall be noaskcc .
93072	autoprint	Enable automatic writing of messages after delete and undelete commands. The default shall be noautoprint .
93073		
93074	bang	Enable the special-case treatment of exclamation marks ('!') in escape command lines; see the escape command and Command Escapes in mailx (on page 2824). The default shall be nobang , disabling the expansion of '!' in the <i>command</i> argument to the ~! command and the ~< <i>command</i> escape.
93075		
93076		
93077		
93078	cmd=command	
93079		Set the default command to be invoked by the pipe command. The default shall be nocmd .
93080		
93081	crt=number	Pipe messages having more than <i>number</i> lines through the command specified by the value of the <i>PAGER</i> variable. The default shall be nocrt . If it is set to null, the value used is implementation-defined.
93082		
93083		
93084	XSI debug	Enable verbose diagnostics for debugging. Messages are not delivered. The default shall be nodebug .
93085		
93086	dot	When dot is set, a period on a line by itself during message input from a terminal shall also signify end-of-file (in addition to normal end-of-file). The default shall be nodot . If ignoreeof is set (see below), a setting of nodot shall be ignored and the period is the only method to terminate input mode.
93087		
93088		
93089		
93090	escape=c	Set the command escape character to be the character 'c'. By default, the command escape character shall be tilde. If escape is unset, tilde shall be used; if it is set to null, command escaping shall be disabled.
93091		
93092		
93093	flipr	Reverse the meanings of the R and r commands. The default shall be noflipr .
93094	folder=directory	
93095		The default directory for saving mail files. User-specified filenames beginning with a plus sign ('+') shall be expanded by preceding the filename with this directory name to obtain the real pathname. If <i>directory</i> does not start with a slash ('/'), the contents of <i>HOME</i> shall be prefixed to it. The default shall be nofolder . If folder is unset or set to null, user-specified filenames beginning with '+' shall refer to files in the current directory that begin with the literal '+' character. See also outfolder below. The folder value need not affect the processing of the files named in <i>MBOX</i> and <i>DEAD</i> .
93096		
93097		
93098		
93099		
93100		
93101		
93102		
93103	header	Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The default shall be header .
93104		
93105	hold	Preserve all messages that are read in the system mailbox instead of putting them in the mbox save file. The default shall be nohold .
93106		
93107	ignore	Ignore interrupts while entering messages. The default shall be noignore .
93108	ignoreeof	Ignore normal end-of-file during message input. Input can be terminated only by entering a period ('.') on a line by itself or by the ~. command escape. The default shall be noignoreeof . See also dot above.
93109		
93110		
93111	indentprefix=string	
93112		A string that shall be added as a prefix to each line that is inserted into the message by the ~m command escape. This variable shall default to one <tab>.
93113		

93114	keep	When a system mailbox, secondary mailbox, or mbox is empty, truncate it to zero length instead of removing it. The default shall be nokeep .
93115		
93116	keepsave	Keep the messages that have been saved from the system mailbox into other files in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default shall be nokeepsave .
93117		
93118		
93119	metoo	Suppress the deletion of the login name of the user from the recipient list when replying to a message or sending to a group. The default shall be nometoo .
93120		
93121	XSI onehop	When responding to a message that was originally sent to several recipients, the other recipient addresses are normally forced to be relative to the originating author's machine for the response. This flag disables alteration of the recipients' addresses, improving efficiency in a network where all machines can send directly to all other machines (that is, one hop away). The default shall be noonehop .
93122		
93123		
93124		
93125		
93126	outfolder	Cause the files used to record outgoing messages to be located in the directory specified by the folder variable unless the pathname is absolute. The default shall be nooutfolder . See the record variable.
93127		
93128		
93129	page	Insert a <form-feed> after each message sent through the pipe created by the pipe command. The default shall be nopage .
93130		
93131	prompt=string	
93132		Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if noprompt is set, no prompting shall occur. The default shall be to prompt with the string " ? ".
93133		
93134	quiet	Refrain from writing the opening message and version when entering <i>mailx</i> . The default shall be noquiet .
93135		
93136	record=file	Record all outgoing mail in the file with the pathname <i>file</i> . The default shall be norecord . See also outfolder above.
93137		
93138	save	Enable saving of messages in the dead-letter file on interrupt or delivery error. See the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be save .
93139		
93140	screen=number	
93141		Set the number of lines in a screenful of headers for the headers and z commands.
93142		If screen is not specified, a value based on the terminal type identified by the <i>TERM</i> environment variable, the window size, the baud rate, or some combination of these shall be used.
93143		
93144		
93145	sendwait	Wait for the background mailer to finish before returning. The default shall be nosendwait .
93146		
93147	showto	When the sender of the message was the user who is invoking <i>mailx</i> , write the information from the To: line instead of the From: line in the header summary. The default shall be noshowto .
93148		
93149		
93150	sign=string	Set the variable inserted into the text of a message when the ~a command escape is given. The default shall be nosign . The character sequences ' \t ' and ' \n ' shall be recognized in the variable as <tab>s and <newline>s, respectively. (See also ~i in Command Escapes in mailx (on page 2824).)
93151		
93152		
93153		
93154	Sign=string	Set the variable inserted into the text of a message when the ~A command escape is given. The default shall be noSign . The character sequences ' \t ' and ' \n ' shall be recognized in the variable as <tab>s and <newline>s, respectively.
93155		
93156		
93157	toplines=number	
93158		Set the number of lines of the message to write with the top command. The default shall be 5.
93159		

93160

Commands in mailx93161
93162
93163
93164
93165
93166

The following *mailx* commands shall be provided. In the following list, header refers to lines from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines within the header that begin with one or more non-white-space characters, immediately followed by a colon and white space and continuing until the next line beginning with a non-white-space character or an empty line. Header-field refers to the portion of a header line prior to the first colon in that line.

93167
93168
93169
93170
93171

For each of the commands listed below, the command can be entered as the abbreviation (those characters in the Synopsis command word preceding the '['), the full command (all characters shown for the command word, omitting the '[' and ']'), or any truncation of the full command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the Synopsis) can be entered as **ex**, **exi**, or **exit**.

93172

The arguments to commands can be quoted, using the following methods:

93173
93174
93175
93176
93177

- An argument can be enclosed between paired double-quotes (" ") or single-quotes (' '); any white space, shell word expansion, or backslash characters within the quotes shall be treated literally as part of the argument. A double-quote shall be treated literally within single-quotes and *vice versa*. These special properties of the quote marks shall occur only when they are paired at the beginning and end of the argument.

93178
93179

- A backslash outside of the enclosing quotes shall be discarded and the following character treated literally as part of the argument.

93180
93181

- An unquoted backslash at the end of a command line shall be discarded and the next line shall continue the command.

93182

Filenames, where expected, shall be subjected to the following transformations, in sequence:

93183
93184
93185
93186

- If the filename begins with an unquoted plus sign, and the **folder** variable is defined (see the **folder** variable), the plus sign shall be replaced by the value of the **folder** variable followed by a slash. If the **folder** variable is unset or is set to null, the filename shall be unchanged.

93187
93188
93189

- Shell word expansions shall be applied to the filename (see [Section 2.6](#), on page 2253). If more than a single pathname results from this expansion and the command is expecting one file, the effects are unspecified.

93190

Declare Aliases93191
93192

Synopsis: a[lias] [alias [address...]]
 g[roup] [alias [address...]]

93193
93194
93195
93196
93197
93198
93199
93200

Add the given addresses to the alias specified by *alias*. The names shall be substituted when *alias* is used as a recipient address specified by the user in an outgoing message (that is, other recipients addressed indirectly through the **reply** command shall not be substituted in this manner). Mail address alias substitution shall apply only when the alias string is used as a full address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution. If no arguments are given, write a listing of the current aliases to standard output. If only an *alias* argument is given, write a listing of the specified alias to standard output. These listings need not reflect the same order of addresses that were entered.

93201 **Declare Alternatives**93202 *Synopsis:* alt[ernates] name...

93203 (See also the **metoo** variable.) Declare a list of alternative names for the user's login. When
 93204 responding to a message, these names shall be removed from the list of recipients for the
 93205 response. The comparison of names shall be in a case-insensitive manner. With no arguments,
 93206 **alternates** shall write the current list of alternative names.

93207 **Change Current Directory**

93208 *Synopsis:* cd [directory]
 93209 ch[dir] [directory]

93210 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

93211 **Copy Messages**

93212 *Synopsis:* c[opy] [file]
 93213 c[opy] [msglist] file
 93214 C[opy] [msglist]

93215 Copy messages to the file named by the pathname *file* without marking the messages as saved.
 93216 Otherwise, it shall be equivalent to the **save** command.

93217 In the capitalized form, save the specified messages in a file whose name is derived from the
 93218 author of the message to be saved, without marking the messages as saved. Otherwise, it shall
 93219 be equivalent to the **Save** command.

93220 **Delete Messages**93221 *Synopsis:* d[el]ete [msglist]

93222 Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see
 93223 the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there
 93224 are messages remaining after the **delete** command, the current message shall be written as
 93225 described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be
 93226 written.

93227 **Discard Header Fields**

93228 *Synopsis:* di[scard] [header-field...]
 93229 ig[nore] [header-field...]

93230 Suppress the specified header fields when writing messages. Specified *header-fields* shall be
 93231 added to the list of suppressed header fields. Examples of header fields to ignore are **status** and
 93232 **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall
 93233 override this command. The comparison of header fields shall be in a case-insensitive manner. If
 93234 no arguments are specified, write a list of the currently suppressed header fields to standard
 93235 output; the listing need not reflect the same order of header fields that were entered.

93236 If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

93237

Delete Messages and Display

93238

Synopsis: `dp [msglist]`

93239

`dt [msglist]`

93240

Delete the specified messages as described for the **delete** command, except that the **autoprint** variable shall have no effect, and the current message shall be written only if it was set to a message after the last message deleted by the command. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt.

93241

93242

93243

93244

93245

Echo a String

93246

Synopsis: `ec[ho] string ...`

93247

Echo the given strings, equivalent to the shell *echo* utility.

93248

Edit Messages

93249

Synopsis: `e[dit] [msglist]`

93250

Edit the given messages. The messages shall be placed in a temporary file and the utility named by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is unspecified.

93251

93252

93253

The **edit** command does not modify the contents of those messages in the mailbox.

93254

Exit

93255

Synopsis: `ex[it]`

93256

`x[it]`

93257

Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also **quit**).

93258

93259

Change Folder

93260

Synopsis: `fi[le] [file]`

93261

`fold[er] [file]`

93262

Quit (see the **quit** command) from the current file of messages and read in the file named by the pathname *file*. If no argument is given, the name and status of the current mailbox shall be written.

93263

93264

93265

Several unquoted special characters shall be recognized when used as *file* names, with the following substitutions:

93266

93267

`%` The system mailbox for the invoking user.

93268

`%user` The system mailbox for *user*.

93269

`#` The previous file.

93270

`&` The current **mbox**.

93271

`+file` The named file in the **folder** directory. (See the **folder** variable.)

93272

The default file shall be the current mailbox.

93273

Display List of Folders

93274

Synopsis: *folders*

93275

93276

93277

Write the names of the files in the directory set by the **folder** variable. The command specified by the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES section).

93278

Follow Up Specified Messages

93279

Synopsis: *fo[llowup] [message]*

93280

F[ollowup] [msglist]

93281

93282

In the lowercase form, respond to a message, recording the response in a file whose name is derived from the author of the message. See also the **save** and **copy** commands and **outfolder**.

93283

93284

93285

93286

In the capitalized form, respond to the first message in the *msglist*, sending the message to the author of each message in the *msglist*. The subject line shall be taken from the first message and the response shall be recorded in a file whose name is derived from the author of the first message. See also the **Save** and **Copy** commands and **outfolder**.

93287

Both forms shall override the **record** variable, if set.

93288

Display Header Summary for Specified Messages

93289

Synopsis: *f[rom] [msglist]*

93290

Write the header summary for the specified messages.

93291

Display Header Summary

93292

Synopsis: *h[eaders] [message]*

93293

93294

93295

93296

93297

Write the page of headers that includes the message specified. If the *message* argument is not specified, the current message shall not change. However, if the *message* argument is specified, the current message shall become the message that appears at the top of the page of headers that includes the message specified. The **screen** variable sets the number of headers per page. See also the **z** command.

93298

Help

93299

Synopsis: *hel[p]*

93300

?

93301

Write a summary of commands.

93302

Hold Messages

93303

Synopsis: *ho[ld] [msglist]*

93304

pre[serve] [msglist]

93305

93306

93307

93308

Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall override any commands that might previously have marked the messages to be deleted. During the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve* marking of a message.

93309 **Execute Commands Conditionally**

93310 *Synopsis:* i[f] s|r
 93311 mail-commands
 93312 el[se]
 93313 mail-commands
 93314 en[dif]

93315 Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an
 93316 **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be
 93317 executed only in Receive Mode.

93318 **List Available Commands**

93319 *Synopsis:* l[ist]

93320 Write a list of all commands available. No explanation shall be given.

93321 **Mail a Message**

93322 *Synopsis:* m[ail] address...

93323 Mail a message to the specified addresses or aliases.

93324 **Direct Messages to mbox**

93325 *Synopsis:* mb[ox] [msglist]

93326 Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally.
 93327 See **MBOX**. See also the **exit** and **quit** commands.

93328 **Process Next Specified Message**

93329 *Synopsis:* n[ext] [message]

93330 If the current message has not been written (for example, by the **print** command) since *mailx*
 93331 started or since any other message was the current message, behave as if the **print** command
 93332 was entered. Otherwise, if there is an undeleted message after the current message, make it the
 93333 current message and behave as if the **print** command was entered. Otherwise, an informational
 93334 message to the effect that there are no further messages in the mailbox shall be written, followed
 93335 by the *mailx* prompt. Should the current message location be the result of an immediately
 93336 preceding **hold**, **mbox**, **preserve**, or **touch** command, **next** will act as if the current message has
 93337 already been written.

93338 **Pipe Message**

93339 *Synopsis:* pi[pe] [[msglist] command]
 93340 | [[msglist] command]

93341 Pipe the messages through the given *command* by invoking the command interpreter specified
 93342 by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure
 93343 that the command is given as a single argument. Quoting, described previously, can be used to
 93344 accomplish this. If no arguments are given, the current message shall be piped through the
 93345 command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed>
 93346 shall be inserted after each message.

93347

Display Message with Headers

93348

Synopsis: P[rint] [msglist]

93349

T[ype] [msglist]

93350

Write the specified messages, including all header lines, to standard output. Override suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

93351

93352

93353

93354

Display Message

93355

Synopsis: p[rint] [msglist]

93356

t[ype] [msglist]

93357

Write the specified messages to standard output. If **crt** is set, the messages longer than the number of lines specified by the **crt** variable shall be paged through the command specified by the *PAGER* environment variable.

93358

93359

93360

Quit

93361

Synopsis: q[uit]

93362

end-of-file

93363

Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages in the mailbox.

93364

93365

93366

93367

Reply to a Message List

93368

Synopsis: R[eply] [msglist]

93369

R[espond] [msglist]

93370

Mail a reply message to the sender of each message in the *msglist*. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the first message. If **record** is set to a filename, the response shall be saved at the end of that file.

93371

93372

93373

93374

See also the **flpr** variable.

93375

Reply to a Message

93376

Synopsis: r[eply] [message]

93377

r[espond] [message]

93378

Mail a reply message to all recipients included in the header of the message. The subject line shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject from the message. If **record** is set to a filename, the response shall be saved at the end of that file.

93379

93380

93381

93382

See also the **flpr** variable.

93383

Retain Header Fields

93384

Synopsis: ret[ain] [*header-field...*]

93385

Retain the specified header fields when writing messages. This command shall override all **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently retained header fields to standard output; the listing need not reflect the same order of header fields that were entered.

93386

93387

93388

93389

Save Messages

93390

Synopsis: s[ave] [*file*]

93391

s[ave] [*msglist*] *file*

93392

S[ave] [*msglist*]

93393

Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file* argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be appended to the file. The message shall be put in the state *saved*, and shall behave as specified in the description of the *saved* state when the current mailbox is exited by the **quit** or **file** command.

93394

93395

93396

93397

93398

In the capitalized form, save the specified messages in a file whose name is derived from the author of the first message. The name of the file shall be taken to be the author's name with all network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and **outfolder** variable.

93399

93400

93401

93402

Set Variables

93403

Synopsis: se[t] [*name*=[*string*]] ...] [*name=number* ...] [*noname* ...]

93404

Define one or more variables called *name*. The variable can be given a null, string, or numeric value. Quoting and backslash escapes can occur anywhere in *string*, as described previously, as if the *string* portion of the argument were the entire argument. The forms *name* and *name=* shall be equivalent to *name=""* for variables that take string values. The **set** command without arguments shall write a list of all defined variables and their values. The **no name** form shall be equivalent to **unset name**.

93405

93406

93407

93408

93409

93410

Invoke a Shell

93411

Synopsis: sh[ell]

93412

Invoke an interactive command interpreter (see also *SHELL*).

93413

Display Message Size

93414

Synopsis: si[ze] [*msglist*]

93415

Write the size in bytes of each of the specified messages.

93416

Read mailx Commands From a File

93417

Synopsis: so[urce] *file*

93418

Read and execute commands from the file named by the pathname *file* and return to command mode.

93419

93420

Display Beginning of Messages

93421

Synopsis: `to[p] [msglist]`

93422

Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken as the number of lines to write. The default shall be 5.

93423

93424

Touch Messages

93425

Synopsis: `tou[ch] [msglist]`

93426

Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a file, it shall be placed in the **mbox** upon normal termination. See **exit** and **quit**.

93427

93428

Delete Aliases

93429

Synopsis: `una[lias] [alias]...`

93430

Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

93431

Undelete Messages

93432

Synopsis: `u[ndelete] [msglist]`

93433

Change the state of the specified messages from deleted to read. If **autoprint** is set, the last message of those restored shall be written. If *msglist* is not specified, the message shall be selected as follows:

93434

93435

93436

- If there are any deleted messages that follow the current message, the first of these shall be chosen.

93437

93438

- Otherwise, the last deleted message that also precedes the current message shall be chosen.

93439

Unset Variables

93440

Synopsis: `uns[et] name...`

93441

Cause the specified variables to be erased.

93442

Edit Message with Full-Screen Editor

93443

Synopsis: `v[isual] [msglist]`

93444

Edit the given messages with a screen editor. Each message shall be placed in a temporary file, and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The default editor shall be *vi*.

93445

93446

93447

The **visual** command does not modify the contents of those messages in the mailbox.

93448

Write Messages to a File

93449

Synopsis: `w[rite] [msglist] file`

93450

Write the given messages to the file specified by the pathname *file*, minus the message header. Otherwise, it shall be equivalent to the **save** command.

93451

93452

Scroll Header Display

93453

Synopsis: z[+|-]

93454

93455

93456

Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if '-' is specified) one screenful. The number of headers written shall be set by the **screen** variable.

93457

Invoke Shell Command

93458

Synopsis: !command

93459

93460

93461

Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

93462

Null Command

93463

Synopsis: # comment

93464

This null command (comment) shall be ignored by *mailx*.

93465

Display Current Message Number

93466

Synopsis: =

93467

Write the current message number.

93468

Command Escapes in mailx

93469

93470

93471

The following commands can be entered only from input mode, by beginning a line with the escape character (by default, tilde ('~')). See the **escape** variable description for changing this special character. The format for the commands shall be:

93472

```
<escape-character><command-char><separator>[<arguments>]
```

93473

where the *<separator>* can be zero or more *<blank>*s.

93474

93475

93476

93477

In the following descriptions, the application shall ensure that the argument *command* (but not *mailx-command*) is a shell command string. Any string acceptable to the command interpreter specified by the *SHELL* variable when it is invoked as *SHELL -c command_string* shall be valid. The command can be presented as multiple arguments (that is, quoting is not required).

93478

93479

Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send Mode and produce unspecified results.

93480

93481

93482

93483

~! *command* Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*; and then return to input mode. If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

93484

~. Simulate end-of-file (terminate message input).

93485

93486

~: *mailx-command*, ~_ *mailx-command*

Perform the command-level request.

93487

~? Write a summary of command escapes.

93488

~A This shall be equivalent to ~i **Sign**.

93489

~a This shall be equivalent to ~i **sign**.

- 93490 ~**b** *name...* Add the *names* to the blind carbon copy (**Bcc**) list.
- 93491 ~**c** *name...* Add the *names* to the carbon copy (**Cc**) list.
- 93492 ~**d** Read in the dead-letter file. See *DEAD* for a description of this file.
- 93493 ~**e** Invoke the editor, as specified by the *EDITOR* environment variable, on the partial message.
- 93494
- 93495 ~**f** [*msglist*] Forward the specified messages. The specified messages shall be inserted into the current message without alteration. This command escape also shall insert message headers into the message with field selection affected by the **discard**, **ignore**, and **retain** commands.
- 93496
- 93497
- 93498
- 93499 ~**F** [*msglist*] This shall be the equivalent of the ~**f** command escape, except that all headers shall be included in the message, regardless of previous **discard**, **ignore**, and **retain** commands.
- 93500
- 93501
- 93502 ~**h** If standard input is a terminal, prompt for a **Subject** line and the **To**, **Cc**, and **Bcc** lists. Other implementation-defined headers may also be presented for editing. If the field is written with an initial value, it can be edited as if it had just been typed.
- 93503
- 93504
- 93505 ~**i** *string* Insert the value of the named variable, followed by a <newline>, into the text of the message. If the string is unset or null, the message shall not be changed.
- 93506
- 93507 ~**m** [*msglist*] Insert the specified messages into the message, prefixing non-empty lines with the string in the **indentprefix** variable. This command escape also shall insert message headers into the message, with field selection affected by the **discard**, **ignore**, and **retain** commands.
- 93508
- 93509
- 93510
- 93511 ~**M** [*msglist*] This shall be the equivalent of the ~**m** command escape, except that all headers shall be included in the message, regardless of previous **discard**, **ignore**, and **retain** commands.
- 93512
- 93513
- 93514 ~**p** Write the message being entered. If the message is longer than **crt** lines (see [Internal Variables in mailx](#), on page 2813), the output shall be paginated as described for the *PAGER* variable.
- 93515
- 93516
- 93517 ~**q** Quit (see the **quit** command) from input mode by simulating an interrupt. If the body of the message is not empty, the partial message shall be saved in the dead-letter file. See *DEAD* for a description of this file.
- 93518
- 93519
- 93520 ~**r** *file*, ~< *file*, ~**r** !*command*, ~< !*command*
- 93521 Read in the file specified by the pathname *file*. If the argument begins with an exclamation mark (' ! '), the rest of the string shall be taken as an arbitrary system command; the command interpreter specified by *SHELL* shall be invoked with two arguments: **-c** and *command*. The standard output of *command* shall be inserted into the message.
- 93522
- 93523
- 93524
- 93525
- 93526 ~**s** *string* Set the subject line to *string*.
- 93527
- 93528 ~**t** *name...* Add the given *names* to the **To** list.
- 93529
- 93528 ~**v** Invoke the full-screen editor, as specified by the *VISUAL* environment variable, on the partial message.
- 93529
- 93530 ~**w** *file* Write the partial message, without the header, onto the file named by the pathname *file*. The file shall be created or the message shall be appended to it if the file exists.
- 93531
- 93532
- 93533 ~**x** Exit as with ~**q**, except the message shall not be saved in the dead-letter file.

93534 ~| *command* Pipe the body of the message through the given *command* by invoking the
 93535 command interpreter specified by *SHELL* with two arguments: *-c* and *command*. If
 93536 the *command* returns a successful exit status, the standard output of the command
 93537 shall replace the message. Otherwise, the message shall remain unchanged. If the
 93538 *command* fails, an error message giving the exit status shall be written.

93539 EXIT STATUS

93540 UP When the *-e* option is specified, the following exit values are returned:

93541 0 Mail was found.

93542 >0 Mail was not found or an error occurred.

93543 Otherwise, the following exit values are returned:

93544 0 Successful completion; note that this status implies that all messages were *sent*, but it gives
 93545 no assurances that any of them were actually *delivered*.

93546 >0 An error occurred.

93547 CONSEQUENCES OF ERRORS

93548 UP When in **input mode (Receive Mode)** or Send Mode:

93549 UP • If an error is encountered processing an input line beginning with a tilde (*'~'*) character,
 93550 (see [Command Escapes in mailx](#), on page 2824), a diagnostic message shall be written to
 93551 standard error, and the message being composed may be modified, but this condition shall
 93552 not prevent the message from being sent.

93553 • Other errors shall prevent the sending of the message.

93554 UP When in command mode:

93555 • Default.

93556 APPLICATION USAGE

93557 Delivery of messages to remote systems requires the existence of communication paths to such
 93558 systems. These need not exist.

93559 Input lines are limited to {*LINE_MAX*} bytes, but mailers between systems may impose more
 93560 severe line-length restrictions. This volume of POSIX.1-200x does not place any restrictions on
 93561 the length of messages handled by *mailx*, and for delivery of local messages the only limitations
 93562 should be the normal problems of available disk space for the target mail file. When sending
 93563 messages to external machines, applications are advised to limit messages to less than 100 000
 93564 bytes because some mail gateways impose message-length restrictions.

93565 The format of the system mailbox is intentionally unspecified. Not all systems implement
 93566 system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some
 93567 system mailboxes may be multiple files, others records in a database. The internal format of the
 93568 messages themselves is specified with the historical format from Version 7, but only after the
 93569 messages have been saved in some file other than the system mailbox. This was done so that
 93570 many historical applications expecting text-file mailboxes are not broken.

93571 Some new formats for messages can be expected in the future, probably including binary data,
 93572 bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from
 93573 handling such messages, but it must store them as text files in secondary mailboxes (unless some
 93574 extension, such as a variable or command line option, is used to change the stored format). Its
 93575 method of doing so is implementation-defined and might include translating the data into text
 93576 file-compatible or readable form or omitting certain portions of the message from the stored
 93577 output.

93578 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**
 93579 command discards all header-fields except those explicitly retained. The **discard** command
 93580 keeps all header-fields except those explicitly discarded. If headers exist on the retained header
 93581 list, **discard** and **ignore** commands are ignored.

93582 EXAMPLES

93583 None.

93584 RATIONALE

93585 The standard developers felt strongly that a method for applications to send messages to specific
 93586 users was necessary. The obvious example is a batch utility, running non-interactively, that
 93587 wishes to communicate errors or results to a user. However, the actual format, delivery
 93588 mechanism, and method of reading the message are clearly beyond the scope of this volume of
 93589 POSIX.1-200x.

93590 The intent of this command is to provide a simple, portable interface for sending messages non-
 93591 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that
 93592 implementations explicitly denote the sender and recipient in the body of the delivered message.
 93593 Further specification of formats for either the message envelope or the message itself were
 93594 deliberately not made, as the industry is in the midst of changing from the current standards to a
 93595 more internationalized standard and it is probably incorrect, at this time, to require either one.

93596 Implementations are encouraged to conform to the various delivery mechanisms described in
 93597 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request
 93598 for Comment (RFC) documents RFC 819, RFC 822, RFC 920, RFC 921, and RFC 1123.

93599 Many historical systems modified each body line that started with **From** by prefixing the ‘F’
 93600 with ‘>’. It is unnecessary, but allowed, to do that when the string does not follow a blank line
 93601 because it cannot be confused with the next header.

93602 The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do
 93603 not modify the contents of those messages in the mailbox; such a capability could be added as an
 93604 extension, such as by using different command names.

93605 The restriction on a subject line being {LINE_MAX}–10 bytes is based on the historical format
 93606 that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a
 93607 message may encounter on other systems are not able to handle lines that long, however.

93608 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient
 93609 justification to exclude this utility from this volume of POSIX.1-200x. It is also arguable that it is,
 93610 in fact, testable, but that the tests themselves are not portable.

93611 When *mailx* is being used by an application that wishes to receive the results as if none of the
 93612 User Portability Utilities option features were supported, the *DEAD* environment variable must
 93613 be set to **/dev/null**. Otherwise, it may be subject to the file creations described in *mailx*
 93614 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to
 93615 **/dev/null**, historical versions of *mailx* and *Mail* read initialization commands from a file before
 93616 processing begins. Since the initialization that a user specifies could alter the contents of
 93617 messages an application is trying to send, such applications must set *MAILRC* to **/dev/null**.

93618 The description of *LC_TIME* uses “may affect” because many historical implementations do not
 93619 or cannot manipulate the date and time strings in the incoming mail headers. Some headers
 93620 found in incoming mail do not have enough information to determine the timezone in which the
 93621 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal
 93622 form that then is parsed by routines like *strftime()* that can take *LC_TIME* settings into account.
 93623 Changing all these times to a user-specified format is allowed, but not required.

93624 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System
 93625 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by
 93626 declaring that *cat* is the paginator, would not meet with the intended meaning of this

93627 description. However, any “portable user” would have to set *PAGER* explicitly to get his or her
 93628 preferred paginator on all systems. The paginator choice was made partially unspecified, unlike
 93629 the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common
 93630 theme of user input, whereas editors differ dramatically.

93631 Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to
 93632 be format details and were omitted.

93633 A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them
 93634 were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an
 93635 appropriate marketing distinction between systems.

93636 In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file*
 93637 option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain
 93638 portable. However, it does force implementations to support usage such as:

```
93639 mailx -fin mymail.box
```

93640 The **no name** method of unsetting variables is not present in all historical systems, but it is in
 93641 System V and provides a logical set of commands corresponding to the format of the display of
 93642 options from the *mailx set* command without arguments.

93643 The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the
 93644 same feature. They are synonyms in this volume of POSIX.1-200x.

93645 The *mailx echo* command was not documented in the BSD version and has been omitted here
 93646 because it is not obviously useful for interactive users.

93647 The default prompt on the System V *mailx* is a question mark, on BSD *Mail* an ampersand. Since
 93648 this volume of POSIX.1-200x chose the *mailx* name, it kept the System V default, assuming that
 93649 BSD users would not have difficulty with this minor incompatibility (that they can override).

93650 The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again,
 93651 since this volume of POSIX.1-200x chose the *mailx* name, it kept the System V default, but allows
 93652 the SunOS user to achieve the desired results using **flpr**, an internal variable in System V *mailx*,
 93653 although it has not been documented in the SVID.

93654 The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command
 93655 escapes were adopted from 4.3 BSD *Mail*.

93656 The **version** command was not included because no sufficiently general specification of the
 93657 version information could be devised that would still be useful to a portable user. This
 93658 command name should be used by suppliers who wish to provide version information about the
 93659 *mailx* command.

93660 The “implementation-specific (unspecified) system start-up file” historically has been named
 93661 **/etc/mailx.rc**, but this specific name and location are not required.

93662 The intent of the wording for the **next** command is that if any command has already displayed
 93663 the current message it should display a following message, but, otherwise, it should display the
 93664 current message. Consider the command sequence:

```
93665 next 3
93666 delete 3
93667 next
```

93668 where the **autoprint** option was not set. The normative text specifies that the second **next**
 93669 command should display a message following the third message, because even though the
 93670 current message has not been displayed since it was set by the **delete** command, it has been
 93671 displayed since the current message was anything other than message number 3. This does not
 93672 always match historical practice in some implementations, where the command file address
 93673 followed by **next** (or the default command) would skip the message for which the user had

93674 searched.

93675 FUTURE DIRECTIONS

93676 None.

93677 SEE ALSO

93678 [Chapter 2](#) (on page 2245), *ed*, *ls*, *more*, *vi*

93679 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +

93680 CHANGE HISTORY

93681 First released in Issue 2.

93682 Issue 5

93683 The description of the *EDITOR* environment variable is changed to indicate that *ed* is the default editor if this variable is not set. In previous issues, this default was not stated explicitly at this point but was implied further down in the text.

93686 The FUTURE DIRECTIONS section is added.

93687 Issue 6

93688 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 93690 • The `-F` option is added.
- 93691 • The `allnet`, `debug`, and `sendwait` internal variables are added.
- 93692 • The `C`, `ec`, `fo`, `F`, and `S` *mailx* commands are added.

93693 In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “HOME directory” is replaced by “directory referred to by the HOME environment variable”.

93695 The *mailx* utility is aligned with the IEEE P1003.2b draft standard, which includes various clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993 standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11, #103, #106, #108, #114, #115, #122, and #129.

93699 The normative text is reworded to avoid use of the term “must” for application requirements.

93700 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

93701 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was overlooked in the first version of this standard. |

93704 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/17 is applied, updating the EXTENDED DESCRIPTION (Internal Variables in *mailx*). The system start-up file is changed from “implementation-defined” to “unspecified” for consistency with other text in the EXTENDED DESCRIPTION.

93708 Issue 7

93709 Austin Group Interpretation 1003.1-2001 #089 is applied, clarifying the effect of the *LC_TIME* - environment variable.

93711 Austin Group Interpretation 1003.1-2001 #090 is applied, updating the description of the `next` command.

93713 SD5-XCU-ERN-69 is applied. |

93714 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

93715 Shading to indicate support for the User Portability Utilities option is added. +

93716 **NAME**93717 make — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)93718 **SYNOPSIS**93719 SD make [-einpqrst] [-f *makefile*]. . . [-k|-S] [*macro=value*. . .]
93720 [*target_name*. . .]93721 **DESCRIPTION**93722 The *make* utility shall update files that are derived from other files. A typical case is one where
93723 object files are derived from the corresponding source files. The *make* utility examines time
93724 relationships and shall update those derived files (called targets) that have modified times
93725 earlier than the modified times of the files (called prerequisites) from which they are derived. A
93726 description file (makefile) contains a description of the relationships between files, and the
93727 commands that need to be executed to update the targets to reflect changes in their
93728 prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and
93729 optional commands to be executed when a prerequisite is newer than the target. There are two
93730 types of rule:

- 93731 1.
- Inference rules*
- , which have one target name with at least one period (' . ') and no slash
-
- 93732 (' / ')
-
- 93733 2.
- Target rules*
- , which can have more than one target name

93734 In addition, *make* shall have a collection of built-in macros and inference rules that infer
93735 prerequisite relationships to simplify maintenance of programs.93736 To receive exactly the behavior described in this section, the user shall ensure that a portable
93737 makefile shall:

- 93738 • Include the special target
- .POSIX**
-
- 93739 • Omit any special target reserved for implementations (a leading period followed by
-
- 93740 uppercase letters) that has not been specified by this section

93741 The behavior of *make* is unspecified if either or both of these conditions are not met.93742 **OPTIONS**93743 The *make* utility shall conform to XBD [Section 12.2](#) (on page 201), except for Guideline 9.

93744 The following options shall be supported:

- 93745
- e**
- Cause environment variables, including those with null values, to override macro
-
- 93746 assignments within makefiles.
-
- 93747
- f *makefile***
- Specify a different makefile. The argument
- makefile*
- is a pathname of a description
-
- 93748 file, which is also referred to as the
- makefile*
- . A pathname of '-' shall denote the
-
- 93749 standard input. There can be multiple instances of this option, and they shall be
-
- 93750 processed in the order specified. The effect of specifying the same option-argument
-
- 93751 more than once is unspecified.
-
- 93752
- i**
- Ignore error codes returned by invoked commands. This mode is the same as if the
-
- 93753 special target
- .IGNORE**
- were specified without prerequisites.
-
- 93754
- k**
- Continue to update other targets that do not depend on the current target if a non-
-
- 93755 ignored error occurs while executing the commands to bring a target up-to-date.
-
- 93756
- n**
- Write commands that would be executed on standard output, but do not execute
-
- 93757 them. However, lines with a plus sign ('+') prefix shall be executed. In this mode,
-
- 93758 lines with an at sign ('@ ') character prefix shall be written to standard output.

- 93759 **-p** Write to standard output the complete set of macro definitions and target
93760 descriptions. The output format is unspecified.
- 93761 **-q** Return a zero exit value if the target file is up-to-date; otherwise, return an exit
93762 value of 1. Targets shall not be updated if this option is specified. However, a
93763 makefile command line (associated with the targets) with a plus sign ('+') prefix
93764 shall be executed.
- 93765 **-r** Clear the suffix list and do not use the built-in rules.
- 93766 **-S** Terminate *make* if an error occurs while executing the commands to bring a target
93767 up-to-date. This shall be the default and the opposite of **-k**.
- 93768 **-s** Do not write makefile command lines or touch messages (see **-t**) to standard
93769 output before executing. This mode shall be the same as if the special target
93770 **.SILENT** were specified without prerequisites.
- 93771 **-t** Update the modification time of each target as though a *touch target* had been
93772 executed. Targets that have prerequisites but no commands (see **Target Rules**, on
93773 page 2835), or that are already up-to-date, shall not be touched in this manner.
93774 Write messages to standard output for each target file indicating the name of the
93775 file and that it was touched. Normally, the *makefile* command lines associated with
93776 each target are not executed. However, a command line with a plus sign ('+')
93777 prefix shall be executed.

93778 Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any
93779 options specified on the *make* utility command line. If the **-k** and **-S** options are both specified
93780 on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option
93781 specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment
93782 variable, the result is undefined.

93783 OPERANDS

93784 The following operands shall be supported:

93785 *target_name* Target names, as defined in the EXTENDED DESCRIPTION section. If no target is
93786 specified, while *make* is processing the makefiles, the first target that *make*
93787 encounters that is not a special target or an inference rule shall be used.

93788 *macro=value* Macro definitions, as defined in **Macros** (on page 2836).

93789 If the *target_name* and *macro=value* operands are intermixed on the *make* utility command line,
93790 the results are unspecified.

93791 STDIN

93792 The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT
93793 FILES section.

93794 INPUT FILES

93795 The input file, otherwise known as the makefile, is a text file containing rules, macro definitions,
93796 and comments. See the EXTENDED DESCRIPTION section.

93797 ENVIRONMENT VARIABLES

93798 The following environment variables shall affect the execution of *make*:

93799 **LANG** Provide a default value for the internationalization variables that are unset or null. |
93800 (See XBD **Section 8.2** (on page 160) for the precedence of internationalization |
93801 variables used to determine the values of locale categories.)

93802 **LC_ALL** If set to a non-empty string value, override the values of all the other
93803 internationalization variables.

93804 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 93805 characters (for example, single-byte as opposed to multi-byte characters in
 93806 arguments and input files).

93807 **LC_MESSAGES**
 93808 Determine the locale that should be used to affect the format and contents of
 93809 diagnostic messages written to standard error.

93810 **MAKEFLAGS**
 93811 This variable shall be interpreted as a character string representing a series of
 93812 option characters to be used as the default options. The implementation shall
 93813 accept both of the following formats (but need not accept them when intermixed):

- 93814 • The characters are option letters without the leading hyphens or <blank>
 93815 separation used on a *make* utility command line.
- 93816 • The characters are formatted in a manner similar to a portion of the *make*
 93817 utility command line: options are preceded by hyphens and
 93818 <blank>-separated as described in XBD Section 12.2 (on page 201). The
 93819 *macro=value* macro definition operands can also be included. The difference
 93820 between the contents of **MAKEFLAGS** and the *make* utility command line is
 93821 that the contents of the variable shall not be subjected to the word expansions
 93822 (see Section 2.6, on page 2253) associated with parsing the command line
 93823 values.

93824 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

93825 XSI **PROJECTDIR**
 93826 Provide a directory to be used to search for SCCS files not found in the current
 93827 directory. In all of the following cases, the search for SCCS files is made in the
 93828 directory **SCCS** in the identified directory. If the value of **PROJECTDIR** begins with
 93829 a slash, it shall be considered an absolute pathname; otherwise, the value of
 93830 **PROJECTDIR** is treated as a user name and that user's initial working directory
 93831 shall be examined for a subdirectory **src** or **source**. If such a directory is found, it
 93832 shall be used. Otherwise, the value is used as a relative pathname.

93833 If **PROJECTDIR** is not set or has a null value, the search for SCCS files shall be
 93834 made in the directory **SCCS** in the current directory.

93835 The setting of **PROJECTDIR** affects all files listed in the remainder of this utility
 93836 description for files with a component named **SCCS**.

93837 The value of the **SHELL** environment variable shall not be used as a macro and shall not be
 93838 modified by defining the **SHELL** macro in a makefile or on the command line. All other
 93839 environment variables, including those with null values, shall be used as macros, as defined in
 93840 **Macros** (on page 2836).

93841 ASYNCHRONOUS EVENTS

93842 If not already ignored, *make* shall trap **SIGHUP**, **SIGTERM**, **SIGINT**, and **SIGQUIT** and remove
 93843 the current target unless the target is a directory or the target is a prerequisite of the special
 93844 target **.PRECIOUS** or unless one of the **-n**, **-p**, or **-q** options was specified. Any targets removed
 93845 in this manner shall be reported in diagnostic messages of unspecified format, written to
 93846 standard error. After this cleanup process, if any, *make* shall take the standard action for all other
 93847 signals.

93848 STDOUT

93849 The *make* utility shall write all commands to be executed to standard output unless the **-s** option
 93850 was specified, the command is prefixed with an at sign, or the special target **.SILENT** has either
 93851 the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work
 93852 needing to be done, it shall write a message to standard output indicating that no action was

93853 taken. If the `-t` option is present and a file is touched, *make* shall write to standard output a
 93854 message of unspecified format indicating that the file was touched, including the filename of the
 93855 file.

93856 STDERR

93857 The standard error shall be used only for diagnostic messages.

93858 OUTPUT FILES

93859 Files can be created when the `-t` option is present. Additional files can also be created by the
 93860 utilities invoked by *make*.

93861 EXTENDED DESCRIPTION

93862 The *make* utility attempts to perform the actions required to ensure that the specified targets are
 93863 up-to-date. A target is considered out-of-date if it is older than any of its prerequisites or if it
 93864 does not exist. The *make* utility shall treat all prerequisites as targets themselves and recursively
 93865 ensure that they are up-to-date, processing them in the order in which they appear in the rule.
 93866 The *make* utility shall use the modification times of files to determine whether the corresponding
 93867 targets are out-of-date.

93868 After *make* has ensured that all of the prerequisites of a target are up-to-date and if the target is
 93869 out-of-date, the commands associated with the target entry shall be executed. If there are no
 93870 commands listed for the target, the target shall be treated as up-to-date.

93871 Makefile Syntax

93872 A makefile can contain rules, macro definitions (see [Macros](#), on page 2836), include lines, and
 93873 comments. There are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall
 93874 contain a set of built-in inference rules. If the `-r` option is present, the built-in rules shall not be
 93875 used and the suffix list shall be cleared. Additional rules of both types can be specified in a
 93876 makefile. If a rule is defined more than once, the value of the rule shall be that of the last one
 93877 specified. Macros can also be defined more than once, and the value of the macro is specified in
 93878 [Macros](#) (on page 2836). Comments start with a number sign (`'#'`) and continue until an
 93879 unescaped `<newline>` is reached.

93880 By default, the following files shall be tried in sequence: `./makefile` and `./Makefile`. If neither
 93881 XSI `./makefile` or `./Makefile` are found, other implementation-defined files may also be tried. On
 93882 XSI-conformant systems, the additional files `./s.makefile`, `./SCCS/s.makefile`, `./s.Makefile`, and
 93883 `./SCCS/s.Makefile` shall also be tried.

93884 The `-f` option shall direct *make* to ignore any of these default files and use the specified argument
 93885 as a makefile instead. If the `'-'` argument is specified, standard input shall be used.

93886 The term *makefile* is used to refer to any rules provided by the user, whether in `./makefile` or its
 93887 variants, or specified by the `-f` option.

93888 The rules in makefiles shall consist of the following types of lines: target rules, including special
 93889 targets (see [Target Rules](#), on page 2835), inference rules (see [Inference Rules](#), on page 2838),
 93890 macro definitions (see [Macros](#), on page 2836), empty lines, and comments.

93891 When an escaped `<newline>` (one preceded by a backslash) is found anywhere in the makefile
 93892 except in a command line, an include line, or a line immediately preceding an include line, it
 93893 shall be replaced, along with any leading white space on the following line, with a single
 93894 `<space>`. When an escaped `<newline>` is found in a command line in a makefile, the command
 93895 line shall contain the backslash, the `<newline>`, and the next line, except that the first character
 93896 of the next line shall not be included if it is a `<tab>`. When an escaped `<newline>` is found in an
 93897 include line or in a line immediately preceding an include line, the behavior is unspecified. +

93898	Include Lines	+
93899	If the word include appears at the beginning of a line and is followed by one or more <blank>s,	+
93900	the string formed by the remainder of the line shall be processed as follows to produce a	+
93901	pathname:	+
93902	• The trailing <newline> and any comment shall be discarded. If the resulting string	+
93903	contains any double-quote characters (' " ') the behavior is unspecified.	+
93904	• The resulting string shall be processed for macro expansion (see Macros (on page 2836).	+
93905	• Any <blank>s that appear after the first non-<blank> shall be used as separators to divide	+
93906	the macro-expanded string into fields. It is unspecified whether any other white-space	+
93907	characters are also used as separators. It is unspecified whether pathname expansion (see	+
93908	Section 2.13 , on page 2278) is also performed.	+
93909	• If the processing of separators and optional pathname expansion results in either zero or	+
93910	two or more non-empty fields, the behavior is unspecified. If it results in one non-empty	+
93911	field, that field is taken as the pathname.	+
93912	If the pathname does not begin with a ' / ' it shall be treated as relative to the current working	+
93913	directory of the process, not relative to the directory containing the makefile. If the file does not	+
93914	exist in this location, it is unspecified whether additional directories are searched.	+
93915	The contents of the file specified by the pathname shall be read and processed as if they	+
93916	appeared in the makefile in place of the include line. If the file ends with an escaped <newline>	+
93917	the behavior is unspecified.	+
93918	The file may itself contain further include lines. Implementations shall support nesting of	+
93919	include files up to a depth of at least 16.	+
93920	Makefile Execution	
93921	Makefile command lines shall be processed one at a time by writing the makefile command line	
93922	to the standard output (unless one of the conditions listed under '@' suppresses the writing)	
93923	and executing the command(s) in the line. A <tab> may precede the command to standard	
93924	output. Command execution shall be as if the makefile command line were the argument to the	
93925	<i>system()</i> function. The environment for the command being executed shall contain all of the	
93926	variables in the environment of <i>make</i> .	
93927	By default, when <i>make</i> receives a non-zero status from the execution of a command, it shall	
93928	terminate with an error message to standard error.	
93929	Makefile command lines can have one or more of the following prefixes: a hyphen ('-'), an at	
93930	sign ('@'), or a plus sign ('+'). These shall modify the way in which <i>make</i> processes the	
93931	command. When a command is written to standard output, the prefix shall not be included in	
93932	the output.	
93933	- If the command prefix contains a hyphen, or the -i option is present, or the special target	
93934	.IGNORE has either the current target as a prerequisite or has no prerequisites, any error	
93935	found while executing the command shall be ignored.	
93936	@ If the command prefix contains an at sign and the <i>make</i> utility command line -n option is	
93937	not specified, or the -s option is present, or the special target .SILENT has either the current	
93938	target as a prerequisite or has no prerequisites, the command shall not be written to	
93939	standard output before it is executed.	
93940	+ If the command prefix contains a plus sign, this indicates a makefile command line that	
93941	shall be executed even if -n , -q , or -t is specified.	

93942 **Target Rules**

93943 Target rules are formatted as follows:

```
93944 target [target...]: [prerequisite...][;command]
93945 [command
93946 <tab>command
93947 ...]
```

93948 *line that does not begin with <tab>*

93949 Target entries are specified by a <blank>-separated, non-null list of targets, then a colon, then a
93950 <blank>-separated, possibly empty list of prerequisites. Text following a semicolon, if any, and
93951 all following lines that begin with a <tab>, are makefile command lines to be executed to update
93952 the target. The first non-empty line that does not begin with a <tab> or '#' shall begin a new
93953 entry. An empty or blank line, or a line beginning with '#', may begin a new entry.

93954 Applications shall select target names from the set of characters consisting solely of periods,
93955 underscores, digits, and alphabets from the portable character set (see XBD Section 6.1, on
93956 page 111). Implementations may allow other characters in target names as extensions. The
93957 interpretation of targets containing the characters '%' and '"' is implementation-defined.

93958 A target that has prerequisites, but does not have any commands, can be used to add to the
93959 prerequisite list for that target. Only one target rule for any given target can contain commands.

93960 Lines that begin with one of the following are called *special targets* and control the operation of
93961 *make*:

93962 **.DEFAULT** If the makefile uses this special target, the application shall ensure that it is
93963 specified with commands, but without prerequisites. The commands shall be used
93964 by *make* if there are no other rules available to build a target.

93965 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors
93966 from commands associated with them to be ignored in the same manner as
93967 specified by the `-i` option. Subsequent occurrences of **.IGNORE** shall add to the
93968 list of targets ignoring command errors. If no prerequisites are specified, *make* shall
93969 behave as if the `-i` option had been specified and errors from all commands
93970 associated with all targets shall be ignored.

93971 **.POSIX** The application shall ensure that this special target is specified without
93972 prerequisites or commands. If it appears as the first non-comment line in the
93973 makefile, *make* shall process the makefile as specified by this section; otherwise, the
93974 behavior of *make* is unspecified.

93975 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the
93976 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS
93977 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious
93978 files. If no prerequisites are specified, all targets in the makefile shall be treated as
93979 if specified with **.PRECIOUS**.

93980 XSI **.SCCS_GET** The application shall ensure that this special target is specified without
93981 prerequisites. If this special target is included in a makefile, the commands
93982 specified with this target shall replace the default commands associated with this
93983 special target (see [Default Rules](#), on page 2840). The commands specified with this
93984 target are used to get all SCCS files that are not found in the current directory.

93985 When source files are named in a dependency list, *make* shall treat them just like
93986 any other target. Because the source file is presumed to be present in the directory,
93987 there is no need to add an entry for it to the makefile. When a target has no
93988 dependencies, but is present in the directory, *make* shall assume that that file is up-
93989 to-date. If, however, an SCCS file named **SCCS/s.source_file** is found for a target

93990 *source_file*, *make* compares the timestamp of the target file with that of the
 93991 **SCCS/s.source_file** to ensure the target is up-to-date. If the target is missing, or if
 93992 the SCCS file is newer, *make* shall automatically issue the commands specified for
 93993 the **.SCCS_GET** special target to retrieve the most recent version. However, if the
 93994 target is writable by anyone, *make* shall not retrieve a new version.

93995 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause
 93996 commands associated with them not to be written to the standard output before
 93997 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of
 93998 targets with silent commands. If no prerequisites are specified, *make* shall behave
 93999 as if the **-s** option had been specified and no commands or touch messages
 94000 associated with any target shall be written to standard output.

94001 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are
 94002 used in conjunction with the inference rules (see [Inference Rules](#), on page 2838). If
 94003 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be
 94004 cleared.

94005 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified
 94006 without commands.

94007 Targets with names consisting of a leading period followed by the uppercase letters "POSIX"
 94008 and then any other characters are reserved for future standardization. Targets with names
 94009 consisting of a leading period followed by one or more uppercase letters are reserved for
 94010 implementation extensions.

94011 **Macros**

94012 Macro definitions are in the form:

```
94013 string1 = [string2]
```

94014 The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all
 94015 characters, if any, after the equal sign, up to a comment character ('#') or an unescaped
 94016 <newline>. Any <blank>s immediately before or after the equal sign shall be ignored.

94017 Applications shall select macro names from the set of characters consisting solely of periods,
 94018 underscores, digits, and alphabets from the portable character set (see [XBD Section 6.1](#), on
 94019 page 111). A macro name shall not contain an equals sign. Implementations may allow other
 94020 characters in macro names as extensions.

94021 Macros can appear anywhere in the makefile. Macro expansions using the forms $\$(string1)$ or
 94022 $\${string1}$ shall be replaced by *string2*, as follows:

- 94023 • Macros in target lines shall be evaluated when the target line is read.
- 94024 • Macros in makefile command lines shall be evaluated when the command is executed.
- 94025 • Macros in the string before the equals sign in a macro definition shall be evaluated when
 94026 the macro assignment is made.
- 94027 • Macros after the equals sign in a macro definition shall not be evaluated until the defined
 94028 macro is used in a rule or command, or before the equals sign in a macro definition.

94029 The parentheses or braces are optional if *string1* is a single character. The macro $\$\$$ shall be
 94030 replaced by the single character '\$'. If *string1* in a macro expansion contains a macro
 94031 expansion, the results are unspecified.

94032 Macro expansions using the forms $\$(string1[:subst1=[subst2]])$ or $\${string1[:subst1=[subst2]]}$ can
 94033 be used to replace all occurrences of *subst1* with *subst2* when the macro substitution is
 94034 performed. The *subst1* to be replaced shall be recognized when it is a suffix at the end of a word
 94035 in *string1* (where a *word*, in this context, is defined to be a string delimited by the beginning of

94036 the line, a <blank>, or a <newline>). If *string1* in a macro expansion contains a macro expansion,
94037 the results are unspecified.

94038 Macro expansions in *string1* of macro definition lines shall be evaluated when read. Macro
94039 expansions in *string2* of macro definition lines shall be performed when the macro identified by
94040 *string1* is expanded in a rule or command.

94041 Macro definitions shall be taken from the following sources, in the following logical order,
94042 before the makefile(s) are read.

- 94043 1. Macros specified on the *make* utility command line, in the order specified on the
94044 command line. It is unspecified whether the internal macros defined in [Internal Macros](#)
94045 (on page 2839) are accepted from this source.
- 94046 2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the
94047 environment variable. It is unspecified whether the internal macros defined in [Internal](#)
94048 [Macros](#) (on page 2839) are accepted from this source.
- 94049 3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and
94050 including the variables with null values.
- 94051 4. Macros defined in the inference rules built into *make*.

94052 Macro definitions from these sources shall not override macro definitions from a lower-
94053 numbered source. Macro definitions from a single source (for example, the *make* utility
94054 command line, the *MAKEFLAGS* environment variable, or the other environment variables)
94055 shall override previous macro definitions from the same source.

94056 Macros defined in the makefile(s) shall override macro definitions that occur before them in the
94057 makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined
94058 in the makefile(s) shall override macro definitions from source 3. Macros defined in the
94059 makefile(s) shall not override macro definitions from source 1 or source 2.

94060 Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*)
94061 and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not
94062 already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted
94063 in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance
94064 of the *make* command, the original macro's value is recovered. Other implementation-defined
94065 options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of
94066 the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the
94067 *MAKEFLAGS* environment variable shall be modified to match the new value of the
94068 *MAKEFLAGS* macro. The result of setting *MAKEFLAGS* in the Makefile is unspecified.

94069 Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the
94070 *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other
94071 implementation-defined variables may also be added to the environment of *make*.

94072 The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the
94073 pathname of the shell command language interpreter (see *sh*). The *SHELL* environment variable
94074 shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified
94075 on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect
94076 the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the
94077 command line are implementation-defined.

94078

Inference Rules

94079

Inference rules are formatted as follows:

94080

```
target:
```

94081

```
<tab>command
```

94082

```
[<tab>command]
```

94083

```
...
```

94084

```
line that does not begin with <tab> or #
```

94085

The application shall ensure that the *target* portion is a valid target name (see [Target Rules](#), on page 2835) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any slashes or periods.) If there is only one period in the target, it is a single-suffix inference rule. Targets with two periods are double-suffix inference rules. Inference rules can have only one target before the colon.

94091

The application shall ensure that the makefile does not specify prerequisites for inference rules; no characters other than white space shall follow the colon in the first line, except when creating the *empty rule*, described below. Prerequisites are inferred, as described below.

94092

94093

94094

Inference rules can be redefined. A target that matches an existing inference rule shall overwrite the old inference rule. An empty rule can be created with a command consisting of simply a semicolon (that is, the rule still exists and is found during inference rule search, but since it is empty, execution has no effect). The empty rule can also be formatted as follows:

94095

94096

94097

94098

```
rule: ;
```

94099

where zero or more <blank>s separate the colon and semicolon.

94100

The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be made up-to-date. A list of inference rules defines the commands to be executed. By default, *make* contains a built-in set of inference rules. Additional rules can be specified in the makefile.

94101

94102

94103

The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by the inference rules. The order in which the suffixes are specified defines the order in which the inference rules for the suffixes are used. New suffixes shall be appended to the current list by specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is required to change the order of the suffixes.

94104

94105

94106

94107

94108

94109

Normally, the user would provide an inference rule for each suffix. The inference rule to update a target with a suffix *.s1* from a prerequisite with a suffix *.s2* is specified as a target *.s2.s1*. The internal macros provide the means to specify general inference rules (see [Internal Macros](#), on page 2839).

94110

94111

94112

94113

When no target rule is found to update a target, the inference rules shall be checked. The suffix of the target (*.s1*) to be built is compared to the list of suffixes specified by the **.SUFFIXES** special targets. If the *.s1* suffix is found in **.SUFFIXES**, the inference rules shall be searched in the order defined for the first *.s2.s1* rule whose prerequisite file (*\$.s2*) exists. If the target is out-of-date with respect to this prerequisite, the commands for that inference rule shall be executed.

94114

94115

94116

94117

94118

If the target to be built does not contain a suffix and there is no rule for the target, the single suffix inference rules shall be checked. The single-suffix inference rules define how to build a target if a file is found with a name that matches the target name with one of the single suffixes appended. A rule with one suffix *.s2* is the definition of how to build *target* from **target.s2**. The other suffix (*.s1*) is treated as null.

94119

94120

94121

94122

94123

XSI

A tilde ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule **.c~.o** would transform an SCCS C-language source file into an object file (**.o**). Because the **s.** of the

94124

94125 SCCS files is a prefix, it is incompatible with *make's* suffix point of view. Hence, the '*~*' is a way
94126 of changing any file reference into an SCCS file reference.

94127 Libraries

94128 If a target or prerequisite contains parentheses, it shall be treated as a member of an archive
94129 library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o*
94130 to the member name. The application shall ensure that the member is an object file with the *.o*
94131 suffix. The modification time of the expression is the modification time for the member as kept
94132 in the archive library; see *ar*. The *.a* suffix shall refer to an archive library. The *.s2.a* rule shall be
94133 used to update a member in the library from a file with a suffix *.s2*.

94134 Internal Macros

94135 The *make* utility shall maintain five internal macros that can be used in target and inference rules.
94136 In order to clearly define the meaning of these macros, some clarification of the terms *target rule*,
94137 *inference rule*, *target*, and *prerequisite* is necessary.

94138 Target rules are specified by the user in a makefile for a particular target. Inference rules are
94139 user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites
94140 are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those
94141 prerequisites that are generated when inference rules are used. Inference rules are applied to
94142 implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in
94143 the makefile. Target rules are applied to targets specified in the makefile.

94144 Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit)
94145 shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon
94146 recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be
94147 processed recursively until a target is found that has no prerequisites, at which point the
94148 recursion stops. The recursion shall then back up, updating each target as it goes.

94149 In the definitions that follow, the word *target* refers to one of:

- 94150 • A target specified in the makefile
- 94151 • An explicit prerequisite specified in the makefile that becomes the target when *make*
94152 processes it during recursion
- 94153 • An implicit prerequisite that becomes a target when *make* processes it during recursion

94154 In the definitions that follow, the word *prerequisite* refers to one of the following:

- 94155 • An explicit prerequisite specified in the makefile for a particular target
- 94156 • An implicit prerequisite generated as a result of locating an appropriate inference rule and
94157 corresponding file that matches the suffix of the target

94158 The five internal macros are:

94159 **\$@** The **\$@** shall evaluate to the full target name of the current target, or the archive
94160 filename part of a library archive target. It shall be evaluated for both target and
94161 inference rules.

94162 For example, in the *.c.a* inference rule, **\$@** represents the out-of-date *.a* file to be built.
94163 Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-
94164 date **lib.a**.

94165 **\$\$** The **\$\$** macro shall be evaluated only when the current target is an archive library
94166 member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and
94167 **\$\$** shall evaluate to *member.o*. The **\$\$** macro shall be evaluated for both target and
94168 inference rules.

- 94169 For example, in a makefile target rule to build **lib.a(file.o)**, **file.o**, as
 94170 opposed to **file.a**, which represents **lib.a**.
- 94171 **\$?** The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current
 94172 target. It shall be evaluated for both target and inference rules.
- 94173 For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and
 94174 where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to
 94175 **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.
- 94176 **\$<** In an inference rule, the **\$<** macro shall evaluate to the filename whose existence
 94177 allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the **\$<**
 94178 macro shall evaluate to the current target name. The meaning of the **\$<** macro shall be
 94179 otherwise unspecified.
- 94180 For example, in the **.c.a** inference rule, **\$<** represents the prerequisite **.c** file.
- 94181 **\$*** The **\$*** macro shall evaluate to the current target name with its suffix deleted. It shall be
 94182 evaluated at least for inference rules.
- 94183 For example, in the **.c.a** inference rule, **\$*.o** represents the out-of-date **.o** file that
 94184 corresponds to the prerequisite **.c** file.

94185 Each of the internal macros has an alternative form. When an uppercase 'D' or 'F' is appended
 94186 to any of the macros, the meaning shall be changed to the *directory part* for 'D' and *filename part*
 94187 for 'F'. The directory part is the path prefix of the file without a trailing slash; for the current
 94188 directory, the directory part is **.** . When the **\$?** macro contains more than one prerequisite
 94189 filename, the **\$(?D)** and **\$(?F)** (or **\${?D}** and **\${?F}**) macros expand to a list of directory name parts
 94190 and filename parts respectively.

94191 For the target *lib(member.o)* and the **s2.a** rule, the internal macros shall be defined as:

94192 **\$<** *member.s2*
 94193 **\$*** *member*
 94194 **\$@** *lib*
 94195 **\$?** *member.s2*
 94196 **\$%** *member.o*

94197 Default Rules

94198 The default rules for *make* shall achieve results that are the same as if the following were used.
 94199 Implementations that do not support the C-Language Development Utilities option may omit
 94200 **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.
 94201 Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference
 94202 rules. Implementations may provide additional macros and rules.

94203 SPECIAL TARGETS

94204 XSI **.SCCS_GET: sccs \$(SCCSFLAGS) get \$(SCCSGETFLAGS) \$@**

94205 XSI **.SUFFIXES: .o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~**

94206 MACROS

94207 **MAKE=make**
 94208 **AR=ar**
 94209 **ARFLAGS=-rv**
 94210 **YACC=yacc**
 94211 **YFLAGS=**

```

94212         LEX=lex
94213         LFLAGS=
94214         LDFLAGS=
94215         CC=c99
94216         CFLAGS=-O
94217         FC=fort77
94218         FFLAGS=-O 1
94219   XSI     GET=get
94220         GFLAGS=
94221         SCCSFLAGS=
94222         SCCSGETFLAGS=-s

```

94223 *SINGLE SUFFIX RULES*

```

94224         .c:
94225             $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<
94226
94227         .f:
94228             $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $<
94229
94230         .sh:
94231             cp $< $@
94232             chmod a+x $@
94233
94234   XSI     .c~:
94235             $(GET) $(GFLAGS) -p $< > $*.c
94236             $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
94237
94238         .f~:
94239             $(GET) $(GFLAGS) -p $< > $*.f
94240             $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f
94241
94242         .sh~:
94243             $(GET) $(GFLAGS) -p $< > $*.sh
94244             cp $*.sh $@
94245             chmod a+x $@

```

94241 *DOUBLE SUFFIX RULES*

```

94242         .c.o:
94243             $(CC) $(CFLAGS) -c $<
94244
94245         .f.o:
94246             $(FC) $(FFLAGS) -c $<
94247
94248         .y.o:
94249             $(YACC) $(YFLAGS) $<
94250             $(CC) $(CFLAGS) -c y.tab.c
94251             rm -f y.tab.c
94252             mv y.tab.o $@
94253
94254         .l.o:
94255             $(LEX) $(LFLAGS) $<
94256             $(CC) $(CFLAGS) -c lex.yy.c
94257             rm -f lex.yy.c
94258             mv lex.yy.o $@
94259
94260         .y.c:
94261             $(YACC) $(YFLAGS) $<

```

```

94258         mv y.tab.c $@
94259     .l.c:
94260         $(LEX) $(LFLAGS) $<
94261         mv lex.yy.c $@
94262     XSI .c~.o:
94263         $(GET) $(GFLAGS) -p $< > $*.c
94264         $(CC) $(CFLAGS) -c $*.c
94265     .f~.o:
94266         $(GET) $(GFLAGS) -p $< > $*.f
94267         $(FC) $(FFLAGS) -c $*.f
94268     .y~.o:
94269         $(GET) $(GFLAGS) -p $< > $*.y
94270         $(YACC) $(YFLAGS) $*.y
94271         $(CC) $(CFLAGS) -c y.tab.c
94272         rm -f y.tab.c
94273         mv y.tab.o $@
94274     .l~.o:
94275         $(GET) $(GFLAGS) -p $< > $*.l
94276         $(LEX) $(LFLAGS) $*.l
94277         $(CC) $(CFLAGS) -c lex.yy.c
94278         rm -f lex.yy.c
94279         mv lex.yy.o $@
94280     .y~.c:
94281         $(GET) $(GFLAGS) -p $< > $*.y
94282         $(YACC) $(YFLAGS) $*.y
94283         mv y.tab.c $@
94284     .l~.c:
94285         $(GET) $(GFLAGS) -p $< > $*.l
94286         $(LEX) $(LFLAGS) $*.l
94287         mv lex.yy.c $@
94288     .c.a:
94289         $(CC) -c $(CFLAGS) $<
94290         $(AR) $(ARFLAGS) $@ $*.o
94291         rm -f $*.o
94292     .f.a:
94293         $(FC) -c $(FFLAGS) $<
94294         $(AR) $(ARFLAGS) $@ $*.o
94295         rm -f $*.o

```

EXIT STATUS

When the **-q** option is specified, the *make* utility shall exit with one of the following values:

- 0 Successful completion.
- 1 The target was not up-to-date.
- >1 An error occurred.

When the **-q** option is not specified, the *make* utility shall exit with one of the following values:

94302 0 Successful completion.

94303 >0 An error occurred.

94304 CONSEQUENCES OF ERRORS

94305 Default.

94306 APPLICATION USAGE

94307 If there is a source file (such as *./source.c*) and there are two SCCS files corresponding to it
 94308 (*./s.source.c* and *./SCCS/s.source.c*), on XSI-conformant systems *make* uses the SCCS file in the
 94309 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,
 94310 *get*, and so on) or the *sccs* utility for all source files in a given directory. If both forms are used for
 94311 a given source file, future developers are very likely to be confused.

94312 It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to
 94313 guarantee that they are not affected by local extensions.

94314 The **-k** and **-S** options are both present so that the relationship between the command line, the
 94315 **MAKEFLAGS** variable, and the makefile can be controlled precisely. If the **k** flag is passed in
 94316 **MAKEFLAGS** and a command is of the form:

```
94317 $(MAKE) -S foo
```

94318 then the default behavior is restored for the child *make*.

94319 When the **-n** option is specified, it is always added to **MAKEFLAGS**. This allows a recursive
 94320 *make -n target* to be used to see all of the action that would be taken to update *target*.

94321 Because of widespread historical practice, interpreting a '#' number sign inside a variable as
 94322 the start of a comment has the unfortunate side effect of making it impossible to place a number
 94323 sign in a variable, thus forbidding something like:

```
94324 CFLAGS = "-D COMMENT_CHAR='#'"
```

94325 Many historical *make* utilities stop chaining together inference rules when an intermediate target
 94326 is nonexistent. For example, it might be possible for a *make* to determine that both **.y.c** and **.c.o**
 94327 could be used to convert a **.y** to a **.o**. Instead, in this case, *make* requires the use of a **.y.o** rule.

94328 The best way to provide portable makefiles is to include all of the rules needed in the makefile
 94329 itself. The rules provided use only features provided by other parts of this volume of
 94330 POSIX.1-200x. The default rules include rules for optional commands in this volume of
 94331 POSIX.1-200x. Only rules pertaining to commands that are provided are needed in an
 94332 implementation's default set.

94333 Macros used within other macros are evaluated when the new macro is used rather than when
 94334 the new macro is defined. Therefore:

```
94335 MACRO = value1
94336 NEW   = $(MACRO)
94337 MACRO = value2
```

```
94338 target:
94339     echo $(NEW)
```

94340 would produce *value2* and not *value1* since **NEW** was not expanded until it was needed in the
 94341 *echo* command line.

94342 Some historical applications have been known to intermix *target_name* and *macro=name* operands
 94343 on the command line, expecting that all of the macros are processed before any of the targets are
 94344 dealt with. Conforming applications do not do this, although some backwards-compatibility
 94345 support may be included in some implementations.

94346 The following characters in filenames may give trouble: '=', ':', '\', '|', and '@'. In |

94347 include filenames, pattern matching characters and ' ' should also be avoided, as they may be |
 94348 treated as special by some implementations. |

94349 For inference rules, the description of \$< and \$? seem similar. However, an example shows the |
 94350 minor difference. In a makefile containing:

```
94351 foo.o: foo.h
```

94352 if **foo.h** is newer than **foo.o**, yet **foo.c** is older than **foo.o**, the built-in rule to make **foo.o** from
 94353 **foo.c** is used, with \$< equal to **foo.c** and \$? equal to **foo.h**. If **foo.c** is also newer than **foo.o**, \$< is
 94354 equal to **foo.c** and \$? is equal to **foo.h** **foo.c**.

94355 EXAMPLES

- 94356 1. The following command:

```
94357 make
```

94358 makes the first target found in the makefile.

- 94359 2. The following command:

```
94360 make junk
```

94361 makes the target **junk**.

- 94362 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in
 94363 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

```
94364 pgm: a.o b.o
94365      c99 a.o b.o -o pgm
94366 a.o: incl.h a.c
94367      c99 -c a.c
94368 b.o: incl.h b.c
94369      c99 -c b.c
```

- 94370 4. An example for making optimized **.o** files from **.c** files is:

```
94371 .c.o:
94372      c99 -c -O $*.c
```

94373 or:

```
94374 .c.o:
94375      c99 -c -O $<
```

- 94376 5. The most common use of the archive interface follows. Here, it is assumed that the source
 94377 files are all C-language source:

```
94378 lib: lib(file1.o) lib(file2.o) lib(file3.o)
94379      @echo lib is now up-to-date
```

94380 The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.

94381 The treatment of escaped <newline>s throughout the makefile is historical practice. For
 94382 example, the inference rule:

```
94383 .c.o\  

  94384 :
```

94385 works, and the macro:

```
94386 f= bar baz\  

  94387    biz
94388 a:
94389    echo ==$f==
```

94390 echoes "=="bar baz biz==".

94391 If \$? were:

94392 /usr/include/stdio.h /usr/include/unistd.h foo.h

94393 then \$(?D) would be:

94394 /usr/include /usr/include .

94395 and \$(?F) would be:

94396 stdio.h unistd.h foo.h

94397 6. The contents of the built-in rules can be viewed by running:

94398 make -p -f /dev/null 2>/dev/null

RATIONALE

94399 The *make* utility described in this volume of POSIX.1-200x is intended to provide the means for
 94400 changing portable source code into executables that can be run on an POSIX.1-200x-conforming
 94401 system. It reflects the most common features present in System V and BSD *makes*.
 94402

94403 Historically, the *make* utility has been an especially fertile ground for vendor and research
 94404 organization-specific syntax modifications and extensions. Examples include:

- 94405 • Syntax supporting parallel execution (such as from various multi-processor vendors, GNU,
 94406 and others)
- 94407 • Additional “operators” separating targets and their prerequisites (System V, BSD, and
 94408 others)
- 94409 • Specifying that command lines containing the strings “\${MAKE}” and “\$(MAKE)” are
 94410 executed when the `-n` option is specified (GNU and System V)
- 94411 • Modifications of the meaning of internal macros when referencing libraries (BSD and
 94412 others)
- 94413 • Using a single instance of the shell for all of the command lines of the target (BSD and
 94414 others)
- 94415 • Allowing spaces as well as tabs to delimit command lines (BSD)
- 94416 • Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and
 94417 others)
- 94418 • Remote execution of command lines (Sprite and others)
- 94419 • Specifying additional special targets (BSD, System V, and most others)

94420 Additionally, many vendors and research organizations have rethought the basic concepts of
 94421 *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of
 94422 *make* fulfills the needs of a different community of users; it is unreasonable for this volume of
 94423 POSIX.1-200x to require behavior that would be incompatible (and probably inferior) to
 94424 historical practice for such a community.

94425 In similar circumstances, when the industry has enough sufficiently incompatible formats as to
 94426 make them irreconcilable, this volume of POSIX.1-200x has followed one or both of two courses
 94427 of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line options
 94428 have been provided to select the desired behavior (*grep*, *od*, and *pax*).

94429 Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes
 94430 accepted by almost all versions of *make*, it was decided that it would be counter-productive to
 94431 change the name. And since the makefile itself is a basic unit of portability, it would not be
 94432 completely effective to reserve a new option letter, such as *make -P*, to achieve the portable

94433 behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to
 94434 specify “standard” behavior. This special target does not preclude extensions in the *make* utility,
 94435 nor does it preclude such extensions being used by the makefile specifying the target; it does,
 94436 however, preclude any extensions from being applied that could alter the behavior of previously
 94437 valid syntax; such extensions must be controlled via command line options or new special
 94438 targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to
 94439 guarantee that they are not affected by local extensions.

94440 The portable version of *make* described in this reference page is not intended to be the state-of-
 94441 the-art software generation tool and, as such, some newer and more leading-edge features have
 94442 not been included. An attempt has been made to describe the portable makefile in a manner that
 94443 does not preclude such extensions as long as they do not disturb the portable behavior described
 94444 here.

94445 When the **-n** option is specified, it is always added to *MAKEFLAGS*. This allows a recursive
 94446 *make -n target* to be used to see all of the action that would be taken to update *target*.

94447 The definition of *MAKEFLAGS* allows both the System V letter string and the BSD command
 94448 line formats. The two formats are sufficiently different to allow implementations to support both
 94449 without ambiguity.

94450 Early proposals stated that an “unquoted” number sign was treated as the start of a comment.
 94451 The *make* utility does not pay any attention to quotes. A number sign starts a comment
 94452 regardless of its surroundings.

94453 The text about “other implementation-defined pathnames may also be tried” in addition to
 94454 *./makefile* and *./Makefile* is to allow such extensions as **SCCS/s.Makefile** and other variations.
 94455 It was made an implementation-defined requirement (as opposed to unspecified behavior) to
 94456 highlight surprising implementations that might select something unexpected like
 94457 */etc/Makefile*. XSI-conformant systems also try *./s.makefile*, **SCCS/s.makefile**, *./s.Makefile*,
 94458 and **SCCS/s.Makefile**.

94459 Early proposals contained the macro **NPROC** as a means of specifying that *make* should use *n*
 94460 processes to do the work required. While this feature is a valuable extension for many systems, it
 94461 is not common usage and could require other non-trivial extensions to makefile syntax. This
 94462 extension is not required by this volume of POSIX.1-200x, but could be provided as a compatible
 94463 extension. The macro **PARALLEL** is used by some historical systems with essentially the same
 94464 meaning (but without using a name that is a common system limit value). It is suggested that
 94465 implementors recognize the existing use of **NPROC** and/or **PARALLEL** as extensions to *make*.

94466 The default rules are based on System V. The default **CC=** value is *c99* instead of *cc* because this
 94467 volume of POSIX.1-200x does not standardize the utility named *cc*. Thus, every conforming
 94468 application would be required to define **CC=c99** to expect to run. There is no advantage
 94469 conferred by the hope that the makefile might hit the “preferred” compiler because this cannot
 94470 be guaranteed to work. Also, since the portable makescript can only use the *c99* options, no
 94471 advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue
 94472 as to whether *c99* is as valuable as *cc*.

94473 The **-d** option to *make* is frequently used to produce debugging information, but is too
 94474 implementation-defined to add to this volume of POSIX.1-200x.

94475 The **-p** option is not passed in *MAKEFLAGS* on most historical implementations and to change
 94476 this would cause many implementations to break without sufficiently increased portability.

94477 Commands that begin with a plus sign (‘+’) are executed even if the **-n** option is present. Based
 94478 on the GNU version of *make*, the behavior of **-n** when the plus-sign prefix is encountered has
 94479 been extended to apply to **-q** and **-t** as well. However, the System V convention of forcing
 94480 command execution with **-n** when the command line of a target contains either of the strings
 94481 “\$(MAKE)” or “\${MAKE}” has not been adopted. This functionality appeared in early

94482 proposals, but the danger of this approach was pointed out with the following example of a
94483 portion of a makefile:

```
94484 subdir:
94485     cd subdir; rm all_the_files; $(MAKE)
```

94486 The loss of the System V behavior in this case is well-balanced by the safety afforded to other
94487 makefiles that were not aware of this situation. In any event, the command line plus-sign prefix
94488 can provide the desired functionality.

94489 The double colon in the target rule format is supported in BSD systems to allow more than one
94490 target line containing the same target name to have commands associated with it. Since this is
94491 not functionality described in the SVID or XPG3 it has been allowed as an extension, but not
94492 mandated.

94493 The default rules are provided with text specifying that the built-in rules shall be the same as if
94494 the listed set were used. The intent is that implementations should be able to use the rules
94495 without change, but will be allowed to alter them in ways that do not affect the primary
94496 behavior.

94497 The best way to provide portable makefiles is to include all of the rules needed in the makefile
94498 itself. The rules provided use only features provided by other portions of this volume of
94499 POSIX.1-200x. The default rules include rules for optional commands in this volume of
94500 POSIX.1-200x. Only rules pertaining to commands that are provided are needed in the default
94501 set of an implementation.

94502 One point of discussion was whether to drop the default rules list from this volume of
94503 POSIX.1-200x. They provide convenience, but do not enhance portability of applications. The
94504 prime benefit is in portability of users who wish to type *make command* and have the command
94505 build from a **command.c** file.

94506 The historical *MAKESHELL* feature was omitted. In some implementations it is used to let a user
94507 override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the
94508 shell should be chosen by the makefile writer or specified on the *make* command line and not by
94509 a user running *make*.

94510 The *make* utilities in most historical implementations process the prerequisites of a target in left-
94511 to-right order, and the makefile format requires this. It supports the standard idiom used in
94512 many makefiles that produce *yacc* programs; for example:

```
94513 foo: y.tab.o lex.o main.o
94514     $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

94515 In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct
94516 **y.tab.h**. Although there may be better ways to express this relationship, it is widely used
94517 historically. Implementations that desire to update prerequisites in parallel should require an
94518 explicit extension to *make* or the makefile format to accomplish it, as described previously.

94519 The algorithm for determining a new entry for target rules is partially unspecified. Some
94520 historical *makes* allow blank, empty, or comment lines within the collection of commands
94521 marked by leading <tab>s. A conforming makefile must ensure that each command starts with
94522 a <tab>, but implementations are free to ignore blank, empty, and comment lines without
94523 triggering the start of a new entry.

94524 The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with
94525 the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do
94526 so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned
94527 up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it
94528 is required to resend itself the signal it received so that it exits with a status that reflects the
94529 signal. The results from SIGQUIT are partially unspecified because, on systems that create **core**

94530 files upon receipt of SIGQUIT, the **core** from *make* would conflict with a **core** file from the
 94531 command that was running when the SIGQUIT arrived. The main concern was to prevent
 94532 damaged files from appearing up-to-date when *make* is rerun.

94533 The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no
 94534 prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites;
 94535 it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of
 94536 targets than for the entire makefile. These extensions to *make* in System V were made to match
 94537 historical practice from the BSD *make*.

94538 Macros are not exported to the environment of commands to be run. This was never the case in
 94539 any historical *make* and would have serious consequences. The environment is the same as the
 94540 environment to *make* except that **MAKEFLAGS** and macros defined on the *make* command line
 94541 are added.

94542 Some implementations do not use *system()* for all command lines, as required by the portable
 94543 makefile format; as a performance enhancement, they select lines without shell metacharacters
 94544 for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but
 94545 merely that the same results be achieved. The metacharacters typically used to bypass the direct
 94546 *execve()* execution have been any of:

94547 = | ^ () ; & < > * ? [] : \$ \ ' " \ \n

94548 The default in some advanced versions of *make* is to group all the command lines for a target and
 94549 execute them using a single shell invocation; the System V method is to pass each line
 94550 individually to a separate shell. The single-shell method has the advantages in performance and
 94551 the lack of a requirement for many continued lines. However, converting to this newer method
 94552 has caused portability problems with many historical makefiles, so the behavior with the POSIX
 94553 makefile is specified to be the same as that of System V. It is suggested that the special target
 94554 **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a
 94555 target or group of targets.

94556 Novice users of *make* have had difficulty with the historical need to start commands with a
 94557 <tab>. Since it is often difficult to discern differences between <tab>s and <space>s on terminals
 94558 or printed listings, confusing bugs can arise. In early proposals, an attempt was made to correct
 94559 this problem by allowing leading <blank>s instead of <tab>s. However, implementors reported
 94560 many makefiles that failed in subtle ways following this change, and it is difficult to implement
 94561 a *make* that unambiguously can differentiate between macro and command lines. There is
 94562 extensive historical practice of allowing leading spaces before macro definitions. Forcing macro
 94563 lines into column 1 would be a significant backwards-compatibility problem for some makefiles.
 94564 Therefore, historical practice was restored.

94565 There is substantial variation in the handling of include lines by different implementations. |
 94566 However, there is enough commonality for the standard to be able to specify a minimum set of |
 94567 requirements that allow the feature to be used portably. Known variations have been explicitly |
 94568 called out as unspecified behavior in the description.

94569 The System V dynamic dependency feature was not included. It would support:

94570 cat: \$\$@.c

94571 that would expand to;

94572 cat: cat.c

94573 This feature exists only in the new version of System V *make* and, while useful, is not in wide
 94574 usage. This means that macros are expanded twice for prerequisites: once at makefile parse time
 94575 and once at target update time.

94576 Consideration was given to adding metarules to the POSIX *make*. This would make **%.o: %.c** the
 94577 same as **.c.o:**. This is quite useful and available from some vendors, but it would cause too many

94578 changes to this *make* to support. It would have introduced rule chaining and new substitution
 94579 rules. However, the rules for target names have been set to reserve the ‘%’ and ‘”’ characters.
 94580 These are traditionally used to implement metarules and quoting of target names, respectively.
 94581 Implementors are strongly encouraged to use these characters only for these purposes.

94582 A request was made to extend the suffix delimiter character from a period to any character. The
 94583 metarules feature in newer *makes* solves this problem in a more general way. This volume of
 94584 POSIX.1-200x is staying with the more conservative historical definition.

94585 The standard output format for the `-p` option is not described because it is primarily a
 94586 debugging option and because the format is not generally useful to programs. In historical
 94587 implementations the output is not suitable for use in generating makefiles. The `-p` format has
 94588 been variable across historical implementations. Therefore, the definition of `-p` was only to
 94589 provide a consistently named option for obtaining *make* script debugging information.

94590 Some historical implementations have not cleared the suffix list with `-r`.

94591 Implementations should be aware that some historical applications have intermixed *target_name*
 94592 and *macro=value* operands on the command line, expecting that all of the macros are processed
 94593 before any of the targets are dealt with. Conforming applications do not do this, but some
 94594 backwards-compatibility support may be warranted.

94595 Empty inference rules are specified with a semicolon command rather than omitting all
 94596 commands, as described in an early proposal. The latter case has no traditional meaning and is
 94597 reserved for implementation extensions, such as in GNU *make*.

94598 FUTURE DIRECTIONS

94599 None.

94604 CHANGE HISTORY

94605 First released in Issue 2.

94606 Issue 5

94607 The FUTURE DIRECTIONS section is added.

94608 Issue 6

94609 This utility is marked as part of the Software Development Utilities option.

94610 The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the
 94611 SPECIAL TARGETS section.

94612 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from
 94613 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of
 94614 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

94615 It is specified whether the command line is related to the makefile or to the *make* command, and
 94616 the macro processing rules are updated to align with the IEEE P1003.2b draft standard.

94617 The normative text is reworded to avoid use of the term “must” for application requirements.

94618 PASC Interpretation 1003.2 #193 is applied.

94619
94620
94621
94622
94623**Issue 7**

SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not apply.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

Include lines in makefiles are introduced.

+

94624 **NAME**
 94625 man — display system documentation

94626 **SYNOPSIS**
 94627 man [-k] *name* . . .

94628 **DESCRIPTION**
 94629 The *man* utility shall write information about each of the *name* operands. If *name* is the name of a
 94630 standard utility, *man* at a minimum shall write a message describing the syntax used by the
 94631 standard utility, its options, and operands. If more information is available, the *man* utility shall
 94632 provide it in an implementation-defined manner.

94633 An implementation may provide information for values of *name* other than the standard utilities.
 94634 Standard utilities that are listed as optional and that are not supported by the implementation
 94635 either shall cause a brief message indicating that fact to be displayed or shall cause a full display
 94636 of information as described previously.

94637 **OPTIONS**
 94638 The *man* utility shall conform to XBD [Section 12.2](#) (on page 201).

94639 The following option shall be supported:

94640 **-k** Interpret *name* operands as keywords to be used in searching a utilities summary
 94641 database that contains a brief purpose entry for each standard utility and write lines
 94642 from the summary database that match any of the keywords. The keyword search shall
 94643 produce results that are the equivalent of the output of the following command:

```
94644 grep -Ei '  
94645 name  
94646 name  
94647 ...  
94648 ' summary-database
```

94649 This assumes that the *summary-database* is a text file with a single entry per line; this
 94650 organization is not required and the example using *grep -Ei* is merely illustrative of the
 94651 type of search intended. The purpose entry to be included in the database shall consist
 94652 of a terse description of the purpose of the utility.

94653 **OPERANDS**
 94654 The following operand shall be supported:

94655 *name* A keyword or the name of a standard utility. When **-k** is not specified and *name*
 94656 does not represent one of the standard utilities, the results are unspecified.

94657 **STDIN**
 94658 Not used.

94659 **INPUT FILES**
 94660 None.

94661 **ENVIRONMENT VARIABLES**
 94662 The following environment variables shall affect the execution of *man*:

94663 **LANG** Provide a default value for the internationalization variables that are unset or null.
 94664 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 94665 variables used to determine the values of locale categories.)

94666	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
94667		
94668	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and in the summary database). The value of <i>LC_CTYPE</i> need not affect the format of the information written about the <i>name</i> operands.
94669		
94670		
94671		
94672	<i>LC_MESSAGES</i>	
94673		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
94674		
94675		
94676	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
94677	<i>PAGER</i>	Determine an output filtering command for writing the output to a terminal. Any string acceptable as a <i>command_string</i> operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal device, the reference page output shall be piped through the command. If the <i>PAGER</i> variable is null or not set, the command shall be either <i>more</i> or another paginator utility documented in the system documentation.
94678		
94679		
94680		
94681		
94682		
94683	ASYNCHRONOUS EVENTS	
94684		Default.
94685	STDOUT	
94686		The <i>man</i> utility shall write text describing the syntax of the utility <i>name</i> , its options and its operands, or, when <i>-k</i> is specified, lines from the summary database. The format of this text is implementation-defined.
94687		
94688		
94689	STDERR	
94690		The standard error shall be used for diagnostic messages, and may also be used for informational messages of unspecified format.
94691		
94692	OUTPUT FILES	
94693		None.
94694	EXTENDED DESCRIPTION	
94695		None.
94696	EXIT STATUS	
94697		The following exit values shall be returned:
94698		0 Successful completion.
94699		>0 An error occurred.
94700	CONSEQUENCES OF ERRORS	
94701		Default.
94702	APPLICATION USAGE	
94703		None.
94704	EXAMPLES	
94705		None.
94706	RATIONALE	
94707		It is recognized that the <i>man</i> utility is only of minimal usefulness as specified. The opinion of the standard developers was strongly divided as to how much or how little information <i>man</i> should be required to provide. They considered, however, that the provision of some portable way of accessing documentation would aid user portability. The arguments against a fuller specification were:
94708		
94709		
94710		
94711		

- 94712 • Large quantities of documentation should not be required on a system that does not have
- 94713 excess disk space.
- 94714 • The current manual system does not present information in a manner that greatly aids user
- 94715 portability.
- 94716 • A “better help system” is currently an area in which vendors feel that they can add value
- 94717 to their POSIX implementations.

94718 The `-f` option was considered, but due to implementation differences, it was not included in this
 94719 volume of POSIX.1-200x.

94720 The description was changed to be more specific about what has to be displayed for a utility. The
 94721 standard developers considered it insufficient to allow a display of only the synopsis without
 94722 giving a short description of what each option and operand does.

94723 The “purpose” entry to be included in the database can be similar to the section title (less the
 94724 numeric prefix) from this volume of POSIX.1-200x for each utility. These titles are similar to
 94725 those used in historical systems for this purpose.

94726 See *mailx* for rationale concerning the default paginator.

94727 The caveat in the *LC_CTYPE* description was added because it is not a requirement that an
 94728 implementation provide reference pages for all of its supported locales on each system;
 94729 changing *LC_CTYPE* does not necessarily translate the reference page into another language.
 94730 This is equivalent to the current state of *LC_MESSAGES* in POSIX.1-200x—locale-specific
 94731 messages are not yet a requirement.

94732 The historical *MANPATH* variable is not included in POSIX because no attempt is made to
 94733 specify naming conventions for reference page files, nor even to mandate that they are files at
 94734 all. On some implementations they could be a true database, a hypertext file, or even fixed
 94735 strings within the *man* executable. The standard developers considered the portability of
 94736 reference pages to be outside their scope of work. However, users should be aware that
 94737 *MANPATH* is implemented on a number of historical systems and that it can be used to tailor
 94738 the search pattern for reference pages from the various categories (utilities, functions, file
 94739 formats, and so on) when the system administrator reveals the location and conventions for
 94740 reference pages on the system.

94741 The keyword search can rely on at least the text of the section titles from these utility
 94742 descriptions, and the implementation may add more keywords. The term “section titles” refers
 94743 to the strings such as:

```
94744 man - Display system documentation
94745 ps - Report process status
```

94746 FUTURE DIRECTIONS

94758

NAME

94759

mesg — permit or deny messages

94760

SYNOPSIS

94761

mesg [y|n]

94762

DESCRIPTION

94763

94764

94765

94766

94767

94768

The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or other utilities to a terminal device. The terminal device affected shall be determined by searching for the first terminal in the sequence of devices associated with standard input, standard output, and standard error, respectively. With no arguments, *mesg* shall report the current state without changing it. Processes with appropriate privileges may be able to send messages to the terminal independent of the current state.

94769

OPTIONS

94770

None.

94771

OPERANDS

94772

The following operands shall be supported in the POSIX locale:

94773

y

Grant permission to other users to send messages to the terminal device.

94774

n

Deny permission to other users to send messages to the terminal device.

94775

STDIN

94776

Not used.

94777

INPUT FILES

94778

None.

94779

ENVIRONMENT VARIABLES

94780

The following environment variables shall affect the execution of *mesg*:

94781

LANG

Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)

94783

94784

LC_ALL

If set to a non-empty string value, override the values of all the other internationalization variables.

94785

94786

LC_CTYPE

Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

94787

94788

94789

LC_MESSAGES

Determine the locale that should be used to affect the format and contents of diagnostic messages written (by *mesg*) to standard error.

94790

94791

94792

XSI

*NLSPATH*Determine the location of message catalogs for the processing of *LC_MESSAGES*.

94793

ASYNCHRONOUS EVENTS

94794

Default.

94795

STDOUT

94796

If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.

94797 **STDERR**
 94798 The standard error shall be used only for diagnostic messages.

94799 **OUTPUT FILES**
 94800 None.

94801 **EXTENDED DESCRIPTION**
 94802 None.

94803 **EXIT STATUS**
 94804 The following exit values shall be returned:

- 94805 0 Receiving messages is allowed.
- 94806 1 Receiving messages is not allowed.
- 94807 >1 An error occurred.

94808 **CONSEQUENCES OF ERRORS**
 94809 Default.

94810 **APPLICATION USAGE**
 94811 The mechanism by which the message status of the terminal is changed is unspecified.
 94812 Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has
 94813 successfully completed. These actions may include, but are not limited to: another invocation of
 94814 the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or
 94815 *chmod()* function, and so on.

94816 **EXAMPLES**
 94817 None.

94818 **RATIONALE**
 94819 The terminal changed by *mesg* is that associated with the standard input, output, or error, rather
 94820 than the controlling terminal for the session. This is because users logged in more than once
 94821 should be able to change any of their login terminals without having to stop the job running in
 94822 those sessions. This is not a security problem involving the terminals of other users because
 94823 appropriate privileges would be required to affect the terminal of another user.

94824 The method of checking each of the first three file descriptors in sequence until a terminal is
 94825 found was adopted from System V.

94826 The file */dev/tty* is not specified for the terminal device because it was thought to be too
 94827 restrictive. Typical environment changes for the *n* operand are that write permissions are
 94828 removed for *others* and *group* from the appropriate device. It was decided to leave the actual
 94829 description of what is done as unspecified because of potential differences between
 94830 implementations.

94831 The format for standard output is unspecified because of differences between historical
 94832 implementations. This output is generally not useful to shell scripts (they can use the exit status),
 94833 so exact parsing of the output is unnecessary.

94834 **FUTURE DIRECTIONS**
 94835 None.

94836 **SEE ALSO**
 94837 *talk*, *write*

94839

CHANGE HISTORY

94840

First released in Issue 2.

94841

Issue 6

94842

This utility is marked as part of the User Portability Utilities option.

94843

Issue 7

94844

The *mesg* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

94845

94846 **NAME**

94847 mkdir — make directories

94848 **SYNOPSIS**94849 mkdir [-p] [-m *mode*] *dir*...94850 **DESCRIPTION**94851 The *mkdir* utility shall create the directories specified by the operands, in the order specified.94852 For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function
94853 defined in the System Interfaces volume of POSIX.1-200x, called with the following arguments:

- 94854 1. The
- dir*
- operand is used as the
- path*
- argument.
-
- 94855 2. The value of the bitwise-inclusive OR of S_IRWXU, S_IRWXG, and S_IRWXO is used as
-
- 94856 the
- mode*
- argument. (If the
- m**
- option is specified, the value of the
- mkdir()*
- mode*
- argument
-
- 94857 is unspecified, but the directory shall at no time have permissions less restrictive than the
-
- 94858
- m mode**
- option-argument.)

94859 **OPTIONS**94860 The *mkdir* utility shall conform to XBD [Section 12.2](#) (on page 201).

94861 The following options shall be supported:

94862 **-m mode** Set the file permission bits of the newly-created directory to the specified *mode*
94863 value. The *mode* option-argument shall be the same as the *mode* operand defined
94864 for the *chmod* utility. In the *symbolic_mode* strings, the *op* characters '+' and '-'
94865 shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add
94866 permissions to the default mode, '-' shall delete permissions from the default
94867 mode.94868 **-p** Create any missing intermediate pathname components.94869 For each *dir* operand that does not name an existing directory, effects equivalent to
94870 those caused by the following command shall occur:94871

```
mkdir -p -m $(umask -S),u+wx $(dirname dir) &&  
mkdir [-m mode] dir
```

94873 where the **-m mode** option represents that option supplied to the original
94874 invocation of *mkdir*, if any.94875 Each *dir* operand that names an existing directory shall be ignored without error.94876 **OPERANDS**

94877 The following operand shall be supported:

94878 *dir* A pathname of a directory to be created.94879 **STDIN**

94880 Not used.

94881 **INPUT FILES**

94882 None.

94883 **ENVIRONMENT VARIABLES**94884 The following environment variables shall affect the execution of *mkdir*:94885 **LANG** Provide a default value for the internationalization variables that are unset or null. |
94886 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
94887 variables used to determine the values of locale categories.)

- 94888 *LC_ALL* If set to a non-empty string value, override the values of all the other
94889 internationalization variables.
- 94890 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
94891 characters (for example, single-byte as opposed to multi-byte characters in
94892 arguments).
- 94893 *LC_MESSAGES*
94894 Determine the locale that should be used to affect the format and contents of
94895 diagnostic messages written to standard error.
- 94896 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 94897 **ASYNCHRONOUS EVENTS**
- 94898 Default.
- 94899 **STDOUT**
- 94900 Not used.
- 94901 **STDERR**
- 94902 The standard error shall be used only for diagnostic messages.
- 94903 **OUTPUT FILES**
- 94904 None.
- 94905 **EXTENDED DESCRIPTION**
- 94906 None.
- 94907 **EXIT STATUS**
- 94908 The following exit values shall be returned:
- 94909 0 All the specified directories were created successfully or the **-p** option was specified and all
94910 the specified directories now exist.
- 94911 >0 An error occurred.
- 94912 **CONSEQUENCES OF ERRORS**
- 94913 Default.
- 94914 **APPLICATION USAGE**
- 94915 The default file mode for directories is *a=rwx* (777 on most systems) with selected permissions
94916 removed in accordance with the file mode creation mask. For intermediate pathname
94917 components created by *mkdir*, the mode is the default modified by *u+wx* so that the
94918 subdirectories can always be created regardless of the file mode creation mask; if different
94919 ultimate permissions are desired for the intermediate directories, they can be changed
94920 afterwards with *chmod*.
- 94921 Note that some of the requested directories may have been created even if an error occurs.
- 94922 **EXAMPLES**
- 94923 None.
- 94924 **RATIONALE**
- 94925 The System V **-m** option was included to control the file mode.
- 94926 The System V **-p** option was included to create any needed intermediate directories and to
94927 complement the functionality provided by *rmdir* for removing directories in the path prefix as
94928 they become empty. Because no error is produced if any path component already exists, the **-p**
94929 option is also useful to ensure that a particular directory exists.
- 94930 The functionality of *mkdir* is described substantially through a reference to the *mkdir()* function
94931 in the System Interfaces volume of POSIX.1-200x. For example, by default, the mode of the
94932 directory is affected by the file mode creation mask in accordance with the specified behavior of

94933 the *mkdir()* function. In this way, there is less duplication of effort required for describing details
94934 of the directory creation.

FUTURE DIRECTIONS

94935 None.

94948 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

94949 **NAME**

94950 mkfifo — make FIFO special files

94951 **SYNOPSIS**94952 `mkfifo [-m mode] file...`94953 **DESCRIPTION**94954 The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order
94955 specified.94956 For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function
94957 defined in the System Interfaces volume of POSIX.1-200x, called with the following arguments:

- 94958
1. The *file* operand is used as the *path* argument.
 - 94959 2. The value of the bitwise-inclusive OR of S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP,
94960 S_IROTH, and S_IWOTH is used as the *mode* argument. (If the `-m` option is specified, the
94961 value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have
94962 permissions less restrictive than the `-m mode` option-argument.)

94963 **OPTIONS**94964 The *mkfifo* utility shall conform to XBD [Section 12.2](#) (on page 201).

94965 The following option shall be supported:

94966 `-m mode` Set the file permission bits of the newly-created FIFO to the specified *mode* value.
94967 The *mode* option-argument shall be the same as the *mode* operand defined for the
94968 *chmod* utility. In the *symbolic_mode* strings, the *op* characters '+' and '-' shall be
94969 interpreted relative to an assumed initial mode of *a=rw*.94970 **OPERANDS**

94971 The following operand shall be supported:

94972 *file* A pathname of the FIFO special file to be created.94973 **STDIN**

94974 Not used.

94975 **INPUT FILES**

94976 None.

94977 **ENVIRONMENT VARIABLES**94978 The following environment variables shall affect the execution of *mkfifo*:94979 *LANG* Provide a default value for the internationalization variables that are unset or null.
94980 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
94981 variables used to determine the values of locale categories.)94982 *LC_ALL* If set to a non-empty string value, override the values of all the other
94983 internationalization variables.94984 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
94985 characters (for example, single-byte as opposed to multi-byte characters in
94986 arguments).94987 *LC_MESSAGES*94988 Determine the locale that should be used to affect the format and contents of
94989 diagnostic messages written to standard error.

94990 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

94991 **ASYNCHRONOUS EVENTS**

94992 Default.

94993 **STDOUT**

94994 Not used.

94995 **STDERR**

94996 The standard error shall be used only for diagnostic messages.

94997 **OUTPUT FILES**

94998 None.

94999 **EXTENDED DESCRIPTION**

95000 None.

95001 **EXIT STATUS**

95002 The following exit values shall be returned:

95003 0 All the specified FIFO special files were created successfully.

95004 >0 An error occurred.

95005 **CONSEQUENCES OF ERRORS**

95006 Default.

95007 **APPLICATION USAGE**

95008 None.

95009 **EXAMPLES**

95010 None.

95011 **RATIONALE**

95012 This utility was added to permit shell applications to create FIFO special files.

95013 The **-m** option was added to control the file mode, for consistency with the similar functionality
95014 provided by the *mkdir* utility.

95015 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate
95016 directories leading up to the FIFO specified by the final component. This was removed because
95017 it is not commonly needed and is not common practice with similar utilities.

95018 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function
95019 in the System Interfaces volume of POSIX.1-200x. For example, by default, the mode of the FIFO
95020 file is affected by the file mode creation mask in accordance with the specified behavior of the
95021 *mkfifo()* function. In this way, there is less duplication of effort required for describing details of
95022 the file creation.

95023 **FUTURE DIRECTIONS**

95024 None.

95025 **SEE ALSO**

95026 *chmod*, *umask*

95027 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

95028 XSH *mkfifo*

95029 **CHANGE HISTORY**

95030 First released in Issue 3.

95031

95032

Issue 6

The `-m` option is aligned with the IEEE P1003.2b draft standard to clarify an ambiguity.

95033

NAME

95034

more — display files on a page-by-page basis

95035

SYNOPSIS

95036

UP `more [-ceisu] [-n number] [-p command] [-t tagstring] [file...]`

95037

DESCRIPTION

95038

95039

95040

95041

95042

95043

The *more* utility shall read files and either write them to the terminal on a page-by-page basis or filter them to standard output. If standard output is not a terminal device, all input files shall be copied to standard output in their entirety, without modification, except as specified for the `-s` option. If standard output is a terminal device, the files shall be written a number of lines (one screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION section.

95044

95045

95046

95047

Certain block-mode terminals do not have all the capabilities necessary to support the complete *more* definition; they are incapable of accepting commands that are not terminated with a <newline>. Implementations that support such terminals shall provide an operating mode to *more* in which all commands can be terminated with a <newline> on those terminals. This mode:

95048

- Shall be documented in the system documentation

95049

95050

95051

- Shall, at invocation, inform the user of the terminal deficiency that requires the <newline> usage and provide instructions on how this warning can be suppressed in future invocations

95052

- Shall not be required for implementations supporting only fully capable terminals

95053

- Shall not affect commands already requiring <newline>s

95054

95055

- Shall not affect users on the capable terminals from using *more* as described in this volume of POSIX.1-200x

95056

OPTIONS

95057

95058

The *more* utility shall conform to XBD [Section 12.2](#) (on page 201), except that '+' may be recognized as an option delimiter as well as '-'.

95059

The following options shall be supported:

95060

95061

95062

95063

95064

-c If a screen is to be written that has no lines in common with the current screen, or *more* is writing its first screen, *more* shall not scroll the screen, but instead shall redraw each line of the screen in turn, from the top of the screen to the bottom. In addition, if *more* is writing its first screen, the screen shall be cleared. This option may be silently ignored on devices with insufficient terminal capabilities.

95065

95066

-e By default, *more* shall exit immediately after writing the last line of the last file in the argument list. If the `-e` option is specified:

95067

95068

95069

1. If there is only a single file in the argument list and that file was completely displayed on a single screen, *more* shall exit immediately after writing the last line of that file.

95070

95071

95072

2. Otherwise, *more* shall exit only after reaching end-of-file on the last file in the argument list twice without an intervening operation. See the EXTENDED DESCRIPTION section.

95073

95074

-i Perform pattern matching in searches without regard to case; see XBD [Section 9.2](#) (on page 168).

- 95075 **-n number** Specify the number of lines per screenful. The *number* argument is a positive
95076 decimal integer. The **-n** option shall override any values obtained from any other
95077 source.
- 95078 **-p command** Each time a screen from a new file is displayed or redisplayed (including as a
95079 result of *more* commands; for example, **:p**), execute the *more* command(s) in the
95080 command arguments in the order specified, as if entered by the user after the first
95081 screen has been displayed. No intermediate results shall be displayed (that is, if the
95082 command is a movement to a screen different from the normal first screen, only the
95083 screen resulting from the command shall be displayed.) If any of the commands
95084 fail for any reason, an informational message to this effect shall be written, and no
95085 further commands specified using the **-p** option shall be executed for this file.
- 95086 **-s** Behave as if consecutive empty lines were a single empty line.
- 95087 **-t tagstring** Write the screenful of the file containing the tag named by the *tagstring* argument.
95088 See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**
95089 command is optional. It shall be provided on any system that also provides a
95090 conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined
95091 results.
- 95092 The filename resulting from the **-t** option shall be logically added as a prefix to the
95093 list of command line files, as if specified by the user. If the tag named by the
95094 *tagstring* argument is not found, it shall be an error, and *more* shall take no further
95095 action.
- 95096 If the tag specifies a line number, the first line of the display shall contain the
95097 beginning of that line. If the tag specifies a pattern, the first line of the display shall
95098 contain the beginning of the matching text from the first line of the file that
95099 contains that pattern. If the line does not exist in the file or matching text is not
95100 found, an informational message to this effect shall be displayed, and *more* shall
95101 display the default screen as if **-t** had not been specified.
- 95102 If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be
95103 processed first; that is, the file and starting line for the display shall be as specified
95104 by **-t**, and then the **-p more** command shall be executed. If the line (matching text)
95105 specified by the **-t** command does not exist (is not found), no **-p more** command
95106 shall be executed for this file at any time.
- 95107 **-u** Treat a <backspace> as a printable control character, displayed as an
95108 implementation-defined character sequence (see the EXTENDED DESCRIPTION
95109 section), suppressing backspacing and the special handling that produces
95110 underlined or standout mode text on some terminal types. Also, do not ignore a
95111 <carriage-return> at the end of a line.

OPERANDS

The following operand shall be supported:

- 95114 *file* A pathname of an input file. If no *file* operands are specified, the standard input
95115 shall be used. If a *file* is '-', the standard input shall be read at that point in the
95116 sequence.

STDIN

The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

INPUT FILES

The input files being examined shall be text files. If standard output is a terminal, standard error shall be used to read commands from the user. If standard output is a terminal, standard error is not readable, and command input is needed, *more* may attempt to obtain user commands from the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error

more*Utilities*

95124 indicating that it was unable to read user commands. If standard output is not a terminal, no
 95125 error shall result if standard error cannot be opened for reading.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *more*:

95126 *COLUMNS* Override the system-selected horizontal display line size. See XBD [Chapter 8](#) (on
 95129 page 159) for valid values and results when it is unset or null.

95130 *EDITOR* Used by the *v* command to select an editor. See the EXTENDED DESCRIPTION
 95131 section.

95132 *LANG* Provide a default value for the internationalization variables that are unset or null.
 95133 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 95134 variables used to determine the values of locale categories.)

95135 *LC_ALL* If set to a non-empty string value, override the values of all the other
 95136 internationalization variables.

95137 *LC_COLLATE*
 95138 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 95139 character collating elements within regular expressions.

95140 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 95141 characters (for example, single-byte as opposed to multi-byte characters in
 95142 arguments and input files) and the behavior of character classes within regular
 95143 expressions.

95144 *LC_MESSAGES*
 95145 Determine the locale that should be used to affect the format and contents of
 95146 diagnostic messages written to standard error and informative messages written to
 95147 standard output.

95148 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

95149 *LINES* Override the system-selected vertical screen size, used as the number of lines in a
 95150 screenful. See XBD [Chapter 8](#) (on page 159) for valid values and results when it is
 95151 unset or null. The *-n* option shall take precedence over the *LINES* variable for
 95152 determining the number of lines in a screenful.

95153 *MORE* Determine a string containing options described in the OPTIONS section preceded
 95154 with hyphens and <blank>-separated as on the command line. Any command line
 95155 options shall be processed after those in the *MORE* variable, as if the command
 95156 line were:

95157 `more $MORE options operands`

95158 The *MORE* variable shall take precedence over the *TERM* and *LINES* variables for
 95159 determining the number of lines in a screenful.

95160 *TERM* Determine the name of the terminal type. If this variable is unset or null, an
 95161 unspecified default terminal type is used.

ASYNCHRONOUS EVENTS

95162 Default.

STDOUT

95164 The standard output shall be used to write the contents of the input files.
 95165

95166 **STDERR**

95167 The standard error shall be used for diagnostic messages and user commands (see the INPUT
 95168 FILES section), and, if standard output is a terminal device, to write a prompting string. The
 95169 prompting string shall appear on the screen line below the last line of the file displayed in the
 95170 current screenful. The prompt shall contain the name of the file currently being examined and
 95171 shall contain an end-of-file indication and the name of the next file, if any, when prompting at
 95172 the end-of-file. If an error or informational message is displayed, it is unspecified whether it is
 95173 contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the
 95174 user shall be prompted for a continuation character, at which point another message or the user
 95175 prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether
 95176 informational messages are written for other user commands.

95177 **OUTPUT FILES**

95178 None.

95179 **EXTENDED DESCRIPTION**

95180 The following section describes the behavior of *more* when the standard output is a terminal
 95181 device. If the standard output is not a terminal device, no options other than `-s` shall have any
 95182 effect, and all input files shall be copied to standard output otherwise unmodified, at which time
 95183 *more* shall exit without further action.

95184 The number of lines available per screen shall be determined by the `-n` option, if present, or by
 95185 examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither
 95186 method yields a number, an unspecified number of lines shall be used.

95187 The maximum number of lines written shall be one less than this number, because the screen
 95188 line after the last line written shall be used to write a user prompt and user input. If the number
 95189 of lines in the screen is less than two, the results are undefined. It is unspecified whether user
 95190 input is permitted to be longer than the remainder of the single line where the prompt has been
 95191 written.

95192 The number of columns available per line shall be determined by examining values in the
 95193 environment (see the ENVIRONMENT VARIABLES section), with a default value as described
 95194 in XBD [Chapter 8](#) (on page 159).

95195 Lines that are longer than the display shall be folded; the length at which folding occurs is
 95196 unspecified, but should be appropriate for the output device. Folding may occur between glyphs
 95197 of single characters that take up multiple display columns.

95198 When standard output is a terminal and `-u` is not specified, *more* shall treat `<backspace>`s and
 95199 `<carriage-return>`s specially:

- 95200 • A character, followed first by a sequence of n `<backspace>`s (where n is the same as the
 95201 number of column positions that the character occupies), then by n underscore characters
 95202 (`'_'`), shall cause that character to be written as underlined text, if the terminal type
 95203 supports that. The n underscore characters, followed first by n `<backspace>`s, then any
 95204 character with n column positions, shall also cause that character to be written as
 95205 underlined text, if the terminal type supports that.
- 95206 • A sequence of n `<backspace>`s (where n is the same as the number of column positions that
 95207 the previous character occupies) that appears between two identical printable characters
 95208 shall cause the first of those two characters to be written as emboldened text (that is,
 95209 visually brighter, standout mode, or inverse-video mode), if the terminal type supports
 95210 that, and the second to be discarded. Immediately subsequent occurrences of
 95211 `<backspace>/character` pairs for that same character shall also be discarded. (For example,
 95212 the sequence `"a\b a\b a\b a"` is interpreted as a single emboldened `'a'`.)

- 95213 • The *more* utility shall logically discard all other <backspace>s from the line as well as the
- 95214 character which precedes them, if any.
- 95215 • A <carriage-return> at the end of a line shall be ignored, rather than being written as a
- 95216 non-printable character, as described in the next paragraph.

95217 It is implementation-defined how other non-printable characters are written. Implementations
 95218 should use the same format that they use for the *ex print* command; see the OPTIONS section
 95219 within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it
 95220 crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the
 95221 number of columns on the display is less than the number of columns any single character in the
 95222 line being displayed would occupy.

95223 When each new file is displayed (or redisplayed), *more* shall write the first screen of the file.
 95224 Once the initial screen has been written, *more* shall prompt for a user command. If the execution
 95225 of the user command results in a screen that has lines in common with the current screen, and
 95226 the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is
 95227 unspecified whether the screen is scrolled or redrawn.

95228 For all files but the last (including standard input if no file was specified, and for the last file as
 95229 well, if the *-e* option was not specified), when *more* has written the last line in the file, *more* shall
 95230 prompt for a user command. This prompt shall contain the name of the next file as well as an
 95231 indication that *more* has reached end-of-file. If the user command is *f*, <control>-F, <space>, *j*,
 95232 <newline>, *d*, <control>-D, or *s*, *more* shall display the next file. Otherwise, if displaying the last
 95233 file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

95234 Several of the commands described in this section display a previous screen from the input
 95235 stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is
 95236 implementation-defined how much backwards motion is supported. If a command cannot be
 95237 executed because of a limitation on backwards motion, an error message to this effect shall be
 95238 displayed, the current screen shall not change, and the user shall be prompted for another
 95239 command.

95240 If a command cannot be performed because there are insufficient lines to display, *more* shall alert
 95241 the terminal. If a command cannot be performed because there are insufficient lines to display or
 95242 a */* command fails: if the input is the standard input, the last screen in the file may be displayed;
 95243 otherwise, the current file and screen shall not change, and the user shall be prompted for
 95244 another command.

95245 The interactive commands in the following sections shall be supported. Some commands can be
 95246 preceded by a decimal integer, called *count* in the following descriptions. If not specified with
 95247 the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular
 95248 expression, as described in XBD Section 9.3 (on page 169). The term “examine” is historical
 95249 usage meaning “open the file for viewing”; for example, *more foo* would be expressed as
 95250 examining file *foo*.

95251 In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a
 95252 line from the file being examined.

95253 In the following descriptions, the *current position* refers to two things:

- 95254 1. The position of the current line on the screen
- 95255 2. The line number (in the file) of the current line on the screen

95256 Usually, the line on the screen corresponding to the current position is the third line on the
 95257 screen. If this is not possible (there are fewer than three lines to display or this is the first page of
 95258 the file, or it is the last page of the file), then the current position is either the first or last line on
 95259 the screen as described later.

95260

Help

95261

Synopsis: h

95262

Write a summary of these commands and other implementation-defined commands. The behavior shall be as if the *more* utility were executed with the *-e* option on a file that contained the summary information. The user shall be prompted as described earlier in this section when end-of-file is reached. If the user command is one of those specified to continue to the next file, *more* shall return to the file and screen state from which the *h* command was executed.

95263

95264

95265

95266

95267

Scroll Forward One Screenful

95268

Synopsis: [*count*]f

95269

[*count*]<control>-F

95270

Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size, only the final screenful shall be written.

95271

95272

Scroll Backward One Screenful

95273

Synopsis: [*count*]b

95274

[*count*]<control>-B

95275

Scroll backward *count* lines, with a default of one screenful (see the *-n* option). If *count* is more than the screen size, only the final screenful shall be written.

95276

95277

Scroll Forward One Line

95278

Synopsis: [*count*]<space>

95279

[*count*]j

95280

[*count*]<newline>

95281

Scroll forward *count* lines. The default *count* for the <space> shall be one screenful; for *j* and <newline>, one line. The entire *count* lines shall be written, even if *count* is more than the screen size.

95282

95283

95284

Scroll Backward One Line

95285

Synopsis: [*count*]k

95286

Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the screen size.

95287

95288

Scroll Forward One Half Screenful

95289

Synopsis: [*count*]d

95290

[*count*]<control>-D

95291

Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it shall become the new default for subsequent *d*, <control>-D, and *u* commands.

95292

95293

Skip Forward One Line

95294

Synopsis: [*count*]s

95295

Display the screenful beginning with the line *count* lines after the last line on the current screen. If *count* would cause the current position to be such that less than one screenful would be written, the last screenful in the file shall be written.

95296

95297

95298 **Scroll Backward One Half Screenful**

95299 *Synopsis:* [count]u
 95300 [count]<control>-U

95301 Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it
 95302 shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands.
 95303 The entire *count* lines shall be written, even if *count* is more than the screen size.

95304 **Go to Beginning of File**

95305 *Synopsis:* [count]g

95306 Display the screenful beginning with line *count*.

95307 **Go to End-of-File**

95308 *Synopsis:* [count]G

95309 If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the
 95310 last screenful of the file.

95311 **Refresh the Screen**

95312 *Synopsis:* r
 95313 <control>-L

95314 Refresh the screen.

95315 **Discard and Refresh**

95316 *Synopsis:* R

95317 Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered
 95318 input shall not be discarded and the **R** command shall be equivalent to the **r** command.

95319 **Mark Position**

95320 *Synopsis:* m*letter*

95321 Mark the current position with the letter named by *letter*, where *letter* represents the name of one
 95322 of the lowercase letters of the portable character set. When a new file is examined, all marks may
 95323 be lost.

95324 **Return to Mark**

95325 *Synopsis:* ' *letter*

95326 Return to the position that was previously marked with the letter named by *letter*, making that
 95327 line the current position.

95328 **Return to Previous Position**

95329 *Synopsis:* ''

95330 Return to the position from which the last large movement command was executed (where a
 95331 "large movement" is defined as any movement of more than a screenful of lines). If no such
 95332 movements have been made, return to the beginning of the file.

95333

Search Forward for Pattern

95334

Synopsis: [*count*]/[!]*pattern*<newline>

95335

Display the screenful beginning with the *count*th line containing the pattern. The search shall start after the first line currently displayed. The null regular expression ('/' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, the matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

95336

95337

95338

95339

95340

Search Backward for Pattern

95341

Synopsis: [*count*?][!]*pattern*<newline>

95342

Display the screenful beginning with the *count*th previous line containing the pattern. The search shall start on the last line before the first line currently displayed. The null regular expression ('?' followed by a <newline>) shall repeat the search using the previous regular expression, with a default *count*. If the character '!' is included, matching lines shall be those that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall be displayed.

95343

95344

95345

95346

95347

95348

Repeat Search

95349

Synopsis: [*count*]n

95350

Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was " /!" or "?!").

95351

95352

Repeat Search in Reverse

95353

Synopsis: [*count*]N

95354

Repeat the search in the opposite direction of the previous search for the *count*th line containing the last *pattern* (or not containing the last *pattern*, if the previous search was " /!" or "?!").

95355

95356

Examine New File

95357

Synopsis: :e [*filename*]<newline>

95358

Examine a new file. If the *filename* argument is not specified, the current file (see the :n and :p commands below) shall be re-examined. The *filename* shall be subjected to the process of shell word expansions (see [Section 2.6](#), on page 2253); if more than a single pathname results, the effects are unspecified. If *filename* is a number sign ('#'), the previously examined file shall be re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable file), an error message to this effect shall be displayed and the current file and screen shall not change.

95359

95360

95361

95362

95363

95364

Examine Next File

95365

Synopsis: [*count*]:n

95366

Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

95367

95368

Examine Previous File

95369

Synopsis: [*count*]:p

95370

Examine the previous file. If a number *count* is specified, the *count*th previous file shall be examined. If *filename* refers to a non-seekable file, the results are unspecified.

95371

95372

Go to Tag

95373

Synopsis: :t *tagstring*<newline>

95374

If the file containing the tag named by the *tagstring* argument is not the current file, examine the file, as if the :e command was executed with that file as the argument. Otherwise, or in addition, display the screenful beginning with the tag, as described for the -t option (see the OPTIONS section). If the *ctags* utility is not supported by the system, the use of :t produces undefined results.

95375

95376

95377

95378

95379

Invoke Editor

95380

Synopsis: v

95381

Invoke an editor to edit the current file being examined. If standard input is being examined, the results are unspecified. The name of the editor shall be taken from the environment variable *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the editor shall be invoked with a -c *linenumber* command line argument, where *linenumber* is the line number of the file line containing the display line currently displayed as the first line of the screen. It is implementation-defined whether line-setting options are passed to editors other than *vi* and *ex*.

95382

95383

95384

95385

95386

95387

95388

When the editor exits, *more* shall resume with the same file and screen as when the editor was invoked.

95389

95390

Display Position

95391

Synopsis: =
<control>-G

95392

95393

Write a message for which the information references the first byte of the line after the last line of the file on the screen. This message shall include the name of the file currently being examined, its number relative to the total number of files there are to examine, the line number in the file, the byte number and the total bytes in the file, and what percentage of the file precedes the current position. If *more* is reading from standard input, or the file is shorter than a single screen, the line number, the byte number, the total bytes, and the percentage need not be written.

95394

95395

95396

95397

95398

95399

Quit

95400

Synopsis: q
 :q
 ZZ

95401

95402

95403

Exit *more*.

95404

EXIT STATUS

95405

The following exit values shall be returned:

95406

0 Successful completion.

95407

>0 An error occurred.

95408
95409
95410
95411
95412
95413
95414**CONSEQUENCES OF ERRORS**

If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to examine the next file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not be affected.

95415
95416
95417
95418
95419**APPLICATION USAGE**

When the standard output is not a terminal, only the **-s** filter-modification option is effective. This is based on historical practice. For example, a typical implementation of *man* pipes its output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to *lp*, however, it is undesirable for this squeezing to happen.

95420
95421**EXAMPLES**

The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

95422
95423

```
more -p G file1 file2
```

Examine each file starting with its last screenful.

95424
95425
95426

```
more -p 100 file1 file2
```

Examine each file starting with line 100 in the current position (usually the third line, so line 98 would be the first line written).

95427
95428
95429

```
more -p /100 file1 file2
```

Examine each file starting with the first line containing the string "100" in the current position

95430

RATIONALE95431
95432
95433
95434
95435
95436
95437

The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the POSIX file display program since it is more widely available than either the public-domain program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use and has become more amenable for *vi* users. Several features originally derived from various file editors, found in both *less* and *pg*, have been added to this volume of POSIX.1-200x as they have proved extremely popular with users.

95438
95439
95440
95441
95442

There are inconsistencies between *more* and *vi* that result from historical practice. For example, the single-character commands **h**, **f**, **b**, and **<space>** are screen movers in *more*, but cursor movers in *vi*. These inconsistencies were maintained because the cursor movements are not applicable to *more* and the powerful functionality achieved without the use of the control key justifies the differences.

95443
95444
95445

The tags interface has been included in a program that is not a text editor because it promotes another degree of consistent operation with *vi*. It is conceivable that the paging environment of *more* would be superior for browsing source code files in some circumstances.

95446
95447
95448
95449
95450
95451
95452
95453

The operating mode referred to for block-mode terminals effectively adds a **<newline>** to each Synopsis line that currently has none. So, for example, **d<newline>** would page one screenful. The mode could be triggered by a command line option, environment variable, or some other method. The details are not imposed by this volume of POSIX.1-200x because there are so few systems known to support such terminals. Nevertheless, it was considered that all systems should be able to support *more* given the exception cited for this small community of terminals because, in comparison to *vi*, the cursor movements are few and the command set relatively amenable to the optional **<newline>s**.

95454
95455
95456

Some versions of *more* provide a shell escaping mechanism similar to the *ex !* command. The standard developers did not consider that this was necessary in a paginator, particularly given the wide acceptance of multiple window terminals and job control features. (They chose to

95457 retain such features in the editors and *mailx* because the shell interaction also gives an
95458 opportunity to modify the editing buffer, which is not applicable to *more*.)

95459 The **-p** (position) option replaces the **+** command because of the Utility Syntax Guidelines. The
95460 **+command** option is no longer specified by POSIX.1-200x but may be present in some
95461 implementations. In early proposals, it took a *pattern* argument, but historical *less* provided
95462 the *more* general facility of a command. It would have been desirable to use the same **-c** as *ex* and *vi*,
95463 but the letter was already in use.

95464 The text stating “from a non-rewindable stream ... implementations may limit the amount of
95465 backwards motion supported” would allow an implementation that permitted no backwards
95466 motion beyond text already on the screen. It was not possible to require a minimum amount of
95467 backwards motion that would be effective for all conceivable device types. The implementation
95468 should allow the user to back up as far as possible, within device and reasonable memory
95469 allocation constraints.

95470 Historically, non-printable characters were displayed using the ARPA standard mappings,
95471 which are as follows:

- 95472 1. Printable characters are left alone.
- 95473 2. Control characters less than `\177` are represented as followed by the character offset from
95474 the '@' character in the ASCII map; for example, `\007` is represented as 'G'.
- 95475 3. `\177` is represented as followed by ' ? '.

95476 The display of characters having their eighth bit set was less standard. Existing implementations
95477 use hex (`0x00`), octal (`\000`), and a meta-bit display. (The latter displayed characters with their
95478 eighth bit set as the two characters "M-", followed by the seven-bit display as described
95479 previously.) The latter probably has the best claim to historical practice because it was used with
95480 the **-v** option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

95481 No specific display format is required by POSIX.1-200x. Implementations are encouraged to
95482 conform to historic practice in the absence of any strong reason to diverge.

95483 FUTURE DIRECTIONS

95484 None.

95489 CHANGE HISTORY

95490 First released in Issue 4.

95491 Issue 5

95492 The FUTURE DIRECTIONS section is added.

95493 Issue 6

95494 This utility is marked as part of the User Portability Utilities option.

95495 The obsolescent SYNOPSIS is removed.

95496 The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:

- 95497 • Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
- 95498 • The *more* utility should be able to handle underlined and emboldened displays of
95499 characters that are wider than a single column position.

95500
95501
95502
95503**Issue 7**

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized as an option delimiter in the OPTIONS section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

95504 **NAME**
 95505 mv — move files

95506 **SYNOPSIS**
 95507 mv [-if] *source_file target_file*
 95508 mv [-if] *source_file... target_dir*

95509 **DESCRIPTION**

95510 In the first synopsis form, the *mv* utility shall move the file named by the *source_file* operand to
 95511 the destination specified by the *target_file*. This first synopsis form is assumed when the final
 95512 operand does not name an existing directory and is not a symbolic link referring to an existing
 95513 directory.

95514 In the second synopsis form, *mv* shall move each file named by a *source_file* operand to a
 95515 destination file in the existing directory named by the *target_dir* operand, or referenced if
 95516 *target_dir* is a symbolic link referring to an existing directory. The destination path for each
 95517 *source_file* shall be the concatenation of the target directory, a single slash character, and the last
 95518 pathname component of the *source_file*. This second form is assumed when the final operand
 95519 names an existing directory.

95520 If any operand specifies an existing file of a type not specified by the System Interfaces volume
 95521 of POSIX.1-200x, the behavior is implementation-defined.

95522 For each *source_file* the following steps shall be taken:

- 95523 1. If the destination path exists, the *-f* option is not specified, and either of the following
 95524 conditions is true:
- 95525 a. The permissions of the destination path do not permit writing and the standard
 95526 input is a terminal.
 - 95527 b. The *-i* option is specified.

95528 the *mv* utility shall write a prompt to standard error and read a line from standard input.
 95529 If the response is not affirmative, *mv* shall do nothing more with the current *source_file*
 95530 and go on to any remaining *source_files*.

- 95531 2. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the
 95532 System Interfaces volume of POSIX.1-200x, called with the following arguments:
- 95533 a. The *source_file* operand is used as the *old* argument.
 - 95534 b. The destination path is used as the *new* argument.

95535 If this succeeds, *mv* shall do nothing more with the current *source_file* and go on to any
 95536 remaining *source_files*. If this fails for any reasons other than those described for the *errno*
 95537 [EXDEV] in the System Interfaces volume of POSIX.1-200x, *mv* shall write a diagnostic
 95538 message to standard error, do nothing more with the current *source_file*, and go on to any
 95539 remaining *source_files*.

- 95540 3. If the destination path exists, and it is a file of type directory and *source_file* is not a file of
 95541 type directory, or it is a file not of type directory and *source_file* is a file of type directory,
 95542 *mv* shall write a diagnostic message to standard error, do nothing more with the current
 95543 *source_file*, and go on to any remaining *source_files*.

- 95544 4. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv*
 95545 shall write a diagnostic message to standard error, do nothing more with the current
 95546 *source_file*, and go on to any remaining *source_files*.

95547 5. The file hierarchy rooted in *source_file* shall be duplicated as a file hierarchy rooted in the
 95548 destination path. If *source_file* or any of the files below it in the hierarchy are symbolic
 95549 links, the links themselves shall be duplicated, including their contents, rather than any
 95550 files to which they refer. The following characteristics of each file in the file hierarchy
 95551 shall be duplicated:

- 95552 • The time of last data modification and time of last access
- 95553 • The user ID and group ID
- 95554 • The file mode

95555 If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode
 95556 bits *S_ISUID* and *S_ISGID* shall not be duplicated.

95557 When files are duplicated to another file system, the implementation may require that the
 95558 process invoking *mv* has read access to each file being duplicated.

95559 If files being duplicated to another file system have hard links to other files, it is
 95560 unspecified whether the files copied to the new file system have the hard links preserved
 95561 or separate copies are created for the linked files.

95562 If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic
 95563 message to standard error, do nothing more with the current *source_file*, and go on to any
 95564 remaining *source_files*.

95565 If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic
 95566 message to standard error, but this failure shall not cause *mv* to modify its exit status.

95567 6. The file hierarchy rooted in *source_file* shall be removed. If this fails for any reason, *mv*
 95568 shall write a diagnostic message to the standard error, do nothing more with the current
 95569 *source_file*, and go on to any remaining *source_files*.

95570 OPTIONS

95571 The *mv* utility shall conform to XBD [Section 12.2](#) (on page 201).

95572 The following options shall be supported:

- 95573 **-f** Do not prompt for confirmation if the destination path exists. Any previous
 95574 occurrence of the **-i** option is ignored.
- 95575 **-i** Prompt for confirmation if the destination path exists. Any previous occurrence of
 95576 the **-f** option is ignored.

95577 Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option
 95578 specified shall determine the behavior of *mv*.

95579 OPERANDS

95580 The following operands shall be supported:

- 95581 *source_file* A pathname of a file or directory to be moved.
- 95582 *target_file* A new pathname for the file or directory being moved.
- 95583 *target_dir* A pathname of an existing directory into which to move the input files.

95584 STDIN

95585 The standard input shall be used to read an input line in response to each prompt specified in
 95586 the *STDERR* section. Otherwise, the standard input shall not be used.

95587 **INPUT FILES**95588 The input files specified by each *source_file* operand can be of any file type.95589 **ENVIRONMENT VARIABLES**95590 The following environment variables shall affect the execution of *mv*:

95591 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 95592 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 95593 variables used to determine the values of locale categories.)

95594 **LC_ALL** If set to a non-empty string value, override the values of all the other
 95595 internationalization variables.

95596 **LC_COLLATE**

95597 Determine the locale for the behavior of ranges, equivalence classes, and multi-
 95598 character collating elements used in the extended regular expression defined for
 95599 the **yesexpr** locale keyword in the **LC_MESSAGES** category.

95600 **LC_CTYPE**

95601 Determine the locale for the interpretation of sequences of bytes of text data as
 95602 characters (for example, single-byte as opposed to multi-byte characters in
 95603 arguments and input files), the behavior of character classes used in the extended
 95604 regular expression defined for the **yesexpr** locale keyword in the **LC_MESSAGES**
 category.

95605 **LC_MESSAGES**

95606 Determine the locale for the processing of affirmative responses that should be
 95607 used to affect the format and contents of diagnostic messages written to standard
 95608 error.

95609 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

95610 **ASYNCHRONOUS EVENTS**

95611 Default.

95612 **STDOUT**

95613 Not used.

95614 **STDERR**

95615 Prompts shall be written to the standard error under the conditions specified in the
 95616 DESCRIPTION section. The prompts shall contain the destination pathname, but their format is
 95617 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic
 95618 messages.

95619 **OUTPUT FILES**

95620 The output files may be of any file type.

95621 **EXTENDED DESCRIPTION**

95622 None.

95623 **EXIT STATUS**

95624 The following exit values shall be returned:

95625 0 All input files were moved successfully.

95626 >0 An error occurred.

95627 **CONSEQUENCES OF ERRORS**

95628 If the copying or removal of *source_file* is prematurely terminated by a signal or error, *mv* may
 95629 leave a partial copy of *source_file* at the source or destination. The *mv* utility shall not modify
 95630 both *source_file* and the destination path simultaneously; termination at any point shall leave
 95631 either *source_file* or the destination path complete.

APPLICATION USAGE

Some implementations mark for update the last file status change timestamp of renamed files and some do not. Applications which make use of the last file status change timestamp may behave differently with respect to renamed files unless they are designed to allow for either behavior.

EXAMPLES

If the current directory contains only files **a** (of any type defined by the System Interfaces volume of POSIX.1-200x), **b** (also of any type), and a directory **c**:

```
mv a b c
mv c d
```

results with the original files **a** and **b** residing in the directory **d** in the current directory.

RATIONALE

Early proposals diverged from the SVID and BSD historical practice in that they required that when the destination path exists, the `-f` option is not specified, and input is not a terminal, `mv` fails. This was done for compatibility with `cp`. The current text returns to historical practice. It should be noted that this is consistent with the `rename()` function defined in the System Interfaces volume of POSIX.1-200x, which does not require write permission on the target.

For absolute clarity, paragraph (1), describing the behavior of `mv` when prompting for confirmation, should be interpreted in the following manner:

```
if (exists AND (NOT f_option) AND
    ((not_writable AND input_is_terminal) OR i_option))
```

The `-i` option exists on BSD systems, giving applications and users a way to avoid accidentally unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD `mv` deletes all existing destination paths without prompting, even when `-i` is specified; this is inconsistent with the behavior of the 4.3 BSD `cp` utility, which always generates an error when the file is unwritable and the standard input is not a terminal. The standard developers decided that use of `-i` is a request for interaction, so when the destination path exists, the utility takes instructions from whatever responds to standard input.

The `rename()` function is able to move directories within the same file system. Some historical versions of `mv` have been able to move directories, but not to a different file system. The standard developers considered that this was an annoying inconsistency, so this volume of POSIX.1-200x requires directories to be able to be moved even across file systems. There is no `-R` option to confirm that moving a directory is actually intended, since such an option was not required for moving directories in historical practice. Requiring the application to specify it sometimes, depending on the destination, seemed just as inconsistent. The semantics of the `rename()` function were preserved as much as possible. For example, `mv` is not permitted to “rename” files to or from directories, even though they might be empty and removable.

Historic implementations of `mv` did not exit with a non-zero exit status if they were unable to duplicate any file characteristics when moving a file across file systems, nor did they write a diagnostic message for the user. The former behavior has been preserved to prevent scripts from breaking; a diagnostic message is now required, however, so that users are alerted that the file characteristics have changed.

The exact format of the interactive prompts is unspecified. Only the general nature of the contents of prompts are specified because implementations may desire more descriptive prompts than those used on historical implementations. Therefore, an application not using the `-f` option or using the `-i` option relies on the system to provide the most suitable dialog directly with the user, based on the behavior specified.

When `mv` is dealing with a single file system and `source_file` is a symbolic link, the link itself is moved as a consequence of the dependence on the `rename()` functionality, per the

95681 DESCRIPTION. Across file systems, this has to be made explicit.

95682 **FUTURE DIRECTIONS**

95683 None.

95684 **SEE ALSO**

95685 *cp, ln*

95688 **CHANGE HISTORY**

95689 First released in Issue 2.

95690 **Issue 6**

95691 The *mv* utility is changed to describe processing of symbolic links as specified in the
95692 IEEE P1003.2b draft standard.

95693 The APPLICATION USAGE section is added.

95694 **Issue 7**

95695 SD5-XCU-ERN-13 is applied, making an editorial correction to the SYNOPSIS.

95696 SD5-XCU-ERN-51 is applied to the DESCRIPTION, defining the behavior for when files are
95697 being duplicated to another file system while having hard links.

95698 Changes are made related to support for finegrained timestamps. +

DRAFT

95699 **NAME**
 95700 `newgrp` — change to a new group

95701 **SYNOPSIS**
 95702 `newgrp [-l] [group]`

95703 **DESCRIPTION**
 95704 The *newgrp* utility shall create a new shell execution environment with a new real and effective
 95705 group identification. Of the attributes listed in [Section 2.12](#) (on page 2277), the new shell
 95706 execution environment shall retain the working directory, file creation mask, and exported
 95707 variables from the previous environment (that is, open files, traps, unexported variables, alias
 95708 definitions, shell functions, and *set* options may be lost). All other aspects of the process
 95709 environment that are preserved by the *exec* family of functions defined in the System Interfaces
 95710 volume of POSIX.1-200x shall also be preserved by *newgrp*; whether other aspects are preserved
 95711 is unspecified.

95712 A failure to assign the new group identifications (for example, for security or password-related
 95713 reasons) shall not prevent the new shell execution environment from being created.

95714 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 95715 • On systems where the effective group ID is normally in the supplementary group list (or
 95716 whenever the old effective group ID actually is in the supplementary group list):
 - 95717 — If the new effective group ID is also in the supplementary group list, *newgrp* shall
 95718 change the effective group ID.
 - 95719 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add
 95720 the new effective group ID to the list, if there is room to add it.
- 95721 • On systems where the effective group ID is not normally in the supplementary group list
 95722 (or whenever the old effective group ID is not in the supplementary group list):
 - 95723 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete
 95724 it.
 - 95725 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if
 95726 there is room.

95727 **Note:** The System Interfaces volume of POSIX.1-200x does not specify whether the effective group ID
 95728 of a process is included in its supplementary group list.

95729 With no operands, *newgrp* shall change the effective group back to the groups identified in the
 95730 user's user entry, and shall set the list of supplementary groups to that set in the user's group
 95731 database entries.

95732 If the first argument is '-', the results are unspecified.

95733 If a password is required for the specified group, and the user is not listed as a member of that
 95734 group in the group database, the user shall be prompted to enter the correct password for that
 95735 group. If the user is listed as a member of that group, no password shall be requested. If no
 95736 password is required for the specified group, it is implementation-defined whether users not
 95737 listed as members of that group can change to that group. Whether or not a password is
 95738 required, implementation-defined system accounting or security mechanisms may impose
 95739 additional authorization restrictions that may cause *newgrp* to write a diagnostic message and
 95740 suppress the changing of the group identification.

95782**OPTIONS**

The *newgrp* utility shall conform to XBD [Section 12.2](#) (on page 201), except for the unspecified usage of `'-'`.

The following option shall be supported:

`-l` (The letter ell.) Change the environment to what would be expected if the user actually logged in again.

OPERANDS

The following operand shall be supported:

group A group name from the group database or a non-negative numeric group ID. Specifies the group ID to which the real and effective group IDs shall be set. If *group* is a non-negative numeric string and exists in the group database as a group name (see *getgrnam()*), the numeric group ID associated with that group name shall be used as the group ID.

STDIN

Not used.

INPUT FILES

The file `/dev/tty` shall be used to read a single line of text for password checking, when one is required.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *newgrp*:

LANG Provide a default value for the internationalization variables that are unset or null. (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)

LC_ALL If set to a non-empty string value, override the values of all the other internationalization variables.

LC_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).

LC_MESSAGES Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

Default.

STDOUT

Not used.

STDERR

The standard error shall be used for diagnostic messages and a prompt string for a password, if one is required. Diagnostic messages may be written in cases where the exit status is not available. See the EXIT STATUS section.

OUTPUT FILES

None.

95783 **EXTENDED DESCRIPTION**

95784 None.

95785 **EXIT STATUS**

95786 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group
 95787 identification was changed successfully, the exit status shall be the exit status of the shell.
 95788 Otherwise, the following exit value shall be returned:

95789 >0 An error occurred.

95790 **CONSEQUENCES OF ERRORS**

95791 The invoking shell may terminate.

95792 **APPLICATION USAGE**

95793 There is no convenient way to enter a password into the group database. Use of group
 95794 passwords is not encouraged, because by their very nature they encourage poor security
 95795 practices. Group passwords may disappear in the future.

95796 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with
 95797 *newgrp*, which in turn overlays itself with a new shell after changing group. On some
 95798 implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

95799 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a
 95800 useful interface for the support of applications.

95801 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it
 95802 successfully invokes a new shell and the rest of the original shell script is bypassed when the
 95803 new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.
 95804 But usage such as:

```
95805 newgrp foo
95806 echo $?
```

95807 is not useful because the new shell might not have access to any status *newgrp* may have
 95808 generated (and most historical systems do not provide this status). A zero status echoed here
 95809 does not necessarily indicate that the user has changed to the new group successfully. Following
 95810 *newgrp* with the *id* command provides a portable means of determining whether the group
 95811 change was successful or not.

95812 **EXAMPLES**

95813 None.

95814 **RATIONALE**

95815 Most historical implementations use one of the *exec* functions to implement the behavior of
 95816 *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected
 95817 after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*
 95818 issue a diagnostic message to tell the user that the environment changed, it would be
 95819 inappropriate to require this change to some historical implementations.

95820 The password mechanism is allowed in the group database, but how this would be
 95821 implemented is not specified.

95822 The *newgrp* utility was retained in this volume of POSIX.1-200x, even given the existence of the
 95823 multiple group permissions feature in the System Interfaces volume of POSIX.1-200x, for several
 95824 reasons. First, in some implementations, the group ownership of a newly created file is
 95825 determined by the group of the directory in which the file is created, as allowed by the System
 95826 Interfaces volume of POSIX.1-200x; on other implementations, the group ownership of a newly
 95827 created file is determined by the effective group ID. On implementations of the latter type,
 95828 *newgrp* allows files to be created with a specific group ownership. Finally, many
 95829 implementations use the real group ID in accounting, and on such systems, *newgrp* allows the
 95830 accounting identity of the user to be changed.

CHANGE HISTORY

First released in Issue 2.

Issue 6

This utility is marked as part of the User Portability Utilities option.

The obsolescent SYNOPSIS is removed.

The text describing supplemental groups is no longer conditional on {NGROUPS_MAX} being greater than 1. This is because {NGROUPS_MAX} now has a minimum value of 8. This is a FIPS requirement.

Issue 7

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first argument is '- '.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

The *newgrp* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

95851 **NAME**
 95852 `nice` — invoke a utility with an altered nice value

95853 **SYNOPSIS**
 95854 `nice [-n increment] utility [argument...]`

95855 **DESCRIPTION**
 95856 The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see
 95857 XBD [Section 3.238](#), on page 66). With no options, the executed utility shall be run with a nice
 95858 value that is some implementation-defined quantity greater than or equal to the nice value of the
 95859 current process. If the user lacks appropriate privileges to affect the nice value in the requested
 95860 manner, the *nice* utility shall not affect the nice value; in this case, a warning message may be
 95861 written to standard error, but this shall not prevent the invocation of *utility* or affect the exit
 95862 status.

95863 **OPTIONS**
 95864 The *nice* utility shall conform to XBD [Section 12.2](#) (on page 201).

95865 The following option is supported:

95866 `-n increment` A positive or negative decimal integer which shall have the same effect on the
 95867 execution of the utility as if the utility had called the *nice()* function with the
 95868 numeric value of the *increment* option-argument.

95869 **OPERANDS**
 95870 The following operands shall be supported:

95871 *utility* The name of a utility that is to be invoked. If the *utility* operand names any of the
 95872 special built-in utilities in [Section 2.14](#) (on page 2280), the results are undefined.

95873 *argument* Any string to be supplied as an argument when invoking the utility named by the
 95874 *utility* operand.

95875 **STDIN**
 95876 Not used.

95877 **INPUT FILES**
 95878 None.

95879 **ENVIRONMENT VARIABLES**
 95880 The following environment variables shall affect the execution of *nice*:

95881 *LANG* Provide a default value for the internationalization variables that are unset or null.
 95882 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 95883 variables used to determine the values of locale categories.)

95884 *LC_ALL* If set to a non-empty string value, override the values of all the other
 95885 internationalization variables.

95886 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 95887 characters (for example, single-byte as opposed to multi-byte characters in
 95888 arguments).

95889 *LC_MESSAGES*
 95890 Determine the locale that should be used to affect the format and contents of
 95891 diagnostic messages written to standard error.

95892 *XSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

95893 *PATH* Determine the search path used to locate the utility to be invoked. See XBD |
95894 Chapter 8 (on page 159).

95895 **ASYNCHRONOUS EVENTS**

95896 Default.

95897 **STDOUT**

95898 Not used.

95899 **STDERR**

95900 The standard error shall be used only for diagnostic messages.

95901 **OUTPUT FILES**

95902 None.

95903 **EXTENDED DESCRIPTION**

95904 None.

95905 **EXIT STATUS**

95906 If *utility* is invoked, the exit status of *nice* shall be the exit status of *utility*; otherwise, the *nice*
95907 utility shall exit with one of the following values:

95908 1-125 An error occurred in the *nice* utility.

95909 126 The utility specified by *utility* was found but could not be invoked.

95910 127 The utility specified by *utility* could not be found.

95911 **CONSEQUENCES OF ERRORS**

95912 Default.

95913 **APPLICATION USAGE**

95914 The only guaranteed portable uses of this utility are:

95915 *nice utility*

95916 Run *utility* with the default higher or equal nice value.

95917 *nice -n <positive integer> utility*

95918 Run *utility* with a higher nice value.

95919 On some implementations they have no discernible effect on the invoked utility and on some
95920 others they are exactly equivalent.

95921 Historical systems have frequently supported the *<positive integer>* up to 20. Since there is no
95922 error penalty associated with guessing a number that is too high, users without access to the
95923 system conformance document (to see what limits are actually in place) could use the historical 1
95924 to 20 range or attempt to use very large numbers if the job should be truly low priority.

95925 The nice value of a process can be displayed using the command:

95926 `ps -o nice`

95927 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if
95928 an error occurs so that applications can distinguish “failure to find a utility” from “invoked
95929 utility exited with an error indication”. The value 127 was chosen because it is not commonly
95930 used for other meanings; most utilities use small values for “normal error conditions” and the
95931 values above 128 can be confused with termination due to receipt of a signal. The value 126 was
95932 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some
95933 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction
95934 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to
95935 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for
95936 any other reason.

EXAMPLES

None.

RATIONALE

The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The command *nice -x utility*, for example, would be treated the same as the command *nice --1 utility*. If the user does not have appropriate privileges, this results in a “permission denied” error. This is considered a bug.

When a user without appropriate privileges gives a negative *increment*, System V treats it like the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not run the utility. The standard specifies the System V behavior together with an optional BSD-style “permission denied” message.

The C shell has a built-in version of *nice* that has a different interface from the one described in this volume of POSIX.1-200x.

The term “utility” is used, rather than “command”, to highlight the fact that shell compound commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used. However, “utility” includes user application programs and shell scripts, not just utilities defined in this volume of POSIX.1-200x.

Historical implementations of *nice* provide a nice value range of 40 or 41 discrete steps, with the default nice value being the midpoint of that range. By default, they raise the nice value of the executed utility by 10.

Some historical documentation states that the *increment* value must be within a fixed range. This is misleading; the valid *increment* values on any invocation are determined by the current process nice value, which is not always the default.

The definition of nice value is not intended to suggest that all processes in a system have priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the System Interfaces volume of POSIX.1-200x make the notion of a single underlying priority for all scheduling policies problematic. Some implementations may implement the *nice*-related features to affect all processes on the system, others to affect just the general time-sharing activities implied by this volume of POSIX.1-200x, and others may have no effect at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are possible.

Earlier versions of this standard allowed a *-increment* option. This form is no longer specified by POSIX.1-200x but may be present in some implementations.

FUTURE DIRECTIONS

None.

95985
95986
95987
95988**Issue 7**

Austin Group Interpretation 1003.1-2001 #027 is applied. +

SD5-XCU-ERN-32 and SD5-XCU-ERN-33 are applied, updating the DESCRIPTION, APPLICATION USAGE, and RATIONALE sections.

The *nice* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities. -

95989 **NAME**

95990 nl — line numbering filter

95991 **SYNOPSIS**

```
95992 xSI nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num]
95993 [-n format] [-s sep] [-v startnum] [-w width] [file]
```

95994 **DESCRIPTION**

95995 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and
 95996 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional
 95997 functionality may be provided in accordance with the command options in effect.

95998 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at
 95999 the start of each logical page. A logical page consists of a header, a body, and a footer section.
 96000 Empty sections are valid. Different line numbering options are independently available for
 96001 header, body, and footer (for example, no numbering of header and footer lines while
 96002 numbering blank lines only in the body).

96003 The starts of logical page sections shall be signaled by input lines containing nothing but the
 96004 following delimiter characters:

Line	Start of
\: \: \:	Header
\: \:	Body
\:	Footer

96009 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

96010 **OPTIONS**

96011 The *nl* utility shall conform to XBD [Section 12.2](#) (on page 201). Only one file can be named.

96012 The following options shall be supported:

96013 **-b *type*** Specify which logical page body lines shall be numbered. Recognized *types* and
 96014 their meaning are:

96015 **a** Number all lines.

96016 **t** Number only non-empty lines.

96017 **n** No line numbering.

96018 ***pstring*** Number only lines that contain the basic regular expression specified in
 96019 *string*.

96020 The default *type* for logical page body shall be **t** (text lines numbered).

96021 **-d *delim*** Specify the delimiter characters that indicate the start of a logical page section.
 96022 These can be changed from the default characters "\:" to two user-specified
 96023 characters. If only one character is entered, the second character shall remain the
 96024 default character ':'.

96025 **-f *type*** Specify the same as **b *type*** except for footer. The default for logical page footer shall
 96026 be **n** (no lines numbered).

96027 **-h *type*** Specify the same as **b *type*** except for header. The default *type* for logical page
 96028 header shall be **n** (no lines numbered).

- 96029 **-i *incr*** Specify the increment value used to number logical page lines. The default shall be
96030 1.
- 96031 **-l *num*** Specify the number of blank lines to be considered as one. For example, **-l 2** results
96032 in only the second adjacent blank line being numbered (if the appropriate **-h a**,
96033 **-b a**, or **-f a** option is set). The default shall be 1.
- 96034 **-n *format*** Specify the line numbering format. Recognized values are: **ln**, left justified, leading
96035 zeros suppressed; **rn**, right justified, leading zeros suppressed; **rz**, right justified,
96036 leading zeros kept. The default *format* shall be **rn** (right justified).
- 96037 **-p** Specify that numbering should not be restarted at logical page delimiters.
- 96038 **-s *sep*** Specify the characters used in separating the line number and the corresponding
96039 text line. The default *sep* shall be a <tab>.
- 96040 **-v *startnum*** Specify the initial value used to number logical page lines. The default shall be 1.
- 96041 **-w *width*** Specify the number of characters to be used for the line number. The default *width*
96042 shall be 6.

OPERANDS

The following operand shall be supported:

file A pathname of a text file to be line-numbered.

STDIN

The standard input is a text file that is used if no *file* operand is given.

INPUT FILES

The input file named by the *file* operand is a text file.

ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *nl*:

LANG Provide a default value for the internationalization variables that are unset or null. |
96052 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
96053 variables used to determine the values of locale categories.)

LC_ALL If set to a non-empty string value, override the values of all the other
96055 internationalization variables.

LC_COLLATE Determine the locale for the behavior of ranges, equivalence classes, and multi-
96057 character collating elements within regular expressions.

LC_CTYPE Determine the locale for the interpretation of sequences of bytes of text data as
96060 characters (for example, single-byte as opposed to multi-byte characters in
96061 arguments and input files), the behavior of character classes within regular
96062 expressions, and for deciding which characters are in character class **graph** (for the
96063 **-b t**, **-f t**, and **-h t** options).

LC_MESSAGES Determine the locale that should be used to affect the format and contents of
96065 diagnostic messages written to standard error.

NLSPATH Determine the location of message catalogs for the processing of **LC_MESSAGES**.

ASYNCHRONOUS EVENTS

Default.

96071 **STDOUT**

96072 The standard output shall be a text file in the following format:

96073 "%s%s%s", <line number>, <separator>, <input line>

96074 where <line number> is one of the following numeric formats:

96075 %6d When the **rn** format is used (the default; see **-n**).96076 %06d When the **rz** format is used.96077 %-6d When the **ln** format is used.96078 <empty> When line numbers are suppressed for a portion of the page; the <separator> is also
96079 suppressed.96080 In the preceding list, the number 6 is the default width; the **-w** option can change this value.96081 **STDERR**

96082 The standard error shall be used only for diagnostic messages.

96083 **OUTPUT FILES**

96084 None.

96085 **EXTENDED DESCRIPTION**

96086 None.

96087 **EXIT STATUS**

96088 The following exit values shall be returned:

96089 0 Successful completion.

96090 >0 An error occurred.

96091 **CONSEQUENCES OF ERRORS**

96092 Default.

96093 **APPLICATION USAGE**96094 In using the **-d delim** option, care should be taken to escape characters that have special meaning
96095 to the command interpreter.96096 **EXAMPLES**

96097 The command:

96098 `nl -v 10 -i 10 -d \!+ file1`96099 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is
96100 "!+". Note that the '!' has to be escaped when using *csh* as a command interpreter because of
96101 its history substitution syntax. For *ksh* and *sh* the escape is not necessary, but does not do any
96102 harm.96103 **RATIONALE**

96104 None.

96105 **FUTURE DIRECTIONS**

96106 None.

96107 **SEE ALSO**96108 *pr*

CHANGE HISTORY

First released in Issue 2.

Issue 5

The option `[-f type]` is added to the SYNOPSIS. The option descriptions are presented in alphabetic order. The description of `-bt` is changed to “Number only non-empty lines”.

Issue 6

The obsolescent behavior allowing the options to be intermingled with the optional *file* operand is removed.

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

96120 **NAME**96121 nm — write the name list of an object file (**DEVELOPMENT**)96122 **SYNOPSIS**96123 SD nm [-APv] [-g|-u] [-t *format*] *file...*96124 XSI nm [-APv] [-efox] [-g|-u] [-t *format*] *file...*96125 **DESCRIPTION**96126 The *nm* utility shall display symbolic information appearing in the object file, executable file, or
96127 object-file library named by *file*. If no symbolic information is available for a valid input file, the
96128 *nm* utility shall report that fact, but not consider it an error condition.96129 XSI The default base used when numeric values are written is unspecified. On XSI-conformant
96130 systems, it shall be decimal.96131 **OPTIONS**96132 The *nm* utility shall conform to XBD [Section 12.2](#) (on page 201).

96133 The following options shall be supported:

96134 **-A** Write the full pathname or library name of an object on each line.96135 XSI **-e** Write only external (global) and static symbol information.96136 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally
96137 suppressed.96138 **-g** Write only external (global) symbol information.96139 XSI **-o** Write numeric values in octal (equivalent to **-t o**).96140 **-P** Write information in a portable output format, as specified in the STDOUT section.96141 **-t *format*** Write each numeric value in the specified format. The format shall be dependent
96142 on the single character used as the *format* option-argument:

96143 XSI d The offset is written in decimal (default).

96144 o The offset is written in octal.

96145 x The offset is written in hexadecimal.

96146 **-u** Write only undefined symbols.96147 **-v** Sort output by value instead of alphabetically.96148 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).96149 **OPERANDS**

96150 The following operand shall be supported:

96151 *file* A pathname of an object file, executable file, or object-file library.96152 **STDIN**

96153 See the INPUT FILES section.

96154 **INPUT FILES**96155 The input file shall be an object file, an object-file library whose format is the same as those
96156 produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept
96157 additional implementation-defined object library formats for the input file.

ENVIRONMENT VARIABLES

96158
96159 The following environment variables shall affect the execution of *nm*:

96160 *LANG* Provide a default value for the internationalization variables that are unset or null. |
96161 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
96162 variables used to determine the values of locale categories.)

96163 *LC_ALL* If set to a non-empty string value, override the values of all the other
96164 internationalization variables.

96165 *LC_COLLATE*
96166 Determine the locale for character collation information for the symbol-name and
96167 symbol-value collation sequences.

96168 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
96169 characters (for example, single-byte as opposed to multi-byte characters in
96170 arguments).

96171 *LC_MESSAGES*
96172 Determine the locale that should be used to affect the format and contents of
96173 diagnostic messages written to standard error.

96174 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

96175
96176 Default.

STDOUT

96177
96178 If symbolic information is present in the input files, then for each file or for each member of an
96179 archive, the *nm* utility shall write the following information to standard output. By default, the
96180 format is unspecified, but the output shall be sorted alphabetically by symbol name:

- 96181 • Library or object name, if **-A** is specified
- 96182 • Symbol name
- 96183 • Symbol type, which shall either be one of the following single characters or an
96184 implementation-defined type represented by a single character:
 - 96185 A Global absolute symbol.
 - 96186 a Local absolute symbol.
 - 96187 B Global “bss” (that is, uninitialized data space) symbol.
 - 96188 b Local bss symbol.
 - 96189 D Global data symbol.
 - 96190 d Local data symbol.
 - 96191 T Global text symbol.
 - 96192 t Local text symbol.
 - 96193 U Undefined symbol.
- 96194 • Value of the symbol
- 96195 • The size associated with the symbol, if applicable

96196 This information may be supplemented by additional information specific to the
96197 implementation.

96198 If the **-P** option is specified, the previous information shall be displayed using the following
96199 portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,

96200 respectively:

96201 "%s%s %s %d %d\n", <library/object name>, <name>, <type>,
96202 <value>, <size>

96203 "%s%s %s %o %o\n", <library/object name>, <name>, <type>,
96204 <value>, <size>

96205 "%s%s %s %x %x\n", <library/object name>, <name>, <type>,
96206 <value>, <size>

96207 where <library/object name> shall be formatted as follows:

- 96208 • If **-A** is not specified, <library/object name> shall be an empty string.
- 96209 • If **-A** is specified and the corresponding *file* operand does not name a library:
96210 "%s: ", <file>
- 96211 • If **-A** is specified and the corresponding *file* operand names a library. In this case,
96212 <object file> shall name the object file in the library containing the symbol being described:
96213 "%s[%s]: ", <file>, <object file>

96214 If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is
96215 specified and it names a library, *nm* shall write a line identifying the object containing the
96216 following symbols before the lines containing those symbols, in the form:

- 96217 • If the corresponding *file* operand does not name a library:
96218 "%s:\n", <file>
- 96219 • If the corresponding *file* operand names a library; in this case, <object file> shall be the
96220 name of the file in the library containing the following symbols:
96221 "%s[%s]:\n", <file>, <object file>

96222 If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

96223 **STDERR**

96224 The standard error shall be used only for diagnostic messages.

96225 **OUTPUT FILES**

96226 None.

96227 **EXTENDED DESCRIPTION**

96228 None.

96229 **EXIT STATUS**

96230 The following exit values shall be returned:

- 96231 0 Successful completion.
- 96232 >0 An error occurred.

96233 **CONSEQUENCES OF ERRORS**

96234 Default.

APPLICATION USAGE

Mechanisms for dynamic linking make this utility less meaningful when applied to an executable file because a dynamically linked executable may omit numerous library routines that would be found in a statically linked executable.

EXAMPLES

None.

RATIONALE

Historical implementations of *nm* have used different bases for numeric output and supplied different default types of symbols that were reported. The `-t format` option, similar to that used in *od* and *strings*, can be used to specify the numeric base; `-g` and `-u` can be used to restrict the amount of output or the types of symbols included in the output.

The compromise of using `-t format versus` using `-d`, `-o`, and other similar options was necessary because of differences in the meaning of `-o` between implementations. The `-o` option from BSD has been provided here as `-A` to avoid confusion with the `-o` from System V (which has been provided here as `-t` and as `-o` on XSI-conformant systems).

The option list was significantly reduced from that provided by historical implementations.

The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified default output.

It was recognized that mechanisms for dynamic linking make this utility less meaningful when applied to an executable file (because a dynamically linked executable file may omit numerous library routines that would be found in a statically linked executable file), but the value of *nm* during software development was judged to outweigh other limitations.

The default output format of *nm* is not specified because of differences in historical implementations. The `-P` option was added to allow some type of portable output format. After a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to create one that did not match the current format of any of these four systems. The format devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary depending on locale (because no English descriptions are included). All of the systems currently have the information available to use this format.

The format given in *nm* STDOUT uses spaces between the fields, which may be any number of <blank>s required to align the columns. The single-character types were selected to match historical practice, and the requirement that implementation additions also be single characters made parsing the information easier for shell scripts.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

This utility is marked as supported when both the User Portability Utilities option and the Software Development Utilities option are supported.

96278
96279
96280
96281**Issue 7**

The *nm* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

96282 **NAME**
 96283 nohup — invoke a utility immune to hangups

96284 **SYNOPSIS**
 96285 nohup *utility* [*argument...*]

96286 **DESCRIPTION**
 96287 The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied
 96288 as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be
 96289 set to be ignored.

96290 If standard input is associated with a terminal, the *nohup* utility may redirect standard input
 96291 from an unspecified file.

96292 If the standard output is a terminal, all output written by the named *utility* to its standard output
 96293 shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot
 96294 be created or opened for appending, the output shall be appended to the end of the file
 96295 **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be
 96296 created or opened for appending, *utility* shall not be invoked. If a file is created, the file's
 96297 permission bits shall be set to S_IRUSR | S_IWUSR.

96298 If standard error is a terminal and standard output is open but is not a terminal, all output
 96299 written by the named utility to its standard error shall be redirected to the same open file
 96300 description as the standard output. If standard error is a terminal and standard output either is a
 96301 terminal or is closed, the same output shall instead be appended to the end of the **nohup.out** file
 96302 as described above.

96303 **OPTIONS**
 96304 None.

96305 **OPERANDS**
 96306 The following operands shall be supported:
 96307 *utility* The name of a utility that is to be invoked. If the *utility* operand names any of the
 96308 special built-in utilities in [Section 2.14](#) (on page 2280), the results are undefined.
 96309 *argument* Any string to be supplied as an argument when invoking the utility named by the
 96310 *utility* operand.

96311 **STDIN**
 96312 Not used.

96313 **INPUT FILES**
 96314 None.

96315 **ENVIRONMENT VARIABLES**
 96316 The following environment variables shall affect the execution of *nohup*:

96317 *HOME* Determine the pathname of the user's home directory: if the output file **nohup.out**
 96318 cannot be created in the current directory, the *nohup* utility shall use the directory
 96319 named by *HOME* to create the file.

96320 *LANG* Provide a default value for the internationalization variables that are unset or null.
 96321 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 96322 variables used to determine the values of locale categories.)

96323 *LC_ALL* If set to a non-empty string value, override the values of all the other
 96324 internationalization variables.

96325 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 96326 characters (for example, single-byte as opposed to multi-byte characters in
 96327 arguments).

96328 *LC_MESSAGES*
 96329 Determine the locale that should be used to affect the format and contents of
 96330 diagnostic messages written to standard error.

96331 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

96332 *PATH* Determine the search path that is used to locate the utility to be invoked. See XBD
 96333 Chapter 8 (on page 159).

96334 ASYNCHRONOUS EVENTS

96335 The *nohup* utility shall take the standard action for all signals except that SIGHUP shall be
 96336 ignored.

96337 STDOUT

96338 If the standard output is not a terminal, the standard output of *nohup* shall be the standard
 96339 output generated by the execution of the *utility* specified by the operands. Otherwise, nothing
 96340 shall be written to the standard output.

96341 STDERR

96342 If the standard output is a terminal, a message shall be written to the standard error, indicating
 96343 the name of the file to which the output is being appended. The name of the file shall be either
 96344 **nohup.out** or **\$HOME/nohup.out**.

96345 OUTPUT FILES

96346 Output written by the named utility is appended to the file **nohup.out** (or **\$HOME/nohup.out**),
 96347 if the conditions hold as described in the DESCRIPTION.

96348 EXTENDED DESCRIPTION

96349 None.

96350 EXIT STATUS

96351 The following exit values shall be returned:

96352 126 The utility specified by *utility* was found but could not be invoked.

96353 127 An error occurred in the *nohup* utility or the utility specified by *utility* could not be
 96354 found.

96355 Otherwise, the exit status of *nohup* shall be that of the utility specified by the *utility* operand.

96356 CONSEQUENCES OF ERRORS

96357 Default.

96358 APPLICATION USAGE

96359 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if
 96360 an error occurs so that applications can distinguish “failure to find a utility” from “invoked
 96361 utility exited with an error indication”. The value 127 was chosen because it is not commonly
 96362 used for other meanings; most utilities use small values for “normal error conditions” and the
 96363 values above 128 can be confused with termination due to receipt of a signal. The value 126 was
 96364 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some
 96365 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction
 96366 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to
 96367 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for
 96368 any other reason.

EXAMPLES

It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by placing pipelines and command lists in a single file; this file can then be invoked as a utility, and the *nohup* applies to everything in the file.

Alternatively, the following command can be used to apply *nohup* to a complex command:

```
nohup sh -c 'complex-command-line' </dev/null
```

RATIONALE

The 4.3 BSD version ignores SIGTERM and SIGHUP, and if **./nohup.out** cannot be used, it fails instead of trying to use **\$HOME/nohup.out**.

The *cs* utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this volume of POSIX.1-200x.

The term *utility* is used, rather than *command*, to highlight the fact that shell compound commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility* includes user application programs and shell scripts, not just the standard utilities.

Historical versions of the *nohup* utility use default file creation semantics. Some more recent versions use the permissions specified here as an added security precaution.

Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this volume of POSIX.1-200x.

Historical versions of *nohup* did not affect standard input, but that causes problems in the common scenario where the user logs into a system, types the command:

```
nohup make &
```

at the prompt, and then logs out. If standard input is not affected by *nohup*, the login session may not terminate for quite some time, since standard input remains open until *make* exits. To avoid this problem, POSIX.1-200x allows implementations to redirect standard input if it is a terminal. Since the behavior is implementation-defined, portable applications that may run into the problem should redirect standard input themselves. For example, instead of:

```
nohup make &
```

an application can invoke:

```
nohup make </dev/null &
```

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 7

Austin Group Interpretations 1003.1-2001 #104, #105, and #106 are applied.

96410 NAME

96411 od — dump files in various formats

96412 SYNOPSIS

96413 od [-v] [-A *address_base*] [-j *skip*] [-N *count*] [-t *type_string*]...
96414 [*file*...]96415 XSI od [-bcdosx] [*file*] [[+]offset[.][b]]

96416 DESCRIPTION

96417 The *od* utility shall write the contents of its input files to standard output in a user-specified
96418 format.

96419 OPTIONS

96420 The *od* utility shall conform to XBD Section 12.2 (on page 201), except that the order of
96421 presentation of the **-t** options and the **-bcdosx** options is significant.

96422 The following options shall be supported:

96423 **-A** *address_base*96424 Specify the input offset base. See the EXTENDED DESCRIPTION section. The
96425 application shall ensure that the *address_base* option-argument is a character. The
96426 characters 'd', 'o', and 'x' specify that the offset base shall be written in
96427 decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the
96428 offset shall not be written.96429 XSI **-b** Interpret bytes in octal. This shall be equivalent to **-t o1**.96430 XSI **-c** Interpret bytes as characters specified by the current setting of the *LC_CTYPE*
96431 category. Certain non-graphic characters appear as C escapes: "NUL=\0",
96432 "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal
96433 numbers.96434 XSI **-d** Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to
96435 **-t u2**.96436 **-j** *skip* Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or
96437 seek past the first *skip* bytes in the concatenated input files. If the combined input is
96438 not at least *skip* bytes long, the *od* utility shall write a diagnostic message to
96439 standard error and exit with a non-zero exit status.96440 By default, the *skip* option-argument shall be interpreted as a decimal number.
96441 With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;
96442 otherwise, with a leading '0', the offset shall be interpreted as an octal number.
96443 Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted
96444 as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is
96445 hexadecimal, any appended 'b' shall be considered to be the final hexadecimal
96446 digit.96447 **-N** *count* Format no more than *count* bytes of input. By default, *count* shall be interpreted as
96448 a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a
96449 hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an
96450 octal number. If *count* bytes of input (after successfully skipping, if **-j** *skip* is
96451 specified) are not available, it shall not be considered an error; the *od* utility shall
96452 format the input that is available.

96453	XSI	-o	Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to -t o2 .
96454	XSI	-s	Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to
96455		-t d2 .	
96456		-t <i>type_string</i>	
96457			Specify one or more output types. See the EXTENDED DESCRIPTION section. The
96458			application shall ensure that the <i>type_string</i> option-argument is a string specifying
96459			the types to be used when writing the input data. The string shall consist of the
96460			type specification characters a, c, d, f, o, u, and x, specifying named character,
96461			character, signed decimal, floating point, octal, unsigned decimal, and
96462			hexadecimal, respectively. The type specification characters d, f, o, u, and x can be
96463			followed by an optional unsigned decimal integer that specifies the number of
96464			bytes to be transformed by each instance of the output type. The type specification
96465			character f can be followed by an optional F, D, or L indicating that the conversion
96466			should be applied to an item of type float , double , or long double , respectively.
96467			The type specification characters d, o, u, and x can be followed by an optional C, S,
96468			I, or L indicating that the conversion should be applied to an item of type char ,
96469			short , int , or long , respectively. Multiple types can be concatenated within the
96470			same <i>type_string</i> and multiple -t options can be specified. Output lines shall be
96471			written for each type specified in the order in which the type specification
96472			characters are specified.
96473		-v	Write all input data. Without the -v option, any number of groups of output lines,
96474			which would be identical to the immediately preceding group of output lines
96475			(except for the byte offsets), shall be replaced with a line containing only an
96476			asterisk ('*').
96477	XSI	-x	Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to -t x2 .
96478	XSI		Multiple types can be specified by using multiple -bcdostx options. Output lines are written for
96479			each type specified in the order in which the types are specified.

OPERANDS

The following operands shall be supported:

96482		<i>file</i>	A pathname of a file to be read. If no <i>file</i> operands are specified, the standard input
96483			shall be used.
96484			If there are no more than two operands, none of the -A , -j , -N , -t , or -v options is
96485			specified, and either of the following is true: the first character of the last operand
96486			is a plus sign ('+'), or there are two operands and the first character of the last
96487	XSI		operand is numeric; the last operand shall be interpreted as an offset operand on
96488			XSI-conformant systems. Under these conditions, the results are unspecified on
96489			systems that are not XSI-conformant systems.
96490	XSI	[+] <i>offset</i> [.] [b]	The <i>offset</i> operand specifies the offset in the file where dumping is to commence.
96491			This operand is normally interpreted as octal bytes. If '.' is appended, the offset
96492			shall be interpreted in decimal. If 'b' is appended, the offset shall be interpreted
96493			in units of 512 bytes.

STDIN

The standard input shall be used only if no *file* operands are specified. See the INPUT FILES section.

INPUT FILES

The input files can be any file type.

96499 **ENVIRONMENT VARIABLES**96500 The following environment variables shall affect the execution of *od*:96501 *LANG* Provide a default value for the internationalization variables that are unset or null. |
96502 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
96503 variables used to determine the values of locale categories.)96504 *LC_ALL* If set to a non-empty string value, override the values of all the other
96505 internationalization variables.96506 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
96507 characters (for example, single-byte as opposed to multi-byte characters in
96508 arguments and input files).96509 *LC_MESSAGES*
96510 Determine the locale that should be used to affect the format and contents of
96511 diagnostic messages written to standard error.96512 *LC_NUMERIC*
96513 Determine the locale for selecting the radix character used when writing floating-
96514 point formatted output.96515 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.96516 **ASYNCHRONOUS EVENTS**

96517 Default.

96518 **STDOUT**

96519 See the EXTENDED DESCRIPTION section.

96520 **STDERR**

96521 The standard error shall be used only for diagnostic messages.

96522 **OUTPUT FILES**

96523 None.

96524 **EXTENDED DESCRIPTION**96525 The *od* utility shall copy sequentially each input file to standard output, transforming the input
96526 data according to the output types specified by the *-t* option or the *-bcdosx* options. If no
96527 output type is specified, the default output shall be as if *-t oS* had been specified.96528 The number of bytes transformed by the output type specifier *c* may be variable depending on
96529 the *LC_CTYPE* category.96530 The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds
96531 to the various C-language types as follows. If the *c99* compiler is present on the system, these
96532 specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes
96533 may vary among systems that conform to POSIX.1-200x.

- 96534 • For the type specifier characters
- d*
- ,
- o*
- ,
- u*
- , and
- x*
- , the default number of bytes shall
-
- 96535 correspond to the size of the underlying implementation's basic integer type. For these
-
- 96536 specifier characters, the implementation shall support values of the optional number of
-
- 96537 bytes to be converted corresponding to the number of bytes in the C-language types
- char**
- ,
-
- 96538
- short**
- ,
- int**
- , and
- long**
- . These numbers can also be specified by an application as the
-
- 96539 characters 'C', 'S', 'I', and 'L', respectively. The implementation shall also support
-
- 96540 the values 1, 2, 4, and 8, even if it provides no C-Language types of those sizes. The
-
- 96541 implementation shall support the decimal value corresponding to the C-language type
-
- 96542
- long long**
- . The byte order used when interpreting numeric values is implementation-
-
- 96543 defined, but shall correspond to the order in which a constant of the corresponding type is
-
- 96544 stored in memory on the system.

- For the type specifier character `f`, the default number of bytes shall correspond to the number of bytes in the underlying implementation's basic double precision floating-point data type. The implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **float**, **double**, and **long double**. These numbers can also be specified by an application as the characters `'F'`, `'D'`, and `'L'`, respectively.

The type specifier character `a` specifies that bytes shall be interpreted as named characters from the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least significant seven bits of each byte shall be used for this type specification. Bytes with the values listed in the following table shall be written using the corresponding names for those characters.

Table 4-12 Named Characters in *od*

Value	Name	Value	Name	Value	Name	Value	Name
\000	nul	\001	soh	\002	stx	\003	etx
\004	eot	\005	enq	\006	ack	\007	bel
\010	bs	\011	ht	\012	lf or nl*	\013	vt
\014	ff	\015	cr	\016	so	\017	si
\020	dle	\021	dc1	\022	dc2	\023	dc3
\024	dc4	\025	nak	\026	syn	\027	etb
\030	can	\031	em	\032	sub	\033	esc
\034	fs	\035	gs	\036	rs	\037	us
\040	sp	\177	del				

Note: The "\012" value may be written either as `lf` or `nl`.

The type specifier character `c` specifies that bytes shall be interpreted as characters specified by the current setting of the `LC_CTYPE` locale category. Characters listed in the table in XBD Chapter 5 (on page 107) (`'\'`, `'\a'`, `'\b'`, `'\f'`, `'\n'`, `'\r'`, `'\t'`, `'\v'`) shall be written as the corresponding escape sequences, except that backslash shall be written as a single backslash and a NUL shall be written as `'\0'`. Other non-printable characters shall be written as one three-digit octal number for each byte in the character. Printable multi-byte characters shall be written in the area corresponding to the first byte of the character; the two-character sequence `"**"` shall be written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. When either the `-j skip` or `-N count` option is specified along with the `c` type specifier, and this results in an attempt to start or finish in the middle of a multi-byte character, the result is implementation-defined.

The input data shall be manipulated in blocks, where a block is defined as a multiple of the least common multiple of the number of bytes transformed by the specified output types. If the least common multiple is greater than 16, the results are unspecified. Each input block shall be written as transformed by each output type, one per written line, in the order that the output types were specified. If the input block size is larger than the number of bytes transformed by the output type, the output type shall sequentially transform the parts of the input block, and the output from each of the transformations shall be separated by one or more `<blank>s`.

If, as a result of the specification of the `-N` option or end-of-file being reached on the last input file, input data only partially satisfies an output type, the input shall be extended sufficiently with null bytes to write the last byte of the input.

Unless `-A n` is specified, the first output line produced for each input block shall be preceded by the input offset, cumulative across input files, of the next byte to be written. The format of the input offset is unspecified; however, it shall not contain any `<blank>s`, shall start at the first character of the output line, and shall be followed by one or more `<blank>s`. In addition, the offset of the byte following the last byte written shall be written after all the input data has been processed, but shall not be followed by any `<blank>s`.

96594 If no `-A` option is specified, the input offset base is unspecified.

96595 EXIT STATUS

96596 The following exit values shall be returned:

96597 0 All input files were processed successfully.

96598 >0 An error occurred.

96599 CONSEQUENCES OF ERRORS

96600 Default.

96601 APPLICATION USAGE

96602 XSI-conformant applications are warned not to use filenames starting with '+' or a first
96603 operand starting with a numeric character so that the old functionality can be maintained by
96604 implementations, unless they specify one of the `-A`, `-j`, or `-N` options. To guarantee that one of
96605 these filenames is always interpreted as a filename, an application could always specify the
96606 address base format with the `-A` option.

96607 EXAMPLES

96608 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as
96609 standard input to the command:

96610 `od -A d -t a`

96611 on an implementation using an input block size of 16 bytes, the standard output, independent of
96612 the current locale setting, would be similar to:

```
96613 0000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
96614 0000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
96615 0000032 sp ! " # $ % & ' ( ) * + , - . /
96616 0000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
96617 0000064 @ A B C D E F G H I J K L M N O
96618 0000080 P Q R S T U V W X Y Z [ \ ] ^ _
96619 0000096 ` a b c d e f g h i j k l m n o
96620 0000112 p q r s t u v w x y z { | } ~ del
96621 0000128
```

96622 Note that this volume of POSIX.1-200x allows `nl` or `lf` to be used as the name for the
96623 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character
96624 `lf` (line feed), but traditional implementations have referred to this character as newline (`nl`) and
96625 the POSIX locale character set symbolic name for the corresponding character is a `<newline>`.

96626 The command:

96627 `od -A o -t o2x2x -N 18`

96628 on a system with 32-bit words and an implementation using an input block size of 16 bytes
96629 could write 18 bytes in approximately the following format:

```
96630 0000000 032056 031440 041123 042040 052516 044530 020043 031464
96631          342e 3320 4253 4420 554e 4958 2023 3334
96632          342e3320 42534420 554e4958 20233334
96633 0000020 032472
96634          353a
96635          353a0000
96636 0000022
```

96637 The command:

96638 `od -A d -t f -t o4 -t x4 -N 24 -j 0x15`

96639 on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point

```

96640 format) would skip 21 bytes of input data and then write 24 bytes in approximately the
96641 following format:
96642 0000000 1.0000000000000000e+00 1.5735000000000000e+01
96643 07774000000 00000000000 10013674121 35341217270
96644 3ff00000 00000000 402f3851 eb851eb8
96645 0000016 1.4066823000000000e+02
96646 10030312542 04370303230

96648 0000024

```

RATIONALE

96649 The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently
 96650 *hexdump*. There were several objections to all of these based on the following reasons:
 96651

- 96652 • The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- 96653 • The *hexdump* description was much more complex than needed for a simple dump utility.
- 96654 • The *od* utility has been available on all historical implementations and there was no need to
 96655 create a new name for a utility so similar to the historical *od* utility.

96656 The original reasons for not standardizing historical *od* were also fairly widespread. Those
 96657 reasons are given below along with rationale explaining why the standard developers believe
 96658 that this version does not suffer from the indicated problem:

- 96659 • The BSD and System V versions of *od* have diverged, and the intersection of features
 96660 provided by both does not meet the needs of the user community. In fact, the System V
 96661 version only provides a mechanism for dumping octal bytes and **shorts**, signed and
 96662 unsigned decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability
 96663 to dump **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned
 96664 decimal, and hexadecimal **longs**. The version presented here provides more normalized
 96665 forms for dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned
 96666 decimal, and hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as
 96667 current locale characters.
- 96668 • It would not be possible to come up with a compatible superset of the BSD and System V
 96669 flags that met the requirements of the standard developers. The historical default *od* output
 96670 is the specified default output of this utility. None of the option letters chosen for this
 96671 version of *od* conflict with any of the options to historical versions of *od*.
- 96672 • On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps
 96673 of **ints**, even in the BSD version. Because of the way options are named, the name space
 96674 could not be extended to solve these problems. This is why the **-t** option was added (with
 96675 type specifiers more closely matched to the *printf()* formats used in the rest of this volume
 96676 of POSIX.1-200x) and the optional field sizes were added to the **d**, **f**, **o**, **u**, and **x** type
 96677 specifiers. It is also one of the reasons why the historical practice was not mandated as a
 96678 required obsolescent form of *od*. (Although the old versions of *od* are not listed as an
 96679 obsolescent form, implementations are urged to continue to recognize the older forms for
 96680 several more years.) The **a**, **c**, **f**, **o**, and **x** types match the meaning of the corresponding
 96681 format characters in the historical implementations of *od* except for the default sizes of the
 96682 fields converted. The **d** format is signed in this volume of POSIX.1-200x to match the
 96683 *printf()* notation. (Historical versions of *od* used **d** as a synonym for **u** in this version. The
 96684 System V implementation uses **s** for signed decimal; BSD uses **i** for signed decimal and **s**
 96685 for null-terminated strings.) Other than **d** and **u**, all of the type specifiers match format
 96686 characters in the historical BSD version of *od*.

96687 The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are
 96688 used even though it is recognized that there may be zero or more than one compiler for the

C language on an implementation and that they may use different sizes for some of these types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**, while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the implementation for these types, corresponding to the values reported by invocations of the *getconf* utility when called with *system_var* operands {UCHAR_MAX}, {USHORT_MAX}, {UINT_MAX}, and {ULONG_MAX} for the types **char**, **short**, **int**, and **long**, respectively. There are similar constants required by the ISO C standard, but not required by the System Interfaces volume of POSIX.1-200x or this volume of POSIX.1-200x. They are {FLT_MANT_DIG}, {DBL_MANT_DIG}, and {LDBL_MANT_DIG} for the types **float**, **double**, and **long double**, respectively. If the optional *c99* utility is provided by the implementation and used as specified by this volume of POSIX.1-200x, these are the sizes that would be provided. If an option is used that specifies different sizes for these types, there is no guarantee that the *od* utility is able to interpret binary data output by such a program correctly.

This volume of POSIX.1-200x requires that the numeric values of these lengths be recognized by the *od* utility and that symbolic forms also be recognized. Thus, a conforming application can always look at an array of **unsigned long** data elements using *od -t uL*.

- The method of specifying the format for the address field based on specifying a starting offset in a file unnecessarily tied the two together. The **-A** option now specifies the address base and the **-S** option specifies a starting offset.
- It would be difficult to break the dependence on U.S. ASCII to achieve an internationalized utility. It does not seem to be any harder for *od* to dump characters in the current locale than it is for the *ed* or *sed* I commands. The **c** type specifier does this without difficulty and is completely compatible with the historical implementations of the **c** format character when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The **a** type specifier (from the BSD **a** format character) was left as a portable means to dump ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by *pax* could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard as a subset of their base codeset.

The use of "***" as an indication of continuation of a multi-byte character in **c** specifier output was chosen based on seeing an implementation that uses this method. The continuation bytes have to be marked in a way that is not ambiguous with another single-byte or multi-byte character.

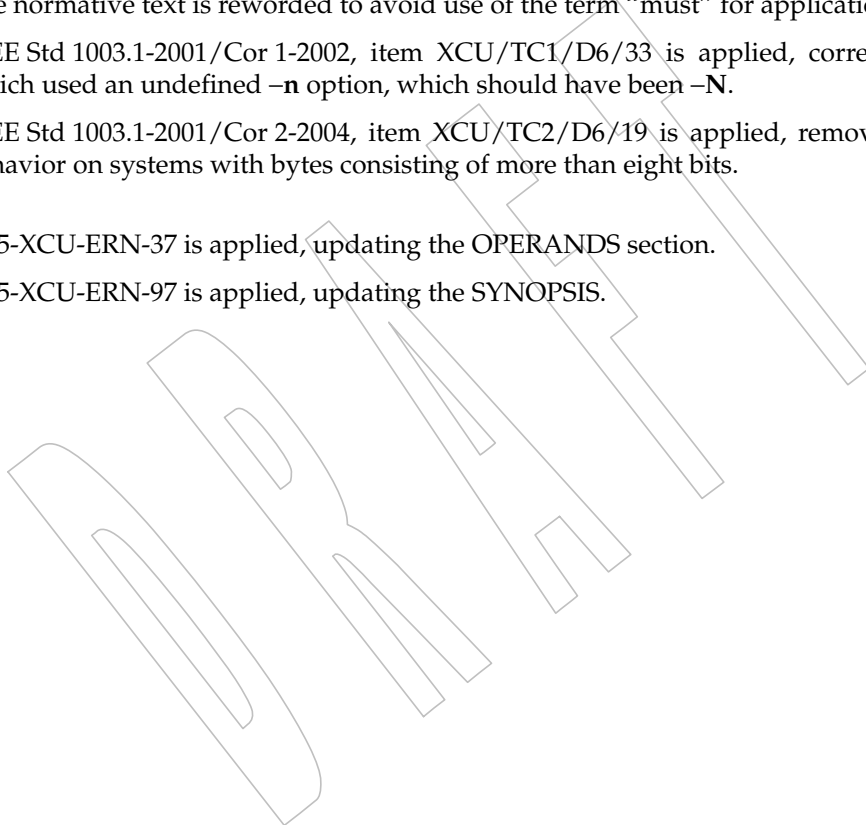

An early proposal used **-S** and **-n**, respectively, for the **-j** and **-N** options eventually selected. These were changed to avoid conflicts with historical implementations.

The original standard specified **-t o2** as the default when no output type was given. This was changed to **-t oS** (the length of a **short**) to accommodate a supercomputer implementation that historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at the same time to address an historical implementation that had no two-byte data types in its C compiler.

The use of a basic integer data type is intended to allow the implementation to choose a word size commonly used by applications on that architecture.

Earlier versions of this standard allowed for implementations with bytes other than eight bits, but this has been modified in this version.

96736	FUTURE DIRECTIONS	
96737	All option and operand interfaces marked XSI may be removed in a future version.

96757 **NAME**
 96758 `paste` — merge corresponding or subsequent lines of files

96759 **SYNOPSIS**
 96760 `paste [-s] [-d list] file...`

96761 **DESCRIPTION**
 96762 The *paste* utility shall concatenate the corresponding lines of the given input files, and write the
 96763 resulting lines to standard output.

96764 The default operation of *paste* shall concatenate the corresponding lines of the input files. The
 96765 <newline> of every line except the line from the last input file shall be replaced with a <tab>.

96766 If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall
 96767 behave as though empty lines were read from the files on which end-of-file was detected, unless
 96768 the `-s` option is specified.

96769 **OPTIONS**
 96770 The *paste* utility shall conform to XBD [Section 12.2](#) (on page 201).

96771 The following options shall be supported:

96772 `-d list` Unless a backslash character appears in *list*, each character in *list* is an element
 96773 specifying a delimiter character. If a backslash character appears in *list*, the
 96774 backslash character and one or more characters following it are an element
 96775 specifying a delimiter character as described below. These elements specify one or
 96776 more delimiters to use, instead of the default <tab>, to replace the <newline> of
 96777 the input lines. The elements in *list* shall be used circularly; that is, when the list is
 96778 exhausted the first element from the list is reused. When the `-s` option is specified:

- The last <newline> in a file shall not be modified.
- The delimiter shall be reset to the first element of *list* after each *file* operand is processed.

96782 When the `-s` option is not specified:

- The <newline>s in the file specified by the last *file* operand shall not be modified.
- The delimiter shall be reset to the first element of *list* each time a line is processed from each file.

96787 If a backslash character appears in *list*, it and the character following it shall be
 96788 used to represent the following delimiter characters:

96789 `\n` <newline>.

96790 `\t` <tab>.

96791 `\\` Backslash character.

96792 `\0` Empty string (not a null character). If `'\0'` is immediately followed by the
 96793 character `'x'`, the character `'X'`, or any character defined by the `LC_CTYPE`
 96794 **digit** keyword (see XBD [Chapter 7](#), on page 121), the results are unspecified. |

96795 If any other characters follow the backslash, the results are unspecified.

96796 `-s` Concatenate all of the lines of each separate input file in command line order. The
 96797 <newline> of every line except the last line in each input file shall be replaced with
 96798 the <tab>, unless otherwise specified by the `-d` option.

96799 **OPERANDS**

96800 The following operand shall be supported:

96801 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the
 96802 standard input shall be used; the standard input shall be read one line at a time,
 96803 circularly, for each instance of '-'. Implementations shall support pasting of at
 96804 least 12 *file* operands.

96805 **STDIN**96806 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES
96807 section.96808 **INPUT FILES**

96809 The input files shall be text files, except that line lengths shall be unlimited.

96810 **ENVIRONMENT VARIABLES**96811 The following environment variables shall affect the execution of *paste*:

96812 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 96813 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 96814 used to determine the values of locale categories.)

96815 *LC_ALL* If set to a non-empty string value, override the values of all the other
 96816 internationalization variables.

96817 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 96818 characters (for example, single-byte as opposed to multi-byte characters in
 96819 arguments and input files).

96820 *LC_MESSAGES*96821 Determine the locale that should be used to affect the format and contents of
96822 diagnostic messages written to standard error.96823 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.96824 **ASYNCHRONOUS EVENTS**

96825 Default.

96826 **STDOUT**96827 Concatenated lines of input files shall be separated by the <tab> (or other characters under the
96828 control of the -d option) and terminated by a <newline>.96829 **STDERR**

96830 The standard error shall be used only for diagnostic messages.

96831 **OUTPUT FILES**

96832 None.

96833 **EXTENDED DESCRIPTION**

96834 None.

96835 **EXIT STATUS**

96836 The following exit values shall be returned:

96837 0 Successful completion.

96838 >0 An error occurred.

96839 **CONSEQUENCES OF ERRORS**96840 If one or more input files cannot be opened when the -s option is not specified, a diagnostic
96841 message shall be written to standard error, but no output is written to standard output. If the -s
96842 option is specified, the *paste* utility shall provide the default behavior described in Section 1.4 (on
96843 page 2235).

APPLICATION USAGE

When the escape sequences of the *list* option-argument are used in a shell script, they must be quoted; otherwise, the shell treats the '\ ' as a special character.

Conforming applications should only use the specific backslash escaped delimiters presented in this volume of POSIX.1-200x. Historical implementations treat '\x', where 'x' is not in this list, as 'x', but future implementations are free to expand this list to recognize other common escapes similar to those accepted by *printf* and other standard utilities.

Most of the standard utilities work on text files. The *cut* utility can be used to turn files with arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
cut -b 1-500 -n file > file1
cut -b 501- -n file > file2
```

creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in *file* that are longer than 500 + {LINE_MAX} bytes. The original file can be recreated from **file1** and **file2** using the command:

```
paste -d "\0" file1 file2 > file
```

The commands:

```
paste -d "\0" ...
paste -d " " ...
```

are not necessarily equivalent; the latter is not specified by this volume of POSIX.1-200x and may result in an error. The construct '\0' is used to mean "no separator" because historical versions of *paste* did not follow the syntax guidelines, and the command:

```
paste -d " " ...
```

could not be handled properly by *getopt()*.

EXAMPLES

1. Write out a directory in four columns:

```
ls | paste - - - -
```

2. Combine pairs of lines from a file into single lines:

```
paste -s -d "\t\n" file
```

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

The normative text is reworded to avoid use of the term "must" for application requirements.

96885
96886

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

96887 NAME

96888 patch — apply changes to files

96889 SYNOPSIS

96890 patch [-blNR] [-c|-e|-n|-u] [-d *dir*] [-D *define*] [-i *patchfile*]
96891 [-o *outfile*] [-p *num*] [-r *rejectfile*] [*file*]

96892 DESCRIPTION

96893 The *patch* utility shall read a source (patch) file containing any of four forms of difference (diff)
96894 listings produced by the *diff* utility (normal, copied context, unified context, or in the style of *ed*)
96895 and apply those differences to a file. By default, *patch* shall read from the standard input.96896 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a *-c*,
96897 *-e*, *-n*, or *-u* option.96898 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they
96899 came from separate patch files. (In this case, the application shall ensure that the name of the
96900 patch file is determinable for each *diff* listing.)

96901 OPTIONS

96902 The *patch* utility shall conform to XBD Section 12.2 (on page 201).

96903 The following options shall be supported:

96904 **-b** Save a copy of the original contents of each modified file, before the differences are
96905 applied, in a file of the same name with the suffix **.orig** appended to it. If the file
96906 already exists, it shall be overwritten; if multiple patches are applied to the same
96907 file, the **.orig** file shall be written only for the first patch. When the *-o outfile* option
96908 is also specified, *file.orig* shall not be created but, if *outfile* already exists, *outfile.orig*
96909 shall be created.96910 **-c** Interpret the patch file as a copied context difference (the output of the utility *diff*
96911 when the *-c* or *-C* options are specified).96912 **-d *dir*** Change the current directory to *dir* before processing as described in the
96913 EXTENDED DESCRIPTION section.96914 **-D *define*** Mark changes with one of the following C preprocessor constructs:96915 #ifdef *define*
96916 ...
96917 #endif

96918 #ifndef *define*
96919 ...
96920 #endif96921 optionally combined with the C preprocessor construct **#else**. If the patched file is
96922 processed with the C preprocessor, where the macro *define* is defined, the output
96923 shall contain the changes from the patch file; otherwise, the output shall not
96924 contain the patches specified in the patch file.96925 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.96926 **-i *patchfile*** Read the patch information from the file named by the pathname *patchfile*, rather
96927 than the standard input.96928 **-l** (The letter ell.) Cause any sequence of <blank>s in the difference script to match
96929 any sequence of <blank>s in the input file. Other characters shall be matched
96930 exactly.

- 96931 **-n** Interpret the script as a normal difference.
- 96932 **-N** Ignore patches where the differences have already been applied to the file; by
96933 default, already-applied patches shall be rejected.
- 96934 **-o** *outfile* Instead of modifying the files (specified by the *file* operand or the difference
96935 listings) directly, write a copy of the file referenced by each patch, with the
96936 appropriate differences applied, to *outfile*. Multiple patches for a single file shall be
96937 applied to the intermediate versions of the file created by any previous patches,
96938 and shall result in multiple, concatenated versions of the file being written to
96939 *outfile*.
- 96940 **-p** *num* For all pathnames in the patch file that indicate the names of files to be patched,
96941 delete *num* pathname components from the beginning of each pathname. If the
96942 pathname in the patch file is absolute, any leading slashes shall be considered the
96943 first component (that is, **-p 1** shall remove the leading slashes). Specifying **-p 0**
96944 shall cause the full pathname to be used. If **-p** is not specified, only the basename
96945 (the final pathname component) shall be used.
- 96946 **-R** Reverse the sense of the patch script; that is, assume that the difference script was
96947 created from the new version to the old version. The **-R** option cannot be used
96948 with *ed* scripts. The *patch* utility shall attempt to reverse each portion of the script
96949 before applying it. Rejected differences shall be saved in swapped format. If this
96950 option is not specified, and until a portion of the patch file is successfully applied,
96951 *patch* attempts to apply each portion in its reversed sense as well as in its normal
96952 sense. If the attempt is successful, the user shall be prompted to determine whether
96953 the **-R** option should be set.
- 96954 **-r** *rejectfile* Override the default reject filename. In the default case, the reject file shall have the
96955 same name as the output file, with the suffix **.rej** appended to it; see [Patch](#)
96956 [Application](#) (on page 2916).
- 96957 **-u** Interpret the patch file as a unified context difference (the output of the *diff* utility
96958 when the **-u** or **-U** options are specified).

OPERANDS

96959 The following operand shall be supported:

96960 *file* A pathname of a file to patch.

STDIN

96961 See the INPUT FILES section.

INPUT FILES

96962 Input files shall be text files.

ENVIRONMENT VARIABLES

96963 The following environment variables shall affect the execution of *patch*:

96964 **LANG** Provide a default value for the internationalization variables that are unset or null. |
96965 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables |
96966 used to determine the values of locale categories.)

96967 **LC_ALL** If set to a non-empty string value, override the values of all the other
96968 internationalization variables.

96969 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
96970 characters (for example, single-byte as opposed to multi-byte characters in
96971 arguments and input files).

96976		LC_MESSAGES	
96977			Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error and informative messages written to standard output.
96978			
96979			
96980	XSI	NLSPATH	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
96981		LC_TIME	Determine the locale for recognizing the format of file timestamps written by the <i>diff</i> utility in a context-difference input file.
96982			
96983		ASYNCHRONOUS EVENTS	
96984			Default.
96985		STDOUT	
96986			Not used.
96987		STDERR	
96988			The standard error shall be used for diagnostic and informational messages.
96989		OUTPUT FILES	
96990			The output of the <i>patch</i> utility, the save files (.orig suffixes), and the reject files (.rej suffixes) shall be text files.
96991			
96992		EXTENDED DESCRIPTION	
96993			A patch file may contain patching instructions for more than one file; filenames shall be determined as specified in Filename Determination (on page 2916). When the -b option is specified, for each patched file, the original shall be saved in a file of the same name with the suffix .orig appended to it.
96994			
96995			
96996			
96997			For each patched file, a reject file may also be created as noted in Patch Application (on page 2916). In the absence of a -r option, the name of this file shall be formed by appending the suffix .rej to the original filename.
96998			
96999			
97000		Patch File Format	
97001			The patch file shall contain zero or more lines of header information followed by one or more patches. Each patch shall contain zero or more lines of filename identification in the format produced by the -c , -C , -u , or -U options of the <i>diff</i> utility, and one or more sets of <i>diff</i> output, which are customarily called <i>hunks</i> .
97002			
97003			
97004			
97005			The <i>patch</i> utility shall recognize the following expression in the header information:
97006		Index: <i>pathname</i>	
97007			The file to be patched is named <i>pathname</i> .
97008			If all lines (including headers) within a patch begin with the same leading sequence of <blank>s, the <i>patch</i> utility shall remove this sequence before proceeding. Within each patch, if the type of difference is common context, the <i>patch</i> utility shall recognize the following expressions:
97009			
97010			
97011		*** <i>filename timestamp</i>	
97012			The patches arose from <i>filename</i> .
97013		--- <i>filename timestamp</i>	
97014			The patches should be applied to <i>filename</i> .
97015			If the type of difference is unified context, the <i>patch</i> utility shall recognize the following expressions:
97016			
97017		--- <i>filename timestamp</i>	
97018			The patches arose from <i>filename</i> .

97019 +++ *filename timestamp*
 97020 The patches should be applied to *filename*.

97021 Each hunk within a patch shall be the *diff* output to change a line range within the original file.
 97022 The line numbers for successive hunks within a patch shall occur in ascending order.

97023 Filename Determination

97024 If no *file* operand is specified, *patch* shall perform the following steps to determine the filename
 97025 to use:

- 97026 1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as
 97027 specified by the `-p` option) from the filename on the line beginning with "****" (if copied
 97028 context) or "----" (if unified context), then test for the existence of this file relative to the
 97029 current directory (or the directory specified with the `-d` option). If the file exists, the *patch*
 97030 utility shall use this filename.
- 97031 2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as
 97032 specified by the `-p` option) from the filename on the line beginning with "----" (if copied
 97033 context) or "+++ " (if unified context), then test for the existence of this file relative to the
 97034 current directory (or the directory specified with the `-d` option). If the file exists, the *patch*
 97035 utility shall use this filename.
- 97036 3. If the header information contains a line beginning with the string **Index:**, the *patch* utility
 97037 shall delete pathname components (as specified by the `-p` option) from this line, then test
 97038 for the existence of this file relative to the current directory (or the directory specified
 97039 with the `-d` option). If the file exists, the *patch* utility shall use this filename.
- 97040 4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a `get -e`
 97041 **SCCS/s.filename** command to retrieve an editable version of the file. If the file exists, the
 97042 *patch* utility shall use this filename.
- 97043 5. The *patch* utility shall write a prompt to standard output and request a filename
 97044 interactively from the controlling terminal (for example, `/dev/tty`).

97045 Patch Application

97046 If the `-c`, `-e`, `-n`, or `-u` option is present, the *patch* utility shall interpret information within each
 97047 hunk as a copied context difference, an *ed* difference, a normal difference, or a unified context
 97048 difference, respectively. In the absence of any of these options, the *patch* utility shall determine
 97049 the type of difference based on the format of information within the hunk.

97050 For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line
 97051 number at the beginning of the hunk, plus or minus any offset used in applying the previous
 97052 hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and
 97053 backwards at least 1 000 bytes for a set of lines that match the hunk context.

97054 If no such place is found and it is a context difference, then another scan shall take place,
 97055 ignoring the first and last line of context. If that fails, the first two and last two lines of context
 97056 shall be ignored and another scan shall be made. Implementations may search more extensively
 97057 for installation locations.

97058 If no location can be found, the *patch* utility shall append the hunk to the reject file. A rejected
 97059 hunk that is a copied context difference, an *ed* difference, or a normal difference shall be written
 97060 in copied-context-difference format regardless of the format of the patch file. It is
 97061 implementation-defined whether a rejected hunk that is a unified context difference is written in
 97062 copied-context-difference format or in unified-context-difference format. If the input was a
 97063 normal or *ed*-style difference, the reject file may contain differences with zero lines of context.
 97064 The line numbers on the hunks in the reject file may be different from the line numbers in the
 97065 patch file since they shall reflect the approximate locations for the failed hunks in the new file

97066 rather than the old one.

97067 If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking
97068 the *ed* utility.

97069 EXIT STATUS

97070 The following exit values shall be returned:

- 97071 0 Successful completion.
- 97072 1 One or more lines were written to a reject file.
- 97073 >1 An error occurred.

97074 CONSEQUENCES OF ERRORS

97075 Patches that cannot be correctly placed in the file shall be written to a reject file.

97076 APPLICATION USAGE

97077 The **-R** option does not work with *ed* scripts because there is too little information to reconstruct
97078 the reverse operation.

97079 The **-p** option makes it possible to customize a patch file to local user directory structures
97080 without manually editing the patch file. For example, if the filename in the patch file was:

97081 `/curds/whey/src/blurfl/blurfl.c`

97082 Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

97083 `curds/whey/src/blurfl/blurfl.c`

97084 without the leading slash, **-p 4** gives:

97085 `blurfl/blurfl.c`

97086 and not specifying **-p** at all gives:

97087 `blurfl.c` .

97088 EXAMPLES

97089 None.

97090 RATIONALE

97091 Some of the functionality in historical *patch* implementations was not specified. The following
97092 documents those features present in historical implementations that have not been specified.

97093 A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options
97094 and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

97095 In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility
97096 would search for the corresponding version information (the string specified in the header,
97097 delimited by <blank>s or the beginning or end of a line or the file) anywhere in the original file.
97098 This was deleted as too simplistic and insufficiently trustworthy a mechanism to standardize.
97099 For example, if:

97100 `Prereq: 1.2`

97101 were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the
97102 prerequisite.

97103 The following options were dropped from historical implementations of *patch* as insufficiently
97104 useful to standardize:

- 97105 **-b** The **-b** option historically provided a method for changing the name extension of
97106 the backup file from the default **.orig**. This option has been modified and retained
97107 in this volume of POSIX.1-200x.

- 97108 **-F** The **-F** option specified the number of lines of a context diff to ignore when
97109 searching for a place to install a patch.
- 97110 **-f** The **-f** option historically caused *patch* not to request additional information from
97111 the user.
- 97112 **-r** The **-r** option historically provided a method of overriding the extension of the
97113 reject file from the default **.rej**.
- 97114 **-s** The **-s** option historically caused *patch* to work silently unless an error occurred.
- 97115 **-x** The **-x** option historically set internal debugging flags.

97116 In some file system implementations, the saving of a **.orig** file may produce unwanted results. In
97117 the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum
97118 filenames), the **.orig** file overwrites the new file. The reject file may also exceed this filename
97119 limit. It was suggested, due to some historical practice, that a tilde ('~') suffix be used instead
97120 of **.orig** and some other character instead of the **.rej** suffix. This was rejected because it is not
97121 obvious to the user which file is which. The suffixes **.orig** and **.rej** are clearer and more
97122 understandable.

97123 The **-b** option has the opposite sense in some historical implementations—do not save the **.orig**
97124 file. The default case here is not to save the files, making *patch* behave more consistently with the
97125 other standard utilities.

97126 The **-w** option in early proposals was changed to **-l** to match historical practice.

97127 The **-N** option was included because without it, a non-interactive application cannot reject
97128 previously applied patches. For example, if a user is piping the output of *diff* into the *patch*
97129 utility, and the user only wants to patch a file to a newer version non-interactively, the **-N** option
97130 is required.

97131 Changes to the **-l** option description were proposed to allow matching across <newline>s in
97132 addition to just <blank>s. Since this is not historical practice, and since some ambiguities could
97133 result, it is suggested that future developments in this area utilize another option letter, such as
97134 **-L**.

97135 The **-u** option of GNU *patch* has been added, along with support for unified context formats.

97136 **FUTURE DIRECTIONS**

97137 None.

97138 **SEE ALSO**

97140 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

97141 **CHANGE HISTORY**

97142 First released in Issue 4.

97143 **Issue 5**

97144 The FUTURE DIRECTIONS section is added.

97145 **Issue 6**

97146 This utility is marked as part of the User Portability Utilities option.

97147 The description of the **-D** option and the steps in [Filename Determination](#) (on page 2916) are
97148 changed to match historical practice as defined in the IEEE P1003.2b draft standard.

97149 The normative text is reworded to avoid use of the term “must” for application requirements.

97150 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the
97151 *patch* utility performs **ifdef** selection for the **-D** option.

97152

Issue 7

97153

The *patch* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

97154

97155

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

97156

SD5-XCU-ERN-103 and SD5-XCU-ERN-120 are applied, adding the `-u` option.

97157 **NAME**

97158 pathchk — check pathnames

97159 **SYNOPSIS**97160 pathchk [-p] [-P] *pathname*...97161 **DESCRIPTION**97162 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used
97163 to access or create a file without causing syntax errors) and portable (that is, no filename
97164 truncation results). More extensive portability checks are provided by the **-p** and **-P** options.97165 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the
97166 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 97167
- Is longer than {PATH_MAX} bytes (see **Pathname Variable Values** in XBD [Chapter 13](#) (on
97168 page 205), **<limits.h>**)
 - Contains any component longer than {NAME_MAX} bytes in its containing directory
 - Contains any component in a directory that is not searchable
 - Contains any character in any component that is not valid in its containing directory

97172 The format of the diagnostic message is not specified, but shall indicate the error detected and
97173 the corresponding *pathname* operand.97174 It shall not be considered an error if one or more components of a *pathname* operand do not exist
97175 as long as a file matching the pathname specified by the missing components could be created
97176 that does not violate any of the checks specified above.97177 **OPTIONS**97178 The *pathchk* utility shall conform to XBD [Section 12.2](#) (on page 201).

97179 The following option shall be supported:

97180 **-p** Instead of performing checks based on the underlying file system, write a
97181 diagnostic for each *pathname* operand that:

- 97182
- Is longer than {_POSIX_PATH_MAX} bytes (see **Minimum Values** in XBD
97183 [Chapter 13](#) (on page 205), **<limits.h>**)
 - Contains any component longer than {_POSIX_NAME_MAX} bytes
 - Contains any character in any component that is not in the portable filename
97186 character set

97187 **-P** Write a diagnostic for each *pathname* operand that:

- 97188
- Contains a component whose first character is the hyphen character
 - Is empty

97190 **OPERANDS**

97191 The following operand shall be supported:

97192 *pathname* A pathname to be checked.97193 **STDIN**

97194 Not used.

97195 **INPUT FILES**

97196 None.

97197 **ENVIRONMENT VARIABLES**97198 The following environment variables shall affect the execution of *pathchk*:

97199 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 97200 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 97201 used to determine the values of locale categories.)

97202 *LC_ALL* If set to a non-empty string value, override the values of all the other
 97203 internationalization variables.

97204 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 97205 characters (for example, single-byte as opposed to multi-byte characters in
 97206 arguments).

97207 *LC_MESSAGES*

97208 Determine the locale that should be used to affect the format and contents of
 97209 diagnostic messages written to standard error.

97210 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

97211 **ASYNCHRONOUS EVENTS**

97212 Default.

97213 **STDOUT**

97214 Not used.

97215 **STDERR**

97216 The standard error shall be used only for diagnostic messages.

97217 **OUTPUT FILES**

97218 None.

97219 **EXTENDED DESCRIPTION**

97220 None.

97221 **EXIT STATUS**

97222 The following exit values shall be returned:

97223 0 All *pathname* operands passed all of the checks.

97224 >0 An error occurred.

97225 **CONSEQUENCES OF ERRORS**

97226 Default.

97227 **APPLICATION USAGE**

97228 The *test* utility can be used to determine whether a given pathname names an existing file; it
 97229 does not, however, give any indication of whether or not any component of the pathname was
 97230 truncated in a directory where the *_POSIX_NO_TRUNC* feature is not in effect. The *pathchk*
 97231 utility does not check for file existence; it performs checks to determine whether a pathname
 97232 does exist or could be created with no pathname component truncation.

97233 The *noclobber* option in the shell (see the *set* special built-in) can be used to atomically create a
 97234 file. As with all file creation semantics in the System Interfaces volume of POSIX.1-200x, it
 97235 guarantees atomic creation, but still depends on applications to agree on conventions and
 97236 cooperate on the use of files after they have been created.

97237 To verify that a pathname meets the requirements of filename portability, applications should
 97238 use both the *-p* and *-P* options together.

97267
97268
97269
97270
97271
97272
97273
97274
97275
97276
97277
97278
97279
97280
97281
97282
97283
97284
97285
97286
97287

To verify that all pathnames in an imported data interchange archive are legitimate and unambiguous on the current system:

```
# This example assumes that no pathnames in the archive
# contain <newline> characters.
pax -f archive | sed -e 's/^[^[:alnum:]]/\\&/g' | xargs pathchk --
if [ $? -eq 0 ]
then
    pax -r -f archive
else
    echo Investigate problems before importing files.
    exit 1
fi
```

To verify that all files in the current directory hierarchy could be moved to any system conforming to the System Interfaces volume of POSIX.1-200x that also supports the *pax* utility:

```
find . -exec pathchk -p -P {} +
if [ $? -eq 0 ]
then
    pax -w -f ../archive .
else
    echo Portable archive cannot be created.
    exit 1
fi
```

To verify that a user-supplied pathname names a readable file and that the application can create a file extending the given path without truncation and without overwriting any existing file:

```
case $- in
    *C*)   reset="";;
    *)    reset="set +C"
          set -C;;
esac
test -r "$path" && pathchk "$path.out" &&
rm "$path.out" > "$path.out"
if [ $? -ne 0 ]; then
    printf "%s: %s not found or %s.out fails \
creation checks.\n" $0 "$path" "$path"
    $reset # Reset the noclobber option in case a trap
          # on EXIT depends on it.
    exit 1
fi
$reset
PROCESSING < "$path" > "$path.out"
```

The following assumptions are made in this example:

1. **PROCESSING** represents the code that is used by the application to use **\$path** once it is verified that **\$path.out** works as intended.
2. The state of the *noclobber* option is unknown when this code is invoked and should be set on exit to the state it was in when this code was invoked. (The **reset** variable is used in this example to restore the initial state.)
3. Note the usage of:

```
rm "$path.out" > "$path.out"
```

- 97288 a. The *pathchk* command has already verified, at this point, that **\$path.out** is not
97289 truncated.
- 97290 b. With the *noclobber* option set, the shell verifies that **\$path.out** does not already exist
97291 before invoking *rm*.
- 97292 c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application
97293 can create the file again in the **PROCESSING** step.
- 97294 d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:
97295 `rm "$path.out" > "$path.out"`
97296 should be replaced with:
97297 `> "$path.out"`
97298 which verifies that the file did not already exist, but leaves **\$path.out** in place for
97299 use by **PROCESSING**.

RATIONALE

97300 The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set*
97301 `-C(noclobber)` option added to the shell, replaces the *mktmp*, *validfnam*, and *create* utilities that
97302 appeared in early proposals. All of these utilities were attempts to solve several common
97303 problems:
97304

- 97305 • Verify the validity (for several different definitions of “valid”) of a pathname supplied by a
97306 user, generated by an application, or imported from an external source.
- 97307 • Atomically create a file.
- 97308 • Perform various string handling functions to generate a temporary filename.

97309 The *create* utility, included in an early proposal, provided checking and atomic creation in a
97310 single invocation of the utility; these are orthogonal issues and need not be grouped into a single
97311 utility. Note that the *noclobber* option also provides a way of creating a lock for process
97312 synchronization; since it provides an atomic *create*, there is no race between a test for existence
97313 and the following creation if it did not exist.

97314 Having a function like *tmpnam()* in the ISO C standard is important in many high-level
97315 languages. The shell programming language, however, has built-in string manipulation
97316 facilities, making it very easy to construct temporary filenames. The names needed obviously
97317 depend on the application, but are frequently of a form similar to:

97318 `$TMPDIR/application_abbreviation$$suffix`

97319 In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop
97320 can be used with the shell *noclobber* option to create a file without risk of collisions, as long as
97321 applications trying to use the same filename name space are cooperating on the use of files after
97322 they have been created.

97323 For historical purposes, `-p` does not check for the use of the hyphen character as the first
97324 character in a component of the pathname, or for an empty *pathname* operand.

FUTURE DIRECTIONS

97325 None.

97335 **NAME**
 97336 pax — portable archive interchange

97337 **SYNOPSIS**

97338 pax [-dv] [-c|-n] [-H|-L] [-o options] [-f archive] [-s replstr]...
 97339 [pattern...]

97340 pax -r[-c|-n] [-dikuv] [-H|-L] [-f archive] [-o options]... [-p string]...
 97341 [-s replstr]... [pattern...]

97342 pax -w [-dituvX] [-H|-L] [-b blocksize] [[-a] [-f archive]] [-o options]... |
 97343 [-s replstr]... [-x format] [file...]

97344 pax -r -w [-diklntuvX] [-H|-L] [-o options]... [-p string]... |
 97345 [-s replstr]... [file...] directory

97346 **DESCRIPTION**

97347 The *pax* utility shall read, write, and write lists of the members of archive files and copy
 97348 directory hierarchies. A variety of archive formats shall be supported; see the *-x format* option.

97349 The action to be taken depends on the presence of the *-r* and *-w* options. The four combinations
 97350 of *-r* and *-w* are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,
 97351 corresponding respectively to the four forms shown in the SYNOPSIS section.

97352 **list** In **list** mode (when neither *-r* nor *-w* are specified), *pax* shall write the names of
 97353 the members of the archive file read from the standard input, with pathnames
 97354 matching the specified patterns, to standard output. If a named file is of type
 97355 directory, the file hierarchy rooted at that file shall be listed as well.

97356 **read** In **read** mode (when *-r* is specified, but *-w* is not), *pax* shall extract the members of
 97357 the archive file read from the standard input, with pathnames matching the
 97358 specified patterns. If an extracted file is of type directory, the file hierarchy rooted
 97359 at that file shall be extracted as well. The extracted files shall be created performing
 97360 pathname resolution with the directory in which *pax* was invoked as the current
 97361 working directory.

97362 If an attempt is made to extract a directory when the directory already exists, this
 97363 shall not be considered an error. If an attempt is made to extract a FIFO when the
 97364 FIFO already exists, this shall not be considered an error.

97365 The ownership, access, and modification times, and file mode of the restored files
 97366 are discussed under the *-p* option.

97367 **write** In **write** mode (when *-w* is specified, but *-r* is not), *pax* shall write the contents of
 97368 the *file* operands to the standard output in an archive format. If no *file* operands are
 97369 specified, a list of files to copy, one per line, shall be read from the standard input
 97370 and each entry in this list shall be processed as if it had been a *file* operand on the
 97371 command line. A file of type directory shall include all of the files in the file
 97372 hierarchy rooted at the file.

97373 **copy** In **copy** mode (when both *-r* and *-w* are specified), *pax* shall copy the *file* operands
 97374 to the destination directory.

97375 If no *file* operands are specified, a list of files to copy, one per line, shall be read
 97376 from the standard input. A file of type directory shall include all of the files in the
 97377 file hierarchy rooted at the file.

97378 The effect of the **copy** shall be as if the copied files were written to a *pax* format
 97379 archive file and then subsequently extracted, except that there may be hard links

between the original and the copied files. If the destination directory is a subdirectory of one of the files to be copied, the results are unspecified. If the destination directory is a file of a type not defined by the System Interfaces volume of POSIX.1-200x, the results are implementation-defined; otherwise, it shall be an error for the file named by the *directory* operand not to exist, not be writable by the user, or not be a file of type directory.

In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member, *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces volume of POSIX.1-200x, called with the following arguments:

- The intermediate directory used as the *path* argument
- The value of the bitwise-inclusive OR of S_IRWXU, S_IRWXG, and S_IRWXO as the *mode* argument

If any specified *pattern* or *file* operands are not matched by at least one file or archive member, *pax* shall write a diagnostic message to standard error for each one that did not match and exit with a non-zero exit status.

The archive formats described in the EXTENDED DESCRIPTION section shall be automatically detected on input. The default output archive format shall be implementation-defined.

A single archive can span multiple files. The *pax* utility shall determine, in an implementation-defined manner, what file to read or write as the next file.

If the selected archive format supports the specification of linked files, it shall be an error if these files cannot be linked when the archive is extracted, except that if the files to be linked are symbolic links and the system is not capable of making hard links to symbolic links, then separate copies of the symbolic link shall be created instead. For archive formats that do not store file contents with each name that causes a hard link, if the file that contains the data is not extracted during this *pax* session, either the data shall be restored from the original file, or a diagnostic message shall be displayed with the name of a file that can be used to extract the data. In traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall write a diagnostic message to standard error and shall terminate.

OPTIONS

The *pax* utility shall conform to XBD Section 12.2 (on page 201), except that the order of presentation of the **-o**, **-p**, and **-s** options is significant.

The following options shall be supported:

- r** Read an archive file from standard input.
- w** Write files to the standard output in the specified archive format.
- a** Append files to the end of the archive. It is implementation-defined which devices on the system support appending. Additional file formats unspecified by this volume of POSIX.1-200x may impose restrictions on appending.
- b *blocksize*** Block the output at a positive decimal integer number of bytes per write to the archive file. Devices and archive formats may impose restrictions on blocking. Blocking shall be automatically determined on input. Conforming applications shall not specify a *blocksize* value larger than 32256. Default blocking when creating archives depends on the archive format. (See the **-x** option below.)
- c** Match all file or archive members except those specified by the *pattern* or *file* operands.

- 97425 **-d** Cause files of type directory being copied or archived or archive members of type
97426 directory being extracted or listed to match only the file or archive member itself
97427 and not the file hierarchy rooted at the file.
- 97428 **-f** *archive* Specify the pathname of the input or output archive, overriding the default
97429 standard input (in **list** or **read** modes) or standard output (**write** mode).
- 97430 **-H** If a symbolic link referencing a file of type directory is specified on the command
97431 line, *pax* shall archive the file hierarchy rooted in the file referenced by the link,
97432 using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic
97433 link referencing a file of any other file type which *pax* can normally archive is
97434 specified on the command line, then *pax* shall archive the file referenced by the
97435 link, using the name of the link. The default behavior, when neither **-H** or **-L** are
97436 specified, shall be to archive the symbolic link itself.
- 97437 **-i** Interactively rename files or archive members. For each archive member matching
97438 a *pattern* operand or file matching a *file* operand, a prompt shall be written to the
97439 file **/dev/tty**. The prompt shall contain the name of the file or archive member, but
97440 the format is otherwise unspecified. A line shall then be read from **/dev/tty**. If this
97441 line is blank, the file or archive member shall be skipped. If this line consists of a
97442 single period, the file or archive member shall be processed with no modification
97443 to its name. Otherwise, its name shall be replaced with the contents of the line. The
97444 *pax* utility shall immediately exit with a non-zero exit status if end-of-file is
97445 encountered when reading a response or if **/dev/tty** cannot be opened for reading
97446 and writing.
- 97447 The results of extracting a hard link to a file that has been renamed during
97448 extraction are unspecified.
- 97449 **-k** Prevent the overwriting of existing files.
- 97450 **-l** (The letter ell.) In **copy** mode, hard links shall be made between the source and
97451 destination file hierarchies whenever possible. If specified in conjunction with **-H**
97452 or **-L**, when a symbolic link is encountered, the hard link created in the destination
97453 file hierarchy shall be to the file referenced by the symbolic link. If specified when
97454 neither **-H** nor **-L** is specified, when a symbolic link is encountered, the
97455 implementation shall create a hard link to the symbolic link in the source file
97456 hierarchy or copy the symbolic link to the destination.
- 97457 **-L** If a symbolic link referencing a file of type directory is specified on the command
97458 line or encountered during the traversal of a file hierarchy, *pax* shall archive the file
97459 hierarchy rooted in the file referenced by the link, using the name of the link as the
97460 root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any
97461 other file type which *pax* can normally archive is specified on the command line or
97462 encountered during the traversal of a file hierarchy, *pax* shall archive the file
97463 referenced by the link, using the name of the link. The default behavior, when
97464 neither **-H** or **-L** are specified, shall be to archive the symbolic link itself.
- 97465 **-n** Select the first archive member that matches each *pattern* operand. No more than
97466 one archive member shall be matched for each pattern (although members of type
97467 directory shall still match the file hierarchy rooted at that file).
- 97468 **-o** *options* Provide information to the implementation to modify the algorithm for extracting
97469 or writing files. The value of *options* shall consist of one or more comma-separated
97470 keywords of the form:
97471 *keyword*[[:]=*value*][,*keyword*[[:]=*value*], ...]
- 97472 Some keywords apply only to certain file formats, as indicated with each
97473 description. Use of keywords that are inapplicable to the file format being

processed produces undefined results.

Keywords in the *options* argument shall be a string that would be a valid portable filename as described in XBD [Section 3.275](#) (on page 71).

Note: Keywords are not expected to be filenames, merely to follow the same character composition rules as portable filenames.

Keywords can be preceded with white space. The *value* field shall consist of zero or more characters; within *value*, the application shall precede any literal comma with a backslash, which shall be ignored, but preserves the comma as part of *value*. A comma as the final character, or a comma followed solely by white space as the final characters, in *options* shall be ignored. Multiple `-o` options can be specified; if keywords given to these multiple `-o` options conflict, the keywords and values appearing later in command line sequence shall take precedence and the earlier shall be silently ignored. The following keyword values of *options* shall be supported for the file formats as indicated:

delete=pattern

(Applicable only to the `-x pax` format.) When used in **write** or **copy** mode, *pax* shall omit from extended header records that it produces any keywords matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore any keywords matching the string pattern in the extended header records. In both cases, matching shall be performed using the pattern matching notation described in [Section 2.13.1](#) (on page 2278) and [Section 2.13.2](#) (on page 2279). For example:

```
-o delete=security.*
```

would suppress security-related information. See [pax Extended Header](#) (on page 2938) for extended header record keyword usage.

When multiple `-odelete=pattern` options are specified, the patterns shall be additive; all keywords matching the specified string patterns shall be omitted from extended header records that *pax* produces.

exthdr.name=string

(Applicable only to the `-x pax` format.) This keyword allows user control over the name that is written into the **ustar** header blocks for the extended header produced under the circumstances described in [pax Header Block](#) (on page 2937). The name shall be the contents of *string*, after the following character substitutions have been made:

<i>string</i>	
Includes:	Replaced By:
%d	The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname.
%f	The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.
%p	The process ID of the <i>pax</i> process.
%%	A '%' character.

Any other '%' characters in *string* produce undefined results.

If no `-o exthdr.name=string` is specified, *pax* shall use the following default value:

```
%d/PaxHeaders.%p/%f
```

globexthdr.name=string

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of *string*, after the following character substitutions have been made:

<i>string</i> Includes:	Replaced By:
%n	An integer that represents the sequence number of the global extended header record in the archive, starting at 1.
%p	The process ID of the <i>pax</i> process.
%%	A '%' character.

Any other '%' characters in *string* produce undefined results.

If no **-o globexthdr.name=string** is specified, *pax* shall use the following default value:

```
$TMPDIR/GlobalHead.%p.%n
```

where *\$TMPDIR* represents the value of the *TMPDIR* environment variable. If *TMPDIR* is not set, *pax* shall use **/tmp**.

invalid=action

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

The following mutually-exclusive values of the *action* argument are supported:

binary In **write** mode, *pax* shall generate a **hdrcharset=BINARY** extended header record for each file with a filename, link name, group name, owner name, or any other field in an extended header record that cannot be translated to the UTF-8 codeset, allowing the archive to contain the files with unencoded extended header record values. In **read** or **copy** mode, *pax* shall use the values specified in the header without translation, regardless of whether this may overwrite an existing file with a valid name. In **list** mode, *pax* shall behave identically to the **bypass** action.

97567 97568 97569 97570	bypass	In read or copy mode, <i>pax</i> shall bypass the file, causing no change to the destination hierarchy. In list mode, <i>pax</i> shall write all requested valid values for the file, but its method for writing invalid values is unspecified.
97571 97572 97573 97574	rename	In read or copy mode, <i>pax</i> shall act as if the -i option were in effect for each file with invalid filename or link name values, allowing the user to provide a replacement name interactively. In list mode, <i>pax</i> shall behave identically to the bypass action.
97575 97576 97577 97578 97579 97580 97581 97582 97583	UTF-8	When used in read , copy , or list mode and a filename, link name, owner name, or any other field in an extended header record cannot be translated from the pax UTF-8 codeset format to the codeset and current locale of the implementation, <i>pax</i> shall use the actual UTF-8 encoding for the name. If a hdrcharset extended header record is in effect for this file, the character set specified by that record shall be used instead of UTF-8. If a hdrcharset=BINARY extended header record is in effect for this file, no translation shall be performed.
97584 97585 97586 97587	write	In read or copy mode, <i>pax</i> shall write the file, translating the name, regardless of whether this may overwrite an existing file with a valid name. In list mode, <i>pax</i> shall behave identically to the bypass action.
97588 97589 97590 97591		If no -o invalid=option is specified, <i>pax</i> shall act as if -o invalid=bypass were specified. Any overwriting of existing files that may be allowed by the -o invalid= actions shall be subject to permission (-p) and modification time (-u) restrictions, and shall be suppressed if the -k option is also specified.
97592 97593 97594 97595	linkdata	(Applicable only to the -x pax format.) In write mode, <i>pax</i> shall write the contents of a file to the archive even when that file is merely a hard link to a file whose contents have already been written to the archive.
97596 97597 97598 97599 97600 97601 97602 97603 97604	listopt=format	This keyword specifies the output format of the table of contents produced when the -v option is specified in list mode. See List Mode Format Specifications (on page 2933). To avoid ambiguity, the listopt=format shall be the only or final keyword=value pair in a -o option-argument; all characters in the remainder of the option-argument shall be considered part of the format string. When multiple -olistopt=format options are specified, the format strings shall be considered a single, concatenated string, evaluated in command line order.
97605 97606 97607 97608	times	(Applicable only to the -x pax format.) When used in write or copy mode, <i>pax</i> shall include atime and mtime extended header records for each file. See pax Extended Header File Times (on page 2941).
97609 97610 97611 97612		In addition to these keywords, if the -x pax format is specified, any of the keywords and values defined in pax Extended Header (on page 2938), including implementation extensions, can be used in -o option-arguments, in either of two modes:
97613 97614 97615 97616	keyword=value	When used in write or copy mode, these keyword/value pairs shall be included at the beginning of the archive as typeflag g global extended header records. When used in read or list mode, these keyword/value pairs shall act

97617 as if they had been at the beginning of the archive as **typeflag g** global
97618 extended header records.

97619 **keyword:=value**

97620 When used in **write** or **copy** mode, these keyword/value pairs shall be
97621 included as records at the beginning of a **typeflag x** extended header for each
97622 file. (This shall be equivalent to the equal-sign form except that it creates no
97623 **typeflag g** global extended header records.) When used in **read** or **list** mode,
97624 these keyword/value pairs shall act as if they were included as records at the
97625 end of each extended header; thus, they shall override any global or file-
97626 specific extended header record keywords of the same names. For example, in
97627 the command:

```
97628 pax -r -o "  
97629 gname:=mygroup,  
97630 " <archive
```

97631 the group name will be forced to a new value for all files read from the
97632 archive.

97633 The precedence of **-o** keywords over various fields in the archive is described in
97634 [pax Extended Header Keyword Precedence](#) (on page 2941).

97635 **-p string**

97636 Specify one or more file characteristic options (privileges). The *string* option-
97637 argument shall be a string specifying file characteristics to be retained or discarded
97638 on extraction. The string shall consist of the specification characters a, e, m, o, and
97639 p. Other implementation-defined characters can be included. Multiple
97640 characteristics can be concatenated within the same string and multiple **-p** options
can be specified. The meaning of the specification characters are as follows:

- 97641 a Do not preserve file access times.
- 97642 e Preserve the user ID, group ID, file mode bits (see XBD [Section 3.168](#), on page |
97643 56), access time, modification time, and any other implementation-defined file |
97644 characteristics.
- 97645 m Do not preserve file modification times.
- 97646 o Preserve the user ID and group ID.
- 97647 p Preserve the file mode bits. Other implementation-defined file mode attributes
97648 may be preserved.

97649 In the preceding list, "preserve" indicates that an attribute stored in the archive
97650 shall be given to the extracted file, subject to the permissions of the invoking
97651 process. The access and modification times of the file shall be preserved unless
97652 otherwise specified with the **-p** option or not stored in the archive. All attributes
97653 that are not preserved shall be determined as part of the normal file creation action
97654 (see [Section 1.1.1.4](#), on page 2228).

97655 If neither the e nor the o specification character is specified, or the user ID and
97656 group ID are not preserved for any reason, *pax* shall not set the S_ISUID and
97657 S_ISGID bits of the file mode.

97658 If the preservation of any of these items fails for any reason, *pax* shall write a
97659 diagnostic message to standard error. Failure to preserve these items shall affect
97660 the final exit status, but shall not cause the extracted file to be deleted.

97661 If file characteristic letters in any of the *string* option-arguments are duplicated or
97662 conflict with each other, the ones given last shall take precedence. For example, if
97663 **-p eme** is specified, file modification times are preserved.

97664 -s replstr Modify file or archive member names named by *pattern* or *file* operands according
97665 to the substitution expression *replstr*, using the syntax of the *ed* utility. The concepts
97666 of “address” and “line” are meaningless in the context of the *pax* utility, and shall
97667 not be supplied. The format shall be:

97668 -s /old/new/[gp]

97669 where as in *ed*, *old* is a basic regular expression and *new* can contain an ampersand,
97670 ‘\n’ (where *n* is a digit) back-references, or subexpression matching. The *old*
97671 string shall also be permitted to contain <newline>s.

97672 Any non-null character can be used as a delimiter (‘/’ shown here). Multiple -s
97673 expressions can be specified; the expressions shall be applied in the order
97674 specified, terminating with the first successful substitution. The optional trailing
97675 ‘g’ is as defined in the *ed* utility. The optional trailing ‘p’ shall cause successful
97676 substitutions to be written to standard error. File or archive member names that
97677 substitute to the empty string shall be ignored when reading and writing archives.

97678 -t When reading files from the file system, and if the user has the permissions
97679 required by *utime()* to do so, set the access time of each file read to the access time
97680 that it had before being read by *pax*.

97681 -u Ignore files that are older (having a less recent file modification time) than a pre-
97682 existing file or archive member with the same name. In **read** mode, an archive
97683 member with the same name as a file in the file system shall be extracted if the
97684 archive member is newer than the file. In **write** mode, an archive file member with
97685 the same name as a file in the file system shall be superseded if the file is newer
97686 than the archive member. If -a is also specified, this is accomplished by appending
97687 to the archive; otherwise, it is unspecified whether this is accomplished by actual
97688 replacement in the archive or by appending to the archive. In **copy** mode, the file
97689 in the destination hierarchy shall be replaced by the file in the source hierarchy or
97690 by a link to the file in the source hierarchy if the file in the source hierarchy is
97691 newer.

97692 -v In **list** mode, produce a verbose table of contents (see the STDOUT section).
97693 Otherwise, write archive member pathnames to standard error (see the STDERR
97694 section).

97695 -x format Specify the output archive format. The *pax* utility shall support the following
97696 formats:

97697 **cpio** The **cpio** interchange format; see the EXTENDED DESCRIPTION
97698 section. The default *blocksize* for this format for character special
97699 archive files shall be 5120. Implementations shall support all
97700 *blocksize* values less than or equal to 32256 that are multiples of 512.

97701 **pax** The **pax** interchange format; see the EXTENDED DESCRIPTION
97702 section. The default *blocksize* for this format for character special
97703 archive files shall be 5120. Implementations shall support all
97704 *blocksize* values less than or equal to 32256 that are multiples of 512.

97705 **ustar** The **tar** interchange format; see the EXTENDED DESCRIPTION
97706 section. The default *blocksize* for this format for character special
97707 archive files shall be 10240. Implementations shall support all
97708 *blocksize* values less than or equal to 32256 that are multiples of 512.

97709 Implementation-defined formats shall specify a default block size as well as any
97710 other block sizes supported for character special archive files.

97711 Any attempt to append to an archive file in a format different from the existing

97712 archive format shall cause *pax* to exit immediately with a non-zero exit status.

97713 **-X** When traversing the file hierarchy specified by a pathname, *pax* shall not descend
97714 into directories that have a different device ID (*st_dev*; see the System Interfaces
97715 volume of POSIX.1-200x, *stat()*).

97716 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered
97717 an error and the last option specified shall determine the behavior of the utility.

97718 The options that operate on the names of files or archive members (**-c**, **-i**, **-n**, **-s**, **-u**, and **-v**)
97719 shall interact as follows. In **read** mode, the archive members shall be selected based on the user-
97720 specified *pattern* operands as modified by the **-c**, **-n**, and **-u** options. Then, any **-s** and **-i**
97721 options shall modify, in that order, the names of the selected files. The **-v** option shall write
97722 names resulting from these modifications.

97723 In **write** mode, the files shall be selected based on the user-specified pathnames as modified by
97724 the **-n** and **-u** options. Then, any **-s** and **-i** options shall modify, in that order, the names of
97725 these selected files. The **-v** option shall write names resulting from these modifications.

97726 If both the **-u** and **-n** options are specified, *pax* shall not consider a file selected unless it is
97727 newer than the file to which it is compared.

97728 List Mode Format Specifications

97729 In **list** mode with the **-o listopt=format** option, the *format* argument shall be applied for each
97730 selected file. The *pax* utility shall append a <newline> to the **listopt** output for each selected file.
97731 The *format* argument shall be used as the *format* string described in XBD Chapter 5 (on page 107),
97732 with the exceptions 1. through 5. defined in the EXTENDED DESCRIPTION section of *printf*,
97733 plus the following exceptions:

- 97734 6. The sequence (*keyword*) can occur before a format conversion specifier. The conversion
97735 argument is defined by the value of *keyword*. The implementation shall support the
97736 following keywords:

- 97737 — Any of the Field Name entries in Table 4-13 (on page 2942) and Table 4-15 (on page
97738 2945). The implementation may support the *cpio* keywords without the leading *c_* in
97739 addition to the form required by Table 4-15 (on page 2945).

- 97740 — Any keyword defined for the extended header in **pax Extended Header** (on page
97741 2938).

- 97742 — Any keyword provided as an implementation-defined extension within the extended
97743 header defined in **pax Extended Header** (on page 2938).

97744 For example, the sequence "%(charset)s" is the string value of the name of the character
97745 set in the extended header.

97746 The result of the keyword conversion argument shall be the value from the applicable
97747 header field or extended header, without any trailing NULs.

97748 All keyword values used as conversion arguments shall be translated from the UTF-8
97749 encoding (or alternative encoding specified by any **hdrcharset** extended header record) to
97750 the character set appropriate for the local file system, user database, and so on, as
97751 applicable.

- 97752 7. An additional conversion specifier character, **T**, shall be used to specify time formats. The **T**
97753 conversion specifier character can be preceded by the sequence (*keyword=subformat*), where
97754 *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime**
97755 and the default subformat shall be:

97756 %b %e %H:%M %Y

- 97757 8. An additional conversion specifier character, *M*, shall be used to specify the file mode string
 97758 as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used.
 97759 For example, % . 1M writes the single character corresponding to the <entry type> field of the
 97760 *ls -l* command.
- 97761 9. An additional conversion specifier character, *D*, shall be used to specify the device for block
 97762 or special files, if applicable, in an implementation-defined format. If not applicable, and
 97763 (*keyword*) is specified, then this conversion shall be equivalent to %(*keyword*)u. If not
 97764 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to <space>.
- 97765 10. An additional conversion specifier character, *F*, shall be used to specify a pathname. The *F*
 97766 conversion character can be preceded by a sequence of comma-separated keywords:
 97767 (*keyword*[,*keyword*] . . .)
- 97768 The values for all the keywords that are non-null shall be concatenated together, each
 97769 separated by a ' / '. The default shall be (**path**) if the keyword **path** is defined; otherwise,
 97770 the default shall be (**prefix,name**).
- 97771 11. An additional conversion specifier character, *L*, shall be used to specify a symbolic link
 97772 expansion. If the current file is a symbolic link, then %L shall expand to:
 97773 "%s -> %s", <value of keyword>, <contents> of link
- 97774 Otherwise, the %L conversion specification shall be the equivalent of %F.

OPERANDS

97775 The following operands shall be supported:

- 97776 *directory* The destination directory pathname for **copy** mode.
- 97777 *file* A pathname of a file to be copied or archived.
- 97778 *pattern* A pattern matching one or more pathnames of archive members. A pattern must
 97779 be given in the name-generating notation of the pattern matching notation in
 97780 [Section 2.13](#) (on page 2278), including the filename expansion rules in [Section](#)
 97781 [2.13.3](#) (on page 2279). The default, if no *pattern* is specified, is to select all members
 97782 in the archive.
 97783

STDIN

97784 In **write** mode, the standard input shall be used only if no *file* operands are specified. It shall be a
 97785 text file containing a list of pathnames, one per line, without leading or trailing <blank>s.
 97786

97787 In **list** and **read** modes, if **-f** is not specified, the standard input shall be an archive file.

97788 Otherwise, the standard input shall not be used.

INPUT FILES

97789 The input file named by the *archive* option-argument, or standard input when the archive is read
 97790 from there, shall be a file formatted according to one of the specifications in the EXTENDED
 97791 DESCRIPTION section or some other implementation-defined format.
 97792

97793 The file */dev/tty* shall be used to write prompts and read responses.

ENVIRONMENT VARIABLES

97794 The following environment variables shall affect the execution of *pax*:

- 97796 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 97797 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables |
 97798 used to determine the values of locale categories.)
- 97799 *LC_ALL* If set to a non-empty string value, override the values of all the other
 97800 internationalization variables.

97801		<i>LC_COLLATE</i>	
97802			Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements used in the pattern matching expressions for the <i>pattern</i> operand, the basic regular expression for the -s option, and the extended regular expression defined for the yesexpr locale keyword in the <i>LC_MESSAGES</i> category.
97803			
97804			
97805			
97806			
97807		<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes used in the extended regular expression defined for the yesexpr locale keyword in the <i>LC_MESSAGES</i> category, and pattern matching.
97808			
97809			
97810			
97811			
97812		<i>LC_MESSAGES</i>	
97813			Determine the locale for the processing of affirmative responses that should be used to affect the format and contents of diagnostic messages written to standard error.
97814			
97815			
97816		<i>LC_TIME</i>	Determine the format and contents of date and time strings when the -v option is specified.
97817			
97818	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
97819		<i>TMPDIR</i>	Determine the pathname that provides part of the default global extended header record file, as described for the -o globexthdr= keyword in the OPTIONS section.
97820			
97821		<i>TZ</i>	Determine the timezone used to calculate date and time strings when the -v option is specified. If <i>TZ</i> is unset or null, an unspecified default timezone shall be used.
97822			

ASYNCHRONOUS EVENTS

Default.

STDOUT

In **write** mode, if **-f** is not specified, the standard output shall be the archive formatted according to one of the specifications in the EXTENDED DESCRIPTION section, or some other implementation-defined format (see **-x format**).

In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall be written to standard output using the format described under [List Mode Format Specifications](#) (on page 2933). In **list** mode without the **-olistopt=format** option, the table of contents of the selected archive members shall be written to standard output using the following format:

```
"%s\n", <pathname>
```

If the **-v** option is specified in **list** mode, the table of contents of the selected archive members shall be written to standard output using the following formats.

For pathnames representing hard links to previous members of the archive:

```
"%sΔ==Δ%s\n", <ls -l listing>, <linkname>
```

For all other pathnames:

```
"%s\n", <ls -l listing>
```

where *<ls -l listing>* shall be the format specified by the *ls* utility with the **-l** option. When writing pathnames in this format, it is unspecified what is written for fields for which the underlying archive format does not have the correct information, although the correct number of *<blank>*-separated fields shall be written.

In **list** mode, standard output shall not be buffered more than a line at a time.

97845 **STDERR**

97846 If **-v** is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the
 97847 standard error output using the following format:

97848 "%s\n", <pathname>

97849 These pathnames shall be written as soon as processing is begun on the file or archive member,
 97850 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is
 97851 written when the file has been read or written.

97852 If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be
 97853 written to standard error in the following format:

97854 "%sΔ>Δ%s\n", <original pathname>, <new pathname>

97855 In all operating modes of *pax*, optional messages of unspecified format concerning the input
 97856 archive format and volume number, the number of files, blocks, volumes, and media parts as
 97857 well as other diagnostic messages may be written to standard error.

97858 In all formats, for both standard output and standard error, it is unspecified how non-printable
 97859 characters in pathnames or link names are written.

97860 When using the **-xpax** archive format, if a filename, link name, group name, owner name, or any
 97861 other field in an extended header record cannot be translated between the codeset in use for that
 97862 extended header record and the character set of the current locale, *pax* shall write a diagnostic
 97863 message to standard error, shall process the file as described for the **-o invalid=** option, and then
 97864 shall continue processing with the next file.

97865 **OUTPUT FILES**

97866 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the
 97867 copied output files shall be the type of the file being copied. In either mode, existing files in the
 97868 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),
 97869 and invalid-value (**-o invalid=**) tests allow it.

97870 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted
 97871 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other
 97872 implementation-defined format.

97873 **EXTENDED DESCRIPTION**97874 **pax Interchange Format**

97875 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The
 97876 physical layout of the archive shall be identical to the **ustar** format described in [ustar](#)
 97877 [Interchange Format](#) (on page 2942). Each file archived shall be represented by the following
 97878 sequence:

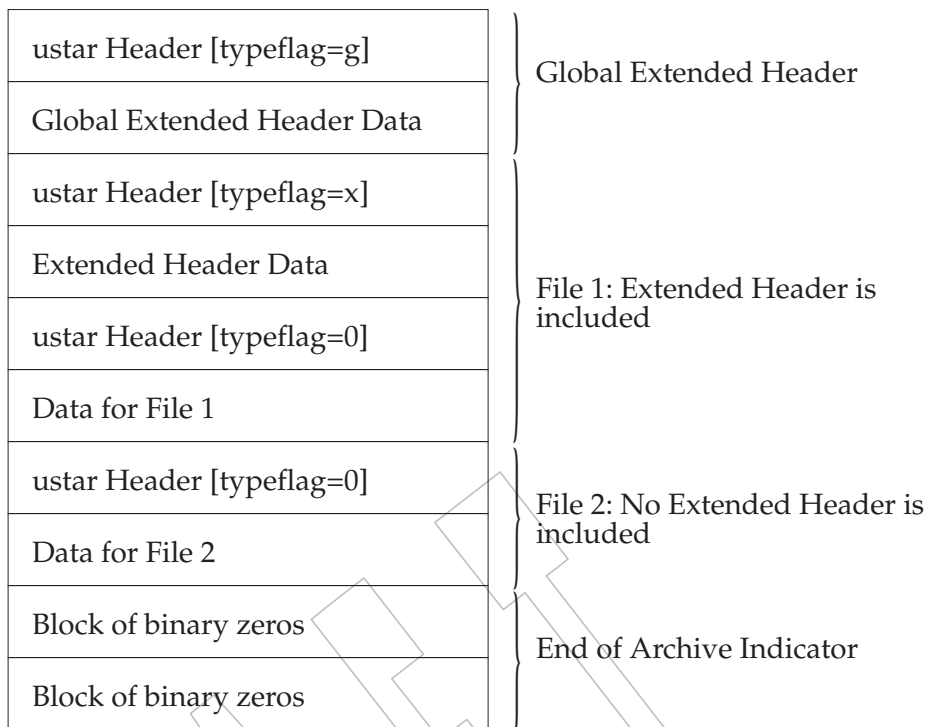

- 97879 • An optional header block with extended header records. This header block is of the form
 97880 described in [pax Header Block](#) (on page 2937), with a *typeflag* value of **x** or **g**. The
 97881 extended header records, described in [pax Extended Header](#) (on page 2938), shall be
 97882 included as the data for this header block.
- 97883 • A header block that describes the file. Any fields in the preceding optional extended
 97884 header shall override the associated fields in this header block for this file.
- 97885 • Zero or more blocks that contain the contents of the file.

97886 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,
 97887 interpreted as an end-of-archive indicator.

97888 A schematic of an example archive with global extended header records and two actual files is
 97889 shown in [Figure 4-1](#) (on page 2937). In the example, the second file in the archive has no

97890

extended header preceding it, presumably because it has no need for extended attributes.

97891

Figure 4-1 pax Format Archive Example

97892

pax Header Block

97893

The **pax** header block shall be identical to the **ustar** header block described in [ustar Interchange Format](#) (on page 2942), except that two additional *typeflag* values are defined:

97894

97895

x Represents extended header records for the following file in the archive (which shall have its own **ustar** header block). The format of these extended header records shall be as described in [pax Extended Header](#) (on page 2938).

97896

97897

97898

g Represents global extended header records for the following files in the archive. The format of these extended header records shall be as described in [pax Extended Header](#) (on page 2938). Each value shall affect all subsequent files that do not override that value in their own extended header record and until another global extended header record is reached that provides another value for the same field. The *typeflag* **g** global headers should not be used with interchange media that could suffer partial data loss in transporting the archive.

97899

97900

97901

97902

97903

97904

For both of these types, the *size* field shall be the size of the extended header records in octets. The other fields in the header block are not meaningful to this version of the *pax* utility. However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2:1993 standard, the header block fields are used to create a regular file that contains the extended header records as data. Therefore, header block field values should be selected to provide reasonable file access to this regular file.

97905

97906

97907

97908

97909

97910

A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit one) (hard link) may be included, which means that the *size* field may be greater than zero. Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

97911

97912

97913

pax Extended Header97914
97915
97916
97917
97918
97919
97920

A **pax** extended header contains values that are inappropriate for the **ustar** header block because of limitations in that format: fields requiring a character encoding other than that described in the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar** header, and fields whose format or length do not fit the requirements of the **ustar** header. The values in an extended header add attributes to the following file (or files; see the description of the *typeflag* **g** header block) or override values in the following header block(s), as indicated in the following list of keywords.

97921

An extended header shall consist of one or more records, each constructed as follows:

97922

```
"%d %s=%s\n", <length>, <keyword>, <value>
```

97923
97924
97925
97926
97927
97928
97929
97930
97931

The extended header records shall be encoded according to the ISO/IEC 10646-1:2000 standard UTF-8 encoding. The *<length>* field, *<blank>*, equals sign, and *<newline>* shown shall be limited to the portable character set, as encoded in UTF-8. The *<keyword>* fields can be any UTF-8 characters. The *<length>* field shall be the decimal length of the extended header record in octets, including the trailing *<newline>*. If there is a **hdrcharset** extended header in effect for a file, the *value* field for any **gname**, **linkpath**, **path**, and **uname** extended header records shall be encoded using the character set specified by the **hdrcharset** extended header record; otherwise, the *value* field shall be encoded using UTF-8. The *value* field for all other keywords specified by POSIX.1-200x shall be encoded using UTF-8.

97932
97933
97934
97935
97936
97937
97938
97939
97940

The *<keyword>* field shall be one of the entries from the following list or a keyword provided as an implementation extension. Keywords consisting entirely of lowercase letters, digits, and periods are reserved for future standardization. A keyword shall not include an equals sign. (In the following list, the notations "file(s)" or "block(s)" is used to acknowledge that a keyword affects the following single file after a *typeflag* **x** extended header, but possibly multiple files after *typeflag* **g**. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode shall apply only when such a record has not already been provided through the use of the **-o** option. When used in **copy** mode, *pax* shall behave as if an archive had been created with applicable extended header records and then extracted.)

97941
97942
97943
97944
97945

atime The file access time for the following file(s), equivalent to the value of the *st_atime* member of the **stat** structure for a file, as described by the *stat()* function. The access time shall be restored if the process has the appropriate privilege required to do so. The format of the *<value>* shall be as described in [pax Extended Header File Times](#) (on page 2941).

97946
97947
97948

charset The name of the character set used to encode the data in the following file(s). The entries in the following table are defined to refer to known standards; additional names may be agreed on between the originator and recipient.

97949
97950
97951

97954
97955
97956
97957
97958
97959
97960
97961
97962
97963
97964
97965
97966

<value>	Formal Standard
ISO-IRΔ646Δ1990	ISO/IEC 646:1990
ISO-IRΔ8859Δ1Δ1998	ISO/IEC 8859-1:1998
ISO-IRΔ8859Δ2Δ1999	ISO/IEC 8859-2:1999
ISO-IRΔ8859Δ3Δ1999	ISO/IEC 8859-3:1999
ISO-IRΔ8859Δ4Δ1998	ISO/IEC 8859-4:1998
ISO-IRΔ8859Δ5Δ1999	ISO/IEC 8859-5:1999
ISO-IRΔ8859Δ6Δ1999	ISO/IEC 8859-6:1999
ISO-IRΔ8859Δ7Δ1987	ISO/IEC 8859-7:1987
ISO-IRΔ8859Δ8Δ1999	ISO/IEC 8859-8:1999
ISO-IRΔ8859Δ9Δ1999	ISO/IEC 8859-9:1999
ISO-IRΔ8859Δ10Δ1998	ISO/IEC 8859-10:1998
ISO-IRΔ8859Δ13Δ1998	ISO/IEC 8859-13:1998
ISO-IRΔ8859Δ14Δ1998	ISO/IEC 8859-14:1998
ISO-IRΔ8859Δ15Δ1999	ISO/IEC 8859-15:1999
ISO-IRΔ10646Δ2000	ISO/IEC 10646:2000
ISO-IRΔ10646Δ2000ΔUTF-8	ISO/IEC 10646, UTF-8 encoding
BINARY	None.

The encoding is included in an extended header for information only; when *pax* is used as described in POSIX.1-200x, it shall not translate the file data into any other encoding. The **BINARY** entry indicates unencoded binary data.

When used in **write** or **copy** mode, it is implementation-defined whether *pax* includes a **charset** extended header record for a file.

97967
97968
97969

97970
97971

comment A series of characters used as a comment. All characters in the <value> field shall be ignored by *pax*.

97972
97973

gid The group ID of the group that owns the file, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the *gid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *gid* extended header record for each file whose group ID is greater than 2 097 151 (octal 7 777 777).

97974
97975
97976
97977
97978

gname The group of the file(s), formatted as a group name in the group database. This record shall override the *gid* and *gname* fields in the following header block(s), and any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall translate the name from the encoding in the header record to the character set appropriate for the group database on the receiving system. If any of the characters cannot be translated, and if neither the **-oinvalid=UTF-8** option nor the **-oinvalid=binary** option is specified, the results are implementation-defined. When used in **write** or **copy** mode, *pax* shall include a **gname** extended header record for each file whose group name cannot be represented entirely with the letters and digits of the portable character set.

97979
97980
97981
97982
97983
97984
97985
97986
97987
97988

hdrcharset The name of the character set used to encode the value field of the **gname**, **linkpath**, **path**, and **uname** *pax* extended header records. The entries in the following table are defined to refer to known standards; additional names may be agreed between the originator and the recipient.

97989
97990
97991
97992

<value>	Formal Standard
ISO-IRΔ10646Δ2000ΔUTF-8	ISO/IEC 10646, UTF-8 encoding
BINARY	None.

97993
97994
97995

If no **hdrcharset** extended header record is specified, the default character set used to encode all values in extended header records shall be the ISO/IEC 10646-1:2000

97996
97997

97998		standard UTF-8 encoding.
97999		The BINARY entry indicates that all values recorded in extended headers for affected files are unencoded binary data from the underlying system.
98000		
98001	linkpath	The pathname of a link being created to another file, of any type, previously archived. This record shall override the <i>linkname</i> field in the following ustar header block(s). The following ustar header block shall determine the type of link created. If <i>typeflag</i> of the following header block is 1, it shall be a hard link. If <i>typeflag</i> is 2, it shall be a symbolic link and the linkpath value shall be the contents of the symbolic link. The <i>pax</i> utility shall translate the name of the link (contents of the symbolic link) from the encoding in the header to the character set appropriate for the local file system. When used in write or copy mode, <i>pax</i> shall include a linkpath extended header record for each link whose pathname cannot be represented entirely with the members of the portable character set other than NUL.
98002		
98003		
98004		
98005		
98006		
98007		
98008		
98009		
98010		
98011		
98012	mtime	The file modification time of the following file(s), equivalent to the value of the <i>st_mtime</i> member of the stat structure for a file, as described in the <i>stat()</i> function. This record shall override the <i>mtime</i> field in the following header block(s). The modification time shall be restored if the process has the appropriate privilege required to do so. The format of the <i><value></i> shall be as described in pax Extended Header File Times (on page 2941).
98013		
98014		
98015		
98016		
98017		
98018	path	The pathname of the following file(s). This record shall override the <i>name</i> and <i>prefix</i> fields in the following header block(s). The <i>pax</i> utility shall translate the pathname of the file from the encoding in the header to the character set appropriate for the local file system.
98019		
98020		
98021		
98022		When used in write or copy mode, <i>pax</i> shall include a <i>path</i> extended header record for each file whose pathname cannot be represented entirely with the members of the portable character set other than NUL.
98023		
98024		
98025	realtime.any	The keywords prefixed by “realtime.” are reserved for future standardization.
98026	security.any	The keywords prefixed by “security.” are reserved for future standardization.
98027	size	The size of the file in octets, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the <i>size</i> field in the following header block(s). When used in write or copy mode, <i>pax</i> shall include a <i>size</i> extended header record for each file with a size value greater than 8 589 934 591 (octal 77 777 777 777).
98028		
98029		
98030		
98031		
98032	uid	The user ID of the file owner, expressed as a decimal number using digits from the ISO/IEC 646:1991 standard. This record shall override the <i>uid</i> field in the following header block(s). When used in write or copy mode, <i>pax</i> shall include a <i>uid</i> extended header record for each file whose owner ID is greater than 2 097 151 (octal 7 777 777).
98033		
98034		
98035		
98036		
98037	uname	The owner of the following file(s), formatted as a user name in the user database. This record shall override the <i>uid</i> and <i>uname</i> fields in the following header block(s), and any <i>uid</i> extended header record. When used in read , copy , or list mode, <i>pax</i> shall translate the name from the encoding in the header record to the character set appropriate for the user database on the receiving system. If any of the characters cannot be translated, and if neither the -oinvalid=UTF-8 option nor the -oinvalid=binary option is specified, the results are implementation-defined. When used in write or copy mode, <i>pax</i> shall include a uname extended header record for each file whose user name cannot be represented entirely with the letters and digits of the portable character set.
98038		
98039		
98040		
98041		
98042		
98043		
98044		
98045		
98046		

98047 If the *<value>* field is zero length, it shall delete any header block field, previously entered
98048 extended header value, or global extended header value of the same name.

98049 If a keyword in an extended header record (or in a **-o** option-argument) overrides or deletes a
98050 corresponding field in the **ustar** header block, *pax* shall ignore the contents of that header block
98051 field.

98052 Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the
98053 *<value>* field shall be considered data for the field. None of the length limitations of the **ustar**
98054 header block fields in Table 4-13 (on page 2942) shall apply to the extended header records.

98055 **pax Extended Header Keyword Precedence**

98056 This section describes the precedence in which the various header records and fields and
98057 command line options are selected to apply to a file in the archive. When *pax* is used in **read** or
98058 **list** modes, it shall determine a file attribute in the following sequence:

- 98059 1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step
98060 7., if applicable, or ignored otherwise.
- 98061 2. If **-okeyword:=** is used, the affected attributes shall be ignored.
- 98062 3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
- 98063 4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the
98064 *<value>*. When extended header records conflict, the last one given in the header shall
98065 take precedence.
- 98066 5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
- 98067 6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be
98068 assigned the *<value>*. When global extended header records conflict, the last one given in
98069 the global header shall take precedence.
- 98070 7. Otherwise, the attribute shall be determined from the **ustar** header block.

98071 **pax Extended Header File Times**

98072 The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's
98073 modification time cannot be represented exactly in the **ustar** header logical record described in
98074 [ustar Interchange Format](#) (on page 2942). This can occur if the time is out of **ustar** range, or if
98075 the file system of the underlying implementation supports non-integer time granularities and
98076 the time is not an integer. All of these time records shall be formatted as a decimal representation
98077 of the time in seconds since the Epoch. If a period (*' . '*) decimal point character is present, the
98078 digits to the right of the point shall represent the units of a subsecond timing granularity, where
98079 the first digit is tenths of a second and each subsequent digit is a tenth of the previous digit. In
98080 **read** or **copy** mode, the *pax* utility shall truncate the time of a file to the greatest value that is not
98081 greater than the input header file time. In **write** or **copy** mode, the *pax* utility shall output a time
98082 exactly if it can be represented exactly as a decimal number, and otherwise shall generate only
98083 enough digits so that the same time shall be recovered if the file is extracted on a system whose
98084 underlying implementation supports the same time granularity.

98085

ustar Interchange Format

98086

98087

98088

98089

98090

98091

98092

A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a fixed-size logical record of 512 octets (see below). Although this format may be thought of as being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of transportable media are not excluded. Each file archived shall be represented by a header logical record that describes the file, followed by zero or more logical records that give the contents of the file. At the end of the archive file there shall be two 512-octet logical records filled with binary zeros, interpreted as an end-of-archive indicator.

98093

98094

98095

98096

98097

The logical records may be grouped for physical I/O operations, as described under the **-b** *blocksize* and **-x** *ustar* options. Each group of logical records may be written with a single operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a single tape physical block. The last physical block shall always be the full size, so logical records after the two zero logical records may contain undefined data.

98098

98099

The header logical record shall be structured as shown in the following table. All lengths and offsets are in decimal.

98100

<i>devminor</i>	337	8
<i>prefix</i>	345	155

98118

98119

98120

98121

98122

98123

98124

All characters in the header logical record shall be represented in the coded character set of the ISO/IEC 646: 1991 standard. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside of slash and the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes.

98125

98126

98127

98128

98129

However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described in POSIX.1-200x. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

98130

98131

Each field within the header logical record is contiguous; that is, there is no padding used. Each character on the archive medium shall be stored contiguously.

98132

The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character.

98133 The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all
 98134 characters in the array contain non-NUL characters including the last character. The *version* field
 98135 is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character.
 98136 All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991
 98137 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

98138 The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be
 98139 formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up
 98140 to the first NUL character), a slash character, and *name*; otherwise, *name* is used alone. In either
 98141 case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall
 98142 be ignored. In this manner, pathnames of at most 256 characters can be supported. If a pathname
 98143 does not fit in the space provided, *pax* shall notify the user of the error, and shall not store any
 98144 part of the file—header or data—on the medium.

98145 The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a
 98146 *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall
 98147 notify the user of the error, and shall not attempt to store the link on the medium.

98148 The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit
 98149 representation. The encoded bits shall represent the following values:

98150 **Table 4-14** *ustar mode* Field

Bit Value	POSIX.1-200x Bit	Description
04 000	S_ISUID	Set UID on execution.
02 000	S_ISGID	Set GID on execution.
01 000	<reserved>	Reserved for future standardization.
00 400	S_IRUSR	Read permission for file owner class.
00 200	S_IWUSR	Write permission for file owner class.
00 100	S_IXUSR	Execute/search permission for file owner class.
00 040	S_IRGRP	Read permission for file group class.
00 020	S_IWGRP	Write permission for file group class.
00 010	S_IXGRP	Execute/search permission for file group class.
00 004	S_IROTH	Read permission for file other class.
00 002	S_IWOTH	Write permission for file other class.
00 001	S_IXOTH	Execute/search permission for file other class.

98164 When appropriate privilege is required to set one of these mode bits, and the user restoring the
 98165 files from the archive does not have the appropriate privilege, the mode bits for which the user
 98166 does not have appropriate privilege shall be ignored. Some of the mode bits in the archive
 98167 format are not mentioned elsewhere in this volume of POSIX.1-200x. If the implementation does
 98168 not support those bits, they may be ignored.

98169 The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

98170 The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type
 98171 1 (a link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is set to
 98172 specify a file of type 5 (directory), the *size* field shall be interpreted as described under the
 98173 definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag*
 98174 field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size*
 98175 field is unspecified by this volume of POSIX.1-200x, and no data logical records shall be stored
 98176 on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If the
 98177 *typeflag* field is set to any other value, the number of logical records written following the header
 98178 shall be $(size+511)/512$, ignoring any fraction in the result of the division.

98179 The *mtime* field shall be the modification time of the file at the time it was archived. It is the
 98180 ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained
 98181 from the *stat()* function.

98182 The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of
 98183 the simple sum of all octets in the header logical record. Each octet in the header shall be treated
 98184 as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the
 98185 precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is
 98186 treated as if it were all spaces.

98187 The *typeflag* field specifies the type of file archived. If a particular implementation does not
 98188 recognize the type, or the user does not have appropriate privilege to create that type, the file
 98189 shall be extracted as if it were a regular file if the file type is defined to have a meaning for the
 98190 *size* field that could cause data logical records to be written on the medium (see the previous
 98191 description for *size*). If conversion to a regular file occurs, the *pax* utility shall produce an error
 98192 indicating that the conversion took place. All of the *typeflag* fields shall be coded in the
 98193 ISO/IEC 646:1991 standard IRV:

- | | | |
|---|------|--|
| 98194
98195
98196
98197 | 0 | Represents a regular file. For backwards-compatibility, a <i>typeflag</i> value of binary zero ('\0') should be recognized as meaning a regular file when extracting files from the archive. Archives written with this version of the archive file format create regular files with a <i>typeflag</i> value of the ISO/IEC 646:1991 standard IRV '0'. |
| 98198
98199
98200
98201
98202 | 1 | Represents a file linked to another file, of any type, previously archived. Such files are identified by having the same device and file serial numbers, and pathnames that refer to different directory entries. All such files shall be archived as linked files. The linked-to name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than 100 octets in length. |
| 98203
98204 | 2 | Represents a symbolic link. The contents of the symbolic link shall be stored in the <i>linkname</i> field. |
| 98205
98206
98207
98208 | 3, 4 | Represent character special files and block special files respectively. In this case the <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format of which is unspecified by this volume of POSIX.1-200x. Implementations may map the device specifications to their own local specification or may ignore the entry. |
| 98209
98210
98211
98212
98213 | 5 | Specifies a directory or subdirectory. On systems where disk allocation is performed on a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i> field of zero indicates no such limiting. Systems that do not support limiting in this manner should ignore the <i>size</i> field. |
| 98214
98215 | 6 | Specifies a FIFO special file. Note that the archiving of a FIFO file archives the existence of this file and not its contents. |
| 98216
98217
98218 | 7 | Reserved to represent a file to which an implementation has associated some high-performance attribute. Implementations without such extensions should treat this file as a regular file (type 0). |
| 98219
98220 | A-Z | The letters 'A' to 'Z', inclusive, are reserved for custom implementations. All other values are reserved for future versions of this standard. |

98221 It is unspecified whether files with pathnames that refer to the same directory entry are archived
 98222 as linked files or as separate files. If they are archived as linked files, this means that attempting
 98223 to extract both pathnames from the resulting archive will always cause an error (unless the *-u*
 98224 option is used) because the link cannot be created.

98225 It is unspecified whether files with the same device and file serial numbers being appended to
 98226 an archive are treated as linked files to members that were in the archive before the append.

98227 Attempts to archive a socket using *ustar* interchange format shall produce a diagnostic message.
 98228 Handling of other file types is implementation-defined.

98229 The *magic* field is the specification that this archive was output in this archive format. If this field

98230 contains **ustar** (the five characters from the ISO/IEC 646:1991 standard IRV shown followed by
 98231 NUL), the *uname* and *gname* fields shall contain the ISO/IEC 646:1991 standard IRV
 98232 representation of the owner and group of the file, respectively (truncated to fit, if necessary).
 98233 When the file is restored by a privileged, protection-preserving version of the utility, the user
 98234 and group databases shall be scanned for these names. If found, the user and group IDs
 98235 contained within these files shall be used rather than the values contained within the *uid* and *gid*
 98236 fields.

98237 **cpio Interchange Format**

98238 The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that
 98239 describes the file, the name of the file, and then the contents of the file.

98240 An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used
 98241 only to make physical I/O more efficient. The last group of blocks shall always be at the full
 98242 size.

98243 For the octet-oriented **cpio** archive format, the individual entry information shall be in the order
 98244 indicated and described by the following table; see also the **<cpio.h>** header.

98245 **Table 4-15** Octet-Oriented cpio Archive Entry

Header Field Name	Length (in Octets)	Interpreted as
<i>c_magic</i>	6	Octal number
<i>c_dev</i>	6	Octal number
<i>c_ino</i>	6	Octal number
<i>c_mode</i>	6	Octal number
<i>c_uid</i>	6	Octal number
<i>c_gid</i>	6	Octal number
<i>c_nlink</i>	6	Octal number
<i>c_rdev</i>	6	Octal number
<i>c_mtime</i>	11	Octal number
<i>c_namesize</i>	6	Octal number
<i>c_filesize</i>	11	Octal number
Filename Field Name	Length	Interpreted as
<i>c_name</i>	<i>c_namesize</i>	Pathname string
File Data Field Name	Length	Interpreted as
<i>c_filedata</i>	<i>c_filesize</i>	Data

98262 **cpio Header**

98263 For each file in the archive, a header as defined previously shall be written. The information in
 98264 the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted
 98265 as octal numbers. The octal numbers shall be extended to the necessary length by appending the
 98266 ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result
 98267 is written to the most-significant digit of the stream of octets first. The fields shall be interpreted
 98268 as follows:

98269 *c_magic* Identify the archive as being a transportable archive by containing the identifying
 98270 value "070707".

98271 *c_dev, c_ino* Contains values that uniquely identify the file within the archive (that is, no files
 98272 contain the same pair of *c_dev* and *c_ino* values unless they are links to the same
 98273 file). The values shall be determined in an unspecified manner.

98274 *c_mode* Contains the file type and access permissions as defined in the following table.

98275 **Table 4-16** Values for *cpio c_mode* Field

File Permissions Name	Value	Indicates
C_IRUSR	000 400	Read by owner
C_IWUSR	000 200	Write by owner
C_IXUSR	000 100	Execute by owner
C_IRGRP	000 040	Read by group
C_IWGRP	000 020	Write by group
C_IXGRP	000 010	Execute by group
C_IROTH	000 004	Read by others
C_IWOTH	000 002	Write by others
C_IXOTH	000 001	Execute by others
C_ISUID	004 000	Set <i>uid</i>
C_ISGID	002 000	Set <i>gid</i>
C_ISVTX	001 000	Reserved
File Type Name	Value	Indicates
C_ISDIR	040 000	Directory
C_ISFIFO	010 000	FIFO
C_ISREG	0100 000	Regular file
C_ISLNK	0120 000	Symbolic link
C_ISBLK	060 000	Block special file
C_ISCHR	020 000	Character special file
C_ISSOCK	0140 000	Socket
C_ISCTG	0110 000	Reserved

98298 Directories, FIFOs, symbolic links, and regular files shall be supported on a system
 98299 conforming to this volume of POSIX.1-200x; additional values defined previously
 98300 are reserved for compatibility with existing systems. Additional file types may be
 98301 supported; however, such files should not be written to archives intended to be
 98302 transported to other systems.

98303 *c_uid* Contains the user ID of the owner.

98304 *c_gid* Contains the group ID of the group.

98305 *c_nlink* Contains a number greater than or equal to the number of links in the archive
 98306 referencing the file. If the *-a* option is used to append to a *cpio* archive, then the *pax*
 98307 utility need not account for the files in the existing part of the archive when
 98308 calculating the *c_nlink* values for the appended part of the archive, and need not
 98309 alter the *c_nlink* values in the existing part of the archive if additional files with the
 98310 same *c_dev* and *c_ino* values are appended to the archive.

98311 *c_rdev* Contains implementation-defined information for character or block special files.

98312 *c_mtime* Contains the latest time of modification of the file at the time the archive was
 98313 created.

98314 *c_namesize* Contains the length of the pathname, including the terminating NUL character.

98315 *c_filesize* Contains the length in octets of the data section following the header structure.

98316

cpio Filename

98317

The *c_name* field shall contain the pathname of the file. The length of this field in octets is the value of *c_namesize*.

98318

98319

If a filename is found on the medium that would create an invalid pathname, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored.

98320

98321

98322

All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes. However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described previously in this volume of POSIX.1-200x. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the local file system and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

98323

98324

98325

98326

98327

98328

98329

98330

98331

98332

98333

cpio File Data

98334

Following *c_name*, there shall be *c_filesize* octets of data. Interpretation of such data occurs in a manner dependent on the file. For regular files, the data shall consist of the contents of the file. For symbolic links, the data shall consist of the contents of the symbolic link. If *c_filesize* is zero, no data shall be contained in *c_filedata*.

98335

98336

98337

98338

When restoring from an archive:

98339

- If the user does not have the appropriate privilege to create a file of the specified type, *pax* shall ignore the entry and write an error message to standard error.

98340

98341

- Only regular files and symbolic links have data to be restored. Presuming a regular file meets any selection criteria that might be imposed on the format-reading utility by the user, such data shall be restored.

98342

98343

98344

- If a user does not have appropriate privilege to set a particular mode flag, the flag shall be ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this volume of POSIX.1-200x. If the implementation does not support those flags, they may be ignored.

98345

98346

98347

98348

cpio Special Entries

98349

FIFO special files, directories, and the trailer shall be recorded with *c_filesize* equal to zero. Symbolic links shall be recorded with *c_filesize* equal to the length of the contents of the symbolic link. For other special files, *c_filesize* is unspecified by this volume of POSIX.1-200x. The header for the next file entry in the archive shall be written directly after the last octet of the file entry preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive; the contents of octets in the last block of the archive following such a header are undefined.

98350

98351

98352

98353

98354

98355

EXIT STATUS

98356

The following exit values shall be returned:

98357

0 All files were processed successfully.

98358

>0 An error occurred.

CONSEQUENCES OF ERRORS

98359
98360
98361
98362
98363
98364

If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a diagnostic message shall be written to standard error and a non-zero exit status shall be returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax* shall not, by default, create a second copy of the file.

98365
98366
98367
98368
98369

If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may have only partially extracted the file or (if the **-n** option was not specified) may have extracted a file of the same name as that specified by the user, but which is not the file the user wanted. Additionally, the file modes of extracted directories may have additional bits from the **S_IRWXU** mask set as well as incorrect modification and access times.

APPLICATION USAGE

98370
98371
98372
98373
98374
98375
98376
98377
98378
98379
98380

Caution is advised when using the **-a** option to append to a *cpio* format archive. If any of the files being appended happen to be given the same *c_dev* and *c_ino* values as a file in the existing part of the archive, then they may be treated as links to that file on extraction. Thus, it is risky to use **-a** with *cpio* format except when it is done on the same system that the original archive was created on, and with the same *pax* utility, and in the knowledge that there has been little or no file system activity since the original archive was created that could lead to any of the files appended being given the same *c_dev* and *c_ino* values as an unrelated file in the existing part of the archive. Also, when (intentionally) appending additional links to a file in the existing part of the archive, the *c_nlink* values in the modified archive can be smaller than the number of links to the file in the archive, which may mean that the links are not preserved on extraction.

98381
98382
98383
98384
98385

The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio* implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p** option also provides a consistent means of extending the ways in which future file attributes can be addressed, such as for enhanced security systems or high-performance files. Although it may seem complex, there are really two modes that are most commonly used:

98386
98387
98388
98389

-p e “Preserve everything”. This would be used by the historical superuser, someone with all the appropriate privileges, to preserve all aspects of the files as they are recorded in the archive. The **e** flag is the sum of **o** and **p**, and other implementation-defined attributes.

98390
98391
98392
98393

-p p “Preserve” the file mode bits. This would be used by the user with regular privileges who wished to preserve aspects of the file other than the ownership. The file times are preserved by default, but two other flags are offered to disable these and use the time of extraction.

98394
98395
98396
98397
98398

The one pathname per line format of standard input precludes pathnames containing `<newline>`s. Although such pathnames violate the portable filename guidelines, they may exist and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from historical archive programs. The problem can be avoided by listing filename arguments on the command line instead of on standard input.

98399
98400
98401
98402

It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this volume of POSIX.1-200x. Specifically, creating files of type block special or character special, restoring file access times unless the files are owned by the user (the **-t** option), or preserving file owner, group, and mode (the **-p** option) all probably require appropriate privileges.

98403
98404
98405

In **read** mode, implementations are permitted to overwrite files when the archive has multiple members with the same name. This may fail if permissions on the first version of the file do not permit it to be overwritten.

98406

The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ($8 * 2^{30}$) in size.

98407

When archives containing binary header information are listed, the filenames printed may

98408 cause strange behavior on some terminals.

98409 EXAMPLES

98410 The following command:

```
98411 pax -w -f /dev/rmt/lm .
```

98412 copies the contents of the current directory to tape drive 1, medium density (assuming historical
98413 System V device naming procedures—the historical BSD device name would be `/dev/rmt9`).

98414 The following commands:

```
98415 mkdir newdir
```

```
98416 pax -rw olddir newdir
```

98417 copy the `olddir` directory hierarchy to `newdir`.

```
98418 pax -r -s ',^//*usr//*,,' -f a.pax
```

98419 reads the archive `a.pax`, with all files rooted in `/usr` in the archive extracted relative to the current
98420 directory.

98421 Using the option:

```
98422 -o listopt="%M %(atime)T %(size)D %(name)s"
```

98423 overrides the default output description in Standard Output and instead writes:

```
98424 -rw-rw--- Jan 12 15:53 2003 1492 /usr/foo/bar
```

98425 Using the options:

```
98426 -o listopt='%L\t%(size)D\n%.7' \
```

```
98427 -o listopt='(name)s\n%(atime)T\n%T'
```

98428 overrides the default output description in Standard Output and instead writes:

```
98429 /usr/foo/bar -> /tmp 1492
```

```
98430 /usr/fo
```

```
98431 Jan 12 15:53 1991
```

```
98432 Jan 31 15:53 2003
```

98433 RATIONALE

98434 The `pax` utility was new for the ISO POSIX-2:1993 standard. It represents a peaceful compromise
98435 between advocates of the historical `tar` and `cpio` utilities.

98436 A fundamental difference between `cpio` and `tar` was in the way directories were treated. The `cpio`
98437 utility did not treat directories differently from other files, and to select a directory and its
98438 contents required that each file in the hierarchy be explicitly specified. For `tar`, a directory
98439 matched every file in the file hierarchy it rooted.

98440 The `pax` utility offers both interfaces; by default, directories map into the file hierarchy they root.
98441 The `-d` option causes `pax` to skip any file not explicitly referenced, as `cpio` historically did. The `tar`
98442 `-style` behavior was chosen as the default because it was believed that this was the more
98443 common usage and because `tar` is the more commonly available interface, as it was historically
98444 provided on both System V and BSD implementations.

98445 The data interchange format specification in this volume of POSIX.1-200x requires that processes
98446 with “appropriate privileges” shall always restore the ownership and permissions of extracted
98447 files exactly as archived. If viewed from the historic equivalence between superuser and
98448 “appropriate privileges”, there are two problems with this requirement. First, users running as
98449 superusers may unknowingly set dangerous permissions on extracted files. Second, it is
98450 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the
98451 archive was created by the superuser. (It should be noted that restoration of ownerships and

98452 permissions for the superuser, by default, is historical practice in *cpio*, but not in *tar*.) In order to
 98453 avoid these two problems, the *pax* specification has an additional “privilege” mechanism, the **-p**
 98454 option. Only a *pax* invocation with the privileges needed, and which has the **-p** option set using
 98455 the **e** specification character, has the “appropriate privilege” to restore full ownership and
 98456 permission information.

98457 Note also that this volume of POSIX.1-200x requires that the file ownership and access
 98458 permissions shall be set, on extraction, in the same fashion as the *creat()* function when provided
 98459 with the mode stored in the archive. This means that the file creation mask of the user is applied
 98460 to the file permissions.

98461 Users should note that directories may be created by *pax* while extracting files with permissions
 98462 that are different from those that existed at the time the archive was created. When extracting
 98463 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set
 98464 their file creation mask appropriately to protect these files during extraction.

98465 The table of contents output is written to standard output to facilitate pipeline processing.

98466 An early proposal had hard links displaying for all pathnames. This was removed because it
 98467 complicates the output of the case where **-v** is not specified and does not match historical *cpio*
 98468 usage. The hard-link information is available in the **-v** display.

98469 The description of the **-l** option allows implementations to make hard links to symbolic links.
 98470 POSIX.1-200x does not specify any way to create a hard link to a symbolic link, but many
 98471 implementations provide this capability as an extension. If there are hard links to symbolic links
 98472 when an archive is created, the implementation is required to archive the hard link in the archive
 98473 (unless **-H** or **-L** is specified). When in **read** mode and in **copy** mode, implementations
 98474 supporting hard links to symbolic links should use them when appropriate.

98475 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that have
 98476 been brought along from historical usage. For example, there are restrictions on the length of
 98477 pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory
 98478 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

98479 The default *blocksize* value of 5 120 bytes for *cpio* was selected because it is one of the standard
 98480 block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value
 98481 for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10 240
 98482 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The
 98483 maximum block size of 32 256 bytes (2^{15} -512 bytes) is the largest multiple of 512 bytes that fits
 98484 into a signed 16-bit tape controller transfer register. There are known limitations in some
 98485 historical systems that would prevent larger blocks from being accepted. Historical values were
 98486 chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate
 98487 archives. Also, default block sizes for any file type other than character special file has been
 98488 deleted from this volume of POSIX.1-200x as unimportant and not likely to affect the structure of
 98489 the resulting archive.

98490 Implementations are permitted to modify the block-size value based on the archive format or the
 98491 device to which the archive is being written. This is to provide implementations with the
 98492 opportunity to take advantage of special types of devices, and it should not be used without a
 98493 great deal of consideration as it almost certainly decreases archive portability.

98494 The intended use of the **-n** option was to permit extraction of one or more files from the archive
 98495 without processing the entire archive. This was viewed by the standard developers as offering
 98496 significant performance advantages over historical implementations. The **-n** option in early
 98497 proposals had three effects; the first was to cause special characters in patterns to not be treated
 98498 specially. The second was to cause only the first file that matched a pattern to be extracted. The
 98499 third was to cause *pax* to write a diagnostic message to standard error when no file was found
 98500 matching a specified pattern. Only the second behavior is retained by this volume of
 98501 POSIX.1-200x, for many reasons. First, it is in general not acceptable for a single option to have

98502 multiple effects. Second, the ability to make pattern matching characters act as normal characters
 98503 is useful for parts of *pax* other than file extraction. Third, a finer degree of control over the
 98504 special characters is useful because users may wish to normalize only a single special character
 98505 in a single filename. Fourth, given a more general escape mechanism, the previous behavior of
 98506 the `-n` option can be easily obtained using the `-s` option or a *sed* script. Finally, writing a
 98507 diagnostic message when a pattern specified by the user is unmatched by any file is useful
 98508 behavior in all cases.

98509 In this version, the `-n` was removed from the **copy** mode synopsis of *pax*; it is inapplicable
 98510 because there are no pattern operands specified in this mode.

98511 There is another method than *pax* for copying subtrees in POSIX.1-200x described as part of the
 98512 *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive interface,
 98513 while *pax* offers a finer granularity of control. Each provides additional functionality to the
 98514 other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not. It is
 98515 the intention of the standard developers that the results be similar (using appropriate option
 98516 combinations in both utilities). The results are not required to be identical; there seemed
 98517 insufficient gain to applications to balance the difficulty of implementations having to guarantee
 98518 that the results would be exactly identical.

98519 A single archive may span more than one file. It is suggested that implementations provide
 98520 informative messages to the user on standard error whenever the archive file is changed.

98521 The `-d` option (do not create intermediate directories not listed in the archive) found in early
 98522 proposals was originally provided as a complement to the historic `-d` option of *cpio*. It has been
 98523 deleted.

98524 The `-s` option in early proposals specified a subset of the substitution command from the *ed*
 98525 utility. As there was no reason for only a subset to be supported, the `-s` option is now compatible
 98526 with the current *ed* specification. Since the delimiter can be any non-null character, the following
 98527 usage with single spaces is valid:

```
98528 pax -s " foo bar " ...
```

98529 The `-t` description is worded so as to note that this may cause the access time update caused by
 98530 some other activity (which occurs while the file is being read) to be overwritten.

98531 The default behavior of *pax* with regard to file modification times is the same as historical
 98532 implementations of *tar*. It is not the historical behavior of *cpio*.

98533 Because the `-i` option uses `/dev/tty`, utilities without a controlling terminal are not able to use
 98534 this option.

98535 The `-y` option, found in early proposals, has been deleted because a line containing a single
 98536 period for the `-i` option has equivalent functionality. The special lines for the `-i` option (a single
 98537 period and the empty line) are historical practice in *cpio*.

98538 In early drafts, a `-charmap` option was included to increase portability of files between systems
 98539 using different coded character sets. This option was omitted because it was apparent that
 98540 consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate
 98541 substitute.

98542 The ISO POSIX-2:1993 standard and ISO POSIX-1 standard requirements for *pax*, however,
 98543 made it very difficult to create a single archive containing files created using extended characters
 98544 provided by different locales. This version adds the **hdrcharset** keyword to make it possible to
 98545 archive files in these cases without dropping files due to translation errors.

98546 Translating filenames and other attributes from a locale's encoding to UTF-8 and then back again
 98547 can lose information, as the resulting filename might not be byte-for-byte equivalent to the
 98548 original. To avoid this problem, users can specify the `-o hdrcharset=binary` option, which will
 98549 cause the resulting archive to use binary format for all names and attributes. Such archives are

98550 not portable among hosts that use different native encodings (e.g., EBCDIC *versus* ASCII-based
 98551 encodings), but they will allow interchange among the vast majority of POSIX file systems in
 98552 practical use. Also, the `-o hdrcharset=binary` option will cause *pax* in **copy** mode to behave
 98553 more like other standard utilities such as *cp*.

98554 If the values specified by the `-o exthdr.name=value`, `-o globexthdr.name=value`, or by
 98555 `$TMPDIR` (if `-o globexthdr.name` is not specified) require a character encoding other than that
 98556 described in the ISO/IEC 646:1991 standard, a **path** extended header record will have to be
 98557 created for the file. If a **hdrcharset** extended header record is active for such headers, it will
 98558 determine the codeset used for the value field in these extended **path** header records. These **path**
 98559 extended header records always need to be created when writing an archive even if
 98560 **hdrcharset=binary** has been specified and would contain the same (binary) data that appears in
 98561 the **ustar** header record prefix and *name* fields. (In other words, an extended header **path** record
 98562 is always required to be generated if the *prefix* or *name* fields contain non-ASCII characters even
 98563 when **hdrcharset=binary** is also in effect for that file.)

98564 The `-k` option was added to address international concerns about the dangers involved in the
 98565 character set transformations of `-e` (if the target character set were different from the source, the
 98566 filenames might be transformed into names matching existing files) and also was made more
 98567 general to protect files transferred between file systems with different {NAME_MAX} values
 98568 (truncating a filename on a smaller system might also inadvertently overwrite existing files). As
 98569 stated, it prevents any overwriting, even if the target file is older than the source. This version
 98570 adds more granularity of options to solve this problem by introducing the `-oinvalid=option`—
 98571 specifically the **UTF-8** and **binary** actions. (Note that an existing file is still subject to overwriting
 98572 in this case. The `-k` option closes that loophole.)

98573 Some of the file characteristics referenced in this volume of POSIX.1-200x might not be
 98574 supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the
 98575 file access time. For this reason, the *e* specification character has been provided, intended to
 98576 cause all file characteristics specified in the archive to be retained.

98577 It is required that extracted directories, by default, have their access and modification times and
 98578 permissions set to the values specified in the archive. This has obvious problems in that the
 98579 directories are almost certainly modified after being extracted and that directory permissions
 98580 may not permit file creation. One possible solution is to create directories with the mode
 98581 specified in the archive, as modified by the *umask* of the user, with sufficient permissions to
 98582 allow file creation. After all files have been extracted, *pax* would then reset the access and
 98583 modification times and permissions as necessary.

98584 The list-mode formatting description borrows heavily from the one defined by the *printf* utility.
 98585 However, since there is no separate operand list to get conversion arguments, the format was
 98586 extended to allow specifying the name of the conversion argument as part of the conversion
 98587 specification.

98588 The **T** conversion specifier allows time fields to be displayed in any of the date formats. Unlike
 98589 the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past.
 98590 This makes parsing the output more predictable.

98591 The **D** conversion specifier handles the ability to display the major/minor or file size, as with *ls*,
 98592 by using `%-8(size)D`.

98593 The **L** conversion specifier handles the *ls* display for symbolic links.

98594 Conversion specifiers were added to generate existing known types used for *ls*.

pax Interchange Format

The new POSIX data interchange format was developed primarily to satisfy international concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers realized that this new POSIX data interchange format should be very extensible because there were other requirements they foresaw in the near future:

- Support international character encodings and locale information
- Support security information (ACLs, and so on)
- Support future file types, such as realtime or contiguous files
- Include data areas for implementation use
- Support systems with words larger than 32 bits and timers with subsecond granularity

The following were not goals for this format because these are better handled by separate utilities or are inappropriate for a portable format:

- Encryption
- Compression
- Data translation between locales and codesets
- *inode* storage

The format chosen to support the goals is an extension of the **ustar** format. Of the two formats previously available, only the **ustar** format was selected for extensions because:

- It was easier to extend in an upwards-compatible way. It offered version flags and header block type fields with room for future standardization. The **cpio** format, while possessing a more flexible file naming methodology, could not be extended without breaking some theoretical implementation or using a dummy filename that could be a legitimate filename.
- Industry experience since the original “tar wars” fought in developing the ISO POSIX-1 standard has clearly been in favor of the **ustar** format, which is generally the default output format selected for *pax* implementations on new systems.

The new format was designed with one additional goal in mind: reasonable behavior when an older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this allowed the format to include all the extended information in a pseudo-regular file that preceded each real file. An option is given that allows the archive creator to set up reasonable names for these files on the older systems. Also, the normative text suggests that reasonable file access values be used for this **ustar** header block. Making these header files inaccessible for convenient reading and deleting would not be reasonable. File permissions of 600 or 700 are suggested.

The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous version of *pax*), mandated the behavior of the format-reading utility when it encountered an unknown *typeflag*, but was silent about the other two fields.

Early proposals for the first version of this standard contained a proposed archive format that was based on compatibility with the standard for tape files (ISO 1001, similar to the format used historically on many mainframes and minicomputers). This format was overly complex and required considerable overhead in volume and header records. Furthermore, the standard developers felt that it would not be acceptable to the community of POSIX developers, so it was later changed to be a format more closely related to historical practice on POSIX systems.

98640 The prefix and name split of pathnames in **ustar** was replaced by the single path extended
 98641 header record for simplicity.

98642 The concept of a global extended header (*typeflag*) was controversial. If this were applied to an
 98643 archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape
 98644 could be a serious problem; a utility attempting to extract as many files as possible from a
 98645 damaged archive could lose a large percentage of file header information in this case. However,
 98646 if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers
 98647 considerable potential size reductions by eliminating redundant information. Thus, the text
 98648 warns against using the global method for unreliable media and provides a method for
 98649 implanting global information in the extended header for each file, rather than in the *typeflag* **g**
 98650 records.

98651 No facility for data translation or filtering on a per-file basis is included because the standard
 98652 developers could not invent an interface that would allow this in an efficient manner. If a filter,
 98653 such as encryption or compression, is to be applied to all the files, it is more efficient to apply the
 98654 filter to the entire archive as a single file. The standard developers considered interfaces that
 98655 would invoke a shell script for each file going into or out of the archive, but the system overhead
 98656 in this approach was considered to be too high.

98657 One such approach would be to have **filter=** records that give a pathname for an executable.
 98658 When the program is invoked, the file and archive would be open for standard input/output
 98659 and all the header fields would be available as environment variables or command-line
 98660 arguments. The standard developers did discuss such schemes, but they were omitted from
 98661 POSIX.1-200x due to concerns about excessive overhead. Also, the program itself would need to
 98662 be in the archive if it were to be used portably.

98663 There is currently no portable means of identifying the character set(s) used for a file in the file
 98664 system. Therefore, *pax* has not been given a mechanism to generate charset records
 98665 automatically. The only portable means of doing this is for the user to write the archive using the
 98666 **-ocharset=string** command line option. This assumes that all of the files in the archive use the
 98667 same encoding. The “implementation-defined” text is included to allow for a system that can
 98668 identify the encodings used for each of its files.

98669 The table of standards that accompanies the charset record description is acknowledged to be
 98670 very limited. Only a limited number of character set standards is reasonable for maximal
 98671 interchange. Any character set is, of course, possible by prior agreement. It was suggested that
 98672 EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal
 98673 standards, and then only those with reasonably large followings, can be included here, simply as
 98674 a matter of practicality. The *<value>*s represent names of officially registered character sets in the
 98675 format required by the ISO 2375:1985 standard.

98676 The normal comma or *<blank>*-separated list rules are not followed in the case of keyword
 98677 options to allow ease of argument parsing for *getopts*.

98678 Further information on character encodings is in [pax Archive Character Set Encoding/Decoding](#)
 98679 (on page 2956).

98680 The standard developers have reserved keyword name space for vendor extensions. It is
 98681 suggested that the format to be used is:

98682 *VENDOR.keyword*

98683 where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further
 98684 suggested that the keyword following the period be named differently than any of the standard
 98685 keywords so that it could be used for future standardization, if appropriate, by omitting the
 98686 *VENDOR* prefix.

98687 The *<length>* field in the extended header record was included to make it simpler to step
 98688 through the records, even if a record contains an unknown format (to a particular *pax*) with

98689 complex interactions of special characters. It also provides a minor integrity checkpoint within
 98690 the records to aid a program attempting to recover files from a damaged archive.

98691 There are no extended header versions of the *devmajor* and *devminor* fields because the
 98692 unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific
 98693 extended keywords (such as *VENDOR.devmajor*) should be used.

98694 Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly
 98695 on a symbolic name basis, as in **ustar**.

98696 Just as with the **ustar** format descriptions, the new format makes no special arrangements for
 98697 multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file
 98698 and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing
 98699 their labels, and mounting each in the proper sequence are considered to be implementation
 98700 details that cannot be described portably.

98701 The **pax** format is intended for interchange, not only for backup on a single (family of) systems.
 98702 It is not as densely packed as might be possible for backup:

- 98703 • It contains information as coded characters that could be coded in binary.
- 98704 • It identifies extended records with name fields that could be omitted in favor of a fixed-
 98705 field layout.
- 98706 • It translates names into a portable character set and identifies locale-related information,
 98707 both of which are probably unnecessary for backup.

98708 The requirements on restoring from an archive are slightly different from the historical wording,
 98709 allowing for non-monolithic privilege to bring forward as much as possible. In particular,
 98710 attributes such as “high performance file” might be broadly but not universally granted while
 98711 set-user-ID or *chown()* might be much more restricted. There is no implication in POSIX.1-200x
 98712 that the security information be honored after it is restored to the file hierarchy, in spite of what
 98713 might be improperly inferred by the silence on that topic. That is a topic for another standard.

98714 Links are recorded in the fashion described here because a link can be to any file type. It is
 98715 desirable in general to be able to restore part of an archive selectively and restore all of those files
 98716 completely. If the data is not associated with each link, it is not possible to do this. However, the
 98717 data associated with a file can be large, and when selective restoration is not needed, this can be
 98718 a significant burden. The archive is structured so that files that have no associated data can
 98719 always be restored by the name of any link name of any link, and the user may choose whether
 98720 data is recorded with each instance of a file that contains data. The format permits mixing of
 98721 both types of links in a single archive; this can be done for special needs, and *pax* is expected to
 98722 interpret such archives on input properly, despite the fact that there is no *pax* option that would
 98723 force this mixed case on output. (When **-o linkdata** is used, the output must contain the
 98724 duplicate data, but the implementation is free to include it or omit it when **-o linkdata** is not
 98725 used.)

98726 The time values are included as extended header records for those implementations needing
 98727 more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be
 98728 negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject
 98729 the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a
 98730 leading ‘-’. Even though some implementations can support finer file-time granularities than
 98731 seconds, the normative text requires support only for seconds since the Epoch because the
 98732 ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new
 98733 format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will
 98734 be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification
 98735 time) is described with “appropriate privilege” so that it can be ignored when writing to the file
 98736 system. POSIX does not provide a portable means to change file creation time. Nothing is
 98737 intended to prevent a non-portable implementation of *pax* from restoring the value.

98738 The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the
 98739 sizes specified in the regular *tar* header. New file system architectures are emerging that will
 98740 exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits
 98741 for user and group IDs, but the extended header values were included for completeness,
 98742 allowing overrides for all of the decimal values in the *tar* header.

98743 The standard developers intended to describe the effective results of *pax* with regard to file
 98744 ownerships and permissions; implementations are not restricted in timing or sequencing the
 98745 restoration of such, provided the results are as specified.

98746 Much of the text describing the extended headers refers to use in “**write or copy modes**”. The
 98747 **copy** mode references are due to the normative text: “The effect of the copy shall be as if the
 98748 copied files were written to an archive file and then subsequently extracted ...”. There is
 98749 certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode,
 98750 but the effects must be as if it had.

98751 **pax Archive Character Set Encoding/Decoding**

98752 There is a need to exchange archives of files between systems of different native codesets.
 98753 Filenames, group names, and user names must be preserved to the fullest extent possible when
 98754 an archive is read on the receiving platform. Translation of the contents of files is not within the
 98755 scope of the *pax* utility.

98756 There will also be the need to represent characters that are not available on the receiving
 98757 platform. These unsupported characters cannot be automatically folded to the local set of
 98758 characters due to the chance of collisions. This could result in overwriting previous extracted
 98759 files from the archive or pre-existing files on the system.

98760 For these reasons, the codeset used to represent characters within the extended header records of
 98761 the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields
 98762 requiring translation include, at a minimum, filenames, user names, group names, and link
 98763 pathnames. Implementations may wish to have localized extended keywords that use non-
 98764 portable characters.

98765 The standard developers considered the following options:

- 98766 • The archive creator specifies the well-defined name of the source codeset. The receiver
 98767 must then recognize the codeset name and perform the appropriate translations to the
 98768 destination codeset.
- 98769 • The archive creator includes within the archive the character mapping table for the source
 98770 codeset used to encode extended header records. The receiver must then read the
 98771 character mapping table and perform the appropriate translations to the destination
 98772 codeset.
- 98773 • The archive creator translates the extended header records in the source codeset into a
 98774 canonical form. The receiver must then perform the appropriate translations to the
 98775 destination codeset.

98776 The approach that incorporates the name of the source codeset poses the problem of codeset
 98777 name registration, and makes the archive useless to *pax* archive decoders that do not recognize
 98778 that codeset.

98779 Because parts of an archive may be corrupted, the standard developers felt that including the
 98780 character map of the source codeset was too fragile. The loss of this one key component could
 98781 result in making the entire archive useless. (The difference between this and the global extended
 98782 header decision was that the latter has a workaround—duplicating extended header records on
 98783 unreliable media—but this would be too burdensome for large character set maps.)

98784 Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the

98785 cross-product of all source and destination codesets.

98786 To simplify the translation from the source codeset to the canonical form and from the canonical
 98787 form to the destination codeset, the standard developers decided that the internal representation
 98788 should be a stateless encoding. A stateless encoding is one where each codepoint has the same
 98789 meaning, without regard to the decoder being in a specific state. An example of a stateful
 98790 encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the
 98791 ISO/IEC 646: 1991 standard (equivalent to 7-bit ASCII).

98792 For these reasons, the standard developers decided to adopt a canonical format for the
 98793 representation of file information strings. The obvious, well-endorsed candidate is the
 98794 ISO/IEC 10646-1: 2000 standard (based in part on Unicode), which can be used to represent the
 98795 characters of virtually all standardized character sets. The standard developers initially agreed
 98796 upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters
 98797 provides a sufficiently rich set to represent all commonly-used codesets.

98798 However, the standard developers found that the 16-bit Unicode representation had some
 98799 problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character
 98800 made the extended header records twice as long for the case of strings coded entirely from
 98801 historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the
 98802 ISO/IEC 10646-1: 2000 standard. This multi-byte representation encodes UCS2 or UCS4
 98803 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In
 98804 addition, NUL octets and other characters possibly confusing to POSIX file systems do not
 98805 appear, except to represent themselves. It was realized that certain national codesets take up
 98806 more space after the encoding, due to their placement within the UCS range; it was felt that the
 98807 usefulness of the encoding of the names outweighs the disadvantage of size increase for file,
 98808 user, and group names.

98809 The encoding of UTF-8 is as follows:

98810	UCS4 Hex Encoding	UTF-8 Binary Encoding
98811	00000000-0000007F	0xxxxxxx
98812	00000080-000007FF	110xxxxx 10xxxxxx
98813	00000800-0000FFFF	1110xxxx 10xxxxxx 10xxxxxx
98814	00010000-001FFFFFFF	11110xxx 10xxxxxx 10xxxxxx 10xxxxxx
98815	00200000-03FFFFFFF	111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx
98816	04000000-7FFFFFFF	1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx

98817 where each 'x' represents a bit value from the character being translated.

98818 **ustar Interchange Format**

98819 The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of
 98820 the historical *tar* utility. The goal of these changes was not only to provide the functional
 98821 enhancements desired, but also to retain compatibility between new and old versions. This
 98822 compatibility has been retained. Archives written using the old archive format are compatible
 98823 with the new format.

98824 Implementors should be aware that the previous file format did not include a mechanism to
 98825 archive directory type files. For this reason, the convention of using a filename ending with slash
 98826 was adopted to specify a directory on the archive.

98827 The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for
 98828 {PATH_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname
 98829 be stored there without the use of the *prefix* field. Although the name field is known to be too
 98830 small to contain {PATH_MAX} characters, the value was not changed in this version of the
 98831 archive file format to retain backwards-compatibility, and instead the prefix was introduced.
 98832 Also, because of the earlier version of the format, there is no way to remove the restriction on the

98833 *linkname* field being limited in size to just that of the *name* field.

98834 The *size* field is required to be meaningful in all implementation extensions, although it could be
98835 zero. This is required so that the data blocks can always be properly counted.

98836 It is suggested that if device special files need to be represented that cannot be represented in the
98837 standard format, that one of the extension types (A-Z) be used, and that the additional
98838 information for the special file be represented as data and be reflected in the *size* field.

98839 Attempting to restore a special file type, where it is converted to ordinary data and conflicts with
98840 an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax*
98841 should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is
98842 converted to another type or not). If run as a privileged user, it should be able to do so, and it
98843 would be considered a bug if it did not. The same is true of ordinary data files and similarly
98844 named special files; it is impossible to anticipate the needs of the user (who could really intend
98845 to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the
98846 protection system as required.

98847 The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a
98848 **ustar** archive. POSIX.1-200x does not require the contiguous file extension, but does define a
98849 standard way of archiving such files so that all conforming systems can interpret these file types
98850 in a meaningful and consistent manner. On a system that does not support extended file types,
98851 the *pax* utility should do the best it can with the file and go on to the next.

98852 The file protection modes are those conventionally used by the *ls* utility. This is extended beyond
98853 the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is intended
98854 that the conformance document should not document anything beyond the existence of and
98855 support of such a mode. Further extensions are expected to these bits, particularly with
98856 overloading the set-user-ID and set-group-ID flags.

98857 **cpio Interchange Format**

98858 The reference to appropriate privilege in the **cpio** format refers to an error on standard output;
98859 the **ustar** format does not make comparable statements.

98860 The model for this format was the historical System V *cpio-c* data interchange format. This
98861 model documents the portable version of the **cpio** format and not the binary version. It has the
98862 flexibility to transfer data of any type described within POSIX.1-200x, yet is extensible to transfer
98863 data types specific to extensions beyond POSIX.1-200x (for example, contiguous files). Because it
98864 describes existing practice, there is no question of maintaining upwards-compatibility.

98865 **cpio Header**

98866 There has been some concern that the size of the *c_ino* field of the header is too small to handle
98867 those systems that have very large *inode* numbers. However, the *c_ino* field in the header is used
98868 strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as
98869 the *inode* number of the file in the location from which that file is extracted.

98870 The name *c_magic* is based on historical usage.

98871 **cpio Filename**

98872 For most historical implementations of the *cpio* utility, {PATH_MAX} octets can be used to
98873 describe the pathname without the addition of any other header fields (the NUL character
98874 would be included in this count). {PATH_MAX} is the minimum value for pathname size,
98875 documented as 256 bytes. However, an implementation may use *c_namesize* to determine the
98876 exact length of the pathname. With the current description of the **<cpio.h>** header, this
98877 pathname size can be as large as a number that is described in six octal digits.

98878 Two values are documented under the *c_mode* field values to provide for extensibility for known

98879 file types:

98880 **0110 000** Reserved for contiguous files. The implementation may treat the rest of the
 98881 information for this archive like a regular file. If this file type is undefined, the
 98882 implementation may create the file as a regular file.

98883 This provides for extensibility of the **cpio** format while allowing for the ability to read old
 98884 archives. Files of an unknown type may be read as “regular files” on some implementations. On
 98885 a system that does not support extended file types, the *pax* utility should do the best it can with
 98886 the file and go on to the next.

98887 FUTURE DIRECTIONS

98888 None.

98894 CHANGE HISTORY

98895 First released in Issue 4.

98896 Issue 5

98897 A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only
 98898 support files up to 8 gigabytes in size.

98899 Issue 6

98900 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 98901 • Support has been added for symbolic links in the options and interchange formats.
- 98902 • A new format has been devised, based on extensions to **ustar**.
- 98903 • References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990
 98904 standard have been changed to remove the “extended” adjective because this could cause
 98905 confusion with the extended *tar* header added in this version. (All references to *tar* are
 98906 actually to **ustar**.)

98907 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

98908 IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can
 98909 ignore an [EEXIST] error when extracting an archive.

98910 IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when
 98911 in **read** mode.

98912 IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

98913 IEEE PASC Interpretation 1003.2 #195 is applied.

98914 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,
 98915 and **-l** options.

98916 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of
 98917 the *pax* process into certain fields. This change provides a method for the implementation to
 98918 ensure that different instances of *pax* extracting a file named **/a/b/foo** will not collide when
 98919 processing the extended header information associated with **foo**.

98920 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing **-x B** to **-x pax** in
 98921 the OPTIONS section.

98922 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/20 is applied, updating the SYNOPSIS to

- 98923 be consistent with the normative text.
- 98924 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/21 is applied, updating the
98925 DESCRIPTION to describe the behavior when files to be linked are symbolic links and the
98926 system is not capable of making hard links to symbolic links.
- 98927 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/22 is applied, updating the OPTIONS
98928 section to describe the behavior for how multiple **-odelete=pattern** options are to be handled.
- 98929 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/23 is applied, updating the **write** option
98930 within the OPTIONS section.
- 98931 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/24 is applied, adding a paragraph into
98932 the OPTIONS section that states that specifying more than one of the mutually-exclusive options
98933 (**-H** and **-L**) is not considered an error and that the last option specified will determine the
98934 behavior of the utility.
- 98935 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/25 is applied, removing the *ctime*
98936 paragraph within the EXTENDED DESCRIPTION. There is a contradiction in the definition of
98937 the *ctime* keyword for the *pax* extended header, in that the *st_ctime* member of the **stat** structure
98938 does not refer to a file creation time. No field in the standard **stat** structure from **<sys/stat.h>**
98939 includes a file creation time.
- 98940 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/26 is applied, making it clear that *typeflag*
98941 1 (**ustar** Interchange Format) applies not only to files that are hard-linked, but also to files that
98942 are aliased via symlinks.
- 98943 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/27 is applied, clarifying the *cpio c_nlink*
98944 field.
- 98945 **Issue 7**
- 98946 Austin Group Interpretations 1003.1-2001 #011, #036, #086, and #109 are applied. +
- 98947 SD5-XCU-ERN-2 is applied, making **-c** and **-n** mutually-exclusive in the SYNOPSIS.
- 98948 SD5-XCU-ERN-3 is applied, revising the default behavior of **-H** and **-L**.
- 98949 SD5-XCU-ERN-5, SD5-XCU-ERN-6, SD5-XCU-ERN-7, SD5-XCU-ERN-60 are applied.
- 98950 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS. -

98951 **NAME**

98952 pr — print files

98953 **SYNOPSIS**

98954 pr [+page] [-column] [-adFmrt] [-e[*char*][*gap*]] [-h *header*] [-i[*char*][*gap*]]
 98955 XSI [-l *lines*] [-n[*char*][*width*]] [-o *offset*] [-s[*char*]] [-w *width*] [-fp]
 98956 [*file...*]

98957 **DESCRIPTION**

98958 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be
 98959 read, formatted, and written to standard output. By default, the input shall be separated into
 98960 66-line pages, each with:

- 98961 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 98962 • A 5-line trailer consisting of blank lines

98963 If standard output is associated with a terminal, diagnostic messages shall be deferred until the
 98964 *pr* utility has completed processing.

98965 When options specifying multi-column output are specified, output text columns shall be of
 98966 equal width; input lines that do not fit into a text column shall be truncated. By default, text
 98967 columns shall be separated with at least one <blank>.

98968 **OPTIONS**

98969 The *pr* utility shall conform to XBD [Section 12.2](#) (on page 201), except that: the *page* option has a
 98970 '+' delimiter; *page* and *column* can be multi-digit numbers; some of the option-arguments are
 98971 optional; and some of the option-arguments cannot be specified as separate arguments from the
 98972 preceding option letter. In particular, the *-s* option does not allow the option letter to be
 98973 separated from its argument, and the options *-e*, *-i*, and *-n* require that both arguments, if
 98974 present, not be separated from the option letter.

98975 The following options shall be supported. In the following option descriptions, *column*, *lines*,
 98976 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

98977 **+page** Begin output at page number *page* of the formatted input.

98978 **-column** Produce multi-column output that is arranged in *column* columns (the default shall
 98979 be 1) and is written down each column in the order in which the text is received
 98980 from the input file. This option should not be used with *-m*. The options *-e* and *-i*
 98981 shall be assumed for multiple text-column output. Whether or not text columns are
 98982 produced with identical vertical lengths is unspecified, but a text column shall
 98983 never exceed the length of the page (see the *-l* option). When used with *-t*, use the
 98984 minimum number of lines to write the output.

98985 **-a** Modify the effect of the *-column* option so that the columns are filled across the
 98986 page in a round-robin order (for example, when *column* is 2, the first input line
 98987 heads column 1, the second heads column 2, the third is the second line in column
 98988 1, and so on).

98989 **-d** Produce output that is double-spaced; append an extra <newline> following every
 98990 <newline> found in the input.

98991 **-e[*char*][*gap*]**

98992 Expand each input <tab> to the next greater column position specified by the
 98993 formula $n*gap+1$, where *n* is an integer > 0. If *gap* is zero or is omitted, it shall
 98994 default to 8. All <tab>s in the input shall be expanded into the appropriate number
 98995 of <space>s. If any non-digit character, *char*, is specified, it shall be used as the

98996		input <tab>. If the first character of the -e option-argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> .
98997		
98998	XSI	-f Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline>s. Pause before beginning the first page if the standard output is associated with a terminal.
98999		
99000		
99001		-F Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline>s.
99002		
99003		-h header Use the string <i>header</i> to replace the contents of the <i>file</i> operand in the page header.
99004		-i[char][gap] In output, replace <space>s with <tab>s wherever one or more adjacent <space>s reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so on. If <i>gap</i> is zero or is omitted, default tab settings at every eighth column position shall be assumed. If any non-digit character, <i>char</i> , is specified, it shall be used as the output <tab>. If the first character of the -i option-argument is a digit, the entire option-argument shall be assumed to be <i>gap</i> .
99005		
99006		
99007		
99008		
99009		
99010		-l lines Override the 66-line default and reset the page length to <i>lines</i> . If <i>lines</i> is not greater than the sum of both the header and trailer depths (in lines), the <i>pr</i> utility shall suppress both the header and trailer, as if the -t option were in effect.
99011		
99012		
99013		-m Merge files. Standard output shall be formatted so the <i>pr</i> utility writes one line from each file specified by a <i>file</i> operand, side by side into text columns of equal fixed widths, in terms of the number of column positions. Implementations shall support merging of at least nine <i>file</i> operands.
99014		
99015		
99016		
99017		-n[char][width]
99018		Provide <i>width</i> -digit line numbering (default for <i>width</i> shall be 5). The number shall occupy the first <i>width</i> column positions of each text column of default output or each line of -m output. If <i>char</i> (any non-digit character) is given, it shall be appended to the line number to separate it from whatever follows (default for <i>char</i> is a <tab>).
99019		
99020		
99021		
99022		
99023		-o offset Each line of output shall be preceded by offset <space>s. If the -o option is not specified, the default offset shall be zero. The space taken is in addition to the output line width (see the -w option below).
99024		
99025		
99026		-p Pause before beginning each page if the standard output is directed to a terminal (<i>pr</i> shall write an <alert> to standard error and wait for a <carriage-return> to be read on <i>/dev/tty</i>).
99027		
99028		
99029		-r Write no diagnostic reports on failure to open files.
99030		-s[char] Separate text columns by the single character <i>char</i> instead of by the appropriate number of <space>s (default for <i>char</i> shall be <tab>).
99031		
99032		-t Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.
99033		
99034		
99035		-w width Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the -w option is not specified and the -s option is not specified, the default width shall be 72. If the -w option is not specified and the -s option is specified, the default width shall be 512.
99036		
99037		
99038		
99039		For single column output, input lines shall not be truncated.

99040 **OPERANDS**

99041 The following operand shall be supported:

99042 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*
99043 operand is '-', the standard input shall be used.99044 **STDIN**99045 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.
99046 See the INPUT FILES section.99047 **INPUT FILES**

99048 The input files shall be text files.

99049 The file */dev/tty* shall be used to read responses required by the **-p** option.99050 **ENVIRONMENT VARIABLES**99051 The following environment variables shall affect the execution of *pr*:99052 *LANG* Provide a default value for the internationalization variables that are unset or null. |
99053 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
99054 used to determine the values of locale categories.)99055 *LC_ALL* If set to a non-empty string value, override the values of all the other
99056 internationalization variables.99057 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
99058 characters (for example, single-byte as opposed to multi-byte characters in
99059 arguments and input files) and which characters are defined as printable (character
99060 class **print**). Non-printable characters are still written to standard output, but are
99061 not counted for the purpose for column-width and line-length calculations.99062 *LC_MESSAGES*
99063 Determine the locale that should be used to affect the format and contents of
99064 diagnostic messages written to standard error.99065 *LC_TIME* Determine the format of the date and time for use in writing header lines.99066 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.99067 *TZ* Determine the timezone used to calculate date and time strings written in header
99068 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.99069 **ASYNCHRONOUS EVENTS**99070 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error
99071 messages to the screen before terminating.99072 **STDOUT**99073 The *pr* utility output shall be a paginated version of the original file (or files). This pagination
99074 shall be accomplished using either `<form-feed>`s or a sequence of `<newline>`s, as controlled by
99075 XSI the **-F** or **-f** option. Page headers shall be generated unless the **-t** option is specified. The page
99076 headers shall be of the form:99077 `"\n\n%s %s Page %d\n\n\n", <output of date>, <file>, <page number>`99078 In the POSIX locale, the `<output of date>` field, representing the date and time of last modification
99079 of the input file (or the current date and time if the input file is standard input), shall be
99080 equivalent to the output of the following command as it would appear if executed at the given
99081 time:99082 `date "+%b %e %H:%M %Y"`99083 without the trailing `<newline>`, if the page being written is from standard input. If the page
99084 being written is not from standard input, in the POSIX locale, the same format shall be used, but

99085 the time used shall be the modification time of the file corresponding to *file* instead of the current
 99086 time. When the *LC_TIME* locale category is not set to the POSIX locale, a different format and
 99087 order of presentation of this field may be used.

99088 If the standard input is used instead of a *file* operand, the *<file>* field shall be replaced by a null
 99089 string.

99090 If the **-h** option is specified, the *<file>* field shall be replaced by the *header* argument.

99091 **STDERR**

99092 The standard error shall be used for diagnostic messages and for alerting the terminal when **-p**
 99093 is specified.

99094 **OUTPUT FILES**

99095 None.

99096 **EXTENDED DESCRIPTION**

99097 None.

99098 **EXIT STATUS**

99099 The following exit values shall be returned:

99100 0 Successful completion.

99101 >0 An error occurred.

99102 **CONSEQUENCES OF ERRORS**

99103 Default.

99104 **APPLICATION USAGE**

99105 A conforming application must protect its first operand, if it starts with a plus sign, by preceding
 99106 it with the **--** argument that denotes the end of the options. For example, *pr+x* could be
 99107 interpreted as an invalid page number or a *file* operand.

99108 **EXAMPLES**

- 99109 1. Print a numbered list of all files in the current directory:

```
99110 ls -a | pr -n -h "Files in $(pwd)."
```

- 99111 2. Print **file1** and **file2** as a double-spaced, three-column listing headed by "file list":

```
99112 pr -3d -h "file list" file1 file2
```

- 99113 3. Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

```
99114 pr -e9 -t <file1 >file2
```

99115 **RATIONALE**

99116 This utility is one of those that does not follow the Utility Syntax Guidelines because of its
 99117 historical origins. The standard developers could have added new options that obeyed the
 99118 guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are
 99119 examples of both actions in this volume of POSIX.1-200x. Because of its widespread use by
 99120 historical applications, the standard developers decided to exempt this version of *pr* from many
 99121 of the guidelines.

99122 Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options
 99123 whether presented as part of the same argument or as a separate argument to *pr*, as suggested by
 99124 the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical
 99125 practice because they are frequently specified without their optional arguments. If a *<blank>*
 99126 were allowed before the option-argument in these cases, a *file* operand could mistakenly be
 99127 interpreted as an option-argument in historical applications.

99128 The text about the minimum number of lines in multi-column output was included to ensure

99129 that a best effort is made in balancing the length of the columns. There are known historical
 99130 implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines
 99131 and a second of 4. Although this is not a problem when a full page with headers and trailers is
 99132 produced, it would be relatively useless when used with *-t*.

99133 Historical implementations of the *pr* utility have differed in the action taken for the *-f* option.
 99134 BSD uses it as described here for the *-F* option; System V uses it to change trailing *<newline>*s
 99135 on each page to a *<form-feed>* and, if standard output is a TTY device, sends an *<alert>* to
 99136 standard error and reads a line from */dev/tty* before the first page. There were strong arguments
 99137 from both sides of this issue concerning historical practice and as a result the *-F* option was
 99138 added. XSI-conformant systems support the System V historical actions for the *-f* option.

99139 The *<output of date>* field in the *-l* format is specified only for the POSIX locale. As noted, the
 99140 format can be different in other locales. No mechanism for defining this is present in this volume
 99141 of POSIX.1-200x, as the appropriate vehicle is a message catalog; that is, the format should be
 99142 specified as a “message”.

99143 FUTURE DIRECTIONS

99144 None.

99145 SEE ALSO

99147 XBD Chapter 8 (on page 159), Section 12.2 (on page 201)

99148 CHANGE HISTORY

99149 First released in Issue 2.

99150 Issue 6

99151 The following new requirements on POSIX implementations derive from alignment with the
 99152 Single UNIX Specification:

- 99153 • The *-p* option is added.

99154 The normative text is reworded to avoid use of the term “must” for application requirements.

99155 Issue 7

99156 PASC Interpretation 1003.2-92 #151 (SD5-XCU-ERN-44) is applied.

99157 Austin Group Interpretation 1003.1-2001 #093 is applied.

99158 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99159 **NAME**99160 `printf` — write formatted output99161 **SYNOPSIS**99162 `printf format [argument...]`99163 **DESCRIPTION**99164 The *printf* utility shall write formatted operands to the standard output. The *argument* operands
99165 shall be formatted under control of the *format* operand.99166 **OPTIONS**

99167 None.

99168 **OPERANDS**

99169 The following operands shall be supported:

99170 *format* A string describing the format to use to write the remaining operands. See the
99171 EXTENDED DESCRIPTION section.99172 *argument* The strings to be written to standard output, under the control of *format*. See the
99173 EXTENDED DESCRIPTION section.99174 **STDIN**

99175 Not used.

99176 **INPUT FILES**

99177 None.

99178 **ENVIRONMENT VARIABLES**99179 The following environment variables shall affect the execution of *printf*:99180 *LANG* Provide a default value for the internationalization variables that are unset or null. |
99181 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
99182 used to determine the values of locale categories.)99183 *LC_ALL* If set to a non-empty string value, override the values of all the other
99184 internationalization variables.99185 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
99186 characters (for example, single-byte as opposed to multi-byte characters in
99187 arguments).99188 *LC_MESSAGES*99189 Determine the locale that should be used to affect the format and contents of
99190 diagnostic messages written to standard error.99191 *LC_NUMERIC*99192 Determine the locale for numeric formatting. It shall affect the format of numbers
99193 written using the *e*, *E*, *f*, *g*, and *G* conversion specifier characters (if supported).99194 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.99195 **ASYNCHRONOUS EVENTS**

99196 Default.

99197 **STDOUT**

99198 See the EXTENDED DESCRIPTION section.

99199 **STDERR**
 99200 The standard error shall be used only for diagnostic messages.

99201 **OUTPUT FILES**
 99202 None.

99203 EXTENDED DESCRIPTION

99204 The *format* operand shall be used as the *format* string described in XBD Chapter 5 (on page 107)
 99205 with the following exceptions:

- 99206 1. A <space> in the format string, in any context other than a flag of a conversion
 99207 specification, shall be treated as an ordinary character that is copied to the output.
- 99208 2. A ' Δ ' character in the format string shall be treated as a ' Δ ' character, not as a <space>.
- 99209 3. In addition to the escape sequences shown in XBD Chapter 5 (on page 107) ('\\', '\a',
 99210 '\b', '\f', '\n', '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit
 99211 octal number, shall be written as a byte with the numeric value specified by the octal
 99212 number.
- 99213 4. The implementation shall not precede or follow output from the *d* or *u* conversion
 99214 specifiers with <blank>s not specified by the *format* operand.
- 99215 5. The implementation shall not precede output from the *o* conversion specifier with zeros
 99216 not specified by the *format* operand.
- 99217 6. The *e*, *E*, *f*, *g*, and *G* conversion specifiers need not be supported.
- 99218 7. An additional conversion specifier character, *b*, shall be supported as follows. The
 99219 argument shall be taken to be a string that may contain backslash-escape sequences. The
 99220 following backslash-escape sequences shall be supported:
 - 99221 — The escape sequences listed in XBD Chapter 5 (on page 107) ('\\', '\a', '\b',
 99222 '\f', '\n', '\r', '\t', '\v'), which shall be converted to the characters they
 99223 represent
 - 99224 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be
 99225 converted to a byte with the numeric value specified by the octal number
 - 99226 — '\c', which shall not be written and shall cause *printf* to ignore any remaining
 99227 characters in the string operand containing it, any remaining string operands, and
 99228 any additional characters in the *format* operand

99229 The interpretation of a backslash followed by any other sequence of characters is
 99230 unspecified.

99231 Bytes from the converted string shall be written until the end of the string or the number
 99232 of bytes indicated by the precision specification is reached. If the precision is omitted, it
 99233 shall be taken to be infinite, so all bytes up to the end of the converted string shall be
 99234 written.

- 99235 8. For each conversion specification that consumes an argument, the next argument operand
 99236 shall be evaluated and converted to the appropriate type for the conversion as specified
 99237 below.
- 99238 9. The *format* operand shall be reused as often as necessary to satisfy the argument
 99239 operands. Any extra *c* or *s* conversion specifiers shall be evaluated as if a null string
 99240 argument were supplied; other extra conversion specifications shall be evaluated as if a
 99241 zero argument were supplied. If the *format* operand contains no conversion specifications
 99242 and *argument* operands are present, the results are unspecified.

- 99243 10. If a character sequence in the *format* operand begins with a '%' character, but does not
99244 form a valid conversion specification, the behavior is unspecified.

99245 The *argument* operands shall be treated as strings if the corresponding conversion specifier is b,
99246 c, or s; otherwise, it shall be evaluated as a C constant, as described by the ISO C standard, with
99247 the following extensions:

- 99248 • A leading plus or minus sign shall be allowed.
- 99249 • If the leading character is a single-quote or double-quote, the value shall be the numeric
99250 value in the underlying codeset of the character following the single-quote or double-
99251 quote.

99252 If an argument operand cannot be completely converted into an internal value appropriate to
99253 the corresponding conversion specification, a diagnostic message shall be written to standard
99254 error and the utility shall not exit with a zero exit status, but shall continue processing any
99255 remaining operands and shall write the value accumulated at the time the error was detected to
99256 standard output.

99257 It is not considered an error if an argument operand is not completely used for a c or s
99258 conversion or if a string operand's first or second character is used to get the numeric value of a
99259 character.

99260 EXIT STATUS

99261 The following exit values shall be returned:

- 99262 0 Successful completion.
- 99263 >0 An error occurred.

99264 CONSEQUENCES OF ERRORS

99265 Default.

99266 APPLICATION USAGE

99267 The floating-point formatting conversion specifications of *printf()* are not required because all
99268 arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations
99269 and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-
99270 point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility
99271 cannot really be used to format *bc* output; it does not support arbitrary precision.)
99272 Implementations are encouraged to support the floating-point conversions as an extension.

99273 Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of
99274 POSIX.1-200x on which it is based, makes no special provision for dealing with multi-byte
99275 characters when using the %c conversion specification or when a precision is specified in a %b or
99276 %s conversion specification. Applications should be extremely cautious using either of these
99277 features when there are multi-byte characters in the character set.

99278 No provision is made in this volume of POSIX.1-200x which allows field widths and precisions
99279 to be specified as '*' since the '*' can be replaced directly in the *format* operand using shell
99280 variable substitution. Implementations can also provide this feature as an extension if they so
99281 choose.

99282 Hexadecimal character constants as defined in the ISO C standard are not recognized in the
99283 *format* operand because there is no consistent way to detect the end of the constant. Octal
99284 character constants are limited to, at most, three octal digits, but hexadecimal character constants
99285 are only terminated by a non-hex-digit character. In the ISO C standard, the "##" concatenation
99286 operator can be used to terminate a constant and follow it with a hexadecimal character to be
99287 written. In the shell, concatenation occurs before the *printf* utility has a chance to parse the end
99288 of the hexadecimal constant.

99289 The %b conversion specification is not part of the ISO C standard; it has been added here as a

99290 portable way to process backslash escapes expanded in string operands as provided by the *echo*
 99291 utility. See also the APPLICATION USAGE section of *echo* (on page 2550) for ways to use *printf*
 99292 as a replacement for all of the traditional versions of the *echo* utility.

99293 If an argument cannot be parsed correctly for the corresponding conversion specification, the
 99294 *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end
 99295 of an argument being used for a numeric conversion shall be reported as errors.

99296 EXAMPLES

99297 To alert the user and then print and read a series of prompts:

```
99298 printf "\aPlease fill in the following: \nName: "  
99299 read name  
99300 printf "Phone number: "  
99301 read phone
```

99302 To read out a list of right and wrong answers from a file, calculate the percentage correctly, and
 99303 print them out. The numbers are right-justified and separated by a single <tab>. The percentage
 99304 is written to one decimal place of accuracy:

```
99305 while read right wrong ; do  
99306     percent=$(echo "scale=1;($right*100)/($right+$wrong)" | bc)  
99307     printf "%2d right\t%2d wrong\t(%s%%)\n" \  
99308         $right $wrong $percent  
99309 done < database_file
```

99310 The command:

```
99311 printf "%5d%4d\n" 1 21 321 4321 54321
```

99312 produces:

```
99313     1  21  
99314     3214321  
99315 54321  0
```

99316 Note that the *format* operand is used three times to print all of the given strings and that a '0'
 99317 was supplied by *printf* to satisfy the last %4d conversion specification.

99318 The *printf* utility is required to notify the user when conversion errors are detected while
 99319 producing numeric output; thus, the following results would be expected on an implementation
 99320 with 32-bit twos-complement integers when %d is specified as the *format* operand:

Argument	Standard Output	Diagnostic Output
5a	5	printf: "5a" not completely converted
9999999999	2147483647	printf: "9999999999" arithmetic overflow
-9999999999	-2147483648	printf: "-9999999999" arithmetic overflow
ABC	0	printf: "ABC" expected numeric value

99327 The diagnostic message format is not specified, but these examples convey the type of
 99328 information that should be reported. Note that the value shown on standard output is what
 99329 would be expected as the return value from the *strtol()* function as defined in the System
 99330 Interfaces volume of POSIX.1-200x. A similar correspondence exists between %u and *strtoul()*
 99331 and %e, %f, and %g (if the implementation supports floating-point conversions) and *strtod()*.

99332 In a locale using the ISO/IEC 646:1991 standard as the underlying codeset, the command:

```
99333 printf "%d\n" 3 +3 -3 \'3 \"+3 "'-3"
```

99334 produces:

- 99335 3 Numeric value of constant 3
- 99336 3 Numeric value of constant 3
- 99337 -3 Numeric value of constant -3
- 99338 51 Numeric value of the character '3' in the ISO/IEC 646:1991 standard codeset
- 99339 43 Numeric value of the character '+' in the ISO/IEC 646:1991 standard codeset
- 99340 45 Numeric value of the character '-' in the ISO/IEC 646:1991 standard codeset

Note that in a locale with multi-byte characters, the value of a character is intended to be the value of the equivalent of the **wchar_t** representation of the character as described in the System Interfaces volume of POSIX.1-200x.

RATIONALE

The *printf* utility was added to provide functionality that has historically been provided by *echo*. However, due to irreconcilable differences in the various versions of *echo* extant, the version has few special features, leaving those to this new *printf* utility, which is based on one in the Ninth Edition system.

The EXTENDED DESCRIPTION section almost exactly matches the *printf()* function in the ISO C standard, although it is described in terms of the file format notation in XBD Chapter 5 (on page 107).

FUTURE DIRECTIONS

None.

XSH *printf*

CHANGE HISTORY

First released in Issue 4.

Issue 7

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99362 **NAME**
 99363 prs — print an SCCS file (**DEVELOPMENT**)

99364 **SYNOPSIS**

```
99365 XSI prs [-a] [-d dataspec] [-r[SID]] file...
99366 prs [-e|-l] -c cutoff [-d dataspec] file...
99367 prs [-e|-l] -r[SID] [-d dataspec] file...
```

99368 **DESCRIPTION**

99369 The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied
 99370 format.

99371 **OPTIONS**

99372 The *prs* utility shall conform to XBD Section 12.2 (on page 201), except that the **-r** option has an
 99373 optional option-argument. This optional option-argument cannot be presented as a separate
 99374 argument. The following options shall be supported:

99375 **-d *dataspec*** Specify the output data specification. The *dataspec* shall be a string consisting of
 99376 SCCS file *data keywords* (see [Data Keywords](#), on page 2972) interspersed with
 99377 optional user-supplied text.

99378 **-r[*SID*]** Specify the SCCS identification string (SID) of a delta for which information is
 99379 desired. If no *SID* option-argument is specified, the SID of the most recently
 99380 created delta shall be assumed.

99381 **-e** Request information for all deltas created earlier than and including the delta
 99382 designated via the **-r** option or the date-time given by the **-c** option.

99383 **-l** Request information for all deltas created later than and including the delta
 99384 designated via the **-r** option or the date-time given by the **-c** option.

99385 **-c *cutoff*** Indicate the *cutoff* date-time, in the form:

99386 `YY[MM[DD[HH[MM[SS]]]]]`

99387 For the YY component, values in the range [69,99] shall refer to years 1969 to 1999
 99388 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.

99389 **Note:** It is expected that in a future version of this standard the default century inferred
 99390 from a 2-digit year will change. (This would apply to all commands accepting a
 99391 2-digit year as input.)

99392 No changes (deltas) to the SCCS file that were created after the specified *cutoff*
 99393 date-time shall be included in the output. Units omitted from the date-time default
 99394 to their maximum possible values; for example, **-c 7502** is equivalent to
 99395 **-c 750228235959**.

99396 **-a** Request writing of information for both removed—that is, *delta type=R* (see
 99397 *rm~~del~~*)—and existing—that is, *delta type=D_r*—deltas. If the **-a** option is not
 99398 specified, information for existing deltas only shall be provided.

99399 **OPERANDS**

99400 The following operand shall be supported:

99401 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*
 99402 utility shall behave as though each file in the directory were specified as a named
 99403 file, except that non-SCCS files (last component of the pathname does not begin
 99404 with **s.**) and unreadable files shall be silently ignored.

99405 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;
 99406 each line of the standard input shall be taken to be the name of an SCCS file to be
 99407 processed. Non-SCCS files and unreadable files shall be silently ignored.

STDIN

99408
 99409 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each
 99410 line of the text file shall be interpreted as an SCCS pathname.

INPUT FILES

99411
 99412 Any SCCS files displayed are files of an unspecified format.

ENVIRONMENT VARIABLES

99413
 99414 The following environment variables shall affect the execution of *prs*:

99415 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 99416 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 99417 used to determine the values of locale categories.)

99418 *LC_ALL* If set to a non-empty string value, override the values of all the other
 99419 internationalization variables.

99420 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 99421 characters (for example, single-byte as opposed to multi-byte characters in
 99422 arguments and input files).

99423 *LC_MESSAGES*
 99424 Determine the locale that should be used to affect the format and contents of
 99425 diagnostic messages written to standard error.

99426 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

99427
 99428 Default.

STDOUT

99429
 99430 The standard output shall be a text file whose format is dependent on the data keywords
 99431 specified with the *-d* option.

Data Keywords

99432
 99433 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an
 99434 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple
 99435 times.

99436 The information written by *prs* shall consist of:

- 99437 1. The user-supplied text
- 99438 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data
 99439 keywords in the order of appearance in the *dataspec*

99440 The format of a data keyword value shall either be simple (*'S'*), in which keyword substitution
 99441 is direct, or multi-line (*'M'*).

99442 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be
 99443 specified by *'\t'* and <newline> by *'\n'*. When the *-r* option is not specified, the default
 99444 *dataspec* shall be:

99445 *:PN::\n\n*

99446 and the following *dataspec* shall be used for each selected delta:

99447 *:Dt:\t:DL:\nMRS:\n:MR:COMMENTS:\n:C:*

*** The line statistics are capped at 99999. For example, if 100000 lines were unchanged in a certain revision, **:Lu:** shall produce the value 99999.

STDERR

The standard error shall be used only for diagnostic messages.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

None.

EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

None.

EXAMPLES

1. The following example:

```
prs -d "User Names for :F: are:\n:UN:" s.file
```

might write to standard output:

```
User Names for s.file are:
```

```
xyz
```

```
131
```

```
abc
```

2. The following example:

```
prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file
```

might write to standard output:

```
Delta for pgm main.c: 3.7 - 77/12/01 By cas
```

3. As a special case:

```
prs s.file
```

might write to standard output:

```
s.file:
```

```
<blank line>
```

```
D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000
```

99543 MRS :
 99544 b178-12345
 99545 b179-54321
 99546 COMMENTS :
 99547 this is the comment line for s.file initial delta
 99548 <blank line>

99549 for each delta table entry of the **D** type. The only option allowed to be used with this
 99550 special case is the **-a** option.

RATIONALE

99551 None.
 99552

FUTURE DIRECTIONS

99553 None.
 99554

CHANGE HISTORY

99558 First released in Issue 2.
 99559

Issue 5

99560 The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end
 99561 of the second paragraph of [Data Keywords](#) (on page 2972).
 99562

99563 The interpretation of the *YY* component of the **-c cutoff** argument is noted.

Issue 6

99564 The normative text is reworded to emphasize the term “shall” for implementation requirements.
 99565

99566 The Open Group Base Resolution bwg2001-007 is applied, updating the table in STDOUT with a
 99567 note that line statistics are capped at 99 999 for the **:Li:**, **:Ld:**, **:Lu:**, and **:DL:** keywords.

99568 The Open Group Interpretation PIN4C.00009 is applied.

Issue 7

99569 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
 99570

99571 NAME

99572 ps — report process status

99573 SYNOPSIS

```
99574 XSI ps [-aA] [-defl] [-g grouplist] [-G grouplist]
99575 [-n namelist] [-o format]... [-p proclist] [-t termlist]
99576 [-u userlist] [-U userlist]
```

99577 DESCRIPTION

99578 The *ps* utility shall write information about processes, subject to having the appropriate
 99579 privileges to obtain information about those processes.

99580 By default, *ps* shall select all processes with the same effective user ID as the current user and the
 99581 same controlling terminal as the invoker.

99582 OPTIONS

99583 The *ps* utility shall conform to XBD Section 12.2 (on page 201).

99584 The following options shall be supported:

99585 **-a** Write information for all processes associated with terminals. Implementations
 99586 may omit session leaders from this list.

99587 **-A** Write information for all processes.

99588 XSI **-d** Write information for all processes, except session leaders.

99589 XSI **-e** Write information for all processes. (Equivalent to **-A**.)

99590 XSI **-f** Generate a **full** listing. (See the STDOUT section for the contents of a **full** listing.)

99591 XSI **-g grouplist** Write information for processes whose session leaders are given in *grouplist*. The
 99592 application shall ensure that the *grouplist* is a single argument in the form of a
 99593 <blank> or comma-separated list.

99594 **-G grouplist** Write information for processes whose real group ID numbers are given in
 99595 *grouplist*. The application shall ensure that the *grouplist* is a single argument in the
 99596 form of a <blank> or comma-separated list.

99597 XSI **-l** Generate a **long** listing. (See STDOUT for the contents of a **long** listing.)

99598 XSI **-n namelist** Specify the name of an alternative system *namelist* file in place of the default. The
 99599 name of the default file and the format of a *namelist* file are unspecified.

99600 **-o format** Write information according to the format specification given in *format*. This is
 99601 fully described in the STDOUT section. Multiple **-o** options can be specified; the
 99602 format specification shall be interpreted as the <space>-separated concatenation of
 99603 all the *format* option-arguments.

99604 **-p proclist** Write information for processes whose process ID numbers are given in *proclist*.
 99605 The application shall ensure that the *proclist* is a single argument in the form of a
 99606 <blank> or comma-separated list.

99607 **-t termlist** Write information for processes associated with terminals given in *termlist*. The
 99608 application shall ensure that the *termlist* is a single argument in the form of a
 99609 <blank> or comma-separated list. Terminal identifiers shall be given in an
 99610 implementation-defined format. On XSI-conformant systems, they shall be given
 99611 in one of two forms: the device's filename (for example, **tty04**) or, if the device's
 99612 filename starts with **tty**, just the identifier following the characters **tty** (for example,
 99613 "04").

99614 XSI **-u *userlist*** Write information for processes whose user ID numbers or login names are given
 99615 in *userlist*. The application shall ensure that the *userlist* is a single argument in the
 99616 form of a <blank> or comma-separated list. In the listing, the numerical user ID
 99617 shall be written unless the **-f** option is used, in which case the login name shall be
 99618 written.

99619 **-U *userlist*** Write information for processes whose real user ID numbers or login names are
 99620 given in *userlist*. The application shall ensure that the *userlist* is a single argument
 99621 in the form of a <blank> or comma-separated list.

99622 With the exception of **-o *format***, all of the options shown are used to select processes. If any are
 99623 specified, the default list shall be ignored and *ps* shall select the processes represented by the
 99624 inclusive OR of all the selection-criteria options.

99625 OPERANDS

99626 None.

99627 STDIN

99628 Not used.

99629 INPUT FILES

99630 None.

99631 ENVIRONMENT VARIABLES

99632 The following environment variables shall affect the execution of *ps*:

99633 **COLUMNS** Override the system-selected horizontal display line size, used to determine the |
 99634 number of text columns to display. See XBD [Chapter 8](#) (on page 159) for valid |
 99635 values and results when it is unset or null.

99636 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 99637 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables |
 99638 used to determine the values of locale categories.)

99639 **LC_ALL** If set to a non-empty string value, override the values of all the other
 99640 internationalization variables.

99641 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 99642 characters (for example, single-byte as opposed to multi-byte characters in
 99643 arguments).

99644 **LC_MESSAGES**
 99645 Determine the locale that should be used to affect the format and contents of
 99646 diagnostic messages written to standard error and informative messages written to
 99647 standard output.

99648 **LC_TIME** Determine the format and contents of the date and time strings displayed.

99649 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

99650 **TZ** Determine the timezone used to calculate date and time strings displayed. If **TZ** is
 99651 unset or null, an unspecified default timezone shall be used.

99652 ASYNCHRONOUS EVENTS

99653 Default.

99654 STDOUT

99655 When the **-o** option is not specified, the standard output format is unspecified.

99656	XSI	On XSI-conformant systems, the output format shall be as follows. The column headings and descriptions of the columns in a <i>ps</i> listing are given below. The precise meanings of these fields are implementation-defined. The letters 'f' and 'l' (below) indicate the option (full or long) that shall cause the corresponding heading to appear; all means that the heading always appears. Note that these two options determine only what information is provided for a process; they do not determine which processes are listed.
99657		
99658		
99659		
99660		
99661		
99662		F (l) Flags (octal and additive) associated with the process.
99663		S (l) The state of the process.
99664		UID (f,l) The user ID number of the process owner; the login name is printed under the -f option.
99665		
99666		PID (all) The process ID of the process; it is possible to kill a process if this datum is known.
99667		
99668		PPID (f,l) The process ID of the parent process.
99669		C (f,l) Processor utilization for scheduling.
99670		PRI (l) The priority of the process; higher numbers mean lower priority.
99671		NI (l) Nice value; used in priority computation.
99672		ADDR (l) The address of the process.
99673		SZ (l) The size in blocks of the core image of the process.
99674		WCHAN (l) The event for which the process is waiting or sleeping; if blank, the process is running.
99675		
99676		STIME (f) Starting time of the process.
99677		TTY (all) The controlling terminal for the process.
99678		TIME (all) The cumulative execution time for the process.
99679		CMD (all) The command name; the full command name and its arguments are written under the -f option.
99680		
99681		A process that has exited and has a parent, but has not yet been waited for by the parent, shall be marked defunct .
99682		
99683		Under the option -f , <i>ps</i> tries to determine the command name and arguments given when the process was created by examining memory or the swap area. Failing this, the command name, as it would appear without the option -f , is written in square brackets.
99684		
99685		
99686		The -o option allows the output format to be specified under user control.
99687		The application shall ensure that the format specification is a list of names presented as a single argument, <blank> or comma-separated. Each variable has a default header. The default header can be overridden by appending an equals sign and the new text of the header. The rest of the characters in the argument shall be used as the header text. The fields specified shall be written in the order specified on the command line, and should be arranged in columns in the output. The field widths shall be selected by the system to be at least as wide as the header text (default or overridden value). If the header text is null, such as -o user= , the field width shall be at least as wide as the default header text. If all header text fields are null, no header line shall be written.
99688		
99689		
99690		
99691		
99692		
99693		
99694		
99695		
99696		The following names are recognized in the POSIX locale:
99697		ruser The real user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.
99698		
99699		user The effective user ID of the process. This shall be the textual user ID, if it can be obtained and the field width permits, or a decimal representation otherwise.
99700		
99701		rgroup The real group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.
99702		

99703	group	The effective group ID of the process. This shall be the textual group ID, if it can be obtained and the field width permits, or a decimal representation otherwise.
99704		
99705	pid	The decimal value of the process ID.
99706	ppid	The decimal value of the parent process ID.
99707	pgid	The decimal value of the process group ID.
99708	pcpu	The ratio of CPU time used recently to CPU time available in the same period, expressed as a percentage. The meaning of “recently” in this context is unspecified. The CPU time available is determined in an unspecified manner.
99709		
99710		
99711	vsz	The size of the process in (virtual) memory in 1 024 byte units as a decimal integer.
99712	nice	The decimal value of the nice value of the process; see <i>nice</i> .
99713	etime	In the POSIX locale, the elapsed time since the process was started, in the form:
99714		[[<i>dd</i> -] <i>hh</i> :] <i>mm</i> : <i>ss</i>
99715		where <i>dd</i> shall represent the number of days, <i>hh</i> the number of hours, <i>mm</i> the number of minutes, and <i>ss</i> the number of seconds. The <i>dd</i> field shall be a decimal integer. The <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be two-digit decimal integers padded on the left with zeros.
99716		
99717		
99718	time	In the POSIX locale, the cumulative CPU time of the process in the form:
99719		[[<i>dd</i> -] <i>hh</i> : <i>mm</i> :] <i>ss</i>
99720		The <i>dd</i> , <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be as described in the etime specifier.
99721	tty	The name of the controlling terminal of the process (if any) in the same format used by the <i>who</i> utility.
99722		
99723	comm	The name of the command being executed (<i>argv</i> [0] value) as a string.
99724	args	The command with all its arguments as a string. The implementation may truncate this value to the field width; it is implementation-defined whether any further truncation occurs. It is unspecified whether the string represented is a version of the argument list as it was passed to the command when it started, or is a version of the arguments as they may have been modified by the application. Applications cannot depend on being able to modify their argument list and having that modification be reflected in the output of <i>ps</i> .
99725		
99726		
99727		
99728		
99729		
99730		
99731		Any field need not be meaningful in all implementations. In such a case a hyphen (‘-’) should be output in place of the field value.
99732		
99733		Only comm and args shall be allowed to contain <blank>s; all others shall not. Any implementation-defined variables shall be specified in the system documentation along with the default header and indicating whether the field may contain <blank>s.
99734		
99735		
99736		The following table specifies the default header to be used in the POSIX locale corresponding to each format specifier.
99737		

Table 4-17 Variable Names and Default Headers in *ps*

Format Specifier	Default Header	Format Specifier	Default Header
args	COMMAND	ppid	PPID
comm	COMMAND	rgroup	RGROUP
etime	ELAPSED	ruser	RUSER
group	GROUP	time	TIME
nice	NI	tty	TT
pcpu	%CPU	user	USER
pgid	PGID	vsz	VSZ
pid	PID		

STDERR

The standard error shall be used only for diagnostic messages.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

None.

EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

Things can change while *ps* is running; the snapshot it gives is only true for an instant, and might not be accurate by the time it is displayed.

The **args** format specifier is allowed to produce a truncated version of the command arguments. In some implementations, this information is no longer available when the *ps* utility is executed.

If the field width is too narrow to display a textual ID, the system may use a numeric version. Normally, the system would be expected to choose large enough field widths, but if a large number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on one line. One way to ensure adequate width for the textual IDs is to override the default header for a field to make it larger than most or all user or group names.

There is no special quoting mechanism for header text. The header text is the rest of the argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
ps -o "user=User Name" -o pid=Process\ ID
```

On some implementations, especially multi-level secure systems, *ps* may be severely restricted and produce information only about child processes owned by the user.

EXAMPLES

The command:

```
ps -o user,pid,ppid=MOM -o args
```

writes at least the following in the POSIX locale:

```
USER    PID    MOM    COMMAND
helene  34     12    ps -o uid,pid,ppid=MOM -o args
```

The contents of the **COMMAND** field need not be the same in all implementations, due to

99782 possible truncation.

99783 RATIONALE

99784 There is very little commonality between BSD and System V implementations of *ps*. Many
 99785 options conflict or have subtly different usages. The standard developers attempted to select a
 99786 set of options for the base standard that were useful on a wide range of systems and selected
 99787 options that either can be implemented on both BSD and System V-based systems without
 99788 breaking the current implementations or where the options are sufficiently similar that any
 99789 changes would not be unduly problematic for users or implementors.

99790 It is recognized that on some implementations, especially multi-level secure systems, *ps* may be
 99791 nearly useless. The default output has therefore been chosen such that it does not break
 99792 historical implementations and also is likely to provide at least some useful information on most
 99793 systems.

99794 The major change is the addition of the format specification capability. The motivation for this
 99795 invention is to provide a mechanism for users to access a wider range of system information, if
 99796 the system permits it, in a portable manner. The fields chosen to appear in this volume of
 99797 POSIX.1-200x were arrived at after considering what concepts were likely to be both reasonably
 99798 useful to the “average” user and had a reasonable chance of being implemented on a wide range
 99799 of systems. Again it is recognized that not all systems are able to provide all the information
 99800 and, conversely, some may wish to provide more. It is hoped that the approach adopted will be
 99801 sufficiently flexible and extensible to accommodate most systems. Implementations may be
 99802 expected to introduce new format specifiers.

99803 The default output should consist of a short listing containing the process ID, terminal name,
 99804 cumulative execution time, and command name of each process.

99805 The preference of the standard developers would have been to make the format specification an
 99806 operand of the *ps* command. Unfortunately, BSD usage precluded this.

99807 At one time a format was included to display the environment array of the process. This was
 99808 deleted because there is no portable way to display it.

99809 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a
 99810 mnemonic compromise was selected.

99811 The **-a** option is described with some optional behavior because the SVID omits session leaders,
 99812 but BSD does not.

99813 In an early proposal, format specifiers appeared for priority and start time. The former was not
 99814 defined adequately in this volume of POSIX.1-200x and was removed in deference to the defined
 99815 nice value; the latter because elapsed time was considered to be more useful.

99816 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,
 99817 followed by additional format specifiers. This was not adopted because the default output is
 99818 implementation-defined. Nevertheless, this is a useful option that should be reserved for that
 99819 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of
 99820 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their
 99821 desired format and add more fields to the end of the output in certain cases where that would be
 99822 useful.

99823 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*
 99824 require that they all use the same format.

99825 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.
 99826 This is because it is difficult to express an algorithm that is useful across all possible machine
 99827 architectures. Historical counterparts to this value have attempted to show percentage of use in
 99828 the recent past, such as the preceding minute. Frequently, these values for all processes did not
 99829 add up to 100%. Implementations are encouraged to provide data in this field to users that will

99830 help them identify processes currently affecting the performance of the system.

99831 **FUTURE DIRECTIONS**

99832 None.

99833 **SEE ALSO**

99836 **CHANGE HISTORY**

99837 First released in Issue 2.

99838 **Issue 6**

99839 This utility is marked as part of the User Portability Utilities option.

99840 The normative text is reworded to avoid use of the term “must” for application requirements.

99841 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

99842 **Issue 7**

99843 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

99844 **NAME**
 99845 `pwd` — return working directory name

99846 **SYNOPSIS**
 99847 `pwd [-L|-P]`

99848 **DESCRIPTION**
 99849 The *pwd* utility shall write to standard output an absolute pathname of the current working
 99850 directory, which does not contain the filenames dot or dot-dot.

99851 **OPTIONS**
 99852 The *pwd* utility shall conform to XBD [Section 12.2](#) (on page 201).

99853 The following options shall be supported by the implementation:

99854 **-L** If the *PWD* environment variable contains an absolute pathname of the current
 99855 directory that does not contain the filenames dot or dot-dot, *pwd* shall write this
 99856 pathname to standard output. Otherwise, the **-L** option shall behave as the **-P**
 99857 option.

99858 **-P** The absolute pathname written shall not contain filenames that, in the context of
 99859 the pathname, refer to files of type symbolic link.

99860 If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*
 99861 utility shall behave as if **-L** had been specified.

99862 **OPERANDS**
 99863 None.

99864 **STDIN**
 99865 Not used.

99866 **INPUT FILES**
 99867 None.

99868 **ENVIRONMENT VARIABLES**
 99869 The following environment variables shall affect the execution of *pwd*:

99870 **LANG** Provide a default value for the internationalization variables that are unset or null.
 99871 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables
 99872 used to determine the values of locale categories.)

99873 **LC_ALL** If set to a non-empty string value, override the values of all the other
 99874 internationalization variables.

99875 **LC_MESSAGES**
 99876 Determine the locale that should be used to affect the format and contents of
 99877 diagnostic messages written to standard error.

99878 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

99879 **PWD** An absolute pathname of the current working directory. If an application sets or
 99880 unsets the value of *PWD*, the behavior of *pwd* is unspecified.

99881 **ASYNCHRONOUS EVENTS**
 99882 Default.

99883 STDOUT

99884 The *pwd* utility output is an absolute pathname of the current working directory:

99885 "%s\n", <directory pathname>

99886 STDERR

99887 The standard error shall be used only for diagnostic messages.

99888 OUTPUT FILES

99889 None.

99890 EXTENDED DESCRIPTION

99891 None.

99892 EXIT STATUS

99893 The following exit values shall be returned:

99894 0 Successful completion.

99895 >0 An error occurred.

99896 CONSEQUENCES OF ERRORS

99897 If an error is detected, output shall not be written to standard output, a diagnostic message shall
99898 be written to standard error, and the exit status is not zero.

99899 APPLICATION USAGE

99900 None.

99901 EXAMPLES

99902 None.

99903 RATIONALE

99904 Some implementations have historically provided *pwd* as a shell special built-in command.

99905 In most utilities, if an error occurs, partial output may be written to standard output. This does
99906 not happen in historical implementations of *pwd*. Because *pwd* is frequently used in historical
99907 shell scripts without checking the exit status, it is important that the historical behavior is
99908 required here; therefore, the CONSEQUENCES OF ERRORS section specifically disallows any
99909 partial output being written to standard output.

99910 An earlier version of this standard stated that the *PWD* environment variable was affected when
99911 the *-P* option was in effect. This was incorrect; conforming implementations do not do this.

99912 FUTURE DIRECTIONS

99913 None.

99926 NAME

99927 qalter — alter batch job

99928 SYNOPSIS

```
99929 OB BE qalter [-a date_time] [-A account_string] [-c interval] [-e path_name]
99930 [-h hold_list] [-j join_list] [-k keep_list] [-l resource_list]
99931 [-m mail_options] [-M mail_list] [-N name] [-o path_name]
99932 [-p priority] [-r y|n] [-S path_name_list] [-u user_list]
99933 job_identifier...
```

99934 DESCRIPTION

99935 The attributes of a batch job are altered by a request to the batch server that manages the batch
 99936 job. The *qalter* utility is a user-accessible batch client that requests the alteration of the attributes
 99937 of one or more batch jobs.

99938 The *qalter* utility shall alter the attributes of those batch jobs, and only those batch jobs, for which
 99939 a batch *job_identifier* is presented to the utility.

99940 The *qalter* utility shall alter the attributes of batch jobs in the order in which the batch
 99941 *job_identifiers* are presented to the utility.

99942 If the *qalter* utility fails to process a batch *job_identifier* successfully, the utility shall proceed to
 99943 process the remaining batch *job_identifiers*, if any.

99944 For each batch *job_identifier* for which the *qalter* utility succeeds, each attribute of the identified
 99945 batch job shall be altered as indicated by all the options presented to the utility.

99946 For each identified batch job for which the *qalter* utility fails, the utility shall not alter any
 99947 attribute of the batch job.

99948 For each batch job that the *qalter* utility processes, the utility shall not modify any attribute other
 99949 than those required by the options and option-arguments presented to the utility.

99950 The *qalter* utility shall alter batch jobs by sending a *Modify Job Request* to the batch server that
 99951 manages each batch job. At the time the *qalter* utility exits, it shall have modified the batch job
 99952 corresponding to each successfully processed batch *job_identifier*. An attempt to alter the
 99953 attributes of a batch job in the RUNNING state is implementation-defined.

99954 OPTIONS

99955 The *qalter* utility shall conform to XBD [Section 12.2](#) (on page 201).

99956 The following options shall be supported by the implementation:

99957 **-a date_time** Redefine the time at which the batch job becomes eligible for execution.

99958 The *date_time* argument shall be in the same form and represent the same time as
 99959 for the *touch* utility. The time so represented shall be set into the *Execution_Time*
 99960 attribute of the batch job. If the time specified is earlier than the current time, the
 99961 **-a** option shall have no effect.

99962 **-A account_string**

99963 Redefine the account to which the resource consumption of the batch job should be
 99964 charged.

99965 The syntax of the *account_string* option-argument is unspecified.

99966 The *qalter* utility shall set the *Account_Name* attribute of the batch job to the value
 99967 of the *account_string* option-argument.

99968 **-c interval** Redefine whether the batch job should be checkpointed, and if so, how often.

99969 The *qalter* utility shall accept a value for the interval option-argument that is one of

99970 the following:

99971 n No checkpointing is to be performed on the batch job

99972 (NO_CHECKPOINT).

99973 s Checkpointing is to be performed only when the batch server is shut

99974 down (CHECKPOINT_AT_SHUTDOWN).

99975 c Automatic periodic checkpointing is to be performed at the

99976 *Minimum_Cpu_Interval* attribute of the batch queue, in units of CPU

99977 minutes (CHECKPOINT_AT_MIN_CPU_INTERVAL).

99978 c=*minutes* Automatic periodic checkpointing is to be performed every *minutes*

99979 of CPU time, or every *Minimum_Cpu_Interval* minutes, whichever is

99980 greater. The *minutes* argument shall conform to the syntax for

99981 unsigned integers and shall be greater than zero.

99982 An implementation may define other checkpoint intervals. The conformance

99983 document for an implementation shall describe any alternative checkpoint

99984 intervals, how they are specified, their internal behavior, and how they affect the

99985 behavior of the utility.

99986 The *qalter* utility shall set the *Checkpoint* attribute of the batch job to the value of the

99987 *interval* option-argument.

99988 **-e path_name** Redefine the path to be used for the standard error stream of the batch job.

99989 The *qalter* utility shall accept a *path_name* option-argument that conforms to the

99990 syntax of the *path_name* element defined in the System Interfaces volume of

99991 POSIX.1-200x, which can be preceded by a host name element of the form

99992 *hostname:*.

99993 If the *path_name* option-argument constitutes an absolute pathname, the *qalter*

99994 utility shall set the *Error_Path* attribute of the batch job to the value of the

99995 *path_name* option-argument, including the host name element, if present.

99996 If the *path_name* option-argument constitutes a relative pathname and no host

99997 name element is specified, the *qalter* utility shall set the *Error_Path* attribute of the

99998 batch job to the value of the absolute pathname derived by expanding the

99999 *path_name* option-argument relative to the current directory of the process that

100000 executes the *qalter* utility.

100001 If the *path_name* option-argument constitutes a relative pathname and a host name

100002 element is specified, the *qalter* utility shall set the *Error_Path* attribute of the batch

100003 job to the value of the option-argument without expansion.

100004 If the *path_name* option-argument does not include a host name element, the *qalter*

100005 utility shall prefix the pathname in the *Error_Path* attribute with *hostname:*, where

100006 *hostname* is the name of the host upon which the *qalter* utility is being executed.

100007 **-h hold_list** Redefine the types of holds, if any, on the batch job. The *qalter* **-h** option shall

100008 accept a value for the *hold_list* option-argument that is a string of alphanumeric

100009 characters in the portable character set.

100010 The *qalter* utility shall accept a value for the *hold_list* option-argument that is a

100011 string of one or more of the characters 'u', 's', or 'o', or the single character

100012 'n'. For each unique character in the *hold_list* option-argument, the *qalter* utility

100013 shall add a value to the *Hold_Types* attribute of the batch job as follows, each

100014

- 100015 representing a different hold type:
- 100016 u USER
- 100017 s SYSTEM
- 100018 o OPERATOR
- 100019 If any of these characters are duplicated in the *hold_list* option-argument, the
- 100020 duplicates shall be ignored. An existing *Hold_Types* attribute can be cleared by the
- 100021 hold type:
- 100022 n NO_HOLD
- 100023 The *qalter* utility shall consider it an error if any hold type other than 'n' is
- 100024 combined with hold type 'n'. Strictly conforming applications shall not repeat
- 100025 any of the characters 'u', 's', 'o', or 'n' within the *hold_list* option-argument.
- 100026 The *qalter* utility shall permit the repetition of characters, but shall not assign
- 100027 additional meaning to the repeated characters. An implementation may define
- 100028 other hold types. The conformance document for an implementation shall describe
- 100029 any additional hold types, how they are specified, their internal behavior, and how
- 100030 they affect the behavior of the utility.
- 100031 **-j** *join_list* Redefine which streams of the batch job are to be merged. The *qalter* **-j** option shall
- 100032 accept a value for the *join_list* option-argument that is a string of alphanumeric
- 100033 characters in the portable character set.
- 100034 The *qalter* utility shall accept a *join_list* option-argument that consists of one or
- 100035 more of the characters 'e' and 'o', or the single character 'n'.
- 100036 All of the other batch job output streams specified shall be merged into the output
- 100037 stream represented by the character listed first in the *join_list* option-argument.
- 100038 For each unique character in the *join_list* option-argument, the *qalter* utility shall
- 100039 add a value to the *Join_Path* attribute of the batch job as follows, each representing
- 100040 a different batch job stream to join:
- 100041 e The standard error of the batch job (JOIN_STD_ERROR).
- 100042 o The standard output of the batch job (JOIN_STD_OUTPUT).
- 100043 An existing *Join_Path* attribute can be cleared by the join type:
- 100044 n NO_JOIN
- 100045 If 'n' is specified, then no files are joined. The *qalter* utility shall consider it an
- 100046 error if any join type other than 'n' is combined with join type 'n'.
- 100047 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or
- 100048 'n' within the *join_list* option-argument. The *qalter* utility shall permit the
- 100049 repetition of characters, but shall not assign additional meaning to the repeated
- 100050 characters.
- 100051 An implementation may define other join types. The conformance document for an
- 100052 implementation shall describe any additional batch job streams, how they are
- 100053 specified, their internal behavior, and how they affect the behavior of the utility.
- 100054 **-k** *keep_list* Redefine which output of the batch job to retain on the execution host.
- 100055 The *qalter* **-k** option shall accept a value for the *keep_list* option-argument that is a
- 100056 string of alphanumeric characters in the portable character set.
- 100057 The *qalter* utility shall accept a *keep_list* option-argument that consists of one or
- 100058 more of the characters 'e' and 'o', or the single character 'n'.

For each unique character in the *keep_list* option-argument, the *qalter* utility shall add a value to the *Keep_Files* attribute of the batch job as follows, each representing a different batch job stream to keep:

e The standard error of the batch job (KEEP_STD_ERROR).

o The standard output of the batch job (KEEP_STD_OUTPUT).

If both 'e' and 'o' are specified, then both files are retained. An existing *Keep_Files* attribute can be cleared by the keep type:

n NO_KEEP

If 'n' is specified, then no files are retained. The *qalter* utility shall consider it an error if any keep type other than 'n' is combined with keep type 'n'.

Strictly conforming applications shall not repeat any of the characters 'e', 'o', or 'n' within the *keep_list* option-argument. The *qalter* utility shall permit the repetition of characters, but shall not assign additional meaning to the repeated characters. An implementation may define other keep types. The conformance document for an implementation shall describe any additional keep types, how they are specified, their internal behavior, and how they affect the behavior of the utility.

-l *resource_list*

Redefine the resources that are allowed or required by the batch job.

The *qalter* utility shall accept a *resource_list* option-argument that conforms to the following syntax:

```
resource=value[ , resource=value, , ... ]
```

The *qalter* utility shall set one entry in the value of the *Resource_List* attribute of the batch job for each resource listed in the *resource_list* option-argument.

Because the list of supported resource names might vary by batch server, the *qalter* utility shall rely on the batch server to validate the resource names and associated values. See [Section 3.3.3](#) (on page 2341) for a means of removing *keyword=value* (and *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

-m *mail_options*

Redefine the points in the execution of the batch job at which the batch server is to send mail about a change in the state of the batch job.

The *qalter* **-m** option shall accept a value for the *mail_options* option-argument that is a string of alphanumeric characters in the portable character set.

The *qalter* utility shall accept a value for the *mail_options* option-argument that is a string of one or more of the characters 'e', 'b', and 'a', or the single character 'n'. For each unique character in the *mail_options* option-argument, the *qalter* utility shall add a value to the *Mail_Users* attribute of the batch job as follows, each representing a different time during the life of a batch job at which to send mail:

e MAIL_AT_EXIT

b MAIL_AT_BEGINNING

a MAIL_AT_ABORT

If any of these characters are duplicated in the *mail_options* option-argument, the duplicates shall be ignored.

- 100103 An existing *Mail_Points* attribute can be cleared by the mail type:
- 100104 n NO_MAIL
- 100105 If 'n' is specified, then mail is not sent. The *qalter* utility shall consider it an error
100106 if any mail type other than 'n' is combined with mail type 'n'. Strictly
100107 conforming applications shall not repeat any of the characters 'e', 'b', 'a', or
100108 'n' within the *mail_options* option-argument. The *qalter* utility shall permit the
100109 repetition of characters but shall not assign additional meaning to the repeated
100110 characters.
- 100111 An implementation may define other mail types. The conformance document for
100112 an implementation shall describe any additional mail types, how they are
100113 specified, their internal behavior, and how they affect the behavior of the utility.
- 100114 **-M** *mail_list* Redefine the list of users to which the batch server that executes the batch job is to
100115 send mail, if the batch server sends mail about the batch job.
- 100116 The syntax of the *mail_list* option-argument is unspecified. If the implementation
100117 of the *qalter* utility uses a name service to locate users, the utility shall accept the
100118 syntax used by the name service.
- 100119 If the implementation of the *qalter* utility does not use a name service to locate
100120 users, the implementation shall accept the following syntax for user names:
- 100121 `mail_address[, mail_address , ...]`
- 100122 The interpretation of *mail_address* is implementation-defined.
- 100123 The *qalter* utility shall set the *Mail_Users* attribute of the batch job to the value of
100124 the *mail_list* option-argument.
- 100125 **-N** *name* Redefine the name of the batch job.
- 100126 The *qalter* **-N** option shall accept a value for the *name* option-argument that is a
100127 string of up to 15 alphanumeric characters in the portable character set where the
100128 first character is alphabetic.
- 100129 The syntax of the *name* option-argument is unspecified.
- 100130 The *qalter* utility shall set the *Job_Name* attribute of the batch job to the value of the
100131 *name* option-argument.
- 100132 **-o** *path_name* Redefine the path for the standard output of the batch job.
- 100133 The *qalter* utility shall accept a *path_name* option-argument that conforms to the
100134 syntax of the *path_name* element defined in the System Interfaces volume of
100135 POSIX.1-200x, which can be preceded by a host name element of the form
100136 *hostname*:.
100137
- 100138 If the *path_name* option-argument constitutes an absolute pathname, the *qalter*
100139 utility shall set the *Output_Path* attribute of the batch job to the value of the
100140 *path_name* option-argument.
- 100141 If the *path_name* option-argument constitutes a relative pathname and no host
100142 name element is specified, the *qalter* utility shall set the *Output_Path* attribute of the
100143 batch job to the absolute pathname derived by expanding the *path_name* option-
100144 argument relative to the current directory of the process that executes the *qalter*
100145 utility.
- 100146 If the *path_name* option-argument constitutes a relative pathname and a host name
100147 element is specified, the *qalter* utility shall set the *Output_Path* attribute of the batch

- 100148 job to the value of the *path_name* option-argument without any expansion of the
100149 pathname.
- 100150 If the *path_name* option-argument does not include a host name element, the *qalter*
100151 utility shall prefix the pathname in the *Output_Path* attribute with *hostname:*, where
100152 *hostname* is the name of the host upon which the *qalter* utility is being executed.
- 100153 **-p priority** Redefine the priority of the batch job.
- 100154 The *qalter* utility shall accept a value for the priority option-argument that
100155 conforms to the syntax for signed decimal integers, and which is not less than
100156 $-1\ 024$ and not greater than $1\ 023$.
- 100157 The *qalter* utility shall set the *Priority* attribute of the batch job to the value of the
100158 *priority* option-argument.
- 100159 **-r y | n** Redefine whether the batch job is rerunnable.
- 100160 If the value of the option-argument is 'y', the *qalter* utility shall set the *Rerunable*
100161 attribute of the batch job to TRUE.
- 100162 If the value of the option-argument is 'n', the *qalter* utility shall set the *Rerunable*
100163 attribute of the batch job to FALSE.
- 100164 The *qalter* utility shall consider it an error if any character other than 'y' or 'n' is
100165 specified in the option-argument.
- 100166 **-S path_name_list**
- 100167 Redefine the shell that interprets the script at the destination system.
- 100168 The *qalter* utility shall accept a *path_name_list* option-argument that conforms to the
100169 following syntax:
- 100170 `pathname[@host][,pathname[@host],...]`
- 100171 The *qalter* utility shall accept only one pathname that is missing a corresponding
100172 host name. The *qalter* utility shall allow only one pathname per named host.
- 100173 The *qalter* utility shall add a value to the *Shell_Path_List* attribute of the batch job
100174 for each entry in the *path_name_list* option-argument. See [Section 3.3.3](#) (on page
100175 2341) for a means of removing *keyword=value* (and *value@keyword*) pairs and other
100176 general rules for list-oriented batch job attributes.
- 100177 **-u user_list** Redefine the user name under which the batch job is to run at the destination
100178 system.
- 100179 The *qalter* utility shall accept a *user_list* option-argument that conforms to the
100180 following syntax:
- 100181 `username[@host][,username[@host],...]`
- 100182 The *qalter* utility shall accept only one user name that is missing a corresponding
100183 host name. The *qalter* utility shall accept only one user name per named host.
- 100184 The *qalter* utility shall add a value to the *User_List* attribute of the batch job for each
100185 entry in the *user_list* option-argument. See [Section 3.3.3](#) (on page 2341) for a means
100186 of removing *keyword=value* (and *value@keyword*) pairs and other general rules for
100187 list-oriented batch job attributes.
- 100188 **OPERANDS**
- 100189 The *qalter* utility shall accept one or more operands that conform to the syntax for a batch
100190 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100191 **STDIN**

100192 Not used.

100193 **INPUT FILES**

100194 None.

100195 **ENVIRONMENT VARIABLES**100196 The following environment variables shall affect the execution of *qalter*:

100197 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100198 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 100199 used to determine the values of locale categories.)

100200 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100201 internationalization variables.

100202 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100203 characters (for example, single-byte as opposed to multi-byte characters in
 100204 arguments).

100205 *LC_MESSAGES*
 100206 Determine the locale that should be used to affect the format and contents of
 100207 diagnostic messages written to standard error.

100208 *LOGNAME* Determine the login name of the user.

100209 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is
 100210 unset or null, an unspecified default timezone shall be used.

100211 **ASYNCHRONOUS EVENTS**

100212 Default.

100213 **STDOUT**

100214 None.

100215 **STDERR**

100216 The standard error shall be used only for diagnostic messages.

100217 **OUTPUT FILES**

100218 None.

100219 **EXTENDED DESCRIPTION**

100220 None.

100221 **EXIT STATUS**

100222 The following exit values shall be returned:

100223 0 Successful completion.

100224 >0 An error occurred.

100225 **CONSEQUENCES OF ERRORS**

100226 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic
 100227 message to standard error when the error reply received from a batch server indicates that the
 100228 batch *job_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to locate
 100229 the batch job on other batch servers is implementation-defined.

APPLICATION USAGE

None.

EXAMPLES

None.

RATIONALE

The *qalter* utility allows users to change the attributes of a batch job.

As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the batch job insofar as an altered job retains its place in the queue with some traditional selection algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and *qsub* utilities.

The result of an attempt on the part of a user to alter a batch job in a RUNNING state is implementation-defined because a batch job in the RUNNING state will already have opened its output files and otherwise performed any actions indicated by the options in effect at the time the batch job began execution.

The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few exceptions: **-V**, **-v**, and **-q**. The **-V** and **-v** are inappropriate for the *qalter* utility, since they capture potentially transient environment information from the submitting process. The **-q** option would specify a new queue, which would largely negate the previously stated advantage of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

Each of the following paragraphs provides the rationale for a *qalter* option.

Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

The **-a** option allows users to alter the date and time at which a batch job becomes eligible to run.

The **-A** option allows users to change the account that will be charged for the resources consumed by the batch job. Support for the **-A** option is mandatory for conforming implementations of *qalter*, even though support of accounting is optional for servers. Whether or not to support accounting is left to the implementor of the server, but mandatory support of the **-A** option assures users of a consistent interface and allows them to control accounting on servers that support accounting.

The **-c** option allows users to alter the checkpointing interval of a batch job. A checkpointing system, which is not defined by POSIX.1-200x, allows recovery of a batch job at the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume expensive computing time or must meet a critical schedule. Users should be allowed to make the tradeoff between the overhead of checkpointing and the risk to the timely completion of the batch job; therefore, this volume of POSIX.1-200x provides the checkpointing interval option. Support for checkpointing is optional for servers.

The **-e** option allows users to alter the name and location of the standard error stream written by a batch job. However, the path of the standard error stream is meaningless if the value of the *Join_Path* attribute of the batch job is TRUE.

The **-h** option allows users to set the hold type in the *Hold_Types* attribute of a batch job. The *qhold* and *qrls* utilities add or remove hold types to the *Hold_Types* attribute, respectively. The **-h** option has been modified to allow for implementation-defined hold types.

The **-j** option allows users to alter the decision to join (merge) the standard error stream of the batch job with the standard output stream of the batch job.

The **-l** option allows users to change the resource limits imposed on a batch job.

The **-m** option allows users to modify the list of points in the life of a batch job at which the designated users will receive mail notification.

- 100277 The **-M** option allows users to alter the list of users who will receive notification about events in
100278 the life of a batch job.
- 100279 The **-N** option allows users to change the name of a batch job.
- 100280 The **-o** option allows users to alter the name and path to which the standard output stream of
100281 the batch job will be written.
- 100282 The **-P** option allows users to modify the priority of a batch job. Support for priority is optional
100283 for batch servers.
- 100284 The **-r** option allows users to alter the rerunability status of a batch job.
- 100285 The **-S** option allows users to change the name and location of the shell image that will be
100286 invoked to interpret the script of the batch job. This option has been modified to allow a list of
100287 shell name and locations associated with different hosts.
- 100288 The **-u** option allows users to change the user identifier under which the batch job will execute.
- 100289 The *job_identifier* operand syntax is provided so that the user can differentiate between the
100290 originating and destination (or executing) batch server. These may or may not be the same. The
100291 *.server_name* portion identifies the originating batch server, while the *@server* portion identifies
100292 the destination batch server.
- 100293 Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the
100294 existing practice from which this utility has been derived.

100295 FUTURE DIRECTIONS

100296 The *qalter* utility may be removed in a future version.

100300 CHANGE HISTORY

100301 Derived from IEEE Std 1003.2d-1994.

100302 Issue 6

100303 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

100304 IEEE PASC Interpretation 1003.2 #182 is applied, clarifying the description of the **-a** option.

100305 Issue 7

100306 The *qalter* utility is marked obsolescent.

100307 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100308 **NAME**

100309 qdel — delete batch jobs

100310 **SYNOPSIS**100311 OB BE `qdel job_identifier...`100312 **DESCRIPTION**100313 A batch job is deleted by sending a request to the batch server that manages the batch job. A
100314 batch job that has been deleted is no longer subject to management by batch services.100315 The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or
100316 more batch jobs.100317 The *qdel* utility shall request a batch server to delete those batch jobs for which a batch
100318 *job_identifier* is presented to the utility.100319 The *qdel* utility shall delete batch jobs in the order in which their batch *job_identifiers* are
100320 presented to the utility.100321 If the *qdel* utility fails to process any batch *job_identifier* successfully, the utility shall proceed to
100322 process the remaining batch *job_identifiers*, if any.100323 The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that
100324 manages the batch job.100325 The *qdel* utility shall not exit until the batch job corresponding to each successfully processed
100326 batch *job_identifier* has been deleted.100327 **OPTIONS**

100328 None.

100329 **OPERANDS**100330 The *qdel* utility shall accept one or more operands that conform to the syntax for a batch
100331 *job_identifier* (see [Section 3.3.1](#), on page 2340).100332 **STDIN**

100333 Not used.

100334 **INPUT FILES**

100335 None.

100336 **ENVIRONMENT VARIABLES**100337 The following environment variables shall affect the execution of *qdel*:100338 *LANG* Provide a default value for the internationalization variables that are unset or null. |
100339 (See [XBD Section 8.2](#) (on page 160) the precedence of internationalization variables |
100340 used to determine the values of locale categories.)100341 *LC_ALL* If set to a non-empty string value, override the values of all the other
100342 internationalization variables.100343 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
100344 characters (for example, single-byte as opposed to multi-byte characters in
100345 arguments).100346 *LC_MESSAGES*100347 Determine the locale that should be used to affect the format and contents of
100348 diagnostic messages written to standard error.

100349 *LOGNAME* Determine the login name of the user.

100350 **ASYNCHRONOUS EVENTS**

100351 Default.

100352 **STDOUT**

100353 An implementation of the *qdel* utility may write informative messages to standard output.

100354 **STDERR**

100355 The standard error shall be used only for diagnostic messages.

100356 **OUTPUT FILES**

100357 None.

100358 **EXTENDED DESCRIPTION**

100359 None.

100360 **EXIT STATUS**

100361 The following exit values shall be returned:

100362 0 Successful completion.

100363 >0 An error occurred.

100364 **CONSEQUENCES OF ERRORS**

100365 In addition to the default behavior, the *qdel* utility shall not be required to write a diagnostic
 100366 message to standard error when the error reply received from a batch server indicates that the
 100367 batch *job_identifier* does not exist on the server. Whether or not the *qdel* utility waits to output the
 100368 diagnostic message while attempting to locate the job on other servers is implementation-
 100369 defined.

100370 **APPLICATION USAGE**

100371 None.

100372 **EXAMPLES**

100373 None.

100374 **RATIONALE**

100375 The *qdel* utility allows users and administrators to delete jobs.

100376 The *qdel* utility provides functionality that is not otherwise available. For example, the *kill* utility
 100377 of the operating system does not suffice. First, to use the *kill* utility, the user might have to log in
 100378 on a remote node, because the *kill* utility does not operate across the network. Second, unlike
 100379 *qdel*, *kill* cannot remove jobs from queues. Lastly, the arguments of the *qdel* utility are job
 100380 identifiers rather than process identifiers, and so this utility can be passed the output of the
 100381 *qselect* utility, thus providing users with a means of deleting a list of jobs.

100382 Because a set of jobs can be selected using the *qselect* utility, the *qdel* utility has not been
 100383 complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted
 100384 are identified individually by their job identifiers.

100385 Historically, the *qdel* utility has been a component of NQS, the existing practice on which it is
 100386 based. However, the *qdel* utility defined in this volume of POSIX.1-200x does not provide an
 100387 option for specifying a signal number to send to the batch job prior to the killing of the process;
 100388 that capability has been subsumed by the *qsig* utility.

100389 A discussion was held about the delays of networking and the possibility that the batch server
 100390 may never respond, due to a down router, down batch server, or other network mishap. The
 100391 DESCRIPTION records this under the words “fails to process any job identifier”. In the broad
 100392 sense, the network problem is also an error, which causes the failure to process the batch job
 100393 identifier.

100394 **FUTURE DIRECTIONS**
100395 The *qdel* utility may be removed in a future version.

100396 **SEE ALSO**
100397 [Chapter 3](#) (on page 2319), *kill*, *qselect*, *qsig*
100398 XBD [Chapter 8](#) (on page 159)

100399 **CHANGE HISTORY**
100400 Derived from IEEE Std 1003.2d-1994.

100401 **Issue 6**
100402 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

100403 **Issue 7**
100404 The *qdel* utility is marked obsolescent.
100405 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100406 **NAME**
 100407 qhold — hold batch jobs

100408 **SYNOPSIS**
 100409 OB BE qhold [-h *hold_list*] *job_identifier*...

100410 DESCRIPTION

100411 A hold is placed on a batch job by a request to the batch server that manages the batch job. A
 100412 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-
 100413 accessible client of batch services that requests one or more types of hold to be placed on one or
 100414 more batch jobs.

100415 The *qhold* utility shall place holds on those batch jobs for which a batch *job_identifier* is presented
 100416 to the utility.

100417 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job_identifiers*
 100418 are presented to the utility. If the *qhold* utility fails to process any batch *job_identifier* successfully,
 100419 the utility shall proceed to process the remaining batch *job_identifiers*, if any.

100420 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch
 100421 server that manages the batch job.

100422 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to
 100423 each successfully processed batch *job_identifier*.

100424 OPTIONS

100425 The *qhold* utility shall conform to XBD [Section 12.2](#) (on page 201).

100426 The following option shall be supported by the implementation:

100427 **-h *hold_list*** Define the types of holds to be placed on the batch job.

100428 The *qhold* **-h** option shall accept a value for the *hold_list* option-argument that is a
 100429 string of alphanumeric characters in the portable character set (see XBD [Section](#)
 100430 [6.1](#), on page 111).

100431 The *qhold* utility shall accept a value for the *hold_list* option-argument that is a
 100432 string of one or more of the characters 'u', 's', or 'o', or the single character
 100433 'n'.

100434 For each unique character in the *hold_list* option-argument, the *qhold* utility shall
 100435 add a value to the *Hold_Types* attribute of the batch job as follows, each
 100436 representing a different hold type:

100437 u USER

100438 s SYSTEM

100439 o OPERATOR

100440 If any of these characters are duplicated in the *hold_list* option-argument, the
 100441 duplicates shall be ignored.

100442 An existing *Hold_Types* attribute can be cleared by the following hold type:

100443 n NO_HOLD

100444 The *qhold* utility shall consider it an error if any hold type other than 'n' is
 100445 combined with hold type 'n'.

100446 Strictly conforming applications shall not repeat any of the characters 'u', 's',

100447 'o', or 'n' within the *hold_list* option-argument. The *qhold* utility shall permit the
 100448 repetition of characters, but shall not assign additional meaning to the repeated
 100449 characters.

100450 An implementation may define other hold types. The conformance document for
 100451 an implementation shall describe any additional hold types, how they are
 100452 specified, their internal behavior, and how they affect the behavior of the utility.

100453 If the **-h** option is not presented to the *qhold* utility, the implementation shall set
 100454 the *Hold_Types* attribute to USER.

100455 OPERANDS

100456 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch
 100457 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100458 STDIN

100459 Not used.

100460 INPUT FILES

100461 None.

100462 ENVIRONMENT VARIABLES

100463 The following environment variables shall affect the execution of *qhold*:

100464 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100465 (See [XBD Section 8.2](#) (on page 160) the precedence of internationalization variables |
 100466 used to determine the values of locale categories.)

100467 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100468 internationalization variables.

100469 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100470 characters (for example, single-byte as opposed to multi-byte characters in
 100471 arguments).

100472 *LC_MESSAGES*
 100473 Determine the locale that should be used to affect the format and contents of
 100474 diagnostic messages written to standard error.

100475 *LOGNAME* Determine the login name of the user.

100476 ASYNCHRONOUS EVENTS

100477 Default.

100478 STDOUT

100479 None.

100480 STDERR

100481 The standard error shall be used only for diagnostic messages.

100482 OUTPUT FILES

100483 None.

100484 EXTENDED DESCRIPTION

100485 None.

100486 EXIT STATUS

100487 The following exit values shall be returned:

100488 0 Successful completion.

100489 >0 An error occurred.

100490 **CONSEQUENCES OF ERRORS**

100491 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic
 100492 message to standard error when the error reply received from a batch server indicates that the
 100493 batch *job_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output
 100494 the diagnostic message while attempting to locate the job on other servers is implementation-
 100495 defined.

100496 **APPLICATION USAGE**

100497 None.

100498 **EXAMPLES**

100499 None.

100500 **RATIONALE**

100501 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job
 100502 ineligible for execution.

100503 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish
 100504 to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired
 100505 using the *qselect* utility.

100506 The **-h** option allows the user to specify the type of hold that is to be placed on the job. This
 100507 option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The
 100508 USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify
 100509 that the user is authorized to set the specified hold for the batch job.

100510 Mail is not required on hold because the administrator has the tools and libraries to build this
 100511 option if he or she wishes.

100512 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not
 100513 traditionally been a part of the NQS.

100514 **FUTURE DIRECTIONS**

100515 The *qhold* utility may be removed in a future version.

100516 **SEE ALSO**

100517 [Chapter 3](#) (on page 2319), *qselect*

100519 **CHANGE HISTORY**

100520 Derived from IEEE Std 1003.2d-1994.

100521 **Issue 6**

100522 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

100523 **Issue 7**

100524 The *qhold* utility is marked obsolescent.

100525 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100526 **NAME**

100527 qmove — move batch jobs

100528 **SYNOPSIS**100529 OB BE `qmove destination job_identifier...`100530 **DESCRIPTION**

100531 To move a batch job is to remove the batch job from the batch queue in which it resides and
 100532 instantiate the batch job in another batch queue. A batch job is moved by a request to the batch
 100533 server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests
 100534 the movement of one or more batch jobs.

100535 The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch
 100536 *job_identifier* is presented to the utility.

100537 The *qmove* utility shall move batch jobs in the order in which the corresponding batch
 100538 *job_identifiers* are presented to the utility.

100539 If the *qmove* utility fails to process a batch *job_identifier* successfully, the utility shall proceed to
 100540 process the remaining batch *job_identifiers*, if any.

100541 The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that
 100542 manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all
 100543 successfully processed batch *job_identifiers* have been moved.

100544 **OPTIONS**

100545 None.

100546 **OPERANDS**

100547 The *qmove* utility shall accept one operand that conforms to the syntax for a destination (see
 100548 [Section 3.3.2](#), on page 2341).

100549 The *qmove* utility shall accept one or more operands that conform to the syntax for a batch
 100550 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100551 **STDIN**

100552 Not used.

100553 **INPUT FILES**

100554 None.

100555 **ENVIRONMENT VARIABLES**100556 The following environment variables shall affect the execution of *qmove*:

100557 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100558 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables |
 100559 used to determine the values of locale categories.)

100560 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100561 internationalization variables.

100562 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100563 characters (for example, single-byte as opposed to multi-byte characters in
 100564 arguments).

100565 *LC_MESSAGES*

100566 Determine the locale that should be used to affect the format and contents of
 100567 diagnostic messages written to standard error.

qmove

Utilities

100568 *LOGNAME* Determine the login name of the user.

100569 **ASYNCHRONOUS EVENTS**

100570 Default.

100571 **STDOUT**

100572 None.

100573 **STDERR**

100574 The standard error shall be used only for diagnostic messages.

100575 **OUTPUT FILES**

100576 None.

100577 **EXTENDED DESCRIPTION**

100578 None.

100579 **EXIT STATUS**

100580 The following exit values shall be returned:

100581 0 Successful completion.

100582 >0 An error occurred.

100583 **CONSEQUENCES OF ERRORS**

100584 In addition to the default behavior, the *qmove* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job_identifier* does not exist on the server. Whether or not the *qmove* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

100589 **APPLICATION USAGE**

100590 None.

100591 **EXAMPLES**

100592 None.

100593 **RATIONALE**

100594 The *qmove* utility allows users to move jobs between queues.

100595 The alternative to using the *qmove* utility—deleting the batch job and requeuing it—entails considerably more typing.

100597 Since the means of selecting jobs based on attributes has been encapsulated in the *qselect* utility, the only option of the *qmove* utility concerns authorization. The **-u** option provides the user with the convenience of changing the user identifier under which the batch job will execute. Minimalism and consistency have taken precedence over convenience; the **-u** option has been deleted because the equivalent capability exists with the **-u** option of the *qalter* utility.

100602 **FUTURE DIRECTIONS**

100603 The *qmove* utility may be removed in a future version.

100604 **SEE ALSO**

100605 [Chapter 3](#) (on page 2319), *qalter*, *qselect*

100607 **CHANGE HISTORY**

100608 Derived from IEEE Std 1003.2d-1994.

- 100609 **Issue 6**
- 100610 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.
- 100611 **Issue 7**
- 100612 The *qmove* utility is marked obsolescent.
- 100613 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100614 **NAME**

100615 qmsg — send message to batch jobs

100616 **SYNOPSIS**100617 OB BE `qmsg [-EO] message_string job_identifiers...`100618 **DESCRIPTION**

100619 To send a message to a batch job is to request that a server write a message string into one or
 100620 more output files of the batch job. A message is sent to a batch job by a request to the batch
 100621 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests
 100622 the sending of messages to one or more batch jobs.

100623 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*
 100624 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the
 100625 message into the files of the batch job.

100626 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,
 100627 for which a batch *job_identifier* is presented to the utility.

100628 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch
 100629 *job_identifiers* are presented to the utility.

100630 If the *qmsg* utility fails to process any batch *job_identifier* successfully, the utility shall proceed to
 100631 process the remaining batch *job_identifiers*, if any.

100632 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that
 100633 manages the batch job that corresponds to each successfully processed batch *job_identifier*.

100634 **OPTIONS**100635 The *qmsg* utility shall conform to XBD [Section 12.2](#) (on page 201).

100636 The following options shall be supported by the implementation:

100637 **-E** Specify that the message is written to the standard error of each batch job.100638 The *qmsg* utility shall write the message into the standard error of the batch job.100639 **-O** Specify that the message is written to the standard output of each batch job.100640 The *qmsg* utility shall write the message into the standard output of the batch job.

100641 If neither the **-O** nor the **-E** option is presented to the *qmsg* utility, the utility shall write the
 100642 message into an implementation-defined file. The conformance document for the
 100643 implementation shall describe the name and location of the implementation-defined file. If both
 100644 the **-O** and the **-E** options are presented to the *qmsg* utility, then the utility shall write the
 100645 messages to both standard output and standard error.

100646 **OPERANDS**100647 The *qmsg* utility shall accept a minimum of two operands, *message_string* and one or more batch
100648 *job_identifiers*.

100649 The *message_string* operand shall be the string to be written to one or more output files of the
 100650 batch job followed by a <newline>. If the string contains <blank>s, then the application shall
 100651 ensure that the string is quoted. The *message_string* shall be encoded in the portable character set
 100652 (see XBD [Section 6.1](#), on page 111).

100653 All remaining operands are batch *job_identifiers* that conform to the syntax for a batch
 100654 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100655 **STDIN**

100656 Not used.

100657 **INPUT FILES**

100658 None.

100659 **ENVIRONMENT VARIABLES**100660 The following environment variables shall affect the execution of *qmsg*:

100661 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100662 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 100663 used to determine the values of locale categories.)

100664 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100665 internationalization variables.

100666 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100667 characters (for example, single-byte as opposed to multi-byte characters in
 100668 arguments).

100669 *LC_MESSAGES*
 100670 Determine the locale that should be used to affect the format and contents of
 100671 diagnostic messages written to standard error.

100672 *LOGNAME* Determine the login name of the user.

100673 **ASYNCHRONOUS EVENTS**

100674 Default.

100675 **STDOUT**

100676 None.

100677 **STDERR**

100678 The standard error shall be used only for diagnostic messages.

100679 **OUTPUT FILES**

100680 None.

100681 **EXTENDED DESCRIPTION**

100682 None.

100683 **EXIT STATUS**

100684 The following exit values shall be returned:

100685 0 Successful completion.

100686 >0 An error occurred.

100687 **CONSEQUENCES OF ERRORS**

100688 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic
 100689 message to standard error when the error reply received from a batch server indicates that the
 100690 batch *job_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output
 100691 the diagnostic message while attempting to locate the job on other servers is implementation-
 100692 defined.

100693 **APPLICATION USAGE**

100694 None.

100695 **EXAMPLES**

100696 None.

100697 **RATIONALE**

100698 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,
 100699 including operators and administrators, have a number of occasions when they want to place
 100700 messages in the output files of a batch job. For example, if a disk that is being used by a batch job
 100701 is showing errors, the operator might note this in the standard error stream of the batch job.

100702 The options of the *qmsg* utility provide users with the means of placing the message in the
 100703 output stream of their choice. The default output stream for the message—if the user does not
 100704 designate an output stream—is implementation-defined, since many implementations will
 100705 provide, as an extension to this volume of POSIX.1-200x, a log file that shows the history of
 100706 utility execution.

100707 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can
 100708 be used to acquire the appropriate list of job identifiers.

100709 The **-E** option allows users to place the message in the standard error stream of the batch job.

100710 The **-O** option allows users to place the message in the standard output stream of the batch job.

100711 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors
 100712 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves
 100713 to be included in this volume of POSIX.1-200x.

100714 **FUTURE DIRECTIONS**100715 The *qmsg* utility may be removed in a future version.100716 **SEE ALSO**100717 [Chapter 3](#) (on page 2319), *qselect*100718 [XBD Section 6.1](#) (on page 111), [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +100719 **CHANGE HISTORY**

100720 Derived from IEEE Std 1003.2d-1994.

100721 **Issue 6**100722 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.100723 **Issue 7**100724 The *qmsg* utility is marked obsolescent.

100725 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100726 **NAME**

100727 qrerun — rerun batch jobs

100728 **SYNOPSIS**100729 OB BE `qrerun job_identifier...`100730 **DESCRIPTION**

100731 To rerun a batch job is to terminate the session leader of the batch job, delete any associated
 100732 checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a
 100733 request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible
 100734 batch client that requests the rerunning of one or more batch jobs.

100735 The *qrerun* utility shall rerun those batch jobs for which a batch *job_identifier* is presented to the
 100736 utility.

100737 The *qrerun* utility shall rerun batch jobs in the order in which their batch *job_identifiers* are
 100738 presented to the utility.

100739 If the *qrerun* utility fails to process any batch *job_identifier* successfully, the utility shall proceed to
 100740 process the remaining batch *job_identifiers*, if any.

100741 The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that
 100742 manages each batch job.

100743 For each successfully processed batch *job_identifier*, the *qrerun* utility shall have rerun the
 100744 corresponding batch job at the time the utility exits.

100745 **OPTIONS**

100746 None.

100747 **OPERANDS**

100748 The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch
 100749 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100750 **STDIN**

100751 Not used.

100752 **INPUT FILES**

100753 None.

100754 **ENVIRONMENT VARIABLES**100755 The following environment variables shall affect the execution of *qrerun*:

100756 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100757 (See XBD [Section 8.2](#) (on page 160) the precedence of internationalization variables |
 100758 used to determine the values of locale categories.)

100759 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100760 internationalization variables.

100761 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100762 characters (for example, single-byte as opposed to multi-byte characters in
 100763 arguments).

100764 *LC_MESSAGES*

100765 Determine the locale that should be used to affect the format and contents of
 100766 diagnostic messages written to standard error.

100767 *LOGNAME* Determine the login name of the user.

100768 **ASYNCHRONOUS EVENTS**

100769 Default.

100770 **STDOUT**

100771 None.

100772 **STDERR**

100773 The standard error shall be used only for diagnostic messages.

100774 **OUTPUT FILES**

100775 None.

100776 **EXTENDED DESCRIPTION**

100777 None.

100778 **EXIT STATUS**

100779 The following exit values shall be returned:

100780 0 Successful completion.

100781 >0 An error occurred.

100782 **CONSEQUENCES OF ERRORS**

100783 In addition to the default behavior, the *qrerun* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job_identifier* does not exist on the server. Whether or not the *qrerun* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

100788 **APPLICATION USAGE**

100789 None.

100790 **EXAMPLES**

100791 None.

100792 **RATIONALE**

100793 The *qrerun* utility allows users to cause jobs in the running state to exit and rerun.

100794 The *qrerun* utility is a new utility, *vis-a-vis* existing practice, that has been defined in this volume of POSIX.1-200x to correct user-perceived deficiencies in the existing practice.

100796 **FUTURE DIRECTIONS**

100797 The *qrerun* utility may be removed in a future version.

100798 **SEE ALSO**

100799 [Chapter 3](#) (on page 2319)

100801 **CHANGE HISTORY**

100802 Derived from IEEE Std 1003.2d-1994.

100803 **Issue 6**

100804 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

100805 **Issue 7**

100806 The *qrerun* utility is marked obsolescent.

100807 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100808 **NAME**
 100809 qrln — release batch jobs

100810 **SYNOPSIS**
 100811 OB BE qrln [-h *hold_list*] *job_identifier*...

100812 DESCRIPTION

100813 A batch job might have one or more holds, which prevent the batch job from executing. A batch
 100814 job from which all the holds have been removed becomes eligible for execution and is said to
 100815 have been released. A batch job hold is removed by sending a request to the batch server that
 100816 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests
 100817 holds be removed from one or more batch jobs.

100818 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch
 100819 *job_identifier* is presented to the utility.

100820 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job_identifiers*
 100821 are presented to the utility.

100822 If the *qrln* utility fails to process a batch *job_identifier* successfully, the utility shall proceed to
 100823 process the remaining batch *job_identifiers*, if any.

100824 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch
 100825 server that manages the batch job.

100826 The *qrln* utility shall not exit until the holds have been removed from the batch job
 100827 corresponding to each successfully processed batch *job_identifier*.

100828 OPTIONS

100829 The *qrln* utility shall conform to XBD [Section 12.2](#) (on page 201).

100830 The following option shall be supported by the implementation:

100831 **-h *hold_list*** Define the types of holds to be removed from the batch job.

100832 The *qrln* **-h** option shall accept a value for the *hold_list* option-argument that is a
 100833 string of alphanumeric characters in the portable character set (see XBD [Section](#)
 100834 [6.1](#), on page 111).

100835 The *qrln* utility shall accept a value for the *hold_list* option-argument that is a string
 100836 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

100837 For each unique character in the *hold_list* option-argument, the *qrln* utility shall add
 100838 a value to the *Hold_Types* attribute of the batch job as follows, each representing a
 100839 different hold type:

100840 u USER

100841 s SYSTEM

100842 o OPERATOR

100843 If any of these characters are duplicated in the *hold_list* option-argument, the
 100844 duplicates shall be ignored.

100845 An existing *Hold_Types* attribute can be cleared by the following hold type:

100846 n NO_HOLD

100847 The *qrln* utility shall consider it an error if any hold type other than 'n' is
 100848 combined with hold type 'n'.

100849 Strictly conforming applications shall not repeat any of the characters 'u', 's',
 100850 'o', or 'n' within the *hold_list* option-argument. The *qrls* utility shall permit the
 100851 repetition of characters, but shall not assign additional meaning to the repeated
 100852 characters.

100853 An implementation may define other hold types. The conformance document for
 100854 an implementation shall describe any additional hold types, how they are
 100855 specified, their internal behavior, and how they affect the behavior of the utility.

100856 If the **-h** option is not presented to the *qrls* utility, the implementation shall remove
 100857 the USER hold in the *Hold_Types* attribute.

100858 OPERANDS

100859 The *qrls* utility shall accept one or more operands that conform to the syntax for a batch
 100860 *job_identifier* (see [Section 3.3.1](#), on page 2340).

100861 STDIN

100862 Not used.

100863 INPUT FILES

100864 None.

100865 ENVIRONMENT VARIABLES

100866 The following environment variables shall affect the execution of *qrls*:

100867 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 100868 (See [XBD Section 8.2](#) (on page 160) the precedence of internationalization variables |
 100869 used to determine the values of locale categories.)

100870 *LC_ALL* If set to a non-empty string value, override the values of all the other
 100871 internationalization variables.

100872 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 100873 characters (for example, single-byte as opposed to multi-byte characters in
 100874 arguments).

100875 *LC_MESSAGES*
 100876 Determine the locale that should be used to affect the format and contents of
 100877 diagnostic messages written to standard error.

100878 *LOGNAME* Determine the login name of the user.

100879 ASYNCHRONOUS EVENTS

100880 Default.

100881 STDOUT

100882 None.

100883 STDERR

100884 The standard error shall be used only for diagnostic messages.

100885 OUTPUT FILES

100886 None.

100887 EXTENDED DESCRIPTION

100888 None.

100889 EXIT STATUS

100890 The following exit values shall be returned:

100891 0 Successful completion.

100892 >0 An error occurred.

100893 CONSEQUENCES OF ERRORS

100894 In addition to the default behavior, the *qrls* utility shall not be required to write a diagnostic
 100895 message to standard error when the error reply received from a batch server indicates that the
 100896 batch *job_identifier* does not exist on the server. Whether or not the *qrls* utility waits to output the
 100897 diagnostic message while attempting to locate the job on other servers is implementation-
 100898 defined.

100899 APPLICATION USAGE

100900 None.

100901 EXAMPLES

100902 None.

100903 RATIONALE

100904 The *qrls* utility allows users, operators, and administrators to remove holds from jobs.

100905 The *qrls* utility does not support any job selection options or wildcard arguments. Users may
 100906 acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could
 100907 select all of their held jobs.

100908 The *-h* option allows the user to specify the type of hold that is to be removed. This option
 100909 allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The batch
 100910 server that manages the batch job will verify whether the user is authorized to remove the
 100911 specified hold for the batch job. If more than one type of hold has been placed on the batch job, a
 100912 user may wish to remove only some of them.

100913 Mail is not required on release because the administrator has the tools and libraries to build this
 100914 option if required.

100915 The *qrls* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of
 100916 POSIX.1-200x as the natural complement to the *qhold* utility.

100917 FUTURE DIRECTIONS

100918 The *qrls* utility may be removed in a future version.

100922 CHANGE HISTORY

100923 Derived from IEEE Std 1003.2d-1994.

100924 Issue 6

100925 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

100926 Issue 7

100927 The *qrls* utility is marked obsolescent.

100928 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

100929 **NAME**

100930 qselect — select batch jobs

100931 **SYNOPSIS**

```
100932 OB BE qselect [-a [op]date_time] [-A account_string] [-c [op]interval]
100933 [-h hold_list] [-l resource_list] [-N name] [-p [op]priority]
100934 [-q destination] [-r y|n] [-s states] [-u user_list]
```

100935 **DESCRIPTION**

100936 To select a set of batch jobs is to return the batch *job_identifiers* for each batch job that meets a list
 100937 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect* utility
 100938 is a user-accessible batch client that requests the selection of batch jobs.

100939 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch
 100940 *job_identifiers* that meet the criteria specified by the options and option-arguments presented to
 100941 the utility.

100942 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The
 100943 *qselect* utility shall not exit until the server replies to each request generated.

100944 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch
 100945 jobs as described in the OPTIONS section.

100946 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required
 100947 by the options presented to the utility.

100948 When an option is specified with a mandatory or optional *op* component to the option-
 100949 argument, then *op* shall specify a relation between the value of a certain batch job attribute and
 100950 the *value* component of the option-argument. If an *op* is allowable on an option, then the
 100951 description of the option letter indicates the *op* as either mandatory or optional. Acceptable
 100952 strings for the *op* component, and the relation the string indicates, are shown in the following
 100953 list:

100954 .eq. The value represented by the attribute of the batch job is equal to the value represented
 100955 by the option-argument.

100956 .ge. The value represented by the attribute of the batch job is greater than or equal to the
 100957 value represented by the option-argument.

100958 .gt. The value represented by the attribute of the batch job is greater than the value
 100959 represented by the option-argument.

100960 .lt. The value represented by the attribute of the batch job is less than the value represented
 100961 by the option-argument.

100962 .le. The value represented by the attribute of the batch job is less than or equal to the value
 100963 represented by the option-argument.

100964 .ne. The value represented by the attribute of the batch job is not equal to the value
 100965 represented by the option-argument.

100966 **OPTIONS**

100967 The *qselect* utility shall conform to XBD [Section 12.2](#) (on page 201).

100968 The following options shall be supported by the implementation:

100969 **-a** [op]date_time

100970 Restrict selection to a specific time, or a range of times.

- 100971 The *qselect* utility shall select only batch jobs for which the value of the
 100972 *Execution_Time* attribute is related to the Epoch equivalent of the local time
 100973 expressed by the value of the *date_time* component of the option-argument in the
 100974 manner indicated by the value of the *op* component of the option-argument.
- 100975 The *qselect* utility shall accept a *date_time* component of the option-argument that
 100976 conforms to the syntax of the *time* operand of the *touch* utility.
- 100977 If the *op* component of the option-argument is not presented to the *qselect* utility,
 100978 the utility shall select batch jobs for which the *Execution_Time* attribute is equal to
 100979 the *date_time* component of the option-argument.
- 100980 When comparing times, the *qselect* utility shall use the following definitions for the
 100981 *op* component of the option-argument:
- 100982 .eq. The time represented by value of the *Execution_Time* attribute of the batch
 100983 job is equal to the time represented by the *date_time* component of the
 100984 option-argument.
 - 100985 .ge. The time represented by value of the *Execution_Time* attribute of the batch
 100986 job is after or equal to the time represented by the *date_time* component of
 100987 the option-argument.
 - 100988 .gt. The time represented by value of the *Execution_Time* attribute of the batch
 100989 job is after the time represented by the *date_time* component of the option-
 100990 argument.
 - 100991 .lt. The time represented by value of the *Execution_Time* attribute of the batch
 100992 job is before the time represented by the *date_time* component of the
 100993 option-argument.
 - 100994 .le. The time represented by value of the *Execution_Time* attribute of the batch
 100995 job is before or equal to the time represented by the *date_time* component
 100996 of the option-argument.
 - 100997 .ne. The time represented by value of the *Execution_Time* attribute of the batch
 100998 job is not equal to the time represented by the *date_time* component of the
 100999 option-argument.
- 101000 The *qselect* utility shall accept the defined character strings for the *op* component of
 101001 the option-argument.
- 101002 **-A** *account_string*
 101003 Restrict selection to the batch jobs charging a specified account.
- 101004 The *qselect* utility shall select only batch jobs for which the value of the
 101005 *Account_Name* attribute of the batch job matches the value of the *account_string*
 101006 option-argument.
- 101007 The syntax of the *account_string* option-argument is unspecified.
- 101008 **-c** [*op*]*interval*
 101009 Restrict selection to batch jobs within a range of checkpoint intervals.
- 101010 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*
 101011 attribute relates to the value of the *interval* component of the option-argument in
 101012 the manner indicated by the value of the *op* component of the option-argument.
- 101013 If the *op* component of the option-argument is omitted, the *qselect* utility shall select
 101014 batch jobs for which the value of the *Checkpoint* attribute is equal to the value of the
 101015 *interval* component of the option-argument.
- 101016 When comparing checkpoint intervals, the *qselect* utility shall use the following

definitions for the *op* component of the option-argument:

.eq. The value of the *Checkpoint* attribute of the batch job equals the value of the *interval* component of the option-argument.

.ge. The value of the *Checkpoint* attribute of the batch job is greater than or equal to the value of the *interval* component option-argument.

.gt. The value of the *Checkpoint* attribute of the batch job is greater than the value of the *interval* component option-argument.

.lt. The value of the *Checkpoint* attribute of the batch job is less than the value of the *interval* component option-argument.

.le. The value of the *Checkpoint* attribute of the batch job is less than or equal to the value of the *interval* component option-argument.

.ne. The value of the *Checkpoint* attribute of the batch job does not equal the value of the *interval* component option-argument.

The *qselect* utility shall accept the defined character strings for the *op* component of the option-argument.

The ordering relationship for the values of the interval option-argument is defined to be:

'n' .gt. 's' .gt. 'c=minutes' .ge. 'c'

When comparing *Checkpoint* attributes with an interval having the value of the single character 'u', only equality or inequality are valid comparisons.

-h hold_list Restrict selection to batch jobs that have a specific type of hold.

The *qselect* utility shall select only batch jobs for which the value of the *Hold_Types* attribute matches the value of the *hold_list* option-argument.

The *qselect* **-h** option shall accept a value for the *hold_list* option-argument that is a string of alphanumeric characters in the portable character set (see XBD Section 6.1, on page 111).

The *qselect* utility shall accept a value for the *hold_list* option-argument that is a string of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

Each unique character in the *hold_list* option-argument of the *qselect* utility is defined as follows, each representing a different hold type:

u USER
s SYSTEM
o OPERATOR

If any of these characters are duplicated in the *hold_list* option-argument, the duplicates shall be ignored.

The *qselect* utility shall consider it an error if any hold type other than 'n' is combined with hold type 'n'.

Strictly conforming applications shall not repeat any of the characters 'u', 's', 'o', or 'n' within the *hold_list* option-argument. The *qselect* utility shall permit the repetition of characters, but shall not assign additional meaning to the repeated characters.

An implementation may define other hold types. The conformance document for

- 101060 an implementation shall describe any additional hold types, how they are
101061 specified, their internal behavior, and how they affect the behavior of the utility.
- 101062 **-l *resource_list***
101063 Restrict selection to batch jobs with specified resource limits and attributes.
- 101064 The *qselect* utility shall accept a *resource_list* option-argument with the following
101065 syntax:
- 101066 *resource_name op value [, , resource_name op value, , ...]*
- 101067 When comparing resource values, the *qselect* utility shall use the following
101068 definitions for the *op* component of the option-argument:
- 101069 .eq. The value of the resource of the same name in the *Resource_List* attribute
101070 of the batch job equals the value of the value component of the option-
101071 argument.
 - 101072 .ge. The value of the resource of the same name in the *Resource_List* attribute
101073 of the batch job is greater than or equal to the value of the *value*
101074 component of the option-argument.
 - 101075 .gt. The value of the resource of the same name in the *Resource_List* attribute
101076 of the batch job is greater than the value of the value component of the
101077 option-argument.
 - 101078 .lt. The value of the resource of the same name in the *Resource_List* attribute
101079 of the batch job is less than the value of the value component of the
101080 option-argument.
 - 101081 .ne. The value of the resource of the same name in the *Resource_List* attribute
101082 of the batch job does not equal the value of the value component of the
101083 option-argument.
 - 101084 .le. The value of the resource of the same name in the *Resource_List* attribute
101085 of the batch job is less than or equal to the value of the *value* component of
101086 the option-argument.
- 101087 When comparing the limit of a *Resource_List* attribute with the *value* component of
101088 the option-argument, if the limit, the value, or both are non-numeric, only equality
101089 or inequality are valid comparisons.
- 101090 The *qselect* utility shall select only batch jobs for which the values of the
101091 *resource_names* listed in the *resource_list* option-argument match the corresponding
101092 limits of the *Resource_List* attribute of the batch job.
- 101093 Limits of *resource_names* present in the *Resource_List* attribute of the batch job that
101094 have no corresponding values in the *resource_list* option-argument shall not be
101095 considered when selecting batch jobs.
- 101096 **-N *name*** Restrict selection to batch jobs with a specified name.
- 101097 The *qselect* utility shall select only batch jobs for which the value of the *Job_Name*
101098 attribute matches the value of the *name* option-argument. The string specified in
101099 the *name* option-argument shall be passed, uninterpreted, to the server. This allows
101100 an implementation to match "wildcard" patterns against batch job names.
- 101101 An implementation shall describe in the conformance document the format it
101102 supports for matching against the *Job_Name* attribute.
- 101103 **-p [*op*]priority**
101104 Restrict selection to batch jobs of the specified priority or range of priorities.

- 101105 The *qselect* utility shall select only batch jobs for which the value of the *Priority*
 101106 attribute of the batch job relates to the value of the *priority* component of the
 101107 option-argument in the manner indicated by the value of the *op* component of the
 101108 option-argument.
- 101109 If the *op* component of the option-argument is omitted, the *qselect* utility shall select
 101110 batch jobs for which the value of the *Priority* attribute of the batch job is equal to
 101111 the value of the *priority* component of the option-argument.
- 101112 When comparing priority values, the *qselect* utility shall use the following
 101113 definitions for the *op* component of the option-argument:
- 101114 .eq. The value of the *Priority* attribute of the batch job equals the value of the
 101115 *priority* component of the option-argument.
 - 101116 .ge. The value of the *Priority* attribute of the batch job is greater than or equal
 101117 to the value of the *priority* component option-argument.
 - 101118 .gt. The value of the *Priority* attribute of the batch job is greater than the value
 101119 of the *priority* component option-argument.
 - 101120 .lt. The value of the *Priority* attribute of the batch job is less than the value of
 101121 the *priority* component option-argument.
 - 101122 .lte. The value of the *Priority* attribute of the batch job is less than or equal to
 101123 the value of the *priority* component option-argument.
 - 101124 .ne. The value of the *Priority* attribute of the batch job does not equal the value
 101125 of the *priority* component option-argument.
- 101126 **-q destination**
 101127 Restrict selection to the specified batch queue or server, or both.
- 101128 The *qselect* utility shall select only batch jobs that are located at the destination
 101129 indicated by the value of the *destination* option-argument.
- 101130 The destination defines a batch queue, a server, or a batch queue at a server.
- 101131 The *qselect* utility shall accept an option-argument for the **-q** option that conforms
 101132 to the syntax for a destination. If the **-q** option is not presented to the *qselect* utility,
 101133 the utility shall select batch jobs from all batch queues at the default batch server.
- 101134 If the option-argument describes only a batch queue, the *qselect* utility shall select
 101135 only batch jobs from the batch queue of the specified name at the default batch
 101136 server. The means by which *qselect* determines the default server is
 101137 implementation-defined.
- 101138 If the option-argument describes only a batch server, the *qselect* utility shall select
 101139 batch jobs from all the batch queues at that batch server.
- 101140 If the option-argument describes both a batch queue and a batch server, the *qselect*
 101141 utility shall select only batch jobs from the specified batch queue at the specified
 101142 server.
- 101143 **-r y | n** Restrict selection to batch jobs with the specified rerunability status.
- 101144 The *qselect* utility shall select only batch jobs for which the value of the *Rerunable*
 101145 attribute of the batch job matches the value of the option-argument.
- 101146 The *qselect* utility shall accept a value for the option-argument that consists of
 101147 either the single character 'y' or the single character 'n'. The character 'y'
 101148 represents the value TRUE, and the character 'n' represents the value FALSE.

101149 **-s states** Restrict selection to batch jobs in the specified states.

101150 The *qselect* utility shall accept an option-argument that consists of any combination
101151 of the characters 'e', 'q', 'r', 'w', 'h', and 't'.

101152 Conforming applications shall not repeat any character in the option-argument.
101153 The *qselect* utility shall permit the repetition of characters in the option-argument,
101154 but shall not assign additional meaning to repeated characters.

101155 The *qselect* utility shall interpret the characters in the *states* option-argument as
101156 follows:

101157 e Represents the EXITING state.

101158 q Represents the QUEUED state.

101159 r Represents the RUNNING state.

101160 t Represents the TRANSITING state.

101161 h Represents the HELD state.

101162 w Represents the WAITING state.

101163 For each character in the *states* option-argument, the *qselect* utility shall select batch
101164 jobs in the corresponding state.

101165 **-u user_list** Restrict selection to batch jobs owned by the specified user names.

101166 The *qselect* utility shall select only the batch jobs of those users specified in the
101167 *user_list* option-argument.

101168 The *qselect* utility shall accept a *user_list* option-argument that conforms to the
101169 following syntax:

101170 *username*[*@host*][, , *username*[*@host*], , . . .]

101171 The *qselect* utility shall accept only one user name that is missing a corresponding
101172 host name. The *qselect* utility shall accept only one user name per named host.

101173 **OPERANDS**

101174 None.

101175 **STDIN**

101176 Not used.

101177 **INPUT FILES**

101178 None.

101179 **ENVIRONMENT VARIABLES**

101180 The following environment variables shall affect the execution of *qselect*:

101181 **LANG** Provide a default value for the internationalization variables that are unset or null. |
101182 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
101183 used to determine the values of locale categories.)

101184 **LC_ALL** If set to a non-empty string value, override the values of all the other
101185 internationalization variables.

101186 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
101187 characters (for example, single-byte as opposed to multi-byte characters in
101188 arguments).

101189 **LC_MESSAGES**

101190 Determine the locale that should be used to affect the format and contents of
101191 diagnostic messages written to standard error.

- 101192 *LOGNAME* Determine the login name of the user.
- 101193 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is
101194 unset or null, an unspecified default timezone shall be used.

ASYNCHRONOUS EVENTS

- 101195 Default.

STDOUT

- 101197 The *qselect* utility shall write zero or more batch *job_identifiers* to standard output.
- 101198 The *qselect* utility shall separate the batch *job_identifiers* written to standard output by white
101199 space.
- 101200 The *qselect* utility shall write batch *job_identifiers* in the following format:
- 101201 *sequence_number.server_name@server*

STDERR

- 101202 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

- 101203 None.

EXTENDED DESCRIPTION

- 101204 None.

EXIT STATUS

- 101207 The following exit values shall be returned:

- 101208 0 Successful completion.
- 101209 >0 An error occurred.

CONSEQUENCES OF ERRORS

- 101210 Default.

APPLICATION USAGE

- 101211 None.

EXAMPLES

- 101212 The following example shows how a user might use the *qselect* utility in conjunction with the
101213 *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are
101214 already running:

- 101215 `qdel $(qselect -s q)`
- 101216 or:
- 101217 `qselect -s q || xargs qdel`

RATIONALE

- 101218 The *qselect* utility allows users to acquire a list of job identifiers that match user-specified
101219 selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of
101220 the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility
101221 is thus a powerful tool for causing another batch system utility to act upon a set of jobs that
101222 match a list of selection criteria.

- 101223 The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.
101224 Each option further restricts the selection of jobs. Many of the selection options allow the
101225 specification of a relational operator. The FORTRAN-like syntax of the operator—that is,
101226 ".lt."—was chosen rather than the C-like "<=" meta-characters.

- 101227 The *-a* option allows users to restrict the selected jobs to those that have been submitted (or
101228 altered) to wait until a particular time. The time period is determined by the argument of this

101236 option, which includes both a time and an operator—it is thus possible to select jobs waiting
 101237 until a specific time, jobs waiting until after a certain time, or those waiting for a time before the
 101238 specified time.

101239 The **-A** option allows users to restrict the selected jobs to those that have been submitted (or
 101240 altered) to charge a particular account.

101241 The **-c** option allows users to restrict the selected jobs to those whose checkpointing interval
 101242 falls within the specified range.

101243 The **-l** option allows users to select those jobs whose resource limits fall within the range
 101244 indicated by the value of the option. For example, a user could select those jobs for which the
 101245 CPU time limit is greater than two hours.

101246 The **-N** option allows users to select jobs by job name. For instance, all the parts of a task that
 101247 have been divided in parallel jobs might be given the same name, and thus manipulated as a
 101248 group by means of this option.

101249 The **-q** option allows users to select jobs in a specified queue.

101250 The **-r** option allows users to select only those jobs with a specified rerun criteria. For instance, a
 101251 user might select only those jobs that can be rerun for use with the *qrerun* utility.

101252 The **-s** option allows users to select only those jobs that are in a certain state.

101253 The **-u** option allows users to select jobs that have been submitted to execute under a particular
 101254 account.

101255 The selection criteria provided by the options of the *qselect* utility allow users to select jobs based
 101256 on all the appropriate attributes that can be assigned to jobs by the *qsub* utility.

101257 Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that
 101258 has been introduced in this volume of POSIX.1-200x.

101259 FUTURE DIRECTIONS

101260 The *qselect* utility may be removed in a future version.

101264 CHANGE HISTORY

101265 Derived from IEEE Std 1003.2d-1994.

101266 Issue 7

101267 The *qselect* utility is marked obsolescent.

101268 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101269 **NAME**

101270 qsig — signal batch jobs

101271 **SYNOPSIS**101272 OB BE `qsig [-s signal] job_identifier...`101273 **DESCRIPTION**

101274 To signal a batch job is to send a signal to the session leader of the batch job. A batch job is
 101275 signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a
 101276 user-accessible batch client that requests the signaling of a batch job.

101277 The *qsig* utility shall signal those batch jobs for which a batch *job_identifier* is presented to the
 101278 utility. The *qsig* utility shall not signal any batch jobs whose batch *job_identifiers* are not
 101279 presented to the utility.

101280 The *qsig* utility shall signal batch jobs in the order in which the corresponding batch
 101281 *job_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job_identifier*
 101282 successfully, the utility shall proceed to process the remaining batch *job_identifiers*, if any.

101283 The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that
 101284 manages the batch job.

101285 For each successfully processed batch *job_identifier*, the *qsig* utility shall have received a
 101286 completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

101287 **OPTIONS**101288 The *qsig* utility shall conform to XBD [Section 12.2](#) (on page 201).

101289 The following option shall be supported by the implementation:

101290 `-s signal` Define the signal to be sent to the batch job.

101291 The *qsig* utility shall accept a *signal* option-argument that is either a symbolic signal
 101292 name or an unsigned integer signal number (see the POSIX.1-1990 standard,
 101293 Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix
 101294 has been omitted.

101295 If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

101296 If the *signal* option-argument is a number, the *qsig* utility shall send the signal
 101297 value represented by the number.

101298 If the `-s` option is not presented to the *qsig* utility, the utility shall send the signal
 101299 SIGTERM to each signaled batch job.

101300 **OPERANDS**

101301 The *qsig* utility shall accept one or more operands that conform to the syntax for a batch
 101302 *job_identifier* (see [Section 3.3.1](#), on page 2340).

101303 **STDIN**

101304 Not used.

101305 **INPUT FILES**

101306 None.

101307 **ENVIRONMENT VARIABLES**101308 The following environment variables shall affect the execution of *qsig*:101309 *LANG* Provide a default value for the internationalization variables that are unset or null. |
101310 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
101311 used to determine the values of locale categories.)101312 *LC_ALL* If set to a non-empty string value, override the values of all the other
101313 internationalization variables.101314 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
101315 characters (for example, single-byte as opposed to multi-byte characters in
101316 arguments).101317 *LC_MESSAGES*
101318 Determine the locale that should be used to affect the format and contents of
101319 diagnostic messages written to standard error.101320 *LOGNAME* Determine the login name of the user.101321 **ASYNCHRONOUS EVENTS**

101322 Default.

101323 **STDOUT**101324 An implementation of the *qsig* utility may write informative messages to standard output.101325 **STDERR**

101326 The standard error shall be used only for diagnostic messages.

101327 **OUTPUT FILES**

101328 None.

101329 **EXTENDED DESCRIPTION**

101330 None.

101331 **EXIT STATUS**

101332 The following exit values shall be returned:

101333 0 Successful completion.

101334 >0 An error occurred.

101335 **CONSEQUENCES OF ERRORS**101336 In addition to the default behavior, the *qsig* utility shall not be required to write a diagnostic
101337 message to standard error when the error reply received from a batch server indicates that the
101338 batch *job_identifier* does not exist on the server. Whether or not the *qsig* utility waits to output the
101339 diagnostic message while attempting to locate the batch job on other servers is implementation-
101340 defined.101341 **APPLICATION USAGE**

101342 None.

101343 **EXAMPLES**

101344 None.

101345 **RATIONALE**101346 The *qsig* utility allows users to signal batch jobs.101347 A user may be unable to signal a batch job with the *kill* utility of the operating system for a
101348 number of reasons. First, the process ID of the batch job may be unknown to the user. Second,
101349 the processes of the batch job may be on a remote node. However, by virtue of communication
101350 between batch nodes, the *qsig* utility can arrange for the signaling of a process.

101351 Because a batch job that is not running cannot be signaled, and because the signal may not

101352 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.

101353 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch
101354 job.

101355 The *-s* option allows users to specify a signal by name or by number, and thus override the
101356 default signal. The POSIX.1-1990 standard defines signals by both name and number.

101357 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of
101358 POSIX.1-200x in response to user-perceived shortcomings in existing practice.

101359 **FUTURE DIRECTIONS**

101360 The *qsig* utility may be removed in a future version.

101361 **SEE ALSO**

101362 [Chapter 3](#) (on page 2319), *kill*, *qdel*

101364 **CHANGE HISTORY**

101365 Derived from IEEE Std 1003.2d-1994.

101366 **Issue 6**

101367 The *LC_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

101368 **Issue 7**

101369 The *qsig* utility is marked obsolescent.

101370 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101371 **NAME**
 101372 qstat — show status of batch jobs

101373 **SYNOPSIS**

101374 OB BE qstat [-f] *job_identifier...*
 101375 qstat -Q [-f] *destination...*
 101376 qstat -B [-f] *server_name...*

101377 **DESCRIPTION**

101378 The status of a batch job, batch queue, or batch server is obtained by a request to the server. The
 101379 *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,
 101380 batch queues, or servers, and writes the status information to standard output.

101381 For each successfully processed batch *job_identifier*, the *qstat* utility shall display information
 101382 about the corresponding batch job.

101383 For each successfully processed destination, the *qstat* utility shall display information about the
 101384 corresponding batch queue.

101385 For each successfully processed server name, the *qstat* utility shall display information about the
 101386 corresponding server.

101387 The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a
 101388 batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*
 101389 *Status Request* to a batch server. The *qstat* utility shall acquire server status information by
 101390 sending a *Server Status Request* to a batch server.

101391 **OPTIONS**

101392 The *qstat* utility shall conform to XBD [Section 12.2](#) (on page 201).

101393 The following options shall be supported by the implementation:

101394 **-f** Specify that a full display is produced.

101395 The minimum contents of a full display are specified in the `STDOUT` section.

101396 Additional contents and format of a full display are implementation-defined.

101397 **-Q** Specify that the operand is a destination.

101398 The *qstat* utility shall display information about each batch queue at each
 101399 destination identified as an operand.

101400 **-B** Specify that the operand is a server name.

101401 The *qstat* utility shall display information about each server identified as an
 101402 operand.

101403 **OPERANDS**

101404 If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that
 101405 conform to the syntax for a destination (see [Section 3.3.2](#), on page 2341).

101406 If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server_name*
 101407 operands.

101408 If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or
 101409 more operands that conform to the syntax for a batch *job_identifier* (see [Section 3.3.1](#), on page
 101410 2340).

101411 **STDIN**

101412 Not used.

101413 **INPUT FILES**

101414 None.

101415 **ENVIRONMENT VARIABLES**101416 The following environment variables shall affect the execution of *qstat*:101417 *HOME* Determine the pathname of the user's home directory.101418 *LANG* Provide a default value for the internationalization variables that are unset or null. |
101419 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
101420 used to determine the values of locale categories.)101421 *LC_ALL* If set to a non-empty string value, override the values of all the other
101422 internationalization variables.101423 *LC_COLLATE*101424 Determine the locale for the behavior of ranges, equivalence classes, and multi-
101425 character collating elements within regular expressions.101426 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
101427 characters (for example, single-byte as opposed to multi-byte characters in
101428 arguments).101429 *LC_MESSAGES*101430 Determine the locale that should be used to affect the format and contents of
101431 diagnostic messages written to standard error.101432 *LC_NUMERIC*101433 Determine the locale for selecting the radix character used when writing floating-
101434 point formatted output.101435 **ASYNCHRONOUS EVENTS**

101436 Default.

101437 **STDOUT**101438 If an operand presented to the *qstat* utility is a batch *job_identifier* and the *-f* option is not
101439 specified, the *qstat* utility shall display the following items on a single line, in the stated order,
101440 with white space between each item, for each successfully processed operand:

- 101441
- The batch *job_identifier*
 - 101442 • The batch job name
 - 101443 • The *Job_Owner* attribute
 - 101444 • The CPU time used by the batch job
 - 101445 • The batch job state
 - 101446 • The batch job location

101447 If an operand presented to the *qstat* utility is a batch *job_identifier* and the *-f* option is specified,
101448 the *qstat* utility shall display the following items for each success fully processed operand:

- 101449
- The batch *job_identifier*
 - 101450 • The batch job name
 - 101451 • The *Job_Owner* attribute

- 101452 • The execution user ID
- 101453 • The CPU time used by the batch job
- 101454 • The batch job state
- 101455 • The batch job location
- 101456 • Additional implementation-defined information, if any, about the batch job or batch queue

101457 If an operand presented to the *qstat* utility is a destination, the **-Q** option is specified, and the **-f**
 101458 option is not specified, the *qstat* utility shall display the following items on a single line, in the
 101459 stated order, with white space between each item, for each successfully processed operand:

- 101460 • The batch queue name
- 101461 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 101462 • The total number of batch jobs in the batch queue
- 101463 • The status of the batch queue
- 101464 • For each state, the number of batch jobs in that state in the batch queue and the name of
 101465 the state
- 101466 • The type of batch queue (execution or routing)

101467 If the operands presented to the *qstat* utility are destinations, the **-Q** option is specified, and the
 101468 **-f** option is specified, the *qstat* utility shall display the following items for each successfully
 101469 processed operand:

- 101470 • The batch queue name
- 101471 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 101472 • The total number of batch jobs in the batch queue
- 101473 • The status of the batch queue
- 101474 • For each state, the number of batch jobs in that state in the batch queue and the name of
 101475 the state
- 101476 • The type of batch queue (execution or routing)
- 101477 • Additional implementation-defined information, if any, about the batch queue

101478 If the operands presented to the *qstat* utility are batch server names, the **-B** option is specified,
 101479 and the **-f** option is not specified, the *qstat* utility shall display the following items on a single
 101480 line, in the stated order, with white space between each item, for each successfully processed
 101481 operand:

- 101482 • The batch server name
- 101483 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 101484 • The total number of batch jobs managed by the batch server
- 101485 • The status of the batch server
- 101486 • For each state, the number of batch jobs in that state and the name of the state

101487 If the operands presented to the *qstat* utility are server names, the **-B** option is specified, and the
 101488 **-f** option is specified, the *qstat* utility shall display the following items for each successfully
 101489 processed operand:

- 101490 • The server name

- 101491 • The maximum number of batch jobs that shall be run in the batch queue concurrently
- 101492 • The total number of batch jobs managed by the server
- 101493 • The status of the server
- 101494 • For each state, the number of batch jobs in that state and the name of the state
- 101495 • Additional implementation-defined information, if any, about the server

STDERR

The standard error shall be used only for diagnostic messages.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

None.

EXIT STATUS

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

CONSEQUENCES OF ERRORS

In addition to the default behavior, the *qstat* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job_identifier* does not exist on the server. Whether or not the *qstat* utility waits to output the diagnostic message while attempting to locate the batch job on other servers is implementation-defined.

APPLICATION USAGE

None.

EXAMPLES

None.

RATIONALE

The *qstat* utility allows users to display the status of jobs and list the batch jobs in queues.

The operands of the *qstat* utility may be either job identifiers, queues (specified as destination identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the nature of the operands.

The other options of the *qstat* utility allow the user to control the amount of information displayed and the format in which it is displayed. Should a user wish to display the status of a set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.

The **-f** option allows users to request a “full” display in an implementation-defined format.

Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice on which it is based.

FUTURE DIRECTIONS

The *qstat* utility may be removed in a future version.

CHANGE HISTORY

Derived from IEEE Std 1003.2d-1994.

Issue 6

IEEE PASC Interpretation 1003.2 #191 is applied, removing the following ENVIRONMENT VARIABLES listed as affecting *qstat*: *COLUMNS*, *LINES*, *LOGNAME*, *TERM*, and *TZ*.

The *LC_TIME* entry is also removed from the ENVIRONMENT VARIABLES section.

Issue 7

The *qstat* utility is marked obsolescent.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

101541 **NAME**

101542 qsub — submit a script

101543 **SYNOPSIS**

```

101544 OB BE qsub [-a date_time] [-A account_string] [-c interval]
101545         [-C directive_prefix] [-e path_name] [-h] [-j join_list]
101546         [-k keep_list] [-m mail_options] [-M mail_list] [-N name]
101547         [-o path_name] [-p priority] [-q destination] [-r y|n]
101548         [-S path_name_list] [-u user_list] [-v variable_list] [-V]
101549         [-z] [script]

```

101550 **DESCRIPTION**

101551 To submit a script is to create a batch job that executes the script. A script is submitted by a
 101552 request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

101553 Upon successful completion, the *qsub* utility shall have created a batch job that will execute the
 101554 submitted script.

101555 The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

101556 The *qsub* utility shall place the value of the following environment variables in the *Variable_List*
 101557 attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name
 101558 of the environment variable shall be the current name prefixed with the string *PBS_O_*.

101559 **Note:** If the current value of the *HOME* variable in the environment space of the *qsub* utility is
 101560 */aa/bb/cc*, then *qsub* shall place *PBS_O_HOME=/aa/bb/cc* in the *Variable_List* attribute of the
 101561 batch job.

101562 In addition to the variables described above, the *qsub* utility shall add the following variables
 101563 with the indicated values to the variable list:

101564 *PBS_O_WORKDIR* The absolute path of the current working directory of the *qsub* utility
 101565 process.

101566 *PBS_O_HOST* The name of the host on which the *qsub* utility is running.

101567 **OPTIONS**

101568 The *qsub* utility shall conform to XBD [Section 12.2](#) (on page 201).

101569 The following options shall be supported by the implementation:

101570 **-a *date_time*** Define the time at which a batch job becomes eligible for execution.

101571 The *qsub* utility shall accept an option-argument that conforms to the syntax of the
 101572 *time* operand of the *touch* utility.

101573

Table 4-18 Environment Variable Values (Utilities)

101574

101575

101576

101577

101578

101579

101580

101581

101582

101583

Variable Name	Value at qsub Time
<i>PBS_O_HOME</i>	<i>HOME</i>
<i>PBS_O_HOST</i>	Client host name
<i>PBS_O_LANG</i>	<i>LANG</i>
<i>PBS_O_LOGNAME</i>	<i>LOGNAME</i>
<i>PBS_O_PATH</i>	<i>PATH</i>
<i>PBS_O_MAIL</i>	<i>MAIL</i>
<i>PBS_O_SHELL</i>	<i>SHELL</i>
<i>PBS_O_TZ</i>	<i>TZ</i>
<i>PBS_O_WORKDIR</i>	Current working directory

101584

101585

Note: The server that initiates execution of the batch job will add other variables to the batch job's environment; see [Section 3.2.2.1](#) (on page 2324).

101586

101587

101588

101589

The *qsub* utility shall set the *Execution_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date_time* option-argument. The Epoch is defined in XBD [Section 3.149](#) (on page 53).

101590

101591

101592

If the *-a* option is not presented to the *qsub* utility, the utility shall set the *Execution_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

101593

101594

101595

-A account_string

Define the account to which the resource consumption of the batch job should be charged.

101596

The syntax of the *account_string* option-argument is unspecified.

101597

101598

The *qsub* utility shall set the *Account_Name* attribute of the batch job to the value of the *account_string* option-argument.

101599

101600

If the *-A* option is not presented to the *qsub* utility, the utility shall omit the *Account_Name* attribute from the attributes of the batch job.

101601

-c interval

Define whether the batch job should be checkpointed, and if so, how often.

101602

101603

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

101604

101605

n No checkpointing shall be performed on the batch job (*NO_CHECKPOINT*).

101606

101607

s Checkpointing shall be performed only when the batch server is shut down (*CHECKPOINT_AT_SHUTDOWN*).

101608

101609

101610

c Automatic periodic checkpointing shall be performed at the *Minimum_Cpu_Interval* attribute of the batch queue, in units of CPU minutes (*CHECKPOINT_AT_MIN_CPU_INTERVAL*).

101611

101612

101613

101614

c=minutes Automatic periodic checkpointing shall be performed every *minutes* of CPU time, or every *Minimum_Cpu_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

101615

101616

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the *interval* option-argument.

101617

If the *-c* option is not presented to the *qsub* utility, the utility shall set the *Checkpoint*

101618 attribute of the batch job to the single character 'u'
 101619 (CHECKPOINT_UNSPECIFIED).

101620 **-C** *directive_prefix*
 101621 Define the prefix that declares a directive to the *qsub* utility within the script.

101622 The *directive_prefix* is not a batch job attribute; it affects the behavior of the *qsub*
 101623 utility.

101624 If the **-C** option is presented to the *qsub* utility, and the value of the *directive_prefix*
 101625 option-argument is the null string, the utility shall not scan the script file for
 101626 directives. If the **-C** option is not presented to the *qsub* utility, then the value of the
 101627 *PBS_DPREFIX* environment variable is used. If the environment variable is not
 101628 defined, then #PBS encoded in the portable character set is the default.

101629 **-e** *path_name*
 101630 Define the path to be used for the standard error stream of the batch job.

101631 The *qsub* utility shall accept a *path_name* option-argument which can be preceded
 101632 by a host name element of the form *hostname*:

101633 If the *path_name* option-argument constitutes an absolute pathname, the *qsub* utility
 101634 shall set the *Error_Path* attribute of the batch job to the value of the *path_name*
 101635 option-argument.

101636 If the *path_name* option-argument constitutes a relative pathname and no host
 101637 name element is specified, the *qsub* utility shall set the *Error_Path* attribute of the
 101638 batch job to the value of the absolute pathname derived by expanding the
 101639 *path_name* option-argument relative to the current directory of the process
 101640 executing *qsub*.

101641 If the *path_name* option-argument constitutes a relative pathname and a host name
 101642 element is specified, the *qsub* utility shall set the *Error_Path* attribute of the batch
 101643 job to the value of the *path_name* option-argument without expansion. The host
 101644 name element shall be included.

101645 If the *path_name* option-argument does not include a host name element, the *qsub*
 101646 utility shall prefix the pathname with *hostname*:, where *hostname* is the name of the
 101647 host upon which the *qsub* utility is being executed.

101648 If the **-e** option is not presented to the *qsub* utility, the utility shall set the
 101649 *Error_Path* attribute of the batch job to the host name and path of the current
 101650 directory of the submitting process and the default filename.

101651 The default filename for standard error has the following format:
 101652 *job_name*.*esequence_number*

101653 **-h** Specify that a USER hold is applied to the batch job.

101654 The *qsub* utility shall set the value of the *Hold_Types* attribute of the batch job to the
 101655 value USER.

101656 If the **-h** option is not presented to the *qsub* utility, the utility shall set the
 101657 *Hold_Types* attribute of the batch job to the value NO_HOLD.

101658 **-j** *join_list* Define which streams of the batch job are to be merged. The *qsub* **-j** option shall
 101659 accept a value for the *join_list* option-argument that is a string of alphanumeric
 101660 characters in the portable character set (see XBD Section 6.1, on page 111).

101661 The *qsub* utility shall accept a *join_list* option-argument that consists of one or more
 101662 of the characters 'e' and 'o', or the single character 'n'.

101663 All of the other batch job output streams specified will be merged into the output
 101664 stream represented by the character listed first in the *join_list* option-argument.

101665 For each unique character in the *join_list* option-argument, the *qsub* utility shall
 101666 add a value to the *Join_Path* attribute of the batch job as follows, each representing
 101667 a different batch job stream to join:

- 101668 e The standard error of the batch job (JOIN_STD_ERROR).
- 101669 o The standard output of the batch job (JOIN_STD_OUTPUT).

101670 An existing *Join_Path* attribute can be cleared by the following join type:

- 101671 n NO_JOIN

101672 If 'n' is specified, then no files are joined. The *qsub* utility shall consider it an error
 101673 if any join type other than 'n' is combined with join type 'n'.

101674 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or
 101675 'n' within the *join_list* option-argument. The *qsub* utility shall permit the
 101676 repetition of characters, but shall not assign additional meaning to the repeated
 101677 characters.

101678 An implementation may define other join types. The conformance document for an
 101679 implementation shall describe any additional batch job streams, how they are
 101680 specified, their internal behavior, and how they affect the behavior of the utility.

101681 If the *-j* option is not presented to the *qsub* utility, the utility shall set the value of
 101682 the *Join_Path* attribute of the batch job to NO_JOIN.

101683 *-k keep_list* Define which output of the batch job to retain on the execution host.

101684 The *qsub -k* option shall accept a value for the *keep_list* option-argument that is a
 101685 string of alphanumeric characters in the portable character set (see XBD [Section](#)
 101686 [6.1](#), on page 111).

101687 The *qsub* utility shall accept a *keep_list* option-argument that consists of one or
 101688 more of the characters 'e' and 'o', or the single character 'n'.

101689 For each unique character in the *keep_list* option-argument, the *qsub* utility shall
 101690 add a value to the *Keep_Files* attribute of the batch job as follows, each representing
 101691 a different batch job stream to keep:

- 101692 e The standard error of the batch job (KEEP_STD_ERROR).
- 101693 o The standard output of the batch job (KEEP_STD_OUTPUT).

101694 If both 'e' and 'o' are specified, then both files are retained. An existing
 101695 *Keep_Files* attribute can be cleared by the following keep type:

- 101696 n NO_KEEP

101697 If 'n' is specified, then no files are retained. The *qsub* utility shall consider it an
 101698 error if any keep type other than 'n' is combined with keep type 'n'.

101699 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or
 101700 'n' within the *keep_list* option-argument. The *qsub* utility shall permit the
 101701 repetition of characters, but shall not assign additional meaning to the repeated
 101702 characters.

101703 An implementation may define other keep types. The conformance document for
 101704 an implementation shall describe any additional keep types, how they are
 101705 specified, their internal behavior, and how they affect the behavior of the utility. If
 101706 the *-k* option is not presented to the *qsub* utility, the utility shall set the *Keep_Files*

101707 attribute of the batch job to the value NO_KEEP.

101708 **-m** *mail_options*

101709 Define the points in the execution of the batch job at which the batch server that
101710 manages the batch job shall send mail about a change in the state of the batch job.

101711 The *qsub* **-m** option shall accept a value for the *mail_options* option-argument that
101712 is a string of alphanumeric characters in the portable character set (see XBD Section
101713 6.1, on page 111).

101714 The *qsub* utility shall accept a value for the *mail_options* option-argument that is a
101715 string of one or more of the characters 'e', 'b', and 'a', or the single character
101716 'n'.

101717 For each unique character in the *mail_options* option-argument, the *qsub* utility shall
101718 add a value to the *Mail_Users* attribute of the batch job as follows, each
101719 representing a different time during the life of a batch job at which to send mail:

101720 e MAIL_AT_EXIT

101721 b MAIL_AT_BEGINNING

101722 a MAIL_AT_ABORT

101723 If any of these characters are duplicated in the *mail_options* option-argument, the
101724 duplicates shall be ignored.

101725 An existing *Mail_Points* attribute can be cleared by the following mail type:

101726 n NO_MAIL

101727 If 'n' is specified, then mail is not sent. The *qsub* utility shall consider it an error if
101728 any mail type other than 'n' is combined with mail type 'n'.

101729 Strictly conforming applications shall not repeat any of the characters 'e', 'b',
101730 'a', or 'n' within the *mail_options* option-argument.

101731 The *qsub* utility shall permit the repetition of characters, but shall not assign
101732 additional meaning to the repeated characters. An implementation may define
101733 other mail types. The conformance document for an implementation shall describe
101734 any additional mail types, how they are specified, their internal behavior, and how
101735 they affect the behavior of the utility.

101736 If the **-m** option is not presented to the *qsub* utility, the utility shall set the
101737 *Mail_Points* attribute to the value MAIL_AT_ABORT.

101738 **-M** *mail_list* Define the list of users to which a batch server that executes the batch job shall
101739 send mail, if the server sends mail about the batch job.

101740 The syntax of the *mail_list* option-argument is unspecified.

101741 If the implementation of the *qsub* utility uses a name service to locate users, the
101742 utility should accept the syntax used by the name service.

101743 If the implementation of the *qsub* utility does not use a name service to locate users,
101744 the implementation should accept the following syntax for user names:

101745 *mail_address*[, *mail_address* , , . . .]

101746 The interpretation of *mail_address* is implementation-defined.

101747 The *qsub* utility shall set the *Mail_Users* attribute of the batch job to the value of the
101748 *mail_list* option-argument.

101749 If the **-M** option is not presented to the *qsub* utility, the utility shall place only the

101750 user name and host name for the current process in the *Mail_Users* attribute of the
 101751 batch job.

101752 **-N name** Define the name of the batch job.

101753 The *qsub* **-N** option shall accept a value for the *name* option-argument that is a
 101754 string of up to 15 alphanumeric characters in the portable character set (see XBD
 101755 [Section 6.1](#), on page 111) where the first character is alphabetic.

101756 The *qsub* utility shall set the value of the *Job_Name* attribute of the batch job to the
 101757 value of the *name* option-argument.

101758 If the **-N** option is not presented to the *qsub* utility, the utility shall set the *Job_Name*
 101759 attribute of the batch job to the name of the *script* argument from which the
 101760 directory specification if any, has been removed.

101761 If the **-N** option is not presented to the *qsub* utility, and the script is read from
 101762 standard input, the utility shall set the *Job_Name* attribute of the batch job to the
 101763 value STDIN.

101764 **-o path_name** Define the path for the standard output of the batch job.

101765 The *qsub* utility shall accept a *path_name* option-argument that conforms to the
 101766 syntax of the *path_name* element defined in the System Interfaces volume of
 101767 POSIX.1-200x, which can be preceded by a host name element of the form
 101768 *hostname:*.
 101769

101770 If the *path_name* option-argument constitutes an absolute pathname, the *qsub* utility
 101771 shall set the *Output_Path* attribute of the batch job to the value of the *path_name*
 101772 option-argument without expansion.

101773 If the *path_name* option-argument constitutes a relative pathname and no host
 101774 name element is specified, the *qsub* utility shall set the *Output_Path* attribute of the
 101775 batch job to the pathname derived by expanding the value of the *path_name* option-
 101776 argument relative to the current directory of the process executing the *qsub*.

101777 If the *path_name* option-argument constitutes a relative pathname and a host name
 101778 element is specified, the *qsub* utility shall set the *Output_Path* attribute of the batch
 101779 job to the value of the *path_name* option-argument without expansion.

101780 If the *path_name* option-argument does not specify a host name element, the *qsub*
 101781 utility shall prefix the pathname with *hostname:*, where *hostname* is the name of the
 101782 host upon which the *qsub* utility is executing.

101783 If the **-o** option is not presented to the *qsub* utility, the utility shall set the
 101784 *Output_Path* attribute of the batch job to the host name and path of the current
 101785 directory of the submitting process and the default filename.

101786 The default filename for standard output has the following format:
 101787 *job_name.osequence_number*

101788 **-p priority** Define the priority the batch job should have relative to other batch jobs owned by
 101789 the batch server.

101790 The *qsub* utility shall set the *Priority* attribute of the batch job to the value of the
 101791 *priority* option-argument.

101792 If the **-p** option is not presented to the *qsub* utility, the value of the *Priority* attribute
 101793 is implementation-defined.

101794 The *qsub* utility shall accept a value for the *priority* option-argument that conforms

- 101795 to the syntax for signed decimal integers, and which is not less than $-1\,024$ and not
101796 greater than $1\,023$.
- 101797 **-q** *destination*
101798 Define the destination of the batch job.
- 101799 The destination is not a batch job attribute; it determines the batch server, and
101800 possibly the batch queue, to which the *qsub* utility batch queues the batch job.
- 101801 The *qsub* utility shall submit the script to the batch server named by the *destination*
101802 option-argument or the server that owns the batch queue named in the *destination*
101803 option-argument.
- 101804 The *qsub* utility shall accept an option-argument for the **-q** option that conforms to
101805 the syntax for a destination (see [Section 3.3.2](#), on page 2341).
- 101806 If the **-q** option is not presented to the *qsub* utility, the *qsub* utility shall submit the
101807 batch job to the default destination. The mechanism for determining the default
101808 destination is implementation-defined.
- 101809 **-r** *y|n*
101810 Define whether the batch job is rerunnable.
- 101811 If the value of the option-argument is *y*, the *qsub* utility shall set the *Rerunable*
101812 attribute of the batch job to TRUE.
- 101813 If the value of the option-argument is *n*, the *qsub* utility shall set the *Rerunable*
101814 attribute of the batch job to FALSE.
- 101815 If the **-r** option is not presented to the *qsub* utility, the utility shall set the *Rerunable*
101816 attribute of the batch job to TRUE.
- 101817 **-S** *path_name_list*
101818 Define the pathname to the shell under which the batch job is to execute.
- 101819 The *qsub* utility shall accept a *path_name_list* option-argument that conforms to the
101820 following syntax:
pathname[@host][, , *pathname*[@host], , . . .]
- 101821 The *qsub* utility shall allow only one pathname for a given host name. The *qsub*
101822 utility shall allow only one pathname that is missing a corresponding host name.
- 101823 The *qsub* utility shall add a value to the *Shell_Path_List* attribute of the batch job for
101824 each entry in the *path_name_list* option-argument.
- 101825 If the **-S** option is not presented to the *qsub* utility, the utility shall set the
101826 *Shell_Path_List* attribute of the batch job to the null string.
- 101827 The conformance document for an implementation shall describe the mechanism
101828 used to set the default shell and determine the current value of the default shell.
101829 An implementation shall provide a means for the installation to set the default
101830 shell to the login shell of the user under which the batch job is to execute. See
101831 [Section 3.3.3](#) (on page 2341) for a means of removing *keyword=value* (and
101832 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.
- 101833 **-u** *user_list*
101834 Define the user name under which the batch job is to execute.
- 101835 The *qsub* utility shall accept a *user_list* option-argument that conforms to the
101836 following syntax:
username[@host][, , *username*[@host], , . . .]
- 101837 The *qsub* utility shall accept only one user name that is missing a corresponding
101838 host name. The *qsub* utility shall accept only one user name per named host.

101839 The *qsub* utility shall add a value to the *User_List* attribute of the batch job for each
101840 entry in the *user_list* option-argument.

101841 If the *-u* option is not presented to the *qsub* utility, the utility shall set the *User_List*
101842 attribute of the batch job to the user name from which the utility is executing. See
101843 [Section 3.3.3](#) (on page 2341) for a means of removing *keyword=value* (and
101844 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

101845 *-v variable_list*

101846 Add to the list of variables that are exported to the session leader of the batch job.

101847 A *variable_list* is a set of strings of either the form *<variable>* or *<variable=value>*,
101848 delimited by commas.

101849 If the *-v* option is presented to the *qsub* utility, the utility shall also add, to the
101850 environment *Variable_List* attribute of the batch job, every variable named in the
101851 environment *variable_list* option-argument and, optionally, values of specified
101852 variables.

101853 If a value is not provided on the command line, the *qsub* utility shall set the value
101854 of each variable in the environment *Variable_List* attribute of the batch job to the
101855 value of the corresponding environment variable for the process in which the
101856 utility is executing; see [Table 4-18](#) (on page 3029).

101857 A conforming application shall not repeat a variable in the environment
101858 *variable_list* option-argument.

101859 The *qsub* utility shall not repeat a variable in the environment *Variable_List* attribute
101860 of the batch job. See [Section 3.3.3](#) (on page 2341) for a means of removing
101861 *keyword=value* (and *value@keyword*) pairs and other general rules for list-oriented
101862 batch job attributes.

101863 *-V* Specify that all of the environment variables of the process are exported to the
101864 context of the batch job.

101865 The *qsub* utility shall place every environment variable in the process in which the
101866 utility is executing in the list and shall set the value of each variable in the attribute
101867 to the value of that variable in the process.

101868 *-z* Specify that the utility does not write the batch *job_identifier* of the created batch job
101869 to standard output.

101870 If the *-z* option is presented to the *qsub* utility, the utility shall not write the batch
101871 *job_identifier* of the created batch job to standard output.

101872 If the *-z* option is not presented to the *qsub* utility, the utility shall write the
101873 identifier of the created batch job to standard output.

101874 OPERANDS

101875 The *qsub* utility shall accept a *script* operand that indicates the path to the script of the batch job.

101876 If the *script* operand is not presented to the *qsub* utility, or if the operand is the single-character
101877 string *'-'*, the utility shall read the script from standard input.

101878 If the script represents a partial path, the *qsub* utility shall expand the path relative to the current
101879 directory of the process executing the utility.

101880 STDIN

101881 The *qsub* utility reads the script of the batch job from standard input if the script operand is
101882 omitted or is the single character *'-'*.

101883 **INPUT FILES**

101884 In addition to binding the file indicated by the *script* operand to the batch job, the *qsub* utility
 101885 reads the script file and acts on directives in the script.

101886 **ENVIRONMENT VARIABLES**

101887 The following environment variables shall affect the execution of *qsub*:

101888 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 101889 (See XBD Section 8.2 (on page 160) the precedence of internationalization variables |
 101890 used to determine the values of locale categories.)

101891 *LC_ALL* If set to a non-empty string value, override the values of all the other
 101892 internationalization variables.

101893 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 101894 characters (for example, single-byte as opposed to multi-byte characters in
 101895 arguments).

101896 *LC_MESSAGES*

101897 Determine the locale that should be used to affect the format and contents of
 101898 diagnostic messages written to standard error.

101899 *LOGNAME* Determine the login name of the user.

101900 *PBS_DPREFIX*

101901 Determine the default prefix for directives within the script.

101902 *SHELL* Determine the pathname of the preferred command language interpreter of the
 101903 user.

101904 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is
 101905 unset or null, an unspecified default timezone shall be used.

101906 **ASYNCHRONOUS EVENTS**

101907 Once created, a batch job exists until it exits, aborts, or is deleted.

101908 After a batch job is created by the *qsub* utility, batch servers might route, execute, modify, or
 101909 delete the batch job.

101910 **STDOUT**

101911 The *qsub* utility writes the batch *job_identifier* assigned to the batch job to standard output, unless
 101912 the *-z* option is specified.

101913 **STDERR**

101914 The standard error shall be used only for diagnostic messages.

101915 **OUTPUT FILES**

101916 None.

101917 **EXTENDED DESCRIPTION**101918 **Script Preservation**

101919 The *qsub* utility shall make the script available to the server executing the batch job in such a
 101920 way that the server executes the script as it exists at the time of submission.

101921 The *qsub* utility can send a copy of the script to the server with the *Queue Job Request* or store a
 101922 temporary copy of the script in a location specified to the server.

101923 **Option Specification**101924 A script can contain directives to the *qsub* utility.101925 The *qsub* utility shall scan the lines of the script for directives, skipping blank lines, until the first
101926 line that begins with a string other than the directive string; if directives occur on subsequent
101927 lines, the utility shall ignore those directives.101928 Lines are separated by a <newline>. If the first line of the script begins with "#!" or a colon
101929 (' : '), then it is skipped. The *qsub* utility shall process a line in the script as a directive if and
101930 only if the string of characters from the first non-white-space character on the line until the first
101931 <space> or <tab> on the line match the directive prefix. If a line in the script contains a directive
101932 and the final characters of the line are backslash ('\ ') and <newline>, then the next line shall be
101933 interpreted as a continuation of that directive.101934 The *qsub* utility shall process the options and option-arguments contained on the directive prefix
101935 line using the same syntax as if the options were input on the *qsub* utility.101936 The *qsub* utility shall continue to process a directive prefix line until after a <newline> is
101937 encountered. An implementation may ignore lines which, according to the syntax of the shell
101938 that will interpret the script, are comments. An implementation shall describe in the
101939 conformance document the format of any shell comments that it will recognize.101940 If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall
101941 ignore the option and the corresponding option-argument, if any, in the directive.101942 If an option that is present in the directive is not present in the arguments to the *qsub* utility, the
101943 utility shall process the option and the option-argument, if any.101944 In order of preference, the *qsub* utility shall select the directive prefix from one of the following
101945 sources:

- 101946
- If the `-C` option is presented to the utility, the value of the *directive_prefix* option-argument
 - If the environment variable *PBS_DPREFIX* is defined, the value of that variable
 - The four-character string "#PBS" encoded in the portable character set

101949 If the `-C` option is present in the script file it shall be ignored.101950 **EXIT STATUS**

101951 The following exit values shall be returned:

101952 0 Successful completion.

101953 >0 An error occurred.

101954 **CONSEQUENCES OF ERRORS**

101955 Default.

101956 **APPLICATION USAGE**

101957 None.

101958 **EXAMPLES**

101959 None.

101960 **RATIONALE**101961 The *qsub* utility allows users to create a batch job that will process the script specified as the
101962 operand of the utility.101963 The options of the *qsub* utility allow users to control many aspects of the queuing and execution
101964 of a batch job.101965 The `-a` option allows users to designate the time after which the batch job will become eligible to
101966 run. By specifying an execution time, users can take advantage of resources at off-peak hours,

101967 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-
 101968 peak pricing of computing time. For these reasons and others, a timing option is existing
 101969 practice on the part of almost every batch system, including NQS.

101970 The **-A** option allows users to specify the account that will be charged for the batch job. Support
 101971 for account is not mandatory for conforming batch servers.

101972 The **-C** option allows users to prescribe the prefix for directives within the script file. The default
 101973 prefix "#PBS" may be inappropriate if the script will be interpreted with an alternate shell, as
 101974 specified by the **-S** option.

101975 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing
 101976 system, which is not defined by this volume of POSIX.1-200x, allows recovery of a batch job at
 101977 the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that
 101978 consume expensive computing time or must meet a critical schedule. Users should be allowed to
 101979 make the tradeoff between the overhead of checkpointing and the risk to the timely completion
 101980 of the batch job; therefore, this volume of POSIX.1-200x provides the checkpointing interval
 101981 option. Support for checkpointing is optional for batch servers.

101982 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default
 101983 path. For example, if the submitted script generally produces a great deal of useless error
 101984 output, a user might redirect the standard error output to the null device. Or, if the file system
 101985 holding the default location (the home directory of the user) has too little free space, the user
 101986 might redirect the standard error stream to a file in another file system.

101987 The **-h** option allows users to create a batch job that is held until explicitly released. The ability
 101988 to create a held job is useful when some external event must complete before the batch job can
 101989 execute. For example, the user might submit a held job and release it when the system load has
 101990 dropped.

101991 The **-j** option allows users to merge the standard error of a batch job into its standard output
 101992 stream, which has the advantage of showing the sequential relationship between output and
 101993 error messages.

101994 The **-m** option allows users to designate those points in the execution of a batch job at which
 101995 mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By
 101996 requesting mail notification at points of interest in the life of a job, the submitting user, or other
 101997 designated users, can track the progress of a batch job.

101998 The **-N** option allows users to associate a name with the batch job. The job name in no way
 101999 affects the processing of the batch job, but rather serves as a mnemonic handle for users. For
 102000 example, the batch job name can help the user distinguish between multiple jobs listed by the
 102001 *qstat* utility.

102002 The **-o** option allows users to redirect the standard output stream. A user might, for example,
 102003 wish to redirect to the null device the standard output stream of a job that produces copious yet
 102004 superfluous output.

102005 The **-P** option allows users to designate the relative priority of a batch job for selection from a
 102006 queue.

102007 The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a
 102008 routing queue, the batch server routes the batch job to another queue for execution or further
 102009 routing. If the user specifies a non-routing queue, the batch server of the queue eventually
 102010 executes the batch job.

102011 The **-r** option allows users to control whether the submitted job will be rerun if the controlling
 102012 batch node fails during execution of the batch job. The **-r** option likewise allows users to
 102013 indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot
 102014 be correctly rerun because of changes they make in the state of databases or other aspects of

102015 their environment. This volume of POSIX.1-200x specifies that the default, if the `-r` option is not
 102016 presented to the utility, will be that the batch job cannot be rerun, since the result of rerunning a
 102017 non-rerunnable job might be catastrophic.

102018 The `-S` option allows users to specify the program (usually a shell) that will be invoked to
 102019 process the script of the batch job. This option has been modified to allow a list of shell names
 102020 and locations associated with different hosts.

102021 The `-u` option is useful when the submitting user is authorized to use more than one account on
 102022 a given host, in which case the `-u` option allows the user to select from among those accounts.
 102023 The option-argument is a list of user-host pairs, so that the submitting user can provide different
 102024 user identifiers for different nodes in the event the batch job is routed. The `-u` option provides a
 102025 lot of flexibility to accommodate sites with complex account structures. Users that have the same
 102026 user identifier on all the hosts they are authorized to use will not need to use the `-u` option.

102027 The `-V` option allows users to export all their current environment variables, as of the time the
 102028 batch job is submitted, to the context of the processes of the batch job.

102029 The `-v` option allows users to export specific environment variables from their current process to
 102030 the processes of the batch job.

102031 The `-z` option allows users to suppress the writing of the batch job identifier to standard output.
 102032 The `-z` option is an existing NQS practice that has been standardized.

102033 Historically, the *qsub* utility has served the batch job-submission function in the NQS system, the
 102034 existing practice on which it is based. Some changes and additions have been made to the *qsub*
 102035 utility in this volume of POSIX.1-200x, *vis-a-vis* NQS, as a result of the growing pool of
 102036 experience with distributed batch systems.

102037 The set of features of the *qsub* utility as defined in this volume of POSIX.1-200x appears to
 102038 incorporate all the common existing practice on potentially conforming platforms.

102039 FUTURE DIRECTIONS

102040 The *qsub* utility may be removed in a future version.

102045 CHANGE HISTORY

102046 Derived from IEEE Std 1003.2d-1994.

102047 Issue 6

102048 The `-I` option has been removed as there is no portable description of the resources that are
 102049 allowed or required by the batch job.

102050 Issue 7

102051 The *qsub* utility is marked obsolescent.

102052 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102053 **NAME**
 102054 read — read a line from standard input

102055 **SYNOPSIS**
 102056 read [-r] var...

102057 **DESCRIPTION**
 102058 The *read* utility shall read a single line from standard input.

102059 By default, unless the *-r* option is specified, backslash ('**') shall act as an escape character, as
 102060 described in [Section 2.2.1](#) (on page 2246). If standard input is a terminal device and the invoking
 102061 shell is interactive, *read* shall prompt for a continuation line when:

- 102062 • The shell reads an input line ending with a backslash <newline>, unless the *-r* option is
 102063 specified.
- 102064 • A here-document is not terminated after a <newline> is entered.

102065 The terminating <newline> (if any) shall be removed from the input and the results shall be split
 102066 into fields as in the shell for the results of parameter expansion (see [Section 2.6.5](#), on page 2258);
 102067 the first field shall be assigned to the first variable *var*, the second field to the second variable
 102068 *var*, and so on. If there are fewer fields than there are *var* operands, the remaining *vars* shall be
 102069 set to empty strings. If there are fewer *vars* than fields, the last *var* shall be set to a value
 102070 comprising the following elements:

- 102071 • The field that corresponds to the last *var* in the normal assignment sequence described
 102072 above
- 102073 • The delimiter(s) that follow the field corresponding to the last *var*
- 102074 • The remaining fields and their delimiters, with trailing *IFS* white space ignored

102075 The setting of variables specified by the *var* operands shall affect the current shell execution
 102076 environment; see [Section 2.12](#) (on page 2277). If it is called in a subshell or separate utility
 102077 execution environment, such as one of the following:

```
102078 (read foo)
102079 nohup read ...
102080 find . -exec read ... \;
```

102081 it shall not affect the shell variables in the caller's environment.

102082 **OPTIONS**
 102083 The *read* utility shall conform to XBD [Section 12.2](#) (on page 201).

102084 The following option is supported:

- 102085 *-r* Do not treat a backslash character in any special way. Consider each backslash to
 102086 be part of the input line.

102087 **OPERANDS**
 102088 The following operand shall be supported:
 102089 *var* The name of an existing or nonexisting shell variable.

102090 **STDIN**
 102091 The standard input shall be a text file.

102092 **INPUT FILES**

102093 None.

102094 **ENVIRONMENT VARIABLES**102095 The following environment variables shall affect the execution of *read*:102096 *IFS* Determine the internal field separators used to delimit fields; see [Section 2.5.3](#) (on
102097 page 2250).102098 *LANG* Provide a default value for the internationalization variables that are unset or null. |
102099 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
102100 variables used to determine the values of locale categories.)102101 *LC_ALL* If set to a non-empty string value, override the values of all the other
102102 internationalization variables.102103 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
102104 characters (for example, single-byte as opposed to multi-byte characters in
102105 arguments).102106 *LC_MESSAGES*102107 Determine the locale that should be used to affect the format and contents of
102108 diagnostic messages written to standard error.102109 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.102110 *PS2* Provide the prompt string that an interactive shell shall write to standard error
102111 when a line ending with a backslash <newline> is read and the *-r* option was not
102112 specified, or if a here-document is not terminated after a <newline> is entered.102113 **ASYNCHRONOUS EVENTS**

102114 Default.

102115 **STDOUT**

102116 Not used.

102117 **STDERR**

102118 The standard error shall be used for diagnostic messages and prompts for continued input.

102119 **OUTPUT FILES**

102120 None.

102121 **EXTENDED DESCRIPTION**

102122 None.

102123 **EXIT STATUS**

102124 The following exit values shall be returned:

102125 0 Successful completion.

102126 >0 End-of-file was detected or an error occurred.

102127 **CONSEQUENCES OF ERRORS**

102128 Default.

APPLICATION USAGE

The `-r` option is included to enable `read` to subsume the purpose of the `line` utility, which is not included in POSIX.1-200x.

EXAMPLES

The following command:

```
while read -r xx yy
do
    printf "%s %s\n" "$yy" "$xx"
done < input_file
```

prints a file with the first field of each line moved to the end of the line.

RATIONALE

The `read` utility historically has been a shell built-in. It was separated off into its own utility to take advantage of the richer description of functionality introduced by this volume of POSIX.1-200x.

Since `read` affects the current shell execution environment, it is generally provided as a shell regular built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:

```
(read foo)
nohup read ...
find . -exec read ... \;
```

it does not affect the shell variables in the environment of the caller.

Although the standard input is required to be a text file, and therefore will always end with a `<newline>` (unless it is an empty file), the processing of continuation lines when the `-r` option is not used can result in the input not ending with a `<newline>`. This occurs if the last line of the input file ends with backslash `<newline>`. It is for this reason that “if any” is used in “The terminating `<newline>` (if any) shall be removed from the input” in the description. It is not a relaxation of the requirement for standard input to be a text file.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 7

SD5-XCU-ERN-126 is applied, clarifying that input lines end with a `<newline>`.

102165 **NAME**
 102166 renice — set nice values of running processes

102167 **SYNOPSIS**
 102168 renice [-g|-p|-u] -n *increment* *ID*...

102169 **DESCRIPTION**
 102170 The *renice* utility shall request that the nice values (see XBD Section 3.238, on page 66) of one or
 102171 more running processes be changed. By default, the applicable processes are specified by their
 102172 process IDs. When a process group is specified (see *-g*), the request shall apply to all processes
 102173 in the process group.

102174 The nice value shall be bounded in an implementation-defined manner. If the requested
 102175 *increment* would raise or lower the nice value of the executed utility beyond implementation-
 102176 defined limits, then the limit whose value was exceeded shall be used.

102177 When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the
 102178 user ID corresponding to the user.

102179 Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values
 102180 of any process unless the user requesting such a change has appropriate privileges to do so for
 102181 the specified process. If the user lacks appropriate privileges to perform the requested action, the
 102182 utility shall return an error status.

102183 The saved set-user-ID of the user's process shall be checked instead of its effective user ID when
 102184 *renice* attempts to determine the user ID of the process in order to determine whether the user
 102185 has appropriate privileges.

102186 **OPTIONS**
 102187 The *renice* utility shall conform to XBD Section 12.2 (on page 201), except for Guideline 9.

102188 The following options shall be supported:

- 102189 **-g** Interpret the following operands as unsigned decimal integer process group IDs.
- 102190 **-n *increment*** Specify how the nice value of the specified process or processes is to be adjusted.
 102191 The *increment* option-argument is a positive or negative decimal integer that shall
 102192 be used to modify the nice value of the specified process or processes.
- 102193 Positive *increment* values shall cause a lower nice value. Negative *increment* values
 102194 may require appropriate privileges and shall cause a higher nice value.
- 102195 **-p** Interpret the following operands as unsigned decimal integer process IDs. The **-p**
 102196 option is the default if no options are specified.
- 102197 **-u** Interpret the following operands as users. If a user exists with a user name equal to
 102198 the operand, then the user ID of that user is used in further processing. Otherwise,
 102199 if the operand represents an unsigned decimal integer, it shall be used as the
 102200 numeric user ID of the user.

102201 **OPERANDS**
 102202 The following operands shall be supported:

102203 ***ID*** A process ID, process group ID, or user name/user ID, depending on the option
 102204 selected.

renice

Utilities

102205 **STDIN**

102206 Not used.

102207 **INPUT FILES**

102208 None.

102209 **ENVIRONMENT VARIABLES**102210 The following environment variables shall affect the execution of *renice*:

102211 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 102212 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 102213 variables used to determine the values of locale categories.)

102214 *LC_ALL* If set to a non-empty string value, override the values of all the other
 102215 internationalization variables.

102216 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 102217 characters (for example, single-byte as opposed to multi-byte characters in
 102218 arguments).

102219 *LC_MESSAGES*

102220 Determine the locale that should be used to affect the format and contents of
 102221 diagnostic messages written to standard error.

102222 *NSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

102223 **ASYNCHRONOUS EVENTS**

102224 Default.

102225 **STDOUT**

102226 Not used.

102227 **STDERR**

102228 The standard error shall be used only for diagnostic messages.

102229 **OUTPUT FILES**

102230 None.

102231 **EXTENDED DESCRIPTION**

102232 None.

102233 **EXIT STATUS**

102234 The following exit values shall be returned:

102235 0 Successful completion.

102236 >0 An error occurred.

102237 **CONSEQUENCES OF ERRORS**

102238 Default.

102239 **APPLICATION USAGE**

102240 None.

102241 **EXAMPLES**

102242 1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

102243 `renice -n 5 -p 987 32`

102244 2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the
 102245 user has the appropriate privileges to do so:

102246 `renice -n -4 -g 324 76`

3. Adjust the nice value so that numeric user ID 8 and user `sas` would have a lower nice value:

```
renice -n 4 -u 8 sas
```

Useful nice value increments on historical systems include 19 or 20 (the affected processes run only when nothing else in the system attempts to run) and any negative number (to make processes run faster).

RATIONALE

The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-argument. However, for clarity, they have been included in the OPTIONS section, rather than the OPERANDS section.

The definition of nice value is not intended to suggest that all processes in a system have priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the System Interfaces volume of POSIX.1-200x make the notion of a single underlying priority for all scheduling policies problematic. Some implementations may implement the *nice*-related features to affect all processes on the system, others to affect just the general time-sharing activities implied by this volume of POSIX.1-200x, and others may have no effect at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of implementation strategies are possible.

Originally, this utility was written in the historical manner, using the term “nice value”. This was always a point of concern with users because it was never intuitively obvious what this meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was hoped that novice users could better understand what this utility was meant to do. Also, it would be easier to document what the utility was meant to do. Unfortunately, the addition of the POSIX realtime scheduling capabilities introduced the concepts of process and thread scheduling priorities that were totally unaffected by the *nice/renice* utilities or the *nice()/setpriority()* functions. Continuing to use the term “system scheduling priority” would have incorrectly suggested that these utilities and functions were indeed affecting these realtime priorities. It was decided to revert to the historical term “nice value” to reference this unrelated process attribute.

Although this utility has use by system administrators (and in fact appears in the system administration portion of the BSD documentation), the standard developers considered that it was very useful for individual end users to control their own processes.

Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
renice nice_value[-p] pid...[-g gid...][-p pid...][-u user...]
renice nice_value -g gid...[-g gid...]-p pid...[-u user...]
renice nice_value -u user...[-g gid...]-p pid...[-u user...]
```

These forms are no longer specified by POSIX.1-200x but may be present in some implementations.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4.

102292	Issue 5	
102293		In the SYNOPSIS, an ellipsis is added to the -u option in all three obsolescent forms.
102294	Issue 6	
102295		This utility is marked as part of the User Portability Utilities option.
102296		The APPLICATION USAGE section is added.
102297		The obsolescent forms of the SYNOPSIS are removed.
102298		Text previously conditional on POSIX_SAVED_IDS is mandatory in this version. This is a FIPS
102299		requirement.
102300	Issue 7	
102301		Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility
102302		Syntax Guidelines does not apply.
102303		SD5-XCU-ERN-97 is applied, updating the SYNOPSIS. +
102304		The <i>renice</i> utility is moved from the User Portability Utilities option to the Base. User Portability
102305		Utilities is now an option for interactive utilities. -

102306 **NAME**
 102307 `rm` — remove directory entries

102308 **SYNOPSIS**
 102309 `rm [-fiRr] file...`

102310 **DESCRIPTION**

102311 The *rm* utility shall remove the directory entry specified by each *file* argument.

102312 If either of the files `dot` or `dot-dot` are specified as the basename portion of an operand (that is,
 102313 the final pathname component) or if an operand resolves to the root directory, *rm* shall write a
 102314 diagnostic message to standard error and do nothing more with such operands.

102315 For each *file* the following steps shall be taken:

- 102316 1. If the *file* does not exist:
- 102317 a. If the `-f` option is not specified, *rm* shall write a diagnostic message to standard
 102318 error.
 - 102319 b. Go on to any remaining *files*.
- 102320 2. If *file* is of type directory, the following steps shall be taken:
- 102321 a. If neither the `-R` option nor the `-r` option is specified, *rm* shall write a diagnostic
 102322 message to standard error, do nothing more with *file*, and go on to any remaining
 102323 files.
 - 102324 b. If the `-f` option is not specified, and either the permissions of *file* do not permit
 102325 writing and the standard input is a terminal or the `-i` option is specified, *rm* shall
 102326 write a prompt to standard error and read a line from the standard input. If the
 102327 response is not affirmative, *rm* shall do nothing more with the current file and go
 102328 on to any remaining files.
 - 102329 c. For each entry contained in *file*, other than `dot` or `dot-dot`, the four steps listed here
 102330 (1 to 4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall
 102331 not traverse directories by following symbolic links into other parts of the
 102332 hierarchy, but shall remove the links themselves.
 - 102333 d. If the `-i` option is specified, *rm* shall write a prompt to standard error and read a
 102334 line from the standard input. If the response is not affirmative, *rm* shall do nothing
 102335 more with the current file, and go on to any remaining files.
- 102336 3. If *file* is not of type directory, the `-f` option is not specified, and either the permissions of
 102337 *file* do not permit writing and the standard input is a terminal or the `-i` option is specified,
 102338 *rm* shall write a prompt to the standard error and read a line from the standard input. If
 102339 the response is not affirmative, *rm* shall do nothing more with the current file and go on
 102340 to any remaining files.
- 102341 4. If the current file is a directory, *rm* shall perform actions equivalent to the `rmdir()` function
 102342 defined in the System Interfaces volume of POSIX.1-200x called with a pathname of the
 102343 current file used as the *path* argument. If the current file is not a directory, *rm* shall
 102344 perform actions equivalent to the `unlink()` function defined in the System Interfaces
 102345 volume of POSIX.1-200x called with a pathname of the current file used as the *path*
 102346 argument.

102347 If this fails for any reason, *rm* shall write a diagnostic message to standard error, do
 102348 nothing more with the current file, and go on to any remaining files.

102349 The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail

102350 due to path length limitations (unless an operand specified by the user exceeds system
102351 limitations).

OPTIONS

102352 The *rm* utility shall conform to XBD [Section 12.2](#) (on page 201). |

102353 The following options shall be supported:

- 102354
- 102355 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the
102356 exit status in the case of nonexistent operands. Any previous occurrences of the **-i**
102357 option shall be ignored.
- 102358 **-i** Prompt for confirmation as described previously. Any previous occurrences of the
102359 **-f** option shall be ignored.
- 102360 **-R** Remove file hierarchies. See the DESCRIPTION.
- 102361 **-r** Equivalent to **-R**.

OPERANDS

102362 The following operand shall be supported:

102363 *file* A pathname of a directory entry to be removed.

STDIN

102365 The standard input shall be used to read an input line in response to each prompt specified in
102366 the STDOUT section. Otherwise, the standard input shall not be used.
102367

INPUT FILES

102368 None.
102369

ENVIRONMENT VARIABLES

102370 The following environment variables shall affect the execution of *rm*:

102371

102372 **LANG** Provide a default value for the internationalization variables that are unset or null. |
102373 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
102374 variables used to determine the values of locale categories.)

102375 **LC_ALL** If set to a non-empty string value, override the values of all the other
102376 internationalization variables.

102377 **LC_COLLATE**
102378 Determine the locale for the behavior of ranges, equivalence classes, and multi-
102379 character collating elements used in the extended regular expression defined for
102380 the **yesexpr** locale keyword in the **LC_MESSAGES** category.

102381 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
102382 characters (for example, single-byte as opposed to multi-byte characters in
102383 arguments) and the behavior of character classes within regular expressions used
102384 in the extended regular expression defined for the **yesexpr** locale keyword in the
102385 **LC_MESSAGES** category.

102386 **LC_MESSAGES**
102387 Determine the locale for the processing of affirmative responses that should be
102388 used to affect the format and contents of diagnostic messages written to standard
102389 error.

102390 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

102391 **ASYNCHRONOUS EVENTS**

102392 Default.

102393 **STDOUT**

102394 Not used.

102395 **STDERR**

102396 Prompts shall be written to standard error under the conditions specified in the DESCRIPTION
 102397 and OPTIONS sections. The prompts shall contain the *file* pathname, but their format is
 102398 otherwise unspecified. The standard error also shall be used for diagnostic messages.

102399 **OUTPUT FILES**

102400 None.

102401 **EXTENDED DESCRIPTION**

102402 None.

102403 **EXIT STATUS**

102404 The following exit values shall be returned:

102405 0 Each directory entry was successfully removed, unless its removal was canceled by a non-
 102406 affirmative response to a prompt for confirmation.

102407 >0 An error occurred.

102408 **CONSEQUENCES OF ERRORS**

102409 Default.

102410 **APPLICATION USAGE**

102411 The *rm* utility is forbidden to remove the names *dot* and *dot-dot* in order to avoid the
 102412 consequences of inadvertently doing something like:

102413 `rm -r .*`

102414 Some implementations do not permit the removal of the last link to an executable binary file that
 102415 is being executed; see the [EBUSY] error in the *unlink()* function defined in the System Interfaces
 102416 volume of POSIX.1-200x. Thus, the *rm* utility can fail to remove such files.

102417 The `-i` option causes *rm* to prompt and read the standard input even if the standard input is not
 102418 a terminal, but in the absence of `-i` the mode prompting is not done when the standard input is
 102419 not a terminal.

102420 **EXAMPLES**

102421 1. The following command:

102422 `rm a.out core`102423 removes the directory entries: **a.out** and **core**.

102424 2. The following command:

102425 `rm -Rf junk`102426 removes the directory **junk** and all its contents, without prompting.102427 **RATIONALE**

102428 For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior
 102429 when prompting for confirmation, should be interpreted in the following manner:

```
102430 if ((NOT f_option) AND
102431     ((not_writable AND input_is_terminal) OR i_option))
```

102432 The exact format of the interactive prompts is unspecified. Only the general nature of the
 102433 contents of prompts are specified because implementations may desire more descriptive

102434 prompts than those used on historical implementations. Therefore, an application not using the
 102435 `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly
 102436 with the user, based on the behavior specified.

102437 The `-r` option is historical practice on all known systems. The synonym `-R` option is provided
 102438 for consistency with the other utilities in this volume of POSIX.1-200x that provide options
 102439 requesting recursive descent through the file hierarchy.

102440 The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with
 102441 “forcing” the unlink without prompting for permission, it always causes diagnostic messages to
 102442 be suppressed and the exit status to be unmodified for nonexistent operands and files that
 102443 cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and
 102444 system errors as well. Suppressing such messages is not a service to either shell scripts or users.

102445 It is less clear that error messages regarding files that cannot be unlinked (removed) should be
 102446 suppressed. Although this is historical practice, this volume of POSIX.1-200x does not permit the
 102447 `-f` option to suppress such messages.

102448 When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each
 102449 directory, once before removing its contents and once before actually attempting to delete the
 102450 directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical
 102451 versions of *rm* were inconsistent in that some did not do the former prompt for directories
 102452 named on the command line and others had obscure prompting behavior when the `-i` option
 102453 was specified and the permissions of the file did not permit writing. The POSIX Shell and
 102454 Utilities *rm* differs little from historic practice, but does require that prompts be consistent.
 102455 Historical versions of *rm* were also inconsistent in that prompts were done to both standard
 102456 output and standard error. This volume of POSIX.1-200x requires that prompts be done to
 102457 standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that
 102458 provide an option to list deleted files on standard output.

102459 The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be
 102460 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its
 102461 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the
 102462 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted
 102463 to fail because of path length restrictions, unless an operand specified by the user is longer than
 102464 `{PATH_MAX}`.

102465 The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of
 102466 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing
 102467 hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

102468 **FUTURE DIRECTIONS**

102469 None.

102474 **CHANGE HISTORY**

102475 First released in Issue 2.

102476 **Issue 5**

102477 The FUTURE DIRECTIONS section is added.

- 102478 **Issue 6**
- 102479 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft
- 102480 standard.
- 102481 **Issue 7**
- 102482 Austin Group Interpretations 1003.1-2001 #019 and #091 are applied.

102483 **NAME**102484 rmdel — remove a delta from an SCCS file (**DEVELOPMENT**)102485 **SYNOPSIS**102486 XSI `rmdel -r SID file...`102487 **DESCRIPTION**

102488 The *rmdel* utility shall remove the delta specified by the SID from each named SCCS file. The
 102489 delta to be removed shall be the most recent delta in its branch in the delta chain of each named
 102490 SCCS file. In addition, the application shall ensure that the SID specified is not that of a version
 102491 being edited for the purpose of making a delta; that is, if a *p-file* (see *get*) exists for the named
 102492 SCCS file, the SID specified shall not appear in any entry of the *p-file*.

102493 Removal of a delta shall be restricted to:

- 102494 1. The user who made the delta
- 102495 2. The owner of the SCCS file
- 102496 3. The owner of the directory containing the SCCS file

102497 **OPTIONS**102498 The *rmdel* utility shall conform to XBD [Section 12.2](#) (on page 201).

102499 The following option shall be supported:

102500 **-r** *SID* Specify the SCCS identification string (*SID*) of the delta to be deleted.102501 **OPERANDS**

102502 The following operand shall be supported:

102503 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rmdel*
 102504 utility shall behave as though each file in the directory were specified as a named
 102505 file, except that non-SCCS files (last component of the pathname does not begin
 102506 with **s**.) and unreadable files shall be silently ignored.

102507 If exactly one *file* operand appears, and it is `'-'`, the standard input shall be read;
 102508 each line of the standard input is taken to be the name of an SCCS file to be
 102509 processed. Non-SCCS files and unreadable files shall be silently ignored.

102510 **STDIN**

102511 The standard input shall be a text file used only when the *file* operand is specified as `'-'`. Each
 102512 line of the text file shall be interpreted as an SCCS pathname.

102513 **INPUT FILES**

102514 The SCCS files shall be files of unspecified format.

102515 **ENVIRONMENT VARIABLES**102516 The following environment variables shall affect the execution of *rmdel*:

102517 **LANG** Provide a default value for the internationalization variables that are unset or null.
 102518 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 102519 variables used to determine the values of locale categories.)

102520 **LC_ALL** If set to a non-empty string value, override the values of all the other
 102521 internationalization variables.

102522 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 102523 characters (for example, single-byte as opposed to multi-byte characters in
 102524 arguments and input files).

102525	LC_MESSAGES	
102526		Determine the locale that should be used to affect the format and contents of
102527		diagnostic messages written to standard error.
102528	NLSPATH	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
102529	ASYNCHRONOUS EVENTS	
102530		Default.
102531	STDOUT	
102532		Not used.
102533	STDERR	
102534		The standard error shall be used only for diagnostic messages.
102535	OUTPUT FILES	
102536		The SCCS files shall be files of unspecified format. During processing of a <i>file</i> , a temporary <i>x-file</i> ,
102537		as described in <i>admin</i> , may be created and deleted; a locking <i>z-file</i> , as described in <i>get</i> , may be
102538		created and deleted.
102539	EXTENDED DESCRIPTION	
102540		None.
102541	EXIT STATUS	
102542		The following exit values shall be returned:
102543	0	Successful completion.
102544	>0	An error occurred.
102545	CONSEQUENCES OF ERRORS	
102546		Default.
102547	APPLICATION USAGE	
102548		None.
102549	EXAMPLES	
102550		None.
102551	RATIONALE	
102552		None.
102553	FUTURE DIRECTIONS	
102554		None.

102557		XBD Chapter 8 (on page 159), Section 12.2 (on page 201)
102558	CHANGE HISTORY	
102559		First released in Issue 2.
102560	Issue 6	
102561		The normative text is reworded to avoid use of the term “must” for application requirements.

102562 **NAME**102563 `rmdir` — remove directories102564 **SYNOPSIS**102565 `rmdir [-p] dir...`102566 **DESCRIPTION**102567 The *rmdir* utility shall remove the directory entry specified by each *dir* operand.102568 For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function
102569 called with the *dir* operand as its only argument.102570 Directories shall be processed in the order specified. If a directory and a subdirectory of that
102571 directory are specified in a single invocation of the *rmdir* utility, the application shall specify the
102572 subdirectory before the parent directory so that the parent directory will be empty when the
102573 *rmdir* utility tries to remove it.102574 **OPTIONS**102575 The *rmdir* utility shall conform to XBD [Section 12.2](#) (on page 201).

102576 The following option shall be supported:

102577 **-p** Remove all directories in a pathname. For each *dir* operand:

- 102578
1. The directory entry it names shall be removed.
 2. If the *dir* operand includes more than one pathname component, effects
102579 equivalent to the following command shall occur:
102580

102581 `rmdir -p $(dirname dir)`102582 **OPERANDS**

102583 The following operand shall be supported:

102584 *dir* A pathname of an empty directory to be removed.102585 **STDIN**

102586 Not used.

102587 **INPUT FILES**

102588 None.

102589 **ENVIRONMENT VARIABLES**102590 The following environment variables shall affect the execution of *rmdir*:102591 **LANG** Provide a default value for the internationalization variables that are unset or null.
102592 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
102593 variables used to determine the values of locale categories.)102594 **LC_ALL** If set to a non-empty string value, override the values of all the other
102595 internationalization variables.102596 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
102597 characters (for example, single-byte as opposed to multi-byte characters in
102598 arguments).102599 **LC_MESSAGES**102600 Determine the locale that should be used to affect the format and contents of
102601 diagnostic messages written to standard error.

102602 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

102603 ASYNCHRONOUS EVENTS

102604 Default.

102605 STDOUT

102606 Not used.

102607 STDERR

102608 The standard error shall be used only for diagnostic messages.

102609 OUTPUT FILES

102610 None.

102611 EXTENDED DESCRIPTION

102612 None.

102613 EXIT STATUS

102614 The following exit values shall be returned:

102615 0 Each directory entry specified by a *dir* operand was removed successfully.

102616 >0 An error occurred.

102617 CONSEQUENCES OF ERRORS

102618 Default.

102619 APPLICATION USAGE

102620 The definition of an empty directory is one that contains, at most, directory entries for dot and
102621 dot-dot.

102622 EXAMPLES

102623 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty
102624 except it contains a directory **c**:

102625 `rmdir -p a/b/c`

102626 removes all three directories.

102627 RATIONALE

102628 On historical System V systems, the `-p` option also caused a message to be written to the
102629 standard output. The message indicated whether the whole path was removed or whether part
102630 of the path remained for some reason. The STDERR section requires this diagnostic when the
102631 entire path specified by a *dir* operand is not removed, but does not allow the status message
102632 reporting success to be written as a diagnostic.

102633 The *rmdir* utility on System V also included a `-s` option that suppressed the informational
102634 message output by the `-p` option. This option has been omitted because the informational
102635 message is not specified by this volume of POSIX.1-200x.

102636 FUTURE DIRECTIONS

102637 None.

CHANGE HISTORY

102643

First released in Issue 2.

102644

Issue 6

102645

The normative text is reworded to avoid use of the term “must” for application requirements.

102646 **NAME**
 102647 sact — print current SCCS file-editing activity (**DEVELOPMENT**)

102648 **SYNOPSIS**
 102649 XSI `sact file...`

102650 **DESCRIPTION**
 102651 The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a
 102652 list to standard output. This situation occurs when *get -e* has been executed previously without
 102653 a subsequent execution of *delta*, *unget*, or *sccs unedit*.

102654 **OPTIONS**
 102655 None.

102656 **OPERANDS**
 102657 The following operand shall be supported:

102658 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*
 102659 utility shall behave as though each file in the directory were specified as a named
 102660 file, except that non-SCCS files (last component of the pathname does not begin
 102661 with **s**.) and unreadable files shall be silently ignored.

102662 If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;
 102663 each line of the standard input shall be taken to be the name of an SCCS file to be
 102664 processed. Non-SCCS files and unreadable files shall be silently ignored.

102665 **STDIN**
 102666 The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each
 102667 line of the text file shall be interpreted as an SCCS pathname.

102668 **INPUT FILES**
 102669 Any SCCS files interrogated are files of an unspecified format.

102670 **ENVIRONMENT VARIABLES**
 102671 The following environment variables shall affect the execution of *sact*:

102672 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 102673 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 102674 variables used to determine the values of locale categories.)

102675 *LC_ALL* If set to a non-empty string value, override the values of all the other
 102676 internationalization variables.

102677 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 102678 characters (for example, single-byte as opposed to multi-byte characters in
 102679 arguments and input files).

102680 *LC_MESSAGES*
 102681 Determine the locale that should be used to affect the format and contents of
 102682 diagnostic messages written to standard error.

102683 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

102684 **ASYNCHRONOUS EVENTS**
 102685 Default.

STDOUT

The output for each named file shall consist of a line in the following format:

```
"%sΔ%sΔ%sΔ%sΔ%s\n", <SID>, <new SID>, <login>, <date>, <time>
```

<SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes are made to make the new delta.

<new SID> Specifies the SID for the new delta to be created.

<login> Contains the login name of the user who makes the delta (that is, who executed a *get* for editing).

<date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data keyword.

<time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data keyword.

If there is more than one named file or if a directory or standard input is named, each pathname shall be written before each of the preceding lines:

```
"\n%s:\n", <pathname>
```

STDERR

The standard error shall be used only for optional informative messages concerning SCCS files with no impending deltas, and for diagnostic messages.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

102725

102726

CHANGE HISTORY

First released in Issue 2.

102727 **NAME**
 102728 `sccs` — front end for the SCCS subsystem (**DEVELOPMENT**)

102729 **SYNOPSIS**
 102730 XSI `sccs [-r] [-d path] [-p path] command [options...] [operands...]`

102731 **DESCRIPTION**
 102732 The `sccs` utility is a front end to the SCCS programs. It also includes the capability to run set-
 102733 user-id to another user to provide additional protection.

102734 The `sccs` utility shall invoke the specified *command* with the specified *options* and *operands*. By
 102735 default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s. ".

102736 The *command* can be the name of one of the SCCS utilities in this volume of POSIX.1-200x (*admin*,
 102737 *delta*, *get*, *prs*, *rmDEL*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the
 102738 EXTENDED DESCRIPTION section.

102739 **OPTIONS**
 102740 The `sccs` utility shall conform to XBD [Section 12.2](#) (on page 201), except that *options* operands are
 102741 actually options to be passed to the utility named by *command*. When the portion of the
 102742 command:

102743 `command [options ...] [operands ...]`

102744 is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax
 102745 Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the
 102746 Guidelines to the extent indicated by their individual OPTIONS sections.

102747 The following options shall be supported preceding the *command* operand:

102748 **-d path** A pathname of a directory to be used as a root directory for the SCCS files. The
 102749 default shall be the current directory. The **-d** option shall take precedence over the
 102750 *PROJECTDIR* variable. See **-p**.

102751 **-p path** A pathname of a directory in which the SCCS files are located. The default shall be
 102752 the **SCCS** directory.

102753 The **-p** option differs from the **-d** option in that the **-d** option-argument shall be
 102754 prefixed to the entire pathname and the **-p** option-argument shall be inserted
 102755 before the final component of the pathname. For example:

102756 `sccs -d /x -p y get a/b`

102757 converts to:

102758 `get /x/a/y/s.b`

102759 This allows the creation of aliases such as:

102760 `alias syssccs="sccs -d /usr/src"`

102761 which is used as:

102762 `syssccs get cmd/who.c`

102763 **-r** Invoke *command* with the real user ID of the process, not any effective user ID that
 102764 the `sccs` utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmDEL*,
 102765 and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to
 102766 change the authorizations. These commands are always run as the real user.

102767 **OPERANDS**

102768 The following operands shall be supported:

102769 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the
102770 EXTENDED DESCRIPTION section.102771 *options* An option or option-argument to be passed to *command*.102772 *operands* An operand to be passed to *command*.102773 **STDIN**102774 See the utility description for the specified *command*.102775 **INPUT FILES**102776 See the utility description for the specified *command*.102777 **ENVIRONMENT VARIABLES**102778 The following environment variables shall affect the execution of *sccs*:102779 *LANG* Provide a default value for the internationalization variables that are unset or null. |
102780 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
102781 variables used to determine the values of locale categories.)102782 *LC_ALL* If set to a non-empty string value, override the values of all the other
102783 internationalization variables.102784 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
102785 characters (for example, single-byte as opposed to multi-byte characters in
102786 arguments and input files).102787 *LC_MESSAGES*102788 Determine the locale that should be used to affect the format and contents of
102789 diagnostic messages written to standard error.102790 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.102791 *PROJECTDIR*102792 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins
102793 with a slash, it shall be considered an absolute pathname; otherwise, the value of
102794 *PROJECTDIR* is treated as a user name and that user's initial working directory
102795 shall be examined for a subdirectory *src* or *source*. If such a directory is found, it
102796 shall be used. Otherwise, the value shall be used as a relative pathname.102797 Additional environment variable effects may be found in the utility description for the specified
102798 *command*.102799 **ASYNCHRONOUS EVENTS**

102800 Default.

102801 **STDOUT**102802 See the utility description for the specified *command*.102803 **STDERR**102804 See the utility description for the specified *command*.102805 **OUTPUT FILES**102806 See the utility description for the specified *command*.102807 **EXTENDED DESCRIPTION**102808 The following pseudo-utilities shall be supported as *command* operands. All options referred to
102809 in the following list are values given in the *options* operands following *command*.

- 102810 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a
 102811 non-zero exit status shall be returned if anything is being edited. The intent is to have
 102812 this included in an “install” entry in a makefile to ensure that everything is included
 102813 into the SCCS file before a version is installed.
- 102814 **clean** Remove everything from the current directory that can be recreated from SCCS files,
 102815 but do not remove any files being edited. If the **-b** option is given, branches shall be
 102816 ignored in the determination of whether they are being edited; this is dangerous if
 102817 branches are kept in the same directory.
- 102818 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any
 102819 options to *admin* are accepted. If the creation is successful, the original files shall be
 102820 renamed by prefixing the basenames with a comma. These renamed files should be
 102821 removed after it has been verified that the SCCS files have been created successfully.
- 102822 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall
 102823 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**
 102824 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be
 102825 passed to *get*.
- 102826 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option is
 102827 useful for making a checkpoint of the current editing phase. The same options shall be
 102828 passed to *delta* as described above, and all the options listed for *get* above except **-e**
 102829 shall be passed to **edit**.
- 102830 **diffs** Write a difference listing between the current version of the files checked out for editing
 102831 and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be passed to
 102832 *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option shall be
 102833 passed to *diff* as **-c**.
- 102834 **edit** Equivalent to *get -e*.
- 102835 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.
 102836 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it
 102837 is followed by a **-r SID** option. Since **fix** does not leave audit trails, it should be used
 102838 carefully.
- 102839 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs
 102840 with two or fewer components) shall be ignored. If a **-u user** option is given, then only
 102841 files being edited by the named user shall be listed. A **-U** option shall be equivalent to
 102842 **-u<current user>**.
- 102843 **print** Write out verbose information about the named files, equivalent to *sccs prs*.
- 102844 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the
 102845 **-b**, **-u**, and **-U** options like **info** and **check**.
- 102846 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any
 102847 changes made since the *get* are lost.

EXIT STATUS

102848 The following exit values shall be returned:

- 102849 0 Successful completion.
- 102850 >0 An error occurred.

CONSEQUENCES OF ERRORS

102852 Default.

102853

APPLICATION USAGE

Many of the SCCS utilities take directory names as operands as well as specific filenames. The pseudo-utilities supported by *sccs* are not described as having this capability, but are not prohibited from doing so.

EXAMPLES

1. To get a file for editing, edit it and produce a new delta:

```
sccs get -e file.c
ex file.c
sccs delta file.c
```

2. To get a file from another directory:

```
sccs -p /usr/src/sccs/s. get cc.c
or:
```

```
sccs get /usr/src/sccs/s.cc.c
```

3. To make a delta of a large number of files in the current directory:

```
sccs delta *.c
```

4. To get a list of files being edited that are not on branches:

```
sccs info -b
```

5. To delta everything being edited by the current user:

```
sccs delta $(sccs tell -U)
```

6. In a makefile, to get source files from an SCCS file if it does not already exist:

```
SRCS = <list of source files>
$(SRCS):
    sccs get $(REL) $@
```

RATIONALE

sccs and its associated utilities are part of the XSI Development Utilities option within the XSI option.

SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement tracking tool. When a file is put under SCCS, the source code control system maintains the file and, when changes are made, identifies and stores them in the file with the original source code and/or documentation. As other changes are made, they too are identified and retained in the file.

Retrieval of the original and any set of changes is possible. Any version of the file as it develops can be reconstructed for inspection or additional modification. History data can be stored with each version, documenting why the changes were made, who made them, and when they were made.

FUTURE DIRECTIONS

None.

102894

CHANGE HISTORY

102895

First released in Issue 4.

102896

Issue 6

102897

In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

102898

102899

The normative text is reworded to avoid use of the term “must” for application requirements.

102900

102901

Issue 7

102902

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

102903 **NAME**102904 `sed` — stream editor102905 **SYNOPSIS**102906 `sed [-n] script [file...]`102907 `sed [-n] -e script [-e script]... [-f script_file]... [file...]` |102908 `sed [-n] [-e script]... -f script_file [-f script_file]... [file...]` |102909 **DESCRIPTION**

102910 The `sed` utility is a stream editor that shall read one or more text files, make editing changes
 102911 according to a script of editing commands, and write the results to standard output. The script
 102912 shall be obtained from either the `script` operand string or a combination of the option-arguments
 102913 from the `-e script` and `-f script_file` options.

102914 **OPTIONS**

102915 The `sed` utility shall conform to XBD [Section 12.2](#) (on page 201), except that the order of
 102916 presentation of the `-e` and `-f` options is significant. |

102917 The following options shall be supported:

102918 `-e script` Add the editing commands specified by the `script` option-argument to the end of
 102919 the script of editing commands. The `script` option-argument shall have the same
 102920 properties as the `script` operand, described in the OPERANDS section.

102921 `-f script_file` Add the editing commands in the file `script_file` to the end of the script.

102922 `-n` Suppress the default output (in which each line, after it is examined for editing, is
 102923 written to standard output). Only lines explicitly selected for output are written.

102924 Multiple `-e` and `-f` options may be specified. All commands shall be added to the script in the
 102925 order specified, regardless of their origin.

102926 **OPERANDS**

102927 The following operands shall be supported:

102928 `file` A pathname of a file whose contents are read and edited. If multiple `file` operands
 102929 are specified, the named files shall be read in the order specified and the
 102930 concatenation shall be edited. If no `file` operands are specified, the standard input
 102931 shall be used.

102932 `script` A string to be used as the script of editing commands. The application shall not
 102933 present a `script` that violates the restrictions of a text file except that the final
 102934 character need not be a <newline>.

102935 **STDIN**

102936 The standard input shall be used only if no `file` operands are specified. See the INPUT FILES
 102937 section.

102938 **INPUT FILES**

102939 The input files shall be text files. The `script_files` named by the `-f` option shall consist of editing
 102940 commands.

102941 **ENVIRONMENT VARIABLES**102942 The following environment variables shall affect the execution of `sed`:

102943 `LANG` Provide a default value for the internationalization variables that are unset or null. |
 102944 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
 102945 variables used to determine the values of locale categories.)

- 102946 *LC_ALL* If set to a non-empty string value, override the values of all the other
102947 internationalization variables.
- 102948 *LC_COLLATE*
102949 Determine the locale for the behavior of ranges, equivalence classes, and multi-
102950 character collating elements within regular expressions.
- 102951 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
102952 characters (for example, single-byte as opposed to multi-byte characters in
102953 arguments and input files), and the behavior of character classes within regular
102954 expressions.
- 102955 *LC_MESSAGES*
102956 Determine the locale that should be used to affect the format and contents of
102957 diagnostic messages written to standard error.
- 102958 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

ASYNCHRONOUS EVENTS

102959 Default.
102960

STDOUT

102961 The input files shall be written to standard output, with the editing commands specified in the
102962 script applied. If the *-n* option is specified, only those input lines selected by the script shall be
102963 written to standard output.
102964

STDERR

102965 The standard error shall be used only for diagnostic messages.
102966

OUTPUT FILES

102967 The output files shall be text files whose formats are dependent on the editing commands given.
102968

EXTENDED DESCRIPTION

102969 The *script* shall consist of editing commands of the following form:
102970

102971 *[address[, address]]function*

102972 where *function* represents a single-character command verb from the list in [Editing Commands](#)
102973 [in sed](#) (on page 3067), followed by any applicable arguments.

102974 The command can be preceded by <blank>s and/or semicolons. The function can be preceded
102975 by <blank>s. These optional characters shall have no effect.

102976 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>,
102977 into the pattern space. Normally the pattern space will be empty, unless a **D** command
102978 terminated the last cycle. The *sed* utility shall then apply in sequence all commands whose
102979 addresses select that pattern space, and at the end of the script copy the pattern space to
102980 standard output (except when *-n* is specified) and delete the pattern space. Whenever the
102981 pattern space is written to standard output or a named file, *sed* shall immediately follow it with a
102982 <newline>.

102983 Some of the editing commands use a hold space to save all or part of the pattern space for
102984 subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

102985 **Addresses in sed**

102986 An address is either a decimal number that counts input lines cumulatively across files, a '\$' character that addresses the last line of input, or a context address (which consists of a BRE, as described in [Regular Expressions in sed](#), preceded and followed by a delimiter, usually a slash).

102989 An editing command with no addresses shall select every pattern space.

102990 An editing command with one address shall select each pattern space that matches the address.

102991 An editing command with two addresses shall select the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second. (If the second address is a number less than or equal to the line number first selected, only one line shall be selected.) Starting at the first line following the selected range, *sed* shall look again for the first address. Thereafter, the process shall be repeated. Omitting either or both of the address components in the following form produces undefined results:

102997 `[address[, address]]`

102998 **Regular Expressions in sed**

102999 The *sed* utility shall support the BREs described in XBD [Section 9.3](#) (on page 169), with the following additions:

- 103001 • In a context address, the construction "`\cBREc`", where *c* is any character other than
103002 backslash or <newline>, shall be identical to "`/BRE/`". If the character designated by *c*
103003 appears following a backslash, then it shall be considered to be that literal character, which
103004 shall not terminate the BRE. For example, in the context address "`\xabc\xdefx`", the
103005 second *x* stands for itself, so that the BRE is "`abcxdef`".
- 103006 • The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A
103007 literal <newline> shall not be used in the BRE of a context address or in the substitute
103008 function.
- 103009 • If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in
103010 the last command applied (either as an address or as part of a substitute command) was
103011 specified.

103012 **Editing Commands in sed**

103013 In the following list of editing commands, the maximum number of permissible addresses for
103014 each function is indicated by `[0addr]`, `[1addr]`, or `[2addr]`, representing zero, one, or two
103015 addresses.

103016 The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall
103017 be preceded by a backslash. Other backslashes in text shall be removed, and the following
103018 character shall be treated literally.

103019 The **r** and **w** command verbs, and the *w* flag to the **s** command, take an *rfile* (or *wfile*) parameter,
103020 separated from the command verb letter or flag by one or more <blank>s; implementations may
103021 allow zero separation as an extension.

103022 The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be
103023 created before processing begins. Implementations shall support at least ten *wfile* arguments in
103024 the script; the actual number (greater than or equal to 10) that is supported by the
103025 implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially
103026 created, if it does not exist, or shall replace the contents of an existing file.

103027 The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following
103028 synopses indicate which arguments shall be separated from the command verbs by a single
103029 <space>.

103030 The **a** and **r** commands schedule text for later output. The text specified for the **a** command, and
 103031 the contents of the file specified for the **r** command, shall be written to standard output just
 103032 before the next attempt to fetch a line of input when executing the **N** or **n** commands, or when
 103033 reaching the end of the script. If written when reaching the end of the script, and the **-n** option
 103034 was not specified, the text shall be written after copying the pattern space to standard output.
 103035 The contents of the file specified for the **r** command shall be as of the time the output is written,
 103036 not the time the **r** command is applied. The text shall be output in the order in which the **a** and **r**
 103037 commands were applied to the input.

103038 Command verbs other than **{**, **a**, **b**, **c**, **i**, **r**, **t**, **w**, **:**, and **#** can be followed by a semicolon, optional
 103039 **<blank>s**, and another command verb. However, when the **s** command verb is used with the **w**
 103040 flag, following it with another command in this manner produces undefined results.

103041 A function can be preceded by one or more **' ! '** characters, in which case the function shall be
 103042 applied if the addresses do not select the pattern space. Zero or more **<blank>s** shall be accepted
 103043 before the first **' ! '** character. It is unspecified whether **<blank>s** can follow a **' ! '** character, and
 103044 conforming applications shall not follow a **' ! '** character with **<blank>s**.

103045 **[2addr]{function**
 103046 **function**
 103047 **...**
 103048 **}**

Execute a list of *sed* functions only when the pattern space is selected. The list of *sed* functions shall be surrounded by braces and separated by **<newline>s**, and conform to the following rules. The braces can be preceded or followed by **<blank>s**. The functions can be preceded by **<blank>s**, but shall not be followed by **<blank>s**. The **<right-brace>** shall be preceded by a **<newline>** and can be preceded or followed by **<blank>s**.

103054 **[1addr]a**
 103055 **text**

Write text to standard output as described previously.

103056 **[2addr]b [label]**

Branch to the **:** function bearing the *label*. If *label* is not specified, branch to the end of the script. The implementation shall support *labels* recognized as unique up to at least 8 characters; the actual length (greater than or equal to 8) that shall be supported by the implementation is unspecified. It is unspecified whether exceeding a label length causes an error or a silent truncation.

103062 **[2addr]c**
 103063 **text**

Delete the pattern space. With a 0 or 1 address or at the end of a 2-address range, place *text* on the output and start the next cycle.

103065 **[2addr]d** Delete the pattern space and start the next cycle.

103066 **[2addr]D** Delete the initial segment of the pattern space through the first **<newline>** and
 103067 start the next cycle.

103068 **[2addr]g** Replace the contents of the pattern space by the contents of the hold space.

103069 **[2addr]G** Append to the pattern space a **<newline>** followed by the contents of the hold
 103070 space.

103071 **[2addr]h** Replace the contents of the hold space with the contents of the pattern space.

103072 **[2addr]H** Append to the hold space a **<newline>** followed by the contents of the pattern
 103073 space.

103074 **[1addr]i**
 103075 **text**

Write *text* to standard output.

103076 103077 103078 103079 103080 103081	[2addr]l	(The letter ell.) Write the pattern space to standard output in a visually unambiguous form. The characters listed in XBD Table 5-1 (on page 108) ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-printable characters not in that table shall be written as one three-digit octal number (with a preceding backslash) for each byte in the character (most significant byte first).
103082 103083 103084 103085		Long lines shall be folded, with the point of folding indicated by writing a backslash followed by a <newline>; the length at which folding occurs is unspecified, but should be appropriate for the output device. The end of each line shall be marked with a '\$'.
103086 103087 103088	[2addr]n	Write the pattern space to standard output if the default output has not been suppressed, and replace the pattern space with the next line of input, less its terminating <newline>.
103089 103090		If no next line of input is available, the n command verb shall branch to the end of the script and quit without starting a new cycle.
103091 103092 103093	[2addr]N	Append the next line of input, less its terminating <newline>, to the pattern space, using an embedded <newline> to separate the appended material from the original material. Note that the current line number changes.
103094 103095 103096		If no next line of input is available, the N command verb shall branch to the end of the script and quit without starting a new cycle or copying the pattern space to standard output.
103097	[2addr]p	Write the pattern space to standard output.
103098	[2addr]P	Write the pattern space, up to the first <newline>, to standard output.
103099	[1addr]q	Branch to the end of the script and quit without starting a new cycle.
103100 103101 103102	[1addr]r rfile	Copy the contents of <i>rfile</i> to standard output as described previously. If <i>rfile</i> does not exist or cannot be read, it shall be treated as if it were an empty file, causing no error condition.
103103 103104 103105 103106 103107 103108	[2addr]s/BRE/replacement/flags	Substitute the replacement string for instances of the BRE in the pattern space. Any character other than backslash or <newline> can be used instead of a slash to delimit the BRE and the replacement. Within the BRE and the replacement, the BRE delimiter itself can be used as a literal character if it is preceded by a backslash.
103109 103110 103111 103112 103113 103114 103115 103116 103117 103118 103119		The replacement string shall be scanned from beginning to end. An ampersand ('&') appearing in the replacement shall be replaced by the string matching the BRE. The special meaning of '&' in this context can be suppressed by preceding it by a backslash. The characters "\n", where <i>n</i> is a digit, shall be replaced by the text matched by the corresponding back-reference expression. If the corresponding back-reference expression does not match, then the characters "\n" shall be replaced by the empty string. The special meaning of "\n" where <i>n</i> is a digit in this context, can be suppressed by preceding it by a backslash. For each other backslash ('\') encountered, the following character shall lose its special meaning (if any). The meaning of a '\ ' immediately followed by any character other than '&', '\', a digit, or the delimiter character used for this command, is unspecified.
103120 103121 103122 103123		A line can be split by substituting a <newline> into it. The application shall escape the <newline> in the replacement by preceding it by a backslash. A substitution shall be considered to have been performed even if the replacement string is identical to the string that it replaces. Any backslash used to alter the default

103124		meaning of a subsequent character shall be discarded from the BRE or the
103125		replacement before evaluating the BRE or using the replacement.
103126		The value of <i>flags</i> shall be zero or more of:
103127	<i>n</i>	Substitute for the <i>n</i> th occurrence only of the BRE found within the
103128		pattern space.
103129	g	Globally substitute for all non-overlapping instances of the BRE
103130		rather than just the first one. If both g and <i>n</i> are specified, the results
103131		are unspecified.
103132	p	Write the pattern space to standard output if a replacement was
103133		made.
103134	w <i>wfile</i>	Write. Append the pattern space to <i>wfile</i> if a replacement was made.
103135		A conforming application shall precede the <i>wfile</i> argument with one
103136		or more <blank>s. If the w flag is not the last flag value given in a
103137		concatenation of multiple flag values, the results are undefined.
103138	[2addr]t [<i>label</i>]	
103139		Test. Branch to the : command verb bearing the <i>label</i> if any substitutions have been
103140		made since the most recent reading of an input line or execution of a t . If <i>label</i> is
103141		not specified, branch to the end of the script.
103142	[2addr]w <i>wfile</i>	
103143		Append (write) the pattern space to <i>wfile</i> .
103144	[2addr]x	Exchange the contents of the pattern and hold spaces.
103145	[2addr]y / <i>string1</i> / <i>string2</i> /	
103146		Replace all occurrences of characters in <i>string1</i> with the corresponding characters
103147		in <i>string2</i> . If a backslash followed by an 'n' appear in <i>string1</i> or <i>string2</i> , the two
103148		characters shall be handled as a single <newline>. If the number of characters in
103149		<i>string1</i> and <i>string2</i> are not equal, or if any of the characters in <i>string1</i> appear more
103150		than once, the results are undefined. Any character other than backslash or
103151		<newline> can be used instead of slash to delimit the strings. If the delimiter is not
103152		'n', within <i>string1</i> and <i>string2</i> , the delimiter itself can be used as a literal character
103153		if it is preceded by a backslash. If a backslash character is immediately followed by
103154		a backslash character in <i>string1</i> or <i>string2</i> , the two backslash characters shall be
103155		counted as a single literal backslash character. The meaning of a backslash
103156		followed by any character that is not 'n', a backslash, or the delimiter character is
103157		undefined.
103158	[0addr]:label	Do nothing. This command bears a <i>label</i> to which the b and t commands branch.
103159	[1addr]=	Write the following to standard output:
103160		"%d\n", <current line number>
103161	[0addr]	Ignore this empty command.
103162	[0addr]#	Ignore the '#' and the remainder of the line (treat them as a comment), with the
103163		single exception that if the first two characters in the script are "#n", the default
103164		output shall be suppressed; this shall be the equivalent of specifying -n on the
103165		command line.

EXIT STATUS

The following exit values shall be returned:

103168 0 Successful completion.

103169 >0 An error occurred.

103170 CONSEQUENCES OF ERRORS

103171 Default.

103172 APPLICATION USAGE

103173 Regular expressions match entire strings, not just individual lines, but a <newline> is matched
103174 by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression
103175 in POSIX.1-200x. Also note that '\n' cannot be used to match a <newline> at the end of an
103176 arbitrary input line; <newline>s appear in the pattern space as a result of the N editing
103177 command.

103178 EXAMPLES

103179 This *sed* script simulates the BSD *cat -s* command, squeezing excess empty lines from standard |
103180 input.

```
103181 sed -n '  
103182 # Write non-empty lines.  
103183 ./ {  
103184     p  
103185     d  
103186 }  
103187 # Write a single empty line, then look for more empty lines.  
103188 /^$/ p  
103189 # Get next line, discard the held <newline> (empty line),  
103190 # and look for more empty lines.  
103191 :Empty  
103192 /^$/ {  
103193     N  
103194     s/./.  
103195     b Empty  
103196 }  
103197 # Write the non-empty line before going back to search  
103198 # for the first in a set of empty lines.  
103199     p  
103200 '
```

103201 The following *sed* command is a much simpler method of squeezing empty lines, although it is +
103202 not quite the same as *cat -s* since it removes any initial empty lines: +

```
103203 sed -n './,/^$/p'
```

103204 RATIONALE

103205 This volume of POSIX.1-200x requires implementations to support at least ten distinct *wfiles*,
103206 matching historical practice on many implementations. Implementations are encouraged to
103207 support more, but conforming applications should not exceed this limit.

103208 The exit status codes specified here are different from those in System V. System V returns 2 for
103209 garbled *sed* commands, but returns zero with its usage message or if the input file could not be
103210 opened. The standard developers considered this to be a bug.

103211 The manner in which the I command writes non-printable characters was changed to avoid the
103212 historical backspace-overstrike method, and other requirements to achieve unambiguous output
103213 were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as
103214 that chosen for *sed*.

103215 This volume of POSIX.1-200x requires implementations to provide pattern and hold spaces of at
103216 least 8 192 bytes, larger than the 4 000 bytes spaces used by some historical implementations, but

103217 less than the 20 480 bytes limit used in an early proposal. Implementations are encouraged to
103218 allocate dynamically larger pattern and hold spaces as needed.

103219 The requirements for acceptance of <blank>s and <space>s in command lines has been made
103220 more explicit than in early proposals to describe clearly the historical practice and to remove
103221 confusion about the phrase “protect initial blanks [*sic*] and tabs from the stripping that is done
103222 on every script line” that appears in much of the historical documentation of the *sed* utility
103223 description of text. (Not all implementations are known to have stripped <blank>s from text
103224 lines, although they all have allowed leading <blank>s preceding the address on a command
103225 line.)

103226 The treatment of ‘#’ comments differs from the SVID which only allows a comment as the first
103227 line of the script, but matches BSD-derived implementations. The comment character is treated
103228 as a command, and it has the same properties in terms of being accepted with leading <blank>s;
103229 the BSD implementation has historically supported this.

103230 Early proposals required that a *script_file* have at least one non-comment line. Some historical
103231 implementations have behaved in unexpected ways if this were not the case. The standard
103232 developers considered that this was incorrect behavior and that application developers should
103233 not have to avoid this feature. A correct implementation of this volume of POSIX.1-200x shall
103234 permit *script_files* that consist only of comment lines.

103235 Early proposals indicated that if **-e** and **-f** options were intermixed, all **-e** options were
103236 processed before any **-f** options. This has been changed to process them in the order presented
103237 because it matches historical practice and is more intuitive.

103238 The treatment of the **p** flag to the **s** command differs between System V and BSD-based systems
103239 when the default output is suppressed. In the two examples:

```
103240 echo a | sed 's/a/A/p'
103241 echo a | sed -n 's/a/A/p'
```

103242 this volume of POSIX.1-200x, BSD, System V documentation, and the SVID indicate that the first
103243 example should write two lines with **A**, whereas the second should write one. Some System V
103244 systems write the **A** only once in both examples because the **p** flag is ignored if the **-n** option is
103245 not specified.

103246 This is a case of a diametrical difference between systems that could not be reconciled through
103247 the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V
103248 documentation behavior was adopted for this volume of POSIX.1-200x because:

- 103249 • No known documentation for any historic system describes the interaction between the **p**
103250 flag and the **-n** option.
- 103251 • The selected behavior is more correct as there is no technical justification for any
103252 interaction between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag
103253 might imply that they are only used together, but this ignores valid scripts that interrupt
103254 the cyclical nature of the processing through the use of the **D**, **d**, **q**, or branching
103255 commands. Such scripts rely on the **p** suffix to write the pattern space because they do not
103256 make use of the default output at the “bottom” of the script.
- 103257 • Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful
103258 if *sed* scripts were written to run both with and without the **-n** option. This is believed to
103259 be unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to
103260 be unnecessary. Because the interaction was not documented, the likelihood of a
103261 programmer discovering the interaction and depending on it is further decreased.
- 103262 • Finally, scripts that break under the specified behavior produce too much output instead of
103263 too little, which is easier to diagnose and correct.

103264 The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in

103265 an early proposal. This limit has been removed because there is no reason an editor processing
 103266 lines of {LINE_MAX} length should have this restriction. The command *s/a/A/2047* should be
 103267 able to substitute the 2047th occurrence of *a* on a line.

103268 The *b*, *t*, and *:* commands are documented to ignore leading white space, but no mention is
 103269 made of trailing white space. Historical implementations of *sed* assigned different locations to
 103270 the labels '*x*' and "*x*". This is not useful, and leads to subtle programming errors, but it is
 103271 historical practice, and changing it could theoretically break working scripts. Implementors are
 103272 encouraged to provide warning messages about labels that are never used or jumps to labels
 103273 that do not exist.

103274 Historically, the *sed !* and *}* editing commands did not permit multiple commands on a single
 103275 line using a semicolon as a command delimiter. Implementations are permitted, but not
 103276 required, to support this extension.

103277 Earlier versions of this standard allowed for implementations with bytes other than eight bits,
 103278 but this has been modified in this version.

103279 FUTURE DIRECTIONS

103280 None.

103281 SEE ALSO

103282 *awk*, *ed*, *grep*

103283 XBD Table 5-1 (on page 108), Chapter 8 (on page 159), Section 9.3 (on page 169), Section 12.2 (on
 103284 page 201)

103285 CHANGE HISTORY

103286 First released in Issue 2.

103287 Issue 5

103288 The FUTURE DIRECTIONS section is added.

103289 Issue 6

103290 The following new requirements on POSIX implementations derive from alignment with the
 103291 Single UNIX Specification:

- 103292 • Implementations are required to support at least ten *wfile* arguments in an editing
 103293 command.

103294 The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

103295 IEEE PASC Interpretation 1003.2 #190 is applied.

103296 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the backslash escape
 103297 sequences in a replacement string for a BRE.

103298 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/28 is applied, removing text describing
 103299 behavior on systems with bytes consisting of more than eight bits.

103300 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/29 is applied, making an editorial
 103301 correction within the Editing Commands in *sed* section.

103302 Issue 7

103303 Austin Group Interpretations 1003.1-2001 #006 and #036 are applied.

103304 SD5-XCU-ERN-97 and SD5-XCU-ERN-123 are applied, updating the SYNOPSIS.

103305 A second example is added.

103306 **NAME**
 103307 sh — shell, the standard command language interpreter

103308 **SYNOPSIS**

103309 sh [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...
 103310 [*command_file* [*argument*...]]
 103311 sh -c [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...
 103312 *command_string* [*command_name* [*argument*...]]
 103313 sh -s [-abCefhimnuvx] [-o *option*]... [+abCefhimnuvx] [+o *option*]...
 103314 [*argument*...]

103315 **DESCRIPTION**

103316 The *sh* utility is a command language interpreter that shall execute commands read from a
 103317 command line string, the standard input, or a specified file. The application shall ensure that the
 103318 commands to be executed are expressed in the language described in [Chapter 2](#) (on page 2245).

103319 Pathname expansion shall not fail due to the size of a file.

103320 Shell input and output redirections have an implementation-defined offset maximum that is
 103321 established in the open file description.

103322 **OPTIONS**

103323 The *sh* utility shall conform to XBD [Section 12.2](#) (on page 201), with an extension for support of a
 103324 leading plus sign ('+') as noted below.

103325 The **-a**, **-b**, **-C**, **-e**, **-f**, **-m**, **-n**, **-o option**, **-u**, **-v**, and **-x** options are described as part of the *set*
 103326 utility in [Section 2.14](#) (on page 2280). The option letters derived from the *set* special built-in shall
 103327 also be accepted with a leading plus sign ('+') instead of a leading hyphen (meaning the
 103328 reverse case of the option as described in this volume of POSIX.1-200x).

103329 The following additional options shall be supported:

103330 **-c** Read commands from the *command_string* operand. Set the value of special
 103331 parameter 0 (see [Section 2.5.2](#), on page 2250) from the value of the *command_name*
 103332 operand and the positional parameters (\$1, \$2, and so on) in sequence from the
 103333 remaining *argument* operands. No commands shall be read from the standard
 103334 input.

103335 **-i** Specify that the shell is *interactive*; see below. An implementation may treat
 103336 specifying the **-i** option as an error if the real user ID of the calling process does
 103337 not equal the effective user ID or if the real group ID does not equal the effective
 103338 group ID.

103339 **-s** Read commands from the standard input.

103340 If there are no operands and the **-c** option is not specified, the **-s** option shall be assumed.

103341 If the **-i** option is present, or if there are no operands and the shell's standard input and
 103342 standard error are attached to a terminal, the shell is considered to be *interactive*.

103343 **OPERANDS**

103344 The following operands shall be supported:

103345 **-** A single hyphen shall be treated as the first operand and then ignored. If both **'-'**
 103346 and **"--"** are given as arguments, or if other operands precede the single hyphen,
 103347 the results are undefined.

- 103348 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.
- 103349 *command_file* The pathname of a file containing commands. If the pathname contains one or
103350 more slash characters, the implementation attempts to read that file; the file need
103351 not be executable. If the pathname does not contain a slash character:
- The implementation shall attempt to read that file from the current working
103352 directory; the file need not be executable.
 - If the file is not in the current working directory, the implementation may
103353 perform a search for an executable file using the value of *PATH*, as described
103354 in [Section 2.9.1.1](#) (on page 2264).

103357 Special parameter 0 (see [Section 2.5.2](#), on page 2250) shall be set to the value of
103358 *command_file*. If *sh* is called using a synopsis form that omits *command_file*, special
103359 parameter 0 shall be set to the value of the first argument passed to *sh* from its
103360 parent (for example, *argv*[0] for a C program), which is normally a pathname used
103361 to execute the *sh* utility.

103362 *command_name*
103363 A string assigned to special parameter 0 when executing the commands in
103364 *command_string*. If *command_name* is not specified, special parameter 0 shall be set
103365 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]
103366 for a C program), which is normally a pathname used to execute the *sh* utility.

103367 *command_string*
103368 A string that shall be interpreted by the shell as one or more commands, as if the
103369 string were the argument to the *system*(*)* function defined in the System Interfaces
103370 volume of POSIX.1-200x. If the *command_string* operand is an empty string, *sh* shall
103371 exit with a zero exit status.

STDIN

- 103372 The standard input shall be used only if one of the following is true:
103373
- The *-s* option is specified.
 - The *-c* option is not specified and no operands are specified.
 - The script executes one or more commands that require input from standard input (such as
103376 a *read* command that does not redirect its input).

103377 See the INPUT FILES section.

103378
103379 When the shell is using standard input and it invokes a command that also uses standard input,
103380 the shell shall ensure that the standard input file pointer points directly after the command it has
103381 read when the command begins execution. It shall not read ahead in such a manner that any
103382 characters intended to be read by the invoked command are consumed by the shell (whether
103383 interpreted by the shell or not) or that characters that are not read by the invoked command are
103384 not seen by the shell. When the command expecting to read standard input is started
103385 asynchronously by an interactive shell, it is unspecified whether characters are read by the
103386 command or interpreted by the shell.

103387 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*
103388 shall enable blocking reads on standard input. This shall remain in effect when the command
103389 completes.

INPUT FILES

103390 The input file shall be a text file, except that line lengths shall be unlimited. If the input file is
103391 empty or consists solely of blank lines or comments, or both, *sh* shall exit with a zero exit status.
103392

ENVIRONMENT VARIABLES

103393			
103394			The following environment variables shall affect the execution of <i>sh</i> :
103395		<i>ENV</i>	This variable, when and only when an interactive shell is invoked, shall be subjected to parameter expansion (see Section 2.6.2 , on page 2254) by the shell, and the resulting value shall be used as a pathname of a file containing shell commands to execute in the current environment. The file need not be executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the results are unspecified. <i>ENV</i> shall be ignored if the real and effective user IDs or real and effective group IDs of the process are different.
103402	UP	<i>FCEDIT</i>	This variable, when expanded by the shell, shall determine the default value for the <i>-e editor</i> option's <i>editor</i> option-argument. If <i>FCEDIT</i> is null or unset, <i>ed</i> shall be used as the editor.
103403			
103404			
103405	UP	<i>HISTFILE</i>	Determine a pathname naming a command history file. If the <i>HISTFILE</i> variable is not set, the shell may attempt to access or create a file <i>.sh_history</i> in the directory referred to by the <i>HOME</i> environment variable. If the shell cannot obtain both read and write access to, or create, the history file, it shall use an unspecified mechanism that allows the history to operate properly. (References to history "file" in this section shall be understood to mean this unspecified mechanism in such cases.) An implementation may choose to access this variable only when initializing the history file; this initialization shall occur when <i>fc</i> or <i>sh</i> first attempt to retrieve entries from, or add entries to, the file, as the result of commands issued by the user, the file named by the <i>ENV</i> variable, or implementation-defined system start-up files. Implementations may choose to disable the history list mechanism for users with appropriate privileges who do not set <i>HISTFILE</i> ; the specific circumstances under which this occurs are implementation-defined. If more than one instance of the shell is using the same history file, it is unspecified how updates to the history file from those shells interact. As entries are deleted from the history file, they shall be deleted oldest first. It is unspecified when history file entries are physically removed from the history file.
103406			
103407			
103408			
103409			
103410			
103411			
103412			
103413			
103414			
103415			
103416			
103417			
103418			
103419			
103420			
103421			
103422		<i>HISTSIZE</i>	Determine a decimal number representing the limit to the number of previous commands that are accessible. If this variable is unset, an unspecified default greater than or equal to 128 shall be used. The maximum number of commands in the history list is unspecified, but shall be at least 128. An implementation may choose to access this variable only when initializing the history file, as described under <i>HISTFILE</i> . Therefore, it is unspecified whether changes made to <i>HISTSIZE</i> after the history file has been initialized are effective.
103423			
103424			
103425			
103426			
103427			
103428			
103429	UP	<i>HOME</i>	Determine the pathname of the user's home directory. The contents of <i>HOME</i> are used in tilde expansion as described in Section 2.6.1 (on page 2253).
103430			
103431		<i>IFS</i>	A string treated as a list of characters that is used for field splitting and to split lines into fields with the <i>read</i> command.
103432			
103433			If <i>IFS</i> is not set, it shall behave as normal for an unset variable, except that field splitting by the shell and line splitting by the <i>read</i> command shall be performed as if the value of <i>IFS</i> is <space><tab><newline>; see Section 2.6.5 (on page 2258).
103434			
103435			
103436			Implementations may ignore the value of <i>IFS</i> in the environment, or the absence of <i>IFS</i> from the environment, at the time the shell is invoked, in which case the shell shall set <i>IFS</i> to <space><tab><newline> when it is invoked.
103437			
103438			
103439		<i>LANG</i>	Provide a default value for the internationalization variables that are unset or null. (See XBD Section 8.2 (on page 160) for the precedence of internationalization variables used to determine the values of locale categories.)
103440			
103441			

103442		<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
103443			
103444		<i>LC_COLLATE</i>	Determine the behavior of range expressions, equivalence classes, and multi-character collating elements within pattern matching.
103445			
103446			
103447		<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), which characters are defined as letters (character class alpha), and the behavior of character classes within pattern matching.
103448			
103449			
103450			
103451		<i>LC_MESSAGES</i>	Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
103452			
103453			
103454	UP	<i>MAIL</i>	Determine a pathname of the user's mailbox file for purposes of incoming mail notification. If this variable is set, the shell shall inform the user if the file named by the variable is created or if its modification time has changed. Informing the user shall be accomplished by writing a string of unspecified format to standard error prior to the writing of the next primary prompt string. Such check shall be performed only after the completion of the interval defined by the <i>MAILCHECK</i> variable after the last such check. The user shall be informed only if <i>MAIL</i> is set and <i>MAILPATH</i> is not set.
103455			
103456			
103457			
103458			
103459			
103460			
103461			
103462	UP	<i>MAILCHECK</i>	Establish a decimal integer value that specifies how often (in seconds) the shell shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i> variables. The default value shall be 600 seconds. If set to zero, the shell shall check before issuing each primary prompt.
103463			
103464			
103465			
103466			
103467	UP	<i>MAILPATH</i>	Provide a list of pathnames and optional messages separated by colons. If this variable is set, the shell shall inform the user if any of the files named by the variable are created or if any of their modification times change. (See the preceding entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each pathname can be followed by ' <i>%</i> ' and a string that shall be subjected to parameter expansion and written to standard error when the modification time changes. If a ' <i>%</i> ' character in the pathname is preceded by a backslash, it shall be treated as a literal ' <i>%</i> ' in the pathname. The default message is unspecified.
103468			
103469			
103470			
103471			
103472			
103473			
103474			
103475			The <i>MAILPATH</i> environment variable takes precedence over the <i>MAIL</i> variable.
103476	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
103477		<i>PATH</i>	Establish a string formatted as described in XBD Chapter 8 (on page 159), used to effect command interpretation; see Section 2.9.1.1 (on page 2264).
103478			
103479		<i>PWD</i>	This variable shall represent an absolute pathname of the current working directory. Assignments to this variable may be ignored unless the value is an absolute pathname of the current working directory and there are no filename components of dot or dot-dot.
103480			
103481			
103482			
103483		ASYNCHRONOUS EVENTS	
103484		Default.	
103485		STDOUT	
103486		See the <i>STDERR</i> section.	

103487 **STDERR**

103488 Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),
 103489 standard error shall be used only for diagnostic messages.

103490 **OUTPUT FILES**

103491 None.

103492 **EXTENDED DESCRIPTION**

103493 UP See [Chapter 2](#). The functionality described in the rest of the EXTENDED DESCRIPTION section
 103494 shall be provided on implementations that support the User Portability Utilities option (and the
 103495 rest of this section is not further shaded for this option).

103496 **Command History List**

103497 When the *sh* utility is being used interactively, it shall maintain a list of commands previously
 103498 entered from the terminal in the file named by the *HISTFILE* environment variable. The type,
 103499 size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the
 103500 file for a user, if file access permissions allow this; see the description of the *HISTFILE*
 103501 environment variable.

103502 **Command Line Editing**

103503 When *sh* is being used interactively from a terminal, the current command and the command
 103504 history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,
 103505 described below, similar to a subset of those described in the *vi* utility. Implementations may
 103506 offer other command line editing modes corresponding to other editing utilities.

103507 The command *set -o vi* shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see
 103508 [Command Line Editing \(vi-mode\)](#)). This command also shall disable any other editing mode
 103509 that the implementation may provide. The command *set +o vi* disables *vi*-mode editing.

103510 Certain block-mode terminals may be unable to support shell command line editing. If a
 103511 terminal is unable to provide either edit mode, it need not be possible to *set -o vi* when using the
 103512 shell on this terminal.

103513 In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the
 103514 *stty* utility.

103515 **Command Line Editing (vi-mode)**

103516 In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations
 103517 which modify a line affect the edit line. The edit line is always the newest line in the command
 103518 history buffer.

103519 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

103520 When in insert mode, an entered character shall be inserted into the command line, except as
 103521 noted in [vi Line Editing Insert Mode](#) (on page 3079). Upon entering *sh* and after termination of
 103522 the previous command, *sh* shall be in insert mode.

103523 Typing an escape character shall switch *sh* into command mode (see [vi Line Editing Command](#)
 103524 [Mode](#), on page 3079). In command mode, an entered character shall either invoke a defined
 103525 operation, be used as part of a multi-character operation, or be treated as an error. A character
 103526 that is not recognized as part of an editing command shall terminate any specific editing
 103527 command and shall alert the terminal. Typing the *interrupt* character in command mode shall
 103528 cause *sh* to terminate command line editing on the current command line, reissue the prompt on
 103529 the next line of the terminal, and reset the command history (see *fc*) so that the most recently
 103530 executed command is the previous command (that is, the command that was being edited when
 103531 it was interrupted is not reentered into the history).

103532 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean
 103533 “move the cursor to the first character of the current word” and the phrase “move the cursor to
 103534 the end of the word” shall mean “move the cursor to the last character of the current word”. The
 103535 phrase “beginning of the command line” indicates the point between the end of the prompt
 103536 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and
 103537 the first character of the command text.

103538 **vi Line Editing Insert Mode**

103539 While in insert mode, any character typed shall be inserted in the current command line, unless
 103540 it is from the following set.

103541 <newline> Execute the current command line. If the current command line is not empty, this
 103542 line shall be entered into the command history (see *fc*).

103543 *erase* Delete the character previous to the current cursor position and move the current
 103544 cursor position back one character. In insert mode, characters shall be erased from
 103545 both the screen and the buffer when backspacing.

103546 *interrupt* Terminate command line editing with the same effects as described for
 103547 interrupting command mode; see [Command Line Editing \(vi-mode\)](#) (on page
 103548 3078).

103549 *kill* Clear all the characters from the input line.

103550 <control>-V Insert the next character input, even if the character is otherwise a special insert
 103551 mode character.

103552 <control>-W Delete the characters from the one preceding the cursor to the preceding word
 103553 boundary. The word boundary in this case is the closer to the cursor of either the
 103554 beginning of the line or a character that is in neither the **blank** nor **punct** character
 103555 classification of the current locale.

103556 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the
 103557 beginning of an input line. If *end-of-file* is entered other than at the beginning of the
 103558 line, the results are unspecified.

103559 <ESC> Place *sh* into command mode.

103560 **vi Line Editing Command Mode**

103561 In command mode for the command line editing feature, decimal digits not beginning with 0
 103562 that precede a command letter shall be remembered. Some commands use these decimal digits
 103563 as a count number that affects the operation.

103564 The term *motion command* represents one of the commands:

103565 <space> 0 b F l W ^ \$; E f T w | , B e h t

103566 If the current line is not the edit line, any command that modifies the current line shall cause the
 103567 content of the current line to replace the content of the edit line, and the current line shall
 103568 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).
 103569 The modification requested shall then be performed to the edit line. When the current line is the
 103570 edit line, the modification shall be done directly to the edit line.

103571 Any command that is preceded by *count* shall take a count (the numeric value of any preceding
 103572 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat
 103573 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out
 103574 of range is considered an error condition and shall alert the terminal, but neither the cursor
 103575 position, nor the command line, shall change.

103576 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*

103577		corresponds to the term <i>unnamed buffer</i> in <i>vi</i> .
103578		The following commands shall be recognized in command mode:
103579	<newline>	Execute the current command line. If the current command line is not empty, this
103580		line shall be entered into the command history (see <i>fc</i>).
103581	<control>-L	Redraw the current command line. Position the cursor at the same location on the
103582		redrawn line.
103583	#	Insert the character '#' at the beginning of the current command line and treat the
103584		resulting edit line as a comment. This line shall be entered into the command
103585		history; see <i>fc</i> .
103586	=	Display the possible shell word expansions (see Section 2.6 , on page 2253) of the
103587		bigword at the current command line position.
103588	Note:	This does not modify the content of the current line, and therefore does not cause
103589		the current line to become the edit line.
103590		These expansions shall be displayed on subsequent terminal lines. If the bigword
103591		contains none of the characters '?', '*', or '[', an asterisk ('*') shall be
103592		implicitly assumed at the end. If any directories are matched, these expansions
103593		shall have a '/' character appended. After the expansion, the line shall be
103594		redrawn, the cursor repositioned at the current cursor position, and <i>sh</i> shall be
103595		placed in command mode.
103596	\	Perform pathname expansion (see Section 2.6.6 , on page 2259) on the current
103597		bigword, up to the largest set of characters that can be matched uniquely. If the
103598		bigword contains none of the characters '?', '*', or '[', an asterisk ('*') shall
103599		be implicitly assumed at the end. This maximal expansion then shall replace the
103600		original bigword in the command line, and the cursor shall be placed after this
103601		expansion. If the resulting bigword completely and uniquely matches a directory, a
103602		'/' character shall be inserted directly after the bigword. If some other file is
103603		completely matched, a single <space> shall be inserted after the bigword. After
103604		this operation, <i>sh</i> shall be placed in insert mode.
103605	*	Perform pathname expansion on the current bigword and insert all expansions
103606		into the command to replace the current bigword, with each expansion separated
103607		by a single <space>. If at the end of the line, the current cursor position shall be
103608		moved to the first column position following the expansions and <i>sh</i> shall be placed
103609		in insert mode. Otherwise, the current cursor position shall be the last column
103610		position of the first character after the expansions and <i>sh</i> shall be placed in insert
103611		mode. If the current bigword contains none of the characters '?', '*', or '[',
103612		before the operation, an asterisk shall be implicitly assumed at the end.
103613	@ <i>letter</i>	Insert the value of the alias named <i>_letter</i> . The symbol <i>letter</i> represents a single
103614		alphabetic character from the portable character set; implementations may support
103615		additional characters as an extension. If the alias <i>_letter</i> contains other editing
103616		commands, these commands shall be performed as part of the insertion. If no alias
103617		<i>_letter</i> is enabled, this command shall have no effect.
103618	[<i>count</i>] [~]	Convert, if the current character is a lowercase letter, to the equivalent uppercase
103619		letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position
103620		then shall be advanced by one character. If the cursor was positioned on the last
103621		character of the line, the case conversion shall occur, but the cursor shall not
103622		advance. If the '~' command is preceded by a <i>count</i> , that number of characters
103623		shall be converted, and the cursor shall be advanced to the character position after
103624		the last character converted. If the <i>count</i> is larger than the number of characters
103625		after the cursor, this shall not be considered an error; the cursor shall advance to

103626		the last character on the line.
103627	[<i>count</i>].	Repeat the most recent non-motion command, even if it was executed on an earlier command line. If the previous command was preceded by a <i>count</i> , and no count is given on the '.' command, the count from the previous command shall be included as part of the repeated command. If the '.' command is preceded by a <i>count</i> , this shall override any <i>count</i> argument to the previous command. The <i>count</i> specified in the '.' command shall become the count for subsequent '.' commands issued without a count.
103628		
103629		
103630		
103631		
103632		
103633		
103634	[<i>number</i>]v	Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the editor exits, the commands in the temporary file shall be executed and placed in the command history. If a <i>number</i> is included, it specifies the command number in the command history to be edited, rather than the current command line.
103635		
103636		
103637		
103638	[<i>count</i>]l (ell)	
103639	[<i>count</i>]<space>	
103640		Move the current cursor position to the next character position. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger than the number of characters after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line.
103641		
103642		
103643		
103644		
103645	[<i>count</i>]h	Move the current cursor position to the <i>count</i> th (default 1) previous character position. If the cursor was positioned on the first character of the line, the terminal shall be alerted and the cursor shall not be moved. If the count is larger than the number of characters before the cursor, this shall not be considered an error; the cursor shall move to the first character on the line.
103646		
103647		
103648		
103649		
103650	[<i>count</i>]w	Move to the start of the next word. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger than the number of words after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line.
103651		
103652		
103653		
103654		
103655	[<i>count</i>]W	Move to the start of the next bigword. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger than the number of bigwords after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line.
103656		
103657		
103658		
103659		
103660	[<i>count</i>]e	Move to the end of the current word. If at the end of a word, move to the end of the next word. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger than the number of words after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line.
103661		
103662		
103663		
103664		
103665	[<i>count</i>]E	Move to the end of the current bigword. If at the end of a bigword, move to the end of the next bigword. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger than the number of bigwords after the cursor, this shall not be considered an error; the cursor shall advance to the last character on the line.
103666		
103667		
103668		
103669		
103670	[<i>count</i>]b	Move to the beginning of the current word. If at the beginning of a word, move to the beginning of the previous word. If the cursor was positioned on the first character of the line, the terminal shall be alerted and the cursor shall not be moved. If the <i>count</i> is larger than the number of words preceding the cursor, this shall not be considered an error; the cursor shall return to the first character on the line.
103671		
103672		
103673		
103674		
103675		

103676	[count]B	Move to the beginning of the current bigword. If at the beginning of a bigword, move to the beginning of the previous bigword. If the cursor was positioned on the first character of the line, the terminal shall be alerted and the cursor shall not be moved. If the <i>count</i> is larger than the number of bigwords preceding the cursor, this shall not be considered an error; the cursor shall return to the first character on the line.
103677		
103678		
103679		
103680		
103681		
103682	^	Move the current cursor position to the first character on the input line that is not a <blank>.
103683		
103684	\$	Move to the last character position on the current command line.
103685	0	(Zero.) Move to the first character position on the current command line.
103686	[count]l	Move to the <i>count</i> th character position on the current command line. If no number is specified, move to the first position. The first character position shall be numbered 1. If the count is larger than the number of characters on the line, this shall not be considered an error; the cursor shall be placed on the last character on the line.
103687		
103688		
103689		
103690		
103691	[count]fc	Move to the first occurrence of the character 'c' that occurs after the current cursor position. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the character 'c' does not occur in the line after the current cursor position, the terminal shall be alerted and the cursor shall not be moved.
103692		
103693		
103694		
103695		
103696	[count]Fc	Move to the first occurrence of the character 'c' that occurs before the current cursor position. If the cursor was positioned on the first character of the line, the terminal shall be alerted and the cursor shall not be moved. If the character 'c' does not occur in the line before the current cursor position, the terminal shall be alerted and the cursor shall not be moved.
103697		
103698		
103699		
103700		
103701	[count]tc	Move to the character before the first occurrence of the character 'c' that occurs after the current cursor position. If the cursor was positioned on the last character of the line, the terminal shall be alerted and the cursor shall not be advanced. If the character 'c' does not occur in the line after the current cursor position, the terminal shall be alerted and the cursor shall not be moved.
103702		
103703		
103704		
103705		
103706	[count]Tc	Move to the character after the first occurrence of the character 'c' that occurs before the current cursor position. If the cursor was positioned on the first character of the line, the terminal shall be alerted and the cursor shall not be moved. If the character 'c' does not occur in the line before the current cursor position, the terminal shall be alerted and the cursor shall not be moved.
103707		
103708		
103709		
103710		
103711	[count];	Repeat the most recent f , F , t , or T command. Any number argument on that previous command shall be ignored. Errors are those described for the repeated command.
103712		
103713		
103714	[count],	Repeat the most recent f , F , t , or T command. Any number argument on that previous command shall be ignored. However, reverse the direction of that command.
103715		
103716		
103717	a	Enter insert mode after the current cursor position. Characters that are entered shall be inserted before the next character.
103718		
103719	A	Enter insert mode after the end of the current command line.
103720	i	Enter insert mode at the current cursor position. Characters that are entered shall be inserted before the current character.
103721		

103722	I	Enter insert mode at the beginning of the current command line.
103723	R	Enter insert mode, replacing characters from the command line beginning at the
103724		current cursor position.
103725	[count]c <i>motion</i>	
103726		Delete the characters between the current cursor position and the cursor position
103727		that would result from the specified motion command. Then enter insert mode
103728		before the first character following any deleted characters. If <i>count</i> is specified, it
103729		shall be applied to the motion command. A <i>count</i> shall be ignored for the following
103730		motion commands:
103731		0 ^ \$ c
103732		If the motion command is the character 'c', the current command line shall be
103733		cleared and insert mode shall be entered. If the motion command would move the
103734		current cursor position toward the beginning of the command line, the character
103735		under the current cursor position shall not be deleted. If the motion command
103736		would move the current cursor position toward the end of the command line, the
103737		character under the current cursor position shall be deleted. If the <i>count</i> is larger
103738		than the number of characters between the current cursor position and the end of
103739		the command line toward which the motion command would move the cursor, this
103740		shall not be considered an error; all of the remaining characters in the
103741		mentioned range shall be deleted and insert mode shall be entered. If the
103742		motion command is invalid, the terminal shall be alerted, the cursor shall not be
103743		moved, and no text shall be deleted.
103744	C	Delete from the current character to the end of the line and enter insert mode at the
103745		new end-of-line.
103746	S	Clear the entire edit line and enter insert mode.
103747	[count]rc	Replace the current character with the character 'c'. With a number <i>count</i> ,
103748		replace the current and the following <i>count</i> -1 characters. After this command, the
103749		current cursor position shall be on the last character that was changed. If the <i>count</i>
103750		is larger than the number of characters after the cursor, this shall not be considered
103751		an error; all of the remaining characters shall be changed.
103752	[count]_	Append a <space> after the current character position and then append the last
103753		bigword in the previous input line after the <space>. Then enter insert mode after
103754		the last character just appended. With a number <i>count</i> , append the <i>count</i> th bigword
103755		in the previous line.
103756	[count]x	Delete the character at the current cursor position and place the deleted characters
103757		in the save buffer. If the cursor was positioned on the last character of the line, the
103758		character shall be deleted and the cursor position shall be moved to the previous
103759		character (the new last character). If the <i>count</i> is larger than the number of
103760		characters after the cursor, this shall not be considered an error; all the characters
103761		from the cursor to the end of the line shall be deleted.
103762	[count]X	Delete the character before the current cursor position and place the deleted
103763		characters in the save buffer. The character under the current cursor position shall
103764		not change. If the cursor was positioned on the first character of the line, the
103765		terminal shall be alerted, and the X command shall have no effect. If the line
103766		contained a single character, the X command shall have no effect. If the line
103767		contained no characters, the terminal shall be alerted and the cursor shall not be
103768		moved. If the <i>count</i> is larger than the number of characters before the cursor, this
103769		shall not be considered an error; all the characters from before the cursor to the
103770		beginning of the line shall be deleted.

103771	[count]d <i>motion</i>	
103772		Delete the characters between the current cursor position and the character
103773		position that would result from the motion command. A number <i>count</i> repeats the
103774		motion command <i>count</i> times. If the motion command would move toward the
103775		beginning of the command line, the character under the current cursor position
103776		shall not be deleted. If the motion command is d , the entire current command line
103777		shall be cleared. If the <i>count</i> is larger than the number of characters between the
103778		current cursor position and the end of the command line toward which the motion
103779		command would move the cursor, this shall not be considered an error; all of the
103780		remaining characters in the aforementioned range shall be deleted. The deleted
103781		characters shall be placed in the save buffer.
103782	D	Delete all characters from the current cursor position to the end of the line. The
103783		deleted characters shall be placed in the save buffer.
103784	[count]y <i>motion</i>	
103785		Yank (that is, copy) the characters from the current cursor position to the position
103786		resulting from the motion command into the save buffer. A number <i>count</i> shall be
103787		applied to the motion command. If the motion command would move toward the
103788		beginning of the command line, the character under the current cursor position
103789		shall not be included in the set of yanked characters. If the motion command is y ,
103790		the entire current command line shall be yanked into the save buffer. The current
103791		cursor position shall be unchanged. If the <i>count</i> is larger than the number of
103792		characters between the current cursor position and the end of the command line
103793		toward which the motion command would move the cursor, this shall not be
103794		considered an error; all of the remaining characters in the aforementioned range
103795		shall be yanked.
103796	Y	Yank the characters from the current cursor position to the end of the line into the
103797		save buffer. The current character position shall be unchanged.
103798	[count]p	Put a copy of the current contents of the save buffer after the current cursor
103799		position. The current cursor position shall be advanced to the last character put
103800		from the save buffer. A <i>count</i> shall indicate how many copies of the save buffer
103801		shall be put.
103802	[count]P	Put a copy of the current contents of the save buffer before the current cursor
103803		position. The current cursor position shall be moved to the last character put from
103804		the save buffer. A <i>count</i> shall indicate how many copies of the save buffer shall be
103805		put.
103806	u	Undo the last command that changed the edit line. This operation shall not undo
103807		the copy of any command line to the edit line.
103808	U	Undo all changes made to the edit line. This operation shall not undo the copy of
103809		any command line to the edit line.
103810	[count]k	
103811	[count]-	Set the current command line to be the <i>count</i> th previous command line in the shell
103812		command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be
103813		positioned on the first character of the new command. If a k or - command would
103814		retreat past the maximum number of commands in effect for this shell (affected by
103815		the <i>HISTSIZE</i> environment variable), the terminal shall be alerted, and the
103816		command shall have no effect.
103817	[count]j	
103818	[count]+	Set the current command line to be the <i>count</i> th next command line in the shell
103819		command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be
103820		positioned on the first character of the new command. If a j or + command

103821 advances past the edit line, the current command line shall be restored to the edit
103822 line and the terminal shall be alerted.

103823 **[number]G** Set the current command line to be the oldest command line stored in the shell
103824 command history. With a number *number*, set the current command line to be the
103825 command line *number* in the history. If command line *number* does not exist, the
103826 terminal shall be alerted and the command line shall not be changed.

103827 **/pattern<newline>**

103828 Move backwards through the command history, searching for the specified
103829 pattern, beginning with the previous command line. Patterns use the pattern
103830 matching notation described in Section 2.13 (on page 2278), except that the '^'
103831 character shall have special meaning when it appears as the first character of
103832 *pattern*. In this case, the '^' is discarded and the characters after the '^' shall be
103833 matched only at the beginning of a line. Commands in the command history shall
103834 be treated as strings, not as filenames. If the pattern is not found, the current
103835 command line shall be unchanged and the terminal is alerted. If it is found in a
103836 previous line, the current command line shall be set to that line and the cursor
103837 shall be set to the first character of the new command line.

103838 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If
103839 there is no previous non-empty pattern, the terminal shall be alerted and the
103840 current command line shall remain unchanged.

103841 **?pattern<newline>**

103842 Move forwards through the command history, searching for the specified pattern,
103843 beginning with the next command line. Patterns use the pattern matching notation
103844 described in Section 2.13 (on page 2278), except that the '^' character shall have
103845 special meaning when it appears as the first character of *pattern*. In this case, the
103846 '^' is discarded and the characters after the '^' shall be matched only at the
103847 beginning of a line. Commands in the command history shall be treated as strings,
103848 not as filenames. If the pattern is not found, the current command line shall be
103849 unchanged and the terminal alerted. If it is found in a following line, the current
103850 command line shall be set to that line and the cursor shall be set to the first
103851 character of the new command line.

103852 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If
103853 there is no previous non-empty pattern, the terminal shall be alerted and the
103854 current command line shall remain unchanged.

103855 **n** Repeat the most recent / or ? command. If there is no previous / or ?, the terminal
103856 shall be alerted and the current command line shall remain unchanged.

103857 **N** Repeat the most recent / or ? command, reversing the direction of the search. If
103858 there is no previous / or ?, the terminal shall be alerted and the current command
103859 line shall remain unchanged.

103860 EXIT STATUS

103861 The following exit values shall be returned:

103862 0 The script to be executed consisted solely of zero or more blank lines or comments, or
103863 both.

103864 1-125 A non-interactive shell detected a syntax, redirection, or variable assignment error.

103865 127 A specified *command_file* could not be found by a non-interactive shell.

103866 Otherwise, the shell shall return the exit status of the last command it invoked or attempted to
103867 invoke (see also the *exit* utility in Section 2.14, on page 2280).

CONSEQUENCES OF ERRORS

See [Section 2.8.1](#) (on page 2262).

APPLICATION USAGE

Standard input and standard error are the files that determine whether a shell is interactive when `-i` is not specified. For example:

```
sh > file
```

and:

```
sh 2> file
```

create interactive and non-interactive shells, respectively. Although both accept terminal input, the results of error conditions are different, as described in [Section 2.8.1](#) (on page 2262); in the second example a redirection error encountered by a special built-in utility aborts the shell.

A conforming application must protect its first operand, if it starts with a plus sign, by preceding it with the `--` argument that denotes the end of the options.

Applications should note that the standard *PATH* to the shell cannot be assumed to be either `/bin/sh` or `/usr/bin/sh`, and should be determined by interrogation of the *PATH* returned by *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell built-in.

For example, to determine the location of the standard *sh* utility:

```
command -v sh
```

On some implementations this might return:

```
/usr/xpg4/bin/sh
```

Furthermore, on systems that support executable scripts (the `#!` construct), it is recommended that applications using executable scripts install them using *getconf PATH* to determine the shell pathname and update the `#!` script appropriately as it is being installed (for example, with *sed*). For example:

```
#
# Installation time script to install correct POSIX shell pathname
#
# Get list of paths to check
#
Sifs=$IFS
Sifs_set=${IFS+y}
IFS=:
set -- $(getconf PATH)
if [ "$Sifs_set" = y ]
then
    IFS=$Sifs
else
    unset IFS
fi
#
# Check each path for 'sh'
#
for i
do
    if [ -x "${i}"/sh ]
    then
        Pshell=${i}/sh
```

```

103916         fi
103917     done
103918     #
103919     # This is the list of scripts to update. They should be of the
103920     # form '${name}.source' and will be transformed to '${name}'.
103921     # Each script should begin:
103922     #
103923     # #!INSTALLSHELLPATH
103924     #
103925     scripts="a b c"
103926     #
103927     # Transform each script
103928     #
103929     for i in ${scripts}
103930     do
103931         sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
103932     done

```

EXAMPLES

1. Execute a shell command from a string:

```
sh -c "cat myfile"
```

2. Execute a shell script from a file in the current directory:

```
sh my_shell_cmds
```

RATIONALE

The *sh* utility and the *set* special built-in utility share a common set of options.

The name *IFS* was originally an abbreviation of “Input Field Separators”; however, this name is misleading as the *IFS* characters are actually used as field terminators. The KornShell ignores the contents of *IFS* upon entry to the script. A conforming application cannot rely on importing *IFS*. One justification for this, beyond security considerations, is to assist possible future shell compilers. Allowing *IFS* to be imported from the environment prevents many optimizations that might otherwise be performed via dataflow analysis of the script itself.

The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been invoked, probably by a C-language program, with standard input that has been opened using the `O_NONBLOCK` flag; see `open()` in the System Interfaces volume of POSIX.1-200x. If the shell did not reset this flag, it would immediately terminate because no input data would be available yet and that would be considered the same as end-of-file.

The options associated with a *restricted shell* (command name *rsh* and the `-r` option) were excluded because the standard developers considered that the implied level of security could not be achieved and they did not want to raise false expectations.

On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the name `-i`. When it is called by a sequence such as:

```
sh -
```

or by:

```
#! usr/bin/sh -
```

the historical systems have assumed that no option letters follow. Thus, this volume of POSIX.1-200x allows the single hyphen to mark the end of the options, in addition to the use of the regular `--` argument, because it was considered that the older practice was so pervasive. An alternative approach is taken by the KornShell, where real and effective user/group IDs

103963 must match for an interactive shell; this behavior is specifically allowed by this volume of
103964 POSIX.1-200x.

103965 **Note:** There are other problems with set-user-ID scripts that the two approaches described here do not
103966 resolve.

103967 The initialization process for the history file can be dependent on the system start-up files, in
103968 that they may contain commands that effectively preempt the user's settings of *HISTFILE* and
103969 *HISTSIZ*E. For example, function definition commands are recorded in the history file, unless
103970 the *set -o nolog* option is set. If the system administrator includes function definitions in some
103971 system start-up file called before the *ENV* file, the history file is initialized before the user gets a
103972 chance to influence its characteristics. In some historical shells, the history file is initialized just
103973 after the *ENV* file has been processed. Therefore, it is implementation-defined whether changes
103974 made to *HISTFILE* after the history file has been initialized are effective.

103975 The default messages for the various *MAIL*-related messages are unspecified because they vary
103976 across implementations. Typical messages are:

103977 "you have mail\n"

103978 or:

103979 "you have new mail\n"

103980 It is important that the descriptions of command line editing refer to the same shell as that in
103981 POSIX.1-200x so that interactive users can also be application programmers without having to
103982 deal with programmatic differences in their two environments. It is also essential that the utility
103983 name *sh* be specified because this explicit utility name is too firmly rooted in historical practice
103984 of application programs for it to change.

103985 Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on
103986 terminals that do not support command line editing. However, it is not historical practice for the
103987 shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in
103988 all cases. Implementations are encouraged to supply diagnostics in this case whenever possible,
103989 rather than leaving the user in a state where editing commands work incorrectly.

103990 In early proposals, the KornShell-derived *emacs* mode of command line editing was included,
103991 even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant
103992 that the full *emacs* editor not be standardized because they were concerned that an attempt to
103993 standardize this very powerful environment would encourage vendors to ship strictly
103994 conforming versions lacking the extensibility required by the community. The author of the
103995 original *emacs* program also expressed his desire to omit the program. Furthermore, there were a
103996 number of historical systems that did not include *emacs*, or included it without supporting it, but
103997 there were very few that did not include and support *vi*. The shell *emacs* command line editing
103998 mode was finally omitted because it became apparent that the KornShell version and the editor
103999 being distributed with the GNU system had diverged in some respects. The author of *emacs*
104000 requested that the POSIX *emacs* mode either be deleted or have a significant number of
104001 unspecified conditions. Although the KornShell author agreed to consider changes to bring the
104002 shell into alignment, the standard developers decided to defer specification at that time. At the
104003 time, it was assumed that convergence on an acceptable definition would occur for a subsequent
104004 draft, but that has not happened, and there appears to be no impetus to do so. In any case,
104005 implementations are free to offer additional command line editing modes based on the exact
104006 models of editors their users are most comfortable with.

104007 Early proposals had the following list entry in *vi Line Editing Insert Mode* (on page 3079):

104008 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.
104009 Otherwise, the backslash itself shall be inserted into the input line.

104010 However, this is not actually a feature of *sh* command line editing insert mode, but one of some
104011 historical terminal line drivers. Some conforming implementations continue to do this when the

104012 `stty iexten` flag is set.

104013 FUTURE DIRECTIONS

104014 None.

104015 SEE ALSO

104016 [Chapter 2](#) (on page 2245), *cd*, *echo*, *exit*, *fc*, *pwd*, *read*, *set*, *stty*, *test*, *umask*, *vi*

104019 CHANGE HISTORY

104020 First released in Issue 2.

104021 Issue 5

104022 The FUTURE DIRECTIONS section is added.

104023 Text is added to the DESCRIPTION for the Large File Summit proposal.

104024 Issue 6

104025 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

104026 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

104027 The following new requirements on POSIX implementations derive from alignment with the
104028 Single UNIX Specification:

- 104029 • The option letters derived from the *set* special built-in are also accepted with a leading plus
104030 sign ('+').
- 104031 • Large file extensions are added:
 - 104032 — Pathname expansion does not fail due to the size of a file.
 - 104033 — Shell input and output redirections have an implementation-defined offset maximum
104034 that is established in the open file description.

104035 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to
104036 “directory referred to by the *HOME* environment variable”.

104037 Descriptions for the *ENV* and *PWD* environment variables are included to align with the
104038 IEEE P1003.2b draft standard.

104039 The normative text is reworded to avoid use of the term “must” for application requirements.

104040 Issue 7

104041 Austin Group Interpretation 1003.1-2001 #098 is applied, changing the definition of *IFS*.

104042 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS. +

104043 Minor editorial changes are made to the User Portability Utilities option shading. No normative
104044 changes are implied.

104045 Minor changes are made to the install script example in the APPLICATION USAGE section. |

104046 **NAME**

104047 sleep — suspend execution for an interval

104048 **SYNOPSIS**104049 sleep *time*104050 **DESCRIPTION**104051 The *sleep* utility shall suspend execution for at least the integral number of seconds specified by
104052 the *time* operand.104053 **OPTIONS**

104054 None.

104055 **OPERANDS**

104056 The following operand shall be supported:

104057 *time* A non-negative decimal integer specifying the number of seconds for which to
104058 suspend execution.104059 **STDIN**

104060 Not used.

104061 **INPUT FILES**

104062 None.

104063 **ENVIRONMENT VARIABLES**104064 The following environment variables shall affect the execution of *sleep*:104065 *LANG* Provide a default value for the internationalization variables that are unset or null. |
104066 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
104067 variables used to determine the values of locale categories.)104068 *LC_ALL* If set to a non-empty string value, override the values of all the other
104069 internationalization variables.104070 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
104071 characters (for example, single-byte as opposed to multi-byte characters in
104072 arguments).104073 *LC_MESSAGES*
104074 Determine the locale that should be used to affect the format and contents of
104075 diagnostic messages written to standard error.104076 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.104077 **ASYNCHRONOUS EVENTS**104078 If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 104079 1. Terminate normally with a zero exit status.
-
- 104080 2. Effectively ignore the signal.
-
- 104081 3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS
-
- 104082 section of Section 1.4 (on page 2235). This could include terminating with a non-zero exit
-
- 104083 status.

104084 The *sleep* utility shall take the standard action for all other signals.

104085 **STDOUT**

104086 Not used.

104087 **STDERR**

104088 The standard error shall be used only for diagnostic messages.

104089 **OUTPUT FILES**

104090 None.

104091 **EXTENDED DESCRIPTION**

104092 None.

104093 **EXIT STATUS**

104094 The following exit values shall be returned:

104095 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal
104096 was received. See the ASYNCHRONOUS EVENTS section.

104097 >0 An error occurred.

104098 **CONSEQUENCES OF ERRORS**

104099 Default.

104100 **APPLICATION USAGE**

104101 None.

104102 **EXAMPLES**104103 The *sleep* utility can be used to execute a command after a certain amount of time, as in:104104 `(sleep 105; command) &`

104105 or to execute a command every so often, as in:

104106 `while true`
104107 `do`
104108 `command`
104109 `sleep 37`
104110 `done`104111 **RATIONALE**104112 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because
104113 most implementations of this utility rely on the arrival of that signal to notify them that the
104114 requested finishing time has been successfully attained. Such implementations thus do not
104115 distinguish this situation from the successful completion case. Other implementations are
104116 allowed to catch the signal and go back to sleep until the requested time expires or to provide
104117 the normal signal termination procedures.104118 As with all other utilities that take integral operands and do not specify subranges of allowed
104119 values, *sleep* is required by this volume of POSIX.1-200x to deal with *time* requests of up to
104120 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls to
104121 the delay mechanism of the underlying operating system if its argument range is less than this.104122 **FUTURE DIRECTIONS**

104123 None.

104124 **SEE ALSO**104125 *wait*

104126 XBD Chapter 8 (on page 159)

104127 XSH *alarm()*, *sleep*

104128

104129

CHANGE HISTORY

First released in Issue 2.

104130 **NAME**104131 `sort` — sort, merge, or sequence check text files104132 **SYNOPSIS**104133 `sort [-m] [-o output] [-bdfinru] [-t char] [-k keydef]... [file...]`104134 `sort [-c|-C] [-bdfinru] [-t char] [-k keydef] [file]`104135 **DESCRIPTION**104136 The *sort* utility shall perform one of the following functions:

- 104137 1. Sort lines of all the named files together and write the result to the specified output.
- 104138 2. Merge lines of all the named (presorted) files together and write the result to the specified
104139 output.
- 104140 3. Check that a single input file is correctly presorted.

104141 Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no
104142 sort keys are specified, the entire line up to, but not including, the terminating <newline>), and
104143 shall be performed using the collating sequence of the current locale.

104144 **OPTIONS**

104145 The *sort* utility shall conform to XBD Section 12.2 (on page 201), except for Guideline 9, and the
104146 `-k keydef` option should follow the `-b`, `-d`, `-f`, `-i`, `-n`, and `-r` options. In addition, '+' may be
104147 recognized as an option delimiter as well as '-'. |

104148 The following options shall be supported:

104149 `-c` Check that the single input file is ordered as specified by the arguments and the
104150 collating sequence of the current locale. Output shall not be sent to standard
104151 output. The exit code shall indicate whether or not disorder was detected or an
104152 error occurred. If disorder (or, with `-u`, a duplicate key) is detected, a warning
104153 message shall be sent to standard error indicating where the disorder or duplicate
104154 key was found. |

104155 `-C` Same as `-c`, except that a warning message shall not be sent to standard error if
104156 disorder or, with `-u`, a duplicate key is detected. |

104157 `-m` Merge only; the input file shall be assumed to be already sorted.

104158 `-o output` Specify the name of an output file to be used instead of the standard output. This
104159 file can be the same as one of the input *files*.

104160 `-u` Unique: suppress all but one in each set of lines having equal keys. If used with
104161 the `-c` option, check that there are no lines with duplicate keys, in addition to
104162 checking that the input file is sorted.

104163 The following options shall override the default ordering rules. When ordering options appear
104164 independent of any key field specifications, the requested field ordering rules shall be applied
104165 globally to all sort keys. When attached to a specific key (see `-k`), the specified ordering options
104166 shall override all global ordering options for that key.

104167 `-d` Specify that only <blank>s and alphanumeric characters, according to the current
104168 setting of *LC_CTYPE*, shall be significant in comparisons. The behavior is
104169 undefined for a sort key to which `-i` or `-n` also applies.

104170 `-f` Consider all lowercase characters that have uppercase equivalents, according to
104171 the current setting of *LC_CTYPE*, to be the uppercase equivalent for the purposes
104172 of comparison.

- 104173 **-i** Ignore all characters that are non-printable, according to the current setting of
104174 *LC_CTYPE*. The behavior is undefined for a sort key for which **-n** also applies.
- 104175 **-n** Restrict the sort key to an initial numeric string, consisting of optional <blank>s,
104176 optional minus sign, and zero or more digits with an optional radix character and
104177 thousands separators (as defined in the current locale), which shall be sorted by
104178 arithmetic value. An empty digit string shall be treated as zero. Leading zeros and
104179 signs on zeros shall not affect ordering.
- 104180 **-r** Reverse the sense of comparisons.

104181 The treatment of field separators can be altered using the options:

- 104182 **-b** Ignore leading <blank>s when determining the starting and ending positions of a
104183 restricted sort key. If the **-b** option is specified before the first **-k** option, it shall be
104184 applied to all **-k** options. Otherwise, the **-b** option can be attached independently
104185 to each **-k** *field_start* or *field_end* option-argument (see below).
- 104186 **-t char** Use *char* as the field separator character; *char* shall not be considered to be part of a
104187 field (although it can be included in a sort key). Each occurrence of *char* shall be
104188 significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not
104189 specified, <blank>s shall be used as default field separators; each maximal non-
104190 empty sequence of <blank>s that follows a non-<blank> shall be a field separator.

104191 Sort keys can be specified using the options:

- 104192 **-k keydef** The *keydef* argument is a restricted sort key field definition. The format of this
104193 definition is:

104194 *field_start*[*type*][, *field_end*[*type*]]

104195 where *field_start* and *field_end* define a key field restricted to a portion of the line
104196 (see the EXTENDED DESCRIPTION section), and *type* is a modifier from the list of
104197 characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall behave like the
104198 **-b** option, but shall apply only to the *field_start* or *field_end* to which it is attached.
104199 The other modifiers shall behave like the corresponding options, but shall apply
104200 only to the key field to which they are attached; they shall have this effect if
104201 specified with *field_start*, *field_end*, or both. If any modifier is attached to a
104202 *field_start* or to a *field_end*, no option shall apply to either. Implementations shall
104203 support at least nine occurrences of the **-k** option, which shall be significant in
104204 command line order. If no **-k** option is specified, a default sort key of the entire
104205 line shall be used.

104206 When there are multiple key fields, later keys shall be compared only after all
104207 earlier keys compare equal. Except when the **-u** option is specified, lines that
104208 otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or
104209 **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in
104210 the lines significant to the comparison. The order in which lines that still compare
104211 equal are written is unspecified.

104212 OPERANDS

104213 The following operand shall be supported:

- 104214 *file* A pathname of a file to be sorted, merged, or checked. If no *file* operands are
104215 specified, or if a *file* operand is '-', the standard input shall be used.

104216 STDIN

104217 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.
104218 See the INPUT FILES section.

104219 **INPUT FILES**

104220 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a
 104221 file ending with an incomplete last line.

104222 **ENVIRONMENT VARIABLES**

104223 The following environment variables shall affect the execution of *sort*:

104224 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 104225 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 104226 variables used to determine the values of locale categories.)

104227 **LC_ALL** If set to a non-empty string value, override the values of all the other
 104228 internationalization variables.

104229 **LC_COLLATE**
 104230 Determine the locale for ordering rules.

104231 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 104232 characters (for example, single-byte as opposed to multi-byte characters in
 104233 arguments and input files) and the behavior of character classification for the **-b**,
 104234 **-d**, **-f**, **-i**, and **-n** options.

104235 **LC_MESSAGES**
 104236 Determine the locale that should be used to affect the format and contents of
 104237 diagnostic messages written to standard error.

104238 **LC_NUMERIC**
 104239 Determine the locale for the definition of the radix character and thousands
 104240 separator for the **-n** option.

104241 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

104242 **ASYNCHRONOUS EVENTS**

104243 Default.

104244 **STDOUT**

104245 Unless the **-o** or **-c** options are in effect, the standard output shall contain the sorted input.

104246 **STDERR**

104247 The standard error shall be used for diagnostic messages. When **-c** is specified, if disorder is |
 104248 detected (or if **-u** is also specified and a duplicate key is detected), a message shall be written to |
 104249 the standard error which identifies the input line at which disorder (or a duplicate key) was |
 104250 detected. A warning message about correcting an incomplete last line of an input file may be
 104251 generated, but need not affect the final exit status.

104252 **OUTPUT FILES**

104253 If the **-o** option is in effect, the sorted input shall be written to the file *output*.

104254 **EXTENDED DESCRIPTION**

104255 The notation:

104256 **-k** *field_start*[*type*][,*field_end*[*type*]]

104257 shall define a key field that begins at *field_start* and ends at *field_end* inclusive, unless *field_start*
 104258 falls beyond the end of the line or after *field_end*, in which case the key field is empty. A missing
 104259 *field_end* shall mean the last character of the line.

104260 A field comprises a maximal sequence of non-separating characters and, in the absence of option
 104261 **-t**, any preceding field separator.

104262 The *field_start* portion of the *keydef* option-argument shall have the form:

104263 *field_number*[.*first_character*]

104264 Fields and characters within fields shall be numbered starting with 1. The *field_number* and
 104265 *first_character* pieces, interpreted as positive decimal integers, shall specify the first character to
 104266 be used as part of a sort key. If *first_character* is omitted, it shall refer to the first character of the
 104267 field.

104268 The *field_end* portion of the *keydef* option-argument shall have the form:

104269 *field_number*[. *last_character*]

104270 The *field_number* shall be as described above for *field_start*. The *last_character* piece, interpreted
 104271 as a non-negative decimal integer, shall specify the last character to be used as part of the sort
 104272 key. If *last_character* evaluates to zero or *last_character* is omitted, it shall refer to the last
 104273 character of the field specified by *field_number*.

104274 If the **-b** option or **b** type modifier is in effect, characters within a field shall be counted from the
 104275 first non-<blank> in the field. (This shall apply separately to *first_character* and *last_character*.)

104276 EXIT STATUS

104277 The following exit values shall be returned:

- 104278 0 All input files were output successfully, or **-c** was specified and the input file was correctly
 104279 sorted.
- 104280 1 Under the **-c** option, the file was not ordered as specified, or if the **-c** and **-u** options were
 104281 both specified, two input lines were found with equal keys.
- 104282 >1 An error occurred.

104283 CONSEQUENCES OF ERRORS

104284 Default.

104285 APPLICATION USAGE

104286 The default value for **-t**, <blank>, has different properties from, for example, **-t"<space>"**. If a
 104287 line contains:

104288 <space><space>foo

104289 the following treatment would occur with default separation as opposed to specifically selecting
 104290 a <space>:

Field	Default	-t "<space>"
1	<space><space>foo	empty
2	empty	empty
3	empty	foo

104295 The leading field separator itself is included in a field when **-t** is not used. For example, this
 104296 command returns an exit status of zero, meaning the input was already sorted:

```
104297 sort -c -k 2 <<eof
104298 y<tab>b
104299 x<space>a
104300 eof
```

104301 (assuming that a <tab> precedes the <space> in the current collating sequence). The field
 104302 separator is not included in a field when it is explicitly set via **-t**. This is historical practice and
 104303 allows usage such as:

```
104304 sort -t "|" -k 2n <<eof
104305 Atlanta|425022|Georgia
104306 Birmingham|284413|Alabama
104307 Columbia|100385|South Carolina
104308 eof
```

104309 where the second field can be correctly sorted numerically without regard to the non-numeric
104310 field separator.

104311 The wording in the OPTIONS section clarifies that the **-b**, **-d**, **-f**, **-i**, **-n**, and **-r** options have to
104312 come before the first sort key specified if they are intended to apply to all specified keys. The
104313 way it is described in this volume of POSIX.1-200x matches historical practice, not historical
104314 documentation. The results are unspecified if these options are specified after a **-k** option.

104315 The **-f** option might not work as expected in locales where there is not a one-to-one mapping
104316 between an uppercase and a lowercase letter.

104317 EXAMPLES

- 104318 1. The following command sorts the contents of **infile** with the second field as the sort key:

```
104319 sort -k 2,2 infile
```

- 104320 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**,
104321 placing the output in **outfile** and using the second character of the second field as the sort
104322 key (assuming that the first character of the second field is the field separator):

```
104323 sort -r -o outfile -k 2.2,2.2 infile1 infile2
```

- 104324 3. The following command sorts the contents of **infile1** and **infile2** using the second
104325 non-**<blank>** of the second field as the sort key:

```
104326 sort -k 2.2b,2.2b infile1 infile2
```

- 104327 4. The following command prints the System V password file (user database) sorted by the
104328 numeric user ID (the third colon-separated field):

```
104329 sort -t : -k 3,3n /etc/passwd
```

- 104330 5. The following command prints the lines of the already sorted file **infile**, suppressing all
104331 but one occurrence of lines having the same third field:

```
104332 sort -um -k 3.1,3.0 infile
```

104333 RATIONALE

104334 Examples in some historical documentation state that options **-um** with one input file keep the
104335 first in each set of lines with equal keys. This behavior was deemed to be an implementation
104336 artifact and was not standardized.

104337 The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with
104338 using *sort* to sort several files individually and then merge them together. The text concerning **-z**
104339 in historical documentation appeared to require implementations to determine the proper buffer
104340 length during the sort phase of operation, but not during the merge.

104341 The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was
104342 omitted because of non-portability in international usage.

104343 An undocumented **-T** option exists in some implementations. It is used to specify a directory for
104344 intermediate files. Implementations are encouraged to support the use of the *TMPDIR*
104345 environment variable instead of adding an option to support this functionality.

104346 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is
104347 not consistent with other utility conventions. Second, it did not meet syntax guideline
104348 requirements.

104349 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already
104350 states that optional leading **<blank>**s are tolerated in doing the comparison. If **-b** is enabled,
104351 rather than implied, by **-n**, this has unusual side effects. When a character offset is used in a
104352 column of numbers (for example, to sort modulo 100), that offset is measured relative to the
104353 most significant digit, not to the column. Based upon a recommendation from the author of the

104354 original *sort* utility, the `-b` implication has been omitted from this volume of POSIX.1-200x, and
 104355 an application wishing to achieve the previously mentioned side effects has to code the `-b` flag
 104356 explicitly.

104357 Earlier versions of this standard allowed the `-o` option to appear after operands. Historical
 104358 practice allowed all options to be interspersed with operands. This version of the standard
 104359 allows implementations to accept options after operands but conforming applications should
 104360 not use this form.

104361 Earlier versions of this standard also allowed the `-number` and `+number` options. These options |
 104362 are no longer specified by POSIX.1-200x but may be present in some implementations.

104363 Historical implementations produced a message on standard error when `-c` was specified and +
 104364 disorder was detected, and when `-c` and `-u` were specified and a duplicate key was detected. An +
 104365 earlier version of this standard contained wording that did not make it clear that this message +
 104366 was allowed and some implementations removed this message to be sure that they conformed +
 104367 to the standard's requirements. Confronted with this difference in behavior, interactive users +
 104368 that wanted to be sure that they got visual feedback instead of just exit code 1 could have used a +
 104369 command like:

```
104370 sort -c file || echo disorder +
```

104371 whether or not the *sort* utility provided a message in this case. But, it was not easy for a user to +
 104372 find where the disorder or duplicate key occurred on implementations that do not produce a +
 104373 message, especially when some parts of the input line were not part of the key and when one or +
 104374 more of the `-b`, `-d`, `-f`, `-i`, `-n`, or `-r` options or *keydef* type modifiers were in use. POSIX.1-200x +
 104375 requires a message to be produced in this case. POSIX.1-200x also contains the `-C` option giving +
 104376 users the ability to choose either behavior. +

104377 When a disorder or duplicate is found when the `-c` option is specified, some implementations +
 104378 print a message containing the first line that is out of order or contains a duplicate key; others +
 104379 print a message specifying the line number of the offending line. This standard allows either +
 104380 type of message.

104381 FUTURE DIRECTIONS

104382 None.

104387 CHANGE HISTORY

104388 First released in Issue 2.

104389 Issue 6

104390 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

104391 IEEE PASC Interpretation 1003.2 #168 is applied.

104392 Issue 7

104393 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that Guideline 9 of the Utility -
 104394 Syntax Guidelines does not apply and noting that '+' may be recognized as an option delimiter.

104395 Austin Group Interpretation 1003.1-2001 #120 is applied, clarifying the use of the `-c` option and +
 104396 introducing the `-C` option. +

104397 XCU-ERN-81 is applied, modifying the description of the `-i` option. +

104398 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104399 **NAME**
 104400 `split` — split files into pieces

104401 **SYNOPSIS**
 104402 `split [-l line_count] [-a suffix_length] [file[name]]`
 104403 `split -b n[k|m] [-a suffix_length] [file[name]]`

104404 **DESCRIPTION**
 104405 The *split* utility shall read an input file and write one or more output files. The default size of
 104406 each output file shall be 1 000 lines. The size of the output files can be modified by specification
 104407 of the `-b` or `-l` options. Each output file shall be created with a unique suffix. The suffix shall
 104408 consist of exactly *suffix_length* lowercase letters from the POSIX locale. The letters of the suffix
 104409 shall be used as if they were a base-26 digit system, with the first suffix to be created consisting
 104410 of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all
 104411 'z' characters is created. By default, the names of the output files shall be 'x', followed by a
 104412 two-character suffix from the character set as described above, starting with "aa", "ab", "ac",
 104413 and so on, and continuing until the suffix "zz", for a maximum of 676 files.

104414 If the number of files required exceeds the maximum allowed by the suffix length provided,
 104415 such that the last allowable file would be larger than the requested size, the *split* utility shall fail
 104416 after creating the last file with a valid suffix; *split* shall not delete the files it created with valid
 104417 suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the
 104418 input file, and may be smaller than the requested size.

104419 **OPTIONS**
 104420 The *split* utility shall conform to XBD [Section 12.2](#) (on page 201).

104421 The following options shall be supported:

104422 `-a suffix_length`
 104423 Use *suffix_length* letters to form the suffix portion of the filenames of the split file. If
 104424 `-a` is not specified, the default suffix length shall be two. If the sum of the *name*
 104425 operand and the *suffix_length* option-argument would create a filename exceeding
 104426 {NAME_MAX} bytes, an error shall result; *split* shall exit with a diagnostic message
 104427 and no files shall be created.

104428 `-b n` Split a file into pieces *n* bytes in size.

104429 `-b nk` Split a file into pieces *n**1 024 bytes in size.

104430 `-b nm` Split a file into pieces *n**1 048 576 bytes in size.

104431 `-l line_count` Specify the number of lines in each resulting file piece. The *line_count* argument is
 104432 an unsigned decimal integer. The default is 1 000. If the input does not end with a
 104433 <newline>, the partial line shall be included in the last output file.

104434 **OPERANDS**
 104435 The following operands shall be supported:

104436 *file* The pathname of the ordinary file to be split. If no input file is given or *file* is '-',
 104437 the standard input shall be used.

104438 *name* The prefix to be used for each of the files resulting from the split operation. If no
 104439 *name* argument is given, 'x' shall be used as the prefix of the output files. The
 104440 combined length of the basename of *prefix* and *suffix_length* cannot exceed
 104441 {NAME_MAX} bytes. See the OPTIONS section.

104442 **STDIN**

104443 See the INPUT FILES section.

104444 **INPUT FILES**

104445 Any file can be used as input.

104446 **ENVIRONMENT VARIABLES**104447 The following environment variables shall affect the execution of *split*:

104448 **LANG** Provide a default value for the internationalization variables that are unset or null. |
 104449 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 104450 variables used to determine the values of locale categories.)

104451 **LC_ALL** If set to a non-empty string value, override the values of all the other
 104452 internationalization variables.

104453 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 104454 characters (for example, single-byte as opposed to multi-byte characters in
 104455 arguments and input files).

104456 **LC_MESSAGES**
 104457 Determine the locale that should be used to affect the format and contents of
 104458 diagnostic messages written to standard error.

104459 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

104460 **ASYNCHRONOUS EVENTS**

104461 Default.

104462 **STDOUT**

104463 Not used.

104464 **STDERR**

104465 The standard error shall be used only for diagnostic messages.

104466 **OUTPUT FILES**

104467 The output files contain portions of the original input file; otherwise, unchanged.

104468 **EXTENDED DESCRIPTION**

104469 None.

104470 **EXIT STATUS**

104471 The following exit values shall be returned:

104472 0 Successful completion.

104473 >0 An error occurred.

104474 **CONSEQUENCES OF ERRORS**

104475 Default.

104476 **APPLICATION USAGE**

104477 None.

104478 **EXAMPLES**104479 In the following examples **foo** is a text file that contains 5 000 lines.104480 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:104481 `split foo`

104482 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,
 104483 **xaab**, **xaac**, **xaad**, and **xaae**:

104484 `split -a 3 foo`

- 104485 3. Create three files with four-letter suffixes and a supplied prefix, **bar_aaa**, **bar_aaab**, and
 104486 **bar_aaac**:
- ```
104487 split -a 4 -l 2000 foo bar_
```
- 104488 4. Create as many files as are necessary to contain at most 20\*1024 bytes, each with the  
 104489 default prefix of **x** and a five-letter suffix:
- ```
104490 split -a 5 -b 20k foo
```

RATIONALE

104491 The **-b** option was added to provide a mechanism for splitting files other than by lines. While
 104492 most uses of the **-b** option are for transmitting files over networks, some believed it would have
 104493 additional uses.
 104494

104495 The **-a** option was added to overcome the limitation of being able to create only 676 files.

104496 Consideration was given to deleting this utility, using the rationale that the functionality
 104497 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the
 104498 purpose of the User Portability Utilities option, it was decided to retain both this utility and the
 104499 *csplit* utility because users use both utilities and have historical expectations of their behavior.
 104500 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical
 104501 *csplit*.

104502 The text "*split* shall not delete the files it created with valid suffixes" would normally be
 104503 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the
 104504 historical behavior of *split* is made explicit to avoid misinterpretation.

104505 Earlier versions of this standard allowed a *-line_count* option. This form is no longer specified by
 104506 POSIX.1-200x but may be present in some implementations.

FUTURE DIRECTIONS

104507 None.

CHANGE HISTORY

104512 First released in Issue 2.
 104513

Issue 6

104514 This utility is marked as part of the User Portability Utilities option.

104515 The APPLICATION USAGE section is added.

104516 The obsolescent SYNOPSIS is removed.
 104517

Issue 7

104518 Austin Group Interpretation 1003.1-2001 #027 is applied.

104519 The *split* utility is moved from the User Portability Utilities option to the Base. User Portability
 104520 Utilities is now an option for interactive utilities.
 104521

104522 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104523 **NAME**

104524 strings — find printable strings in files

104525 **SYNOPSIS**104526 strings [-a] [-t *format*] [-n *number*] [*file...*]104527 **DESCRIPTION**

104528 The *strings* utility shall look for printable strings in regular files and shall write those strings to
 104529 standard output. A printable string is any sequence of four (by default) or more printable
 104530 characters terminated by a <newline> or NUL character. Additional implementation-defined
 104531 strings may be written; see *localedef*.

104532 If the first argument is '- ', the results are unspecified.

104533 **OPTIONS**104534 The *strings* utility shall conform to XBD Section 12.2 (on page 201), except for the unspecified
104535 usage of '- '.

104536 The following options shall be supported:

104537 **-a** Scan files in their entirety. If **-a** is not specified, it is implementation-defined what
104538 portion of each file is scanned for strings.104539 **-n *number*** Specify the minimum string length, where the *number* argument is a positive
104540 decimal integer. The default shall be 4.104541 **-t *format*** Write each string preceded by its byte offset from the start of the file. The format
104542 shall be dependent on the single character used as the *format* option-argument:

104543 d The offset shall be written in decimal.

104544 o The offset shall be written in octal.

104545 x The offset shall be written in hexadecimal.

104546 **OPERANDS**

104547 The following operand shall be supported:

104548 *file* A pathname of a regular file to be used as input. If no *file* operand is specified, the
104549 *strings* utility shall read from the standard input.104550 **STDIN**

104551 See the INPUT FILES section.

104552 **INPUT FILES**104553 The input files named by the utility arguments or the standard input shall be regular files of any
104554 format.104555 **ENVIRONMENT VARIABLES**104556 The following environment variables shall affect the execution of *strings*:104557 **LANG** Provide a default value for the internationalization variables that are unset or null.
104558 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
104559 variables used to determine the values of locale categories.)104560 **LC_ALL** If set to a non-empty string value, override the values of all the other
104561 internationalization variables.104562 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
104563 characters (for example, single-byte as opposed to multi-byte characters in
104564 arguments and input files) and to identify printable strings.

- 104565 **LC_MESSAGES**
- 104566 Determine the locale that should be used to affect the format and contents of
- 104567 diagnostic messages written to standard error.
- 104568 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 104569 **ASYNCHRONOUS EVENTS**
- 104570 Default.
- 104571 **STDOUT**
- 104572 Strings found shall be written to the standard output, one per line.
- 104573 When the **-t** option is not specified, the format of the output shall be:
- 104574 "%s", <string>
- 104575 With the **-t o** option, the format of the output shall be:
- 104576 "%o %s", <byte offset>, <string>
- 104577 With the **-t x** option, the format of the output shall be:
- 104578 "%x %s", <byte offset>, <string>
- 104579 With the **-t d** option, the format of the output shall be:
- 104580 "%d %s", <byte offset>, <string>
- 104581 **STDERR**
- 104582 The standard error shall be used only for diagnostic messages.
- 104583 **OUTPUT FILES**
- 104584 None.
- 104585 **EXTENDED DESCRIPTION**
- 104586 None.
- 104587 **EXIT STATUS**
- 104588 The following exit values shall be returned:
- 104589 0 Successful completion.
- 104590 >0 An error occurred.
- 104591 **CONSEQUENCES OF ERRORS**
- 104592 Default.
- 104593 **APPLICATION USAGE**
- 104594 By default the data area (as opposed to the text, "bss", or header areas) of a binary executable
- 104595 file is scanned. Implementations document which areas are scanned.
- 104596 Some historical implementations do not require NUL or <newline> terminators for strings to
- 104597 permit those languages that do not use NUL as a string terminator to have their strings written.
- 104598 **EXAMPLES**
- 104599 None.
- 104600 **RATIONALE**
- 104601 Apart from rationalizing the option syntax and slight difficulties with object and executable
- 104602 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were
- 104603 introduced to replace the non-conforming **-** and **-number** options. These options are no longer
- 104604 specified by POSIX.1-200x but may be present in some implementations.
- 104605 The **-o** option historically means different things on different implementations. Some use it to
- 104606 mean "offset in decimal", while others use it as "offset in octal". Instead of trying to decide which
- 104607 way would be least objectionable, the **-t** option was added. It was originally named **-O** to mean

104608 “offset”, but was changed to `-t` to be consistent with *od*.

104609 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of
104610 POSIX.1-200x requires implementations to write strings as defined by the current locale.

104611 FUTURE DIRECTIONS

104612 None.

104616 CHANGE HISTORY

104617 First released in Issue 4.

104618 Issue 6

104619 This utility is marked as part of the User Portability Utilities option.

104620 The obsolescent SYNOPSIS is removed.

104621 The normative text is reworded to avoid use of the term “must” for application requirements.

104622 Issue 7

104623 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying the behavior if the first
104624 argument is ‘-’.

104625 The *strings* utility is moved from the User Portability Utilities option to the Base. User
104626 Portability Utilities is now an option for interactive utilities.

104627 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

104628 **NAME**
 104629 strip — remove unnecessary information from strippable files (**DEVELOPMENT**)

104630 **SYNOPSIS**
 104631 SD strip *file...*

104632 **DESCRIPTION**
 104633 XSI A strippable file is defined as a relocatable, object, or executable file. On XSI-conformant
 104634 systems, a strippable file can also be an archive of object or relocatable files.
 104635 The *strip* utility shall remove from strippable files named by the *file* operands any information
 104636 the implementor deems unnecessary for execution of those files. The nature of that information
 104637 is unspecified. The effect of *strip* on object and executable files shall be similar to the use of the
 104638 XSI *-s* option to *c99* or *fort77*. The effect of *strip* on an archive of object files shall be similar to the
 104639 use of the *-s* option to *c99* or *fort77* for each object file in the archive.

104640 **OPTIONS**
 104641 None.

104642 **OPERANDS**
 104643 The following operand shall be supported:
 104644 *file* A pathname referring to a strippable file.

104645 **STDIN**
 104646 Not used.

104647 **INPUT FILES**
 104648 The input files shall be in the form of strippable files successfully produced by any compiler
 104649 XSI defined by this volume of POSIX.1-200x or produced by creating or updating an archive of such
 104650 files using the *ar* utility.

104651 **ENVIRONMENT VARIABLES**
 104652 The following environment variables shall affect the execution of *strip*:

104653 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 104654 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 104655 variables used to determine the values of locale categories.)

104656 *LC_ALL* If set to a non-empty string value, override the values of all the other
 104657 internationalization variables.

104658 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 104659 characters (for example, single-byte as opposed to multi-byte characters in
 104660 arguments).

104661 *LC_MESSAGES*
 104662 Determine the locale that should be used to affect the format and contents of
 104663 diagnostic messages written to standard error.

104664 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

104665 **ASYNCHRONOUS EVENTS**
 104666 Default.

- 104667 **STDOUT**
- 104668 Not used.
- 104669 **STDERR**
- 104670 The standard error shall be used only for diagnostic messages.
- 104671 **OUTPUT FILES**
- 104672 The *strip* utility shall produce strippable files of unspecified format.
- 104673 **EXTENDED DESCRIPTION**
- 104674 None.
- 104675 **EXIT STATUS**
- 104676 The following exit values shall be returned:
- 104677 0 Successful completion.
- 104678 >0 An error occurred.
- 104679 **CONSEQUENCES OF ERRORS**
- 104680 Default.
- 104681 **APPLICATION USAGE**
- 104682 None.
- 104683 **EXAMPLES**
- 104684 None.
- 104685 **RATIONALE**
- 104686 Historically, this utility has been used to remove the symbol table from a strippable file. It was
- 104687 included since it is known that the amount of symbolic information can amount to several
- 104688 megabytes; the ability to remove it in a portable manner was deemed important, especially for
- 104689 smaller systems.
- 104690 The behavior of *strip* on object and executable files is said to be the same as the `-s` option to a
- 104691 compiler. While the end result is essentially the same, it is not required to be identical.
- 104692 XSI-conformant systems support use of *strip* on archive files containing object files or relocatable
- 104693 files.
- 104694 **FUTURE DIRECTIONS**
- 104695 None.
- 104696 **SEE ALSO**
- 104697 *ar*, *c99*, *fort77*
- 104698 XBD [Chapter 8](#) (on page 159)
- 104699 **CHANGE HISTORY**
- 104700 First released in Issue 2.
- 104701 **Issue 6**
- 104702 This utility is marked as part of the Software Development Utilities option.
- 104703 **Issue 7**
- 104704 Austin Group Interpretation 1003.1-2001 #103 is applied.

104705 **NAME**
 104706 `stty` — set the options for a terminal

104707 **SYNOPSIS**
 104708 `stty [-a|-g]`
 104709 `stty operand...`

104710 **DESCRIPTION**
 104711 The `stty` utility shall set or report on terminal I/O characteristics for the device that is its
 104712 standard input. Without options or operands specified, it shall report the settings of certain
 104713 characteristics, usually those that differ from implementation-defined defaults. Otherwise, it
 104714 shall modify the terminal state according to the specified operands. Detailed information about
 104715 the modes listed in the first five groups below are described in XBD [Chapter 11](#) (on page 185).
 104716 Operands in the Combination Modes group (see [Combination Modes](#), on page 3112) are
 104717 implemented using operands in the previous groups. Some combinations of operands are
 104718 mutually-exclusive on some terminal types; the results of using such combinations are
 104719 unspecified.

104720 Typical implementations of this utility require a communications line configured to use the
 104721 **termios** interface defined in the System Interfaces volume of POSIX.1-200x. On systems where
 104722 none of these lines are available, and on lines not currently configured to support the **termios**
 104723 interface, some of the operands need not affect terminal characteristics.

104724 **OPTIONS**
 104725 The `stty` utility shall conform to XBD [Section 12.2](#) (on page 201).

104726 The following options shall be supported:

- 104727 **-a** Write to standard output all the current settings for the terminal.
- 104728 **-g** Write to standard output all the current settings in an unspecified form that can be
 104729 used as arguments to another invocation of the `stty` utility on the same system. The
 104730 form used shall not contain any characters that would require quoting to avoid
 104731 word expansion by the shell; see [Section 2.6](#) (on page 2253).

104732 **OPERANDS**
 104733 The following operands shall be supported to set the terminal characteristics.

104734 **Control Modes**

104735 **parenb** (**-parenb**) Enable (disable) parity generation and detection. This shall have the effect of
 104736 setting (not setting) PARENB in the **termios** `c_flag` field, as defined in XBD
 104737 [Chapter 11](#) (on page 185).

104738 **parodd** (**-parodd**)
 104739 Select odd (even) parity. This shall have the effect of setting (not setting)
 104740 PARODD in the **termios** `c_flag` field, as defined in XBD [Chapter 11](#) (on page
 104741 185).

104742 **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,
 104743 CS7, and CS8, respectively, in the **termios** `c_flag` field, as defined in XBD
 104744 [Chapter 11](#) (on page 185).

104745 *number* Set terminal baud rate to the number given, if possible. If the baud rate is set
 104746 to zero, the modem control lines shall no longer be asserted. This shall have
 104747 the effect of setting the input and output **termios** baud rate values as defined
 104748 in XBD [Chapter 11](#) (on page 185).

104749	ispeed <i>number</i>	Set terminal input baud rate to the number given, if possible. If the input baud rate is set to zero, the input baud rate shall be specified by the value of the output baud rate. This shall have the effect of setting the input termios baud rate values as defined in XBD Chapter 11 (on page 185).
104750		
104751		
104752		
104753	ospeed <i>number</i>	Set terminal output baud rate to the number given, if possible. If the output baud rate is set to zero, the modem control lines shall no longer be asserted. This shall have the effect of setting the output termios baud rate values as defined in XBD Chapter 11 (on page 185).
104754		
104755		
104756		
104757	hupcl (-hupcl)	Stop asserting modem control lines (do not stop asserting modem control lines) on last close. This shall have the effect of setting (not setting) HUPCL in the termios <i>c_cflag</i> field, as defined in XBD Chapter 11 (on page 185).
104758		
104759		
104760	hup (-hup)	Equivalent to hupcl (-hupcl).
104761	cstopb (-cstopb)	Use two (one) stop bits per character. This shall have the effect of setting (not setting) CSTOPB in the termios <i>c_cflag</i> field, as defined in XBD Chapter 11 (on page 185).
104762		
104763		
104764	cread (-cread)	Enable (disable) the receiver. This shall have the effect of setting (not setting) CREAD in the termios <i>c_cflag</i> field, as defined in XBD Chapter 11 (on page 185).
104765		
104766		
104767	clocal (-clocal)	Assume a line without (with) modem control. This shall have the effect of setting (not setting) CLOCAL in the termios <i>c_cflag</i> field, as defined in XBD Chapter 11 (on page 185).
104768		
104769		
104770	It is unspecified whether <i>stty</i> shall report an error if an attempt to set a Control Mode fails.	
104771	Input Modes	
104772	ignbrk (-ignbrk)	Ignore (do not ignore) break on input. This shall have the effect of setting (not setting) IGNBRK in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104773		
104774		
104775	brkint (-brkint)	Signal (do not signal) INTR on break. This shall have the effect of setting (not setting) BRKINT in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104776		
104777		
104778	ignpar (-ignpar)	Ignore (do not ignore) bytes with parity errors. This shall have the effect of setting (not setting) IGNPAR in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104779		
104780		
104781	parmrk (-parmrk)	Mark (do not mark) parity errors. This shall have the effect of setting (not setting) PARMRK in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104782		
104783		
104784		
104785	inpck (-inpck)	Enable (disable) input parity checking. This shall have the effect of setting (not setting) INPCK in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104786		
104787		
104788	istrip (-istrip)	Strip (do not strip) input characters to seven bits. This shall have the effect of setting (not setting) ISTRIP in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104789		
104790		
104791	inlcr (-inlcr)	Map (do not map) NL to CR on input. This shall have the effect of setting (not setting) INLCR in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104792		
104793		

104794		igncr (-igncr)	Ignore (do not ignore) CR on input. This shall have the effect of setting (not setting) IGNCR in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104795			
104796			
104797		icrnl (-icrnl)	Map (do not map) CR to NL on input. This shall have the effect of setting (not setting) ICRNL in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104798			
104799			
104800		ixon (-ixon)	Enable (disable) START/STOP output control. Output from the system is stopped when the system receives STOP and started when the system receives START. This shall have the effect of setting (not setting) IXON in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104801			
104802			
104803			
104804	XSI	ixany (-ixany)	Allow any character to restart output. This shall have the effect of setting (not setting) IXANY in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104805			
104806			
104807		ixoff (-ixoff)	Request that the system send (not send) STOP characters when the input queue is nearly full and START characters to resume data transmission. This shall have the effect of setting (not setting) IXOFF in the termios <i>c_iflag</i> field, as defined in XBD Chapter 11 (on page 185).
104808			
104809			
104810			
104811		Output Modes	
104812		opost (-opost)	Post-process output (do not post-process output; ignore all other output modes). This shall have the effect of setting (not setting) OPOST in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104813			
104814			
104815	XSI	ocrnl (-ocrnl)	Map (do not map) CR to NL on output This shall have the effect of setting (not setting) OCRNL in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104816			
104817			
104818	XSI	onocr (-onocr)	Do not (do) output CR at column zero. This shall have the effect of setting (not setting) ONOCR in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104819			
104820			
104821	XSI	onlret (-onlret)	The terminal newline key performs (does not perform) the CR function. This shall have the effect of setting (not setting) ONLRET in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104822			
104823			
104824	XSI	ofill (-ofill)	Use fill characters (use timing) for delays. This shall have the effect of setting (not setting) OFILL in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104825			
104826			
104827	XSI	ofdel (-ofdel)	Fill characters are DELs (NULs). This shall have the effect of setting (not setting) OFDEL in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104828			
104829			
104830	XSI	cr0 cr1 cr2 cr3	Select the style of delay for CRs. This shall have the effect of setting CRDLY to CR0, CR1, CR2, or CR3, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104831			
104832			
104833	XSI	nl0 nl1	Select the style of delay for NL. This shall have the effect of setting NLDLY to NL0 or NL1, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104834			
104835			
104836	XSI	tab0 tab1 tab2 tab3	Select the style of delay for horizontal tabs. This shall have the effect of setting TABDLY to TAB0, TAB1, TAB2, or TAB3, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185). Note that TAB3 has the effect of expanding <tab>s to <space>s.
104837			
104838			
104839			
104840			

104841	XSI	tabs (-tabs)	Synonym for tab0 (tab3).
104842	XSI	bs0 bs1	Select the style of delay for backspaces. This shall have the effect of setting BSDLY to BS0 or BS1, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104843			
104844			
104845	XSI	ff0 ff1	Select the style of delay for form-feeds. This shall have the effect of setting FFDLY to FF0 or FF1, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104846			
104847			
104848	XSI	vt0 vt1	Select the style of delay for vertical-tabs. This shall have the effect of setting VTDLY to VT0 or VT1, respectively, in the termios <i>c_oflag</i> field, as defined in XBD Chapter 11 (on page 185).
104849			
104850			
104851		Local Modes	
104852		isig (-isig)	Enable (disable) the checking of characters against the special control characters INTR, QUIT, and SUSP. This shall have the effect of setting (not setting) ISIG in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104853			
104854			
104855			
104856		icanon (-icanon)	Enable (disable) canonical input (ERASE and KILL processing). This shall have the effect of setting (not setting) ICANON in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104857			
104858			
104859		iexten (-iexten)	Enable (disable) any implementation-defined special control characters not currently controlled by icanon , isig , ixon , or ixoff . This shall have the effect of setting (not setting) IEXTEN in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104860			
104861			
104862			
104863		echo (-echo)	Echo back (do not echo back) every character typed. This shall have the effect of setting (not setting) ECHO in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104864			
104865			
104866		echoe (-echoe)	The ERASE character visually erases (does not erase) the last character in the current line from the display, if possible. This shall have the effect of setting (not setting) ECHOE in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104867			
104868			
104869			
104870		echok (-echok)	Echo (do not echo) NL after KILL character. This shall have the effect of setting (not setting) ECHOK in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104871			
104872			
104873		echonl (-echonl)	Echo (do not echo) NL, even if echo is disabled. This shall have the effect of setting (not setting) ECHONL in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104874			
104875			
104876		noflsh (-noflsh)	Disable (enable) flush after INTR, QUIT, SUSP. This shall have the effect of setting (not setting) NOFLSH in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104877			
104878			
104879		tostop (-tostop)	Send SIGTTOU for background output. This shall have the effect of setting (not setting) TOSTOP in the termios <i>c_lflag</i> field, as defined in XBD Chapter 11 (on page 185).
104880			
104881			

104882

Special Control Character Assignments

104883

<control>-character string

104884

Set *<control>-character* to *string*. If *<control>-character* is one of the character sequences in the first column of the following table, the corresponding XBD Chapter 11 (on page 185) control character from the second column shall be recognized. This has the effect of setting the corresponding element of the **termios** *c_cc* array (see XBD Chapter 13 (on page 205), **<termios.h>**).

104885

104886

104887

104888

104893

104894

104895

104896

104897

104898

104899

104900

If *string* is a single character, the control character shall be set to that character. If *string* is the two-character sequence "^-" or the string *undef*, the control character shall be set to `_POSIX_VDISABLE`, if it is in effect for the device; if `_POSIX_VDISABLE` is not in effect for the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character sequence beginning with circumflex ('^'), and the second character is one of those listed in the "^c" column of the following table, the control character shall be set to the corresponding character value in the Value column of the table.

104901

104915

104916

104917

104918

104919

104920

min number

104921

Set the value of MIN to *number*. MIN is used in non-canonical mode input processing (**icanon**).

104922

104923

time number

104924

Set the value of TIME to *number*. TIME is used in non-canonical mode input processing (**icanon**).

104925

- 104926 **Combination Modes**
- 104927 *saved settings*
- 104928 Set the current terminal characteristics to the saved settings produced by the **-g** option.
- 104929 **evenp** or **parity**
- 104930 Enable **parenb** and **cs7**; disable **parodd**.
- 104931 **oddp**
- 104932 Enable **parenb**, **cs7**, and **parodd**.
- 104933 **-parity**, **-evenp**, or **-oddp**
- 104934 Disable **parenb**, and set **cs8**.
- 104935 XSI **raw** (**-raw** or **cooked**)
- 104936 Enable (disable) raw input and output. Raw mode shall be equivalent to setting:
- 104937 `stty cs8 erase ^- kill ^- intr ^- \`
- 104938 `quit ^- eof ^- eol ^- -post -inpck`
- 104939 **nl** (**-nl**)
- 104940 Disable (enable) **icrnl**. In addition, **-nl** unsets **inlcr** and **igncr**.
- 104941 **ek** Reset ERASE and KILL characters back to system defaults.
- 104942 **sane**
- 104943 Reset all modes to some reasonable, unspecified, values.
- 104944 **STDIN**
- 104945 Although no input is read from standard input, standard input shall be used to get the current
- 104946 terminal I/O characteristics and to set new terminal I/O characteristics.
- 104947 **INPUT FILES**
- 104948 None.
- 104949 **ENVIRONMENT VARIABLES**
- 104950 The following environment variables shall affect the execution of *stty*:
- 104951 **LANG** Provide a default value for the internationalization variables that are unset or null. |
- 104952 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |
- 104953 variables used to determine the values of locale categories.)
- 104954 **LC_ALL** If set to a non-empty string value, override the values of all the other
- 104955 internationalization variables.
- 104956 **LC_CTYPE** This variable determines the locale for the interpretation of sequences of bytes of
- 104957 text data as characters (for example, single-byte as opposed to multi-byte
- 104958 characters in arguments) and which characters are in the class **print**.
- 104959 **LC_MESSAGES**
- 104960 Determine the locale that should be used to affect the format and contents of
- 104961 diagnostic messages written to standard error.
- 104962 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.
- 104963 **ASYNCHRONOUS EVENTS**
- 104964 Default.

104965 **STDOUT**

104966 If operands are specified, no output shall be produced.

104967 If the **-g** option is specified, *stty* shall write to standard output the current settings in a form that
104968 can be used as arguments to another instance of *stty* on the same system.

104969 If the **-a** option is specified, all of the information as described in the OPERANDS section shall
104970 be written to standard output. Unless otherwise specified, this information shall be written as
104971 <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified
104972 number of tokens per line. Additional information may be written.

104973 If no options or operands are specified, an unspecified subset of the information written for the
104974 **-a** option shall be written.

104975 If speed information is written as part of the default output, or if the **-a** option is specified and if
104976 the terminal input speed and output speed are the same, the speed information shall be written
104977 as follows:

104978 "speed %d baud;", <speed>

104979 Otherwise, speeds shall be written as:

104980 "ispeed %d baud; ospeed %d baud;", <ispeed>, <ospeed>

104981 In locales other than the POSIX locale, the word **baud** may be changed to something more
104982 appropriate in those locales.

104983 If control characters are written as part of the default output, or if the **-a** option is specified,
104984 control characters shall be written as:

104985 "%s = %s;", <control-character name>, <value>

104986 where <value> is either the character, or some visual representation of the character if it is non-
104987 printable, or the string *undef* if the character is disabled.

104988 **STDERR**

104989 The standard error shall be used only for diagnostic messages.

104990 **OUTPUT FILES**

104991 None.

104992 **EXTENDED DESCRIPTION**

104993 None.

104994 **EXIT STATUS**

104995 The following exit values shall be returned:

104996 0 The terminal options were read or set successfully.

104997 >0 An error occurred.

104998 **CONSEQUENCES OF ERRORS**

104999 Default.

105000 **APPLICATION USAGE**

105001 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.
105002 For example, a program may:

```
105003 saveterm="$(stty -g)"           # save terminal state
105004 stty (new settings)           # set new state
105005 ...                           # ...
105006 stty $saveterm                # restore terminal state
```

105007 Since the format is unspecified, the saved value is not portable across systems.

105008 Since the `-a` format is so loosely specified, scripts that save and restore terminal settings should
 105009 use the `-g` option.

105010 EXAMPLES

105011 None.

105012 RATIONALE

105013 The original *stty* description was taken directly from System V and reflected the System V
 105014 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

105015 Output modes are specified only for XSI-conformant systems. All implementations are expected
 105016 to provide *stty* operands corresponding to all of the output modes they support.

105017 The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the
 105018 preferred ERASE and KILL characters. As an application programming utility, *stty* can be used
 105019 within shell scripts to alter the terminal settings for the duration of the script.

105020 The **termios** section states that individual disabling of control characters is possible through the
 105021 option `_POSIX_VDISABLE`. If enabled, two conventions currently exist for specifying this:
 105022 System V uses `"^-"`, and BSD uses *undef*. Both are accepted by *stty* in this volume of
 105023 POSIX.1-200x. The other BSD convention of using the letter 'u' was rejected because it conflicts
 105024 with the actual letter 'u', which is an acceptable value for a control character.

105025 Early proposals did not specify the mapping of `"^c"` to control characters because the control
 105026 characters were not specified in the POSIX locale character set description file requirements. The
 105027 control character set is now specified in XBD [Chapter 3](#) (on page 33), so the historical mapping is
 105028 specified. Note that although the mapping corresponds to control-character key assignments on
 105029 many terminals that use the ISO/IEC 646:1991 standard (or ASCII) character encodings, the
 105030 mapping specified here is to the control characters, not their keyboard encodings.

105031 Since **termios** supports separate speeds for input and output, two new options were added to
 105032 specify each distinctly.

105033 Some historical implementations use standard input to get and set terminal characteristics;
 105034 others use standard output. Since input from a login TTY is usually restricted to the owner while
 105035 output to a TTY is frequently open to anyone, using standard input provides fewer chances of
 105036 accidentally (or maliciously) altering the terminal settings of other users. Using standard input
 105037 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard
 105038 input is required by this volume of POSIX.1-200x.

105039 FUTURE DIRECTIONS

105040 None.

nl(-nl).

105055

Issue 7

105056

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105057 **NAME**

105058 tabs — set terminal tabs

105059 **SYNOPSIS**

105060 XSI tabs [-n|-a|-a2|-c|-c2|-c3|-f|-p|-s|-u] [-T type]

105061 tabs [-T type] n[[sep[+]n]...]

105062 **DESCRIPTION**

105063 The *tabs* utility shall display a series of characters that first clears the hardware terminal tab
 105064 settings and then initializes the tab stops at the specified positions and optionally adjusts the
 105065 margin.

105066 The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,
 105067 tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position
 105068 on that line. The maximum number of tab stops allowed is terminal-dependent.

105069 It need not be possible to implement *tabs* on certain terminals. If the terminal type obtained from
 105070 the *TERM* environment variable or *-T* option represents such a terminal, an appropriate
 105071 diagnostic message shall be written to standard error and *tabs* shall exit with a status greater
 105072 than zero.

105073 **OPTIONS**

105074 XSI The *tabs* utility shall conform to XBD Section 12.2 (on page 201), except for various extensions:
 105075 the options *-a2*, *-c2*, and *-c3* are multi-character.

105076 The following options shall be supported:

105077 *-n* Specify repetitive tab stops separated by a uniform number of column positions, *n*,
 105078 where *n* is a single-digit decimal number. The default usage of *tabs* with no
 105079 arguments shall be equivalent to *tabs -8*. When *-0* is used, the tab stops shall be
 105080 cleared and no new ones set.

105081 XSI *-a* 1,10,16,36,72

105082 Assembler, applicable to some mainframes.

105083 XSI *-a2* 1,10,16,40,72

105084 Assembler, applicable to some mainframes.

105085 XSI *-c* 1,8,12,16,20,55

105086 COBOL, normal format.

105087 XSI *-c2* 1,6,10,14,49

105088 COBOL, compact format (columns 1 to 6 omitted).

105089 XSI *-c3* 1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67105090 COBOL compact format (columns 1 to 6 omitted), with more tabs than *-c2*.105091 XSI *-f* 1,7,11,15,19,23

105092 FORTRAN

105093 XSI *-p* 1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61

105094 PL/1

105095 XSI *-s* 1,10,55

105096 SNOBOL

105097 XSI *-u* 1,12,20,44

105098 Assembler, applicable to some mainframes.

105099 -T *type* Indicate the type of terminal. If this option is not supplied and the *TERM* variable
105100 is unset or null, an unspecified default terminal type shall be used. The setting of
105101 *type* shall take precedence over the value in *TERM*.

105102 OPERANDS

105103 The following operand shall be supported:

105104 *n*[[*sep*[+]*n*]...] A single command line argument that consists of one or more tab-stop values (*n*) |
105105 separated by a separator character (*sep*) which is either a comma or a <blank> |
105106 character. The application shall ensure that the tab-stop values are positive decimal |
105107 integers in strictly ascending order. If any tab-stop value (except the first one) is |
105108 preceded by a plus sign, it is taken as an increment to be added to the previous |
105109 value. For example, the tab lists 1,10,20,30 and "1 10 +10 +10" are considered |
105110 to be identical.

105111 STDIN

105112 Not used.

105113 INPUT FILES

105114 None.

105115 ENVIRONMENT VARIABLES

105116 The following environment variables shall affect the execution of *tabs*:

105117 *LANG* Provide a default value for the internationalization variables that are unset or null. |
105118 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
105119 variables used to determine the values of locale categories.)

105120 *LC_ALL* If set to a non-empty string value, override the values of all the other |
105121 internationalization variables.

105122 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as |
105123 characters (for example, single-byte as opposed to multi-byte characters in |
105124 arguments).

105125 *LC_MESSAGES*

105126 Determine the locale that should be used to affect the format and contents of |
105127 diagnostic messages written to standard error.

105128 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

105129 *TERM* Determine the terminal type. If this variable is unset or null, and if the -T option is |
105130 not specified, an unspecified default terminal type shall be used.

105131 ASYNCHRONOUS EVENTS

105132 Default.

105133 STDOUT

105134 If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be |
105135 written to standard output in an unspecified format. If standard output is not a terminal, |
105136 undefined results occur.

105137 STDERR

105138 The standard error shall be used only for diagnostic messages.

105139 OUTPUT FILES

105140 None.

105141 **EXTENDED DESCRIPTION**

105142 None.

105143 **EXIT STATUS**

105144 The following exit values shall be returned:

105145 0 Successful completion.

105146 >0 An error occurred.

105147 **CONSEQUENCES OF ERRORS**

105148 Default.

105149 **APPLICATION USAGE**105150 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

105151 This utility is not recommended for application use.

105152 Some integrated display units might not have escape sequences to set tab stops, but may be set
 105153 by internal system calls. On these terminals, *tabs* works if standard output is directed to the
 105154 terminal; if output is directed to another file, however, *tabs* fails.

105155 **EXAMPLES**

105156 None.

105157 **RATIONALE**

105158 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.
 105159 However, the separate *tabs* utility was retained because it seems more intuitive to use a
 105160 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or
 105161 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary
 105162 tab stops.

105163 The System V *tabs* interface is very complex; the version in this volume of POSIX.1-200x has a
 105164 reduced feature list, but many of the features omitted were restored as part of the XSI option
 105165 even though the supported languages and coding styles are primarily historical.

105166 There was considerable sentiment for specifying only a means of resetting the tabs back to a
 105167 known state—presumably the “standard” of tabs every eight positions. The following features
 105168 were omitted:

- 105169 • Setting tab stops via the first line in a file, using *--file*. Since even the SVID has no
 105170 complete explanation of this feature, it is doubtful that it is in widespread use.

105171 In an early proposal, a *-t tablist* option was added for consistency with *expand*; this was later
 105172 removed when inconsistencies with the historical list of tabs were identified.

105173 Consideration was given to adding a *-p* option that would output the current tab settings so
 105174 that they could be saved and then later restored. This was not accepted because querying the tab
 105175 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be
 105176 supported on a wide range of terminals.

105177 **FUTURE DIRECTIONS**

105178 None.

105179 **SEE ALSO**105180 *expand*, *stty*, *tput*, *unexpand*

105181 XBD Chapter 8 (on page 159), Section 12.2 (on page 201)

105182

CHANGE HISTORY

105183

First released in Issue 2.

105184

Issue 6

105185

This utility is marked as part of the User Portability Utilities option.

105186

The normative text is reworded to avoid use of the term “must” for application requirements.

105187

Issue 7

105188

The *tabs* utility is removed from the User Portability Utilities option. User Portability Utilities is now an option for interactive utilities.

105189

105190

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105191

The SYNOPSIS and OPERANDS sections are updated.

+

105192 **NAME**
 105193 tail — copy the last part of a file

105194 **SYNOPSIS**
 105195 tail [-f] [-c *number*|-n *number*] [*file*]

105196 **DESCRIPTION**
 105197 The *tail* utility shall copy its input file to the standard output beginning at a designated place.
 105198 Copying shall begin at the point in the file indicated by the *-c number* or *-n number* options. The
 105199 option-argument *number* shall be counted in units of lines or bytes, according to the options *-n*
 105200 and *-c*. Both line and byte counts start from 1.

105201 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in
 105202 length. Such a buffer, if any, shall be no smaller than {LINE_MAX}*10 bytes.

105203 **OPTIONS**
 105204 The *tail* utility shall conform to XBD Section 12.2 (on page 201), except that '+' may be
 105205 recognized as an option delimiter as well as '-'. |

105206 The following options shall be supported:

105207 *-c number* The application shall ensure that the *number* option-argument is a decimal integer
 105208 whose sign affects the location in the file, measured in bytes, to begin the copying:

Sign	Copying Starts
+	Relative to the beginning of the file.
-	Relative to the end of the file.
<i>none</i>	Relative to the end of the file.

105213 The application shall ensure that if the sign of the *number* option-argument is '+',
 105214 the *number* option-argument is a positive decimal integer.

105215 The origin for counting shall be 1; that is, *-c +1* represents the first byte of the file,
 105216 *-c -1* the last.

105217 *-f* If the input file is a regular file or if the *file* operand specifies a FIFO, do not
 105218 terminate after the last line of the input file has been copied, but read and copy
 105219 further bytes from the input file when they become available. If no *file* operand is
 105220 specified and standard input is a pipe or FIFO, the *-f* option shall be ignored. If the
 105221 input file is not a FIFO, pipe, or regular file, it is unspecified whether or not the *-f*
 105222 option shall be ignored.

105223 *-n number* This option shall be equivalent to *-c number*, except the starting location in the file
 105224 shall be measured in lines instead of bytes. The origin for counting shall be 1; that
 105225 is, *-n +1* represents the first line of the file, *-n -1* the last.

105226 If neither *-c* nor *-n* is specified, *-n 10* shall be assumed.

105227 **OPERANDS**
 105228 The following operand shall be supported:

105229 *file* A pathname of an input file. If no *file* operands are specified, the standard input
 105230 shall be used.

105231 **STDIN**

105232 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES
105233 section.

105234 **INPUT FILES**

105235 If the `-c` option is specified, the input file can contain arbitrary data; otherwise, the input file
105236 shall be a text file.

105237 **ENVIRONMENT VARIABLES**

105238 The following environment variables shall affect the execution of *tail*:

105239 **LANG** Provide a default value for the internationalization variables that are unset or null. |
105240 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
105241 variables used to determine the values of locale categories.)

105242 **LC_ALL** If set to a non-empty string value, override the values of all the other
105243 internationalization variables.

105244 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
105245 characters (for example, single-byte as opposed to multi-byte characters in
105246 arguments and input files).

105247 **LC_MESSAGES**

105248 Determine the locale that should be used to affect the format and contents of
105249 diagnostic messages written to standard error.

105250 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

105251 **ASYNCHRONOUS EVENTS**

105252 Default.

105253 **STDOUT**

105254 The designated portion of the input file shall be written to standard output.

105255 **STDERR**

105256 The standard error shall be used only for diagnostic messages.

105257 **OUTPUT FILES**

105258 None.

105259 **EXTENDED DESCRIPTION**

105260 None.

105261 **EXIT STATUS**

105262 The following exit values shall be returned:

105263 0 Successful completion.

105264 >0 An error occurred.

105265 **CONSEQUENCES OF ERRORS**

105266 Default.

105267 **APPLICATION USAGE**

105268 The `-c` option should be used with caution when the input is a text file containing multi-byte
105269 characters; it may produce output that does not start on a character boundary.

105270 Although the input file to *tail* can be any type, the results might not be what would be expected
105271 on some character special device files or on file types not described by the System Interfaces
105272 volume of POSIX.1-200x. Since this volume of POSIX.1-200x does not specify the block size used
105273 when doing input, *tail* need not read all of the data from devices that only perform block
105274 transfers.

EXAMPLES

The `-f` option can be used to monitor the growth of a file that is being written by some other process. For example, the command:

```
tail -f fred
```

prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between the time *tail* is initiated and killed. As another example, the command:

```
tail -f -c 15 fred
```

prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between the time *tail* is initiated and killed.

RATIONALE

This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The historical `-b` option was omitted because of the general non-portability of block-sized units of text. The `-c` option historically meant “characters”, but this volume of POSIX.1-200x indicates that it means “bytes”. This was selected to allow reasonable implementations when multi-byte characters are possible; it was not named `-b` to avoid confusion with the historical `-b`.

The origin of counting both lines and bytes is 1, matching all widespread historical implementations. Hence *tail -n +0* is not conforming usage because it attempts to output line zero; but note that *tail -n 0* does conform, and outputs nothing.

Earlier versions of this standard allowed the following forms in the SYNOPSIS:

```
tail -[number][b|c|l][f] [file]
tail +[number][b|c|l][f] [file]
```

These forms are no longer specified by POSIX.1-200x, but may be present in some implementations.

The restriction on the internal buffer is a compromise between the historical System V implementation of 4096 bytes and the BSD 32768 bytes.

The `-f` option has been implemented as a loop that sleeps for 1 second and copies any bytes that are available. This is sufficient, but if more efficient methods of determining when new data are available are developed, implementations are encouraged to use them.

Historical documentation indicates that *tail* ignores the `-f` option if the input file is a pipe (pipe and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System V-based systems, this was true when input was taken from standard input, but it did not ignore the `-f` flag if a FIFO was named as the *file* operand. Since the `-f` option is not useful on pipes and all historical implementations ignore `-f` if no *file* operand is specified and standard input is a pipe, this volume of POSIX.1-200x requires this behavior. However, since the `-f` option is useful on a FIFO, this volume of POSIX.1-200x also requires that if a FIFO is named, the `-f` option shall not be ignored. Earlier versions of this standard did not state any requirement for the case where no *file* operand is specified and standard input is a FIFO. The standard has been updated to reflect current practice which is to treat this case the same as a pipe on standard input. Although historical behavior does not ignore the `-f` option for other file types, this is unspecified so that implementations are allowed to ignore the `-f` option if it is known that the file cannot be extended.

This was changed to the current form based on comments noting that `-c` was almost never used without specifying a number and that there was no need to specify `-l` if `-n number` was given.

105318 **FUTURE DIRECTIONS**

105319 None.

105320 **SEE ALSO**105321 *head*105322 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +105323 **CHANGE HISTORY**

105324 First released in Issue 2.

105325 **Issue 6**

105326 The obsolescent SYNOPSIS lines and associated text are removed.

105327 The normative text is reworded to avoid use of the term “must” for application requirements.

105328 **Issue 7**105329 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized
105330 as an option delimiter in the OPTIONS section.105331 Austin Group Interpretation 1003.1-2001 #100 is applied, adding the requirement on applications
105332 that if the sign of the option-argument *number* is ‘+’, the *number* option-argument is a positive
105333 decimal integer.

105334 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

105335 SD5-XCU-ERN-114 is applied, updating the OPTIONS section (the -f option).

105336 **NAME**

105337 talk — talk to another user

105338 **SYNOPSIS**105339 UP `talk address [terminal]`105340 **DESCRIPTION**105341 The *talk* utility is a two-way, screen-oriented communication program.105342 When first invoked, *talk* shall send a message similar to:

105343 Message from <unspecified string>
 105344 talk: connection requested by *your_address*
 105345 talk: respond with: talk *your_address*

105346 to the specified *address*. At this point, the recipient of the message can reply by typing:105347 `talk your_address`

105348 Once communication is established, the two parties can type simultaneously, with their output
 105349 displayed in separate regions of the screen. Characters shall be processed as follows:

- 105350 • Typing the alert character shall alert the recipient's terminal.
- 105351 • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 105352 • Typing the erase and kill characters shall affect the sender's terminal in the manner
 105353 described by the **termios** interface in XBD [Chapter 11](#) (on page 185).
- 105354 • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the
 105355 *talk* session has been terminated on one side, the other side of the *talk* session shall be
 105356 notified that the *talk* session has been terminated and shall be able to do nothing except
 105357 exit.
- 105358 • Typing characters from *LC_CTYPE* classifications **print** or **space** shall cause those
 105359 characters to be sent to the recipient's terminal.
- 105360 • When and only when the *stty iexten* local mode is enabled, the existence and processing of
 105361 additional special control characters and multi-byte or single-byte functions shall be
 105362 implementation-defined.
- 105363 • Typing other non-printable characters shall cause implementation-defined sequences of
 105364 printable characters to be sent to the recipient's terminal.

105365 Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.
 105366 However, a user's privilege may further constrain the domain of accessibility of other users'
 105367 terminals. The *talk* utility shall fail when the user lacks the appropriate privileges to perform the
 105368 requested action.

105369 Certain block-mode terminals do not have all the capabilities necessary to support the
 105370 simultaneous exchange of messages required for *talk*. When this type of exchange cannot be
 105371 supported on such terminals, the implementation may support an exchange with reduced levels
 105372 of simultaneous interaction or it may report an error describing the terminal-related deficiency.

105373 **OPTIONS**

105374 None.

105375 **OPERANDS**

105376 The following operands shall be supported:

105377 *address* The recipient of the *talk* session. One form of *address* is the *<user name>*, as returned
 105378 by the *who* utility. Other address formats and how they are handled are
 105379 unspecified.

105380 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to
 105381 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message
 105382 shall be displayed on one or more accessible terminals in use by the recipient. The
 105383 format of *terminal* shall be the same as that returned by the *who* utility.

105384 **STDIN**

105385 Characters read from standard input shall be copied to the recipient's terminal in an unspecified
 105386 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a
 105387 non-zero status.

105388 **INPUT FILES**

105389 None.

105390 **ENVIRONMENT VARIABLES**105391 The following environment variables shall affect the execution of *talk*:

105392 *LANG* Provide a default value for the internationalization variables that are unset or null.
 105393 (See XBD Section 8.2 (on page 160) for the precedence of internationalization
 105394 variables used to determine the values of locale categories.)

105395 *LC_ALL* If set to a non-empty string value, override the values of all the other
 105396 internationalization variables.

105397 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 105398 characters (for example, single-byte as opposed to multi-byte characters in
 105399 arguments and input files). If the recipient's locale does not use an *LC_CTYPE*
 105400 equivalent to the sender's, the results are undefined.

105401 *LC_MESSAGES*

105402 Determine the locale that should be used to affect the format and contents of
 105403 diagnostic messages written to standard error and informative messages written to
 105404 standard output.

105405 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

105406 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,
 105407 an unspecified default terminal type shall be used.

105408 **ASYNCHRONOUS EVENTS**

105409 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero
 105410 status. It shall take the standard action for all other signals.

105411 **STDOUT**

105412 If standard output is a terminal, characters copied from the recipient's standard input may be
 105413 written to standard output. Standard output also may be used for diagnostic messages. If
 105414 standard output is not a terminal, *talk* shall exit with a non-zero status.

105415 **STDERR**

105416 None.

105417 **OUTPUT FILES**

105418 None.

105419 **EXTENDED DESCRIPTION**

105420 None.

105421 **EXIT STATUS**

105422 The following exit values shall be returned:

105423 0 Successful completion.

105424 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.105425 **CONSEQUENCES OF ERRORS**

105426 Default.

105427 **APPLICATION USAGE**

105428 Because the handling of non-printable, non-`<space>`s is tied to the *stty* description of **iexten**,
 105429 implementation extensions within the terminal driver can be accessed. For example, some
 105430 implementations provide line editing functions with certain control character sequences.

105431 **EXAMPLES**

105432 None.

105433 **RATIONALE**

105434 The *write* utility was included in this volume of POSIX.1-200x since it can be implemented on all
 105435 terminal types. The *talk* utility, which cannot be implemented on certain terminals, was
 105436 considered to be a “better” communications interface. Both of these programs are in widespread
 105437 use on historical implementations. Therefore, both utilities have been specified.

105438 All references to networking abilities (*talking* to a user on another system) were removed as
 105439 being outside the scope of this volume of POSIX.1-200x.

105440 Historical BSD and System V versions of *talk* terminate both of the conversations when either
 105441 user breaks out of the session. This can lead to adverse consequences if a user unwittingly
 105442 continues to enter text that is interpreted by the shell when the other terminates the session.
 105443 Therefore, the version of *talk* specified by this volume of POSIX.1-200x requires both users to
 105444 terminate their end of the session explicitly.

105445 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 105446 • The original “Message from *<unspecified string>* ...” message sent to the terminal of the
 105447 recipient cannot be internationalized because the environment of the recipient is as yet
 105448 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 105449 • Subsequent communication between the two parties cannot be internationalized because
 105450 the two parties may specify different languages in their environment (and non-portable
 105451 characters cannot be mapped from one language to another).
- 105452 • Neither party can be required to communicate in a language other than C and/or the one
 105453 specified by their environment because unavailable terminal hardware support (for
 105454 example, fonts) may be required.

105455 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*
 105456 implementations actually use standard output to write to the terminal, but this volume of
 105457 POSIX.1-200x does not require that to be the case.

105458 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*
 105459 require that they all use or accept the same format.

105460 The handling of non-printable characters is partially implementation-defined because the details
 105461 of mapping them to printable sequences is not needed by the user. Historical implementations,
 105462 for security reasons, disallow the transmission of non-printable characters that may send
 105463 commands to the other terminal.

- 105464 **FUTURE DIRECTIONS**
- 105465 None.

- 105472 This utility is marked as part of the User Portability Utilities option.

105473 **NAME**

105474 tee — duplicate standard input

105475 **SYNOPSIS**

105476 tee [-ai] [*file...*]

105477 **DESCRIPTION**

105478 The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.

105479 The *tee* utility shall not buffer output.

105480 If the **-a** option is not specified, output files shall be written (see [Section 1.1.1.4](#) (on page 2228)).

105481 **OPTIONS**

105482 The *tee* utility shall conform to XBD [Section 12.2](#) (on page 201).

105483 The following options shall be supported:

105484 **-a** Append the output to the files.

105485 **-i** Ignore the SIGINT signal.

105486 **OPERANDS**

105487 The following operands shall be supported:

105488 *file* A pathname of an output file. Processing of at least 13 *file* operands shall be

105489 supported.

105490 **STDIN**

105491 The standard input can be of any type.

105492 **INPUT FILES**

105493 None.

105494 **ENVIRONMENT VARIABLES**

105495 The following environment variables shall affect the execution of *tee*:

105496 **LANG** Provide a default value for the internationalization variables that are unset or null. |

105497 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |

105498 variables used to determine the values of locale categories.)

105499 **LC_ALL** If set to a non-empty string value, override the values of all the other

105500 internationalization variables.

105501 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as

105502 characters (for example, single-byte as opposed to multi-byte characters in

105503 arguments).

105504 **LC_MESSAGES**

105505 Determine the locale that should be used to affect the format and contents of

105506 diagnostic messages written to standard error.

105507 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC_MESSAGES**.

105508 **ASYNCHRONOUS EVENTS**

105509 Default, except that if the **-i** option was specified, SIGINT shall be ignored.

105510 **STDOUT**

105511 The standard output shall be a copy of the standard input.

105512 **STDERR**

105513 The standard error shall be used only for diagnostic messages.

105514 **OUTPUT FILES**105515 If any *file* operands are specified, the standard input shall be copied to each named file.105516 **EXTENDED DESCRIPTION**

105517 None.

105518 **EXIT STATUS**

105519 The following exit values shall be returned:

105520 0 The standard input was successfully copied to all output files.

105521 >0 An error occurred.

105522 **CONSEQUENCES OF ERRORS**105523 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*
105524 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,
105525 the default actions specified in [Section 1.4](#) (on page 2235) apply.105526 **APPLICATION USAGE**105527 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.105528 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.105529 **EXAMPLES**

105530 Save an unsorted intermediate form of the data in a pipeline:

105531

```
... | tee unsorted | sort > sorted
```

105532 **RATIONALE**105533 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or
105534 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.105535 It should be noted that early versions of BSD ignore any invalid options and accept a single '-'
105536 as an alternative to -i. They also print a message if unable to open a file:105537

```
"tee: cannot access %s\n", <pathname>
```

105538 Historical implementations ignore write errors. This is explicitly not permitted by this volume of
105539 POSIX.1-200x.105540 Some historical implementations use O_APPEND when providing append mode; others use the
105541 *lseek()* function to seek to the end-of-file after opening the file without O_APPEND. This volume
105542 of POSIX.1-200x requires functionality equivalent to using O_APPEND; see [Section 1.1.1.4](#) (on
105543 page 2228).105544 **FUTURE DIRECTIONS**

105545 None.

105546 **SEE ALSO**105547 [Chapter 1](#) (on page 2227), *cat*105548 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)105549 XSH *lseek()*105550 **CHANGE HISTORY**

105556 **NAME**105557 `test` — evaluate expression105558 **SYNOPSIS**105559 `test` [*expression*]105560 [[*expression*]]105561 **DESCRIPTION**

105562 The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit
 105563 status. An exit status of zero indicates that the expression evaluated as true and an exit status of
 105564 1 indicates that the expression evaluated as false.

105565 In the second form of the utility, which uses "[]" rather than *test*, the application shall ensure
 105566 that the square brackets are separate arguments.

105567 **OPTIONS**

105568 The *test* utility shall not recognize the "--" argument in the manner specified by Guideline 10 in
 105569 XBD Section 12.2 (on page 201).

105570 No options shall be supported.

105571 **OPERANDS**

105572 The application shall ensure that all operators and elements of primaries are presented as
 105573 separate arguments to the *test* utility.

105574 The following primaries can be used to construct *expression*:

105575 **-b** *pathname* True if *pathname* resolves to a file that exists and is a block special file. False if
 105576 *pathname* cannot be resolved, or if *pathname* resolves to a file that exists but is not a
 105577 block special file.

105578 **-c** *pathname* True if *pathname* resolves to a file that exists and is a character special file. False if
 105579 *pathname* cannot be resolved, or if *pathname* resolves to a file that exists but is not a
 105580 character special file.

105581 **-d** *pathname* True if *pathname* resolves to a file that exists and is a directory. False if *pathname*
 105582 cannot be resolved, or if *pathname* resolves to a file that exists but is not a directory.

105583 **-e** *pathname* True if *pathname* resolves to a file that exists. False if *pathname* cannot be resolved.

105584 **-f** *pathname* True if *pathname* resolves to a file that exists and is a regular file. False if *pathname*
 105585 cannot be resolved, or if *pathname* resolves to a file that exists but is not a regular
 105586 file.

105587 **-g** *pathname* True if *pathname* resolves to a file that exists and has its set-group-ID flag set. False
 105588 if *pathname* cannot be resolved, or if *pathname* resolves to a file that exists but does
 105589 not have its set-group-ID flag set.

105590 **-h** *pathname* True if *pathname* resolves to a file that exists and is a symbolic link. False if
 105591 *pathname* cannot be resolved, or if *pathname* resolves to a file that exists but is not a
 105592 symbolic link. If the final component of *pathname* is a symlink, that symlink is not
 105593 followed.

105594 **-L** *pathname* True if *pathname* resolves to a file that exists and is a symbolic link. False if
 105595 *pathname* cannot be resolved, or if *pathname* resolves to a file that exists but is not a
 105596 symbolic link. If the final component of *pathname* is a symlink, that symlink is not
 105597 followed.

105598	-n <i>string</i>	True if the length of <i>string</i> is non-zero; otherwise, false.
105599	-p <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and is a FIFO. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file that exists but is not a FIFO.
105600		
105601	-r <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and for which permission to read from the file will be granted, as defined in Section 1.1.1.4 (on page 2228). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file for which permission to read from the file will not be granted.
105602		
105603		
105604		
105605	-S <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and is a socket. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file that exists but is not a socket.
105606		
105607	-s <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and has a size greater than zero. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file that exists but does not have a size greater than zero.
105608		
105609		
105610	-t <i>file_descriptor</i>	
105611		True if file descriptor number <i>file_descriptor</i> is open and is associated with a terminal. False if <i>file_descriptor</i> is not a valid file descriptor number, or if file descriptor number <i>file_descriptor</i> is not open, or if it is open but is not associated with a terminal.
105612		
105613		
105614		
105615	-u <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and has its set-user-ID flag set. False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file that exists but does not have its set-user-ID flag set.
105616		
105617		
105618	-w <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and for which permission to write to the file will be granted, as defined in Section 1.1.1.4 (on page 2228). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file for which permission to write to the file will not be granted.
105619		
105620		
105621		
105622	-x <i>pathname</i>	True if <i>pathname</i> resolves to a file that exists and for which permission to execute the file (or search it, if it is a directory) will be granted, as defined in Section 1.1.1.4 (on page 2228). False if <i>pathname</i> cannot be resolved, or if <i>pathname</i> resolves to a file for which permission to execute (or search) the file will not be granted.
105623		
105624		
105625		
105626	-z <i>string</i>	True if the length of string <i>string</i> is zero; otherwise, false.
105627	<i>string</i>	True if the string <i>string</i> is not the null string; otherwise, false.
105628	<i>s1 = s2</i>	True if the strings <i>s1</i> and <i>s2</i> are identical; otherwise, false.
105629	<i>s1 != s2</i>	True if the strings <i>s1</i> and <i>s2</i> are not identical; otherwise, false.
105630	<i>n1 -eq n2</i>	True if the integers <i>n1</i> and <i>n2</i> are algebraically equal; otherwise, false.
105631	<i>n1 -ne n2</i>	True if the integers <i>n1</i> and <i>n2</i> are not algebraically equal; otherwise, false.
105632	<i>n1 -gt n2</i>	True if the integer <i>n1</i> is algebraically greater than the integer <i>n2</i> ; otherwise, false.
105633	<i>n1 -ge n2</i>	True if the integer <i>n1</i> is algebraically greater than or equal to the integer <i>n2</i> ; otherwise, false.
105634		
105635	<i>n1 -lt n2</i>	True if the integer <i>n1</i> is algebraically less than the integer <i>n2</i> ; otherwise, false.
105636	<i>n1 -le n2</i>	True if the integer <i>n1</i> is algebraically less than or equal to the integer <i>n2</i> ; otherwise, false.
105637		
105638	OB XSI expression1 -a expression2	
105639		True if both <i>expression1</i> and <i>expression2</i> are true; otherwise, false. The -a binary primary is left associative. It has a higher precedence than -o .
105640		

- 105641 OB XSI `expression1 -o expression2`
 105642 True if either *expression1* or *expression2* is true; otherwise, false. The `-o` binary
 105643 primary is left associative.
- 105644 With the exception of the `-h file` and `-L file` primaries, if a *file* argument is a symbolic link, *test*
 105645 shall evaluate the expression by resolving the symbolic link and using the file referenced by the
 105646 link.
- 105647 These primaries can be combined with the following operators:
- 105648 `! expression` True if *expression* is false. False if *expression* is true.
- 105649 OB XSI `(expression)` True if *expression* is true. False if *expression* is false. The parentheses can be used to
 105650 alter the normal precedence and associativity.
- 105651 The primaries with two elements of the form: -
 105652 `-primary_operator primary_operand`
- 105653 are known as *unary primaries*. The primaries with three elements in either of the two forms: -
 105654 `primary_operand -primary_operator primary_operand`
 105655 `primary_operand primary_operator primary_operand`
- 105656 are known as *binary primaries*. Additional implementation-defined operators and
 105657 *primary_operators* may be provided by implementations. They shall be of the form `-operator`
 105658 where the first character of *operator* is not a digit.
- 105659 The algorithm for determining the precedence of the operators and the return value that shall be
 105660 generated is based on the number of arguments presented to *test*. (However, when using the
 105661 "`[. . .]`" form, the right-bracket final argument shall not be counted in this algorithm.)
- 105662 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:
- 105663 0 arguments: Exit false (1).
- 105664 1 argument: Exit true (0) if \$1 is not null; otherwise, exit false.
- 105665 2 arguments:
- If \$1 is '!', exit true if \$2 is null, false if \$2 is not null.
 - If \$1 is a unary primary, exit true if the unary test is true, false if the unary test is false.
 - Otherwise, produce unspecified results.
- 105666
- 105667
- 105668
- 105669 3 arguments:
- If \$2 is a binary primary, perform the binary test of \$1 and \$3.
 - If \$1 is '!', negate the two-argument test of \$2 and \$3.
 - If \$1 is '(', and \$3 is ')', perform the unary test of \$2. On systems that do not support the XSI option, the results are unspecified if \$1 is ' (' and \$3 is ') '.
 - Otherwise, produce unspecified results.
- 105670
- 105671 OB XSI
- 105672
- 105673
- 105674
- 105675 4 arguments:
- If \$1 is '!', negate the three-argument test of \$2, \$3, and \$4.
 - If \$1 is ' (' and \$4 is ') ', perform the two-argument test of \$2 and \$3. On systems that do not support the XSI option, the results are unspecified if \$1 is ' (' and \$4 is ') '.
 - Otherwise, the results are unspecified.
- 105676 OB XSI
- 105677
- 105678
- 105679
- 105680 >4 arguments: The results are unspecified.

test

Utilities

105681 OB XSI On XSI-conformant systems, combinations of primaries and operators shall be
 105682 evaluated using the precedence and associativity rules described previously.
 105683 In addition, the string comparison binary primaries '=' and '! =' shall have
 105684 a higher precedence than any unary primary.

105685 **STDIN**

105686 Not used.

105687 **INPUT FILES**

105688 None.

105689 **ENVIRONMENT VARIABLES**105690 The following environment variables shall affect the execution of *test*:

105691 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 105692 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 105693 variables used to determine the values of locale categories.)

105694 *LC_ALL* If set to a non-empty string value, override the values of all the other
 105695 internationalization variables.

105696 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 105697 characters (for example, single-byte as opposed to multi-byte characters in
 105698 arguments).

105699 *LC_MESSAGES*

105700 Determine the locale that should be used to affect the format and contents of
 105701 diagnostic messages written to standard error.

105702 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

105703 **ASYNCHRONOUS EVENTS**

105704 Default.

105705 **STDOUT**

105706 Not used.

105707 **STDERR**

105708 The standard error shall be used only for diagnostic messages.

105709 **OUTPUT FILES**

105710 None.

105711 **EXTENDED DESCRIPTION**

105712 None.

105713 **EXIT STATUS**

105714 The following exit values shall be returned:

105715 0 *expression* evaluated to true.105716 1 *expression* evaluated to false or *expression* was missing.

105717 >1 An error occurred.

105718 **CONSEQUENCES OF ERRORS**

105719 Default.

APPLICATION USAGE

The XSI extensions specifying the `-a` and `-o` binary primaries and the `'(' and ')'` operators have been marked obsolescent. (Many expressions using them are ambiguously defined by the grammar depending on the specific expressions being evaluated.) Scripts using these expressions should be converted to the forms given below. Even though many implementations will continue to support these obsolescent forms, scripts should be extremely careful when dealing with user-supplied input that could be confused with these and other primaries and operators. Unless the application developer knows all the cases that produce input to the script, invocations like:

```
test "$1" -a "$2"
```

should be written as:

```
test "$1" && test "$2"
```

to avoid problems if a user supplied values such as \$1 set to `'!'` and \$2 set to the null string. That is, in cases where maximal portability is of concern, replace:

```
test expr1 -a expr2
```

with:

```
test expr1 && test expr2
```

and replace:

```
test expr1 -o expr2
```

with:

```
test expr1 || test expr2
```

but note that, in *test*, `-a` has higher precedence than `-o` while `"&&"` and `"||"` have equal precedence in the shell.

Parentheses or braces can be used in the shell command language to effect grouping.

Parentheses must be escaped when using *sh*; for example:

```
test \( expr1 -a expr2 \) -o expr3
```

This command is not always portable even on XSI-conformant systems depending on the expressions specified by *expr1*, *expr2*, and *expr3*. The following form can be used instead:

```
( test expr1 && test expr2 ) || test expr3
```

The two commands:

```
test "$1"
test ! "$1"
```

could not be used reliably on some historical systems. Unexpected results would occur if such a *string* expression were used and \$1 expanded to `'!'`, `'('`, or a known unary primary. Better constructs are:

```
test -n "$1"
test -z "$1"
```

respectively.

Historical systems have also been unreliable given the common construct:

```
test "$response" = "expected string"
```

One of the following is a more reliable form:

```
105761 test "X$response" = "Xexpected string"
105762 test "expected string" = "$response"
```

105763 Note that the second form assumes that *expected string* could not be confused with any unary
 105764 primary. If *expected string* starts with '-', '(', '!', or even '=', the first form should be used
 105765 instead. Using the preceding rules without the XSI marked extensions, any of the three
 105766 comparison forms is reliable, given any input. (However, note that the strings are quoted in all
 105767 cases.)

105768 Because the string comparison binary primaries, '=' and '!=', have a higher precedence than
 105769 any unary primary in the greater than 4 argument case, unexpected results can occur if
 105770 arguments are not properly prepared. For example, in:

```
105771 test -d $1 -o -d $2
```

105772 If \$1 evaluates to a possible directory name of '=', the first three arguments are considered a
 105773 string comparison, which shall cause a syntax error when the second -d is encountered. One of
 105774 the following forms prevents this; the second is preferred:

```
105775 test \( -d "$1" \) -o \( -d "$2" \)
105776 test -d "$1" || test -d "$2"
```

105777 Also in the greater than 4 argument case:

```
105778 test "$1" = "bat" -a "$2" = "ball"
```

105779 syntax errors occur if \$1 evaluates to '(' or '!'. One of the following forms prevents this; the
 105780 third is preferred:

```
105781 test "X$1" = "Xbat" -a "X$2" = "Xball"
105782 test "$1" = "bat" && test "$2" = "ball"
105783 test "X$1" = "Xbat" && test "X$2" = "Xball"
```

105784 EXAMPLES

- 105785 1. Exit if there are not two or three arguments (two variations):

```
105786 if [ $# -ne 2 ] && [ $# -ne 3 ]; then exit 1; fi
105787 if [ $# -lt 2 ] || [ $# -gt 3 ]; then exit 1; fi
```

- 105788 2. Perform a *mkdir* if a directory does not exist:

```
105789 test ! -d tempdir && mkdir tempdir
```

- 105790 3. Wait for a file to become non-readable:

```
105791 while test -r thefile
105792 do
105793     sleep 30
105794 done
105795 echo "thefile" is no longer readable'
```

- 105796 4. Perform a command if the argument is one of three strings (two variations):

```
105797 if [ "$1" = "pear" ] || [ "$1" = "grape" ] || [ "$1" = "apple" ]
105798 then
105799     command
105800 fi
105801 case "$1" in
105802     pear|grape|apple) command ;;
105803 esac
```

RATIONALE

The KornShell-derived conditional command (double bracket `[[]]`) was removed from the shell command language description in an early proposal. Objections were raised that the real problem is misuse of the `test` command (`I`), and putting it into the shell is the wrong way to fix the problem. Instead, proper documentation and a new shell reserved word (`!`) are sufficient.

Tests that require multiple `test` operations can be done at the shell level using individual invocations of the `test` command and shell logicals, rather than using the error-prone `-o` flag of `test`.

XSI-conformant systems support more than four arguments.

XSI-conformant systems support the combining of primaries with the following constructs:

expression1 `-a` *expression2*

True if both *expression1* and *expression2* are true.

expression1 `-o` *expression2*

True if at least one of *expression1* and *expression2* are true.

(*expression*)

True if *expression* is true.

In evaluating these more complex combined expressions, the following precedence rules are used:

- The unary primaries have higher precedence than the algebraic binary primaries.
- The unary primaries have lower precedence than the string binary primaries.
- The unary and binary primaries have higher precedence than the unary *string* primary.
- The `!` operator has higher precedence than the `-a` operator, and the `-a` operator has higher precedence than the `-o` operator.
- The `-a` and `-o` operators are left associative.
- The parentheses can be used to alter the normal precedence and associativity.

The BSD and System V versions of `-f` are not the same. The BSD definition was:

`-f file` True if *file* exists and is not a directory.

The SVID version (true if the file exists and is a regular file) was chosen for this volume of POSIX.1-200x because its use is consistent with the `-b`, `-c`, `-d`, and `-p` operands (*file* exists and is a specific file type).

The `-e` primary, possessing similar functionality to that provided by the C shell, was added because it provides the only way for a shell script to find out if a file exists without trying to open the file. Since implementations are allowed to add additional file types, a portable script cannot use:

```
test -b foo -o -c foo -o -d foo -o -f foo -o -p foo
```

to find out if `foo` is an existing file. On historical BSD systems, the existence of a file could be determined by:

```
test -f foo -o -d foo
```

but there was no easy way to determine that an existing file was a regular file. An early proposal used the KornShell `-a` primary (with the same meaning), but this was changed to `-e` because there were concerns about the high probability of humans confusing the `-a` primary with the `-a` binary operator.

The following options were not included in this volume of POSIX.1-200x, although they are

105847 provided by some implementations. These operands should not be used by new
105848 implementations for other purposes:

105849 **-k file** True if *file* exists and its sticky bit is set.

105850 **-C file** True if *file* is a contiguous file.

105851 **-V file** True if *file* is a version file.

105852 The following option was not included because it was undocumented in most implementations,
105853 has been removed from some implementations (including System V), and the functionality is
105854 provided by the shell (see [Section 2.6.2](#) (on page 2254).

105855 **-l string** The length of the string *string*.

105856 The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not
105857 provide them. The **-k** operand is derived from System V; historical BSD does not provide it.

105858 On historical BSD systems, *test -w directory* always returned false because *test* tried to open the
105859 directory for writing, which always fails.

105860 Some additional primaries newly invented or from the KornShell appeared in an early proposal
105861 as part of the conditional command (`[[]]`): *s1 > s2*, *s1 < s2*, *str = pattern*, *str != pattern*, *f1 -nt f2*, *f1*
105862 *-ot f2*, and *f1 -ef f2*. They were not carried forward into the *test* utility when the conditional
105863 command was removed from the shell because they have not been included in the *test* utility
105864 built into historical implementations of the *sh* utility.

105865 The **-t file_descriptor** primary is shown with a mandatory argument because the grammar is
105866 ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,
105867 providing a default of 1.

105868 FUTURE DIRECTIONS

105869 None.

105870 SEE ALSO

105871 [Section 1.1.1.4](#) (on page 2228), *find*

105872 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

105873 CHANGE HISTORY

105874 First released in Issue 2.

105875 Issue 5

105876 The FUTURE DIRECTIONS section is added.

105877 Issue 6

105878 The **-h** operand is added for symbolic links, and access permission requirements are clarified for
105879 the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.

105880 The normative text is reworded to avoid use of the term “must” for application requirements.

105881 The **-L** and **-S** operands are added for symbolic links and sockets.

105882 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/38 is applied, adding XSI margin
105883 marking and shading to a line in the OPERANDS section referring to the use of parentheses as
105884 arguments to the *test* utility.

105885 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/30 is applied, rewording the existence
105886 primaries for the *test* utility.

105887

Issue 7

105888

Austin Group Interpretation 1003.1-2001 #107 is applied.

105889 **NAME**105890 `time` — `time` a simple command105891 **SYNOPSIS**105892 `time [-p] utility [argument...]`105893 **DESCRIPTION**105894 The `time` utility shall invoke the utility named by the `utility` operand with arguments supplied as
105895 the `argument` operands and write a message to standard error that lists timing statistics for the
105896 utility. The message shall include the following information:

- 105897 • The elapsed (real) time between invocation of `utility` and its termination.
- 105898 • The User CPU time, equivalent to the sum of the `tms_utime` and `tms_cutime` fields returned
105899 by the `times()` function defined in the System Interfaces volume of POSIX.1-200x for the
105900 process in which `utility` is executed.
- 105901 • The System CPU time, equivalent to the sum of the `tms_stime` and `tms_cstime` fields
105902 returned by the `times()` function for the process in which `utility` is executed.

105903 The precision of the timing shall be no less than the granularity defined for the size of the clock
105904 tick unit on the system, but the results shall be reported in terms of standard time units (for
105905 example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

105906 When `time` is used as part of a pipeline, the times reported are unspecified, except when it is the
105907 sole command within a grouping command (see [Section 2.9.4.1](#), on page 2268) in that pipeline.
105908 For example, the commands on the left are unspecified; those on the right report on utilities `a`
105909 and `c`, respectively:

```
105910 time a | b | c      { time a; } | b | c
105911 a | b | time c     a | b | (time c)
```

105912 **OPTIONS**105913 The `time` utility shall conform to XBD [Section 12.2](#) (on page 201).

105914 The following option shall be supported:

105915 `-p` Write the timing output to standard error in the format shown in the `STDERR`
105916 section.

105917 **OPERANDS**

105918 The following operands shall be supported:

105919 `utility` The name of a utility that is to be invoked. If the `utility` operand names any of the
105920 special built-in utilities in [Section 2.14](#) (on page 2280), the results are undefined.

105921 `argument` Any string to be supplied as an argument when invoking the utility named by the
105922 `utility` operand.

105923 **STDIN**

105924 Not used.

105925 **INPUT FILES**

105926 None.

105927 **ENVIRONMENT VARIABLES**105928 The following environment variables shall affect the execution of `time`:

105929 `LANG` Provide a default value for the internationalization variables that are unset or null.
105930 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
105931 variables used to determine the values of locale categories.)

105932		<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
105933			
105934		<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments).
105935			
105936			
105937		<i>LC_MESSAGES</i>	
105938			Determine the locale that should be used to affect the format and contents of diagnostic and informative messages written to standard error.
105939			
105940		<i>LC_NUMERIC</i>	
105941			Determine the locale for numeric formatting.
105942	XSI	<i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
105943		<i>PATH</i>	Determine the search path that shall be used to locate the utility to be invoked; see XBD Chapter 8 (on page 159).
105944			

ASYNCHRONOUS EVENTS

Default.

STDOUT

Not used.

STDERR

The standard error shall be used to write the timing statistics. If **-p** is specified, the following format shall be used in the POSIX locale:

```
"real %f\nuser %f\nsys %f\n", <real seconds>, <user seconds>,
  <system seconds>
```

where each floating-point number shall be expressed in seconds. The precision used may be less than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits shall follow the radix character). The number of digits following the radix character shall be no less than one, even if this always results in a trailing zero. The implementation may append white space and additional information following the format shown here.

OUTPUT FILES

None.

EXTENDED DESCRIPTION

None.

EXIT STATUS

If the *utility* utility is invoked, the exit status of *time* shall be the exit status of *utility*; otherwise, the *time* utility shall exit with one of the following values:

- 1-125 An error occurred in the *time* utility.
- 126 The utility specified by *utility* was found but could not be invoked.
- 127 The utility specified by *utility* could not be found.

CONSEQUENCES OF ERRORS

Default.

APPLICATION USAGE

The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an error occurs so that applications can distinguish “failure to find a utility” from “invoked utility exited with an error indication”. The value 127 was chosen because it is not commonly used for other meanings; most utilities use small values for “normal error conditions” and the values above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen in a similar manner to indicate that the utility could be found, but not invoked. Some scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for any other reason.

EXAMPLES

It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by placing pipelines and command lists in a single file; this file can then be invoked as a utility, and the *time* applies to everything in the file.

Alternatively, the following command can be used to apply *time* to a complex command:

```
time sh -c 'complex-command-line'
```

RATIONALE

When the *time* utility was originally proposed to be included in the ISO POSIX-2:1993 standard, questions were raised about its suitability for inclusion on the grounds that it was not useful for conforming applications, specifically:

- The underlying CPU definitions from the System Interfaces volume of POSIX.1-200x are vague, so the numeric output could not be compared accurately between systems or even between invocations.
- The creation of portable benchmark programs was outside the scope this volume of POSIX.1-200x.

However, *time* does fit in the scope of user portability. Human judgement can be applied to the analysis of the output, and it could be very useful in hands-on debugging of applications or in providing subjective measures of system performance. Hence it has been included in this volume of POSIX.1-200x.

The default output format has been left unspecified because historical implementations differ greatly in their style of depicting this numeric output. The `-p` option was invented to provide scripts with a common means of obtaining this information.

In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather than just a simple command. The POSIX definition has been worded to allow this implementation. Consideration was given to invalidating this approach because of the historical model from the C shell and System V shell. However, since the System V *time* utility historically has not produced accurate results in pipeline timing (because the constituent processes are not all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to break historical KornShell usage.

The term *utility* is used, rather than *command*, to highlight the fact that shell compound commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility* includes user application programs and shell scripts, not just the standard utilities.

FUTURE DIRECTIONS

None.

106022 First released in Issue 2.

106023 **Issue 6**

106024 This utility is marked as part of the User Portability Utilities option.

106025 **Issue 7**106026 The *time* utility is moved from the User Portability Utilities option to the Base. User Portability
106027 Utilities is now an option for interactive utilities.

106028 SD5-XCU-ERN-115 is applied, updating the example in the DESCRIPTION.

106029 **NAME**
 106030 touch — change file access and modification times

106031 **SYNOPSIS**
 106032 touch [-acm] [-r *ref_file*|-t *time*] *file*...

106033 **DESCRIPTION**
 106034 The *touch* utility shall change the last data modification timestamps, the last data access
 106035 timestamps, or both.

106036 The time used can be specified by the **-t *time*** option-argument, the corresponding time fields of
 106037 the file referenced by the **-r *ref_file*** option-argument, or the *date_time* operand, as specified in the
 106038 following sections. If none of these are specified, *touch* shall use the current time (the value
 106039 returned by the equivalent of the *time()* function defined in the System Interfaces volume of
 106040 POSIX.1-200x).

106041 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined
 106042 in the System Interfaces volume of POSIX.1-200x:

- 106043 1. If *file* does not exist:
 - 106044 a. The *creat()* function is called with the following arguments:
 - 106045 — The *file* operand is used as the *path* argument.
 - 106046 — The value of the bitwise-inclusive OR of S_IRUSR, S_IWUSR, S_IRGRP,
 106047 S_IWGRP, S_IROTH, and S_IWOTH is used as the *mode* argument.
 - 106048 b. The *futimens()* function is called with the following arguments:
 - 106049 — The file descriptor opened in step 1a.
 - 106050 — The access time and the modification time, set as described in the OPTIONS
 106051 section, are used as the first and second elements of the *times* array argument,
 106052 respectively.
- 106053 2. If *file* exists, the *utimensat()* function is called with the following arguments:
 - 106054 a. The AT_FDCWD special value is used as the *fd* argument. +
 - 106055 b. The *file* operand is used as the *path* argument.
 - 106056 c. The access time and the modification time, set as described in the OPTIONS +
 106057 section, are used as the first and second elements of the *times* array argument, +
 106058 respectively. +
 - 106059 d. The *flag* argument is set to zero. |

106060 **OPTIONS**
 106061 The *touch* utility shall conform to XBD Section 12.2 (on page 201). |

106062 The following options shall be supported:

- 106063 **-a** Change the access time of *file*. Do not change the modification time unless **-m** is
 106064 also specified.
- 106065 **-c** Do not create a specified *file* if it does not exist. Do not write any diagnostic
 106066 messages concerning this condition.
- 106067 **-m** Change the modification time of *file*. Do not change the access time unless **-a** is
 106068 also specified.

- 106069 **-r** *ref_file* Use the corresponding time of the file named by the pathname *ref_file* instead of
106070 the current time.
- 106071 **-t** *time* Use the specified *time* instead of the current time. The option-argument shall be a
106072 decimal number of the form:
- 106073 [[CC]YY]MMDDhhmm[.SS]
- 106074 where each two digits represents the following:
- 106075 *MM* The month of the year [01,12].
- 106076 *DD* The day of the month [01,31].
- 106077 *hh* The hour of the day [00,23].
- 106078 *mm* The minute of the hour [00,59].
- 106079 *CC* The first two digits of the year (the century).
- 106080 *YY* The second two digits of the year.
- 106081 *SS* The second of the minute [00,60].

106082 Both *CC* and *YY* shall be optional. If neither is given, the current year shall be
106083 assumed. If *YY* is specified, but *CC* is not, *CC* shall be derived as follows:

If YY is:	CC becomes:
[69,99]	19
[00,68]	20

106087 **Note:** It is expected that in a future version of this standard the default century inferred
106088 from a 2-digit year will change. (This would apply to all commands accepting a
106089 2-digit year as input.)

106090 The resulting time shall be affected by the value of the *TZ* environment variable. If
106091 the resulting time value precedes the Epoch, the behavior is implementation-
106092 defined. If the time is out of range for the file's timestamp, *touch* shall exit
106093 immediately with an error status. The range of valid times past the Epoch is
106094 implementation-defined, but it shall extend to at least the time 0 hours, 0 minutes,
106095 0 seconds, January 1, 2038, Coordinated Universal Time. Some implementations
106096 may not be able to represent dates beyond January 18, 2038, because they use
106097 **signed int** as a time holder.

106098 The range for *SS* is [00,60] rather than [00,59] because of leap seconds. If *SS* is 60,
106099 and the resulting time, as affected by the *TZ* environment variable, does not refer
106100 to a leap second, the resulting time shall be one second after a time where *SS* is 59.
106101 If *SS* is not given a value, it is assumed to be zero.

106102 If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**
106103 options were specified.

106104 OPERANDS

106105 The following operands shall be supported:

106106 *file* A pathname of a file whose times shall be modified.

106107 STDIN

106108 Not used.

touch

Utilities

106109 **INPUT FILES**

106110 None.

106111 **ENVIRONMENT VARIABLES**106112 The following environment variables shall affect the execution of *touch*:

106113 *LANG* Provide a default value for the internationalization variables that are unset or null. |
 106114 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |
 106115 variables used to determine the values of locale categories.)

106116 *LC_ALL* If set to a non-empty string value, override the values of all the other |
 106117 internationalization variables.

106118 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as |
 106119 characters (for example, single-byte as opposed to multi-byte characters in |
 106120 arguments).

106121 *LC_MESSAGES*

106122 Determine the locale that should be used to affect the format and contents of |
 106123 diagnostic messages written to standard error.

106124 *XSIPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

106125 *TZ* Determine the timezone to be used for interpreting the *time* option-argument. If *TZ* |
 106126 is unset or null, an unspecified default timezone shall be used.

106127 **ASYNCHRONOUS EVENTS**

106128 Default.

106129 **STDOUT**

106130 Not used.

106131 **STDERR**

106132 The standard error shall be used only for diagnostic messages.

106133 **OUTPUT FILES**

106134 None.

106135 **EXTENDED DESCRIPTION**

106136 None.

106137 **EXIT STATUS**

106138 The following exit values shall be returned:

106139 0 The utility executed successfully and all requested changes were made.

106140 >0 An error occurred.

106141 **CONSEQUENCES OF ERRORS**

106142 Default.

106143 **APPLICATION USAGE**

106144 The interpretation of time is taken to be *seconds since the Epoch* (see XBD Section 4.15, on page |
 106145 100). It should be noted that implementations conforming to the System Interfaces volume of |
 106146 POSIX.1-200x do not take leap seconds into account when computing seconds since the Epoch. |
 106147 When *SS=60* is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a time |
 106148 when *SS=59*.

106149 Although the *-t time* option-argument specifies values in 1969, the access time and modification |
 106150 time fields are defined in terms of seconds since the Epoch (00:00:00 on 1 January 1970 UTC). |
 106151 Therefore, depending on the value of *TZ* when *touch* is run, there is never more than a few valid |
 106152 hours in 1969 and there need not be any valid times in 1969.

106153 One ambiguous situation occurs if *-t time* is not specified, *-r ref_file* is not specified, and the first

106154 operand is an eight or ten-digit decimal number. A portable script can avoid this problem by
 106155 using:

106156 touch -- file

106157 or:

106158 touch ./file

106159 in this case.

106160 EXAMPLES

106161 None.

106162 RATIONALE

106163 The functionality of *touch* is described almost entirely through references to functions in the
 106164 System Interfaces volume of POSIX.1-200x. In this way, there is no duplication of effort required
 106165 for describing such side effects as the relationship of user IDs to the user database, permissions,
 106166 and so on.

106167 There are some significant differences between the *touch* utility in this volume of POSIX.1-200x
 106168 and those in System V and BSD systems. They are upwards-compatible for historical
 106169 applications from both implementations:

106170 1. In System V, an ambiguity exists when a pathname that is a decimal number leads the
 106171 operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be
 106172 touched to the current time. The `-t time` construct solves these problems for future
 106173 conforming applications (note that the `-t` option is not historical practice).

106174 2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is
 106175 treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates
 106176 following the Epoch was included as recognition that some implementations are not able
 106177 to represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

106178 The `-r` option was added because several comments requested this capability. This option was
 106179 named `-f` in an early proposal, but was changed because the `-f` option is used in the BSD
 106180 version of *touch* with a different meaning.

106181 At least one historical implementation of *touch* incremented the exit code if `-c` was specified and
 106182 the file did not exist. This volume of POSIX.1-200x requires exit status zero if no errors occur.

106183 In previous editions of the standard, if at least two operands are specified, and the first operand
 106184 is an eight or ten-digit decimal integer, the first operand was assumed to be a *date_time* operand.
 106185 This usage was removed in this edition of the standard since it had been marked obsolescent
 106186 previously.

106187 FUTURE DIRECTIONS

106188 None.

106193 CHANGE HISTORY

106194 First released in Issue 2.

106195	Issue 6	
106196		The obsolescent <i>date_time</i> operand is removed.
106197		The Open Group Corrigendum U027/1 is applied. This extends the range of valid time past the Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated Universal Time. This is a new requirement on POSIX implementations.
106198		
106199		
106200		The range for seconds is changed from [00,61] to [00,60] to align with the ISO/IEC 9899:1999 standard, and to allow for positive leap seconds.
106201		
106202	Issue 7	
106203		Austin Group Interpretation 1003.1-2001 #118 is applied. +
106204		SD5-XCU-ERN-45 is applied, adding a new paragraph to the RATIONALE.
106205		SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.
106206		SD5-XCU-ERN-110 is applied, updating the OPTIONS section.
106207		Changes are made related to support for finegrained timestamps. +

106208 **NAME**
 106209 tput — change terminal characteristics

106210 **SYNOPSIS**
 106211 tput [-T *type*] *operand*...

106212 **DESCRIPTION**
 106213 The *tput* utility shall display terminal-dependent information. The manner in which this
 106214 information is retrieved is unspecified. The information displayed shall clear the terminal
 106215 screen, initialize the user's terminal, or reset the user's terminal, depending on the operand
 106216 given. The exact consequences of displaying this information are unspecified.

106217 **OPTIONS**
 106218 The *tput* utility shall conform to XBD [Section 12.2](#) (on page 201).

106219 The following option shall be supported:

106220 **-T *type*** Indicate the type of terminal. If this option is not supplied and the *TERM* variable
 106221 is unset or null, an unspecified default terminal type shall be used. The setting of
 106222 *type* shall take precedence over the value in *TERM*.

106223 **OPERANDS**
 106224 The following strings shall be supported as operands by the implementation in the POSIX locale:

106225 **clear** Display the clear-screen sequence.
 106226 **init** Display the sequence that initializes the user's terminal in an implementation-
 106227 defined manner.
 106228 **reset** Display the sequence that resets the user's terminal in an implementation-defined
 106229 manner.

106230 If a terminal does not support any of the operations described by these operands, this shall not
 106231 be considered an error condition.

106232 **STDIN**
 106233 Not used.

106234 **INPUT FILES**
 106235 None.

106236 **ENVIRONMENT VARIABLES**
 106237 The following environment variables shall affect the execution of *tput*:

106238 **LANG** Provide a default value for the internationalization variables that are unset or null.
 106239 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization
 106240 variables used to determine the values of locale categories.)

106241 **LC_ALL** If set to a non-empty string value, override the values of all the other
 106242 internationalization variables.

106243 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 106244 characters (for example, single-byte as opposed to multi-byte characters in
 106245 arguments).

106246 **LC_MESSAGES**
 106247 Determine the locale that should be used to affect the format and contents of
 106248 diagnostic messages written to standard error.

- 106249 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.
- 106250 **TERM** Determine the terminal type. If this variable is unset or null, and if the **-T** option is
106251 not specified, an unspecified default terminal type shall be used.

ASYNCHRONOUS EVENTS

- 106252 Default.

STDOUT

- 106255 If standard output is a terminal device, it may be used for writing the appropriate sequence to
106256 clear the screen or reset or initialize the terminal. If standard output is not a terminal device,
106257 undefined results occur.

STDERR

- 106258 The standard error shall be used only for diagnostic messages.

OUTPUT FILES

- 106260 None.

EXTENDED DESCRIPTION

- 106262 None.

EXIT STATUS

- 106265 The following exit values shall be returned:
- 106266 0 The requested string was written successfully.
- 106267 1 Unspecified.
- 106268 2 Usage error.
- 106269 3 No information is available about the specified terminal type.
- 106270 4 The specified operand is invalid.
- 106271 >4 An error occurred.

CONSEQUENCES OF ERRORS

- 106272 If one of the operands is not available for the terminal, *tput* continues processing the remaining
106273 operands.

APPLICATION USAGE

- 106275 The difference between resetting and initializing a terminal is left unspecified, as they vary
106276 greatly based on hardware types. In general, resetting is a more severe action.

- 106278 Some terminals use control characters to perform the stated functions, and on such terminals it
106279 might make sense to use *tput* to store the initialization strings in a file or environment variable
106280 for later use. However, because other terminals might rely on system calls to do this work, the
106281 standard output cannot be used in a portable manner, such as the following non-portable
106282 constructs:

- ```
106283 ClearVar='tput clear`
106284 tput reset | mailx -s "Wake Up" ddg
```

**EXAMPLES**

- 106286 1. Initialize the terminal according to the type of terminal in the environmental variable  
106287 *TERM*. This command can be included in a **.profile** file.
- ```
106288 tput init
```
- 106289 2. Reset a 450 terminal.
- ```
106290 tput -T 450 reset
```

**RATIONALE**

The list of operands was reduced to a minimum for the following reasons:

- The only features chosen were those that were likely to be used by human users interacting with a terminal.
- Specifying the full *terminfo* set was not considered desirable, but the standard developers did not want to select among operands.
- This volume of POSIX.1-200x does not attempt to provide applications with sophisticated terminal handling capabilities, as that falls outside of its assigned scope and intersects with the responsibilities of other standards bodies.

The difference between resetting and initializing a terminal is left unspecified as this varies greatly based on hardware types. In general, resetting is a more severe action.

The exit status of 1 is historically reserved for finding out if a Boolean operand is not set. Although the operands were reduced to a minimum, the exit status of 1 should still be reserved for the Boolean operands, for those sites that wish to support them.

**FUTURE DIRECTIONS**

None.

+

**CHANGE HISTORY**

First released in Issue 4.

**Issue 6**

This utility is marked as part of the User Portability Utilities option.

**Issue 7**

The *tput* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

106317 **NAME**

106318 tr — translate characters

106319 **SYNOPSIS**106320 tr [-c|-C] [-s] *string1 string2*106321 tr -s [-c|-C] *string1*106322 tr -d [-c|-C] *string1*106323 tr -ds [-c|-C] *string1 string2*106324 **DESCRIPTION**

106325 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 106326 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 106327 translations that occur while copying characters and single-character collating elements.

106328 **OPTIONS**106329 The *tr* utility shall conform to XBD [Section 12.2](#) (on page 201).

106330 The following options shall be supported:

106331 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 106332 DESCRIPTION section.

106333 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 106334 DESCRIPTION section.

106335 **-d** Delete all occurrences of input characters that are specified by *string1*.

106336 **-s** Replace instances of repeated characters with a single character, as described in the  
 106337 EXTENDED DESCRIPTION section.

106338 **OPERANDS**

106339 The following operands shall be supported:

106340 *string1, string2*

106341 Translation control strings. Each string shall represent a set of characters to be  
 106342 converted into an array of characters used for the translation. For a detailed  
 106343 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 106344 section.

106345 **STDIN**

106346 The standard input can be any type of file.

106347 **INPUT FILES**

106348 None.

106349 **ENVIRONMENT VARIABLES**106350 The following environment variables shall affect the execution of *tr*:

106351 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 106352 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 106353 variables used to determine the values of locale categories.)

106354 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 106355 internationalization variables.

106356 **LC\_COLLATE**

106357 Determine the locale for the behavior of range expressions and equivalence classes.

106358 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106359 characters (for example, single-byte as opposed to multi-byte characters in  
 106360 arguments) and the behavior of character classes.

106361 *LC\_MESSAGES*  
 106362 Determine the locale that should be used to affect the format and contents of  
 106363 diagnostic messages written to standard error.

106364 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 106365 ASYNCHRONOUS EVENTS

106366 Default.

## 106367 STDOUT

106368 The *tr* output shall be identical to the input, with the exception of the specified transformations.

## 106369 STDERR

106370 The standard error shall be used only for diagnostic messages.

## 106371 OUTPUT FILES

106372 None.

## 106373 EXTENDED DESCRIPTION

106374 The operands *string1* and *string2* (if specified) define two arrays of characters. The constructs in  
 106375 the following list can be used to specify characters or single-character collating elements. If any  
 106376 of the constructs result in multi-character collating elements, *tr* shall exclude, without a  
 106377 diagnostic, those multi-character elements from the resulting array.

106378 *character* Any character not described by one of the conventions below shall represent itself.

106379 *\octal* Octal sequences can be used to represent characters with specific coded values. An  
 106380 octal sequence shall consist of a backslash followed by the longest sequence of one,  
 106381 two, or three-octal-digit characters (01234567). The sequence shall cause the value  
 106382 whose encoding is represented by the one, two, or three-digit octal integer to be  
 106383 placed into the array. Multi-byte characters require multiple, concatenated escape  
 106384 sequences of this type, including the leading '*\*' for each byte.

106385 *\character* The backslash-escape sequences in XBD Table 5-1 (on page 108) ('*\\*', '*\a*',  
 106386 '*\b*', '*\f*', '*\n*', '*\r*', '*\t*', '*\v*') shall be supported. The results of using any  
 106387 other character, other than an octal digit, following the backslash are unspecified.

106388 *c-c* In the POSIX locale, this construct shall represent the range of collating elements  
 106389 between the range endpoints (as long as neither endpoint is an octal sequence of  
 106390 the form *\octal*), inclusive, as defined by the collation sequence. The characters or  
 106391 collating elements in the range shall be placed in the array in ascending collation  
 106392 sequence. If the second endpoint precedes the starting endpoint in the collation  
 106393 sequence, it is unspecified whether the range of collating elements is empty, or this  
 106394 construct is treated as invalid. In locales other than the POSIX locale, this construct  
 106395 has unspecified behavior.

106396 If either or both of the range endpoints are octal sequences of the form *\octal*, this  
 106397 shall represent the range of specific coded values between the two range  
 106398 endpoints, inclusive.

106399 *[:class:]* Represents all characters belonging to the defined character class, as defined by the  
 106400 current setting of the *LC\_CTYPE* locale category. The following character class  
 106401 names shall be accepted when specified in *string1*:

|              |              |              |              |              |               |
|--------------|--------------|--------------|--------------|--------------|---------------|
| <b>alnum</b> | <b>blank</b> | <b>digit</b> | <b>lower</b> | <b>punct</b> | <b>upper</b>  |
| <b>alpha</b> | <b>cntrl</b> | <b>graph</b> | <b>print</b> | <b>space</b> | <b>xdigit</b> |

|                                                                                                                      |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 106404<br>106405<br>106406                                                                                           | XSI                      | In addition, character class expressions of the form <code>[:name:]</code> shall be recognized in those locales where the <code>name</code> keyword has been given a <b>charclass</b> definition in the <code>LC_CTYPE</code> category.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 106407<br>106408<br>106409<br>106410<br>106411<br>106412<br>106413<br>106414<br>106415<br>106416<br>106417<br>106418 |                          | When both the <code>-d</code> and <code>-s</code> options are specified, any of the character class names shall be accepted in <code>string2</code> . Otherwise, only character class names <b>lower</b> or <b>upper</b> are valid in <code>string2</code> and then only if the corresponding character class ( <b>upper</b> and <b>lower</b> , respectively) is specified in the same relative position in <code>string1</code> . Such a specification shall be interpreted as a request for case conversion. When <code>[:lower:]</code> appears in <code>string1</code> and <code>[:upper:]</code> appears in <code>string2</code> , the arrays shall contain the characters from the <b>toupper</b> mapping in the <code>LC_CTYPE</code> category of the current locale. When <code>[:upper:]</code> appears in <code>string1</code> and <code>[:lower:]</code> appears in <code>string2</code> , the arrays shall contain the characters from the <b>tolower</b> mapping in the <code>LC_CTYPE</code> category of the current locale. The first character from each mapping pair shall be in the array for <code>string1</code> and the second character from each mapping pair shall be in the array for <code>string2</code> in the same relative position. |
| 106419<br>106420                                                                                                     |                          | Except for case conversion, the characters specified by a character class expression shall be placed in the array in an unspecified order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 106421<br>106422                                                                                                     |                          | If the name specified for <code>class</code> does not define a valid character class in the current locale, the behavior is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 106423<br>106424<br>106425<br>106426<br>106427                                                                       | [ <code>=equiv=</code> ] | Represents all characters or collating elements belonging to the same equivalence class as <code>equiv</code> , as defined by the current setting of the <code>LC_COLLATE</code> locale category. An equivalence class expression shall be allowed only in <code>string1</code> , or in <code>string2</code> when it is being used by the combined <code>-d</code> and <code>-s</code> options. The characters belonging to the equivalence class shall be placed in the array in an unspecified order.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 106428<br>106429<br>106430<br>106431<br>106432<br>106433                                                             | [ <code>x*n</code> ]     | Represents <code>n</code> repeated occurrences of the character <code>x</code> . Because this expression is used to map multiple characters to one, it is only valid when it occurs in <code>string2</code> . If <code>n</code> is omitted or is zero, it shall be interpreted as large enough to extend the <code>string2</code> -based sequence to the length of the <code>string1</code> -based sequence. If <code>n</code> has a leading zero, it shall be interpreted as an octal value. Otherwise, it shall be interpreted as a decimal value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

An exception is case conversion, as described previously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 106448                                                                                                               |                          | When the <code>-d</code> option is specified:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 106449                                                                                                               |                          | • Input characters found in the array specified by <code>string1</code> shall be deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

- 106450 • When the `-C` option is specified with `-d`, all characters except those specified by *string1*
- 106451 shall be deleted. The contents of *string2* are ignored, unless the `-s` option is also specified.
- 106452 • When the `-c` option is specified with `-d`, all values except those specified by *string1* shall
- 106453 be deleted. The contents of *string2* shall be ignored, unless the `-s` option is also specified.
- 106454 • The same string cannot be used for both the `-d` and the `-s` option; when both options are
- 106455 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be
- 106456 required.

106457 When the `-s` option is specified, after any deletions or translations have taken place, repeated

106458 sequences of the same character shall be replaced by one occurrence of the same character, if the

106459 character is found in the array specified by the last operand. If the last operand contains a

106460 character class, such as the following example:

```
106461 tr -s '[:space:]'
```

106462 the last operand's array shall contain all of the characters in that character class. However, in a

106463 case conversion, as described previously, such as:

```
106464 tr -s '[:upper:]' '[:lower:]'
```

106465 the last operand's array shall contain only those characters defined as the second characters in

106466 each of the **toupper** or **tolower** character pairs, as appropriate.

106467 An empty string used for *string1* or *string2* produces undefined results.

#### 106468 EXIT STATUS

106469 The following exit values shall be returned:

106470 0 All input was processed successfully.

106471 >0 An error occurred.

#### 106472 CONSEQUENCES OF ERRORS

106473 Default.

#### 106474 APPLICATION USAGE

106475 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

106476 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must

106477 use the full three digits to avoid ambiguity.

106478 When *string2* is shorter than *string1*, a difference results between historical System V and BSD

106479 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible

106480 to do the following:

```
106481 tr 0123456789 d
```

106482 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in

106483 this volume of POSIX.1-200x, both the BSD and System V behaviors are allowed, but a

106484 conforming application cannot rely on the BSD behavior. It would have to code the example in

106485 the following way:

```
106486 tr 0123456789 '[d*]'
```

106487 It should be noted that, despite similarities in appearance, the string operands used by *tr* are not

106488 regular expressions.

106489 Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL

106490 characters in its input stream. NUL characters can be stripped by using:

```
106491 tr -d '\000'
```

## EXAMPLES

1. The following example creates a list of all words in **file1** one per line in **file2**, where a word is taken to be a maximal string of letters.

```
tr -cs "[:alpha:]" "[\n*]" <file1 >file2
```

2. The next example translates all lowercase characters in **file1** to uppercase and writes the results to standard output.

```
tr "[:lower:]" "[:upper:]" <file1
```

3. This example uses an equivalence class to identify accented variants of the base character 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

```
tr "[=e=]" "[e*]" <file1 >file2
```

## RATIONALE

In some early proposals, an explicit option `-n` was added to disable the historical behavior of stripping NUL characters from the input. It was considered that automatically stripping NUL characters from the input was not correct functionality. However, the removal of `-n` in a later proposal does not remove the requirement that `tr` correctly process NUL characters in its input stream. NUL characters can be stripped by using `tr -d '\000'`.

Historical implementations of `tr` differ widely in syntax and behavior. For example, the BSD version has not needed the bracket characters for the repetition sequence. The `tr` utility syntax is based more closely on the System V and XPG3 model while attempting to accommodate historical BSD implementations. In the case of the short `string2` padding, the decision was to unspecified the behavior and preserve System V and XPG3 scripts, which might find difficulty with the BSD method. The assumption was made that BSD users of `tr` have to make accommodations to meet the syntax defined here. Since it is possible to use the repetition sequence to duplicate the desired behavior, whereas there is no simple way to achieve the System V method, this was the correct, if not desirable, approach.

The use of octal values to specify control characters, while having historical precedents, is not portable. The introduction of escape sequences for control characters should provide the necessary portability. It is recognized that this may cause some historical scripts to break.

An early proposal included support for multi-character collating elements. It was pointed out that, while `tr` does employ some syntactical elements from REs, the aim of `tr` is quite different; ranges, for example, do not have a similar meaning ("any of the chars in the range matches", *versus* "translate each character in the range to the output counterpart"). As a result, the previously included support for multi-character collating elements has been removed. What remains are ranges in current collation order (to support, for example, accented characters), character classes, and equivalence classes.

In XPG3 the `[:class:]` and `[=equiv=]` conventions are shown with double brackets, as in RE syntax. However, `tr` does not implement RE principles; it just borrows part of the syntax. Consequently, `[:class:]` and `[=equiv=]` should be regarded as syntactical elements on a par with `[x*n]`, which is not an RE bracket expression.

The standard developers will consider changes to `tr` that allow it to translate characters between different character encodings, or they will consider providing a new utility to accomplish this.

On historical System V systems, a range expression requires enclosing square-brackets, such as:

```
tr '[a-z]' '[A-Z]'
```

However, BSD-based systems did not require the brackets, and this convention is used here to avoid breaking large numbers of BSD scripts:

```
tr a-z A-Z
```

106538 The preceding System V script will continue to work because the brackets, treated as regular  
 106539 characters, are translated to themselves. However, any System V script that relied on "a-z"  
 106540 representing the three characters 'a', '-', and 'z' have to be rewritten as "az-".

106541 The ISO POSIX-2:1993 standard had a -c option that behaved similarly to the -C option, but did  
 106542 not supply functionality equivalent to the -c option specified in POSIX.1-200x. This meant that  
 106543 historical practice of being able to specify *tr -cd\000-\177* (which would delete all bytes with  
 106544 the top bit set) would have no effect because, in the C locale, bytes with the values octal 200 to  
 106545 octal 377 are not characters.

106546 The earlier version also said that octal sequences referred to collating elements and could be  
 106547 placed adjacent to each other to specify multi-byte characters. However, it was noted that this  
 106548 caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were  
 106549 intending to specify multi-byte characters or multiple single byte characters. POSIX.1-200x  
 106550 specifies that octal sequences always refer to single byte binary values when used to specify an  
 106551 endpoint of a range of collating elements.

106552 Earlier versions of this standard allowed for implementations with bytes other than eight bits, |  
 106553 but this has been modified in this version.

#### 106554 FUTURE DIRECTIONS

106555 None.

#### 106556 SEE ALSO

106557 *sed*

#### 106559 CHANGE HISTORY

106560 First released in Issue 2.

##### 106561 Issue 6

106562 The -C operand is added, and the description of the -c operand is changed to align with the  
 106563 IEEE P1003.2b draft standard.

106564 The normative text is reworded to avoid use of the term "must" for application requirements.

106565 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/31 is applied, removing text describing  
 106566 behavior on systems with bytes consisting of more than eight bits.

106567 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/32 is applied, updating an example in the  
 106568 EXAMPLES section to avoid using unspecified behavior.

106569 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/33 is applied, making a correction to the  
 106570 RATIONALE.

##### 106571 Issue 7

106572 SD5-XCU-ERN-30 is applied.

106573 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106574 **NAME**  
 106575       true — return true value

106576 **SYNOPSIS**  
 106577       true

106578 **DESCRIPTION**  
 106579       The *true* utility shall return with exit code zero.

106580 **OPTIONS**  
 106581       None.

106582 **OPERANDS**  
 106583       None.

106584 **STDIN**  
 106585       Not used.

106586 **INPUT FILES**  
 106587       None.

106588 **ENVIRONMENT VARIABLES**  
 106589       None.

106590 **ASYNCHRONOUS EVENTS**  
 106591       Default.

106592 **STDOUT**  
 106593       Not used.

106594 **STDERR**  
 106595       Not used.

106596 **OUTPUT FILES**  
 106597       None.

106598 **EXTENDED DESCRIPTION**  
 106599       None.

106600 **EXIT STATUS**  
 106601       Zero.

106602 **CONSEQUENCES OF ERRORS**  
 106603       None.

106604 **APPLICATION USAGE**  
 106605       This utility is typically used in shell scripts, as shown in the EXAMPLES section. The special  
 106606       built-in utility `:` is sometimes more efficient than *true*.

106607 **EXAMPLES**  
 106608       This command is executed forever:  
 106609       while true  
 106610       do  
 106611             command  
 106612       done

106613  
106614  
106615  
106616  
  
106617  
106618  
  
106619  
106620  
  
106621  
106622  
  
106623  
106624  
106625  
106626

**RATIONALE**

The *true* utility has been retained in this volume of POSIX.1-200x, even though the shell special built-in `:` provides similar functionality, because *true* is widely used in historical scripts and is less cryptic to novice script readers.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

[Section 2.9](#) (on page 2263), *false*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/39 is applied, replacing the terms “None” and “Default” from the `STDERR` and `EXIT STATUS` sections, respectively, with terms as defined in [Section 1.4](#) (on page 2235).

106627 **NAME**106628 `tsort` — topological sort106629 **SYNOPSIS**106630 `tsort` [*file*]106631 **DESCRIPTION**106632 The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
106633 partial ordering of items contained in the input.106634 The application shall ensure that the input consists of pairs of items (non-empty strings)  
106635 separated by <blank>s. Pairs of different items indicate ordering. Pairs of identical items  
106636 indicate presence, but not ordering.106637 **OPTIONS**

106638 None.

106639 **OPERANDS**

106640 The following operand shall be supported:

106641 *file* A pathname of a text file to order. If no *file* operand is given, the standard input  
106642 shall be used.106643 **STDIN**106644 The standard input shall be a text file that is used if no *file* operand is given.106645 **INPUT FILES**106646 The input file named by the *file* operand is a text file.106647 **ENVIRONMENT VARIABLES**106648 The following environment variables shall affect the execution of *tsort*:106649 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
106650 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
106651 variables used to determine the values of locale categories.)106652 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106653 internationalization variables.106654 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106655 characters (for example, single-byte as opposed to multi-byte characters in  
106656 arguments and input files).106657 *LC\_MESSAGES*106658 Determine the locale that should be used to affect the format and contents of  
106659 diagnostic messages written to standard error.106660 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.106661 **ASYNCHRONOUS EVENTS**

106662 Default.

106663 **STDOUT**106664 The standard output shall be a text file consisting of the order list produced from the partially  
106665 ordered input.

106666 **STDERR**

106667 The standard error shall be used only for diagnostic messages.

106668 **OUTPUT FILES**

106669 None.

106670 **EXTENDED DESCRIPTION**

106671 None.

106672 **EXIT STATUS**

106673 The following exit values shall be returned:

106674 0 Successful completion.

106675 &gt;0 An error occurred.

106676 **CONSEQUENCES OF ERRORS**

106677 Default.

106678 **APPLICATION USAGE**106679 The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
106680 lexicographic, but depends on the pairs of items given as input.106681 **EXAMPLES**

106682 The command:

106683 `tsort <<EOF`  
106684 `a b c c d e`  
106685 `g g`  
106686 `f g e f`  
106687 `h h`  
106688 `EOF`

106689 produces the output:

106690 `a`  
106691 `b`  
106692 `c`  
106693 `d`  
106694 `e`  
106695 `f`  
106696 `g`  
106697 `h`106698 **RATIONALE**

106699 None.

106700 **FUTURE DIRECTIONS**

106701 None.

106702 **SEE ALSO**106703 XBD [Chapter 8](#) (on page 159)106704 **CHANGE HISTORY**

106705 First released in Issue 2.

106706 **Issue 6**

106707 The normative text is reworded to avoid use of the term “must” for application requirements.

106708

**Issue 7**

106709

The *tsort* utility is moved from the XSI option to the Base.

106710 **NAME**

106711 tty — return user's terminal name

106712 **SYNOPSIS**

106713 tty

106714 **DESCRIPTION**

106715 The *tty* utility shall write to the standard output the name of the terminal that is open as  
 106716 standard input. The name that is used shall be equivalent to the string that would be returned by  
 106717 the *ttyname()* function defined in the System Interfaces volume of POSIX.1-200x.

106718 **OPTIONS**106719 The *tty* utility shall conform to XBD [Section 12.2](#) (on page 201).106720 **OPERANDS**

106721 None.

106722 **STDIN**

106723 While no input is read from standard input, standard input shall be examined to determine  
 106724 whether or not it is a terminal, and, if so, to determine the name of the terminal.

106725 **INPUT FILES**

106726 None.

106727 **ENVIRONMENT VARIABLES**106728 The following environment variables shall affect the execution of *tty*:

106729 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 106730 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 106731 variables used to determine the values of locale categories.)

106732 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 106733 internationalization variables.

106734 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 106735 characters (for example, single-byte as opposed to multi-byte characters in  
 106736 arguments).

106737 **LC\_MESSAGES**

106738 Determine the locale that should be used to affect the format and contents of  
 106739 diagnostic messages written to standard error and informative messages written to  
 106740 standard output.

106741 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106742 **ASYNCHRONOUS EVENTS**

106743 Default.

106744 **STDOUT**

106745 If standard input is a terminal device, a pathname of the terminal as specified by the *ttyname()*  
 106746 function defined in the System Interfaces volume of POSIX.1-200x shall be written in the  
 106747 following format:

106748 "%s\n", &lt;terminal name&gt;

106749 Otherwise, a message shall be written indicating that standard input is not connected to a  
 106750 terminal. In the POSIX locale, the *tty* utility shall use the format:

106751 "not a tty\n"

106752 **STDERR**

106753 The standard error shall be used only for diagnostic messages.

106754 **OUTPUT FILES**

106755 None.

106756 **EXTENDED DESCRIPTION**

106757 None.

106758 **EXIT STATUS**

106759 The following exit values shall be returned:

106760 0 Standard input is a terminal.

106761 1 Standard input is not a terminal.

106762 &gt;1 An error occurred.

106763 **CONSEQUENCES OF ERRORS**

106764 Default.

106765 **APPLICATION USAGE**

106766 This utility checks the status of the file open as standard input against that of an  
 106767 implementation-defined set of files. It is possible that no match can be found, or that the match  
 106768 found need not be the same file as that which was opened for standard input (although they are  
 106769 the same device).

106770 **EXAMPLES**

106771 None.

106772 **RATIONALE**

106773 None.

106774 **FUTURE DIRECTIONS**

106775 None.

106776 **SEE ALSO**106777 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)106778 XSH [isatty\(\)](#), [ttyname\(\)](#)106779 **CHANGE HISTORY**

106780 First released in Issue 2.

106781 **Issue 5**

106782 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
 106783 as obsolete. This is a clarification and does not change the functionality published in previous  
 106784 issues.

106785 **Issue 6**106786 The obsolescent `-s` option is removed.

106787 **NAME**

106788           type — write a description of command type

106789 **SYNOPSIS**

106790 XSI        type name...

106791 **DESCRIPTION**106792       The *type* utility shall indicate how each argument would be interpreted if used as a command  
106793       name.106794 **OPTIONS**

106795       None.

106796 **OPERANDS**

106797       The following operand shall be supported:

106798       *name*        A name to be interpreted.106799 **STDIN**

106800       Not used.

106801 **INPUT FILES**

106802       None.

106803 **ENVIRONMENT VARIABLES**106804       The following environment variables shall affect the execution of *type*:106805       *LANG*        Provide a default value for the internationalization variables that are unset or null. |  
106806                    (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
106807                    variables used to determine the values of locale categories.)106808       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
106809                    internationalization variables.106810       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
106811                    characters (for example, single-byte as opposed to multi-byte characters in  
106812                    arguments).106813       *LC\_MESSAGES*106814                    Determine the locale that should be used to affect the format and contents of  
106815                    diagnostic messages written to standard error.106816       *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.106817       *PATH*        Determine the location of *name*, as described in XBD [Chapter 8](#) (on page 159). |106818 **ASYNCHRONOUS EVENTS**

106819       Default.

106820 **STDOUT**106821       The standard output of *type* contains information about each operand in an unspecified format.  
106822       The information provided typically identifies the operand as a shell built-in, function, alias, or  
106823       keyword, and where applicable, may display the operand's pathname.106824 **STDERR**

106825       The standard error shall be used only for diagnostic messages.

106826 **OUTPUT FILES**

106827 None.

106828 **EXTENDED DESCRIPTION**

106829 None.

106830 **EXIT STATUS**

106831 The following exit values shall be returned:

106832 0 Successful completion.

106833 &gt;0 An error occurred.

106834 **CONSEQUENCES OF ERRORS**

106835 Default.

106836 **APPLICATION USAGE**

106837 Since *type* must be aware of the contents of the current shell execution environment (such as the  
 106838 lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
 106839 regular built-in. If it is called in a separate utility execution environment, such as one of the  
 106840 following:

106841 `nohup type writer`106842 `find . -type f | xargs type`

106843 it might not produce accurate results.

106844 **EXAMPLES**

106845 None.

106846 **RATIONALE**

106847 None.

106848 **FUTURE DIRECTIONS**

106849 None.

106850 **SEE ALSO**106851 *command*, *hash*106852 XBD [Chapter 8](#) (on page 159)106853 **CHANGE HISTORY**

106854 First released in Issue 2.

106855 **NAME**106856 `ulimit` — set or report file size limit106857 **SYNOPSIS**106858 XSI `ulimit [-f] [blocks]`106859 **DESCRIPTION**106860 The *ulimit* utility shall set or report the file-size writing limit imposed on files written by the  
106861 shell and its child processes (files of any size may be read). Only a process with appropriate  
106862 privileges can increase the limit.106863 **OPTIONS**106864 The *ulimit* utility shall conform to XBD [Section 12.2](#) (on page 201). |

106865 The following option shall be supported:

106866 `-f` Set (or report, if no *blocks* operand is present), the file size limit in blocks. The `-f`  
106867 option shall also be the default case.106868 **OPERANDS**

106869 The following operand shall be supported:

106870 *blocks* The number of 512-byte blocks to use as the new file size limit.106871 **STDIN**

106872 Not used.

106873 **INPUT FILES**

106874 None.

106875 **ENVIRONMENT VARIABLES**106876 The following environment variables shall affect the execution of *ulimit*:106877 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
106878 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
106879 variables used to determine the values of locale categories.)106880 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
106881 internationalization variables.106882 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
106883 characters (for example, single-byte as opposed to multi-byte characters in  
106884 arguments).106885 *LC\_MESSAGES*  
106886 Determine the locale that should be used to affect the format and contents of  
106887 diagnostic messages written to standard error.106888 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.106889 **ASYNCHRONOUS EVENTS**

106890 Default.

106891 **STDOUT**106892 The standard output shall be used when no *blocks* operand is present. If the current number of  
106893 blocks is limited, the number of blocks in the current limit shall be written in the following  
106894 format:106895 `"%d\n", <number of 512-byte blocks>`

106896 If there is no current limit on the number of blocks, in the POSIX locale the following format  
106897 shall be used:

106898 "unlimited\n"

#### 106899 **STDERR**

106900 The standard error shall be used only for diagnostic messages.

#### 106901 **OUTPUT FILES**

106902 None.

#### 106903 **EXTENDED DESCRIPTION**

106904 None.

#### 106905 **EXIT STATUS**

106906 The following exit values shall be returned:

106907 0 Successful completion.

106908 >0 A request for a higher limit was rejected or an error occurred.

#### 106909 **CONSEQUENCES OF ERRORS**

106910 Default.

#### 106911 **APPLICATION USAGE**

106912 Since *ulimit* affects the current shell execution environment, it is always provided as a shell  
106913 regular built-in. If it is called in a separate utility execution environment, such as one of the  
106914 following:

```
106915 nohup ulimit -f 10000
106916 env ulimit 10000
```

106917 it does not affect the file size limit of the caller's environment.

106918 Once a limit has been decreased by a process, it cannot be increased (unless appropriate  
106919 privileges are involved), even back to the original system limit.

#### 106920 **EXAMPLES**

106921 Set the file size limit to 51 200 bytes:

```
106922 ulimit -f 100
```

#### 106923 **RATIONALE**

106924 None.

#### 106925 **FUTURE DIRECTIONS**

106926 None.

#### 106927 **SEE ALSO**

106928 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

106929 XSH [ulimit](#)

#### 106930 **CHANGE HISTORY**

106931 First released in Issue 2.

#### 106932 **Issue 7**

106933 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

106934 **NAME**  
 106935 `umask` — get or set the file mode creation mask

106936 **SYNOPSIS**  
 106937 `umask [-S] [mask]`

106938 **DESCRIPTION**  
 106939 The *umask* utility shall set the file mode creation mask of the current shell execution environment  
 106940 (see [Section 2.12](#), on page 2277) to the value specified by the *mask* operand. This mask shall affect  
 106941 the initial value of the file permission bits of subsequently created files. If *umask* is called in a  
 106942 subshell or separate utility execution environment, such as one of the following:

```
106943 (umask 002)
106944 nohup umask ...
106945 find . -exec umask ... \;
```

106946 it shall not affect the file mode creation mask of the caller's environment.

106947 If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 106948 the file mode creation mask of the invoking process.

106949 **OPTIONS**  
 106950 The *umask* utility shall conform to XBD [Section 12.2](#) (on page 201).

106951 The following option shall be supported:

106952 **-S** Produce symbolic output.

106953 The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 106954 *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

106955 **OPERANDS**  
 106956 The following operand shall be supported:

106957 *mask* A string specifying the new file mode creation mask. The string is treated in the  
 106958 same way as the *mode* operand described in the EXTENDED DESCRIPTION  
 106959 section for *chmod*.

106960 For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 106961 the logical complement of the file permission bits portion of the file mode specified  
 106962 by the *symbolic\_mode* string.

106963 In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 106964 interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 106965 for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 106966 the indicated permissions to be set in the mask.

106967 The interpretation of *mode* values that specify file mode bits other than the file  
 106968 permission bits is unspecified.

106969 In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 106970 mask.

106971 The file mode creation mask shall be set to the resulting numeric value.

106972 The default output of a prior invocation of *umask* on the same system with no  
 106973 operand also shall be recognized as a *mask* operand.

**umask**

Utilities

106974 **STDIN**

106975 Not used.

106976 **INPUT FILES**

106977 None.

106978 **ENVIRONMENT VARIABLES**106979 The following environment variables shall affect the execution of *umask*:

106980 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
 106981 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 106982 variables used to determine the values of locale categories.)

106983 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 106984 internationalization variables.

106985 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 106986 characters (for example, single-byte as opposed to multi-byte characters in  
 106987 arguments).

106988 *LC\_MESSAGES*  
 106989 Determine the locale that should be used to affect the format and contents of  
 106990 diagnostic messages written to standard error.

106991 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

106992 **ASYNCHRONOUS EVENTS**

106993 Default.

106994 **STDOUT**

106995 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 106996 output that can later be used as a *umask mask* operand.

106997 If **-S** is specified, the message shall be in the following format:

106998 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 106999 <other permissions>

107000 where the three values shall be combinations of letters from the set {*r*, *w*, *x*}; the presence of a  
 107001 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

107002 If a *mask* operand is specified, there shall be no output written to standard output.

107003 **STDERR**

107004 The standard error shall be used only for diagnostic messages.

107005 **OUTPUT FILES**

107006 None.

107007 **EXTENDED DESCRIPTION**

107008 None.

107009 **EXIT STATUS**

107010 The following exit values shall be returned:

107011 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

107012 >0 An error occurred.

107013 **CONSEQUENCES OF ERRORS**

107014 Default.

**APPLICATION USAGE**

Since *umask* affects the current shell execution environment, it is generally provided as a shell regular built-in.

In contrast to the negative permission logic provided by the file mode creation mask and the octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those permissions that are left alone.

**EXAMPLES**

Either of the commands:

```
umask a=rx,ug+w
```

```
umask 002
```

sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

After setting the mode mask with either of the above commands, the *umask* command can be used to write out the current value of the mode mask:

```
$ umask
0002
```

(The output format is unspecified, but historical implementations use the octal integer mode format.)

```
$ umask -S
u=rwx,g=rwx,o=rx
```

Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask* utility.

Assuming the mode mask is set as above, the command:

```
umask g-w
```

sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits cleared.

The command:

```
umask -- -w
```

sets the mode mask so that subsequently created files have all their write bits cleared. Note that *mask* operands *-r*, *-w*, *-x* or anything beginning with a hyphen, must be preceded by "--" to keep it from being interpreted as an option.

**RATIONALE**

Since *umask* affects the current shell execution environment, it is generally provided as a shell regular built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:

```
(umask 002)
nohup umask ...
find . -exec umask ... \;
```

it does not affect the file mode creation mask of the environment of the caller.

The description of the historical utility was modified to allow it to use the symbolic modes of *chmod*. The *-s* option used in early proposals was changed to *-S* because *-s* could be confused with a *symbolic\_mode* form of mask referring to the S\_ISUID and S\_ISGID bits.

The default output style is unspecified to permit implementors to provide migration to the new symbolic style at the time most appropriate to their users. A *-o* flag to force octal mode output was omitted because the octal mode may not be sufficient to specify all of the information that

107059 may be present in the file mode creation mask when more secure file access permission checks  
107060 are implemented.

107061 It has been suggested that trusted systems developers might appreciate ameliorating the  
107062 requirement that the mode mask “affects” the file access permissions, since it seems access  
107063 control lists might replace the mode mask to some degree. The wording has been changed to say  
107064 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
107065 the file access permissions to the description in the System Interfaces volume of POSIX.1-200x.

#### 107066 FUTURE DIRECTIONS

107067 None.

#### 107068 SEE ALSO

107069 [Chapter 2](#) (on page 2245), *chmod*

107071 XSH *umask*

#### 107072 CHANGE HISTORY

107073 First released in Issue 2.

#### 107074 Issue 6

107075 The following new requirements on POSIX implementations derive from alignment with the  
107076 Single UNIX Specification:

- 107077 • The octal mode is supported.

107078 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/34 is applied, making a correction to the  
107079 RATIONALE.

#### 107080 Issue 7

107081 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107082 **NAME**  
 107083 unalias — remove alias definitions

107084 **SYNOPSIS**  
 107085 unalias *alias-name*...  
 107086 unalias -a

107087 **DESCRIPTION**  
 107088 The *unalias* utility shall remove the definition for each alias name specified. See [Section 2.3.1](#) (on  
 107089 page 2248). The aliases shall be removed from the current shell execution environment; see  
 107090 [Section 2.12](#) (on page 2277).

107091 **OPTIONS**  
 107092 The *unalias* utility shall conform to XBD [Section 12.2](#) (on page 201).  
 107093 The following option shall be supported:  
 107094 **-a** Remove all alias definitions from the current shell execution environment.

107095 **OPERANDS**  
 107096 The following operand shall be supported:  
 107097 *alias-name* The name of an alias to be removed.

107098 **STDIN**  
 107099 Not used.

107100 **INPUT FILES**  
 107101 None.

107102 **ENVIRONMENT VARIABLES**  
 107103 The following environment variables shall affect the execution of *unalias*:  
 107104 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107105 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 107106 variables used to determine the values of locale categories.)  
 107107 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107108 internationalization variables.  
 107109 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 107110 characters (for example, single-byte as opposed to multi-byte characters in  
 107111 arguments).  
 107112 **LC\_MESSAGES**  
 107113 Determine the locale that should be used to affect the format and contents of  
 107114 diagnostic messages written to standard error.  
 107115 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

107116 **ASYNCHRONOUS EVENTS**  
 107117 Default.

107118 **STDOUT**  
 107119 Not used.

- 107120 **STDERR**
- 107121 The standard error shall be used only for diagnostic messages.
- 107122 **OUTPUT FILES**
- 107123 None.
- 107124 **EXTENDED DESCRIPTION**
- 107125 None.
- 107126 **EXIT STATUS**
- 107127 The following exit values shall be returned:
- 107128 0 Successful completion.
- 107129 >0 One of the *alias-name* operands specified did not represent a valid alias definition, or an
- 107130 error occurred.
- 107131 **CONSEQUENCES OF ERRORS**
- 107132 Default.
- 107133 **APPLICATION USAGE**
- 107134 Since *unalias* affects the current shell execution environment, it is generally provided as a shell
- 107135 regular built-in.
- 107136 **EXAMPLES**
- 107137 None.
- 107138 **RATIONALE**
- 107139 The *unalias* description is based on that from historical KornShell implementations. Known
- 107140 differences exist between that and the C shell. The KornShell version was adopted to be
- 107141 consistent with all the other KornShell features in this volume of POSIX.1-200x, such as
- 107142 command line editing.
- 107143 The **-a** option is the equivalent of the *unalias \** form of the C shell and is provided to address
- 107144 security concerns about unknown aliases entering the environment of a user (or application)
- 107145 through the allowable implementation-defined predefined alias route or as a result of an *ENV*
- 107146 file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*
- 107147 rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*
- 107148 would have to be quoted in case there was an alias for *unalias*.)
- 107149 **FUTURE DIRECTIONS**
- 107150 None.
- 107151 **SEE ALSO**
- 107152 [Chapter 2](#) (on page 2245), [alias](#)
- 107153 [XBD Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +
- 107154 **CHANGE HISTORY**
- 107155 First released in Issue 4.
- 107156 **Issue 6**
- 107157 This utility is marked as part of the User Portability Utilities option.
- 107158 **Issue 7**
- 107159 The *unalias* utility is moved from the User Portability Utilities option to the Base. User
- 107160 Portability Utilities is now an option for interactive utilities.

107161 **NAME**  
 107162        *uname* — return system name

107163 **SYNOPSIS**  
 107164        *uname* [-amnrsv]

107165 **DESCRIPTION**  
 107166        By default, the *uname* utility shall write the operating system name to standard output. When  
 107167        options are specified, symbols representing one or more system characteristics shall be written to  
 107168        the standard output. The format and contents of the symbols are implementation-defined. On  
 107169        systems conforming to the System Interfaces volume of POSIX.1-200x, the symbols written shall  
 107170        be those supported by the *uname()* function as defined in the System Interfaces volume of  
 107171        POSIX.1-200x.

107172 **OPTIONS**  
 107173        The *uname* utility shall conform to XBD [Section 12.2](#) (on page 201).

107174        The following options shall be supported:

- 107175        **-a**        Behave as though all of the options **-mnrsv** were specified.
- 107176        **-m**        Write the name of the hardware type on which the system is running to standard  
 107177        output.
- 107178        **-n**        Write the name of this node within an implementation-defined communications  
 107179        network.
- 107180        **-r**        Write the current release level of the operating system implementation.
- 107181        **-s**        Write the name of the implementation of the operating system.
- 107182        **-v**        Write the current version level of this release of the operating system  
 107183        implementation.

107184        If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
 107185        option had been specified.

107186 **OPERANDS**  
 107187        None.

107188 **STDIN**  
 107189        Not used.

107190 **INPUT FILES**  
 107191        None.

107192 **ENVIRONMENT VARIABLES**  
 107193        The following environment variables shall affect the execution of *uname*:

- 107194        **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 107195        (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 107196        variables used to determine the values of locale categories.)
- 107197        **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 107198        internationalization variables.
- 107199        **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
 107200        characters (for example, single-byte as opposed to multi-byte characters in  
 107201        arguments).

107202 *LC\_MESSAGES*  
 107203 Determine the locale that should be used to affect the format and contents of  
 107204 diagnostic messages written to standard error.

107205 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

107206 Default.  
 107207

**STDOUT**

107208 By default, the output shall be a single line of the following form:

107209 "*%s\n*", *<sysname>*  
 107210

107211 If the *-a* option is specified, the output shall be a single line of the following form:

107212 "*%s %s %s %s %s\n*", *<sysname>*, *<nodename>*, *<release>*,  
 107213 *<version>*, *<machine>*

107214 Additional implementation-defined symbols may be written; all such symbols shall be written at  
 107215 the end of the line of output before the *<newline>*.

107216 If options are specified to select different combinations of the symbols, only those symbols shall  
 107217 be written, in the order shown above for the *-a* option. If a symbol is not selected for writing, its  
 107218 corresponding trailing *<blank>*s also shall not be written.

**STDERR**

107219 The standard error shall be used only for diagnostic messages.  
 107220

**OUTPUT FILES**

107221 None.  
 107222

**EXTENDED DESCRIPTION**

107223 None.  
 107224

**EXIT STATUS**

107225 The following exit values shall be returned:  
 107226

107227 0 The requested information was successfully written.

107228 >0 An error occurred.

**CONSEQUENCES OF ERRORS**

107229 Default.  
 107230

**APPLICATION USAGE**

107231 Note that any of the symbols could include embedded *<space>*s, which may affect parsing  
 107232 algorithms if multiple options are selected for output.  
 107233

107234 The node name is typically a name that the system uses to identify itself for inter-system  
 107235 communication addressing.

**EXAMPLES**

107236 The following command:  
 107237

107238 *uname -sr*

107239 writes the operating system name and release level, separated by one or more *<blank>*s.

**RATIONALE**

107240 It was suggested that this utility cannot be used portably since the format of the symbols is  
 107241 implementation-defined. The POSIX.1 working group could not achieve consensus on defining  
 107242 these formats in the underlying *uname()* function, and there was no expectation that this volume  
 107243 of POSIX.1-200x would be any more successful. Some applications may still find this historical  
 107244 utility of value. For example, the symbols could be used for system log entries or for comparison  
 107245

107246 with operator or user input.

107247 **FUTURE DIRECTIONS**

107248 None.

107249 **SEE ALSO**

107250 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

107251 XSH [uname](#)

107252 **CHANGE HISTORY**

107253 First released in Issue 2.

107254 **NAME**

107255 uncompress — expand compressed data

107256 **SYNOPSIS**107257 XSI uncompress [-cfv] [*file...*]107258 **DESCRIPTION**

107259 The *uncompress* utility shall restore files to their original state after they have been compressed  
 107260 using the *compress* utility. If no files are specified, the standard input shall be uncompressed to  
 107261 the standard output. If the invoking process has appropriate privileges, the ownership, modes,  
 107262 access time, and modification time of the original file shall be preserved.

107263 This utility shall support the uncompressing of any files produced by the *compress* utility on the  
 107264 same implementation. For files produced by *compress* on other systems, *uncompress* supports 9 to  
 107265 14-bit compression (see *compress*, **-b**); it is implementation-defined whether values of **-b** greater  
 107266 than 14 are supported.

107267 **OPTIONS**

107268 The *uncompress* utility shall conform to XBD [Section 12.2](#) (on page 201), except that Guideline 1  
 107269 does apply since the utility name has ten letters.

107270 The following options shall be supported:

- 107271 **-c** Write to standard output; no files are changed.
- 107272 **-f** Do not prompt for overwriting files. Except when run in the background, if **-f** is  
 107273 not given the user shall be prompted as to whether an existing file should be  
 107274 overwritten. If the standard input is not a terminal and **-f** is not given, *uncompress*  
 107275 shall write a diagnostic message to standard error and exit with a status greater  
 107276 than zero.
- 107277 **-v** Write messages to standard error concerning the expansion of each file.

107278 **OPERANDS**

107279 The following operand shall be supported:

- 107280 *file* A pathname of a file. If *file* already has the **.Z** suffix specified, it shall be used as the  
 107281 input file and the output file shall be named **file** with the **.Z** suffix removed.  
 107282 Otherwise, *file* shall be used as the name of the output file and **file** with the **.Z**  
 107283 suffix appended shall be used as the input file.

107284 **STDIN**

107285 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is **'-'**.

107286 **INPUT FILES**

107287 Input files shall be in the format produced by the *compress* utility.

107288 **ENVIRONMENT VARIABLES**

107289 The following environment variables shall affect the execution of *uncompress*:

- 107290 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107291 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 107292 variables used to determine the values of locale categories.)
- 107293 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107294 internationalization variables.

107295 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 107296 characters (for example, single-byte as opposed to multi-byte characters in  
 107297 arguments).

107298 **LC\_MESSAGES**  
 107299 Determine the locale that should be used to affect the format and contents of  
 107300 diagnostic messages written to standard error.

107301 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 107302 **ASYNCHRONOUS EVENTS**

107303 Default.

#### 107304 **STDOUT**

107305 When there are no *file* operands or the `-c` option is specified, the uncompressed output is written  
 107306 to standard output.

#### 107307 **STDERR**

107308 Prompts shall be written to the standard error output under the conditions specified in the  
 107309 DESCRIPTION and OPTIONS sections. The prompts shall contain the *file* pathname, but their  
 107310 format is otherwise unspecified. Otherwise, the standard error output shall be used only for  
 107311 diagnostic messages.

#### 107312 **OUTPUT FILES**

107313 Output files are the same as the respective input files to *compress*.

#### 107314 **EXTENDED DESCRIPTION**

107315 None.

#### 107316 **EXIT STATUS**

107317 The following exit values shall be returned:

107318 0 Successful completion.

107319 >0 An error occurred.

#### 107320 **CONSEQUENCES OF ERRORS**

107321 The input file remains unmodified.

#### 107322 **APPLICATION USAGE**

107323 The limit of 14 on the *compress* `-b bits` argument is to achieve portability to all systems (within  
 107324 the restrictions imposed by the lack of an explicit published file format). Some implementations  
 107325 based on 16-bit architectures cannot support 15 or 16-bit uncompression.

#### 107326 **EXAMPLES**

107327 None.

#### 107328 **RATIONALE**

107329 None.

#### 107330 **FUTURE DIRECTIONS**

107331 None.

#### 107332 **SEE ALSO**

107333 *compress*, *zcat*

107334 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

#### 107335 **CHANGE HISTORY**

107336 First released in Issue 4.

- 107337 **Issue 6**
- 107338 The normative text is reworded to avoid use of the term “must” for application requirements.
- 107339 **Issue 7**
- 107340 SD5-XCU-ERN-26 is applied, clarifying that this utility is allowed to break the Utility Syntax
- 107341 Guidelines by having ten letters in its name.
- 107342 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107343 **NAME**  
 107344 unexpand — convert spaces to tabs

107345 **SYNOPSIS**  
 107346 unexpand [-a|-t *tablist*] [*file...*]

107347 **DESCRIPTION**  
 107348 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>s  
 107349 at the beginning of each line into the maximum number of <tab>s followed by the minimum  
 107350 number of <space>s needed to fill the same column positions originally filled by the translated  
 107351 <blank>s. By default, tabstops shall be set at every eighth column position. Each <backspace>  
 107352 shall be copied to the output, and shall cause the column position count for tab calculations to be  
 107353 decremented; the count shall never be decremented to a value less than one.

107354 **OPTIONS**  
 107355 The *unexpand* utility shall conform to XBD Section 12.2 (on page 201).

107356 The following options shall be supported:

107357 **-a** In addition to translating <blank>s at the beginning of each line, translate all  
 107358 sequences of two or more <blank>s immediately preceding a tab stop to the  
 107359 maximum number of <tab>s followed by the minimum number of <space>s  
 107360 needed to fill the same column positions originally filled by the translated  
 107361 <blank>s.

107362 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 107363 is a single argument consisting of a single positive decimal integer or multiple  
 107364 positive decimal integers, separated by <blank>s or commas, in ascending order. If  
 107365 a single number is given, tabs shall be set *tablist* column positions apart instead of  
 107366 the default 8. If multiple numbers are given, the tabs shall be set at those specific  
 107367 column positions.

107368 The application shall ensure that each tab-stop position *N* is an integer value  
 107369 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 107370 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 107371 next character output to be in the (*N*+1)th column position on that line. When the  
 107372 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 107373 (except for the interaction with **-a**, described below).

107374 No <space>-to-<tab> conversions shall occur for characters at positions beyond  
 107375 the last of those specified in a multiple tab-stop list.

107376 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 107377 conversion shall not be limited to the processing of leading <blank>s.

107378 **OPERANDS**  
 107379 The following operand shall be supported:

107380 *file* A pathname of a text file to be used as input.

107381 **STDIN**  
 107382 See the INPUT FILES section.

107383 **INPUT FILES**  
 107384 The input files shall be text files.

107385 **ENVIRONMENT VARIABLES**107386 The following environment variables shall affect the execution of *unexpand*:

107387 **LANG** Provide a default value for the internationalization variables that are unset or null. |  
 107388 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
 107389 variables used to determine the values of locale categories.)

107390 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107391 internationalization variables.

107392 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 107393 characters (for example, single-byte as opposed to multi-byte characters in  
 107394 arguments and input files), the processing of <tab>s and <space>s, and for the  
 107395 determination of the width in column positions each character would occupy on  
 107396 an output device.

107397 **LC\_MESSAGES**  
 107398 Determine the locale that should be used to affect the format and contents of  
 107399 diagnostic messages written to standard error.

107400 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107401 **ASYNCHRONOUS EVENTS**

107402 Default.

107403 **STDOUT**

107404 The standard output shall be equivalent to the input files with the specified <space>-to-<tab>  
 107405 conversions.

107406 **STDERR**

107407 The standard error shall be used only for diagnostic messages.

107408 **OUTPUT FILES**

107409 None.

107410 **EXTENDED DESCRIPTION**

107411 None.

107412 **EXIT STATUS**

107413 The following exit values shall be returned:

107414 0 Successful completion.

107415 &gt;0 An error occurred.

107416 **CONSEQUENCES OF ERRORS**

107417 Default.

107418 **APPLICATION USAGE**

107419 One non-intuitive aspect of *unexpand* is its restriction to leading spaces when neither **-a** nor **-t** is  
 107420 specified. Users who always want to convert all spaces in a file can easily alias *unexpand* to use  
 107421 the **-a** or **-t 8** option.

107422 **EXAMPLES**

107423 None.

107424 **RATIONALE**

107425 On several occasions, consideration was given to adding a **-t** option to the *unexpand* utility to  
 107426 complement the **-t** in *expand* (see *expand*). The historical intent of *unexpand* was to translate  
 107427 multiple <blank>s into tab stops, where tab stops were a multiple of eight column positions on  
 107428 most UNIX systems. An early proposal omitted **-t** because it seemed outside the scope of the  
 107429 User Portability Utilities option; it was not described in any of the base documents. However,  
 107430 hard-coding tab stops every eight columns was not suitable for the international community and

107431 broke historical precedents for some vendors in the FORTRAN community, so `-t` was restored in  
 107432 conjunction with the list of valid extension categories considered by the standard developers.  
 107433 Thus, *unexpand* is now the logical converse of *expand*.

#### 107434 FUTURE DIRECTIONS

107435 None.

#### 107436 SEE ALSO

107437 *expand*, *tabs*

107438 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +

#### 107439 CHANGE HISTORY

107440 First released in Issue 4.

#### 107441 Issue 6

107442 This utility is marked as part of the User Portability Utilities option.

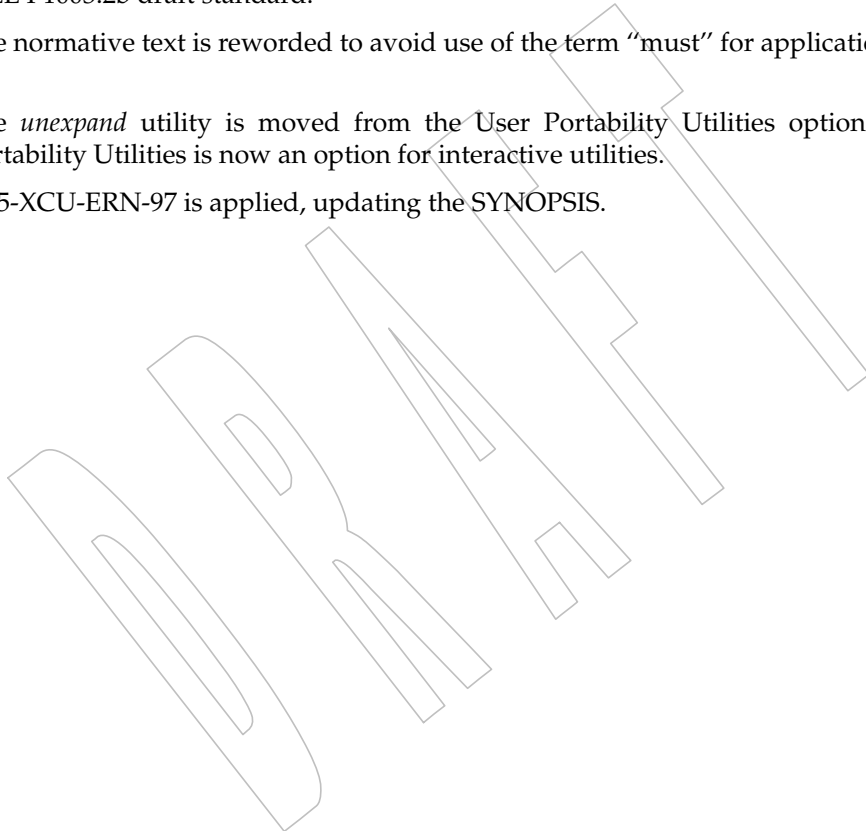

107443 The definition of the `LC_CTYPE` environment variable is changed to align with the  
 107444 IEEE P1003.2b draft standard.

107445 The normative text is reworded to avoid use of the term “must” for application requirements.

#### 107446 Issue 7

107447 The *unexpand* utility is moved from the User Portability Utilities option to the Base. User  
 107448 Portability Utilities is now an option for interactive utilities.

107449 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107450 **NAME**  
 107451 unget — undo a previous get of an SCCS file (**DEVELOPMENT**)

107452 **SYNOPSIS**  
 107453 XSI unget [-ns] [-r *SID*] *file...*

107454 **DESCRIPTION**  
 107455 The *unget* utility shall reverse the effect of a *get* -e done prior to creating the intended new delta.

107456 **OPTIONS**  
 107457 The *unget* utility shall conform to XBD [Section 12.2](#) (on page 201).

107458 The following options shall be supported:

107459 -r *SID* Uniquely identify which delta is no longer intended. (This would have been  
 107460 specified by *get* as the new delta.) The use of this option is necessary only if two or  
 107461 more outstanding *get* commands for editing on the same SCCS file were done by  
 107462 the same person (login name).

107463 -s Suppress the writing to standard output of the intended delta's SID.

107464 -n Retain the file that was obtained by *get*, which would normally be removed from  
 107465 the current directory.

107466 **OPERANDS**  
 107467 The following operands shall be supported:

107468 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *unget*  
 107469 utility shall behave as though each file in the directory were specified as a named  
 107470 file, except that non-SCCS files (last component of the pathname does not begin  
 107471 with s.) and unreadable files shall be silently ignored.

107472 If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 107473 each line of the standard input shall be taken to be the name of an SCCS file to be  
 107474 processed. Non-SCCS files and unreadable files shall be silently ignored.

107475 **STDIN**  
 107476 The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 107477 line of the text file shall be interpreted as an SCCS pathname.

107478 **INPUT FILES**  
 107479 Any SCCS files processed shall be files of an unspecified format.

107480 **ENVIRONMENT VARIABLES**  
 107481 The following environment variables shall affect the execution of *unget*:

107482 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 107483 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 107484 variables used to determine the values of locale categories.)

107485 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107486 internationalization variables.

107487 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107488 characters (for example, single-byte as opposed to multi-byte characters in  
 107489 arguments and input files).

- 107490 **LC\_MESSAGES**
- 107491 Determine the locale that should be used to affect the format and contents of
- 107492 diagnostic messages written to standard error.
- 107493 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 107494 **ASYNCHRONOUS EVENTS**
- 107495 Default.
- 107496 **STDOUT**
- 107497 The standard output shall consist of a line for each file, in the following format:
- 107498 "%s\n", <*SID removed from file*>
- 107499 If there is more than one named file or if a directory or standard input is named, each pathname
- 107500 shall be written before each of the preceding lines:
- 107501 "\n%s:\n", <*pathname*>
- 107502 **STDERR**
- 107503 The standard error shall be used only for diagnostic messages.
- 107504 **OUTPUT FILES**
- 107505 Any SCCS files updated shall be files of an unspecified format. During processing of a *file*, a
- 107506 locking *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and
- 107507 deleted. The *p-file* and *g-file*, as described in *get*, shall be deleted.
- 107508 **EXTENDED DESCRIPTION**
- 107509 None.
- 107510 **EXIT STATUS**
- 107511 The following exit values shall be returned:
- 107512 0 Successful completion.
- 107513 >0 An error occurred.
- 107514 **CONSEQUENCES OF ERRORS**
- 107515 Default.
- 107516 **APPLICATION USAGE**
- 107517 None.
- 107518 **EXAMPLES**
- 107519 None.
- 107520 **RATIONALE**
- 107521 None.
- 107522 **FUTURE DIRECTIONS**

107532

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107533 **NAME**  
 107534 `uniq` — report or filter out repeated lines in a file

107535 **SYNOPSIS**  
 107536 `uniq [-c|-d|-u] [-f fields] [-s char] [input_file [output_file]]`

107537 **DESCRIPTION**  
 107538 The *uniq* utility shall read an input file comparing adjacent lines, and write one copy of each  
 107539 input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 107540 not be written.

107541 Repeated lines in the input shall not be detected if they are not adjacent.

107542 **OPTIONS**  
 107543 The *uniq* utility shall conform to XBD Section 12.2 (on page 201), except that '+' may be  
 107544 recognized as an option delimiter as well as '-'.  
 107545 The following options shall be supported:

107546 **-c** Precede each output line with a count of the number of times the line occurred in  
 107547 the input.

107548 **-d** Suppress the writing of lines that are not repeated in the input.

107549 **-f *fields*** Ignore the first *fields* fields on each input line when doing comparisons, where  
 107550 *fields* is a positive decimal integer. A field is the maximal string matched by the  
 107551 basic regular expression:

107552 `[[:blank:]]*^[[:blank:]]*`

107553 If the *fields* option-argument specifies more fields than appear on an input line, a  
 107554 null string shall be used for comparison.

107555 **-s *chars*** Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 107556 positive decimal integer. If specified in conjunction with the **-f** option, the first  
 107557 *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 107558 argument specifies more characters than remain on an input line, a null string shall  
 107559 be used for comparison.

107560 **-u** Suppress the writing of lines that are repeated in the input.

107561 **OPERANDS**  
 107562 The following operands shall be supported:

107563 *input\_file* A pathname of the input file. If the *input\_file* operand is not specified, or if the  
 107564 *input\_file* is '-', the standard input shall be used.

107565 *output\_file* A pathname of the output file. If the *output\_file* operand is not specified, the  
 107566 standard output shall be used. The results are unspecified if the file named by  
 107567 *output\_file* is the file named by *input\_file*.

107568 **STDIN**  
 107569 The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is '-'.  
 107570 See the INPUT FILES section.

107571 **INPUT FILES**  
 107572 The input file shall be a text file.

107573 **ENVIRONMENT VARIABLES**107574 The following environment variables shall affect the execution of *uniq*:

107575 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
 107576 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
 107577 variables used to determine the values of locale categories.)

107578 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107579 internationalization variables.

107580 *LC\_COLLATE*  
 107581 Determine the locale for ordering rules.

107582 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107583 characters (for example, single-byte as opposed to multi-byte characters in  
 107584 arguments and input files) and which characters constitute a <blank> in the  
 107585 current locale.

107586 *LC\_MESSAGES*  
 107587 Determine the locale that should be used to affect the format and contents of  
 107588 diagnostic messages written to standard error.

107589 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107590 **ASYNCHRONOUS EVENTS**

107591 Default.

107592 **STDOUT**

107593 The standard output shall be used only if no *output\_file* operand is specified. See the OUTPUT  
 107594 FILES section.

107595 **STDERR**

107596 The standard error shall be used only for diagnostic messages.

107597 **OUTPUT FILES**107598 If the *-c* option is specified, the output file shall be empty or each line shall be of the form:

107599 "%d %s", &lt;number of duplicates&gt;, &lt;line&gt;

107600 otherwise, the output file shall be empty or each line shall be of the form:

107601 "%s", &lt;line&gt;

107602 **EXTENDED DESCRIPTION**

107603 None.

107604 **EXIT STATUS**

107605 The following exit values shall be returned:

107606 0 The utility executed successfully.

107607 &gt;0 An error occurred.

107608 **CONSEQUENCES OF ERRORS**

107609 Default.

**APPLICATION USAGE**

The *sort* utility can be used to cause repeated lines to be adjacent in the input file.

**EXAMPLES**

The following input file data (but flushed left) was used for a test series on *uniq*:

```
#01 foo0 bar0 fool bar1
#02 bar0 fool bar1 fool
#03 foo0 bar0 fool bar1
#04
#05 foo0 bar0 fool bar1
#06 foo0 bar0 fool bar1
#07 bar0 fool bar1 foo0
```

What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the input data as a sequence of strings delimited by '\n'. Accordingly, for the *fields* member of the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields*+1th member.

1. This first example tests the line counting option, comparing each line of the input file data starting from the second field:

```
uniq -c -f 1 uniq_0I.t
 1 #01 foo0 bar0 fool bar1
 1 #02 bar0 fool bar1 foo0
 1 #03 foo0 bar0 fool bar1
 1 #04
 2 #05 foo0 bar0 fool bar1
 1 #07 bar0 fool bar1 foo0
```

The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a pair of repeated lines. Given the input data, this can only be true when *uniq* is run using the *-f 1* option (which shall cause *uniq* to ignore the first field on each input line).

2. The second example tests the option to suppress unique lines, comparing each line of the input file data starting from the second field:

```
uniq -d -f 1 uniq_0I.t
#05 foo0 bar0 fool bar1
```

3. This test suppresses repeated lines, comparing each line of the input file data starting from the second field:

```
uniq -u -f 1 uniq_0I.t
#01 foo0 bar0 fool bar1
#02 bar0 fool bar1 fool
#03 foo0 bar0 fool bar1
#04
#07 bar0 fool bar1 foo0
```

4. This suppresses unique lines, comparing each line of the input file data starting from the third character:

```
uniq -d -s 2 uniq_0I.t
```

In the last example, the *uniq* utility found no input matching the above criteria.

107654  
 107655  
 107656  
 107657  
 107658  
 107659  
 107660  
 107661  
 107662  
 107663  
 107664  
 107665  
 107666  
 107667  
 107668  
 107669  
 107670  
 107671  
 107672  
 107673  
 107674  
 107675

**RATIONALE**

Some historical implementations have limited lines to be 1 080 bytes in length, which does not meet the implied {LINE\_MAX} limit.

Earlier versions of this standard allowed the *-number* and *+number* options. These options are no longer specified by POSIX.1-200x but may be present in some implementations.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*comm*, *sort*

XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The obsolescent SYNOPSIS and associated text are removed.

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/40 is applied, adding *LC\_COLLATE* to the ENVIRONMENT VARIABLES section, and changing “the application shall ensure that” in the OUTPUT FILES section.

**Issue 7**

Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that ‘+’ may be recognized as an option delimiter in the OPTIONS section.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107676 **NAME**  
 107677 unlink — call the *unlink()* function

107678 **SYNOPSIS**  
 107679 XSI unlink *file*

107680 **DESCRIPTION**  
 107681 The *unlink* utility shall perform the function call:

107682 unlink(*file*);

107683 A user may need appropriate privilege to invoke the *unlink* utility.

107684 **OPTIONS**  
 107685 None.

107686 **OPERANDS**  
 107687 The following operands shall be supported:  
 107688 *file* The pathname of an existing file.

107689 **STDIN**  
 107690 Not used.

107691 **INPUT FILES**  
 107692 Not used.

107693 **ENVIRONMENT VARIABLES**  
 107694 The following environment variables shall affect the execution of *unlink*:

107695 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
 107696 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 107697 variables used to determine the values of locale categories.)

107698 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 107699 internationalization variables.

107700 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 107701 characters (for example, single-byte as opposed to multi-byte characters in  
 107702 arguments).

107703 *LC\_MESSAGES*  
 107704 Determine the locale that should be used to affect the format and contents of  
 107705 diagnostic messages written to standard error.

107706 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

107707 **ASYNCHRONOUS EVENTS**  
 107708 Default.

107709 **STDOUT**  
 107710 None.

107711 **STDERR**  
 107712 The standard error shall be used only for diagnostic messages.

**unlink***Utilities*

107713 **OUTPUT FILES**  
107714 None.

107715 **EXTENDED DESCRIPTION**  
107716 None.

107717 **EXIT STATUS**  
107718 The following exit values shall be returned:  
107719 0 Successful completion.  
107720 >0 An error occurred.

107721 **CONSEQUENCES OF ERRORS**  
107722 Default.

107723 **APPLICATION USAGE**  
107724 None.

107725 **EXAMPLES**  
107726 None.

107727 **RATIONALE**  
107728 None.

107729 **FUTURE DIRECTIONS**  
107730 None.

107734 XSH *unlink*

107735 **CHANGE HISTORY**  
107736 First released in Issue 5.

107737 **NAME**

107738 uucp — system-to-system copy

107739 **SYNOPSIS**

107740 UU uucp [-cCdfjmr] [-n user] source-file... destination-file

107741 **DESCRIPTION**107742 The *uucp* utility shall copy files named by the *source-file* argument to the *destination-file* argument.  
107743 The files named can be on local or remote systems.107744 The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
107745 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
107746 filenames need not be portable to non-internationalized systems, and so on. Under these  
107747 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
107748 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
107749 and that only characters defined in the portable filename character set be used for naming files.  
107750 The protocol for transfer of files is unspecified by POSIX.1-200x.107751 Typical implementations of this utility require a communications line configured to use XBD  
107752 [Chapter 11](#) (on page 185), but other communications means may be used. On systems where  
107753 there are no available communications means (either temporarily or permanently), this utility  
107754 shall write an error message describing the problem and exit with a non-zero exit status.107755 **OPTIONS**107756 The *uucp* utility shall conform to XBD [Section 12.2](#) (on page 201).

107757 The following options shall be supported:

- 107758 **-c** Do not copy local file to the spool directory for transfer to the remote machine  
107759 (default).
- 107760 **-C** Force the copy of local files to the spool directory for transfer.
- 107761 **-d** Make all necessary directories for the file copy (default).
- 107762 **-f** Do not make intermediate directories for the file copy.
- 107763 **-j** Write the job identification string to standard output. This job identification can be  
107764 used by *uustat* to obtain the status or terminate a job.
- 107765 **-m** Send mail to the requester when the copy is completed.
- 107766 **-n user** Notify *user* on the remote system that a file was sent.
- 107767 **-r** Do not start the file transfer; just queue the job.

107768 **OPERANDS**

107769 The following operands shall be supported:

107770 *destination-file*, *source-file*107771 A pathname of a file to be copied to, or from, respectively. Either name can be a  
107772 pathname on the local machine, or can have the form:107773 *system-name!pathname*107774 where *system-name* is taken from a list of system names that *uucp* knows about.  
107775 The destination *system-name* can also be a list of names such as:107776 *system-name!system-name!...!system-name!pathname*

107777 in which case, an attempt is made to send the file via the specified route to the

107778 destination. Care should be taken to ensure that intermediate nodes in the route  
107779 are willing to forward information.

107780 The shell pattern matching notation characters '?', '\*', and "[...]" appearing  
107781 in *pathname* shall be expanded on the appropriate system.

107782 Pathnames can be one of:

- 107783 1. An absolute pathname.
- 107784 2. A pathname preceded by *~user* where *user* is a login name on the specified  
107785 system and is replaced by that user's login directory. Note that if an invalid  
107786 login is specified, the default is to the public directory (called *PUBDIR*; the  
107787 actual location of *PUBDIR* is implementation-defined).
- 107788 3. A pathname preceded by *~/destination* where *destination* is appended to  
107789 *PUBDIR*.

107790 **Note:** This destination is treated as a filename unless more than one file is being  
107791 transferred by this request or the destination is already a directory. To  
107792 ensure that it is a directory, follow the destination with a '/'. For  
107793 example, *~/dan/* as the destination makes the directory *PUBDIR/dan* if it  
107794 does not exist and puts the requested files in that directory.

- 107795 4. Anything else shall be prefixed by the current directory.

107796 If the result is an erroneous pathname for the remote system, the copy shall fail. If  
107797 the *destination-file* is a directory, the last part of the *source-file* name shall be used.

107798 The read, write, and execute permissions given by *uucp* are implementation-  
107799 defined.

#### 107800 STDIN

107801 Not used.

#### 107802 INPUT FILES

107803 The files to be copied are regular files.

#### 107804 ENVIRONMENT VARIABLES

107805 The following environment variables shall affect the execution of *uucp*:

107806 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
107807 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
107808 variables used to determine the values of locale categories.)

107809 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
107810 internationalization variables.

107811 *LC\_COLLATE*

107812 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
107813 character collating elements within bracketed filename patterns.

107814 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
107815 characters (for example, single-byte as opposed to multi-byte characters in  
107816 arguments and input files) and the behavior of character classes within bracketed  
107817 filename patterns (for example, "[[:lower:]]\*").

107818 *LC\_MESSAGES*

107819 Determine the locale that should be used to affect the format and contents of  
107820 diagnostic messages written to standard error, and informative messages written  
107821 to standard output.

107822 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 107823 **ASYNCHRONOUS EVENTS**

107824 Default.

## 107825 **STDOUT**

107826 Not used.

## 107827 **STDERR**

107828 The standard error shall be used only for diagnostic messages.

## 107829 **OUTPUT FILES**

107830 The output files (which may be on other systems) are copies of the input files.

107831 If **-m** is used, mail files are modified.

## 107832 **EXTENDED DESCRIPTION**

107833 None.

## 107834 **EXIT STATUS**

107835 The following exit values shall be returned:

107836 0 Successful completion.

107837 >0 An error occurred.

## 107838 **CONSEQUENCES OF ERRORS**

107839 Default.

## 107840 **APPLICATION USAGE**

107841 This utility is part of the UUCP Utilities option and need not be supported by all  
107842 implementations.

107843 The domain of remotely accessible files can (and for obvious security reasons usually should) be  
107844 severely restricted.

107845 Note that the `'!'` character in addresses has to be escaped when using *csh* as a command  
107846 interpreter because of its history substitution syntax. For *ksh* and *sh* the escape is not necessary,  
107847 but may be used.

107848 As noted above, shell metacharacters appearing in pathnames are expanded on the appropriate  
107849 system. On an internationalized system, this is done under the control of local settings of  
107850 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
107851 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
107852 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
107853 need not be supported on non-internationalized systems.

## 107854 **EXAMPLES**

107855 None.

## 107856 **RATIONALE**

107857 None.

## 107858 **FUTURE DIRECTIONS**

107859 None.

## 107860 **SEE ALSO**

107861 *mailx*, *uuencode*, *uustat*, *uux*

107863

**CHANGE HISTORY**

107864

First released in Issue 2.

107865

**Issue 6**

107866

The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

107867

The UN margin codes and associated shading are removed from the *-C*, *-f*, *-j*, *-n*, and *-r* options in response to The Open Group Base Resolution bwg2001-003.

107868

107869

**Issue 7**

107870

SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

107871

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107872 **NAME**  
 107873 uudecode — decode a binary file

107874 **SYNOPSIS**  
 107875 uudecode [-o *outfile*] [*file*]

107876 **DESCRIPTION**  
 107877 The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 107878 created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 107879 compatible with one of the formats specified in *uuencode*, and attempt to create or overwrite the  
 107880 file described by the data (or overridden by the **-o** option). The pathname shall be contained in  
 107881 the data or specified by the **-o** option. The file access permission bits and contents for the file to  
 107882 be produced shall be contained in that data. The mode bits of the created file (other than  
 107883 standard output) shall be set from the file access permission bits contained in the data; that is,  
 107884 other attributes of the mode, including the file mode creation mask (see *umask*), shall not affect  
 107885 the file being produced. If either of the *op* characters '+' and '-' (see *chmod*) are specified in  
 107886 symbolic mode, the initial mode on which those operations are based is unspecified.

107887 If the pathname of the file to be produced exists, and the user does not have write permission on  
 107888 that file, *uudecode* shall terminate with an error. If the pathname of the file to be produced exists,  
 107889 and the user has write permission on that file, the existing file shall be overwritten.

107890 If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 107891 than on the target system, the results of *uudecode* are unspecified.

107892 **OPTIONS**  
 107893 The *uudecode* utility shall conform to XBD [Section 12.2](#) (on page 201).

107894 The following option shall be supported by the implementation:

107895 **-o *outfile*** A pathname of a file that shall be used instead of any pathname contained in the  
 107896 input data. Specifying an *outfile* option-argument of **/dev/stdout** shall indicate  
 107897 standard output.

107898 **OPERANDS**  
 107899 The following operand shall be supported:  
 107900 *file* The pathname of a file containing the output of *uuencode*.

107901 **STDIN**  
 107902 See the INPUT FILES section.

107903 **INPUT FILES**  
 107904 The input files shall be files containing the output of *uuencode*.

107905 **ENVIRONMENT VARIABLES**  
 107906 The following environment variables shall affect the execution of *uudecode*:

107907 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 107908 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 107909 variables used to determine the values of locale categories.)

107910 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 107911 internationalization variables.

107912 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 107913 characters (for example, single-byte as opposed to multi-byte characters in  
 107914 arguments and input files).

- 107915 *LC\_MESSAGES*
- 107916 Determine the locale that should be used to affect the format and contents of
- 107917 diagnostic messages written to standard error.
- 107918 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 107919 **ASYNCHRONOUS EVENTS**
- 107920 Default.
- 107921 **STDOUT**
- 107922 If the file data header encoded by *uuencode* is `-` or `/dev/stdout`, or the `-o /dev/stdout` option
- 107923 overrides the file data, the standard output shall be in the same format as the file originally
- 107924 encoded by *uuencode*. Otherwise, the standard output shall not be used.
- 107925 **STDERR**
- 107926 The standard error shall be used only for diagnostic messages.
- 107927 **OUTPUT FILES**
- 107928 The output file shall be in the same format as the file originally encoded by *uuencode*.
- 107929 **EXTENDED DESCRIPTION**
- 107930 None.
- 107931 **EXIT STATUS**
- 107932 The following exit values shall be returned:
- 107933 0 Successful completion.
- 107934 >0 An error occurred.
- 107935 **CONSEQUENCES OF ERRORS**
- 107936 Default.
- 107937 **APPLICATION USAGE**
- 107938 The user who is invoking *uudecode* must have write permission on any file being created.
- 107939 The output of *uuencode* is essentially an encoded bit stream that is not cognizant of byte
- 107940 boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source,
- 107941 if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only
- 107942 data that is meaningful for such a transfer between architectures is generally character data.
- 107943 **EXAMPLES**
- 107944 None.
- 107945 **RATIONALE**
- 107946 Input files are not necessarily text files, as stated by an early proposal. Although the *uuencode*
- 107947 output is a text file, that output could have been wrapped within another file or mail message
- 107948 that is not a text file.
- 107949 The `-o` option is not historical practice, but was added at the request of WG15 so that the user
- 107950 could override the target pathname without having to edit the input data itself.
- 107951 In early drafts, the `[-o outfile]` option-argument allowed the use of `-` to mean standard output.
- 107952 The symbol `-` has only been used previously in POSIX.1-200x as a standard input indicator. The
- 107953 standard developers did not wish to overload the meaning of `-` in this manner. The `/dev/stdout`
- 107954 concept exists on most modern systems. The `/dev/stdout` syntax does not refer to a new special
- 107955 file. It is just a magic cookie to specify standard output.
- 107956 **FUTURE DIRECTIONS**
- 107957 None.

+

**CHANGE HISTORY**

First released in Issue 4.

**Issue 6**

This utility is marked as part of the User Portability Utilities option.

The `-o outfile` option is added, as specified in the IEEE P1003.2b draft standard.

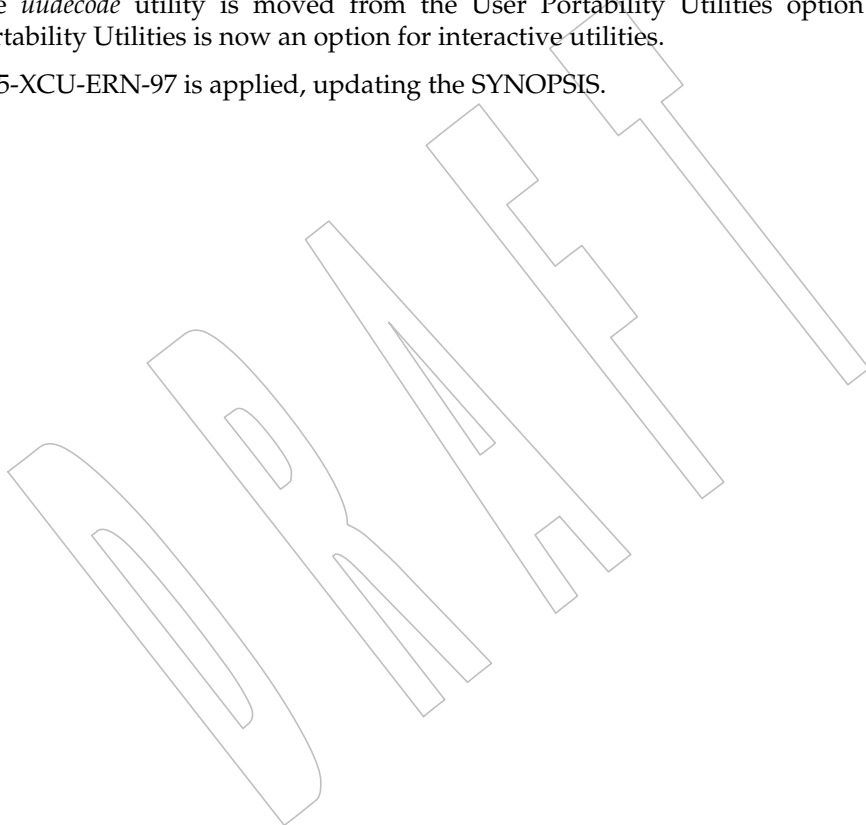

The normative text is reworded to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/35 is applied, clarifying in the DESCRIPTION that the initial mode used if either of the *op* characters is '+' or '-' is unspecified.

**Issue 7**

The *uudecode* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

107974 **NAME**

107975 uuencode — encode a binary file

107976 **SYNOPSIS**107977 uuencode [-m] [*file*] *decode\_pathname*107978 **DESCRIPTION**

107979 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 107980 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 107981 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 107982 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 107983 another system that conforms to this volume of POSIX.1-200x.

107984 **OPTIONS**107985 The *uuencode* utility shall conform to XBD [Section 12.2](#) (on page 201).

107986 The following option shall be supported by the implementation:

107987 **-m** Encode the output using the MIME Base64 algorithm described in STDOUT. If **-m**  
 107988 is not specified, the historical algorithm described in STDOUT shall be used.

107989 **OPERANDS**

107990 The following operands shall be supported:

107991 *decode\_pathname*

107992 The pathname of the file into which the *uudecode* utility shall place the decoded  
 107993 file. Specifying a *decode\_pathname* operand of */dev/stdout* shall indicate that  
 107994 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 107995 are not in the portable filename character set the results are unspecified.

107996 *file* A pathname of the file to be encoded.107997 **STDIN**

107998 See the INPUT FILES section.

107999 **INPUT FILES**

108000 Input files can be files of any type.

108001 **ENVIRONMENT VARIABLES**108002 The following environment variables shall affect the execution of *uuencode*:

108003 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108004 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 108005 variables used to determine the values of locale categories.)

108006 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108007 internationalization variables.

108008 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108009 characters (for example, single-byte as opposed to multi-byte characters in  
 108010 arguments and input files).

108011 **LC\_MESSAGES**

108012 Determine the locale that should be used to affect the format and contents of  
 108013 diagnostic messages written to standard error.

108014 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

108015 **ASYNCHRONOUS EVENTS**

108016 Default.

108017 **STDOUT**108018 **uuencode Base64 Algorithm**

108019 The standard output shall be a text file (encoded in the character set of the current locale) that  
 108020 begins with the line:

108021 "begin-base64 $\Delta$ %s $\Delta$ %s\n", <mode>, <decode\_pathname>

108022 and ends with the line:

108023 "====\n"

108024 In both cases, the lines shall have no preceding or trailing <blank>s.

108025 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
 108026 characters. Proceeding from left to right, a 24-bit input group shall be formed by concatenating  
 108027 three 8-bit input groups. Each 24-bit input group then shall be treated as four concatenated 6-bit  
 108028 groups, each of which shall be translated into a single digit in the Base64 alphabet. When  
 108029 encoding a bit stream via the Base64 encoding, the bit stream shall be presumed to be ordered  
 108030 with the most-significant bit first. That is, the first bit in the stream shall be the high-order bit in  
 108031 the first byte, and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit  
 108032 group is used as an index into an array of 64 printable characters, as shown in Table 4-21.

108033 **Table 4-21 uuencode Base64 Values**

| Value | Encoding | Value | Encoding | Value | Encoding | Value | Encoding |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 0     | A        | 17    | R        | 34    | i        | 51    | z        |
| 1     | B        | 18    | S        | 35    | j        | 52    | 0        |
| 2     | C        | 19    | T        | 36    | k        | 53    | 1        |
| 3     | D        | 20    | U        | 37    | l        | 54    | 2        |
| 4     | E        | 21    | V        | 38    | m        | 55    | 3        |
| 5     | F        | 22    | W        | 39    | n        | 56    | 4        |
| 6     | G        | 23    | X        | 40    | o        | 57    | 5        |
| 7     | H        | 24    | Y        | 41    | p        | 58    | 6        |
| 8     | I        | 25    | Z        | 42    | q        | 59    | 7        |
| 9     | J        | 26    | a        | 43    | r        | 60    | 8        |
| 10    | K        | 27    | b        | 44    | s        | 61    | 9        |
| 11    | L        | 28    | c        | 45    | t        | 62    | +        |
| 12    | M        | 29    | d        | 46    | u        | 63    | /        |
| 13    | N        | 30    | e        | 47    | v        |       |          |
| 14    | O        | 31    | f        | 48    | w        | (pad) | =        |
| 15    | P        | 32    | g        | 49    | x        |       |          |
| 16    | Q        | 33    | h        | 50    | y        |       |          |

108052 The character referenced by the index shall be placed in the output string.

108053 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
 108054 each. All line breaks or other characters not found in the table shall be ignored by decoding  
 108055 software (see *uudecode*).

108056 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
 108057 or encapsulated part of a message. A full encoding quantum shall always be completed at the  
 108058 end of a message. When fewer than 24 input bits are available in an input group, zero bits shall  
 108059 be added (on the right) to form an integral number of 6-bit groups. Output character positions

108060 that are not required to represent actual input data shall be set to the character '='. Since all  
108061 Base64 input is an integral number of octets, only the following cases can arise:

- 108062 1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit  
108063 of encoded output shall be an integral multiple of 4 characters with no '=' padding.
- 108064 2. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded  
108065 output shall be three characters followed by one '=' padding character.
- 108066 3. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded  
108067 output shall be two characters followed by two '=' padding characters.

108068 A terminating "====" evaluates to nothing and denotes the end of the encoded data.

#### 108069 uuencode Historical Algorithm

108070 The standard output shall be a text file (encoded in the character set of the current locale) that  
108071 begins with the line:

108072 "beginΔ%sΔ%s\n" <mode>, <decode\_pathname>

108073 and ends with the line:

108074 "end\n"

108075 In both cases, the lines shall have no preceding or trailing <blank>s.

108076 The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input  
108077 and writes four characters of output by splitting the input at six-bit intervals into four octets,  
108078 containing data in the lower six bits only. These octets shall be converted to characters by adding  
108079 a value of 0x20 to each octet, so that each octet is in the range [0x20,0x5f], and then it shall be  
108080 assumed to represent a printable character in the ISO/IEC 646:1991 standard encoded character  
108081 set. It then shall be translated into the corresponding character codes for the codeset in use in the  
108082 current locale. (For example, the octet 0x41, representing 'A', would be translated to 'A' in the  
108083 current codeset, such as 0xc1 if it were EBCDIC.)

108084 Where the bits of two octets are combined, the least significant bits of the first octet shall be  
108085 shifted left and combined with the most significant bits of the second octet shifted right. Thus  
108086 the three octets *A*, *B*, *C* shall be converted into the four octets:

108087  $0x20 + (((A \gg 2) \ll 6) \mid ((B \gg 4) \& 0xF)) \& 0x3F$

108088  $0x20 + (((A \ll 4) \mid ((B \gg 2) \& 0x3)) \& 0x3F) \mid ((C \gg 6) \& 0x3) \& 0x3F$

108089  $0x20 + (((B \ll 2) \mid ((C \gg 4) \& 0xF)) \& 0x3F) \mid ((C \gg 2) \& 0x3) \& 0x3F$

108090  $0x20 + (((C \ll 0) \mid ((C \gg 0) \& 0x3)) \& 0x3F)$

108091 These octets then shall be translated into the local character set.

108092 Each encoded line contains a length character, equal to the number of characters to be decoded  
108093 plus 0x20 translated to the local character set as described above, followed by the encoded  
108094 characters. The maximum number of octets to be encoded on each line shall be 45.

#### 108095 STDERR

108096 The standard error shall be used only for diagnostic messages.

#### 108097 OUTPUT FILES

108098 None.

#### 108099 EXTENDED DESCRIPTION

108100 None.

108101 **EXIT STATUS**

108102 The following exit values shall be returned:

108103 0 Successful completion.

108104 &gt;0 An error occurred.

108105 **CONSEQUENCES OF ERRORS**

108106 Default.

108107 **APPLICATION USAGE**108108 The file is expanded by 35 percent (each three octets become four, plus control information)  
108109 causing it to take longer to transmit.

108110 Since this utility is intended to create files to be used for data interchange between systems with  
108111 possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
108112 standard was chosen for a midpoint in the algorithm as a known reference point. The output  
108113 from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
108114 standard codeset, it might not be a text file (at least because the <newline>s might not match),  
108115 and the goal of creating a text file would be defeated. If this text file was then carried to another  
108116 machine with the same codeset, it would be perfectly compatible with that system's *uudecode*. If  
108117 it was transmitted over a mail system or sent to a machine with a different codeset, it is assumed  
108118 that, as for every other text file, some translation mechanism would convert it (by the time it  
108119 reached a user on the other system) into an appropriate codeset. This translation only makes  
108120 sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
108121 representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
108122 intermixed with other text files in the same codeset.

108123 **EXAMPLES**

108124 None.

108125 **RATIONALE**

108126 A new algorithm was added at the request of the international community to parallel work in  
108127 RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
108128 is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
108129 65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
108130 per printable character. (The extra 65th character, '=', is used to signify a special processing  
108131 function.)

108132 This subset has the important property that it is represented identically in all versions of the  
108133 ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
108134 represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
108135 share this property, which is the reason that a second algorithm was added to the ISO POSIX-2  
108136 standard.

108137 The string "====" was used for the termination instead of the end used in the original format  
108138 because the latter is a string that could be valid encoded input.

108139 In an early draft, the `-m` option was named `-b` (for Base64), but it was renamed to reflect its  
108140 relationship to the RFC 2045. A `-u` was also present to invoke the default algorithm, but since  
108141 this was not historical practice, it was omitted as being unnecessary.

108142 See the RATIONALE section in *uudecode* for the derivation of the `/dev/stdout` symbol.

108143 **FUTURE DIRECTIONS**

108144 None.

108145 **SEE ALSO**108146 *chmod, mailx, uuencode*108147 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +108148 **CHANGE HISTORY**

108149 First released in Issue 4.

108150 **Issue 6**

108151 This utility is marked as part of the User Portability Utilities option.

108152 The Base64 algorithm and the ability to output to `/dev/stdout` are added as specified in the  
108153 IEEE P1003.2b draft standard.108154 **Issue 7**108155 The *uuencode* utility is moved from the User Portability Utilities option to the Base. User  
108156 Portability Utilities is now an option for interactive utilities.

108157 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108158 **NAME**  
 108159 uustat — uucp status inquiry and job control

108160 **SYNOPSIS**  
 108161 UU uustat [-q|-k *jobid*|-r *jobid*]  
 108162 uustat [-s *system*] [-u *user*]

108163 **DESCRIPTION**  
 108164 The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
 108165 provide general status on *uucp* connections to other systems.

108166 When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
 108167 issued by the current user.

108168 Typical implementations of this utility require a communications line configured to use XBD  
 108169 Chapter 11 (on page 185), but other communications means may be used. On systems where  
 108170 there are no available communications means (either temporarily or permanently), this utility  
 108171 shall write an error message describing the problem and exit with a non-zero exit status.

108172 **OPTIONS**  
 108173 The *uustat* utility shall conform to XBD Section 12.2 (on page 201).

108174 The following options shall be supported:

108175 **-q** Write the jobs queued for each machine.  
 108176 **-k *jobid*** Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
 108177 that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
 108178 has appropriate privileges.  
 108179 **-r *jobid*** Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
 108180 modification time is set to the current time. This prevents the cleanup program  
 108181 from deleting the job until the jobs modification time reaches the limit imposed by  
 108182 the program.  
 108183 **-s *system*** Write the status of all *uucp* requests for remote system *system*.  
 108184 **-u *user*** Write the status of all *uucp* requests issued by *user*.

108185 **OPERANDS**  
 108186 None.

108187 **STDIN**  
 108188 Not used.

108189 **INPUT FILES**  
 108190 None.

108191 **ENVIRONMENT VARIABLES**  
 108192 The following environment variables shall affect the execution of *uustat*:

108193 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 108194 (See XBD Section 8.2 (on page 160) for the precedence of internationalization  
 108195 variables used to determine the values of locale categories.)  
 108196 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108197 internationalization variables.

108198 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108199 characters (for example, single-byte as opposed to multi-byte characters in  
 108200 arguments).

108201 **LC\_MESSAGES**  
 108202 Determine the locale that should be used to affect the format and contents of  
 108203 diagnostic messages written to standard error, and informative messages written  
 108204 to standard output.

108205 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 108206 **ASYNCHRONOUS EVENTS**

108207 Default.

## 108208 **STDOUT**

108209 The standard output shall consist of information about each job selected, in an unspecified  
 108210 format. The information shall include at least the job ID, the user ID or name, and the remote  
 108211 system name.

## 108212 **STDERR**

108213 The standard error shall be used only for diagnostic messages.

## 108214 **OUTPUT FILES**

108215 None.

## 108216 **EXTENDED DESCRIPTION**

108217 None.

## 108218 **EXIT STATUS**

108219 The following exit values shall be returned:

108220 0 Successful completion.

108221 >0 An error occurred.

## 108222 **CONSEQUENCES OF ERRORS**

108223 Default.

## 108224 **APPLICATION USAGE**

108225 This utility is part of the UUCP Utilities option and need not be supported by all  
 108226 implementations.

## 108227 **EXAMPLES**

108228 None.

## 108229 **RATIONALE**

108230 None.

## 108231 **FUTURE DIRECTIONS**

108232 None.

## 108233 **SEE ALSO**

108234 *uucp*

## 108236 **CHANGE HISTORY**

108237 First released in Issue 2.

### 108238 **Issue 6**

108239 The normative text is reworded to avoid use of the term “must” for application requirements.

108240 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

108241 The UN margin code and associated shading are removed from the *-q* option in response to The

- 108242 Open Group Base Resolution bwg2001-003.
- 108243 **Issue 7**
- 108244 SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.
- 108245 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108246 **NAME**

108247 uux — remote command execution

108248 **SYNOPSIS**108249 UU uux [-jnp] *command-string*108250 **DESCRIPTION**

108251 The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 108252 [Section 2.9](#), on page 2263) on a specified system, and then send the standard output of the  
 108253 command to a file on a specified system. Only the first command of a pipeline can have a *system-*  
 108254 *name!* prefix. All other commands in the pipeline shall be executed on the system of the first  
 108255 command.

108256 The following restrictions are applicable to the shell pipeline processed by *uux*:

- 108257 • In gathering files from different systems, pathname expansion shall not be performed by  
 108258 *uux*. Thus, a request such as:

108259 uux "c99 remsys!~/\*.c"

108260 would attempt to copy the file named literally \*.c to the local system.

- 108261 • The redirection operators ">>", "<<", ">|", and ">&" shall not be accepted. Any use of  
 108262 these redirection operators shall cause this utility to write an error message describing the  
 108263 problem and exit with a non-zero exit status.

- 108264 • The reserved word ! cannot be used at the head of the pipeline to modify the exit status.  
 108265 (See the *command-string* operand description below.)

- 108266 • Alias substitution shall not be performed.

108267 A filename can be specified as for *uucp*; it can be an absolute pathname, a pathname preceded by  
 108268 *~name* (which is replaced by the corresponding login directory), a pathname specified as *~/dest*  
 108269 (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 108270 implementation-defined), or a simple filename (which is prefixed by *uux* with the current  
 108271 directory). See *uucp* for the details.

108272 The execution of commands on remote systems shall take place in an execution directory known  
 108273 to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 108274 already reside on that machine. Therefore, the application shall ensure that non-local filenames  
 108275 (without path or machine reference) are unique within the *uux* request.

108276 The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 108277 the application shall ensure that the filename is escaped using parentheses.

108278 The remote system shall notify the user by mail if the requested command on the remote system  
 108279 was disallowed or the files were not accessible. This notification can be turned off by the *-n*  
 108280 option.

108281 Typical implementations of this utility require a communications line configured to use XBD |  
 108282 [Chapter 11](#) (on page 185), but other communications means may be used. On systems where |  
 108283 there are no available communications means (either temporarily or permanently), this utility |  
 108284 shall write an error message describing the problem and exit with a non-zero exit status.

108285 The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 108286 example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
 108287 filenames need not be portable to non-internationalized systems, and so on. Under these  
 108288 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991

108289 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used  
 108290 and that only characters defined in the portable filename character set be used for naming files.

**OPTIONS**

108291 The *uux* utility shall conform to XBD Section 12.2 (on page 201). |

108293 The following options shall be supported:

- 108294 **-j** Write the job identification string to standard output. This job identification can be  
 108295 used by *uustat* to obtain the status or terminate a job. -
- 108296 **-n** Do not notify the user if the command fails.
- 108297 **-p** Make the standard input to *uux* the standard input to the *command-string*. +

**OPERANDS**

108298 The following operand shall be supported:

108300 *command-string*

108301 A string made up of one or more arguments that are similar to normal command  
 108302 arguments, except that the command and any filenames can be prefixed by *system-*  
 108303 *name!*. A null *system-name* shall be interpreted as the local system.

**STDIN**

108304 The standard input shall not be used unless the *'-'* or **-p** option is specified; in those cases, the  
 108305 standard input shall be made the standard input of the *command-string*.  
 108306

**INPUT FILES**

108307 Input files shall be selected according to the contents of *command-string*.  
 108308

**ENVIRONMENT VARIABLES**

108309 The following environment variables shall affect the execution of *uux*:

108311 **LANG** Provide a default value for the internationalization variables that are unset or null. |  
 108312 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 108313 variables used to determine the values of locale categories.)

108314 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 108315 internationalization variables.

108316 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108317 characters (for example, single-byte as opposed to multi-byte characters in  
 108318 arguments).

108319 **LC\_MESSAGES**  
 108320 Determine the locale that should be used to affect the format and contents of  
 108321 diagnostic messages written to standard error.

108322 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**ASYNCHRONOUS EVENTS**

108323 Default.  
 108324

**STDOUT**

108325 The standard output shall not be used unless the **-j** option is specified; in that case, the job  
 108326 identification string shall be written to standard output in the following format:  
 108327

108328 "%s\n", <*jobid*>

**STDERR**

108329 The standard error shall be used only for diagnostic messages.  
 108330

**OUTPUT FILES**

108331 Output files shall be created or written, or both, according to the contents of *command-string*.  
 108332

108333 If **-n** is not used, mail files shall be modified following any command or file-access failures on  
 108334 the remote system.

**EXTENDED DESCRIPTION**

108335 None.  
 108336

**EXIT STATUS**

108337 The following exit values shall be returned:  
 108338

108339 0 Successful completion.

108340 >0 An error occurred.

**CONSEQUENCES OF ERRORS**

108341 Default.  
 108342

**APPLICATION USAGE**

108343 This utility is part of the UUCP Utilities option and need not be supported by all  
 108344 implementations.  
 108345

108346 Note that, for security reasons, many installations limit the list of commands executable on  
 108347 behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
 108348 via *uux*.

108349 Any characters special to the command interpreter should be quoted either by quoting the entire  
 108350 *command-string* or quoting the special characters as individual arguments.

108351 As noted in *uucp*, shell pattern matching notation characters appearing in pathnames are  
 108352 expanded on the appropriate local system. This is done under the control of local settings of  
 108353 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
 108354 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
 108355 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
 108356 need not be supported on non-internationalized systems.

**EXAMPLES**

108357  
 108358 1. The following command gets **file1** from system **a** and **file2** from system **b**, executes *diff* on  
 108359 the local system, and puts the results in **file.diff** in the local *PUBDIR* directory. (*PUBDIR*  
 108360 is the *uucp* public directory on the local system.)

108361 `uux "!diff a!/usr/file1 b!/a4/file2 >!~/file.diff"`

108362 2. The following command fails because *uux* places all files copied to a system in the same  
 108363 working directory. Although the files **xyz** are from two different systems, their filenames  
 108364 are the same and conflict.

108365 `uux "!diff a!/usr1/xyz b!/usr2/xyz >!~/xyz.diff"`

108366 3. The following command succeeds (assuming *diff* is permitted on system **a**) because the  
 108367 file local to system **a** is not copied to the working directory, and hence does not conflict  
 108368 with the file from system **c**.

108369 `uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"`

**RATIONALE**

108370 None.  
 108371

- 108372 **FUTURE DIRECTIONS**
- 108373       None.
- 108374 **SEE ALSO**
- 108375       Chapter 2 (on page 2245), *uucp*, *uuencode*, *uustat*
- 108376       XBD Chapter 8 (on page 159), Chapter 11 (on page 185), Section 12.2 (on page 201) +
- 108377 **CHANGE HISTORY**
- 108378       First released in Issue 2.
- 108379 **Issue 6**
- 108380       The obsolescent SYNOPSIS is removed.
- 108381       The normative text is reworded to avoid use of the term “must” for application requirements.
- 108382       The UN margin code and associated shading are removed from the `-j` option in response to The
- 108383       Open Group Base Resolution bwg2001-003.
- 108384 **Issue 7**
- 108385       SD5-XCU-ERN-46 is applied, moving this utility to the UUCP Utilities Option Group.

108386 **NAME**108387 val — validate SCCS files (**DEVELOPMENT**)108388 **SYNOPSIS**108389 XSI val -  
108390 val [-s] [-m *name*] [-r *SID*] [-y *type*] *file*...108391 **DESCRIPTION**108392 The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
108393 characteristics specified by the options.108394 **OPTIONS**108395 The *val* utility shall conform to XBD [Section 12.2](#) (on page 201), except that the usage of the ‘-’  
108396 operand is not strictly as intended by the guidelines (that is, reading options and operands from  
108397 standard input).

108398 The following options shall be supported:

108399 **-m** *name* Specify a *name*, which is compared with the SCCS %M% keyword in *file*; see [get](#).108400 **-r** *SID* Specify a *SID* (SCCS Identification String), an SCCS delta number. A check shall be  
108401 made to determine whether the *SID* is ambiguous (for example, **-r 1** is ambiguous  
108402 because it physically does not exist but implies 1.1, 1.2, and so on, which may exist)  
108403 or invalid (for example, **-r 1.0** or **-r 1.1.0** are invalid because neither case can exist  
108404 as a valid delta number). If the *SID* is valid and not ambiguous, a check shall be  
108405 made to determine whether it actually exists.108406 **-s** Silence the diagnostic message normally written to standard output for any error  
108407 that is detected while processing each named file on a given command line.108408 **-y** *type* Specify a *type*, which shall be compared with the SCCS %Y% keyword in *file*; see  
108409 [get](#).108410 **OPERANDS**

108411 The following operands shall be supported:

108412 *file* A pathname of an existing SCCS file. If exactly one *file* operand appears, and it is  
108413 ‘-’, the standard input shall be read: each line shall be independently processed  
108414 as if it were a command line argument list. (However, the line is not subjected to  
108415 any of the shell word expansions, such as parameter expansion or quote removal.)108416 **STDIN**108417 The standard input shall be a text file used only when the *file* operand is specified as ‘-’.108418 **INPUT FILES**

108419 Any SCCS files processed shall be files of an unspecified format.

108420 **ENVIRONMENT VARIABLES**108421 The following environment variables shall affect the execution of *val*:108422 **LANG** Provide a default value for the internationalization variables that are unset or null.  
108423 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
108424 variables used to determine the values of locale categories.)108425 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
108426 internationalization variables.

108427 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 108428 characters (for example, single-byte as opposed to multi-byte characters in  
 108429 arguments and input files).

108430 **LC\_MESSAGES**  
 108431 Determine the locale that should be used to affect the format and contents of  
 108432 diagnostic messages written to standard error, and informative messages written  
 108433 to standard output.

108434 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 108435 ASYNCHRONOUS EVENTS

108436 Default.

## 108437 STDOUT

108438 The standard output shall consist of informative messages about either:

- 108439 1. Each file processed
- 108440 2. Each command line read from standard input

108441 If the standard input is not used, for each *file* operand yielding a discrepancy, the output line  
 108442 shall have the following format:

108443 "%s: %s\n", <pathname>, <unspecified string>

108444 If standard input is used, a line of input shall be written before each of the preceding lines for  
 108445 files containing discrepancies:

108446 "%s:\n", <input line>

## 108447 STDERR

108448 Not used.

## 108449 OUTPUT FILES

108450 None.

## 108451 EXTENDED DESCRIPTION

108452 None.

## 108453 EXIT STATUS

108454 The 8-bit code returned by *val* shall be a disjunction of the possible errors; that is, it can be  
 108455 interpreted as a bit string where set bits are interpreted as follows:

108456 0x80 = Missing file argument.  
 108457 0x40 = Unknown or duplicate option.  
 108458 0x20 = Corrupted SCCS file.  
 108459 0x10 = Cannot open file or file not SCCS.  
 108460 0x08 = *SID* is invalid or ambiguous.  
 108461 0x04 = *SID* does not exist.  
 108462 0x02 = %Y%, -y mismatch.  
 108463 0x01 = %M%, -m mismatch.

108464 Note that *val* can process two or more files on a given command line and can process multiple  
 108465 command lines (when reading the standard input). In these cases an aggregate code shall be  
 108466 returned: a logical OR of the codes generated for each command line and file processed.

## 108467 CONSEQUENCES OF ERRORS

108468 Default.

**APPLICATION USAGE**

Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it terminated due to a missing file argument or receipt of a signal.

**EXAMPLES**

In a directory with three SCCS files—*s.x* (of *t* type "text"), *s.y*, and *s.z* (a corrupted file)—the following command could produce the output shown:

```
val - <<EOF
-y source s.x
-m y s.y
s.z
EOF

-y source s.x

s.x: %Y%, -y mismatch
s.z

s.z: corrupted SCCS file
```

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*admin*, *delta*, *get*, *prs*

XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The Open Group Corrigendum U025/4 is applied, correcting a typographical error in the EXIT STATUS.

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

108498 **NAME**  
 108499 `vi` — screen-oriented (visual) display editor

108500 **SYNOPSIS**  
 108501 UP `vi [-rR] [-c command] [-t tagstring] [-w size] [file...]`

## 108502 DESCRIPTION

108503 This utility shall be provided on systems that both support the User Portability Utilities option  
 108504 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.

108505 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
 108506 editor are described in POSIX.1-200x; see the line editor *ex* for additional editing capabilities  
 108507 used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex* commands from  
 108508 within *vi*.

108509 This reference page uses the term *edit buffer* to describe the current working text. No specific  
 108510 implementation is implied by this term. All editing changes are performed on the edit buffer,  
 108511 and no changes to it shall affect any file until an editor command writes the file.

108512 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
 108513 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
 108514 shall indicate the position within the editing buffer.

108515 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
 108516 When these commands cannot be supported on such terminals, this condition shall not produce  
 108517 an error message such as “not an editor command” or report a syntax error. The implementation  
 108518 may either accept the commands and produce results on the screen that are the result of an  
 108519 unsuccessful attempt to meet the requirements of this volume of POSIX.1-200x or report an error  
 108520 describing the terminal-related deficiency.

## 108521 OPTIONS

108522 The *vi* utility shall conform to XBD [Section 12.2](#) (on page 201), except that ‘+’ may be  
 108523 recognized as an option delimiter as well as ‘-’.

108524 The following options shall be supported:

108525 `-c command` See the *ex* command description of the `-c` option.

108526 `-r` See the *ex* command description of the `-r` option.

108527 `-R` See the *ex* command description of the `-R` option.

108528 `-t tagstring` See the *ex* command description of the `-t` option.

108529 `-w size` See the *ex* command description of the `-w` option.

## 108530 OPERANDS

108531 See the OPERANDS section of the *ex* command for a description of the operands supported by  
 108532 the *vi* command.

## 108533 STDIN

108534 If standard input is not a terminal device, the results are undefined. The standard input consists  
 108535 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.

108536 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
 108537 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

108538 **INPUT FILES**

108539 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
108540 the *vi* command.

108541 **ENVIRONMENT VARIABLES**

108542 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
108543 that affect the execution of the *vi* command.

108544 **ASYNCHRONOUS EVENTS**

108545 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
108546 execution of the *vi* command.

108547 **STDOUT**

108548 If standard output is not a terminal device, undefined results occur.

108549 Standard output may be used for writing prompts to the user, for informational messages, and  
108550 for writing lines from the file.

108551 **STDERR**

108552 If standard output is not a terminal device, undefined results occur.

108553 The standard error shall be used only for diagnostic messages.

108554 **OUTPUT FILES**

108555 See the OUTPUT FILES section of the *ex* command for a description of the output files  
108556 supported by the *vi* command.

108557 **EXTENDED DESCRIPTION**

108558 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
108559 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
108560 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
108561 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
108562 command mode; other uses of <ESC> are described later in this section; see [Terminate](#)  
108563 [Command or Input Mode](#) (on page 3224).

108564 **Initialization in *ex* and *vi***

108565 See [Initialization in \*ex\* and \*vi\*](#) (on page 2576) for a description of *ex* and *vi* initialization for the *vi*  
108566 utility.

108567 **Command Descriptions in *vi***

108568 The following symbols are used in this reference page to represent arguments to commands.

108569 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
108570 see [Command Descriptions in \*ex\*](#) (on page 2586).

108571 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
108572 preceding the command name, they can be specified in either order.

108573 *count* A positive integer used as an optional argument to most commands, either to give a  
108574 repeat count or as a size. This argument is optional and shall default to 1 unless  
108575 otherwise specified.

108576 The Synopsis lines for the *vi* commands <control>-G, <control>-L, <control>-R,  
108577 <control>-], %, &, ^, D, m, M, Q, u, U, and ZZ do not have *count* as an optional  
108578 argument. Regardless, it shall not be an error to specify a *count* to these commands, and  
108579 any specified *count* shall be ignored.

108580 *motion* An optional trailing argument used by the !, <, >, c, d, and y commands, which is used  
108581 to indicate the region of text that shall be affected by the command. The motion can be  
108582 either one of the command characters repeated or one of several other *vi* commands

108583 (listed in the following table). Each of the applicable commands specifies the region of  
 108584 text matched by repeating the command; each command that can be used as a motion  
 108585 command specifies the region of text it affects.

108586 Commands that take *motion* arguments operate on either lines or characters, depending  
 108587 on the circumstances. When operating on lines, all lines that fall partially or wholly  
 108588 within the text region specified for the command shall be affected. When operating on  
 108589 characters, only the exact characters in the specified text region shall be affected. Each  
 108590 motion command specifies this individually.

108591 When commands that may be motion commands are not used as motion commands,  
 108592 they shall set the current position to the current line and column as specified.

108593 The following commands shall be valid cursor motion commands:

|        |                   |   |    |   |   |   |
|--------|-------------------|---|----|---|---|---|
| 108594 | <apostrophe>      | ( | -  | j | H |   |
| 108595 | <carriage-return> | ) | \$ | k | L |   |
| 108596 | <comma>           | [ | [  | % | l | M |
| 108597 | <control>-H       | ] | ]  | _ | n | N |
| 108598 | <control>-N       | { | ;  | t | T |   |
| 108599 | <control>-P       | } | ?  | w | W |   |
| 108600 | <grave accent>    | ^ | b  | B |   |   |
| 108601 | <newline>         | + | e  | E |   |   |
| 108602 | <space>           |   | f  | F |   |   |
| 108603 | <zero>            | / | h  | G |   |   |

108604 Any *count* that is specified to a command that has an associated motion command shall  
 108605 be applied to the motion command. If a *count* is applied to both the command and its  
 108606 associated motion command, the effect shall be multiplicative.

108607 The following symbols are used in this section to specify locations in the edit buffer:

108608 *current character*

108609 The character that is currently indicated by the cursor.

108610 *end of a line*

108611 The point located between the last non-<newline> (if any) and the terminating  
 108612 <newline> of a line. For an empty line, this location coincides with the beginning of the  
 108613 line.

108614 *end of the edit buffer*

108615 The location corresponding to the end of the last line in the edit buffer.

108616 The following symbols are used in this section to specify command actions:

108617 *bigword* In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

- 108618 1. A maximal sequence of non-<blank>s preceded and followed by <blank>s or the  
 108619 beginning or end of a line or the edit buffer
- 108620 2. One or more sequential blank lines
- 108621 3. The first character in the edit buffer
- 108622 4. The last non-<newline> in the edit buffer

108623 *word* In the POSIX locale, *vi* shall recognize five kinds of words:

- 108624 1. A maximal sequence of letters, digits, and underscores, delimited at both ends  
 108625 by:

- 108626 — Characters other than letters, digits, or underscores
- 108627 — The beginning or end of a line
- 108628 — The beginning or end of the edit buffer
- 108629 2. A maximal sequence of characters other than letters, digits, underscores, or
- 108630 <blank>s, delimited at both ends by:
- 108631 — A letter, digit, underscore
- 108632 — <blank>s
- 108633 — The beginning or end of a line
- 108634 — The beginning or end of the edit buffer
- 108635 3. One or more sequential blank lines
- 108636 4. The first character in the edit buffer
- 108637 5. The last non-<newline> in the edit buffer

*section boundary*

A *section boundary* is one of the following:

- 108640 1. A line whose first character is a <form-feed>
- 108641 2. A line whose first character is an open curly brace ( ' { ' )
- 108642 3. A line whose first character is a period and whose second and third characters
- 108643 match a two-character pair in the **sections** edit option (see *ed*)
- 108644 4. A line whose first character is a period and whose only other character matches
- 108645 the first character of a two-character pair in the **sections** edit option, where the
- 108646 second character of the two-character pair is a <space>
- 108647 5. The first line of the edit buffer
- 108648 6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a
- 108649 ]] or } command; otherwise, the last non-<newline> of the last line of the edit
- 108650 buffer

*paragraph boundary*

A *paragraph boundary* is one of the following:

- 108653 1. A section boundary
- 108654 2. A line whose first character is a period and whose second and third characters
- 108655 match a two-character pair in the **paragraphs** edit option (see *ed*)
- 108656 3. A line whose first character is a period and whose only other character matches
- 108657 the first character of a two-character pair in the *paragraphs* edit option, where the
- 108658 second character of the two-character pair is a <space>
- 108659 4. One or more sequential blank lines

*remembered search direction*

See the description of *remembered search direction* in *ed*.

*sentence boundary*

A *sentence boundary* is one of the following:

- 108664 1. A paragraph boundary

- 108665                   2. The first non-<blank> that occurs after a paragraph boundary
- 108666                   3. The first non-<blank> that occurs after a period ( ' . ' ), exclamation mark ( ' ! ' ),
- 108667                   or question mark ( ' ? ' ), followed by two <space>s or the end of a line; any
- 108668                   number of closing parenthesis ( ' ) ' ), closing brackets ( ' ] ' ), double quote ( ' " ' ),
- 108669                   or single quote ( ' ' ' ) characters can appear between the punctuation mark and
- 108670                   the two <space>s or end-of-line

108671                   In the remainder of the description of the *vi* utility, the term “buffer line” refers to a line in the

108672                   edit buffer and the term “display line” refers to the line or lines on the display screen used to

108673                   display one buffer line. The term “current line” refers to a specific “buffer line”.

108674                   If there are display lines on the screen for which there are no corresponding buffer lines because

108675                   they correspond to lines that would be after the end of the file, they shall be displayed as a single

108676                   tilde ( ' ~ ' ) character, plus the terminating <newline>.

108677                   The last line of the screen shall be used to report errors or display informational messages. It

108678                   shall also be used to display the input for “line-oriented commands” ( / , ? , : , and ! ). When a line-

108679                   oriented command is executed, the editor shall enter text input mode on the last line on the

108680                   screen, using the respective command characters as prompt characters. (In the case of the !

108681                   command, the associated motion shall be entered by the user before the editor enters text input

108682                   mode.) The line entered by the user shall be terminated by a <newline>, a

108683                   non-<control>-V-escaped <carriage-return>, or unescaped <ESC>. It is unspecified if more

108684                   characters than require a display width minus one column number of screen columns can be

108685                   entered.

108686                   If any command is executed that overwrites a portion of the screen other than the last line of the

108687                   screen (for example, the *ex suspend* or ! commands), other than the *ex shell* command, the user

108688                   shall be prompted for a character before the screen is refreshed and the edit session continued.

108689                   <tab>s shall take up the number of columns on the screen set by the **tabstop** edit option (see *ed*),

108690                   unless there are less than that number of columns before the display margin that will cause the

108691                   displayed line to be folded; in this case, they shall only take up the number of columns up to

108692                   that boundary.

108693                   The cursor shall be placed on the current line and relative to the current column as specified by

108694                   each command described in the following sections.

108695                   In open mode, if the current line is not already displayed, then it shall be displayed.

108696                   In visual mode, if the current line is not displayed, then the lines that are displayed shall be

108697                   expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be

108698                   displayed. If the screen is redrawn, no more than the number of display lines specified by the

108699                   value of the **window** edit option shall be displayed (unless the current line cannot be completely

108700                   displayed in the number of display lines specified by the **window** edit option) and the current

108701                   line shall be positioned as close to the center of the displayed lines as possible (within the

108702                   constraints imposed by the distance of the line from the beginning or end of the edit buffer). If

108703                   the current line is before the first line in the display and the screen is scrolled, an unspecified

108704                   portion of the current line shall be placed on the first line of the display. If the current line is after

108705                   the last line in the display and the screen is scrolled, an unspecified portion of the current line

108706                   shall be placed on the last line of the display.

108707                   In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into

108708                   the lines at the bottom of the display that are available for its presentation, the editor may choose

108709                   not to display any portion of the line. The lines of the display that do not contain text from the

108710                   edit buffer for this reason shall each consist of a single '@' character.

108711                   In visual mode, the editor may choose for unspecified reasons to not update lines in the display

108712                   to correspond to the underlying edit buffer text. The lines of the display that do not correctly

108713                   correspond to text from the edit buffer for this reason shall consist of a single '@' character (plus

108714 the terminating <newline>), and the <control>-R command shall cause the editor to update the  
108715 screen to correctly represent the edit buffer.

108716 Open and visual mode commands that set the current column set it to a column position in the  
108717 display, and not a character position in the line. In this case, however, the column position in the  
108718 display shall be calculated for an infinite width display; for example, the column related to a  
108719 character that is part of a line that has been folded onto additional screen lines will be offset from  
108720 the display line column where the buffer line begins, not from the beginning of a particular  
108721 display line.

108722 The display cursor column in the display is based on the value of the current column, as follows,  
108723 with each rule applied in turn:

- 108724 1. If the current column is after the last display line column used by the displayed line, the  
108725 display cursor column shall be set to the last display line column occupied by the last  
108726 non-<newline> in the current line; otherwise, the display cursor column shall be set to the  
108727 current column.
- 108728 2. If the character of which some portion is displayed in the display line column specified by  
108729 the display cursor column requires more than a single display line column:
  - 108730 a. If in text input mode, the display cursor column shall be adjusted to the first  
108731 display line column in which any portion of that character is displayed.
  - 108732 b. Otherwise, the display cursor column shall be adjusted to the last display line  
108733 column in which any portion of that character is displayed.

108734 The current column shall not be changed by these adjustments to the display cursor column.

108735 If an error occurs during the parsing or execution of a *vi* command:

- 108736 • The terminal shall be alerted. Execution of the *vi* command shall stop, and the cursor (for  
108737 example, the current line and column) shall not be further modified.
- 108738 • Unless otherwise specified by the following command sections, it is unspecified whether  
108739 an informational message shall be displayed.
- 108740 • Any partially entered *vi* command shall be discarded.
- 108741 • If the *vi* command resulted from a **map** expansion, all characters from that **map** expansion  
108742 shall be discarded, except as otherwise specified by the **map** command (see *ed*).
- 108743 • If the *vi* command resulted from the execution of a buffer, no further commands caused by  
108744 the execution of the buffer shall be executed.

## 108745 Page Backwards

108746 *Synopsis:* [count] <control>-B

108747 If in open mode, the <control>-B command shall behave identically to the **z** command.  
108748 Otherwise, if the current line is the first line of the edit buffer, it shall be an error.

108749 If the **window** edit option is less than 3, display a screen where the last line of the display shall  
108750 be some portion of:

108751 *(current first line) -1*

108752 otherwise, display a screen where the first line of the display shall be some portion of:

108753 *(current first line) - count x ((window edit option) -2)*

108754 If this calculation would result in a line that is before the first line of the edit buffer, the first line  
108755 of the display shall display some portion of the first line of the edit buffer.

108756 *Current line:* If no lines from the previous display remain on the screen, set to the last line of the

108757 display; otherwise, set to (*line* – the number of new lines displayed on this screen).

108758 *Current column*: Set to non-`<blank>`.

### 108759 **Scroll Forward**

108760 *Synopsis*: [*count*] `<control>-D`

108761 If the current line is the last line of the edit buffer, it shall be an error.

108762 If no *count* is specified, *count* shall default to the *count* associated with the previous `<control>-D`  
108763 or `<control>-U` command. If there was no previous `<control>-D` or `<control>-U` command, *count*  
108764 shall default to the value of the **scroll** edit option.

108765 If in open mode, write lines starting with the line after the current line, until *count* lines or the  
108766 last line of the file have been written.

108767 *Current line*: If the current line + *count* is past the last line of the edit buffer, set to the last line of  
108768 the edit buffer; otherwise, set to the current line + *count*.

108769 *Current column*: Set to non-`<blank>`.

### 108770 **Scroll Forward by Line**

108771 *Synopsis*: [*count*] `<control>-E`

108772 Display the line count lines after the last line currently displayed.

108773 If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines  
108774 after the last line currently displayed, the last line of the display shall display some portion of  
108775 the last line of the edit buffer.

108776 *Current line*: Unchanged if the previous current character is displayed; otherwise, set to the first  
108777 line displayed.

108778 *Current column*: Unchanged.

### 108779 **Page Forward**

108780 *Synopsis*: [*count*] `<control>-F`

108781 If in open mode, the `<control>-F` command shall behave identically to the **z** command.  
108782 Otherwise, if the current line is the last line of the edit buffer, it shall be an error.

108783 If the **window** edit option is less than 3, display a screen where the first line of the display shall  
108784 be some portion of:

108785 (*current last line*) +1

108786 otherwise, display a screen where the first line of the display shall be some portion of:

108787 (*current first line*) + *count* x ((*window edit option*) - 2)

108788 If this calculation would result in a line that is after the last line of the edit buffer, the last line of  
108789 the display shall display some portion of the last line of the edit buffer.

108790 *Current line*: If no lines from the previous display remain on the screen, set to the first line of the  
108791 display; otherwise, set to (*line* + the number of new lines displayed on this screen).

108792 *Current column*: Set to non-`<blank>`.

108793 **Display Information**108794 *Synopsis:* <control>-G108795 This command shall be equivalent to the *ex file* command.108796 **Move Cursor Backwards**108797 *Synopsis:* [*count*] <control>-H108798 [*count*] h108799 the current *erase* character (see *stty*)

108800 If there are no characters before the current character on the current line, it shall be an error. If  
 108801 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
 108802 number of previous characters on the line.

108803 If used as a motion command:

- 108804 1. The text region shall be from the character before the starting cursor up to and including  
 108805 the *count*th character before the starting cursor.
- 108806 2. Any text copied to a buffer shall be in character mode.

108807 If not used as a motion command:

108808 *Current line:* Unchanged.

108809 *Current column:* Set to (*column* – the number of columns occupied by *count* characters ending  
 108810 with the previous current column).

108811 **Move Down**108812 *Synopsis:* [*count*] <newline>108813 [*count*] <control>-J108814 [*count*] <control>-M108815 [*count*] <control>-N108816 [*count*] j108817 [*count*] <carriage-return>108818 [*count*] +108819 If there are less than *count* lines after the current line in the edit buffer, it shall be an error.

108820 If used as a motion command:

- 108821 1. The text region shall include the starting line and the next *count* – 1 lines.
- 108822 2. Any text copied to a buffer shall be in line mode.

108823 If not used as a motion command:

108824 *Current line:* Set to *current line*+ *count*.

108825 *Current column:* Set to non-<blank> for the <carriage-return>, <control>-M, and + commands;  
 108826 otherwise, unchanged.

108827 **Clear and Redisplay**108828 *Synopsis:* <control>-L108829 If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay  
108830 the screen.108831 *Current line:* Unchanged.108832 *Current column:* Unchanged.108833 **Move Up**108834 *Synopsis:* [count] <control>-P

108835 [count] k

108836 [count] -

108837 If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

108838 If used as a motion command:

- 108839 1. The text region shall include the starting line and the previous *count* lines.
- 108840 2. Any text copied to a buffer shall be in line mode.

108841 If not used as a motion command:

108842 *Current line:* Set to *current line* - *count*.108843 *Current column:* Set to non-<blank> for the - command; otherwise, unchanged.108844 **Redraw Screen**108845 *Synopsis:* <control>-R108846 If any lines have been deleted from the display screen and flagged as deleted on the terminal  
108847 using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall  
108848 be redisplayed to match the contents of the edit buffer.108849 It is unspecified whether lines flagged with @ because they do not fit on the terminal display  
108850 shall be affected.108851 *Current line:* Unchanged.108852 *Current column:* Unchanged.108853 **Scroll Backward**108854 *Synopsis:* [count] <control>-U

108855 If the current line is the first line of the edit buffer, it shall be an error.

108856 If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D  
108857 or <control>-U command. If there was no previous <control>-D or <control>-U command, *count*  
108858 shall default to the value of the **scroll** edit option.108859 *Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line -  
108860 *count*.108861 *Current column:* Set to non-<blank>.

108862

**Scroll Backward by Line**

108863

*Synopsis:* [count] <control>-Y

108864

Display the line *count* lines before the first line currently displayed.

108865

If the current line is the first line of the edit buffer, it shall be an error. If this calculation would result in a line that is before the first line of the edit buffer, the first line of the display shall display some portion of the first line of the edit buffer.

108866

108867

*Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first line displayed.

108868

108869

*Current column:* Unchanged.

108870

108871

**Edit the Alternate File**

108872

*Synopsis:* <control>-^

108873

This command shall be equivalent to the *ex* **edit** command, with the alternate pathname as its argument.

108874

108875

**Terminate Command or Input Mode**

108876

*Synopsis:* <ESC>

108877

If a partial *vi* command (as defined by at least one, non-*count* character) has been entered, discard the *count* and the command character(s).

108878

108879

Otherwise, if no command characters have been entered, and the <ESC> was the result of a map expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall not be an error.

108880

108881

108882

Otherwise, it shall be an error.

108883

*Current line:* Unchanged.

108884

*Current column:* Unchanged.

108885

**Search for tagstring**

108886

*Synopsis:* <control>-]

108887

If the current character is not a word or <blank>, it shall be an error.

108888

This command shall be equivalent to the *ex* **tag** command, with the argument to that command defined as follows.

108889

108890

If the current character is a <blank>:

108891

1. Skip all <blank>s after the cursor up to the end of the line.

108892

2. If the end of the line is reached, it shall be an error.

108893

Then, the argument to the *ex* **tag** command shall be the current character and all subsequent characters, up to the first non-word character or the end of the line.

### Move Cursor Forward

*Synopsis:*    [*count*] <space>  
                  [*count*] 1 (ell)

If there are less than *count* non-`<newline>`s after the cursor on the current line, *count* shall be adjusted to the number of non-`<newline>`s after the cursor on the line.

If used as a motion command:

1. If the current or *count*th character after the cursor is the last non-`<newline>` in the line, the text region shall be comprised of the current character up to and including the last non-`<newline>` in the line. Otherwise, the text region shall be from the current character up to, but not including, the *count*th character after the cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

If there are no non-`<newline>`s after the current character on the current line, it shall be an error.

*Current line:* Unchanged.

*Current column:* Set to the last column that displays any portion of the *count*th character after the current character.

### Replace Text with Results from Shell Command

*Synopsis:*    [*count*] ! *motion shell-commands* <newline>

If the motion command is the ! command repeated:

1. If the edit buffer is empty and no *count* was supplied, the command shall be the equivalent of the `ex :read !` command, with the text input, and no text shall be copied to any buffer.
2. Otherwise:
  - a. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.
  - b. The text region shall be from the current line up to and including the next *count* -1 lines.

Otherwise, the text region shall be the lines in which any character of the text region specified by the motion command appear.

Any text copied to a buffer shall be in line mode.

This command shall be equivalent to the `ex !` command for the specified lines.

### Move Cursor to End-of-Line

*Synopsis:*    [*count*] \$

It shall be an error if there are less than (*count* -1) lines after the current line in the edit buffer.

If used as a motion command:

1. If *count* is 1:
  - a. It shall be an error if the line is empty.
  - b. Otherwise, the text region shall consist of all characters from the starting cursor to the last non-`<newline>` in the line, inclusive, and any text copied to a buffer shall be in character mode.

- 108935 2. Otherwise, if the starting cursor position is at or before the first non-<blank> in the line,  
108936 the text region shall consist of the current and the next *count* -1 lines, and any text saved  
108937 to a buffer shall be in line mode.
- 108938 3. Otherwise, the text region shall consist of all characters from the starting cursor to the last  
108939 non-<newline> in the line that is *count* -1 lines forward from the current line, and any text  
108940 copied to a buffer shall be in character mode.

108941 If not used as a motion command:

108942 *Current line*: Set to the *current line* + *count*-1.

108943 *Current column*: The current column is set to the last display line column of the last  
108944 non-<newline> in the line, or column position 1 if the line is empty.

108945 The current column shall be adjusted to be on the last display line column of the last  
108946 non-<newline> of the current line as subsequent commands change the current line, until a  
108947 command changes the current column.

### 108948 **Move to Matching Character**

108949 *Synopsis*: %

108950 If the character at the current position is not a parenthesis, bracket, or curly brace, search  
108951 forward in the line to the first one of those characters. If no such character is found, it shall be an  
108952 error.

108953 The matching character shall be the parenthesis, bracket, or curly brace matching the  
108954 parenthesis, bracket, or curly brace, respectively, that was at the current position or that was  
108955 found on the current line.

108956 Matching shall be determined as follows, for an open parenthesis:

- 108957 1. Set a counter to 1.
- 108958 2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.
- 108959 3. If the end of the edit buffer is reached, it shall be an error.
- 108960 4. If an open parenthesis is found, increment the counter by 1.
- 108961 5. If a close parenthesis is found, decrement the counter by 1.
- 108962 6. If the counter is zero, the current character is the matching character.

108963 Matching for a close parenthesis shall be equivalent, except that the search shall be backwards,  
108964 from the starting character to the beginning of the buffer, a close parenthesis shall increment the  
108965 counter by 1, and an open parenthesis shall decrement the counter by 1.

108966 Matching for brackets and curly braces shall be equivalent, except that searching shall be done  
108967 for open and close brackets or open and close curly braces. It is implementation-defined whether  
108968 other characters are searched for and matched as well.

108969 If used as a motion command:

- 108970 1. If the matching cursor was after the starting cursor in the edit buffer, and the starting  
108971 cursor position was at or before the first non-<blank> non-<newline> in the starting line,  
108972 and the matching cursor position was at or after the last non-<blank> non-<newline> in  
108973 the matching line, the text region shall consist of the current line to the matching line,  
108974 inclusive, and any text copied to a buffer shall be in line mode.
- 108975 2. If the matching cursor was before the starting cursor in the edit buffer, and the starting  
108976 cursor position was at or after the last non-<blank> non-<newline> in the starting line,  
108977 and the matching cursor position was at or before the first non-<blank> non-<newline> in

108978 the matching line, the text region shall consist of the current line to the matching line,  
108979 inclusive, and any text copied to a buffer shall be in line mode.

108980 3. Otherwise, the text region shall consist of the starting character to the matching character,  
108981 inclusive, and any text copied to a buffer shall be in character mode.

108982 If not used as a motion command:

108983 *Current line*: Set to the line where the matching character is located.

108984 *Current column*: Set to the last column where any portion of the matching character is displayed.

### 108985 Repeat Substitution

108986 *Synopsis*: &

108987 Repeat the previous substitution command. This command shall be equivalent to the *ex &*  
108988 command with the current line as its addresses, and without *options*, *count*, or *flags*.

### 108989 Return to Previous Context at Beginning of Line

108990 *Synopsis*: ' *character*

108991 It shall be an error if there is no line in the edit buffer marked by *character*.

108992 If used as a motion command:

- 108993 1. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
108994 and the marked cursor in the edit buffer shall be logically swapped.
- 108995 2. The text region shall consist of the starting line up to and including the marked line, and  
108996 any text copied to a buffer shall be in line mode.

108997 If not used as a motion command:

108998 *Current line*: Set to the line referenced by the mark.

108999 *Current column*: Set to non-<blank>.

### 109000 Return to Previous Context

109001 *Synopsis*: ' *character*

109002 It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer  
109003 contains a character in the saved numbered character position, it shall be as if the marked  
109004 position is the first non-<blank>.

109005 If used as a motion command:

- 109006 1. It shall be an error if the marked cursor references the same character in the edit buffer as  
109007 the starting cursor.
- 109008 2. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
109009 and the marked cursor in the edit buffer shall be logically swapped.
- 109010 3. If the starting line is empty or the starting cursor is at or before the first non-<blank>  
109011 non-<newline> of the starting line, and the marked cursor line is empty or the marked  
109012 cursor references the first character of the marked cursor line, the text region shall consist  
109013 of all lines containing characters from the starting cursor to the line before the marked  
109014 cursor line, inclusive, and any text copied to a buffer shall be in line mode.
- 109015 4. Otherwise, if the marked cursor line is empty or the marked cursor references a character  
109016 at or before the first non-<blank> non-<newline> of the marked cursor line, the region of  
109017 text shall be from the starting cursor to the last non-<newline> of the line before the  
109018 marked cursor line, inclusive, and any text copied to a buffer shall be in character mode.

109019 5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked  
109020 cursor (exclusive), and any text copied to a buffer shall be in character mode.

109021 If not used as a motion command:

109022 *Current line*: Set to the line referenced by the mark.

109023 *Current column*: Set to the last column in which any portion of the character referenced by the  
109024 mark is displayed.

### 109025 **Return to Previous Section**

109026 *Synopsis*: [ *count* ] [ [

109027 Move the cursor backward through the edit buffer to the first character of the previous section  
109028 boundary, *count* times.

109029 If used as a motion command:

109030 1. If the starting cursor was at the first character of the starting line or the starting line was  
109031 empty, and the first character of the boundary was the first character of the boundary line,  
109032 the text region shall consist of the current line up to and including the line where the  
109033 *count*th next boundary starts, and any text copied to a buffer shall be in line mode.

109034 2. If the boundary was the last line of the edit buffer or the last non-<newline> of the last  
109035 line of the edit buffer, the text region shall consist of the last character in the edit buffer up  
109036 to and including the starting character, and any text saved to a buffer shall be in character  
109037 mode.

109038 3. Otherwise, the text region shall consist of the starting character up to but not including  
109039 the first character in the *count*th next boundary, and any text copied to a buffer shall be in  
109040 character mode.

109041 If not used as a motion command:

109042 *Current line*: Set to the line where the *count*th next boundary in the edit buffer starts.

109043 *Current column*: Set to the last column in which any portion of the first character of the *count*th  
109044 next boundary is displayed, or column position 1 if the line is empty.

### 109045 **Move to Next Section**

109046 *Synopsis*: [ *count* ] ] ]

109047 Move the cursor forward through the edit buffer to the first character of the next section  
109048 boundary, *count* times.

109049 If used as a motion command:

109050 1. If the starting cursor was at the first character of the starting line or the starting line was  
109051 empty, and the first character of the boundary was the first character of the boundary line,  
109052 the text region shall consist of the current line up to and including the line where the  
109053 *count*th previous boundary starts, and any text copied to a buffer shall be in line mode.

109054 2. If the boundary was the first line of the edit buffer, the text region shall consist of the first  
109055 character in the edit buffer up to but not including the starting character, and any text  
109056 copied to a buffer shall be in character mode.

109057 3. Otherwise, the text region shall consist of the first character in the *count*th previous  
109058 section boundary up to but not including the starting character, and any text copied to a  
109059 buffer shall be in character mode.

109060 If not used as a motion command:

109061 *Current line*: Set to the line where the *count*th previous boundary in the edit buffer starts.

109062 *Current column*: Set to the last column in which any portion of the first character of the *count*th  
109063 previous boundary is displayed, or column position 1 if the line is empty.

#### 109064 **Move to First Non-<blank> Position on Current Line**

109065 *Synopsis*:     `^`

109066 If used as a motion command:

- 109067 1. If the line has no non-<blank> non-<newline>s, or if the cursor is at the first non-<blank>  
109068 non-<newline> of the line, it shall be an error.
- 109069 2. If the cursor is before the first non-<blank> non-<newline> of the line, the text region  
109070 shall be comprised of the current character, up to, but not including, the first non-<blank>  
109071 non-<newline> of the line.
- 109072 3. If the cursor is after the first non-<blank> non-<newline> of the line, the text region shall  
109073 be from the character before the starting cursor up to and including the first non-<blank>  
109074 non-<newline> of the line.
- 109075 4. Any text copied to a buffer shall be in character mode.

109076 If not used as a motion command:

109077 *Current line*: Unchanged.

109078 *Current column*: Set to non-<blank>.

#### 109079 **Current and Line Above**

109080 *Synopsis*:     `[count] _`

109081 If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an error.

109082 If used as a motion command:

- 109083 1. If *count* is less than 2, the text region shall be the current line.
- 109084 2. Otherwise, the text region shall include the starting line and the next *count* - 1 lines.
- 109085 3. Any text copied to a buffer shall be in line mode.

109086 If not used as a motion command:

109087 *Current line*: Set to current line + *count* - 1.

109088 *Current column*: Set to non-<blank>.

#### 109089 **Move Back to Beginning of Sentence**

109090 *Synopsis*:     `[count] (`

109091 Move backward to the beginning of a sentence. This command shall be equivalent to the `[]`  
109092 command, with the exception that sentence boundaries shall be used instead of section  
109093 boundaries.

109094 **Move Forward to Beginning of Sentence**109095 *Synopsis:* [ *count* ] )

109096 Move forward to the beginning of a sentence. This command shall be equivalent to the ]] command, with the exception that sentence boundaries shall be used instead of section boundaries.

109097

109098

109099 **Move Back to Preceding Paragraph**109100 *Synopsis:* [ *count* ] {

109101 Move back to the beginning of the preceding paragraph. This command shall be equivalent to the [[ command, with the exception that paragraph boundaries shall be used instead of section boundaries.

109102

109103

109104 **Move Forward to Next Paragraph**109105 *Synopsis:* [ *count* ] }

109106 Move forward to the beginning of the next paragraph. This command shall be equivalent to the ]] command, with the exception that paragraph boundaries shall be used instead of section boundaries.

109107

109108

109109 **Move to Specific Column Position**109110 *Synopsis:* [ *count* ] |

109111 For the purposes of this command, lines that are too long for the current display and that have been folded shall be treated as having a single, 1-based, number of columns.

109112

109113 If there are less than *count* columns in which characters from the current line are displayed on the screen, *count* shall be adjusted to be the last column in which any portion of the line is displayed on the screen.

109114

109115

109116 If used as a motion command:

- 109117 1. If the line is empty, or the cursor character is the same as the character on the *count*th column of the line, it shall be an error.
- 109118
- 109119 2. If the cursor is before the *count*th column of the line, the text region shall be comprised of the current character, up to but not including the character on the *count*th column of the line.
- 109120
- 109121
- 109122 3. If the cursor is after the *count*th column of the line, the text region shall be from the character before the starting cursor up to and including the character on the *count*th column of the line.
- 109123
- 109124
- 109125 4. Any text copied to a buffer shall be in character mode.

109126 If not used as a motion command:

109127 *Current line:* Unchanged.

109128 *Current column:* Set to the last column in which any portion of the character that is displayed in the *count* column of the line is displayed.

109129

109130 **Reverse Find Character**109131 *Synopsis:* [ *count* ] ,109132 If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or  
109133 **T** command, respectively, with the specified *count* and the same search character.109134 If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.109135 **Repeat**109136 *Synopsis:* [ *count* ] .109137 Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall  
109138 be an error if none of these commands have been executed. Commands (other than commands  
109139 that enter text input mode) executed as a result of map expansions, shall not change the value of  
109140 the last repeatable command.109141 Repeated commands with associated motion commands shall repeat the motion command as  
109142 well; however, any specified *count* shall replace the *count*(s) that were originally specified to the  
109143 repeated command or its associated motion command.109144 If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall  
109145 not set the remembered search character for the **;** and **,** commands.109146 If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric  
109147 buffer named with a number less than 9, the buffer associated with the repeated command shall  
109148 be set to be the buffer named by the name of the previous buffer logically incremented by 1.109149 If the repeated character is a text input command, the input text associated with that command  
109150 is repeated literally:

- 109151
- Input characters are neither macro or abbreviation-expanded.
  - Input characters are not interpreted in any special way with the exception that **<newline>**,  
109152 **<carriage-return>**, and **<control>-T** behave as described in [Input Mode Commands in vi](#)  
109153 (on page 3248).

109154 *Current line:* Set as described for the repeated command.109155 *Current column:* Set as described for the repeated command.109156 **Find Regular Expression**109157 *Synopsis:* /109158 If the input line contains no non-**<newline>**s, it shall be equivalent to a line containing only the  
109159 last regular expression encountered. The enhanced regular expressions supported by *vi* are  
109160 described in [Regular Expressions in ex](#) (on page 2608).  
109161109162 Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed  
109163 by an address offset or a *vi* **z** command.109164 If the regular expression is not the last regular expression on the line, or if a line offset or **z**  
109165 command is specified, the regular expression shall be terminated by an unescaped **'/'**  
109166 character, which shall not be used as part of the regular expression. If the regular expression is  
109167 not the first regular expression on the line, it shall be preceded by zero or more **<blank>**s, a  
109168 semicolon, zero or more **<blank>**s, and a leading **'/'** character, which shall not be interpreted as  
109169 part of the regular expression. It shall be an error to precede any regular expression with any  
109170 characters other than these.109171 Each search shall begin from the character after the first character of the last match (or, if it is the  
109172 first search, after the cursor). If the **wrapsan** edit option is set, the search shall continue to the  
109173 character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be

109174 an error if any search fails to find a match, and an informational message to this effect shall be  
109175 displayed.

109176 An optional address offset (see [Addressing in ex](#), on page 2579) can be specified after the last  
109177 regular expression by including a trailing '/' character after the regular expression and  
109178 specifying the address offset. This offset will be from the line containing the match for the last  
109179 regular expression specified. It shall be an error if the line offset would indicate a line address  
109180 less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be  
109181 supported. It shall be an error to follow the address offset with any other characters than  
109182 <blank>s.

109183 If not used as a motion command, an optional **z** command (see [Redraw Window](#), on page 3247)  
109184 can be specified after the last regular expression by including a trailing '/' character after the  
109185 regular expression, zero or more <blank>s, a 'z', zero or more <blank>s, an optional new  
109186 **window** edit option value, zero or more <blank>s, and a location character. The effect shall be as  
109187 if the **z** command was executed after the / command. It shall be an error to follow the **z**  
109188 command with any other characters than <blank>s.

109189 The remembered search direction shall be set to forward.

109190 If used as a motion command:

- 109191 1. It shall be an error if the last match references the same character in the edit buffer as the  
109192 starting cursor.
- 109193 2. If any address offset is specified, the last match shall be adjusted by the specified offset as  
109194 described previously.
- 109195 3. If the starting cursor is after the last match, then the locations of the starting cursor and  
109196 the last match in the edit buffer shall be logically swapped.
- 109197 4. If any address offset is specified, the text region shall consist of all lines containing  
109198 characters from the starting cursor to the last match line, inclusive, and any text copied to  
109199 a buffer shall be in line mode.
- 109200 5. Otherwise, if the starting line is empty or the starting cursor is at or before the first  
109201 non-<blank> non-<newline> of the starting line, and the last match line is empty or the  
109202 last match starts at the first character of the last match line, the text region shall consist of  
109203 all lines containing characters from the starting cursor to the line before the last match  
109204 line, inclusive, and any text copied to a buffer shall be in line mode.
- 109205 6. Otherwise, if the last match line is empty or the last match begins at a character at or  
109206 before the first non-<blank> non-<newline> of the last match line, the region of text shall  
109207 be from the current cursor to the last non-<newline> of the line before the last match line,  
109208 inclusive, and any text copied to a buffer shall be in character mode.
- 109209 7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first  
109210 character of the last match (exclusive), and any text copied to a buffer shall be in character  
109211 mode.

109212 If not used as a motion command:

109213 *Current line*: If a match is found, set to the last matched line plus the address offset, if any;  
109214 otherwise, unchanged.

109215 *Current column*: Set to the last column on which any portion of the first character in the last  
109216 matched string is displayed, if a match is found; otherwise, unchanged.

109217 **Move to First Character in Line**109218 *Synopsis:* 0 (zero)109219 Move to the first character on the current line. The character '0' shall not be interpreted as a  
109220 command if it is immediately preceded by a digit.

109221 If used as a motion command:

- 109222 1. If the cursor character is the first character in the line, it shall be an error.
- 109223 2. The text region shall be from the character before the cursor character up to and including  
109224 the first character in the line.
- 109225 3. Any text copied to a buffer shall be in character mode.

109226 If not used as a motion command:

109227 *Current line:* Unchanged.109228 *Current column:* The last column in which any portion of the first character in the line is  
109229 displayed, or if the line is empty, unchanged.109230 **Execute an ex Command**109231 *Synopsis:* :109232 Execute one or more *ex* commands.

109233 If any portion of the screen other than the last line of the screen was overwritten by any *ex*  
109234 command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from  
109235 the user, and shall then read a character. This action may also be taken for other, unspecified  
109236 reasons.

109237 If the next character entered is a ':', another *ex* command shall be accepted and executed. Any  
109238 other character shall cause the screen to be refreshed and *vi* shall return to command mode.

109239 *Current line:* As specified for the *ex* command.109240 *Current column:* As specified for the *ex* command.109241 **Repeat Find**109242 *Synopsis:* [count] ;

109243 This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and  
109244 with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**,  
109245 **f**, **T**, or **t** command, it shall be an error.

109246 **Shift Left**109247 *Synopsis:* [count] < *motion*

109248 If the motion command is the &lt; command repeated:

- 109249 1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
109250 error.
- 109251 2. The text region shall be from the current line, up to and including the next *count* -1 lines.

109252 Shift any line in the text region specified by the *count* and motion command one shiftwidth (see  
109253 the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The  
109254 unshifted lines shall be copied to the unnamed buffer in line mode.

109255 *Current line:* If the motion was from the current cursor position toward the end of the edit buffer,  
109256 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region

109257 specified by the motion command.

109258 *Current column*: Set to non-<blank>.

### 109259 **Shift Right**

109260 *Synopsis*: [count] > motion

109261 If the motion command is the > command repeated:

- 109262 1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an  
109263 error.
- 109264 2. The text region shall be from the current line, up to and including the next *count* -1 lines.

109265 Shift any line with characters in the text region specified by the *count* and motion command one  
109266 shiftwidth (see the *ex shiftwidth* option) away from the start of the line, as described by the *ex* >  
109267 command. The unshifted lines shall be copied into the unnamed buffer in line mode.

109268 *Current line*: If the motion was from the current cursor position toward the end of the edit buffer,  
109269 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
109270 specified by the motion command.

109271 *Current column*: Set to non-<blank>.

### 109272 **Scan Backwards for Regular Expression**

109273 *Synopsis*: ?

109274 Scan backwards; the ? command shall be equivalent to the / command (see [Find Regular](#)  
109275 [Expression](#), on page 3231) with the following exceptions:

- 109276 1. The input prompt shall be a '? '.
- 109277 2. Each search shall begin from the character before the first character of the last match (or, if  
109278 it is the first search, the character before the cursor character).
- 109279 3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
109280 the **wrapsan** edit option shall affect whether the search wraps to the end of the edit  
109281 buffer and continues.
- 109282 4. The remembered search direction shall be set to backward.

### 109283 **Execute**

109284 *Synopsis*: @buffer

109285 If the *buffer* is specified as @, the last buffer executed shall be used. If no previous buffer has been  
109286 executed, it shall be an error.

109287 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
109288 line-mode buffer, and all but the last line of a character mode buffer, behave as if a <newline>  
109289 were entered as standard input.

109290 If an error occurs during this process, an error message shall be written, and no more characters  
109291 resulting from the execution of this command shall be processed.

109292 If a *count* is specified, behave as if that count were entered as user input before the characters  
109293 from the @ buffer were entered.

109294 *Current line*: As specified for the individual commands.

109295 *Current column*: As specified for the individual commands.

109296 **Reverse Case**109297 *Synopsis:* [count] ~

109298 Reverse the case of the current character and the next *count* -1 characters, such that lowercase  
 109299 characters that have uppercase counterparts shall be changed to uppercase characters, and  
 109300 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
 109301 as prescribed by the current locale. No other characters shall be affected by this command.

109302 If there are less than *count* -1 characters after the cursor in the edit buffer, *count* shall be adjusted  
 109303 to the number of characters after the cursor in the edit buffer minus 1.

109304 For the purposes of this command, the next character after the last non-<newline> on the line  
 109305 shall be the next character in the edit buffer.

109306 *Current line:* Set to the line including the (*count*-1)th character after the cursor.

109307 *Current column:* Set to the last column in which any portion of the (*count*-1)th character after the  
 109308 cursor is displayed.

109309 **Append**109310 *Synopsis:* [count] a

109311 Enter text input mode after the current cursor position. No characters already in the edit buffer  
 109312 shall be affected by this command. A *count* shall cause the input text to be appended *count* -1  
 109313 more times to the end of the input.

109314 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
 109315 on page 3248).

109316 **Append at End-of-Line**109317 *Synopsis:* [count] A

109318 This command shall be equivalent to the *vi* command:

109319 \$ [count] a

109320 (see [Append](#)).109321 **Move Backward to Preceding Word**109322 *Synopsis:* [count] b

109323 With the exception that words are used as the delimiter instead of bigwords, this command shall  
 109324 be equivalent to the **B** command.

109325 **Move Backward to Preceding Bigword**109326 *Synopsis:* [count] B

109327 If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an  
 109328 error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count*  
 109329 shall be adjusted to the number of bigword beginnings between the cursor and the start of the  
 109330 edit buffer.

109331 If used as a motion command:

- 109332 1. The text region shall be from the first character of the *count*th previous bigword beginning  
 109333 up to but not including the cursor character.

109334 2. Any text copied to a buffer shall be in character mode.

109335 If not used as a motion command:

109336 *Current line*: Set to the line containing the *current column*.

109337 *Current column*: Set to the last column upon which any part of the first character of the *count*th  
109338 previous bigword is displayed.

### 109339 Change

109340 *Synopsis*: `[buffer][count] c motion`

109341 If the motion command is the `c` command repeated:

- 109342 1. The buffer text shall be in line mode.
- 109343 2. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an  
109344 error.
- 109345 3. The text region shall be from the current line up to and including the next *count* - 1 lines.

109346 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

109347 The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text  
109348 to be replaced contains characters from more than a single line, or the buffer text is in line mode,  
109349 the replaced text shall be copied into the numeric buffers as well.

109350 If the buffer text is in line mode:

- 109351 1. Any lines that contain characters in the region shall be deleted, and the editor shall enter  
109352 text input mode at the beginning of a new line which shall replace the first line deleted.
- 109353 2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent**  
109354 characters on the first line deleted shall be inserted as if entered by the user.

109355 Otherwise, if characters from more than one line are in the region of text:

- 109356 1. The text shall be deleted.
- 109357 2. Any text remaining in the last line in the text region shall be appended to the first line in  
109358 the region, and the last line in the region shall be deleted.
- 109359 3. The editor shall enter text input mode after the last character not deleted from the first  
109360 line in the text region, if any; otherwise, on the first column of the first line in the region.

109361 Otherwise:

- 109362 1. If the glyph for '\$' is smaller than the region, the end of the region shall be marked with  
109363 a '\$'.
- 109364 2. The editor shall enter text input mode, overwriting the region of text.

109365 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
109366 on page 3248).

### 109367 Change to End-of-Line

109368 *Synopsis*: `[buffer][count] C`

109369 This command shall be equivalent to the *vi* command:

109370 `[buffer][count] c$`

109371 See the `c` command.

109372

**Delete**

109373

*Synopsis:* `[buffer][count] d motion`

109374

If the motion command is the **d** command repeated:

109375

1. The buffer text shall be in line mode.

109376

2. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an error.

109377

109378

3. The text region shall be from the current line up to and including the next *count* - 1 lines.

109379

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

109380

If in open mode, and the current line is deleted, and the line remains on the display, an '@' character shall be displayed as the first glyph of that line.

109381

109382

Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be deleted contains characters from more than a single line, or the buffer text is in line mode, the deleted text shall be copied into the numeric buffers, as well.

109383

109384

109385

*Current line:* Set to the first text region line that appears in the edit buffer, unless that line has been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit buffer is empty.

109386

109387

109388

*Current column:*

109389

1. If the line is empty, set to column position 1.

109390

2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the end of the edit buffer:

109391

109392

a. If a character from the current line is displayed in the current column, set to the last column that displays any portion of that character.

109393

109394

b. Otherwise, set to the last column in which any portion of any character in the line is displayed.

109395

109396

3. Otherwise, if a character is displayed in the column that began the text region, set to the last column that displays any portion of that character.

109397

109398

4. Otherwise, set to the last column in which any portion of any character in the line is displayed.

109399

109400

**Delete to End-of-Line**

109401

*Synopsis:* `[buffer] D`

109402

Delete the text from the current position to the end of the current line; equivalent to the *vi* command:

109403

109404

`[buffer] d$`

109405

**Move to End-of-Word**

109406

*Synopsis:* `[count] e`

109407

With the exception that words are used instead of bigwords as the delimiter, this command shall be equivalent to the **E** command.

109408

109409

**Move to End-of-Bigword**

109410

*Synopsis:* [count] E

109411

If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between the cursor and the end of the edit buffer.

109412

109413

109414

If used as a motion command:

109415

1. The text region shall be from the last character of the *count*th next bigword up to and including the cursor character.

109416

109417

2. Any text copied to a buffer shall be in character mode.

109418

If not used as a motion command:

109419

*Current line:* Set to the line containing the current column.

109420

*Current column:* Set to the last column upon which any part of the last character of the *count*th next bigword is displayed.

109421

109422

**Find Character in Current Line (Forward)**

109423

*Synopsis:* [count] f character

109424

It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

109425

If used as a motion command:

109426

1. The text range shall be from the cursor character up to and including the *count*th occurrence of the specified character after the cursor.

109427

109428

2. Any text copied to a buffer shall be in character mode.

109429

If not used as a motion command:

109430

*Current line:* Unchanged.

109431

*Current column:* Set to the last column in which any portion of the *count*th occurrence of the specified character after the cursor appears in the line.

109432

109433

**Find Character in Current Line (Reverse)**

109434

*Synopsis:* [count] F character

109435

It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

109436

If used as a motion command:

109437

1. The text region shall be from the *count*th occurrence of the specified character before the cursor, up to, but not including the cursor character.

109438

109439

2. Any text copied to a buffer shall be in character mode.

109440

If not used as a motion command:

109441

*Current line:* Unchanged.

109442

*Current column:* Set to the last column in which any portion of the *count*th occurrence of the specified character before the cursor appears in the line.

109443

109444

**Move to Line**

109445

*Synopsis:*    [*count*] G

109446

If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than the last line of the edit buffer, it shall be an error.

109447

109448

If used as a motion command:

109449

1. The text region shall be from the cursor line up to and including the specified line.

109450

2. Any text copied to a buffer shall be in line mode.

109451

If not used as a motion command:

109452

*Current line:* Set to *count* if *count* is specified; otherwise, the last line.

109453

*Current column:* Set to non-<blank>.

109454

**Move to Top of Screen**

109455

*Synopsis:*    [*count*] H

109456

If the beginning of the line *count* greater than the first line of which any portion appears on the display does not exist, it shall be an error.

109457

109458

If used as a motion command:

109459

1. If in open mode, the text region shall be the current line.

109460

2. Otherwise, the text region shall be from the starting line up to and including (the first line of the display + *count* -1).

109461

109462

3. Any text copied to a buffer shall be in line mode.

109463

If not used as a motion command:

109464

If in open mode, this command shall set the current column to non-<blank> and do nothing else.

109465

Otherwise, it shall set the current line and current column as follows.

109466

*Current line:* Set to (the first line of the display + *count* -1).

109467

*Current column:* Set to non-<blank>.

109468

**Insert Before Cursor**

109469

*Synopsis:*    [*count*] i

109470

Enter text input mode before the current cursor position. No characters already in the edit buffer shall be affected by this command. A *count* shall cause the input text to be appended *count* -1 more times to the end of the input.

109471

109472

109473

*Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#), on page 3248).

109474

109475

**Insert at Beginning of Line**

109476

*Synopsis:*    [*count*] I

109477

This command shall be equivalent to the *vi* command  $\wedge[*count*]i$ .

109478

**Join**

109479

*Synopsis:*    [*count*] J

109480

If the current line is the last line in the edit buffer, it shall be an error.

109481

109482

109483

109484

This command shall be equivalent to the *ex* **join** command with no addresses, and an *ex* command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex* command *count* value of *count* -1 for any other value of *count*, except that the current line and column shall be set as follows.

109485

*Current line:* Unchanged.

109486

109487

109488

*Current column:* The last column in which any portion of the character following the last character in the initial line is displayed, or the last non-<newline> in the line if no characters were appended.

109489

**Move to Bottom of Screen**

109490

*Synopsis:*    [*count*] L

109491

109492

If the beginning of the line *count* less than the last line of which any portion appears on the display does not exist, it shall be an error.

109493

If used as a motion command:

109494

109495

109496

109497

109498

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall include all lines from the starting cursor line to (the last line of the display  $-(count - 1)$ ).
3. Any text copied to a buffer shall be in line mode.

109498

If not used as a motion command:

109499

109500

109501

109502

109503

1. If in open mode, this command shall set the current column to non-<blank> and do nothing else.
2. Otherwise, it shall set the current line and current column as follows.

*Current line:* Set to (the last line of the display  $-(count - 1)$ ).*Current column:* Set to non-<blank>.

109504

**Mark Position**

109505

*Synopsis:*    m *letter*

109506

109507

This command shall be equivalent to the *ex* **mark** command with the specified character as an argument.

109508

**Move to Middle of Screen**

109509

*Synopsis:*    M

109510

The middle line of the display shall be calculated as follows:

109511

(the top line of the display) + (((number of lines displayed) + 1) / 2) - 1

109512

If used as a motion command:

109513

109514

109515

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall include all lines from the starting cursor line up to and including the middle line of the display.

109516 3. Any text copied to a buffer shall be in line mode.

109517 If not used as a motion command:

109518 If in open mode, this command shall set the current column to non-<blank> and do nothing else.

109519 Otherwise, it shall set the current line and current column as follows.

109520 *Current line*: Set to the middle line of the display.

109521 *Current column*: Set to non-<blank>.

### 109522 **Repeat Regular Expression Find (Forward)**

109523 *Synopsis*: n

109524 If the remembered search direction was forward, the **n** command shall be equivalent to the *vi /*  
109525 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi ?*  
109526 command with no characters entered by the user.

109527 If the **n** command is used as a motion command for the **!** command, the editor shall not enter  
109528 text input mode on the last line on the screen, and shall behave as if the user entered a single  
109529 '!' character as the text input.

### 109530 **Repeat Regular Expression Find (Reverse)**

109531 *Synopsis*: N

109532 Scan for the next match of the last pattern given to */* or *?*, but in the reverse direction; this is the  
109533 reverse of **n**.

109534 If the remembered search direction was forward, the **N** command shall be equivalent to the *vi ?*  
109535 command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi /*  
109536 command with no characters entered by the user. If the **N** command is used as a motion  
109537 command for the **!** command, the editor shall not enter text input mode on the last line on the  
109538 screen, and shall behave as if the user entered a single **!** character as the text input.

### 109539 **Insert Empty Line Below**

109540 *Synopsis*: o

109541 Enter text input mode in a new line appended after the current line. A *count* shall cause the input  
109542 text to be appended *count* -1 more times to the end of the already added text, each time starting  
109543 on a new, appended line.

109544 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
109545 on page 3248).

### 109546 **Insert Empty Line Above**

109547 *Synopsis*: O

109548 Enter text input mode in a new line inserted before the current line. A *count* shall cause the input  
109549 text to be appended *count* -1 more times to the end of the already added text, each time starting  
109550 on a new, appended line.

109551 *Current line/column*: As specified for the text input commands (see [Input Mode Commands in vi](#),  
109552 on page 3248).

109553 **Put from Buffer Following**109554 *Synopsis:* `[buffer] p`109555 If no *buffer* is specified, the unnamed buffer shall be used.109556 If the buffer text is in line mode, the text shall be appended below the current line, and each line  
109557 of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
109558 appended *count* -1 more times to the end of the already added text, each time starting on a new,  
109559 appended line.109560 If the buffer text is in character mode, the text shall be appended into the current line after the  
109561 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
109562 buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the  
109563 already added text, each time starting after the last added character.109564 *Current line:* If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.109565 *Current column:* If the buffer text is in line mode:

- 109566
1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any  
109567 portion of the first non-<blank> in the line is displayed.
  2. If there is no non-<blank> in the first line of the buffer, set to the last column on which  
109568 any portion of the last non-<newline> in the first line of the buffer is displayed.

109570 If the buffer text is in character mode:

- 109571
1. If the text in the buffer is from more than a single line, then set to the last column on  
109572 which any portion of the first character from the buffer is displayed.
  2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any  
109573 portion of the last character from the buffer is displayed.
  3. Otherwise, set to the first column on which any portion of the first character from the  
109574 buffer is displayed.

109577 **Put from Buffer Before**109578 *Synopsis:* `[buffer] P`109579 If no *buffer* is specified, the unnamed buffer shall be used.109580 If the buffer text is in line mode, the text shall be inserted above the current line, and each line of  
109581 the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be  
109582 appended *count* -1 more times to the end of the already added text, each time starting on a new,  
109583 appended line.109584 If the buffer text is in character mode, the text shall be inserted into the current line before the  
109585 cursor, and each line of the buffer other than the first and last shall become a new line in the edit  
109586 buffer. A *count* shall cause the buffer text to be appended *count* -1 more times to the end of the  
109587 already added text, each time starting after the last added character.109588 *Current line:* Unchanged.109589 *Current column:* If the buffer text is in line mode:

- 109590
1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any  
109591 portion of that character is displayed.
  2. If there is no non-<blank> in the first line of the buffer, set to the last column on which  
109592 any portion of the last non-<newline> in the first line of the buffer is displayed.

109594 If the buffer text is in character mode:

- 109595 1. If the text in the buffer is from more than a single line, then set to the last column on  
109596 which any portion of the first character from the buffer is displayed.
- 109597 2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any  
109598 portion of the last character from the buffer is displayed.
- 109599 3. Otherwise, set to the first column on which any portion of the first character from the  
109600 buffer is displayed.

### 109601 **Enter ex Mode**

109602 *Synopsis:* Q

109603 Leave visual or open mode and enter *ex* command mode.

109604 *Current line:* Unchanged.

109605 *Current column:* Unchanged.

### 109606 **Replace Character**

109607 *Synopsis:* [count] r character

109608 Replace the *count* characters at and after the cursor with the specified character. If there are less  
109609 than *count* non-*<newline>*s at and after the cursor on the line, it shall be an error.

109610 If character is *<control>-V*, any next character other than the *<newline>* shall be stripped of any  
109611 special meaning and used as a literal character.

109612 If character is *<ESC>*, no replacement shall be made and the current line and current column  
109613 shall be unchanged.

109614 If character is *<carriage-return>* or *<newline>*, *count* new lines shall be appended to the current  
109615 line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be  
109616 discarded, and any remaining characters after the cursor in the current line shall be moved to the  
109617 last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same  
109618 number of **autoindent** characters found on the line from which the command was executed.

109619 *Current line:* Unchanged unless the replacement character is a *<carriage-return>* or *<newline>*, in  
109620 which case it shall be set to line + *count*.

109621 *Current column:* Set to the last column position on which a portion of the last replaced character  
109622 is displayed, or if the replacement character caused new lines to be created, set to non-*<blank>*.

### 109623 **Replace Characters**

109624 *Synopsis:* R

109625 Enter text input mode at the current cursor position possibly replacing text on the current line. A  
109626 *count* shall cause the input text to be appended *count* - 1 more times to the end of the input.

109627 *Current line/column:* As specified for the text input commands (see [Input Mode Commands in vi](#),  
109628 on page 3248).

109629 **Substitute Character**109630 *Synopsis:* `[buffer][count] s`109631 This command shall be equivalent to the *vi* command:109632 `[buffer][count] c<space>`109633 **Substitute Lines**109634 *Synopsis:* `[buffer][count] S`109635 This command shall be equivalent to the *vi* command:109636 `[buffer][count] c_`109637 **Move Cursor to Before Character (Forward)**109638 *Synopsis:* `[count] t character`109639 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

109640 If used as a motion command:

- 109641 1. The text region shall be from the cursor up to but not including the *count*th occurrence of
- 109642 the specified character after the cursor.
- 109643 2. Any text copied to a buffer shall be in character mode.

109644 If not used as a motion command:

109645 *Current line:* Unchanged.109646 *Current column:* Set to the last column in which any portion of the character before the *count*th

109647 occurrence of the specified character after the cursor appears in the line.

109648 **Move Cursor to After Character (Reverse)**109649 *Synopsis:* `[count] T character`109650 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

109651 If used as a motion command:

- 109652 1. If the character before the cursor is the specified character, it shall be an error.
- 109653 2. The text region shall be from the character before the cursor up to but not including the
- 109654 *count*th occurrence of the specified character before the cursor.
- 109655 3. Any text copied to a buffer shall be in character mode.

109656 If not used as a motion command:

109657 *Current line:* Unchanged.109658 *Current column:* Set to the last column in which any portion of the character after the *count*th

109659 occurrence of the specified character before the cursor appears in the line.

## Undo

*Synopsis:*     u

This command shall be equivalent to the *ex* **undo** command except that the current line and current column shall be set as follows:

*Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding any deleted text if one exists; otherwise, move to line 1.

*Current column:* If undoing an *ex* command, set to the first non-<blank>.

Otherwise, if undoing a text input command:

1. If the command was a **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to the value it held when the text input command was entered.
2. Otherwise, set to the last column in which any portion of the first character after the deleted text is displayed, or, if no non-<newline>s follow the text deleted from this line, set to the last column in which any portion of the last non-<newline> in the line is displayed, or 1 if the line is empty.

Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

1. If text was added or changed, set to the last column in which any portion of the first character added or changed is displayed.
2. If text was deleted, set to the last column in which any portion of the first character after the deleted text is displayed, or, if no non-<newline>s follow the deleted text, set to the last column in which any portion of the last non-<newline> in the line is displayed, or 1 if the line is empty.

Otherwise, set to non-<blank>.

## Undo Current Line

*Synopsis:*     U

Restore the current line to its state immediately before the most recent time that it became the current line.

*Current line:* Unchanged.

*Current column:* Set to the first column in the line in which any portion of the first character in the line is displayed.

## Move to Beginning of Word

*Synopsis:*     [*count*] w

With the exception that words are used as the delimiter instead of bigwords, this command shall be equivalent to the **W** command.

## Move to Beginning of Bigword

*Synopsis:*     [*count*] W

If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last bigword in the edit buffer.

If used as a motion command:

- 109699 1. If the associated command is *c*, *count* is 1, and the cursor is on a <blank>, the region of  
109700 text shall be the current character and no further action shall be taken.
- 109701 2. If there are less than *count* bigwords between the cursor and the end of the edit buffer,  
109702 then the command shall succeed, and the region of text shall include the last character of  
109703 the edit buffer.
- 109704 3. If there are <blank>s or an end-of-line that precede the *count*th bigword, and the  
109705 associated command is *c*, the region of text shall be up to and including the last character  
109706 before the preceding <blank>s or end-of-line.
- 109707 4. If there are <blank>s or an end-of-line that precede the bigword, and the associated  
109708 command is *d* or *y*, the region of text shall be up to and including the last <blank> before  
109709 the start of the bigword or end-of-line.
- 109710 5. Any text copied to a buffer shall be in character mode.

109711 If not used as a motion command:

- 109712 1. If the cursor is on the last character of the edit buffer, it shall be an error.

109713 *Current line*: Set to the line containing the current column.

109714 *Current column*: Set to the last column in which any part of the first character of the *count*th next  
109715 bigword is displayed.

#### 109716 Delete Character at Cursor

109717 *Synopsis*: [*buffer*][*count*] x

109718 Delete the *count* characters at and after the current character into *buffer*, if specified, and into the  
109719 unnamed buffer.

109720 If the line is empty, it shall be an error. If there are less than *count* non-<newline>s at and after  
109721 the cursor on the current line, *count* shall be adjusted to the number of non-<newline>s at and  
109722 after the cursor.

109723 *Current line*: Unchanged.

109724 *Current column*: If the line is empty, set to column position 1. Otherwise, if there were *count* or  
109725 less non-<newline>s at and after the cursor on the current line, set to the last column that  
109726 displays any part of the last non-<newline> of the line. Otherwise, unchanged.

#### 109727 Delete Character Before Cursor

109728 *Synopsis*: [*buffer*][*count*] X

109729 Delete the *count* characters before the current character into *buffer*, if specified, and into the  
109730 unnamed buffer.

109731 If there are no characters before the current character on the current line, it shall be an error. If  
109732 there are less than *count* previous characters on the current line, *count* shall be adjusted to the  
109733 number of previous characters on the line.

109734 *Current line*: Unchanged.

109735 *Current column*: Set to (current column – the width of the deleted characters).

109736 **Yank**109737 *Synopsis:* `[buffer][count] y motion`109738 Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.109739 If the motion command is the *y* command repeated:

- 109740 1. The buffer shall be in line mode.
- 109741 2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an
- 109742 error.
- 109743 3. The text region shall be from the current line up to and including the next *count* -1 lines.

109744 Otherwise, the buffer text mode and text region shall be as specified by the motion command.

109745 *Current line:* If the motion was from the current cursor position toward the end of the edit buffer,  
 109746 unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 109747 specified by the motion command.

109748 *Current column:*

- 109749 1. If the motion was from the current cursor position toward the end of the edit buffer,  
 109750 unchanged.
- 109751 2. Otherwise, if the current line is empty, set to column position 1.
- 109752 3. Otherwise, set to the last column that displays any part of the first character in the file  
 109753 that is part of the text region specified by the motion command.

109754 **Yank Current Line**109755 *Synopsis:* `[buffer][count] Y`109756 This command shall be equivalent to the *vi* command:109757 `[buffer][count] y_`109758 **Redraw Window**109759 If in open mode, the *z* command shall have the Synopsis:109760 *Synopsis:* `[count] z`

109761 If *count* is not specified, it shall default to the **window** edit option -1. The *z* command shall be  
 109762 equivalent to the *ex z* command, with a type character of = and a *count* of *count* -2, except that  
 109763 the current line and current column shall be set as follows, and the **window** edit option shall not  
 109764 be affected. If the calculation for the *count* argument would result in a negative number, the  
 109765 *count* argument to the *ex z* command shall be zero. A blank line shall be written after the last line  
 109766 is written.

109767 *Current line:* Unchanged.109768 *Current column:* Unchanged.109769 If not in open mode, the *z* command shall have the following Synopsis:109770 *Synopsis:* `[line] z [count] character`

109771 If *line* is not specified, it shall default to the current line. If *line* is specified, but is greater than the  
 109772 number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.

109773 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in the  
 109774 *ex window* command), and the screen shall be redrawn.

109775 *line* shall be placed as specified by the following characters:

109776 <newline>, <carriage-return>

109777 Place the beginning of the line on the first line of the display.

109778 . Place the beginning of the line in the center of the display. The middle line of the display  
109779 shall be calculated as described for the **M** command.

109780 – Place an unspecified portion of the line on the last line of the display.

109781 + If *line* was specified, equivalent to the <newline> case. If *line* was not specified, display a  
109782 screen where the first line of the display shall be (current last line) +1. If there are no lines  
109783 after the last line in the display, it shall be an error.

109784 ^ If *line* was specified, display a screen where the last line of the display shall contain an  
109785 unspecified portion of the first line of a display that had an unspecified portion of the  
109786 specified line on the last line of the display. If this calculation results in a line before the  
109787 beginning of the edit buffer, display the first screen of the edit buffer.

109788 Otherwise, display a screen where the last line of the display shall contain an unspecified  
109789 portion of (current first line –1). If this calculation results in a line before the beginning of  
109790 the edit buffer, it shall be an error.

109791 *Current line*: If *line* and the '^' character were specified:

109792 1. If the first screen was displayed as a result of the command attempting to display lines  
109793 before the beginning of the edit buffer: if the first screen was already displayed,  
109794 unchanged; otherwise, set to (current first line –1).

109795 2. Otherwise, set to the last line of the display.

109796 If *line* and the '+' character were specified, set to the first line of the display.

109797 Otherwise, if *line* was specified, set to *line*.

109798 Otherwise, unchanged.

109799 *Current column*: Set to non-<blank>.

## 109800 **Exit**

109801 *Synopsis*: `ZZ`

109802 This command shall be equivalent to the `ex xit` command with no addresses, trailing `!`, or  
109803 filename (see the `ex xit` command).

## 109804 **Input Mode Commands in vi**

109805 In text input mode, the current line shall consist of zero or more of the following categories, plus  
109806 the terminating <newline>:

109807 1. Characters preceding the text input entry point

109808 Characters in this category shall not be modified during text input mode.

109809 2. **autoindent** characters

109810 **autoindent** characters shall be automatically inserted into each line that is created in text  
109811 input mode, either as a result of entering a <newline> or <carriage-return> while in text  
109812 input mode, or as an effect of the command itself; for example, **O** or **o** (see the `ex`  
109813 **autoindent** command), as if entered by the user.

109814 It shall be possible to erase **autoindent** characters with the <control>-D command; it is  
109815 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W  
109816 characters. Erasing any **autoindent** character turns the glyph into erase-columns and

109817 deletes the character from the edit buffer, but does not change its representation on the  
109818 screen.

### 109819 3. Text input characters

109820 Text input characters are the characters entered by the user. Erasing any text input  
109821 character turns the glyph into erase-columns and deletes the character from the edit  
109822 buffer, but does not change its representation on the screen.

109823 Each text input character entered by the user (that does not have a special meaning) shall  
109824 be treated as follows:

- 109825 a. The text input character shall be appended to the last character in the edit buffer  
109826 from the first, second, or third categories.
- 109827 b. If there are no erase-columns on the screen, the text input command was the **R**  
109828 command, and characters in the fifth category from the original line follow the  
109829 cursor, the next such character shall be deleted from the edit buffer. If the  
109830 **slowopen** edit option is not set, the corresponding glyph on the screen shall  
109831 become erase-columns.
- 109832 c. If there are erase-columns on the screen, as many columns as they occupy, or as are  
109833 necessary, shall be overwritten to display the text input character. (If only part of a  
109834 multi-column glyph is overwritten, the remainder shall be left on the screen, and  
109835 continue to be treated as erase-columns; it is unspecified whether the remainder of  
109836 the glyph is modified in any way.)
- 109837 d. If additional display line columns are needed to display the text input character:
  - 109838 1. If the **slowopen** edit option is set, the text input characters shall be  
109839 displayed on subsequent display line columns, overwriting any characters  
109840 displayed in those columns.
  - 109841 2. Otherwise, any characters currently displayed on or after the column on the  
109842 display line where the text input character is to be displayed shall be  
109843 pushed ahead the number of display line columns necessary to display the  
109844 rest of the text input character.

### 109845 4. Erase-columns

109846 Erase-columns are not logically part of the edit buffer, appearing only on the screen, and  
109847 may be overwritten on the screen by subsequent text input characters. When text input  
109848 mode ends, all erase-columns shall no longer appear on the screen.

109849 Erase-columns are initially the region of text specified by the **c** command (see [Change](#), on  
109850 page 3236); however, erasing **autoindent** or text input characters causes the glyphs of the  
109851 erased characters to be treated as erase-columns.

### 109852 5. Characters following the text region for the **c** command, or the text input entry point for 109853 all other commands

109854 Characters in this category shall not be modified during text input mode, except as  
109855 specified in category 3.b. for the **R** text input command, or as <blank>s deleted when a  
109856 <newline> or <carriage-return> is entered.

109857 It is unspecified whether it is an error to attempt to erase past the beginning of a line that was  
109858 created by the entry of a <newline> or <carriage-return> during text input mode. If it is not an  
109859 error, the editor shall behave as if the erasing character was entered immediately after the last  
109860 text input character entered on the previous line, and all of the non-<newline>s on the current  
109861 line shall be treated as erase-columns.

109862 When text input mode is entered, or after a text input mode character is entered (except as

109863 specified for the special characters below), the cursor shall be positioned as follows:

- 109864 1. On the first column that displays any part of the first erase-column, if one exists
- 109865 2. Otherwise, if the **slowopen** edit option is set, on the first display line column after the last
- 109866 character in the first, second, or third categories, if one exists
- 109867 3. Otherwise, the first column that displays any part of the first character in the fifth
- 109868 category, if one exists
- 109869 4. Otherwise, the display line column after the last character in the first, second, or third
- 109870 categories, if one exists
- 109871 5. Otherwise, on column position 1

109872 The characters that are updated on the screen during text input mode are unspecified, other than

109873 that the last text input character shall always be updated, and, if the **slowopen** edit option is not

109874 set, the current cursor character shall always be updated.

109875 The following specifications are for command characters entered during text input mode.

## 109876 NUL

109877 *Synopsis:* NUL

109878 If the first character of the text input is a NUL, the most recently input text shall be input as if

109879 entered by the user, and then text input mode shall be exited. The text shall be input literally;

109880 that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted

109881 in any special manner. It is unspecified whether implementations shall support more than 256

109882 bytes of remembered input text.

## 109883 <control>-D

109884 *Synopsis:* <control>-D

109885 The <control>-D character shall have no special meaning when in text input mode for a line-

109886 oriented command (see [Command Descriptions in vi](#), on page 3216).

109887 This command need not be supported on block-mode terminals.

109888 If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or

109889 '^' character:

- 109890 1. If the cursor is in column position 1, the <control>-D character shall be discarded and no
- 109891 further action taken.
- 109892 2. Otherwise, the <control>-D character shall have no special meaning.

109893 If the last input character was a '0', the cursor shall be moved to column position 1.

109894 Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.

109895 In addition, the **autoindent** level for the next input line shall be derived from the same line from

109896 which the **autoindent** level for the current input line was derived.

109897 Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the

109898 *ex* **shiftwidth** command) boundary.

109899 All of the glyphs on columns between the starting cursor position and (inclusively) the ending

109900 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on

109901 page 3248).

109902 *Current line:* Unchanged.

109903 *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to

109904 (column -1) - ((column -2) % **shiftwidth**).

109905           **<control>-H**

109906           *Synopsis:*     <control>-H

109907           If in text input mode for a line-oriented command, and there are no characters to erase, text  
109908           input mode shall be terminated, no further action shall be done for this command, and the  
109909           current line and column shall be unchanged.

109910           If there are characters other than **autoindent** characters that have been input on the current line  
109911           before the cursor, the cursor shall move back one character.

109912           Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
109913           implementation-defined whether the <control>-H command is an error or if the cursor moves  
109914           back one **autoindent** character.

109915           Otherwise, if the cursor is in column position 1 and there are previous lines that have been  
109916           input, it is implementation-defined whether the <control>-H command is an error or if it is  
109917           equivalent to entering <control>-H after the last input character on the previous input line.

109918           Otherwise, it shall be an error.

109919           All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
109920           cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on  
109921           page 3248).

109922           The current erase character (see *stty*) shall cause an equivalent action to the <control>-H  
109923           command, unless the previously inserted character was a backslash, in which case it shall be as  
109924           if the literal current erase character had been inserted instead of the backslash.

109925           *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
109926           line -1.

109927           *Current column:* Set to the first column that displays any portion of the character backed up over.

109928           **<newline>**

109929           *Synopsis:*     <newline>  
109930                     <carriage-return>  
109931                     <control>-J  
109932                     <control>-M

109933           If input was part of a line-oriented command, text input mode shall be terminated and the  
109934           command shall continue execution with the input provided.

109935           Otherwise, terminate the current line. If there are no characters other than **autoindent** characters  
109936           on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the  
109937           **autoindent** characters in the line are modified by entering these characters.

109938           Continue text input mode on a new line appended after the current line. If the **slowopen** edit  
109939           option is set, the lines on the screen below the current line shall not be pushed down, but the  
109940           first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the  
109941           screen below the current line shall be pushed down.

109942           If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be  
109943           added as a prefix to the line as described by the *ex* **autoindent** edit option.

109944           All columns after the cursor that are erase-columns (as described in [Input Mode Commands in vi](#),  
109945           on page 3248) shall be discarded.

109946           If the **autoindent** edit option is set, all <blank>s immediately following the cursor shall be  
109947           discarded.

109948           All remaining characters after the cursor shall be transferred to the new line, positioned after

109949 any **autoindent** characters.

109950 *Current line*: Set to current line +1.

109951 *Current column*: Set to the first column that displays any portion of the first character after the

109952 **autoindent** characters on the new line, if any, or the first column position after the last

109953 **autoindent** character, if any, or column position 1.

109954 **<control>-T**

109955 *Synopsis*: `<control>-T`

109956 The `<control>-T` character shall have no special meaning when in text input mode for a line-

109957 oriented command (see [Command Descriptions in vi](#), on page 3216).

109958 This command need not be supported on block-mode terminals.

109959 Behave as if the user entered the minimum number of `<blank>`s necessary to move the cursor

109960 forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth** command)

109961 boundary.

109962 *Current line*: Unchanged.

109963 *Current column*: Set to  $column + \text{shiftwidth} - ((column - 1) \% \text{shiftwidth})$ .

109964 **<control>-U**

109965 *Synopsis*: `<control>-U`

109966 If there are characters other than **autoindent** characters that have been input on the current line

109967 before the cursor, the cursor shall move to the first character input after the **autoindent**

109968 characters.

109969 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is

109970 implementation-defined whether the `<control>-U` command is an error or if the cursor moves to

109971 the first column position on the line.

109972 Otherwise, if the cursor is in column position 1 and there are previous lines that have been

109973 input, it is implementation-defined whether the `<control>-U` command is an error or if it is

109974 equivalent to entering `<control>-U` after the last input character on the previous input line.

109975 Otherwise, it shall be an error.

109976 All of the glyphs on columns between the starting cursor position and (inclusively) the ending

109977 cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on

109978 page 3248).

109979 The current *kill* character (see *stty*) shall cause an equivalent action to the `<control>-U` command,

109980 unless the previously inserted character was a backslash, in which case it shall be as if the literal

109981 current *kill* character had been inserted instead of the backslash.

109982 *Current line*: Unchanged, unless previously input lines are erased, in which case it shall be set to

109983 line -1.

109984 *Current column*: Set to the first column that displays any portion of the last character backed up

109985 over.

109986

**<control>-V**

109987

*Synopsis:* <control>-V

109988

&lt;control&gt;-Q

109989

Allow the entry of any subsequent character, other than <control>-J or the <newline>, as a literal character, removing any special meaning that it may have to the editor in text input mode. If a <control>-V or <control>-Q is entered before a <control>-J or <newline>, the <control>-V or <control>-Q character shall be discarded, and the <control>-J or <newline> shall behave as described in the <newline> command character during input mode.

109990

109991

109992

109993

109994

For purposes of the display only, the editor shall behave as if a '^' character was entered, and the cursor shall be positioned as if overwriting the '^' character. When a subsequent character is entered, the editor shall behave as if that character was entered instead of the original <control>-V or <control>-Q character.

109995

109996

109997

109998

*Current line:* Unchanged.

109999

*Current column:* Unchanged.

110000

**<control>-W**

110001

*Synopsis:* <control>-W

110002

If there are characters other than **autoindent** characters that have been input on the current line before the cursor, the cursor shall move back over the last word preceding the cursor (including any <blank>s between the end of the last word and the current cursor); the cursor shall not move to before the first character after the end of any **autoindent** characters.

110003

110004

110005

110006

Otherwise, if there are **autoindent** characters on the current line before the cursor, it is implementation-defined whether the <control>-W command is an error or if the cursor moves to the first column position on the line.

110007

110008

110009

Otherwise, if the cursor is in column position 1 and there are previous lines that have been input, it is implementation-defined whether the <control>-W command is an error or if it is equivalent to entering <control>-W after the last input character on the previous input line.

110010

110011

110012

Otherwise, it shall be an error.

110013

All of the glyphs on columns between the starting cursor position and (inclusively) the ending cursor position shall become erase-columns as described in [Input Mode Commands in vi](#) (on page 3248).

110014

110015

110016

*Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to line -1.

110017

110018

*Current column:* Set to the first column that displays any portion of the last character backed up over.

110019

110020

**<ESC>**

110021

*Synopsis:* <ESC>

110022

If input was part of a line-oriented command:

110023

1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to command mode. The terminal shall be alerted.

110024

110025

2. If <ESC> was entered, text input mode shall be terminated and the command shall continue execution with the input provided.

110026

110027

Otherwise, terminate text input mode and return to command mode.

110028

Any **autoindent** characters entered on newly created lines that have no other non-<newline>s

- 110029 shall be deleted.
- 110030 Any leading **autoindent** and <blank>s on newly created lines shall be rewritten to be the  
110031 minimum number of <blank>s possible.
- 110032 The screen shall be redisplayed as necessary to match the contents of the edit buffer.
- 110033 *Current line:* Unchanged.
- 110034 *Current column:*
- 110035 1. If there are text input characters on the current line, the column shall be set to the last  
110036 column where any portion of the last text input character is displayed.
  - 110037 2. Otherwise, if a character is displayed in the current column, unchanged.
  - 110038 3. Otherwise, set to column position 1.
- 110039 **EXIT STATUS**
- 110040 The following exit values shall be returned:
- 110041 0 Successful completion.
- 110042 >0 An error occurred.
- 110043 **CONSEQUENCES OF ERRORS**
- 110044 When any error is encountered and the standard input is not a terminal device file, *vi* shall not  
110045 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
110046 status.
- 110047 Otherwise, when an unrecoverable error is encountered it shall be equivalent to a SIGHUP  
110048 asynchronous event.
- 110049 Otherwise, when an error is encountered, the editor shall behave as specified in [Command](#)  
110050 [Descriptions in vi](#) (on page 3216).
- 110051 **APPLICATION USAGE**
- 110052 None.
- 110053 **EXAMPLES**
- 110054 None.
- 110055 **RATIONALE**
- 110056 See the RATIONALE for *ex* for more information on *vi*. Major portions of the *vi* utility  
110057 specification point to *ex* to avoid inadvertent divergence. While *ex* and *vi* have historically been  
110058 implemented as a single utility, this is not required by POSIX.1-200x.
- 110059 It is recognized that portions of *vi* would be difficult, if not impossible, to implement  
110060 satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,  
110061 thus it is not a mandatory requirement that such features should work on all terminals. It is the  
110062 intention, however, that a *vi* implementation should provide the full set of capabilities on all  
110063 terminals capable of supporting them.
- 110064 Historically, *vi* exited immediately if the standard input was not a terminal. POSIX.1-200x  
110065 permits, but does not require, this behavior. An end-of-file condition is not equivalent to an end-  
110066 of-file character. A common end-of-file character, <control>-D, is historically a *vi* command.
- 110067 The text in the STDOUT section reflects the usage of the verb *display* in this section; some  
110068 implementations of *vi* use standard output to write to the terminal, but POSIX.1-200x does not  
110069 require that to be the case.
- 110070 Historically, implementations reverted to open mode if the terminal was incapable of supporting  
110071 full visual mode. POSIX.1-200x requires this behavior. Historically, the open mode of *vi* behaved  
110072 roughly equivalently to the visual mode, with the exception that only a single line from the edit

110073 buffer (one “buffer line”) was kept current at any time. This line was normally displayed on the  
 110074 next-to-last line of a terminal with cursor addressing (and the last line performed its normal  
 110075 visual functions for line-oriented commands and messages). In addition, some few commands  
 110076 behaved differently in open mode than in visual mode. POSIX.1-200x requires conformance to  
 110077 historical practice.

110078 Historically, *ex* and *vi* implementations have expected text to proceed in the usual  
 110079 European/Latin order of left to right, top to bottom. There is no requirement in POSIX.1-200x  
 110080 that this be the case. The specification was deliberately written using words like “before”,  
 110081 “after”, “first”, and “last” in order to permit implementations to support the natural text order  
 110082 of the language.

110083 Historically, lines past the end of the edit buffer were marked with single tilde (‘~’) characters;  
 110084 that is, if the one-based display was 20 lines in length, and the last line of the file was on line  
 110085 one, then lines 2-20 would contain only a single ‘~’ character.

110086 Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it  
 110087 did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the  
 110088 bottom of the screen, the screen lines where the line would have been displayed were displayed  
 110089 as single ‘@’ characters, instead of displaying part of the line. POSIX.1-200x permits, but does  
 110090 not require, this behavior. Implementations are encouraged to attempt always to display a  
 110091 complete line at the bottom of the screen when doing scrolling or screen positioning by buffer  
 110092 lines.

110093 Historically, lines marked with ‘@’ were also used to minimize output to dumb terminals over  
 110094 slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen  
 110095 that were not close to the cursor were simply marked with an ‘@’ sign instead of being updated  
 110096 to match the current text. POSIX.1-200x permits, but does not require this feature because it is  
 110097 used ever less frequently as terminals become smarter and connections are faster.

#### 110098 Initialization in *ex* and *vi*

110099 Historically, *vi* always had a line in the edit buffer, even if the edit buffer was “empty”. For  
 110100 example:

- 110101 1. The *ex* command = executed from visual mode wrote “1” when the buffer was empty.
- 110102 2. Writes from visual mode of an empty edit buffer wrote files of a single character (a  
 110103 <newline>), while writes from *ex* mode of an empty edit buffer wrote empty files.
- 110104 3. Put and read commands into an empty edit buffer left an empty line at the top of the edit  
 110105 buffer.

110106 For consistency, POSIX.1-200x does not permit any of these behaviors.

110107 Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was  
 110108 modified if it was not originally set. POSIX.1-200x does not permit this behavior.

#### 110109 Command Descriptions in *vi*

110110 Motion commands are among the most complicated aspects of *vi* to describe. With some  
 110111 exceptions, the text region and buffer type effect of a motion command on a *vi* command are  
 110112 described on a case-by-case basis. The descriptions of text regions in POSIX.1-200x are not  
 110113 intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a  
 110114 region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can  
 110115 be in either direction, and, if the **wrapsan** option is set, so can movements to search points.  
 110116 Historically, lines are always stored into buffers in text order; that is, from the start of the edit  
 110117 buffer to the end. POSIX.1-200x requires conformance to historical practice.

110118 Historically, command counts were applied to any associated motion, and were multiplicative to  
 110119 any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**.

110120 POSIX.1-200x requires this behavior. Historically, *vi* commands that used bigwords, words,  
 110121 paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only  
 110122 <blank>s, inconsistently. Some commands treated them as a single entity, while others treated  
 110123 each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty lines as  
 110124 individual words; that is, the command would move the cursor to each new empty line. The **e**  
 110125 and **E** commands treated groups of empty lines as a single word; that is, the first use would  
 110126 move past the group of lines. The **b** command would just beep at the user, or if done from the  
 110127 start of the line as a motion command, fail in unexpected ways. If the lines contained only (or  
 110128 ended with) <blank>s, the **w** and **W** commands would just beep at the user, the **E** and **e**  
 110129 commands would treat the group as a single word, and the **B** and **b** commands would treat the  
 110130 lines as individual words. For consistency and simplicity of specification, POSIX.1-200x requires  
 110131 that all *vi* commands treat groups of empty or blank lines as a single entity, and that movement  
 110132 through lines ending with <blank>s be consistent with other movements.

110133 Historically, *vi* documentation indicated that any number of double quotes were skipped after  
 110134 punctuation marks at sentence boundaries; however, implementations only skipped single  
 110135 quotes. POSIX.1-200x requires both to be skipped.

110136 Historically, the first and last characters in the edit buffer were word boundaries. This historical  
 110137 practice is required by POSIX.1-200x.

110138 Historically, *vi* attempted to update the minimum number of columns on the screen possible,  
 110139 which could lead to misleading information being displayed. POSIX.1-200x makes no  
 110140 requirements other than that the current character being entered is displayed correctly, leaving  
 110141 all other decisions in this area up to the implementation.

110142 Historically, lines were arbitrarily folded between columns of any characters that required  
 110143 multiple column positions on the screen, with the exception of tabs, which terminated at the  
 110144 right-hand margin. POSIX.1-200x permits the former and requires the latter. Implementations  
 110145 that do not arbitrarily break lines between columns of characters that occupy multiple column  
 110146 positions should not permit the cursor to rest on a column that does not contain any part of a  
 110147 character.

110148 The historical *vi* had a problem in that all movements were by buffer lines, not by display or  
 110149 screen lines. This is often the right thing to do; for example, single line movements, such as **j** or  
 110150 **k**, should work on buffer lines. Commands like **dj**, or **j.**, where **.** is a change command, only  
 110151 make sense for buffer lines. It is not, however, the right thing to do for screen motion or scrolling  
 110152 commands like <control>-D, <control>-F, and **H**. If the window is fairly small, using buffer lines  
 110153 in these cases can result in completely random motion; for example, **1<control>-D** can result in a  
 110154 completely changed screen, without any overlap. This is clearly not what the user wanted. The  
 110155 problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at  
 110156 the first non-<blank> of the line, they may all refer to the same location in large lines, and will  
 110157 result in no movement at all.

110158 In addition, if the line is larger than the screen, using buffer lines can make it impossible to  
 110159 display parts of the line—there are not any commands that do not display the beginning of the  
 110160 line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the  
 110161 same time, the user suffers. Finally, the page and half-page scrolling commands historically  
 110162 moved to the first non-<blank> in the new line. If the line is approximately the same size as the  
 110163 screen, this is inadequate because the cursor before and after a <control>-D command will refer  
 110164 to the same location on the screen.

110165 Implementations of *ex* and *vi* exist that do not have these problems because the relevant  
 110166 commands (<control>-B, <control>-D, <control>-F, <control>-U, <control>-Y, <control>-E, **H**, **L**,  
 110167 and **M**) operate on display (screen) lines, not (edit) buffer lines.

110168 POSIX.1-200x does not permit this behavior by default because the standard developers believed  
 110169 that users would find it too confusing. However, historical practice has been relaxed. For

110170 example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part of a  
 110171 line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of the  
 110172 line was displayed, and the screen lines corresponding to the line contained single '@'  
 110173 characters. This behavior is permitted, but not required by POSIX.1-200x, so that it is possible for  
 110174 implementations to support long lines in small screens more reasonably without changing the  
 110175 commands to be oriented to the display (instead of oriented to the buffer). POSIX.1-200x also  
 110176 permits implementations to refuse to edit any edit buffer containing a line that will not fit on the  
 110177 screen in its entirety.

110178 The display area (for example, the value of the **window** edit option) has historically been  
 110179 "grown", or expanded, to display new text when local movements are done in displays where  
 110180 the number of lines displayed is less than the maximum possible. Expansion has historically  
 110181 been the first choice, when the target line is less than the maximum possible expansion value  
 110182 away. Scrolling has historically been the next choice, done when the target line is less than half a  
 110183 display away, and otherwise, the screen was redrawn. There were exceptions, however, in that *ex*  
 110184 commands generally always caused the screen to be redrawn. POSIX.1-200x does not specify a  
 110185 standard behavior because there may be external issues, such as connection speed, the number  
 110186 of characters necessary to redraw as opposed to scroll, or terminal capabilities that  
 110187 implementations will have to accommodate.

110188 The current line in POSIX.1-200x maps one-to-one to a buffer line in the file. The current column  
 110189 does not. There are two different column values that are described by POSIX.1-200x. The first is  
 110190 the current column value as set by many of the *vi* commands. This value is remembered for the  
 110191 lifetime of the editor. The second column value is the actual position on the screen where the  
 110192 cursor rests. The two are not always the same. For example, when the cursor is backed by a  
 110193 multi-column character, the actual cursor position on the screen has historically been the last  
 110194 column of the character in command mode, and the first column of the character in input mode.

110195 Commands that set the current line, but that do not set the current cursor value (for example, **j**  
 110196 and **k**) attempt to get as close as possible to the remembered column position, so that the cursor  
 110197 tends to restrict itself to a vertical column as the user moves around in the edit buffer.  
 110198 POSIX.1-200x requires conformance to historical practice, requiring that the display location of  
 110199 the cursor on the display line be adjusted from the current column value as necessary to support  
 110200 this historical behavior.

110201 Historically, only a single line (and for some terminals, a single line minus 1 column) of  
 110202 characters could be entered by the user for the line-oriented commands; that is, **;**, **!**, **/**, or **?**.  
 110203 POSIX.1-200x permits, but does not require, this limitation.

110204 Historically, "soft" errors in *vi* caused the terminal to be alerted, but no error message was  
 110205 displayed. As a general rule, no error message was displayed for errors in command execution  
 110206 in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when  
 110207 a searched-for object was not found. Examples of soft errors included **h** at the left margin,  
 110208 <control>-**B** or **[** at the beginning of the file, **2G** at the end of the file, and so on. In addition,  
 110209 errors such as **%**, **]**, **]**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well.  
 110210 Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n**  
 110211 displayed an error message if no previous regular expression had been specified, and **;** did not  
 110212 display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in  
 110213 this area might reasonably be based on a runtime evaluation of the speed of a network  
 110214 connection. Finally, some implementations have provided error messages for soft errors in order  
 110215 to assist naive users, based on the value of a verbose edit option. POSIX.1-200x does not list  
 110216 specific errors for which an error message shall be displayed. Implementations should conform  
 110217 to historical practice in the absence of any strong reason to diverge.

### Page Backwards

The <control>-B and <control>-F commands historically considered it an error to attempt to page past the beginning or end of the file, whereas the <control>-D and <control>-U commands simply moved to the beginning or end of the file. For consistency, POSIX.1-200x requires the latter behavior for all four commands. All four commands still consider it an error if the current line is at the beginning (<control>-B, <control>-U) or end (<control>-F, <control>-D) of the file. Historically, the <control>-B and <control>-F commands skip two lines in order to include overlapping lines when a single command is entered. This makes less sense in the presence of a *count*, as there will be, by definition, no overlapping lines. The actual calculation used by historical implementations of the *vi* editor for <control>-B was:

```
((current first line) - count x (window edit option)) +2
```

and for <control>-F was:

```
((current first line) + count x (window edit option)) -2
```

This calculation does not work well when intermixing commands with and without counts; for example, **3<control>-F is not equivalent to entering the <control>-F command three times, and is not reversible by entering the <control>-B command three times. For consistency with other *vi* commands that take counts, POSIX.1-200x requires a different calculation.**

### Scroll Forward

The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll** command. 4BSD used:

```
((window edit option) +1) /2
```

while System V used the value of the **scroll** edit option. The System V version is specified by POSIX.1-200x because the standard developers believed that it was more intuitive and permitted the user a method of setting the scroll value initially without also setting the number of lines that are displayed.

### Scroll Forward by Line

Historically, the <control>-E and <control>-Y commands considered it an error if the last and first lines, respectively, were already on the screen. POSIX.1-200x requires conformance to historical practice. Historically, the <control>-E and <control>-Y commands had no effect in open mode. For simplicity and consistency of specification, POSIX.1-200x requires that they behave as usual, albeit with a single line screen.

### Clear and Redisplay

The historical <control>-L command refreshed the screen exactly as it was supposed to be currently displayed, replacing any '@' characters for lines that had been deleted but not updated on the screen with refreshed '@' characters. The intent of the <control>-L command is to refresh when the screen has been accidentally overwritten; for example, by a **write** command from another user, or modem noise.

110255

**Redraw Screen**

110256

110257

110258

110259

110260

110261

The historical <control>-R command redisplayed only when necessary to update lines that had been deleted but not updated on the screen and that were flagged with '@' characters. There is no requirement that the screen be in any way refreshed if no lines of this form are currently displayed. POSIX.1-200x permits implementations to extend this command to refresh lines on the screen flagged with '@' characters because they are too long to be displayed in the current framework; however, the current line and column need not be modified.

110262

**Search for tagstring**

110263

110264

110265

110266

110267

Historically, the first non-<blank> at or after the cursor was the first character, and all subsequent characters that were word characters, up to the end of the line, were included. For example, with the cursor on the leading space or on the '#' character in the text "#bar@", the tag was "#bar". On the character 'b' it was "bar", and on the 'a' it was "ar". POSIX.1-200x requires this behavior.

110268

**Replace Text with Results from Shell Command**

110269

110270

110271

110272

110273

Historically, the <, >, and ! commands considered most cursor motions other than line-oriented motions an error; for example, the command >/foo<CR> succeeded, while the command >I failed, even though the text region described by the two commands might be identical. For consistency, all three commands only consider entire lines and not partial lines, and the region is defined as any line that contains a character that was specified by the motion.

110274

**Move to Matching Character**

110275

110276

110277

Other matching characters have been left implementation-defined in order to allow extensions such as matching '<' and '>' for searching HTML, or #ifdef, #else, and #endif for searching C source.

110278

**Repeat Substitution**

110279

110280

POSIX.1-200x requires that any c and g flags specified to the previous substitute command be ignored; however, the r flag may still apply, if supported by the implementation.

110281

**Return to Previous (Context or Section)**

110282

110283

110284

110285

110286

110287

110288

110289

110290

110291

110292

The [, ], (, ), {, and } commands are all affected by "section boundaries", but in some historical implementations not all of the commands recognize the same section boundaries. This is a bug, not a feature, and a unique section-boundary algorithm was not described for each command. One special case that is preserved is that the sentence command moves to the end of the last line of the edit buffer while the other commands go to the beginning, in order to preserve the traditional character cut semantics of the sentence command. Historically, vi section boundaries at the beginning and end of the edit buffer were the first non-<blank> on the first and last lines of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit buffer if one exists. To increase consistency with other section locations, this has been simplified by POSIX.1-200x to the first character of the first and last lines of the edit buffer, or the first and the last lines of the edit buffer if they are empty.

110293

110294

110295

110296

110297

110298

Sentence boundaries were problematic in the historical vi. They were not only the boundaries as defined for the section and paragraph commands, but they were the first non-<blank> that occurred after those boundaries, as well. Historically, the vi section commands were documented as taking an optional window size as a count preceding the command. This was not implemented in historical versions, so POSIX.1-200x requires that the count repeat the command, for consistency with other vi commands.

**Repeat**

Historically, mapped commands other than text input commands could not be repeated using the **period** command. POSIX.1-200x requires conformance to historical practice.

The restrictions on the interpretation of special characters (for example, <control>-H) in the repetition of text input mode commands is intended to match historical practice. For example, given the input sequence:

```
iab<control>-H<control>-H<control>-Hdef<escape>
```

the user should be informed of an error when the sequence is first entered, but not during a command repetition. The character <control>-T is specifically exempted from this restriction. Historical implementations of *vi* ignored <control>-T characters that were input in the original command during command repetition. POSIX.1-200x prohibits this behavior.

**Find Regular Expression**

Historically, commands did not affect the line searched to or from if the motion command was a search (*l*, *?*, *N*, *n*) and the final position was the start/end of the line. There were some special cases and *vi* was not consistent. POSIX.1-200x does not permit this behavior, for consistency. Historical implementations permitted but were unable to handle searches as motion commands that wrapped (that is, due to the edit option **wraps**) to the original location. POSIX.1-200x requires that this behavior be treated as an error.

Historically, the syntax `"/RE/0"` was used to force the command to cut text in line mode. POSIX.1-200x requires conformance to historical practice.

Historically, in open mode, a **z** specified to a search command redisplayed the current line instead of displaying the current screen with the current line highlighted. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

Historically, trailing **z** commands were permitted and ignored if entered as part of a search used as a motion command. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

**Execute an ex Command**

Historically, *vi* implementations restricted the commands that could be entered on the colon command line (for example, **append** and **change**), and some other commands were known to cause them to fail catastrophically. For consistency, POSIX.1-200x does not permit these restrictions. When executing an *ex* command by entering `:`, it is not possible to enter a <newline> as part of the command because it is considered the end of the command. A different approach is to enter *ex* command mode by using the *vi* **Q** command (and later resuming visual mode with the *ex* **vi** command). In *ex* command mode, the single-line limitation does not exist. So, for example, the following is valid:

```
Q
s/break here/break\
here/
vi
```

POSIX.1-200x requires that, if the *ex* command overwrites any part of the screen that would be erased by a refresh, *vi* pauses for a character from the user. Historically, this character could be any character; for example, a character input by the user before the message appeared, or even a mapped character. This is probably a bug, but implementations that have tried to be more rigorous by requiring that the user enter a specific character, or that the user enter a character after the message was displayed, have been forced by user indignation back into historical behavior. POSIX.1-200x requires conformance to historical practice.

110345

**Shift Left (Right)**110346  
110347  
110348  
110349  
110350  
110351  
110352

Refer to the Rationale for the ! and / commands. Historically, the < and > commands sometimes moved the cursor to the first non-<blank> (for example if the command was repeated or with \_ as the motion command), and sometimes left it unchanged. POSIX.1-200x does not permit this inconsistency, requiring instead that the cursor always move to the first non-<blank>. Historically, the < and > commands did not support buffer arguments, although some implementations allow the specification of an optional buffer. This behavior is neither required nor disallowed by POSIX.1-200x.

110353

**Execute**110354  
110355  
110356  
110357

Historically, buffers could execute other buffers, and loops, infinite and otherwise, were possible. POSIX.1-200x requires conformance to historical practice. The *\*buffer* syntax of *ex* is not required in *vi*, because it is not historical practice and has been used in some *vi* implementations to support additional scripting languages.

110358

**Reverse Case**110359  
110360  
110361  
110362  
110363  
110364  
110365  
110366

Historically, the ~ command ignored any associated *count*, and acted only on the characters in the current line. For consistency with other *vi* commands, POSIX.1-200x requires that an associated *count* act on the next *count* characters, and that the command move to subsequent lines if warranted by *count*, to make it possible to modify large pieces of text in a reasonably efficient manner. There exist *vi* implementations that optionally require an associated motion command for the ~ command. Implementations supporting this functionality are encouraged to base it on the **tildedop** edit option and handle the text regions and cursor positioning identically to the **yank** command.

110367

**Append**110368  
110369  
110370

Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line *count* times, and did not repeat the subsequent lines of the input text. POSIX.1-200x requires that the entire text input be repeated *count* times.

110371

**Move Backward to Preceding Word**110372  
110373  
110374  
110375  
110376  
110377

Historically, *vi* became confused if word commands were used as motion commands in empty files. POSIX.1-200x requires that this be an error. Historical implementations of *vi* had a large number of bugs in the word movement commands, and they varied greatly in behavior in the presence of empty lines, "words" made up of a single character, and lines containing only <blank>s. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

110378

**Change to End-of-Line**110379  
110380  
110381  
110382  
110383  
110384

Some historical implementations of the **C** command did not behave as described by POSIX.1-200x when the \$ key was remapped because they were implemented by pushing the \$ key onto the input queue and reprocessing it. POSIX.1-200x does not permit this behavior. Historically, the **C**, **S**, and **s** commands did not copy replaced text into the numeric buffers. For consistency and simplicity of specification, POSIX.1-200x requires that they behave like their respective **c** commands in all respects.

## Delete

Historically, lines in open mode that were deleted were scrolled up, and an @ glyph written over the beginning of the line. In the case of terminals that are incapable of the necessary cursor motions, the editor erased the deleted line from the screen. POSIX.1-200x requires conformance to historical practice; that is, if the terminal cannot display the '@' character, the line cannot remain on the screen.

## Delete to End-of-Line

Some historical implementations of the **D** command did not behave as described by POSIX.1-200x when the \$ key was remapped because they were implemented by pushing the \$ key onto the input queue and reprocessing it. POSIX.1-200x does not permit this behavior.

## Join

An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent. POSIX.1-200x requires conformance to historical practice. The *vi* **J** command is specified in terms of the *ex* **join** command with an *ex* command *count* value. The address correction for a *count* that is past the end of the edit buffer is necessary for historical compatibility for both *ex* and *vi*.

## Mark Position

Historical practice is that only lowercase letters, plus '' and ''', could be used to mark a cursor position. POSIX.1-200x requires conformance to historical practice, but encourages implementations to support other characters as marks as well.

## Repeat Regular Expression Find (Forward and Reverse)

Historically, the **N** and **n** commands could not be used as motion components for the **c** command. With the exception of the **cN** command, which worked if the search crossed a line boundary, the text region would be discarded, and the user would not be in text input mode. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

## Insert Empty Line (Below and Above)

Historically, counts to the **O** and **o** commands were used as the number of physical lines to open, if the terminal was dumb and the **slowopen** option was not set. This was intended to minimize traffic over slow connections and repainting for dumb terminals. POSIX.1-200x does not permit this behavior, requiring that a *count* to the open command behave as for other text input commands. This change to historical practice was made for consistency, and because a superset of the functionality is provided by the **slowopen** edit option.

## Put from Buffer (Following and Before)

Historically, counts to the **p** and **P** commands were ignored if the buffer was a line mode buffer, but were (mostly) implemented as described in POSIX.1-200x if the buffer was a character mode buffer. Because implementations exist that do not have this limitation, and because pasting lines multiple times is generally useful, POSIX.1-200x requires that *count* be supported for all **p** and **P** commands.

Historical implementations of *vi* were widely known to have major problems in the **p** and **P** commands, particularly when unusual regions of text were copied into the edit buffer. The standard developers viewed these as bugs, and they are not permitted for consistency and simplicity of specification.

Historically, a **P** or **p** command (or an *ex* **put** command executed from open or visual mode) executed in an empty file, left an empty line as the first line of the file. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

110429

**Replace Character**

110430

110431

110432

110433

Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return> argument, for which it replaced *count* characters with a single <newline>. POSIX.1-200x does not permit these inconsistencies.

110434

110435

110436

110437

Historically, the **r** command permitted the <control>-V escaping of entered characters, such as <ESC> and the <carriage-return>; however, it required two leading <control>-V characters instead of one. POSIX.1-200x requires that this be changed for consistency with the other text input commands of *vi*.

110438

110439

110440

110441

110442

Historically, it is an error to enter the **r** command if there are less than *count* characters at or after the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r** command on empty lines, it would require that too large a *count* be adjusted to match the number of characters at or after the cursor for consistency, which is sufficiently different from historical practice to be avoided. POSIX.1-200x requires conformance to historical practice.

110443

**Replace Characters**

110444

110445

110446

110447

110448

Historically, if there were **autoindent** characters in the line on which the **R** command was run, and **autoindent** was set, the first <newline> would be properly indented and no characters would be replaced by the <newline>. Each additional <newline> would replace *n* characters, where *n* was the number of characters that were needed to indent the rest of the line to the proper indentation level. This behavior is a bug and is not permitted by POSIX.1-200x.

110449

**Undo**

110450

110451

110452

110453

110454

110455

110456

110457

110458

110459

110460

Historical practice for cursor positioning after undoing commands was mixed. In most cases, when undoing commands that affected a single line, the cursor was moved to the start of added or changed text, or immediately after deleted text. However, if the user had moved from the line being changed, the column was either set to the first non-<blank>, returned to the origin of the command, or remained unchanged. When undoing commands that affected multiple lines or entire lines, the cursor was moved to the first character in the first line restored. As an example of how inconsistent this was, a search, followed by an **o** text input command, followed by an **undo** would return the cursor to the location where the **o** command was entered, but a **cw** command followed by an **o** command followed by an **undo** would return the cursor to the first non-<blank> of the line. POSIX.1-200x requires the most useful of these behaviors, and discards the least useful, in the interest of consistency and simplicity of specification.

110461

**Yank**

110462

110463

110464

110465

110466

110467

110468

110469

110470

110471

Historically, the **yank** command did not move to the end of the motion if the motion was in the forward direction. It moved to the end of the motion if the motion was in the backward direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion was on the current line. This was further complicated by the fact that for a number of motion commands, the **yank** command moved the cursor but did not update the screen; for example, a subsequent command would move the cursor from the end of the motion, even though the cursor on the screen had not reflected the cursor movement for the **yank** command. POSIX.1-200x requires that all **yank** commands associated with backward motions move the cursor to the end of the motion for consistency, and specifically, to make **'** commands as motions consistent with search patterns as motions.

### Yank Current Line

Some historical implementations of the **Y** command did not behave as described by POSIX.1-200x when the `'_'` key was remapped because they were implemented by pushing the `'_'` key onto the input queue and reprocessing it. POSIX.1-200x does not permit this behavior.

### Redraw Window

Historically, the **z** command always redrew the screen. This is permitted but not required by POSIX.1-200x, because of the frequent use of the **z** command in macros such as `map n nz.` for screen positioning, instead of its use to change the screen size. The standard developers believed that expanding or scrolling the screen offered a better interface for users. The ability to redraw the screen is preserved if the optional new window size is specified, and in the `<control>-L` and `<control>-R` commands.

The semantics of `z^` are confusing at best. Historical practice is that the screen before the screen that ended with the specified line is displayed. POSIX.1-200x requires conformance to historical practice.

Historically, the **z** command would not display a partial line at the top or bottom of the screen. If the partial line would normally have been displayed at the bottom of the screen, the command worked, but the partial line was replaced with `'@'` characters. If the partial line would normally have been displayed at the top of the screen, the command would fail. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

Historically, the **z** command with a line specification of 1 ignored the command. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

Historically, the **z** command did not set the cursor column to the first non-`<blank>` for the character if the first screen was to be displayed, and was already displayed. For consistency and simplicity of specification, POSIX.1-200x does not permit this behavior.

### Input Mode Commands in vi

Historical implementations of *vi* did not permit the user to erase more than a single line of input, or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase **autoindent** characters. As there exist implementations of *vi* that do not have these limitations, both behaviors are permitted, but only historical practice is required. In the case of these extensions, *vi* is required to pause at the **autoindent** and previous line boundaries.

Historical implementations of *vi* updated only the portion of the screen where the current cursor character was displayed. For example, consider the *vi* input keystrokes:

```
iabcd<escape>0C<tab>
```

Historically, the `<tab>` would overwrite the characters "abcd" when it was displayed. Other implementations replace only the `'a'` character with the `<tab>`, and then push the rest of the characters ahead of the cursor. Both implementations have problems. The historical implementation is probably visually nicer for the above example; however, for the keystrokes:

```
iabcd<ESC>0R<tab><ESC>
```

the historical implementation results in the string "bcd" disappearing and then magically reappearing when the `<ESC>` character is entered. POSIX.1-200x requires the former behavior when overwriting erase-columns—that is, overwriting characters that are no longer logically part of the edit buffer—and the latter behavior otherwise.

Historical implementations of *vi* discarded the `<control>-D` and `<control>-T` characters when they were entered at places where their command functionality was not appropriate. POSIX.1-200x requires that the `<control>-T` functionality always be available, and that `<control>-D` be treated as any other key when not operating on **autoindent** characters.

**NUL**

Some historical implementations of *vi* limited the number of characters entered using the NUL input character to 256 bytes. POSIX.1-200x permits this limitation; however, implementations are encouraged to remove this limit.

**<control>-D**

See also Rationale for the input mode command <newline>. The hidden assumptions in the <control>-D command (and in the *vi* **autoindent** specification in general) is that <space>s take up a single column on the screen and that <tab>s are comprised of an integral number of <space>s.

**<newline>**

Implementations are permitted to rewrite **autoindent** characters in the line when <newline>, <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are used, because historical implementations have both done so and found it necessary to do so. For example, a <control>-D when the cursor is preceded by a single <tab>, with **tabstop** set to 8, and **shiftwidth** set to 3, will result in the <tab> being replaced by several <space>s.

**<control>-T**

See also the Rationale for the input mode command <newline>. Historically, <control>-T only worked if no non-<blank>s had yet been input in the current input line. In addition, the characters inserted by <control>-T were treated as **autoindent** characters, and could not be erased using normal user erase characters. Because implementations exist that do not have these limitations, and as moving to a column boundary is generally useful, POSIX.1-200x requires that both limitations be removed.

**<control>-V**

Historically, *vi* used **^V**, regardless of the value of the literal-next character of the terminal. POSIX.1-200x requires conformance to historical practice.

The uses described for <control>-V can also be accomplished with <control>-Q, which is useful on terminals that use <control>-V for the down-arrow function. However, most historical implementations use <control>-Q for the *termios* START character, so the editor will generally not receive the <control>-Q unless **stty ixon** mode is set to off. (In addition, some historical implementations of *vi* explicitly set **ixon** mode to on, so it was difficult for the user to set it to off.) Any of the command characters described in POSIX.1-200x can be made ineffective by their selection as *termios* control characters, using the *stty* utility or other methods described in the System Interfaces volume of POSIX.1-200x.

**<ESC>**

Historically, SIGINT alerted the terminal when used to end input mode. This behavior is permitted, but not required, by POSIX.1-200x.

**FUTURE DIRECTIONS**

None.

+

**CHANGE HISTORY**

110559 First released in Issue 2.  
110560

**Issue 5**

110561 The FUTURE DIRECTIONS section is added.  
110562

**Issue 6**

110563 This utility is marked as part of the User Portability Utilities option.  
110564

110565 The APPLICATION USAGE section is added.  
110566

110566 The obsolescent SYNOPSIS is removed.  
110567

110567 The following new requirements on POSIX implementations derive from alignment with the  
110568 Single UNIX Specification:

- The **reindent** command description is added.  
110569

110570 The *vi* utility has been extensively rewritten for alignment with the IEEE P1003.2b draft  
110571 standard.

110572 IEEE PASC Interpretations 1003.2 #57, #62, #63, #64, #78, and #188 are applied.

110573 IEEE PASC Interpretation 1003.2 #207 is applied, clarifying the description of the **R** command in  
110574 a manner similar to the descriptions of other text input mode commands such as **i**, **o**, and **O**.

110575 The **-l** option is removed.

110576 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/41 is applied, adding [*count*] to the  
110577 Synopsis for **[[**.

110578 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/42 is applied, adding [*count*] to the  
110579 Synopsis for **]]**.

**Issue 7**

110580 Austin Group Interpretation 1003.1-2001 #027 is applied, clarifying that '+' may be recognized  
110581 as an option delimiter in the OPTIONS section.  
110582

110583 Austin Group Interpretation 1003.1-2001 #087 is applied, updating the Put from Buffer Before (**P**)  
110584 command description to address multi-line requirements.

110585 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110586 **NAME**  
 110587 wait — await process completion

110588 **SYNOPSIS**  
 110589 wait [*pid*...]

110590 **DESCRIPTION**  
 110591 When an asynchronous list (see [Section 2.9.3.1](#), on page 2266) is started by the shell, the process  
 110592 ID of the last command in each element of the asynchronous list shall become known in the  
 110593 current shell execution environment; see [Section 2.12](#) (on page 2277).

110594 If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
 110595 invoking shell have terminated and exit with a zero exit status.

110596 If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
 110597 wait until all of them have terminated. If one or more *pid* operands are specified that represent  
 110598 unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
 110599 exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
 110600 requested by the last *pid* operand.

110601 The known process IDs are applicable only for invocations of *wait* in the current shell execution  
 110602 environment.

110603 **OPTIONS**  
 110604 None.

110605 **OPERANDS**  
 110606 The following operand shall be supported:

110607 *pid* One of the following:

- 110608 1. The unsigned decimal integer process ID of a command, for which the  
 110609 utility is to wait for the termination.
- 110610 2. A job control job ID (see XBD [Section 3.202](#), on page 61) that identifies a  
 110611 background process group to be waited for. The job control job ID notation  
 110612 is applicable only for invocations of *wait* in the current shell execution  
 110613 environment; see [Section 2.12](#) (on page 2277). The exit status of *wait* shall be  
 110614 determined by the last command in the pipeline.

110615 **Note:** The job control job ID type of *pid* is only available on systems supporting  
 110616 the User Portability Utilities option.

110617 **STDIN**  
 110618 Not used.

110619 **INPUT FILES**  
 110620 None.

110621 **ENVIRONMENT VARIABLES**  
 110622 The following environment variables shall affect the execution of *wait*:

110623 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 110624 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization  
 110625 variables used to determine the values of locale categories.)

110626 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 110627 internationalization variables.

110628 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 110629 characters (for example, single-byte as opposed to multi-byte characters in  
 110630 arguments).

110631 *LC\_MESSAGES*  
 110632 Determine the locale that should be used to affect the format and contents of  
 110633 diagnostic messages written to standard error.

110634 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 110635 **ASYNCHRONOUS EVENTS**

110636 Default.

#### 110637 **STDOUT**

110638 Not used.

#### 110639 **STDERR**

110640 The standard error shall be used only for diagnostic messages.

#### 110641 **OUTPUT FILES**

110642 None.

#### 110643 **EXTENDED DESCRIPTION**

110644 None.

#### 110645 **EXIT STATUS**

110646 If one or more operands were specified, all of them have terminated or were not known by the  
 110647 invoking shell, and the status of the last operand specified is known, then the exit status of *wait*  
 110648 shall be the exit status information of the command indicated by the last operand specified. If  
 110649 the process terminated abnormally due to the receipt of a signal, the exit status shall be greater  
 110650 than 128 and shall be distinct from the exit status generated by other signals, but the exact value  
 110651 is unspecified. (See the *kill -l* option.) Otherwise, the *wait* utility shall exit with one of the  
 110652 following values:

110653 0 The *wait* utility was invoked with no operands and all process IDs known by the  
 110654 invoking shell have terminated.

110655 1-126 The *wait* utility detected an error.

110656 127 The command identified by the last *pid* operand specified is unknown.

#### 110657 **CONSEQUENCES OF ERRORS**

110658 Default.

#### 110659 **APPLICATION USAGE**

110660 On most implementations, *wait* is a shell built-in. If it is called in a subshell or separate utility  
 110661 execution environment, such as one of the following:

```
110662 (wait)
110663 nohup wait ...
110664 find . -exec wait ... \;
```

110665 it returns immediately because there are no known process IDs to wait for in those  
 110666 environments.

110667 Historical implementations of interactive shells have discarded the exit status of terminated  
 110668 background processes before each shell prompt. Therefore, the status of background processes  
 110669 was usually lost unless it terminated while *wait* was waiting for it. This could be a serious  
 110670 problem when a job that was expected to run for a long time actually terminated quickly with a  
 110671 syntax or initialization error because the exit status returned was usually zero if the requested  
 110672 process ID was not found. This volume of POSIX.1-200x requires the implementation to keep the  
 110673 status of terminated jobs available until the status is requested, so that scripts like:

```

110674 j1&
110675 p1=$!
110676 j2&
110677 wait $p1
110678 echo Job 1 exited with status $?
110679 wait $!
110680 echo Job 2 exited with status $?

```

work without losing status on any of the jobs. The shell is allowed to discard the status of any process if it determines that the application cannot get the process ID for that process from the shell. It is also required to remember only {CHILD\_MAX} number of processes in this way. Since the only way to get the process ID from the shell is by using the '!' shell parameter, the shell is allowed to discard the status of an asynchronous list if "\$!" was not referenced before another asynchronous list was started. (This means that the shell only has to keep the status of the last asynchronous list started if the application did not reference "\$!". If the implementation of the shell is smart enough to determine that a reference to "\$!" was not saved anywhere that the application can retrieve it later, it can use this information to trim the list of saved information. Note also that a successful call to *wait* with no operands discards the exit status of all asynchronous lists.)

If the exit status of *wait* is greater than 128, there is no way for the application to know if the waited-for process exited with that value or was killed by a signal. Since most utilities exit with small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just need to know that the asynchronous job failed; it does not matter whether it detected an error and failed or was killed and did not complete its job normally.

#### EXAMPLES

Although the exact value used when a process is terminated by a signal is unspecified, if it is known that a signal terminated a process, a script can still reliably determine which signal by using *kill* as shown by the following script:

```

110701 sleep 1000&
110702 pid=$!
110703 kill -kill $pid
110704 wait $pid
110705 echo $pid was terminated by a SIG$(kill -l $?) signal.

```

If the following sequence of commands is run in less than 31 seconds:

```

110707 sleep 257 | sleep 31 &
110708 jobs -l %%
110709 either of the following commands returns the exit status of the second sleep in the pipeline:

```

```

110710 wait <pid of sleep 31>
110711 wait %%

```

#### RATIONALE

The description of *wait* does not refer to the *waitpid()* function from the System Interfaces volume of POSIX.1-200x because that would needlessly overspecify this interface. However, the wording means that *wait* is required to wait for an explicit process when it is given an argument so that the status information of other processes is not consumed. Historical implementations use the *wait()* function defined in the System Interfaces volume of POSIX.1-200x until *wait()* returns the requested process ID or finds that the requested process does not exist. Because this means that a shell script could not reliably get the status of all background children if a second background job was ever started before the first job finished, it is recommended that the *wait* utility use a method such as the functionality provided by the *waitpid()* function.

The ability to wait for multiple *pid* operands was adopted from the KornShell.

110723 This new functionality was added because it is needed to determine the exit status of any  
110724 asynchronous list accurately. The only compatibility problem that this change creates is for a  
110725 script like

```
110726 while sleep 60 do
110727 job& echo Job started $(date) as $! done
```

110728 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
110729 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
110730 occasionally *wait* for jobs it started.

#### 110731 **FUTURE DIRECTIONS**

#### 110737 **CHANGE HISTORY**

110738 First released in Issue 2.

110739 **NAME**110740 `wc` — word, line, and byte or character count110741 **SYNOPSIS**110742 `wc [-c|-m] [-lw] [file...]`110743 **DESCRIPTION**110744 The `wc` utility shall read one or more input files and, by default, write the number of  
110745 <newline>s, words, and bytes contained in each input file to the standard output.110746 The utility also shall write a total count for all named files, if more than one input file is  
110747 specified.110748 The `wc` utility shall consider a *word* to be a non-zero-length string of characters delimited by  
110749 white space.110750 **OPTIONS**110751 The `wc` utility shall conform to XBD [Section 12.2](#) (on page 201).

110752 The following options shall be supported:

110753 `-c` Write to the standard output the number of bytes in each input file.110754 `-l` Write to the standard output the number of <newline>s in each input file.110755 `-m` Write to the standard output the number of characters in each input file.110756 `-w` Write to the standard output the number of words in each input file.110757 When any option is specified, `wc` shall report only the information requested by the specified  
110758 options.110759 **OPERANDS**

110760 The following operand shall be supported:

110761 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
110762 shall be used.110763 **STDIN**110764 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
110765 section.110766 **INPUT FILES**

110767 The input files may be of any type.

110768 **ENVIRONMENT VARIABLES**110769 The following environment variables shall affect the execution of `wc`:110770 `LANG` Provide a default value for the internationalization variables that are unset or null. |  
110771 (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
110772 variables used to determine the values of locale categories.)110773 `LC_ALL` If set to a non-empty string value, override the values of all the other  
110774 internationalization variables.110775 `LC_CTYPE` Determine the locale for the interpretation of sequences of bytes of text data as  
110776 characters (for example, single-byte as opposed to multi-byte characters in  
110777 arguments and input files) and which characters are defined as white space  
110778 characters.

110779 *LC\_MESSAGES*  
 110780 Determine the locale that should be used to affect the format and contents of  
 110781 diagnostic messages written to standard error and informative messages written to  
 110782 standard output.

110783 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

### 110784 ASYNCHRONOUS EVENTS

110785 Default.

### 110786 STDOUT

110787 By default, the standard output shall contain an entry for each input file of the form:

110788 "%d %d %d %s\n", *<newlines>*, *<words>*, *<bytes>*, *<file>*

110789 If the *-m* option is specified, the number of characters shall replace the *<bytes>* field in this  
 110790 format.

110791 If any options are specified and the *-l* option is not specified, the number of *<newline>*s shall  
 110792 not be written.

110793 If any options are specified and the *-w* option is not specified, the number of words shall not be  
 110794 written.

110795 If any options are specified and neither *-c* nor *-m* is specified, the number of bytes or characters  
 110796 shall not be written.

110797 If no input *file* operands are specified, no name shall be written and no *<blank>*s preceding the  
 110798 pathname shall be written.

110799 If more than one input *file* operand is specified, an additional line shall be written, of the same  
 110800 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead  
 110801 of a pathname and the total of each column shall be written as appropriate. Such an additional  
 110802 line, if any, is written at the end of the output.

### 110803 STDERR

110804 The standard error shall be used only for diagnostic messages.

### 110805 OUTPUT FILES

110806 None.

### 110807 EXTENDED DESCRIPTION

110808 None.

### 110809 EXIT STATUS

110810 The following exit values shall be returned:

110811 0 Successful completion.

110812 >0 An error occurred.

### 110813 CONSEQUENCES OF ERRORS

110814 Default.

**APPLICATION USAGE**

The `-m` option is not a switch, but an option at the same level as `-c`. Thus, to produce the full default output with character counts instead of bytes, the command required is:

```
wc -mlw
```

**EXAMPLES**

None.

**RATIONALE**

The output file format pseudo-*printf*( ) string differs from the System V version of *wc*:

```
"%7d%7d%7d %s\n"
```

which produces possibly ambiguous and unparseable results for very large files, as it assumes no number shall exceed six digits.

Some historical implementations use only `<space>`, `<tab>`, and `<newline>` as word separators. The equivalent of the ISO C standard *isspace*( ) function is more appropriate.

The `-c` option stands for “character” count, even though it counts bytes. This stems from the sometimes erroneous historical view that bytes and characters are the same size. Due to international requirements, the `-m` option (reminiscent of “multi-byte”) was added to obtain actual character counts.

Early proposals only specified the results when input files were text files. The current specification more closely matches historical practice. (Bytes, words, and `<newline>`s are counted separately and the results are written when an end-of-file is detected.)

Historical implementations of the *wc* utility only accepted one argument to specify the options `-c`, `-l`, and `-w`. Some of them also had multiple occurrences of an option cause the corresponding count to be written multiple times and had the order of specification of the options affect the order of the fields on output, but did not document either of these. Because common usage either specifies no options or only one option, and because none of this was documented, the changes required by this volume of POSIX.1-200x should not break many historical applications (and do not break any historical conforming applications).

**FUTURE DIRECTIONS**

None.

+

**CHANGE HISTORY**

First released in Issue 2.

**Issue 7**

SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

110851 **NAME**110852           what — identify SCCS files (**DEVELOPMENT**)110853 **SYNOPSIS**110854 XSI        **what** [-s] *file...*110855 **DESCRIPTION**

110856       The *what* utility shall search the given files for all occurrences of the pattern that *get* (see *get*)  
 110857       substitutes for the %Z% keyword ("@( #) ") and shall write to standard output what follows  
 110858       until the first occurrence of one of the following:

110859           "   &gt;   newline   \   NUL

110860 **OPTIONS**110861       The *what* utility shall conform to XBD [Section 12.2](#) (on page 201).

110862       The following option shall be supported:

110863       -s           Quit after finding the first occurrence of the pattern in each file.

110864 **OPERANDS**

110865       The following operands shall be supported:

110866       *file*           A pathname of a file to search.110867 **STDIN**

110868       Not used.

110869 **INPUT FILES**

110870       The input files shall be of any file type.

110871 **ENVIRONMENT VARIABLES**110872       The following environment variables shall affect the execution of *what*:

110873       LANG           Provide a default value for the internationalization variables that are unset or null. |  
 110874                      (See XBD [Section 8.2](#) (on page 160) for the precedence of internationalization |  
 110875                      variables used to determine the values of locale categories.)

110876       LC\_ALL          If set to a non-empty string value, override the values of all the other  
 110877                      internationalization variables.

110878       LC\_CTYPE        Determine the locale for the interpretation of sequences of bytes of text data as  
 110879                      characters (for example, single-byte as opposed to multi-byte characters in  
 110880                      arguments and input files).

110881       LC\_MESSAGES     Determine the locale that should be used to affect the format and contents of  
 110882                      diagnostic messages written to standard error.  
 110883

110884       NLSPATH         Determine the location of message catalogs for the processing of LC\_MESSAGES.

110885 **ASYNCHRONOUS EVENTS**

110886       Default.

110887 **STDOUT**110888       The standard output shall consist of the following for each *file* operand:

110889       "%s:\n\t%s\n", &lt;pathname&gt;, &lt;identification string&gt;

110890 **STDERR**

110891 The standard error shall be used only for diagnostic messages.

110892 **OUTPUT FILES**

110893 None.

110894 **EXTENDED DESCRIPTION**

110895 None.

110896 **EXIT STATUS**

110897 The following exit values shall be returned:

110898 0 Any matches were found.

110899 1 Otherwise.

110900 **CONSEQUENCES OF ERRORS**

110901 Default.

110902 **APPLICATION USAGE**110903 The *what* utility is intended to be used in conjunction with the SCCS command *get*, which  
110904 automatically inserts identifying information, but it can also be used where the information is  
110905 inserted by any other means.110906 When the string "@(#)" is included in a library routine in a shared library, it might not be found  
110907 in an **a.out** file using that library routine.110908 **EXAMPLES**110909 If the C-language program in file **f.c** contains:110910 `char ident[] = "@(#)identification information";`110911 and **f.c** is compiled to yield **f.o** and **a.out**, then the command:110912 `what f.c f.o a.out`

110913 writes:

110914 `f.c:`  
110915 `identification information`110916 `...`110917 `f.o:`  
110918 `identification information`110919 `...`110920 `a.out:`  
110921 `identification information`110922 `...`110923 **RATIONALE**

110924 None.

110925 **FUTURE DIRECTIONS**

110926 None.

110927 **SEE ALSO**110928 *get*110929 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

110930 **CHANGE HISTORY**

110931 First released in Issue 2.

110932 **NAME**110933        **who** — display who is on the system110934 **SYNOPSIS**110935 XSI        **who** [-mTu] [-abdHlprt] [*file*]110936 XSI        **who** [-mu] -s [-bHlprt] [*file*]110937        **who** -q [*file*]110938        **who** am i110939        **who** am I110940 **DESCRIPTION**110941        The *who* utility shall list various pieces of information about accessible users. The domain of  
110942 accessibility is implementation-defined.110943 XSI        Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
110944 time since activity occurred on the line, and the process ID of the command interpreter for each  
110945 current system user.110946 **OPTIONS**110947        The *who* utility shall conform to XBD [Section 12.2](#) (on page 201).110948        The following options shall be supported. The metavariables, such as *<line>*, refer to fields  
110949 described in the STDOUT section.110950 XSI        **-a**        Process the implementation-defined database or named file with the **-b**, **-d**, **-l**, **-p**,  
110951 **-r**, **-t**, **-T** and **-u** options turned on.110952 XSI        **-b**        Write the time and date of the last system reboot. The system reboot time is the  
110953 time at which the implementation is able to commence running processes.110954 XSI        **-d**        Write a list of all processes that have expired and not been respawned by the *init*  
110955 system process. The *<exit>* field shall appear for dead processes and contain the  
110956 termination and exit values of the dead process. This can be useful in determining  
110957 why a process terminated.110958 XSI        **-H**        Write column headings above the regular output.110959 XSI        **-l**        (The letter ell.) List only those lines on which the system is waiting for someone to  
110960 login. The *<name>* field shall be **LOGIN** in such cases. Other fields shall be the  
110961 same as for user entries except that the *<state>* field does not exist.110962        **-m**        Output only information about the current terminal.110963 XSI        **-p**        List any other process that is currently active and has been previously spawned by  
110964 *init*.110965 XSI        **-q**        (Quick.) List only the names and the number of users currently logged on. When  
110966 this option is used, all other options shall be ignored.110967 XSI        **-r**        Write the current *run-level* of the *init* process.110968 XSI        **-s**        List only the *<name>*, *<line>*, and *<time>* fields. This is the default case.110969 XSI        **-t**        Indicate the last change to the system clock.

110970           **-T**           Show the state of each terminal, as described in the STDOUT section.

110971           **-u**           Write “idle time” for each displayed user in addition to any other information. The  
 110972 idle time is the time since any activity occurred on the user’s terminal. The method  
 110973 XSI of determining this is unspecified. This option shall list only those users who are  
 110974 currently logged in. The *<name>* is the user’s login name. The *<line>* is the name  
 110975 of the line as found in the directory */dev*. The *<time>* is the time that the user  
 110976 logged in. The *<activity>* is the number of hours and minutes since activity last  
 110977 occurred on that particular line. A dot indicates that the terminal has seen activity  
 110978 in the last minute and is therefore “current”. If more than twenty-four hours have  
 110979 elapsed or the line has not been used since boot time, the entry shall be marked  
 110980 *<old>*. This field is useful when trying to determine whether a person is working at  
 110981 the terminal or not. The *<pid>* is the process ID of the user’s login process.

**OPERANDS**

110982 XSI The following operands shall be supported:

110984 **am i, am I** In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 110985 the **-m** option. The **am** and **i** or **I** must be separate arguments.

110986 *file* Specify a pathname of a file to substitute for the implementation-defined database  
 110987 of logged-on users that *who* uses by default.

**STDIN**

110988 Not used.

**INPUT FILES**

110990 None.

**ENVIRONMENT VARIABLES**

110993 The following environment variables shall affect the execution of *who*:

110994 **LANG** Provide a default value for the internationalization variables that are unset or null. |  
 110995 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 110996 variables used to determine the values of locale categories.)

110997 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 110998 internationalization variables.

110999 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 111000 characters (for example, single-byte as opposed to multi-byte characters in  
 111001 arguments).

111002 **LC\_MESSAGES**  
 111003 Determine the locale that should be used to affect the format and contents of  
 111004 diagnostic messages written to standard error.

111005 **LC\_TIME** Determine the locale used for the format and contents of the date and time strings.

111006 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

111007 **TZ** Determine the timezone used when writing date and time information. If **TZ** is  
 111008 unset or null, an unspecified default timezone shall be used.

**ASYNCHRONOUS EVENTS**

111009 Default.

**STDOUT**

111012 The *who* utility shall write its default format to the standard output in an implementation-  
 111013 defined format, subject only to the requirement of containing the information described above.

111014 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 111015 following general format:

111016 <name>[<state>]<line><time>[<activity>][<pid>][<comment>][<exit>]

111017 For the **-b** option, <line> shall be "system boot". The <name> is unspecified.

111018 The following format shall be used for the **-T** option:

111019 "%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
111020 <time of login>

111021 where <terminal state> is one of the following characters:

111022 + The terminal allows write access to other users.

111023 - The terminal denies write access to other users.

111024 ? The terminal write-access state cannot be determined.

111025 <space> This entry is not associated with a terminal.

111026 In the POSIX locale, the <time of login> shall be equivalent in format to the output of:

111027 date +"%b %e %H:%M"

111028 If the **-u** option is used with **-T**, the idle time shall be added to the end of the previous format in  
111029 an unspecified format.

### 111030 **STDERR**

111031 The standard error shall be used only for diagnostic messages.

### 111032 **OUTPUT FILES**

111033 None.

### 111034 **EXTENDED DESCRIPTION**

111035 None.

### 111036 **EXIT STATUS**

111037 The following exit values shall be returned:

111038 0 Successful completion.

111039 >0 An error occurred.

### 111040 **CONSEQUENCES OF ERRORS**

111041 Default.

### 111042 **APPLICATION USAGE**

111043 The name *init* used for the system process is the most commonly used on historical systems, but  
111044 it may vary.

111045 The "domain of accessibility" referred to is a broad concept that permits interpretation either on  
111046 a very secure basis or even to allow a network-wide implementation like the historical *rwho*.

### 111047 **EXAMPLES**

111048 None.

### 111049 **RATIONALE**

111050 Due to differences between historical implementations, the base options provided were a  
111051 compromise to allow users to work with those functions. The standard developers also  
111052 considered removing all the options, but felt that these options offered users valuable  
111053 functionality. Additional options to match historical systems are available on XSI-conformant  
111054 systems.

111055 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
111056 secure environment. The standard developers considered, however, that having some standard  
111057 method of determining the "accessibility" of other users would aid user portability.

111058 No format was specified for the default *who* output for systems not supporting the XSI option. In  
 111059 such a user-oriented command, designed only for human use, this was not considered to be a  
 111060 deficiency.

111061 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
 111062 that they use the same format.

111063 It is acceptable for an implementation to produce no output for an invocation of *who mil*.

#### 111064 **FUTURE DIRECTIONS**

111065 None.

#### 111066 **SEE ALSO**

111067 *mesg*

111068 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201) +

#### 111069 **CHANGE HISTORY**

111070 First released in Issue 2.

#### 111071 **Issue 6**

111072 This utility is marked as part of the User Portability Utilities option.

111073 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

#### 111074 **Issue 7**

111075 SD5-XCU-ERN-58 is applied, clarifying the **-b** option.

111076 The *who* utility is moved from the User Portability Utilities option to the Base. User Portability  
 111077 Utilities is now an option for interactive utilities.

111078 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

111079 **NAME**

111080 write — write to another user

111081 **SYNOPSIS**111082 write *user\_name* [*terminal*]111083 **DESCRIPTION**111084 The *write* utility shall read lines from the standard input and write them to the terminal of the  
111085 specified user. When first invoked, it shall write the message:111086 **Message from sender-login-id** (*sending-terminal*) [*date*]...111087 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
111088 alerted twice to indicate that what the sender is typing is being written to the recipient's  
111089 terminal.

111090 If the recipient wants to reply, this can be accomplished by typing:

111091 write *sender-login-id* [*sending-terminal*]111092 upon receipt of the initial message. Whenever a line of input as delimited by an NL, EOF, or  
111093 EOL special character (see XBD [Chapter 11](#), on page 185) is accumulated while in canonical  
111094 input mode, the accumulated data shall be written on the other user's terminal. Characters shall  
111095 be processed as follows:

- 111096 • Typing <alert> shall write the alert character to the recipient's terminal.
- 111097 • Typing the erase and kill characters shall affect the sender's terminal in the manner  
111098 described by the **termios** interface in XBD [Chapter 11](#) (on page 185).
- 111099 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
111100 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 111101 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those  
111102 characters to be sent to the recipient's terminal.
- 111103 • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of  
111104 additional special control characters and multi-byte or single-byte functions is  
111105 implementation-defined.
- 111106 • Typing other non-printable characters shall cause implementation-defined sequences of  
111107 printable characters to be written to the recipient's terminal.

111108 To write to a user who is logged in more than once, the *terminal* argument can be used to  
111109 indicate which terminal to write to; otherwise, the recipient's terminal is selected in an  
111110 implementation-defined manner and an informational message is written to the sender's  
111111 standard output, indicating which terminal was chosen.

111112 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
111113 utility. However, a user's privilege may further constrain the domain of accessibility of other  
111114 users' terminals. The *write* utility shall fail when the user lacks the appropriate privileges to  
111115 perform the requested action.

111116 **OPTIONS**

111117 None.

111118 **OPERANDS**

111119 The following operands shall be supported:

|        |     |                               |                                                                                                                                                                                                                                                                                                            |
|--------|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 111120 |     | <i>user_name</i>              | Login name of the person to whom the message shall be written. The application shall ensure that this operand is of the form returned by the <i>who</i> utility.                                                                                                                                           |
| 111121 |     |                               |                                                                                                                                                                                                                                                                                                            |
| 111122 |     | <i>terminal</i>               | Terminal identification in the same format provided by the <i>who</i> utility.                                                                                                                                                                                                                             |
| 111123 |     | <b>STDIN</b>                  |                                                                                                                                                                                                                                                                                                            |
| 111124 |     |                               | Lines to be copied to the recipient's terminal are read from standard input.                                                                                                                                                                                                                               |
| 111125 |     | <b>INPUT FILES</b>            |                                                                                                                                                                                                                                                                                                            |
| 111126 |     |                               | None.                                                                                                                                                                                                                                                                                                      |
| 111127 |     | <b>ENVIRONMENT VARIABLES</b>  |                                                                                                                                                                                                                                                                                                            |
| 111128 |     |                               | The following environment variables shall affect the execution of <i>write</i> :                                                                                                                                                                                                                           |
| 111129 |     | <i>LANG</i>                   | Provide a default value for the internationalization variables that are unset or null. **APPLICATION USAGE**

The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.

**EXAMPLES**

None.

**RATIONALE**

The *write* utility was included in this volume of POSIX.1-200x since it can be implemented on all terminal types. The standard developers considered the *talk* utility, which cannot be implemented on certain terminals, to be a “better” communications interface. Both of these programs are in widespread use on historical implementations. Therefore, the standard developers decided that both utilities should be specified.

The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write* require that they all use or accept the same format.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*mesg*, *talk*, *who*

XBD [Chapter 8](#) (on page 159), [Chapter 11](#) (on page 185)

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

The FUTURE DIRECTIONS section is added.

**Issue 6**

This utility is marked as part of the User Portability Utilities option.

The normative text is reworded to avoid use of the term “must” for application requirements.

**Issue 7**

The *write* utility is moved from the User Portability Utilities option to the Base. User Portability Utilities is now an option for interactive utilities.

111188 **NAME**111189 `xargs` — construct argument lists and invoke utility111190 **SYNOPSIS**111191 XSI `xargs [-ptx] [-E eofstr] [-I replstr|-L number|-n number]`  
111192 `[-s size] [utility [argument...]]`111193 **DESCRIPTION**111194 The *xargs* utility shall construct a command line consisting of the *utility* and *argument* operands  
111195 specified followed by as many arguments read in sequence from standard input as fit in length  
111196 and number constraints specified by the options. The *xargs* utility shall then invoke the  
111197 constructed command line and wait for its completion. This sequence shall be repeated until one  
111198 of the following occurs:

- 111199
- An end-of-file condition is detected on standard input.
  - An argument consisting of just the logical end-of-file string (see the `-E eofstr` option) is  
111200 found on standard input after double-quote processing, apostrophe processing, and  
111201 backslash escape processing (see next paragraph). All arguments up to but not including  
111202 the argument consisting of just the logical end-of-file string shall be used as arguments in  
111203 constructed command lines.
  - An invocation of a constructed command line returns an exit status of 255.

111206 The application shall ensure that arguments in the standard input are separated by unquoted  
111207 `<blank>s`, unescaped `<blank>s`, or `<newline>s`. A string of zero or more non-double-quote  
111208 (`'` `"` `'`) characters and non-`<newline>s` can be quoted by enclosing them in double-quotes. A  
111209 string of zero or more non-apostrophe (`'` `'` `'`) characters and non-`<newline>s` can be quoted by  
111210 enclosing them in apostrophes. Any unquoted character can be escaped by preceding it with a  
111211 backslash. The utility named by *utility* shall be executed one or more times until the end-of-file is  
111212 reached or the logical end-of file string is found. The results are unspecified if the utility named  
111213 by *utility* attempts to read from its standard input.111214 The generated command line length shall be the sum of the size in bytes of the utility name and  
111215 each argument treated as strings, including a null byte terminator for each of these strings. The  
111216 *xargs* utility shall limit the command line length such that when the command line is invoked,  
111217 the combined argument and environment lists (see the *exec* family of functions in the System  
111218 Interfaces volume of POSIX.1-200x) shall not exceed `{ARG_MAX}-2048` bytes. Within this  
111219 constraint, if neither the `-n` nor the `-s` option is specified, the default command line length shall  
111220 be at least `{LINE_MAX}`.111221 **OPTIONS**111222 The *xargs* utility shall conform to XBD [Section 12.2](#) (on page 201).

111223 The following options shall be supported:

111224 `-E eofstr` Use *eofstr* as the logical end-of-file string. If `-E` is not specified, it is unspecified  
111225 whether the logical end-of-file string is the underscore character (`'_'`) or the end-  
111226 of-file string capability is disabled. When *eofstr* is the null string, the logical end-of-  
111227 file string capability shall be disabled and underscore characters shall be taken  
111228 literally.111229 XSI `-I replstr` Insert mode: *utility* is executed for each line from standard input, taking the entire  
111230 line as a single argument, inserting it in *arguments* for each occurrence of *replstr*. A  
111231 maximum of five arguments in *arguments* can each contain one or more instances  
111232 of *replstr*. Any `<blank>s` at the beginning of each line shall be ignored.  
111233 Constructed arguments cannot grow larger than 255 bytes. Option `-x` shall be

|        |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------|-----|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 111234 |     | forced on.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 111235 | XSI | <b>-L <i>number</i></b> The <i>utility</i> shall be executed for each non-empty <i>number</i> lines of arguments from standard input. The last invocation of <i>utility</i> shall be with fewer lines of arguments if fewer than <i>number</i> remain. A line is considered to end with the first <newline> unless the last character of the line is a <blank>; a trailing <blank> signals continuation to the next non-empty line, inclusive. |
| 111236 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111237 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111238 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111239 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111240 |     | <b>-n <i>number</i></b> Invoke <i>utility</i> using as many standard input arguments as possible, up to <i>number</i> (a positive decimal integer) arguments maximum. Fewer arguments shall be used if:                                                                                                                                                                                                                                        |
| 111241 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111242 |     | • The command line length accumulated exceeds the size specified by the <b>-s</b> option (or {LINE_MAX} if there is no <b>-s</b> option).                                                                                                                                                                                                                                                                                                      |
| 111243 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111244 |     | • The last iteration has fewer than <i>number</i> , but not zero, operands remaining.                                                                                                                                                                                                                                                                                                                                                          |
| 111245 |     | <b>-p</b> Prompt mode: the user is asked whether to execute <i>utility</i> at each invocation. Trace mode ( <b>-t</b> ) is turned on to write the command instance to be executed, followed by a prompt to standard error. An affirmative response read from <b>/dev/tty</b> shall execute the command; otherwise, that particular invocation of <i>utility</i> shall be skipped.                                                              |

| 111259 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111260 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111261 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111262 |     | <b>-t</b> Enable trace mode. Each generated command line shall be written to standard error just prior to invocation.                                                                                                                                                                                                                                                                                                                          |
| 111263 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 111264 |     | <b>-x</b> Terminate if a constructed command line will not fit in the implied or specified size (see the <b>-s</b> option above).                                                                                                                                                                                                                                                                                                              |
| 111265 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**OPERANDS**

The following operands shall be supported:

|        |                 |                                                                                                                                                                                                                                                                                                                                                                    |
|--------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 111266 |                 |                                                                                                                                                                                                                                                                                                                                                                    |
| 111267 |                 |                                                                                                                                                                                                                                                                                                                                                                    |
| 111268 | <i>utility</i>  | The name of the utility to be invoked, found by search path using the <i>PATH</i> environment variable, described in XBD Chapter 8 (on page 159). If <i>utility</i> is omitted, the default shall be the <i>echo</i> utility. If the <i>utility</i> operand names any of the special built-in utilities in Section 2.14 (on page 2280), the results are undefined. |
| 111269 |                 |                                                                                                                                                                                                                                                                                                                                                                    |
| 111270 |                 |                                                                                                                                                                                                                                                                                                                                                                    |
| 111271 |                 |                                                                                                                                                                                                                                                                                                                                                                    |
| 111272 | <i>argument</i> | An initial option or operand for the invocation of <i>utility</i> .                                                                                                                                                                                                                                                                                                |

**STDIN**

The standard input shall be a text file. The results are unspecified if an end-of-file condition is detected immediately following an escaped <newline>.

111276 **INPUT FILES**111277 The file `/dev/tty` shall be used to read responses required by the `-p` option.111278 **ENVIRONMENT VARIABLES**111279 The following environment variables shall affect the execution of *xargs*:111280 **LANG** Provide a default value for the internationalization variables that are unset or null. |  
111281 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
111282 variables used to determine the values of locale categories.)111283 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
111284 internationalization variables.111285 **LC\_COLLATE**111286 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
111287 character collating elements used in the extended regular expression defined for  
111288 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.111289 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
111290 characters (for example, single-byte as opposed to multi-byte characters in  
111291 arguments and input files) and the behavior of character classes used in the  
111292 extended regular expression defined for the **yesexpr** locale keyword in the  
111293 *LC\_MESSAGES* category.111294 **LC\_MESSAGES**111295 Determine the locale for the processing of affirmative responses and that should be  
111296 used to affect the format and contents of diagnostic messages written to standard  
111297 error.111298 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.111299 **PATH** Determine the location of *utility*, as described in XBD Chapter 8 (on page 159). |111300 **ASYNCHRONOUS EVENTS**

111301 Default.

111302 **STDOUT**

111303 Not used.

111304 **STDERR**111305 The standard error shall be used for diagnostic messages and the `-t` and `-p` options. If the `-t`  
111306 option is specified, the *utility* and its constructed argument list shall be written to standard error,  
111307 as it will be invoked, prior to invocation. If `-p` is specified, a prompt of the following format  
111308 shall be written (in the POSIX locale):

111309 " ? . . . "

111310 at the end of the line of the output from `-t`.111311 **OUTPUT FILES**

111312 None.

111313 **EXTENDED DESCRIPTION**

111314 None.

111315 **EXIT STATUS**

111316 The following exit values shall be returned:

111317 0 All invocations of *utility* returned exit status zero.111318 1-125 A command line meeting the specified requirements could not be assembled, one or  
111319 more of the invocations of *utility* returned a non-zero exit status, or some other error  
111320 occurred.

111321 126 The utility specified by *utility* was found but could not be invoked.

111322 127 The utility specified by *utility* could not be found.

### 111323 CONSEQUENCES OF ERRORS

111324 If a command line meeting the specified requirements cannot be assembled, the utility cannot be  
 111325 invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits  
 111326 with exit status 255, the *xargs* utility shall write a diagnostic message and exit without  
 111327 processing any remaining input.

### 111328 APPLICATION USAGE

111329 The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no  
 111330 further invocations using the current data stream will succeed. Thus, *utility* should explicitly *exit*  
 111331 with an appropriate value to avoid accidentally returning with 255.

111332 Note that since input is parsed as lines, <blank>s separate arguments, and backslash,  
 111333 apostrophe, and double-quote characters are used for quoting, if *xargs* is used to bundle the  
 111334 output of commands like *find dir -print* or *ls* into commands to be executed, unexpected results  
 111335 are likely if any filenames contain <blank>s, <newline>s, or quoting characters. This can be  
 111336 solved by using *find* to call a script that converts each file found into a quoted string that is then  
 111337 piped to *xargs*, but in most cases it is preferable just to have *find* do the argument aggregation  
 111338 itself by using *-exec* with a '+' terminator instead of ';' . Note that the quoting rules used by  
 111339 *xargs* are not the same as in the shell. They were not made consistent here because existing  
 111340 applications depend on the current rules. An easy (but inefficient) method that can be used to  
 111341 transform input consisting of one argument per line into a quoted form that *xargs* interprets  
 111342 correctly is to precede each non-<newline> character with a backslash. More efficient  
 111343 alternatives are shown in Example 2 and Example 5 below.

111344 On implementations with a large value for {ARG\_MAX}, *xargs* may produce command lines  
 111345 longer than {LINE\_MAX}. For invocation of utilities, this is not a problem. If *xargs* is being used  
 111346 to create a text file, users should explicitly set the maximum command line length with the *-s*  
 111347 option.

111348 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 111349 an error occurs so that applications can distinguish "failure to find a utility" from "invoked  
 111350 utility exited with an error indication". The value 127 was chosen because it is not commonly  
 111351 used for other meanings; most utilities use small values for "normal error conditions" and the  
 111352 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 111353 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 111354 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 111355 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 111356 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 111357 any other reason.

### 111358 EXAMPLES

111359 1. The following command combines the output of the parenthesized commands (minus the  
 111360 apostrophes) onto one line, which is then appended to the file *log*. It assumes that the  
 111361 expansion of "\$0 \$\*" does not include any apostrophes or <newline>s.

```
111362 (logname; date; printf "'%s'\n" "$0 $*") | xargs -E "" >>log
```

111363 2. The following command invokes *diff* with successive pairs of arguments originally typed  
 111364 as command line arguments. It assumes there are no embedded <newline>s in the  
 111365 elements of the original argument list.

```
111366 printf "%s\n" "$@" | sed 's/^[^:alnum:]]/\\&/g' |

 111367 xargs -E "" -n 2 -x diff
```

3. In the following commands, the user is asked which files in the current directory (excluding dotfiles) are to be archived. The files are archived into **arch**; *a*, one at a time or *b*, many at a time. The commands assume that no filenames contain <blank>s, <newline>s, backslashes, apostrophes, or double-quote characters.

```
a. ls | xargs -E "" -p -L 1 ar -r arch
```

```
b. ls | xargs -E "" -p -L 1 | xargs -E "" ar -r arch
```

4. The following command invokes *command1* one or more times with multiple arguments, stopping if an invocation of *command1* has a non-zero exit status.

```
xargs -E "" sh -c 'command1 "$@" || exit 255' sh < xargs_input
```

5. On XSI-conformant systems, the following command moves all files from directory **\$1** to directory **\$2**, and echoes each move command just before doing it. It assumes no filenames contain <newline>s and that neither **\$1** nor **\$2** contains the sequence "{ }".

```
ls -A "$1" | sed -e 's/"/\\"/g' -e 's/.*"/&/' |
xargs -E "" -I {} -t mv "$1"/{} "$2"/{}
```

## RATIONALE

The *xargs* utility was usually found only in System V-based systems; BSD systems included an *apply* utility that provided functionality similar to *xargs -n number*. The SVID lists *xargs* as a software development extension. This volume of POSIX.1-200x does not share the view that it is used only for development, and therefore it is not optional.

The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the number of processes launched by a simplistic use of the *find -exec* combination. The *xargs* utility is also used to enforce an upper limit on memory required to launch a process. With this basis in mind, this volume of POSIX.1-200x selected only the minimal features required.

Although the 255 exit status is mostly an accident of historical implementations, it allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125 range when *xargs* exits. There is no statement of how the various non-zero utility exit status codes are accumulated by *xargs*. The value could be the addition of all codes, their highest value, the last one received, or a single value such as 1. Since no algorithm is arguably better than the others, and since many of the standard utilities say little more (portably) than "pass/fail", no new algorithm was invented.

Several other *xargs* options were removed because simple alternatives already exist within this volume of POSIX.1-200x. For example, the *-i replstr* option can be just as efficiently performed using a shell **for** loop. Since *xargs* calls an *exec* function with each input line, the *-i* option does not usually exploit the grouping capabilities of *xargs*.

The requirement that *xargs* never produces command lines such that invocation of *utility* is within 2048 bytes of hitting the POSIX *exec* {ARG\_MAX} limitations is intended to guarantee that the invoked utility has room to modify its environment variables and command line arguments and still be able to invoke another utility. Note that the minimum {ARG\_MAX} allowed by the System Interfaces volume of POSIX.1-200x is 4096 bytes and the minimum value allowed by this volume of POSIX.1-200x is 2048 bytes; therefore, the 2048 bytes difference seems reasonable. Note, however, that *xargs* may never be able to invoke a utility if the environment passed in to *xargs* comes close to using {ARG\_MAX} bytes.

The version of *xargs* required by this volume of POSIX.1-200x is required to wait for the completion of the invoked command before invoking another command. This was done because historical scripts using *xargs* assumed sequential execution. Implementations wanting to provide parallel operation of the invoked utilities are encouraged to add an option enabling parallel invocation, but should still wait for termination of all of the children before *xargs* terminates

111416 normally.

111417 The `-e` option was omitted from the ISO POSIX-2:1993 standard in the belief that the `eofstr`  
 111418 option-argument was recognized only when it was on a line by itself and before quote and  
 111419 escape processing were performed, and that the logical end-of-file processing was only enabled  
 111420 if a `-e` option was specified. In that case, a simple `sed` script could be used to duplicate the `-e`  
 111421 functionality. Further investigation revealed that:

- 111422 • The logical end-of-file string was checked for after quote and escape processing, making a  
 111423 `sed` script that provided equivalent functionality much more difficult to write.
- 111424 • The default was to perform logical end-of-file processing with an underscore as the logical  
 111425 end-of-file string.

111426 To correct this misunderstanding, the `-E eofstr` option was adopted from the X/Open Portability  
 111427 Guide. Users should note that the description of the `-E` option matches historical documentation  
 111428 of the `-e` option (which was not adopted because it did not support the Utility Syntax  
 111429 Guidelines), by saying that if `eofstr` is the null string, logical end-of-file processing is disabled.  
 111430 Historical implementations of `xargs` actually did not disable logical end-of-file processing; they  
 111431 treated a null argument found in the input as a logical end-of-file string. (A null `string` argument  
 111432 could be generated using single or double quotes ( ' ' or " " ). Since this behavior was not  
 111433 documented historically, it is considered to be a bug.

111434 The `-I`, `-L`, and `-n` options are mutually-exclusive. Some implementations use the last one  
 111435 specified if more than one is given on a command line; other implementations treat  
 111436 combinations of the options in different ways.

#### 111437 FUTURE DIRECTIONS

111438 None.

#### 111439 SEE ALSO

111440 [Chapter 2](#) (on page 2245), [diff](#), [echo](#), [find](#)

111441 XBD [Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

111442 XSH [exec](#)

#### 111443 CHANGE HISTORY

111444 First released in Issue 2.

##### 111445 Issue 5

111446 A second FUTURE DIRECTION is added.

##### 111447 Issue 6

111448 The obsolescent `-e`, `-i`, and `-l` options are removed.

111449 The following new requirements on POSIX implementations derive from alignment with the  
 111450 Single UNIX Specification:

- 111451 • The `-p` option is added.
- 111452 • In the INPUT FILES section, the file `/dev/tty` is used to read responses required by the `-p`  
 111453 option.
- 111454 • The STDERR section is updated to describe the `-p` option.

111455 The description of the `-E` option is aligned with the ISO POSIX-2:1993 standard.

111456 The normative text is reworded to avoid use of the term “must” for application requirements.

|        |                |                                                                                           |

| 111460 |                | SD5-XCU-ERN-128 is applied, clarifying the DESCRIPTION of the logical end-of-file string. |
| 111461 |                | SD5-XCU-ERN-132 is applied, updating the EXAMPLES section.                                |

+

111462 **NAME**111463 yacc — yet another compiler compiler (**DEVELOPMENT**)111464 **SYNOPSIS**111465 CD yacc [-dltv] [-b *file\_prefix*] [-p *sym\_prefix*] *grammar*111466 **DESCRIPTION**

111467 The *yacc* utility shall read a description of a context-free grammar in *grammar* and write C source  
 111468 code, conforming to the ISO C standard, to a code file, and optionally header information into a  
 111469 header file, in the current directory. The C code shall define a function and related routines and  
 111470 macros for an automaton that executes a parsing algorithm meeting the requirements in  
 111471 [Algorithms](#) (on page 3301).

111472 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

111473 The C source code and header file shall be produced in a form suitable as input for the C  
 111474 compiler (see [c99](#)).

111475 **OPTIONS**

111476 The *yacc* utility shall conform to XBD [Section 12.2](#) (on page 201), except for Guideline 9.

111477 The following options shall be supported:

111478 **-b** *file\_prefix* Use *file\_prefix* instead of *y* as the prefix for all output filenames. The code file  
 111479 **y.tab.c**, the header file **y.tab.h** (created when **-d** is specified), and the description  
 111480 file **y.output** (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 111481 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

111482 **-d** Write the header file; by default only the code file is written. The **#define**  
 111483 statements associate the token codes assigned by *yacc* with the user-declared token  
 111484 names. This allows source files other than **y.tab.c** to access the token codes.

111485 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 111486 present, it is unspecified whether the code file or header file contains **#line**  
 111487 directives. This should only be used after the grammar and the associated actions  
 111488 are fully debugged.

111489 **-p** *sym\_prefix* Use *sym\_prefix* instead of **yy** as the prefix for all external names produced by *yacc*.  
 111490 The names affected shall include the functions *yyparse()*, *yylex()*, and *yyerror()*,  
 111491 and the variables *yyval*, *yychar*, and *yydebug*. (In the remainder of this section, the  
 111492 six symbols cited are referenced using their default names only as a notational  
 111493 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 111494 option shall not affect **#define** symbols generated by *yacc*.

111496 **-t** Modify conditional compilation directives to permit compilation of debugging  
 111497 code in the code file. Runtime debugging statements shall always be contained in  
 111498 the code file, but by default conditional compilation directives prevent their  
 111499 compilation.

111500 **-v** Write a file containing a description of the parser and a report of conflicts  
 111501 generated by ambiguities in the grammar.

111502 **OPERANDS**

111503 The following operand is required:

111504 *grammar* A pathname of a file containing instructions, hereafter called *grammar*, for which a  
 111505 parser is to be created. The format for the grammar is described in the EXTENDED  
 111506 DESCRIPTION section.

111507 **STDIN**

111508 Not used.

111509 **INPUT FILES**111510 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
 111511 section.111512 **ENVIRONMENT VARIABLES**111513 The following environment variables shall affect the execution of *yacc*:

111514 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
 111515 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 111516 variables used to determine the values of locale categories.)

111517 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 111518 internationalization variables.

111519 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 111520 characters (for example, single-byte as opposed to multi-byte characters in  
 111521 arguments and input files).

111522 *LC\_MESSAGES*

111523 Determine the locale that should be used to affect the format and contents of  
 111524 diagnostic messages written to standard error.

111525 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

111526 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main()*  
 111527 function defined in *Yacc Library* (on page 3300) shall call:

111528 `setlocale(LC_ALL, "")`

111529 and thus the program generated by *yacc* shall also be affected by the contents of these variables  
 111530 at runtime.

111531 **ASYNCHRONOUS EVENTS**

111532 Default.

111533 **STDOUT**

111534 Not used.

111535 **STDERR**

111536 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* shall write a report of  
 111537 those conflicts to the standard error in an unspecified format.

111538 Standard error shall also be used for diagnostic messages.

111539 **OUTPUT FILES**

111540 The code file, the header file, and the description file shall be text files. All are described in the  
 111541 following sections.

111542 **Code File**

111543 This file shall contain the C source code for the *yyparse()* function. It shall contain code for the  
 111544 various semantic actions with macro substitution performed on them as described in the  
 111545 EXTENDED DESCRIPTION section. It also shall contain a copy of the **#define** statements in the  
 111546 header file. If a **%union** declaration is used, the declaration for YYSTYPE shall also be included  
 111547 in this file.

111548 **Header File**

111549 The header file shall contain **#define** statements that associate the token numbers with the token  
 111550 names. This allows source files other than the code file to access the token codes. If a **%union**  
 111551 declaration is used, the declaration for YYSTYPE and an *extern YYSTYPE yylval* declaration shall  
 111552 also be included in this file.

111553 **Description File**

111554 The description file shall be a text file containing a description of the state machine  
 111555 corresponding to the parser, using an unspecified format. Limits for internal tables (see [Limits](#),  
 111556 on page 3301) shall also be reported, in an implementation-defined manner. (Some  
 111557 implementations may use dynamic allocation techniques and have no specific limit values to  
 111558 report.)

111559 **EXTENDED DESCRIPTION**

111560 The *yacc* command accepts a language that is used to define a grammar for a target language to  
 111561 be parsed by the tables and code generated by *yacc*. The language accepted by *yacc* as a  
 111562 grammar for the target language is described below using the *yacc* input language itself.

111563 The input *grammar* includes rules describing the input structure of the target language and code  
 111564 to be invoked when these rules are recognized to provide the associated semantic action. The  
 111565 code to be executed shall appear as bodies of text that are intended to be C-language code. The  
 111566 C-language inclusions are presumed to form a correct function when processed by *yacc* into its  
 111567 output files. The code included in this way shall be executed during the recognition of the target  
 111568 language.

111569 Given a grammar, the *yacc* utility generates the files described in the OUTPUT FILES section.  
 111570 The code file can be compiled and linked using *c99*. If the declaration and programs sections of  
 111571 the grammar file did not include definitions of *main()*, *yylex()*, and *yyerror()*, the compiled  
 111572 output requires linking with externally supplied versions of those functions. Default versions of  
 111573 *main()* and *yyerror()* are supplied in the *yacc* library and can be linked in by using the **-ly**  
 111574 operand to *c99*. The *yacc* library interfaces need not support interfaces with other than the  
 111575 default **yy** symbol prefix. The application provides the lexical analyzer function, *yylex()*; the *lex*  
 111576 utility is specifically designed to generate such a routine.

111577 **Input Language**

111578 The application shall ensure that every specification file consists of three sections in order:  
 111579 *declarations*, *grammar rules*, and *programs*, separated by double percent signs ("%"). The  
 111580 declarations and programs sections can be empty. If the latter is empty, the preceding "%"  
 111581 mark separating it from the rules section can be omitted.

111582 The input is free form text following the structure of the grammar defined below.

111583 **Lexical Structure of the Grammar**

111584 The <blank>s, <newline>s, and <form-feed>s shall be ignored, except that the application shall  
 111585 ensure that they do not appear in names or multi-character reserved symbols. Comments shall  
 111586 be enclosed in `"/* . . . */"`, and can appear wherever a name is valid.

111587 Names are of arbitrary length, made up of letters, periods ('.'), underscores ('\_'), and non-  
 111588 initial digits. Uppercase and lowercase letters are distinct. Conforming applications shall not  
 111589 use names beginning in `yy` or `YY` since the *yacc* parser uses such names. Many of the names  
 111590 appear in the final output of *yacc*, and thus they should be chosen to conform with any  
 111591 additional rules created by the C compiler to be used. In particular they appear in `#define`  
 111592 statements.

111593 A literal shall consist of a single character enclosed in single-quotes (''). All of the escape  
 111594 sequences supported for character constants by the ISO C standard shall be supported by *yacc*.

111595 The relationship with the lexical analyzer is discussed in detail below.

111596 The application shall ensure that the NUL character is not used in grammar rules or literals.

111597 **Declarations Section**

111598 The declarations section is used to define the symbols used to define the target language and  
 111599 their relationship with each other. In particular, much of the additional information required to  
 111600 resolve ambiguities in the context-free grammar for the target language is provided here.

111601 Usually *yacc* assigns the relationship between the symbolic names it generates and their  
 111602 underlying numeric value. The declarations section makes it possible to control the assignment  
 111603 of these values.

111604 It is also possible to keep semantic information associated with the tokens currently on the parse  
 111605 stack in a user-defined C-language **union**, if the members of the union are associated with the  
 111606 various names in the grammar. The declarations section provides for this as well.

111607 The first group of declarators below all take a list of names as arguments. That list can optionally  
 111608 be preceded by the name of a C union member (called a *tag* below) appearing within '`<`' and  
 111609 '`>`'. (As an exception to the typographical conventions of the rest of this volume of  
 111610 POSIX.1-200x, in this case `<tag>` does not represent a metavariable, but the literal angle bracket  
 111611 characters surrounding a symbol.) The use of *tag* specifies that the tokens named on this line  
 111612 shall be of the same C type as the union member referenced by *tag*. This is discussed in more  
 111613 detail below.

111614 For lists used to define tokens, the first appearance of a given token can be followed by a  
 111615 positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it  
 111616 for lexical purposes shall be taken to be that number.

111617 The following declares *name* to be a token:

```
111618 %token [<tag>] name [number] [name [number]]...
```

111619 If *tag* is present, the C type for all tokens on this line shall be declared to be the type referenced  
 111620 by *tag*. If a positive integer, *number*, follows a *name*, that value shall be assigned to the token.

111621 The following declares *name* to be a token, and assigns precedence to it:

```
111622 %left [<tag>] name [number] [name [number]]...
```

```
111623 %right [<tag>] name [number] [name [number]]...
```

111624 One or more lines, each beginning with one of these symbols, can appear in this section. All  
 111625 tokens on the same line have the same precedence level and associativity; the lines are in order  
 111626 of increasing precedence or binding strength. `%left` denotes that the operators on that line are  
 111627 left associative, and `%right` similarly denotes right associative operators. If *tag* is present, it shall

111628 declare a C type for *names* as described for **%token**.

111629 The following declares *name* to be a token, and indicates that this cannot be used associatively:

111630 `%nonassoc [<tag>] name [number] [name [number]]...`

111631 If the parser encounters associative use of this token it reports an error. If *tag* is present, it shall

111632 declare a C type for *names* as described for **%token**.

111633 The following declares that union member *names* are non-terminals, and thus it is required to

111634 have a *tag* field at its beginning:

111635 `%type <tag> name...`

111636 Because it deals with non-terminals only, assigning a token number or using a literal is also

111637 prohibited. If this construct is present, *yacc* shall perform type checking; if this construct is not

111638 present, the parse stack shall hold only the **int** type.

111639 Every name used in *grammar* not defined by a **%token**, **%left**, **%right**, or **%nonassoc** declaration

111640 is assumed to represent a non-terminal symbol. The *yacc* utility shall report an error for any non-

111641 terminal symbol that does not appear on the left side of at least one grammar rule.

111642 Once the type, precedence, or token number of a name is specified, it shall not be changed. If the

111643 first declaration of a token does not assign a token number, *yacc* shall assign a token number.

111644 Once this assignment is made, the token number shall not be changed by explicit assignment.

111645 The following declarators do not follow the previous pattern.

111646 The following declares the non-terminal *name* to be the *start symbol*, which represents the largest,

111647 most general structure described by the grammar rules:

111648 `%start name`

111649 By default, it is the left-hand side of the first grammar rule; this default can be overridden with

111650 this declaration.

111651 The following declares the *yacc* value stack to be a union of the various types of values desired:

111652 `%union { body of union (in C) }`

111653 By default, the values returned by actions (see below) and the lexical analyzer shall be of type

111654 **int**. The *yacc* utility keeps track of types, and it shall insert corresponding union member names

111655 in order to perform strict type checking of the resulting parser.

111656 Alternatively, given that at least one *<tag>* construct is used, the union can be declared in a

111657 header file (which shall be included in the declarations section by using a **#include** construct

111658 within `{` and `}`), and a **typedef** used to define the symbol `YYSTYPE` to represent this union.

111659 The effect of **%union** is to provide the declaration of `YYSTYPE` directly from the *yacc* input.

111660 C-language declarations and definitions can appear in the declarations section, enclosed by the

111661 following marks:

111662 `{ ... }`

111663 These statements shall be copied into the code file, and have global scope within it so that they

111664 can be used in the rules and program sections.

111665 The application shall ensure that the declarations section is terminated by the token `%%`.

111666 **Grammar Rules in yacc**

111667 The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
 111668 and associates with those rules C-language actions and additional precedence information. The  
 111669 grammar is described below, and a formal definition follows.

111670 The rules section is comprised of one or more grammar rules. A grammar rule has the form:

111671 A : BODY ;

111672 The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
 111673 more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
 111674 Only the names and literals participate in the formation of the grammar; the semantic actions  
 111675 and precedence rules are used in other ways. The colon and the semicolon are *yacc* punctuation.  
 111676 If there are several successive grammar rules with the same left-hand side, the vertical bar ' | '  
 111677 can be used to avoid rewriting the left-hand side; in this case the semicolon appears only after  
 111678 the last rule. The BODY part can be empty (or empty of names and literals) to indicate that the  
 111679 non-terminal symbol matches the empty string.

111680 The *yacc* utility assigns a unique number to each rule. Rules using the vertical bar notation are  
 111681 distinct rules. The number assigned to the rule appears in the description file.

111682 The elements comprising a BODY are:

111683 *name, literal* These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*  
 111684 stands for itself (less the lexically required quotation marks).

111685 *semantic action*

111686 With each grammar rule, the user can associate actions to be performed each time  
 111687 the rule is recognized in the input process. (Note that the word "action" can also  
 111688 refer to the actions of the parser—shift, reduce, and so on.)

111689 These actions can return values and can obtain the values returned by previous  
 111690 actions. These values are kept in objects of type YYSTYPE (see %union). The  
 111691 result value of the action shall be kept on the parse stack with the left-hand side of  
 111692 the rule, to be accessed by other reductions as part of their right-hand side. By  
 111693 using the <tag> information provided in the declarations section, the code  
 111694 generated by *yacc* can be strictly type checked and contain arbitrary information. In  
 111695 addition, the lexical analyzer can provide the same kinds of values for tokens, if  
 111696 desired.

111697 An action is an arbitrary C statement and as such can do input or output, call  
 111698 subprograms, and alter external variables. An action is one or more C statements  
 111699 enclosed in curly braces ' { ' and ' } '.

111700 Certain pseudo-variables can be used in the action. These are macros for access to  
 111701 data structures known internally to *yacc*.

111702 \$\$ The value of the action can be set by assigning it to \$\$ . If type  
 111703 checking is enabled and the type of the value to be assigned cannot  
 111704 be determined, a diagnostic message may be generated.

111705 \$number This refers to the value returned by the component specified by the  
 111706 token *number* in the right side of a rule, reading from left to right;  
 111707 *number* can be zero or negative. If *number* is zero or negative, it refers  
 111708 to the data associated with the name on the parser's stack preceding  
 111709 the leftmost symbol of the current rule. (That is, "\$0" refers to the  
 111710 name immediately preceding the leftmost name in the current rule to  
 111711 be found on the parser's stack and "\$-1" refers to the symbol to *its*  
 111712 left.) If *number* refers to an element past the current point in the rule,  
 111713 or beyond the bottom of the stack, the result is undefined. If type

|        |                   |                                                                                                                  |
|--------|-------------------|------------------------------------------------------------------------------------------------------------------|
| 111714 |                   | checking is enabled and the type of the value to be assigned cannot                                              |
| 111715 |                   | be determined, a diagnostic message may be generated.                                                            |
| 111716 | $\$<tag>number$   |                                                                                                                  |
| 111717 |                   | These correspond exactly to the corresponding symbols without the                                                |
| 111718 |                   | <i>tag</i> inclusion, but allow for strict type checking (and preclude                                           |
| 111719 |                   | unwanted type conversions). The effect is that the macro is expanded                                             |
| 111720 |                   | to use <i>tag</i> to select an element from the YYSTYPE union (using                                             |
| 111721 |                   | <i>dataname.tag</i> ). This is particularly useful if <i>number</i> is not positive.                             |
| 111722 | $\$<tag>\$$       |                                                                                                                  |
| 111723 |                   | This imposes on the reference the type of the union member                                                       |
| 111724 |                   | referenced by <i>tag</i> . This construction is applicable when a reference to                                   |
| 111725 |                   | a left context value occurs in the grammar, and provides <i>yacc</i> with a                                      |
|        |                   | means for selecting a type.                                                                                      |
| 111726 |                   | Actions can occur anywhere in a rule (not just at the end); an action can access                                 |
| 111727 |                   | values returned by actions to its left, and in turn the value it returns can be                                  |
| 111728 |                   | accessed by actions to its right. An action appearing in the middle of a rule shall be                           |
| 111729 |                   | equivalent to replacing the action with a new non-terminal symbol and adding an                                  |
| 111730 |                   | empty rule with that non-terminal symbol on the left-hand side. The semantic                                     |
| 111731 |                   | action associated with the new rule shall be equivalent to the original action. The                              |
| 111732 |                   | use of actions within rules might introduce conflicts that would not otherwise                                   |
| 111733 |                   | exist.                                                                                                           |
| 111734 |                   | By default, the value of a rule shall be the value of the first element in it. If the first                      |
| 111735 |                   | element does not have a type (particularly in the case of a literal) and type                                    |
| 111736 |                   | checking is turned on by <b>%type</b> , an error message shall result.                                           |
| 111737 | <i>precedence</i> |                                                                                                                  |
| 111738 |                   | The keyword <b>%prec</b> can be used to change the precedence level associated with a                            |
| 111739 |                   | particular grammar rule. Examples of this are in cases where a unary and binary                                  |
| 111740 |                   | operator have the same symbolic representation, but need to be given different                                   |
| 111741 |                   | precedences, or where the handling of an ambiguous if-else construction is                                       |
| 111742 |                   | necessary. The reserved symbol <b>%prec</b> can appear immediately after the body of                             |
| 111743 |                   | the grammar rule and can be followed by a token name or a literal. It shall cause                                |
| 111744 |                   | the precedence of the grammar rule to become that of the following token name or                                 |
|        |                   | literal. The action for the rule as a whole can follow <b>%prec</b> .                                            |
| 111745 |                   | If a program section follows, the application shall ensure that the grammar rules are terminated                 |
| 111746 |                   | by <b>%%</b> .                                                                                                   |
| 111747 |                   | <b>Programs Section</b>                                                                                          |
| 111748 |                   | The <i>programs</i> section can include the definition of the lexical analyzer <i>yylex()</i> , and any other    |
| 111749 |                   | functions; for example, those used in the actions specified in the grammar rules. It is unspecified              |
| 111750 |                   | whether the programs section precedes or follows the semantic actions in the output file;                        |
| 111751 |                   | therefore, if the application contains any macro definitions and declarations intended to apply to               |
| 111752 |                   | the code in the semantic actions, it shall place them within "%{ . . . %}" in the declarations                   |
| 111753 |                   | section.                                                                                                         |
| 111754 |                   | <b>Input Grammar</b>                                                                                             |
| 111755 |                   | The following input to <i>yacc</i> yields a parser for the input to <i>yacc</i> . This formal syntax takes       |
| 111756 |                   | precedence over the preceding text syntax description.                                                           |
| 111757 |                   | The lexical structure is defined less precisely; <a href="#">Lexical Structure of the Grammar</a> (on page 3293) |
| 111758 |                   | defines most terms. The correspondence between the previous terms and the tokens below is as                     |
| 111759 |                   | follows.                                                                                                         |

```

111760 IDENTIFIER This corresponds to the concept of name, given previously. It also includes
111761 literals as defined previously.

111762 C_IDENTIFIER This is a name, and additionally it is known to be followed by a colon. A
111763 literal cannot yield this token.

111764 NUMBER A string of digits (a non-negative decimal integer).

111765 TYPE, LEFT, MARK, LCURL, RCURL
111766 These correspond directly to %type, %left, %%, %{, and %}.

111767 {...} This indicates C-language source code, with the possible inclusion of '$'
111768 macros as discussed previously.

## 111845 Conflicts

111846 The parser produced for an input grammar may contain states in which conflicts occur. The  
 111847 conflicts occur because the grammar is not LALR(1). An ambiguous grammar always contains at  
 111848 least one LALR(1) conflict. The *yacc* utility shall resolve all conflicts, using either default rules or  
 111849 user-specified precedence rules.

111850 Conflicts are either shift/reduce conflicts or reduce/reduce conflicts. A shift/reduce conflict is  
 111851 where, for a given state and lookahead symbol, both a shift action and a reduce action are  
 111852 possible. A reduce/reduce conflict is where, for a given state and lookahead symbol, reductions  
 111853 by two different rules are possible.

111854 The rules below describe how to specify what actions to take when a conflict occurs. Not all  
 111855 shift/reduce conflicts can be successfully resolved this way because the conflict may be due to  
 111856 something other than ambiguity, so incautious use of these facilities can cause the language  
 111857 accepted by the parser to be much different from that which was intended. The description file

111858 shall contain sufficient information to understand the cause of the conflict. Where ambiguity is  
111859 the reason either the default or explicit rules should be adequate to produce a working parser.

111860 The declared precedences and associativities (see [Declarations Section](#), on page 3293) are used to  
111861 resolve parsing conflicts as follows:

- 111862 1. A precedence and associativity is associated with each grammar rule; it is the precedence  
111863 and associativity of the last token or literal in the body of the rule. If the `%prec` keyword  
111864 is used, it overrides this default. Some grammar rules might not have both precedence  
111865 and associativity.
- 111866 2. If there is a shift/reduce conflict, and both the grammar rule and the input symbol have  
111867 precedence and associativity associated with them, then the conflict is resolved in favor of  
111868 the action (shift or reduce) associated with the higher precedence. If the precedences are  
111869 the same, then the associativity is used; left associative implies reduce, right associative  
111870 implies shift, and non-associative implies an error in the string being parsed.
- 111871 3. When there is a shift/reduce conflict that cannot be resolved by rule 2, the shift is done.  
111872 Conflicts resolved this way are counted in the diagnostic output described in [Error](#)  
111873 [Handling](#).
- 111874 4. When there is a reduce/reduce conflict, a reduction is done by the grammar rule that  
111875 occurs earlier in the input sequence. Conflicts resolved this way are counted in the  
111876 diagnostic output described in [Error Handling](#).

111877 Conflicts resolved by precedence or associativity shall not be counted in the shift/reduce and  
111878 reduce/reduce conflicts reported by *yacc* on either standard error or in the description file.

### 111879 **Error Handling**

111880 The token **error** shall be reserved for error handling. The name **error** can be used in grammar  
111881 rules. It indicates places where the parser can recover from a syntax error. The default value of  
111882 **error** shall be 256. Its value can be changed using a `%token` declaration. The lexical analyzer  
111883 should not return the value of **error**.

111884 The parser shall detect a syntax error when it is in a state where the action associated with the  
111885 lookahead symbol is **error**. A semantic action can cause the parser to initiate error handling by  
111886 executing the macro `YYERROR`. When `YYERROR` is executed, the semantic action passes control  
111887 back to the parser. `YYERROR` cannot be used outside of semantic actions.

111888 When the parser detects a syntax error, it normally calls `yyerror()` with the character string  
111889 "syntax error" as its argument. The call shall not be made if the parser is still recovering  
111890 from a previous error when the error is detected. The parser is considered to be recovering from  
111891 a previous error until the parser has shifted over at least three normal input symbols since the  
111892 last error was detected or a semantic action has executed the macro `yyerrok`. The parser shall not  
111893 call `yyerror()` when `YYERROR` is executed.

111894 The macro function `YYRECOVERING` shall return 1 if a syntax error has been detected and the  
111895 parser has not yet fully recovered from it. Otherwise, zero shall be returned.

111896 When a syntax error is detected by the parser, the parser shall check if a previous syntax error  
111897 has been detected. If a previous error was detected, and if no normal input symbols have been  
111898 shifted since the preceding error was detected, the parser checks if the lookahead symbol is an  
111899 endmarker (see [Interface to the Lexical Analyzer](#), on page 3300). If it is, the parser shall return  
111900 with a non-zero value. Otherwise, the lookahead symbol shall be discarded and normal parsing  
111901 shall resume.

111902 When `YYERROR` is executed or when the parser detects a syntax error and no previous error has  
111903 been detected, or at least one normal input symbol has been shifted since the previous error was  
111904 detected, the parser shall pop back one state at a time until the parse stack is empty or the

111905 current state allows a shift over **error**. If the parser empties the parse stack, it shall return with a  
 111906 non-zero value. Otherwise, it shall shift over **error** and then resume normal parsing. If the parser  
 111907 reads a lookahead symbol before the error was detected, that symbol shall still be the lookahead  
 111908 symbol when parsing is resumed.

111909 The macro *yyerror* in a semantic action shall cause the parser to act as if it has fully recovered  
 111910 from any previous errors. The macro *yyclearin* shall cause the parser to discard the current  
 111911 lookahead token. If the current lookahead token has not yet been read, *yyclearin* shall have no  
 111912 effect.

111913 The macro YYACCEPT shall cause the parser to return with the value zero. The macro  
 111914 YYABORT shall cause the parser to return with a non-zero value.

### 111915 Interface to the Lexical Analyzer

111916 The *yylex()* function is an integer-valued function that returns a *token number* representing the  
 111917 kind of token read. If there is a value associated with the token returned by *yylex()* (see the  
 111918 discussion of *tag* above), it shall be assigned to the external variable *yyval*.

111919 If the parser and *yylex()* do not agree on these token numbers, reliable communication between  
 111920 them cannot occur. For (single-byte character) literals, the token is simply the numeric value of  
 111921 the character in the current character set. The numbers for other tokens can either be chosen by  
 111922 *yacc*, or chosen by the user. In either case, the **#define** construct of C is used to allow *yylex()*  
 111923 to return these numbers symbolically. The **#define** statements are put into the code file, and the  
 111924 header file if that file is requested. The set of characters permitted by *yacc* in an identifier is  
 111925 larger than that permitted by C. Token names found to contain such characters shall not be  
 111926 included in the **#define** declarations.

111927 If the token numbers are chosen by *yacc*, the tokens other than literals shall be assigned numbers  
 111928 greater than 256, although no order is implied. A token can be explicitly assigned a number by  
 111929 following its first appearance in the declarations section with a number. Names and literals not  
 111930 defined this way retain their default definition. All token numbers assigned by *yacc* shall be  
 111931 unique and distinct from the token numbers used for literals and user-assigned tokens. If  
 111932 duplicate token numbers cause conflicts in parser generation, *yacc* shall report an error;  
 111933 otherwise, it is unspecified whether the token assignment is accepted or an error is reported.

111934 The end of the input is marked by a special token called the *endmarker*, which has a token  
 111935 number that is zero or negative. (These values are invalid for any other token.) All lexical  
 111936 analyzers shall return zero or negative as a token number upon reaching the end of their input.  
 111937 If the tokens up to, but excluding, the endmarker form a structure that matches the start symbol,  
 111938 the parser shall accept the input. If the endmarker is seen in any other context, it shall be  
 111939 considered an error.

### 111940 Completing the Program

111941 In addition to *yparse()* and *yylex()*, the functions *yyerror()* and *main()* are required to make a  
 111942 complete program. The application can supply *main()* and *yyerror()*, or those routines can be  
 111943 obtained from the *yacc* library.

### 111944 Yacc Library

111945 The following functions shall appear only in the *yacc* library accessible through the **-l y** operand  
 111946 to *c99*; they can therefore be redefined by a conforming application:

#### 111947 **int main(void)**

111948 This function shall call *yparse()* and exit with an unspecified value. Other actions within  
 111949 this function are unspecified.

111950 **int yyerror(const char \*s)**

111951 This function shall write the NUL-terminated argument to standard error, followed by a  
111952 <newline>.

111953 The order of the **-ly** and **-ll** operands given to *c99* is significant; the application shall either  
111954 provide its own *main()* function or ensure that **-ly** precedes **-ll**.

### 111955 **Debugging the Parser**

111956 The parser generated by *yacc* shall have diagnostic facilities in it that can be optionally enabled  
111957 at either compile time or at runtime (if enabled at compile time). The compilation of the runtime  
111958 debugging code is under the control of *YYDEBUG*, a preprocessor symbol. If *YYDEBUG* has a  
111959 non-zero value, the debugging code shall be included. If its value is zero, the code shall not be  
111960 included.

111961 In parsers where the debugging code has been included, the external **int yydebug** can be used to  
111962 turn debugging on (with a non-zero value) and off (zero value) at runtime. The initial value of  
111963 *yydebug* shall be zero.

111964 When **-t** is specified, the code file shall be built such that, if *YYDEBUG* is not already defined at  
111965 compilation time (using the *c99* **-D YYDEBUG** option, for example), *YYDEBUG* shall be set  
111966 explicitly to 1. When **-t** is not specified, the code file shall be built such that, if *YYDEBUG* is not  
111967 already defined, it shall be set explicitly to zero.

111968 The format of the debugging output is unspecified but includes at least enough information to  
111969 determine the shift and reduce actions, and the input symbols. It also provides information  
111970 about error recovery.

### 111971 **Algorithms**

111972 The parser constructed by *yacc* implements an LALR(1) parsing algorithm as documented in the  
111973 literature. It is unspecified whether the parser is table-driven or direct-coded.

111974 A parser generated by *yacc* shall never request an input symbol from *yylex()* while in a state  
111975 where the only actions other than the error action are reductions by a single rule.

111976 The literature of parsing theory defines these concepts.

### 111977 **Limits**

111978 The *yacc* utility may have several internal tables. The minimum maximums for these tables are  
111979 shown in the following table. The exact meaning of these values is implementation-defined. The  
111980 implementation shall define the relationship between these values and between them and any  
111981 error messages that the implementation may generate should it run out of space for any internal  
111982 structure. An implementation may combine groups of these resources into a single pool as long  
111983 as the total available to the user does not fall below the sum of the sizes specified by this section.

Table 4-22 Internal Limits in *yacc*

| Limit      | Minimum<br>Maximum | Description                                                                                                                                                                                                                                                        |
|------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| {NTERMS}   | 126                | Number of tokens.                                                                                                                                                                                                                                                  |
| {NNONTERM} | 200                | Number of non-terminals.                                                                                                                                                                                                                                           |
| {NPROD}    | 300                | Number of rules.                                                                                                                                                                                                                                                   |
| {NSTATES}  | 600                | Number of states.                                                                                                                                                                                                                                                  |
| {MEMSIZE}  | 5 200              | Length of rules. The total length, in names (tokens and non-terminals), of all the rules of the grammar. The left-hand side is counted for each rule, even if it is not explicitly repeated, as specified in <a href="#">Grammar Rules in yacc</a> (on page 3295). |
| {ACTSIZE}  | 4 000              | Number of actions. “Actions” here (and in the description file) refer to parser actions (shift, reduce, and so on) not to semantic actions defined in <a href="#">Grammar Rules in yacc</a> (on page 3295).                                                        |

**EXIT STATUS**

The following exit values shall be returned:

- 0 Successful completion.
- >0 An error occurred.

**CONSEQUENCES OF ERRORS**

If any errors are encountered, the run is aborted and *yacc* exits with a non-zero status. Partial code files and header files may be produced. The summary information in the description file shall always be produced if the `-v` flag is present.

**APPLICATION USAGE**

Historical implementations experience name conflicts on the names `yacc.tmp`, `yacc.acts`, `yacc.debug`, `y.tab.c`, `y.tab.h`, and `y.output` if more than one copy of *yacc* is running in a single directory at one time. The `-b` option was added to overcome this problem. The related problem of allowing multiple *yacc* parsers to be placed in the same file was addressed by adding a `-p` option to override the previously hard-coded `yy` variable prefix.

The description of the `-p` option specifies the minimal set of function and variable names that cause conflict when multiple parsers are linked together. `YYSTYPE` does not need to be changed. Instead, the programmer can use `-b` to give the header files for different parsers different names, and then the file with the `yylex()` for a given parser can include the header for that parser. Names such as `yyclearerr` do not need to be changed because they are used only in the actions; they do not have linkage. It is possible that an implementation has other names, either internal ones for implementing things such as `yyclearerr`, or providing non-standard features that it wants to change with `-p`.

Unary operators that are the same token as a binary operator in general need their precedence adjusted. This is handled by the `%prec` advisory symbol associated with the particular grammar rule defining that unary operator. (See [Grammar Rules in yacc](#) (on page 3295).) Applications are not required to use this operator for unary operators, but the grammars that do not require it are rare.

**EXAMPLES**

112029  
112030 Access to the *yacc* library is obtained with library search operands to *c99*. To use the *yacc* library  
112031 *main()*:

112032 `c99 y.tab.c -l y`

112033 Both the *lex* library and the *yacc* library contain *main()*. To access the *yacc main()*:

112034 `c99 y.tab.c lex.yy.c -l y -l l`

112035 This ensures that the *yacc* library is searched first, so that its *main()* is used.

112036 The historical *yacc* libraries have contained two simple functions that are normally coded by the  
112037 application programmer. These functions are similar to the following code:

```
112038 #include <locale.h>
112039 int main(void)
112040 {
112041 extern int yyparse();
112042 setlocale(LC_ALL, "");
112043 /* If the following parser is one created by lex, the
112044 application must be careful to ensure that LC_CTYPE
112045 and LC_COLLATE are set to the POSIX locale. */
112046 (void) yyparse();
112047 return (0);
112048 }
112049 #include <stdio.h>
112050 int yyerror(const char *msg)
112051 {
112052 (void) fprintf(stderr, "%s\n", msg);
112053 return (0);
112054 }
```

**RATIONALE**

112055 The references in [Referenced Documents](#) (on page 0) may be helpful in constructing the parser  
112056 generator. The referenced DeRemer and Pennello article (along with the works it references)  
112057 describes a technique to generate parsers that conform to this volume of POSIX.1-200x. Work in  
112058 this area continues to be done, so implementors should consult current literature before doing  
112059 any new implementations. The original Knuth article is the theoretical basis for this kind of  
112060 parser, but the tables it generates are impractically large for reasonable grammars and should  
112061 not be used. The “equivalent to” wording is intentional to assure that the best tables that are  
112062 LALR(1) can be generated.  
112063

112064 There has been confusion between the class of grammars, the algorithms needed to generate  
112065 parsers, and the algorithms needed to parse the languages. They are all reasonably orthogonal.  
112066 In particular, a parser generator that accepts the full range of LR(1) grammars need not generate  
112067 a table any more complex than one that accepts SLR(1) (a relatively weak class of LR grammars)  
112068 for a grammar that happens to be SLR(1). Such an implementation need not recognize the case,  
112069 either; table compression can yield the SLR(1) table (or one even smaller than that) without  
112070 recognizing that the grammar is SLR(1). The speed of an LR(1) parser for any class is dependent  
112071 more upon the table representation and compression (or the code generation if a direct parser is  
112072 generated) than upon the class of grammar that the table generator handles.

112073 The speed of the parser generator is somewhat dependent upon the class of grammar it handles.  
112074 However, the original Knuth article algorithms for constructing LR parsers were judged by its  
112075 author to be impractically slow at that time. Although full LR is more complex than LALR(1), as  
112076 computer speeds and algorithms improve, the difference (in terms of acceptable wall-clock

112077 execution time) is becoming less significant.

112078 Potential authors are cautioned that the referenced DeRemer and Pennello article previously  
 112079 cited identifies a bug (an over-simplification of the computation of LALR(1) lookahead sets) in  
 112080 some of the LALR(1) algorithm statements that preceded it to publication. They should take the  
 112081 time to seek out that paper, as well as current relevant work, particularly Aho's.

112082 The **-b** option was added to provide a portable method for permitting *yacc* to work on multiple  
 112083 separate parsers in the same directory. If a directory contains more than one *yacc* grammar, and  
 112084 both grammars are constructed at the same time (by, for example, a parallel *make* program),  
 112085 conflict results. While the solution is not historical practice, it corrects a known deficiency in  
 112086 historical implementations. Corresponding changes were made to all sections that referenced  
 112087 the filenames **y.tab.c** (now "the code file"), **y.tab.h** (now "the header file"), and **y.output** (now  
 112088 "the description file").

112089 The grammar for *yacc* input is based on System V documentation. The textual description shows  
 112090 there that the `' ; '` is required at the end of the rule. The grammar and the implementation do  
 112091 not require this. (The use of **C\_IDENTIFIER** causes a reduce to occur in the right place.)

112092 Also, in that implementation, the constructs such as **%token** can be terminated by a semicolon,  
 112093 but this is not permitted by the grammar. The keywords such as **%token** can also appear in  
 112094 uppercase, which is again not discussed. In most places where `' % '` is used, `' \ '` can be  
 112095 substituted, and there are alternate spellings for some of the symbols (for example, **%LEFT** can  
 112096 be `" % < "` or even `" \ < "`).

112097 Historically, `<tag>` can contain any characters except `' > '`, including white space, in the  
 112098 implementation. However, since the *tag* must reference an ISO C standard union member, in  
 112099 practice conforming implementations need to support only the set of characters for ISO C  
 112100 standard identifiers in this context.

112101 Some historical implementations are known to accept actions that are terminated by a period.  
 112102 Historical implementations often allow `' $ '` in names. A conforming implementation does not  
 112103 need to support either of these behaviors.

112104 Deciding when to use **%prec** illustrates the difficulty in specifying the behavior of *yacc*. There  
 112105 may be situations in which the *grammar* is not, strictly speaking, in error, and yet *yacc* cannot  
 112106 interpret it unambiguously. The resolution of ambiguities in the grammar can in many instances  
 112107 be resolved by providing additional information, such as using **%type** or **%union** declarations.  
 112108 It is often easier and it usually yields a smaller parser to take this alternative when it is  
 112109 appropriate.

112110 The size and execution time of a program produced without the runtime debugging code is  
 112111 usually smaller and slightly faster in historical implementations.

112112 Statistics messages from several historical implementations include the following types of  
 112113 information:

112114 `n/512 terminals, n/300 non-terminals`  
 112115 `n/600 grammar rules, n/1500 states`  
 112116 `n shift/reduce, n reduce/reduce conflicts reported`  
 112117 `n/350 working sets used`  
 112118 `Memory: states, etc. n/15000, parser n/15000`  
 112119 `n/600 distinct lookahead sets`  
 112120 `n extra closures`  
 112121 `n shift entries, n exceptions`  
 112122 `n goto entries`  
 112123 `n entries saved by goto default`  
 112124 `Optimizer space used: input n/15000, output n/15000`  
 112125 `n table entries, n zero`

112126 Maximum spread: *n*, Maximum offset: *n*

112127 The report of internal tables in the description file is left implementation-defined because all  
112128 aspects of these limits are also implementation-defined. Some implementations may use  
112129 dynamic allocation techniques and have no specific limit values to report.

112130 The format of the **y.output** file is not given because specification of the format was not seen to  
112131 enhance applications portability. The listing is primarily intended to help human users  
112132 understand and debug the parser; use of **y.output** by a conforming application script would be  
112133 unusual. Furthermore, implementations have not produced consistent output and no popular  
112134 format was apparent. The format selected by the implementation should be human-readable, in  
112135 addition to the requirement that it be a text file.

112136 Standard error reports are not specifically described because they are seldom of use to  
112137 conforming applications and there was no reason to restrict implementations.

112138 Some implementations recognize "`={"`" as equivalent to '`{`' because it appears in historical  
112139 documentation. This construction was recognized and documented as obsolete as long ago as  
112140 1978, in the referenced *Yacc: Yet Another Compiler-Compiler*. This volume of POSIX.1-200x chose to  
112141 leave it as obsolete and omit it.

112142 Multi-byte characters should be recognized by the lexical analyzer and returned as tokens. They  
112143 should not be returned as multi-byte character literals. The token **error** that is used for error  
112144 recovery is normally assigned the value 256 in the historical implementation. Thus, the token  
112145 value 256, which is used in many multi-byte character sets, is not available for use as the value  
112146 of a user-defined token.

#### 112147 FUTURE DIRECTIONS

112148 None.

#### 112149 SEE ALSO

112150 [c99](#), [lex](#)

112151 [XBD Chapter 8](#) (on page 159), [Section 12.2](#) (on page 201)

#### 112152 CHANGE HISTORY

112153 First released in Issue 2.

##### 112154 Issue 5

112155 The FUTURE DIRECTIONS section is added.

##### 112156 Issue 6

112157 This utility is marked as part of the C-Language Development Utilities option.

112158 Minor changes have been added to align with the IEEE P1003.2b draft standard.

112159 The normative text is reworded to avoid use of the term "must" for application requirements.

112160 IEEE PASC Interpretation 1003.2 #177 is applied, changing the comment on **RCURL** from the `}%`  
112161 token to the `%}`.

##### 112162 Issue 7

112163 SD5-XCU-ERN-6 is applied, clarifying that Guideline 9 of the Utility Syntax Guidelines does not  
112164 apply.

112165 SD5-XCU-ERN-97 is applied, updating the SYNOPSIS.

112166 **NAME**

112167 zcat — expand and concatenate data

112168 **SYNOPSIS**112169 XSI zcat [*file...*]112170 **DESCRIPTION**

112171 The *zcat* utility shall write to standard output the uncompressed form of files that have been  
 112172 compressed using the *compress* utility. It is the equivalent of *uncompress -c*. Input files are not  
 112173 affected.

112174 **OPTIONS**

112175 None.

112176 **OPERANDS**

112177 The following operand shall be supported:

112178 *file* The pathname of a file previously processed by the *compress* utility. If *file* already  
 112179 has the *.Z* suffix specified, it is used as submitted. Otherwise, the *.Z* suffix is  
 112180 appended to the filename prior to processing.

112181 **STDIN**112182 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is *'-'*.112183 **INPUT FILES**112184 Input files shall be compressed files that are in the format produced by the *compress* utility.112185 **ENVIRONMENT VARIABLES**112186 The following environment variables shall affect the execution of *zcat*:

112187 *LANG* Provide a default value for the internationalization variables that are unset or null. |  
 112188 (See XBD Section 8.2 (on page 160) for the precedence of internationalization |  
 112189 variables used to determine the values of locale categories.)

112190 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 112191 internationalization variables.

112192 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 112193 characters (for example, single-byte as opposed to multi-byte characters in  
 112194 arguments).

112195 *LC\_MESSAGES*

112196 Determine the locale that should be used to affect the format and contents of  
 112197 diagnostic messages written to standard error.

112198 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

112199 **ASYNCHRONOUS EVENTS**

112200 Default.

112201 **STDOUT**

112202 The compressed files given as input shall be written on standard output in their uncompressed  
 112203 form.

112204 **STDERR**

112205 The standard error shall be used only for diagnostic messages.

112206 **OUTPUT FILES**

112207 None.

112208 **EXTENDED DESCRIPTION**

112209 None.

112210 **EXIT STATUS**

112211 The following exit values shall be returned:

112212 0 Successful completion.

112213 &gt;0 An error occurred.

112214 **CONSEQUENCES OF ERRORS**

112215 Default.

112216 **APPLICATION USAGE**

112217 None.

112218 **EXAMPLES**

112219 None.

112220 **RATIONALE**

112221 None.

112222 **FUTURE DIRECTIONS**

112223 None.

*Rationale for Base Definitions***A.1 Introduction****A.1.1 Scope**

POSIX.1-200x is one of a family of standards known as POSIX. The family of standards extends to many topics; POSIX.1-200x is known as POSIX.1 and consists of both operating system interfaces and shell and utilities. POSIX.1-200x is technically identical to The Open Group Base Specifications, Issue 7.

**Scope of POSIX.1-200x**

The (paraphrased) goals of this development were to revise the single document that is ISO/IEC 9945:2003 Parts 1 through 4, IEEE Std 1003.1, 2004 Edition, and the appropriate parts of The Open Group Single UNIX Specification, Version 3. This work has been undertaken by the Austin Group, a joint working group of IEEE, The Open Group, and ISO/IEC JTC 1/SC 22.

The following are the base documents in this version:

- IEEE Std 1003.1, 2004 Edition
- ISO/IEC 9899:1999, Programming Languages — C (including ISO/IEC 9899:1999/Cor.1:2001(E) and ISO/IEC 9899:1999/Cor.2:2004(E))
- The Open Group Extended API Sets, Parts 1 through 4

This version has addressed the following areas:

- Issues raised by Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and ISO/IEC defect reports against ISO/IEC 9945

The repository of interpretations can be accessed at [www.opengroup.org/austin/interps](http://www.opengroup.org/austin/interps).

- Issues raised in corrigenda for The Open Group Technical Standards and working group resolutions from The Open Group
- Issues arising from ISO TR 24715: 2006, Conflicts between POSIX and the LSB

This is a Type 3 informative technical report highlighting differences between the LSB 3.1 and the 2004 Edition of this standard.

- Changes to make the text self-consistent with the additional material merged

The new material merged has come from the The Open Group Extended API Sets Parts 1 through 4. A list of the new interfaces is included in [Section B.1.1](#) (on page 3393).

- Features, marked legacy or obsolescent in the base documents, have been considered for removal in this version

See [Section B.1.1](#) (on page 3393) and [Section C.1.1](#) (on page 3535).

- 112272 • A review and reorganization of the options within the standard

112273 This has included marking the following options obsolescent:

- 112274 — Batch Environment Services and Utilities
- 112275 — Tracing
- 112276 — XSI STREAMS

112277 The UUCP Utilities option is a new option for this version.

112278 Functionality from the following former options is now mandatory in this version:

|        |     |                                                        |
|--------|-----|--------------------------------------------------------|
| 112279 | AIO | _POSIX_ASYNCHRONOUS_IO (Asynchronous Input and Output) |
| 112280 | BAR | _POSIX_BARRIERS (Barriers)                             |
| 112281 | CS  | _POSIX_CLOCK_SELECTION (Clock Selection)               |
| 112282 | MF  | _POSIX_MAPPED_FILES (Memory Mapped Files)              |
| 112283 | MPR | _POSIX_MEMORY_PROTECTION (Memory Protection)           |
| 112284 | RTS | _POSIX_REALTIME_SIGNALS (Realtime Signals Extension)   |
| 112285 | RWL | _POSIX_READER_WRITER_LOCKS (Read-Write Locks)          |
| 112286 | SEM | _POSIX_SEMAPHORES (Semaphores)                         |
| 112287 | SPI | _POSIX_SPIN_LOCKS (Spin Locks)                         |
| 112288 | THR | _POSIX_THREADS (Threads)                               |
| 112289 | TMO | _POSIX_TIMEOUTS (Timeouts)                             |
| 112290 | TMR | _POSIX_TIMERS (Timers)                                 |
| 112291 | TSF | _POSIX_THREAD_SAFE_FUNCTIONS (Thread-Safe Functions)   |

- 112292 • Alignment with the ISO/IEC 9899:1999 standard, including Technical Corrigendum 2

- 112293 • A review of the use of fixed path filenames within the standard

112294 For example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the  
112295 directory **/usr/lib/cron**.

112296 The following were requirements on POSIX.1-200x:

- 112297 • Backward-compatibility

112298 For interfaces carried forward, it was agreed that there should be no breakage of  
112299 functionality in the existing base documents. All strictly conforming applications will be  
112300 conforming but not necessarily strictly conforming to the revised standard. The goal is for  
112301 system implementations to be able to support the existing and revised standards  
112302 simultaneously.

- 112303 • Architecture and *n*-bit-neutral

112304 The common standard should not make any implicit assumptions about the system  
112305 architecture or size of data types; for example, previously some 32-bit implicit assumptions  
112306 had crept into the standards.

- 112307 • Extensibility

112308 It should be possible to extend the common standard without breaking backwards-  
112309 compatibility; for example, the name space should be reserved and structured to avoid  
112310 duplication of names between the standard and extensions to it.

112311 **POSIX.1 and the ISO C Standard**

112312 The standard developers believed it essential for a programmer to have a single complete  
 112313 reference place, but recognized that deference to the formal standard has to be addressed for the  
 112314 duplicate interface definitions between the ISO C standard and POSIX.1-200x.

112315 Where an interface has a version in the ISO C standard, the DESCRIPTION section describes the  
 112316 relationship to the ISO C standard and markings are included as appropriate to show where the  
 112317 ISO C standard has been extended in the text.

112318 A block of text is included at the start of each affected reference page stating whether the page is  
 112319 aligned with the ISO C standard or extended. Each page has been parsed for additions beyond  
 112320 the ISO C standard (that is, including both POSIX and UNIX extensions), and these extensions  
 112321 are marked as CX extensions (for C extensions).

112322 **FIPS Requirements**

112323 The Federal Information Processing Standards (FIPS) are a series of U.S. government  
 112324 procurement standards managed and maintained on behalf of the U.S. Department of  
 112325 Commerce by the National Institute of Standards and Technology (NIST).

112326 The following restrictions were integrated into IEEE Std 1003.1-2001. They originally came from  
 112327 FIPS 151-2 which was withdrawn by NIST on February 25 2000.

- 112328 • The implementation supports `_POSIX_CHOWN_RESTRICTED`.
- 112329 • The limit `{NGROUPS_MAX}` is greater than or equal to 8.
- 112330 • The implementation supports the setting of the group ID of a file (when it is created) to  
 112331 that of the parent directory.
- 112332 • The implementation supports `_POSIX_SAVED_IDS`.
- 112333 • The implementation supports `_POSIX_VDISABLE`.
- 112334 • The implementation supports `_POSIX_JOB_CONTROL`.
- 112335 • The implementation supports `_POSIX_NO_TRUNC`.
- 112336 • The `read()` function returns the number of bytes read when interrupted by a signal and  
 112337 does not return `-1`.
- 112338 • The `write()` function returns the number of bytes written when interrupted by a signal and  
 112339 does not return `-1`.
- 112340 • In the environment for the login shell, the environment variables `LOGNAME` and `HOME`  
 112341 are defined and have the properties described in POSIX.1-200x.
- 112342 • The value of `{CHILD_MAX}` is greater than or equal to 25.
- 112343 • The value of `{OPEN_MAX}` is greater than or equal to 20.
- 112344 • The implementation supports the functionality associated with the symbols `CS7`, `CS8`,  
 112345 `CSTOPB`, `PARODD`, and `PARENB` defined in `<termios.h>`.

112346 **A.1.2 Conformance**112347 See [Section A.2](#) (on page 3319).112348 **A.1.3 Normative References**

112349 There is no additional rationale provided for this section.

112350 **A.1.4 Change History**

112351 There is no additional rationale provided for this section. +

112352 **A.1.5 Terminology**112353 The meanings specified in POSIX.1-200x for the words *shall*, *should*, and *may* are mandated by  
112354 ISO/IEC directives.112355 In the Rationale (Informative) volume of POSIX.1-200x, the words *shall*, *should*, and *may* are  
112356 sometimes used to illustrate similar usages in POSIX.1-200x. However, the rationale itself does  
112357 not specify anything regarding implementations or applications.112358 **conformance document**112359 As a practical matter, the conformance document is effectively part of the system  
112360 documentation. Conformance documents are distinguished by POSIX.1-200x so that they  
112361 can be referred to distinctly.112362 **implementation-defined**112363 This definition is analogous to that of the ISO C standard and, together with “undefined”  
112364 and “unspecified”, provides a range of specification of freedom allowed to the interface  
112365 implementor.112366 **may**112367 The use of *may* has been limited as much as possible, due both to confusion stemming from  
112368 its ordinary English meaning and to objections regarding the desirability of having as few  
112369 options as possible and those as clearly specified as possible.112370 The usage of *can* and *may* were selected to contrast optional application behavior (can)  
112371 against optional implementation behavior (may).112372 **shall**112373 Declarative sentences are sometimes used in POSIX.1-200x as if they included the word  
112374 *shall*, and facilities thus specified are no less required. For example, the two statements:112375 1. The *foo()* function shall return zero.112376 2. The *foo()* function returns zero.

112377 are meant to be exactly equivalent.

112378 **should**112379 In POSIX.1-200x, the word *should* does not usually apply to the implementation, but rather  
112380 to the application. Thus, the important words regarding implementations are *shall*, which  
112381 indicates requirements, and *may*, which indicates options.112382 **obsolescent**112383 The term “obsolescent” means “do not use this feature in new applications”. A feature  
112384 noted as obsolescent is supported by all implementations, but may be removed in a future  
112385 version; new applications should not use these features. The obsolescence concept is not an  
112386 ideal solution, but was used as a method of increasing consensus: many more objections

112387 would be heard from the user community if some of these historical features were suddenly  
 112388 removed without the grace period obsolescence implies. The phrase “may be removed in a  
 112389 future version” implies that the result of that consideration might in fact keep those features  
 112390 indefinitely if the predominance of applications do not migrate away from them quickly.

#### 112391 **legacy**

112392 The term “legacy” was included in earlier versions of this standard but is no longer used in  
 112393 the current version.

#### 112394 **system documentation**

112395 The system documentation should normally describe the whole of the implementation,  
 112396 including any extensions provided by the implementation. Such documents normally  
 112397 contain information at least as detailed as the specifications in POSIX.1-200x. Few  
 112398 requirements are made on the system documentation, but the term is needed to avoid a  
 112399 dangling pointer where the conformance document is permitted to point to the system  
 112400 documentation.

#### 112401 **undefined**

112402 See *implementation-defined*.

#### 112403 **unspecified**

112404 See *implementation-defined*.

112405 The definitions for “unspecified” and “undefined” appear nearly identical at first  
 112406 examination, but are not. The term “unspecified” means that a conforming application may  
 112407 deal with the unspecified behavior, and it should not care what the outcome is. The term  
 112408 “undefined” says that a conforming application should not do it because no definition is  
 112409 provided for what it does (and implicitly it would care what the outcome was if it tried it).  
 112410 It is important to remember, however, that if the syntax permits the statement at all, it must  
 112411 have some outcome in a real implementation.

112412 Thus, the terms “undefined” and “unspecified” apply to the way the application should  
 112413 think about the feature. In terms of the implementation, it is always “defined”—there is  
 112414 always some result, even if it is an error. The implementation is free to choose the behavior  
 112415 it prefers.

112416 This also implies that an implementation, or another standard, could specify or define the  
 112417 result in a useful fashion. The terms apply to POSIX.1-200x specifically.

112418 The term “implementation-defined” implies requirements for documentation that are not  
 112419 required for “undefined” (or “unspecified”). Where there is no need for a conforming  
 112420 program to know the definition, the term “undefined” is used, even though  
 112421 “implementation-defined” could also have been used in this context. There could be a  
 112422 fourth term, specifying “this standard does not say what this does; it is acceptable to define  
 112423 it in an implementation, but it does not need to be documented”, and undefined would  
 112424 then be used very rarely for the few things for which any definition is not useful. In  
 112425 particular, implementation-defined is used where it is believed that certain classes of  
 112426 application will need to know such details to determine whether the application can be  
 112427 successfully ported to the implementation. Such applications are not always strictly  
 112428 portable, but nevertheless are common and useful; often the requirements met by the  
 112429 application cannot be met without dealing with the issues implied by “implementation-  
 112430 defined”. In some places the text refers to facilities supplied by the implementation that are  
 112431 outside the standard as implementation-supplied or implementation-provided. This is not  
 112432 intended to imply a requirement for documentation. If it were, the term “implementation-  
 112433 defined” would have been used.

112434 In many places POSIX.1-200x is silent about the behavior of some possible construct. For

112435 example, a variable may be defined for a specified range of values and behaviors are  
 112436 described for those values; nothing is said about what happens if the variable has any other  
 112437 value. That kind of silence can imply an error in the standard, but it may also imply that the  
 112438 standard was intentionally silent and that any behavior is permitted. There is a natural  
 112439 tendency to infer that if the standard is silent, a behavior is prohibited. That is not the intent.  
 112440 Silence is intended to be equivalent to the term “unspecified”.

112441 The term “application” is not defined in POSIX.1-200x; it is assumed to be a part of general  
 112442 computer science terminology.

112443 Three terms used within POSIX.1-200x overlap in meaning: “macro”, “symbolic name”, and  
 112444 “symbolic constant”.

#### 112445 **macro**

112446 This usually describes a C preprocessor symbol, the result of the **#define** operator, with or  
 112447 without an argument. It may also be used to describe similar mechanisms in editors and  
 112448 text processors.

#### 112449 **symbolic name**

112450 In earlier versions of this standard this was also sometimes used to refer to a C preprocessor  
 112451 symbol (without arguments), but the intention is for all such uses to have been removed. It  
 112452 is now mainly used to refer to the names for characters in character sets, but is sometimes  
 112453 used to refer to host names and even filenames.

#### 112454 **symbolic constant**

112455 This also refers to a C preprocessor symbol, with specific associated requirements. See the  
 112456 definition in [Section 3.372](#) (on page 84).

### 112457 **A.1.6 Definitions and Concepts**

112458 There is no additional rationale provided for this section.

### 112459 **A.1.7 Portability**

112460 To aid the identification of options within POSIX.1-200x, a notation consisting of margin codes  
 112461 and shading is used. This is based on the notation used in earlier versions of The Open Group  
 112462 Base specifications.

112463 The benefit of this approach is a reduction in the number of *if* statements within the running  
 112464 text, that makes the text easier to read, and also an identification to the programmer that they  
 112465 need to ensure that their target platforms support the underlying options. For example, if  
 112466 functionality is marked with THR in the margin, it will be available on all systems supporting  
 112467 the Threads option, but may not be available on some others.

#### 112468 **A.1.7.1 Codes**

112469 This section includes codes for options defined in XBD [Section 2.1.6](#) (on page 25), and the  
 112470 following additional codes for other purposes:

112471 **CX** This margin code is used to denote extensions beyond the ISO C standard. For  
 112472 interfaces that are duplicated between POSIX.1-200x and the ISO C standard, a CX  
 112473 introduction block describes the nature of the duplication, with any extensions  
 112474 appropriately CX marked and shaded.

112475 Where an interface is added to an ISO C standard header, within the header the  
 112476 interface has an appropriate margin marker and shading (for example, CX, XSI, TSE,  
 112477 and so on) and the same marking appears on the reference page in the SYNOPSIS  
 112478 section. This enables a programmer to easily identify that the interface is extending an

|        |    |                                                                                                                                                                                                                                                                                                                                 |
|--------|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 112479 |    | ISO C standard header.                                                                                                                                                                                                                                                                                                          |
| 112480 | MX | This margin code is used to denote IEC 60559:1989 standard floating-point extensions.                                                                                                                                                                                                                                           |
| 112481 | OB | This margin code is used to denote obsolescent behavior and thus flag a possible future applications portability warning.                                                                                                                                                                                                       |
| 112482 |    |                                                                                                                                                                                                                                                                                                                                 |
| 112483 | OH | The Single UNIX Specification has historically tried to reduce the number of headers an application has had to include when using a particular interface. Sometimes this was fewer than the base standard, and hence a notation is used to flag which headers are optional if you are using a system supporting the XSI option. |
| 112484 |    |                                                                                                                                                                                                                                                                                                                                 |
| 112485 |    |                                                                                                                                                                                                                                                                                                                                 |
| 112486 |    |                                                                                                                                                                                                                                                                                                                                 |

#### 112487 A.1.7.2 Margin Code Notation

112488 Since some features may depend on one or more options, or require more than one option, a  
 112489 notation is used. Where a feature requires support of a single option, a single margin code will  
 112490 occur in the margin. If it depends on two options and both are required, then the codes will  
 112491 appear with a <space> separator. If either of two options are required, then a logical OR is  
 112492 denoted using the ' | ' symbol. If more than two codes are used, a special notation is used.

## 112493 A.2 Conformance

112494 The terms “profile” and “profiling” are used throughout this section.

112495 A profile of a standard or standards is a codified set of option selections, such that by being  
 112496 conformant to a profile, particular classes of users are specifically supported.

### 112497 A.2.1 Implementation Conformance

112498 These definitions allow application developers to know what to depend on in an  
 112499 implementation.

112500 There is no definition of a “strictly conforming implementation”; that would be an  
 112501 implementation that provides *only* those facilities specified by POSIX.1 with no extensions  
 112502 whatsoever. This is because no actual operating system implementation can exist without  
 112503 system administration and initialization facilities that are beyond the scope of POSIX.1.

#### 112504 A.2.1.1 Requirements

112505 The word “support” is used in certain instances, rather than “provide”, in order to allow an  
 112506 implementation that has no resident software development facilities, but that supports the  
 112507 execution of a *Strictly Conforming POSIX.1 Application*, to be a *conforming implementation*.

#### 112508 A.2.1.2 Documentation

112509 The conformance documentation is required to use the same numbering scheme as POSIX.1 for  
 112510 purposes of cross-referencing. All options that an implementation chooses are reflected in  
 112511 <limits.h> and <unistd.h>.

112512 Note that the use of “may” in terms of where conformance documents record where  
 112513 implementations may vary, implies that it is not required to describe those features identified as  
 112514 undefined or unspecified.

112515 Other aspects of systems must be evaluated by purchasers for suitability. Many systems  
 112516 incorporate buffering facilities, maintaining updated data in volatile storage and transferring  
 112517 such updates to non-volatile storage asynchronously. Various exception conditions, such as a  
 112518 power failure or a system crash, can cause this data to be lost. The data may be associated with a

112519 file that is still open, with one that has been closed, with a directory, or with any other internal  
 112520 system data structures associated with permanent storage. This data can be lost, in whole or  
 112521 part, so that only careful inspection of file contents could determine that an update did not  
 112522 occur.

112523 Also, interrelated file activities, where multiple files and/or directories are updated, or where  
 112524 space is allocated or released in the file system structures, can leave inconsistencies in the  
 112525 relationship between data in the various files and directories, or in the file system itself. Such  
 112526 inconsistencies can break applications that expect updates to occur in a specific sequence, so that  
 112527 updates in one place correspond with related updates in another place.

112528 For example, if a user creates a file, places information in the file, and then records this action in  
 112529 another file, a system or power failure at this point followed by restart may result in a state in  
 112530 which the record of the action is permanently recorded, but the file created (or some of its  
 112531 information) has been lost. The consequences of this to the user may be undesirable. For a user  
 112532 on such a system, the only safe action may be to require the system administrator to have a  
 112533 policy that requires, after any system or power failure, that the entire file system must be  
 112534 restored from the most recent backup copy (causing all intervening work to be lost).

112535 The characteristics of each implementation will vary in this respect and may or may not meet  
 112536 the requirements of a given application or user. Enforcement of such requirements is beyond the  
 112537 scope of POSIX.1. It is up to the purchaser to determine what facilities are provided in an  
 112538 implementation that affect the exposure to possible data or sequence loss, and also what  
 112539 underlying implementation techniques and/or facilities are provided that reduce or limit such  
 112540 loss or its consequences.

#### 112541 A.2.1.3 POSIX Conformance

112542 This really means conformance to the base standard; however, since this document includes the  
 112543 core material of the Single UNIX Specification, the standard developers decided that it was  
 112544 appropriate to segment the conformance requirements into two, the former for the base  
 112545 standard, and the latter for the Single UNIX Specification (denoted XSI Conformance).

112546 Within POSIX.1 there are some symbolic constants that, if defined to a certain value or range of  
 112547 values, indicate that a certain option is enabled. Other symbolic constants exist in POSIX.1 for  
 112548 other reasons.

112549 In this version, some features that were previously optional have been made mandatory. For  
 112550 backwards compatibility, the symbolic constants associated with the option are still required  
 112551 now with fixed allowable ranges or values. The following options from the previous version of  
 112552 this standard are now mandatory:

112553     \_POSIX\_ASYNCHRONOUS\_IO  
 112554     \_POSIX\_BARRIERS  
 112555     \_POSIX\_CLOCK\_SELECTION  
 112556     \_POSIX\_MAPPED\_FILES  
 112557     \_POSIX\_MEMORY\_PROTECTION  
 112558     \_POSIX\_READER\_WRITER\_LOCKS  
 112559     \_POSIX\_REALTIME\_SIGNALS  
 112560     \_POSIX\_SEMAPHORES  
 112561     \_POSIX\_SPIN\_LOCKS  
 112562     \_POSIX\_THREAD\_SAFE\_FUNCTIONS  
 112563     \_POSIX\_THREADS  
 112564     \_POSIX\_TIMEOUTS  
 112565     \_POSIX\_TIMERS

112566 A POSIX-conformant system may support the XSI option required by the Single UNIX  
 112567 Specification. This was intentional since the standard developers intend them to be upwards-  
 112568 compatible, so that a system conforming to the Single UNIX Specification can also conform to  
 112569 the base standard at the same time.

#### 112570 A.2.1.4 XSI Conformance

112571 This section is included to describe the conformance requirements for the base volumes of the  
 112572 Single UNIX Specification.

112573 XSI conformance can be thought of as a profile, selecting certain options from POSIX.1-200x.

#### 112574 A.2.1.5 Option Groups

112575 The concept of “Option Groups” is included to allow collections of related functions or options  
 112576 to be grouped together. This has been used as follows: the “XSI Option Groups” have been  
 112577 created to allow super-options, collections of underlying options and related functions, to be  
 112578 collectively supported by XSI-conforming systems.

112579 The standard developers considered the matter of subprofiling and decided it was better to  
 112580 include an enabling mechanism rather than detailed normative requirements. A set of  
 112581 subprofiling options was developed and included later in this volume of POSIX.1-200x as an  
 112582 informative illustration.

#### 112583 Subprofiling Considerations

112584 The goal of not simultaneously fixing maximums and minimums was to allow implementations  
 112585 of the base standard or standards to support multiple profiles without conflict.

112586 The following summarizes the rules for the limit types:

| Limit Type       | Fixed Value                | Minimum Acceptable Value                   | Maximum Acceptable Value                   |
|------------------|----------------------------|--------------------------------------------|--------------------------------------------|
| Standard Profile | $X_p = X_s$<br>(No change) | $Y_p \geq Y_s$<br>(May increase the limit) | $Z_p \leq Z_s$<br>(May decrease the limit) |

112592 The intent is that ranges specified by limits in profiles be entirely contained within the  
 112593 corresponding ranges of the base standard or standards being profiled, and that the unlimited  
 112594 end of a range in a base standard must remain unlimited in any profile of that standard.

112595 Thus, the fixed `_POSIX_*` limits are constants and must not be changed by a profile. The variable  
 112596 counterparts (typically without the leading `_POSIX_`) can be changed but still remain  
 112597 semantically the same; that is, they still allow implementation values to vary as long as they  
 112598 meet the requirements for that value (be it a minimum or maximum).

112599 Where a profile does not provide a feature upon which a limit is based, the limit is not relevant.  
 112600 Applications written to that profile should be written to operate independently of the value of  
 112601 the limit.

112602 An example which has previously allowed implementations to support both the base standard  
 112603 and two other profiles in a compatible manner follows:

```
112604 Base standard (POSIX.1-1996): _POSIX_CHILD_MAX 6
112605 Base standard: CHILD_MAX minimum maximum _POSIX_CHILD_MAX
112606 FIPS profile/SUSv2 CHILD_MAX 25 (minimum maximum)
```

112607 Another example:

112608 Base standard (POSIX.1-1996): `_POSIX_NGROUPS_MAX` 0  
 112609 Base standard: `NGROUPS_MAX` minimum maximum `_POSIX_NGROUP_MAX`  
 112610 FIPS profile/SUSv2 `NGROUPS_MAX` 8

112611 A profile may lower a minimum maximum below the equivalent `_POSIX` value:

112612 Base standard: `_POSIX_foo_MAX` Z  
 112613 Base standard: `foo_MAX` `_POSIX_foo_MAX`  
 112614 profile standard : `foo_MAX` X (X can be less than, equal to,  
 112615 or greater than `_POSIX_foo_MAX`)

112616 In this case an implementation conforming to the profile may not conform to the base standard,  
 112617 but an implementation to the base standard will conform to the profile.

#### 112618 A.2.1.6 Options

112619 The final subsections within *Implementation Conformance* list the core options within  
 112620 POSIX.1-200x. This includes both options for the System Interfaces volume of POSIX.1-200x and  
 112621 the Shell and Utilities volume of POSIX.1-200x.

### 112622 A.2.2 Application Conformance

112623 These definitions guide users or adaptors of applications in determining on which  
 112624 implementations an application will run and how much adaptation would be required to make  
 112625 it run on others. These definitions are modeled after related ones in the ISO C standard.

112626 POSIX.1 occasionally uses the expressions “portable application” or “conforming application”.  
 112627 As they are used, these are synonyms for any of these terms. The differences between the classes  
 112628 of application conformance relate to the requirements for other standards, the options supported  
 112629 (such as the XSI option) or, in the case of the Conforming POSIX.1 Application Using Extensions,  
 112630 to implementation extensions. When one of the less explicit expressions is used, it should be  
 112631 apparent from the context of the discussion which of the more explicit names is appropriate

#### 112632 A.2.2.1 Strictly Conforming POSIX Application

112633 This definition is analogous to that of an ISO C standard “conforming program”.

112634 The major difference between a Strictly Conforming POSIX Application and an ISO C standard  
 112635 strictly conforming program is that the latter is not allowed to use features of POSIX that are not  
 112636 in the ISO C standard.

#### 112637 A.2.2.2 Conforming POSIX Application

112638 Examples of <National Bodies> include ANSI, BSI, and AFNOR.

#### 112639 A.2.2.3 Conforming POSIX Application Using Extensions

112640 Due to possible requirements for configuration or implementation characteristics in excess of the  
 112641 specifications in <limits.h> or related to the hardware (such as array size or file space), not  
 112642 every Conforming POSIX Application Using Extensions will run on every conforming  
 112643 implementation.

112644 A.2.2.4 *Strictly Conforming XSI Application*

112645 This is intended to be upwards-compatible with the definition of a Strictly Conforming POSIX  
112646 Application, with the addition of the facilities and functionality included in the XSI option.

112647 A.2.2.5 *Conforming XSI Application Using Extensions*

112648 Such applications may use extensions beyond the facilities defined by POSIX.1-200x including  
112649 the XSI option, but need to document the additional requirements.

112650 **A.2.3 Language-Dependent Services for the C Programming Language**

112651 POSIX.1 is, for historical reasons, both a specification of an operating system interface, shell and  
112652 utilities, and a C binding for that specification. Efforts had been previously undertaken to  
112653 generate a language-independent specification; however, that had failed, and the fact that the  
112654 ISO C standard is the *de facto* primary language on POSIX and the UNIX system makes this a  
112655 necessary and workable situation.

112656 **A.2.4 Other Language-Related Specifications**

112657 There is no additional rationale provided for this section.

112658 **A.3 Definitions**

112659 The definitions in this section are stated so that they can be used as exact substitutes for the  
112660 terms in text. They should not contain requirements or cross-references to sections within  
112661 POSIX.1-200x; that is accomplished by using an informative note. In addition, the term should  
112662 not be included in its own definition. Where requirements or descriptions need to be addressed  
112663 but cannot be included in the definitions, due to not meeting the above criteria, these occur in  
112664 the General Concepts chapter.

112665 In this version, the definitions have been reworked extensively to meet style requirements and to  
112666 include terms from the base documents (see the Scope).

112667 Many of these definitions are necessarily circular, and some of the terms (such as “process”) are  
112668 variants of basic computing science terms that are inherently hard to define. Where some  
112669 definitions are more conceptual and contain requirements, these appear in the General Concepts  
112670 chapter. Those listed in this section appear in an alphabetical glossary format of terms.

112671 Some definitions must allow extension to cover terms or facilities that are not explicitly  
112672 mentioned in POSIX.1-200x. For example, the definition of “Extended Security Controls”  
112673 permits implementations beyond those defined in POSIX.1-200x.

112674 Some terms in the following list of notes do not appear in POSIX.1-200x; these are marked  
112675 suffixed with an asterisk (\*). Many of them have been specifically excluded from POSIX.1-200x  
112676 because they concern system administration, implementation, or other issues that are not  
112677 specific to the programming interface. Those are marked with a reason, such as  
112678 “implementation-defined”.

112679 **Appropriate Privileges**

112680 One of the fundamental security problems with many historical UNIX systems has been that the  
 112681 privilege mechanism is monolithic—a user has either no privileges or *all* privileges. Thus, a  
 112682 successful “trojan horse” attack on a privileged process defeats all security provisions.  
 112683 Therefore, POSIX.1 allows more granular privilege mechanisms to be defined. For many  
 112684 historical implementations of the UNIX system, the presence of the term “appropriate  
 112685 privileges” in POSIX.1 may be understood as a synonym for “superuser” (UID 0). However,  
 112686 other systems have emerged where this is not the case and each discrete controllable action has  
 112687 *appropriate privileges* associated with it. Because this mechanism is implementation-defined, it  
 112688 must be described in the conformance document. Although that description affects several parts  
 112689 of POSIX.1 where the term “appropriate privilege” is used, because the term “implementation-  
 112690 defined” only appears here, the description of the entire mechanism and its effects on these  
 112691 other sections belongs in this equivalent section of the conformance document. This is especially  
 112692 convenient for implementations with a single mechanism that applies in all areas, since it only  
 112693 needs to be described once.

112694 **Base Character\***

112695 The term “Base Character” has been removed, as it was felt that the use of this term within +  
 112696 POSIX.1-200x was common usage English.

112697 **Byte**

112698 The restriction that a byte is now exactly eight bits was a conscious decision by the standard  
 112699 developers. It came about due to a combination of factors, primarily the use of the type **int8\_t**  
 112700 within the networking functions and the alignment with the ISO/IEC 9899:1999 standard,  
 112701 where the **intN\_t** types are now defined.

112702 According to the ISO/IEC 9899:1999 standard:

- 112703 • The **[u]intN\_t** types must be two’s complement with no padding bits and no illegal values.
- 112704 • All types (apart from bit fields, which are not relevant here) must occupy an integral  
 112705 number of bytes.
- 112706 • If a type with width  $W$  occupies  $B$  bytes with  $C$  bits per byte ( $C$  is the value of  
 112707  $\{\text{CHAR\_BIT}\}$ ), then it has  $P$  padding bits where  $P+W=B*C$ .
- 112708 • Therefore, for **int8\_t**  $P=0$ ,  $W=8$ . Since  $B \geq 1$ ,  $C \geq 8$ , the only solution is  $B=1$ ,  $C=8$ .

112709 The standard developers also felt that this was not an undue restriction for the current state-of-  
 112710 the-art for this version of the standard, but recognize that if industry trends continue, a wider  
 112711 character type may be required in the future.

112712 **Character**

112713 The term “character” is used to mean a sequence of one or more bytes representing a single  
 112714 graphic symbol. The deviation in the exact text of the ISO C standard definition for “byte” meets  
 112715 the intent of the rationale of the ISO C standard also clears up the ambiguity raised by the term  
 112716 “basic execution character set”. The octet-minimum requirement is a reflection of the  
 112717  $\{\text{CHAR\_BIT}\}$  value.

- 112718 **Child Process**
- 112719 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/3 is applied, adding the *vfork()* function  
112720 to those listed.
- 112721 **Clock Tick**
- 112722 The ISO C standard defines a similar interval for use by the *clock()* function. There is no  
112723 requirement that these intervals be the same. In historical implementations these intervals are  
112724 different.
- 112725 **Command**
- 112726 The terms “command” and “utility” are related but have distinct meanings. Command is  
112727 defined as “a directive to a shell to perform a specific task”. The directive can be in the form of a  
112728 single utility name (for example, *ls*), or the directive can take the form of a compound command  
112729 (for example, “*ls | grep name | pr*”). A utility is a program that can be called by name  
112730 from a shell. Issuing only the name of the utility to a shell is the equivalent of a one-word  
112731 command. A utility may be invoked as a separate program that executes in a different process  
112732 than the command language interpreter, or it may be implemented as a part of the command  
112733 language interpreter. For example, the *echo* command (the directive to perform a specific task)  
112734 may be implemented such that the *echo* utility (the logic that performs the task of echoing) is in a  
112735 separate program; therefore, it is executed in a process that is different from the command  
112736 language interpreter. Conversely, the logic that performs the *echo* utility could be built into the  
112737 command language interpreter; therefore, it could execute in the same process as the command  
112738 language interpreter.
- 112739 The terms “tool” and “application” can be thought of as being synonymous with “utility” from  
112740 the perspective of the operating system kernel. Tools, applications, and utilities historically have  
112741 run, typically, in processes above the kernel level. Tools and utilities historically have been a part  
112742 of the operating system non-kernel code and have performed system-related functions, such as  
112743 listing directory contents, checking file systems, repairing file systems, or extracting system  
112744 status information. Applications have not generally been a part of the operating system, and  
112745 they perform non-system-related functions, such as word processing, architectural design,  
112746 mechanical design, workstation publishing, or financial analysis. Utilities have most frequently  
112747 been provided by the operating system distributor, applications by third-party software  
112748 distributors, or by the users themselves. Nevertheless, POSIX.1-200x does not differentiate  
112749 between tools, utilities, and applications when it comes to receiving services from the system, a  
112750 shell, or the standard utilities. (For example, the *xargs* utility invokes another utility; it would be  
112751 of fairly limited usefulness if the users could not run their own applications in place of the  
112752 standard utilities.) Utilities are not applications in the sense that they are not themselves subject  
112753 to the restrictions of POSIX.1-200x or any other standard—there is no requirement for *grep*, *stty*,  
112754 or any of the utilities defined here to be any of the classes of conforming applications.
- 112755 **Column Positions**
- 112756 In most 1-byte character sets, such as ASCII, the concept of column positions is identical to  
112757 character positions and to bytes. Therefore, it has been historically acceptable for some  
112758 implementations to describe line folding or tab stops or table column alignment in terms of  
112759 bytes or character positions. Other character sets pose complications, as they can have internal  
112760 representations longer than one octet and they can have display characters that have different  
112761 widths on the terminal screen or printer.
- 112762 In POSIX.1-200x the term “column positions” has been defined to mean character—not byte—  
112763 positions in input files (such as “column position 7 of the FORTRAN input”). Output files  
112764 describe the column position in terms of the display width of the narrowest printable character

112765 in the character set, adjusted to fit the characteristics of the output device. It is very possible that  
 112766  $n$  column positions will not be able to hold  $n$  characters in some character sets, unless all of those  
 112767 characters are of the narrowest width. It is assumed that the implementation is aware of the  
 112768 width of the various characters, deriving this information from the value of *LC\_CTYPE*, and  
 112769 thus can determine how many column positions to allot for each character in those utilities  
 112770 where it is important.

112771 The term “column position” was used instead of the more natural “column” because the latter is  
 112772 frequently used in the different contexts of columns of figures, columns of table values, and so  
 112773 on. Wherever confusion might result, these latter types of columns are referred to as “text  
 112774 columns”.

### 112775 **Controlling Terminal**

112776 The question of which of possibly several special files referring to the terminal is meant is not  
 112777 addressed in POSIX.1. The filename */dev/tty* is a synonym for the controlling terminal associated  
 112778 with a process.

### 112779 **Device Number\***

112780 The concept is handled in *stat()* as *ID of device*.

### 112781 **Direct I/O**

112782 Historically, direct I/O refers to the system bypassing intermediate buffering, but may be  
 112783 extended to cover implementation-defined optimizations.

### 112784 **Directory**

112785 The format of the directory file is implementation-defined and differs radically between  
 112786 System V and 4.3 BSD. However, routines (derived from 4.3 BSD) for accessing directories and  
 112787 certain constraints on the format of the information returned by those routines are described in  
 112788 the *<dirent.h>* header.

### 112789 **Directory Entry**

112790 Throughout POSIX.1-200x, the term “link” is used (about the *link()* function, for example) in  
 112791 describing the objects that point to files from directories.

### 112792 **Display**

112793 The Shell and Utilities volume of POSIX.1-200x assigns precise requirements for the terms  
 112794 “display” and “write”. Some historical systems have chosen to implement certain utilities  
 112795 without using the traditional file descriptor model. For example, the *vi* editor might employ  
 112796 direct screen memory updates on a personal computer, rather than a *write()* system call. An  
 112797 instance of user prompting might appear in a dialog box, rather than with standard error. When  
 112798 the Shell and Utilities volume of POSIX.1-200x uses the term “display”, the method of  
 112799 outputting to the terminal is unspecified; many historical implementations use *termcap* or  
 112800 *terminfo*, but this is not a requirement. The term “write” is used when the Shell and Utilities  
 112801 volume of POSIX.1-200x mandates that a file descriptor be used and that the output can be  
 112802 redirected. However, it is assumed that when the writing is directly to the terminal (it has not  
 112803 been redirected elsewhere), there is no practical way for a user or test suite to determine whether  
 112804 a file descriptor is being used. Therefore, the use of a file descriptor is mandated only for the  
 112805 redirection case and the implementation is free to use any method when the output is not  
 112806 redirected. The verb *write* is used almost exclusively, with the very few exceptions of those  
 112807 utilities where output redirection need not be supported: *tabs*, *talk*, *tput*, and *vi*.

- 112808           **Dot**
- 112809           The symbolic name *dot* is carefully used in POSIX.1 to distinguish the working directory  
112810           filename from a period or a decimal point.
- 112811           **Dot-Dot**
- 112812           Historical implementations permit the use of these filenames without their special meanings.  
112813           Such use precludes any meaningful use of these filenames by a Conforming POSIX.1  
112814           Application. Therefore, such use is considered an extension, the use of which makes an  
112815           implementation non-conforming; see also [Section A.4.12](#) (on page 3350).
- 112816           **Epoch**
- 112817           Historically, the origin of UNIX system time was referred to as “00:00:00 GMT, January 1, 1970”.  
112818           Greenwich Mean Time is actually not a term acknowledged by the international standards  
112819           community; therefore, this term, “Epoch”, is used to abbreviate the reference to the actual  
112820           standard, Coordinated Universal Time.
- 112821           **FIFO Special File**
- 112822           See [Pipe](#) (on page 3334).
- 112823           **File**
- 112824           It is permissible for an implementation-defined file type to be non-readable or non-writable.
- 112825           **File Classes**
- 112826           These classes correspond to the historical sets of permission bits. The classes are general to  
112827           allow implementations flexibility in expanding the access mechanism for more stringent security  
112828           environments. Note that a process is in one and only one class, so there is no ambiguity.
- 112829           **Filename**
- 112830           At the present time, the primary responsibility for truncating filenames containing multi-byte  
112831           characters must reside with the application. Some industry groups involved in  
112832           internationalization believe that in the future the responsibility must reside with the kernel. For  
112833           the moment, a clearer understanding of the implications of making the kernel responsible for  
112834           truncation of multi-byte filenames is needed.
- 112835           Character-level truncation was not adopted because there is no support in POSIX.1 that advises  
112836           how the kernel distinguishes between single and multi-byte characters. Until that time, it must  
112837           be incumbent upon application developers to determine where multi-byte characters must be  
112838           truncated.
- 112839           **File System**
- 112840           Historically, the meaning of this term has been overloaded with two meanings: that of the  
112841           complete file hierarchy, and that of a mountable subset of that hierarchy; that is, a mounted file  
112842           system. POSIX.1 uses the term “file system” in the second sense, except that it is limited to the  
112843           scope of a process (and root directory of a process). This usage also clarifies the domain in which  
112844           a file serial number is unique.

- 112845           **Graphic Character**
- 112846           This definition is made available for those definitions (in particular, *TZ*) which must exclude  
112847           control characters.
- 112848           **Group Database**
- 112849           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/4 is applied, removing the words “of  
112850           implementation-defined format”. See [User Database](#) (on page 3344).
- 112851           **Group File\***
- 112852           Implementation-defined; see [User Database](#) (on page 3344).
- 112853           **Historical Implementations\***
- 112854           This refers to previously existing implementations of programming interfaces and operating  
112855           systems that are related to the interface specified by POSIX.1.
- 112856           **Hosted Implementation\***
- 112857           This refers to a POSIX.1 implementation that is accomplished through interfaces from the  
112858           POSIX.1 services to some alternate form of operating system kernel services. Note that the line  
112859           between a hosted implementation and a native implementation is blurred, since most  
112860           implementations will provide some services directly from the kernel and others through some  
112861           indirect path. (For example, *fopen()* might use *open()*; or *mkfifo()* might use *mknod()*.) There is  
112862           no necessary relationship between the type of implementation and its correctness, performance,  
112863           and/or reliability.
- 112864           **Implementation\***
- 112865           This term is generally used instead of its synonym, “system”, to emphasize the consequences of  
112866           decisions to be made by system implementors. Perhaps if no options or extensions to POSIX.1  
112867           were allowed, this usage would not have occurred.
- 112868           The term “specific implementation” is sometimes used as a synonym for “implementation”.  
112869           This should not be interpreted too narrowly; both terms can represent a relatively broad group  
112870           of systems. For example, a hardware vendor could market a very wide selection of systems that  
112871           all used the same instruction set, with some systems desktop models and others large multi-user  
112872           minicomputers. This wide range would probably share a common POSIX.1 operating system,  
112873           allowing an application compiled for one to be used on any of the others; this is a [*specific*]  
112874           *implementation*. However, such a wide range of machines probably has some differences  
112875           between the models. Some may have different clock rates, different file systems, different  
112876           resource limits, different network connections, and so on, depending on their sizes or intended  
112877           usages. Even on two identical machines, the system administrators may configure them  
112878           differently. Each of these different systems is known by the term “a specific instance of a specific  
112879           implementation”. This term is only used in the portions of POSIX.1 dealing with runtime  
112880           queries: *sysconf()* and *pathconf()*.

112881 **Incomplete Pathname\***

112882 Absolute pathname has been adequately defined.

112883 **Job Control**112884 In order to understand the job control facilities in POSIX.1 it is useful to understand how they  
112885 are used by a job control-cognizant shell to create the user interface effect of job control.112886 While the job control facilities supplied by POSIX.1 can, in theory, support different types of  
112887 interactive job control interfaces supplied by different types of shells, there was historically one  
112888 particular interface that was most common when the standard was originally developed  
112889 (provided by BSD C Shell).112890 This discussion describes that interface as a means of illustrating how the POSIX.1 job control  
112891 facilities can be used.112892 Job control allows users to selectively stop (suspend) the execution of processes and continue  
112893 (resume) their execution at a later point. The user typically employs this facility via the  
112894 interactive interface jointly supplied by the terminal I/O driver and a command interpreter  
112895 (shell).112896 The user can launch jobs (command pipelines) in either the foreground or background. When  
112897 launched in the foreground, the shell waits for the job to complete before prompting for  
112898 additional commands. When launched in the background, the shell does not wait, but  
112899 immediately prompts for new commands.112900 If the user launches a job in the foreground and subsequently regrets this, the user can type the  
112901 suspend character (typically set to <control>-Z), which causes the foreground job to stop and the  
112902 shell to begin prompting for new commands. The stopped job can be continued by the user (via  
112903 special shell commands) either as a foreground job or as a background job. Background jobs can  
112904 also be moved into the foreground via shell commands.112905 If a background job attempts to access the login terminal (controlling terminal), it is stopped by  
112906 the terminal driver and the shell is notified, which, in turn, notifies the user. (Terminal access  
112907 includes *read()* and certain terminal control functions, and conditionally includes *write()*.) The  
112908 user can continue the stopped job in the foreground, thus allowing the terminal access to  
112909 succeed in an orderly fashion. After the terminal access succeeds, the user can optionally move  
112910 the job into the background via the suspend character and shell commands.112911 *Implementing Job Control Shells*112912 The interactive interface described previously can be accomplished using the POSIX.1 job  
112913 control facilities in the following way.112914 The key feature necessary to provide job control is a way to group processes into jobs. This  
112915 grouping is necessary in order to direct signals to a single job and also to identify which job is in  
112916 the foreground. (There is at most one job that is in the foreground on any controlling terminal at  
112917 a time.)112918 The concept of process groups is used to provide this grouping. The shell places each job in a  
112919 separate process group via the *setpgid()* function. To do this, the *setpgid()* function is invoked by  
112920 the shell for each process in the job. It is actually useful to invoke *setpgid()* twice for each  
112921 process: once in the child process, after calling *fork()* to create the process, but before calling one  
112922 of the *exec* family of functions to begin execution of the program, and once in the parent shell  
112923 process, after calling *fork()* to create the child. The redundant invocation avoids a race condition  
112924 by ensuring that the child process is placed into the new process group before either the parent  
112925 or the child relies on this being the case. The process group ID for the job is selected by the shell  
112926 to be equal to the process ID of one of the processes in the job. Some shells choose to make one

112927 process in the job be the parent of the other processes in the job (if any). Other shells (for  
 112928 example, the C Shell) choose to make themselves the parent of all processes in the pipeline (job).  
 112929 In order to support this latter case, the *setpgid()* function accepts a process group ID parameter  
 112930 since the correct process group ID cannot be inherited from the shell. The shell itself is  
 112931 considered to be a job and is the sole process in its own process group.

112932 The shell also controls which job is currently in the foreground. A foreground and background  
 112933 job differ in two ways: the shell waits for a foreground command to complete (or stop) before  
 112934 continuing to read new commands, and the terminal I/O driver inhibits terminal access by  
 112935 background jobs (causing the processes to stop). Thus, the shell must work cooperatively with  
 112936 the terminal I/O driver and have a common understanding of which job is currently in the  
 112937 foreground. It is the user who decides which command should be currently in the foreground,  
 112938 and the user informs the shell via shell commands. The shell, in turn, informs the terminal I/O  
 112939 driver via the *tcsetpgrp()* function. This indicates to the terminal I/O driver the process group ID  
 112940 of the foreground process group (job). When the current foreground job either stops or  
 112941 terminates, the shell places itself in the foreground via *tcsetpgrp()* before prompting for  
 112942 additional commands. Note that when a job is created the new process group begins as a  
 112943 background process group. It requires an explicit act of the shell via *tcsetpgrp()* to move a  
 112944 process group (job) into the foreground.

112945 When a process in a job stops or terminates, its parent (for example, the shell) receives  
 112946 synchronous notification by calling the *waitpid()* function with the WUNTRACED flag set.  
 112947 Asynchronous notification is also provided when the parent establishes a signal handler for  
 112948 SIGCHLD and does not specify the SA\_NOCLDSTOP flag. Usually all processes in a job stop as  
 112949 a unit since the terminal I/O driver always sends job control stop signals to all processes in the  
 112950 process group.

112951 To continue a stopped job, the shell sends the SIGCONT signal to the process group of the job. In  
 112952 addition, if the job is being continued in the foreground, the shell invokes *tcsetpgrp()* to place the  
 112953 job in the foreground before sending SIGCONT. Otherwise, the shell leaves itself in the  
 112954 foreground and reads additional commands.

112955 There is additional flexibility in the POSIX.1 job control facilities that allows deviations from the  
 112956 typical interface. Clearing the TOSTOP terminal flag allows background jobs to perform *write()*  
 112957 functions without stopping. The same effect can be achieved on a per-process basis by having a  
 112958 process set the signal action for SIGTTOU to SIG\_IGN.

112959 Note that the terms “job” and “process group” can be used interchangeably. A login session that  
 112960 is not using the job control facilities can be thought of as a large collection of processes that are  
 112961 all in the same job (process group). Such a login session may have a partial distinction between  
 112962 foreground and background processes; that is, the shell may choose to wait for some processes  
 112963 before continuing to read new commands and may not wait for other processes. However, the  
 112964 terminal I/O driver will consider all these processes to be in the foreground since they are all  
 112965 members of the same process group.

112966 In addition to the basic job control operations already mentioned, a job control-cognizant shell  
 112967 needs to perform the following actions.

112968 When a foreground (not background) job stops, the shell must sample and remember the current  
 112969 terminal settings so that it can restore them later when it continues the stopped job in the  
 112970 foreground (via the *tcgetattr()* and *tcsetattr()* functions).

112971 Because a shell itself can be spawned from a shell, it must take special action to ensure that  
 112972 subshells interact well with their parent shells.

112973 A subshell can be spawned to perform an interactive function (prompting the terminal for  
 112974 commands) or a non-interactive function (reading commands from a file). When operating non-

112975 interactively, the job control shell will refrain from performing the job control-specific actions  
 112976 described above. It will behave as a shell that does not support job control. For example, all jobs  
 112977 will be left in the same process group as the shell, which itself remains in the process group  
 112978 established for it by its parent. This allows the shell and its children to be treated as a single job  
 112979 by a parent shell, and they can be affected as a unit by terminal keyboard signals.

112980 An interactive subshell can be spawned from another job control-cognizant shell in either the  
 112981 foreground or background. (For example, from the C Shell, the user can execute the command,  
 112982 `csch &`.) Before the subshell activates job control by calling `setpgid()` to place itself in its own  
 112983 process group and `tcsetgrp()` to place its new process group in the foreground, it needs to  
 112984 ensure that it has already been placed in the foreground by its parent. (Otherwise, there could  
 112985 be multiple job control shells that simultaneously attempt to control mediation of the terminal.)  
 112986 To determine this, the shell retrieves its own process group via `getpgrp()` and the process group  
 112987 of the current foreground job via `tcgetpgrp()`. If these are not equal, the shell sends SIGTTIN to  
 112988 its own process group, causing itself to stop. When continued later by its parent, the shell  
 112989 repeats the process group check. When the process groups finally match, the shell is in the  
 112990 foreground and it can proceed to take control. After this point, the shell ignores all the job  
 112991 control stop signals so that it does not inadvertently stop itself.

#### 112992 *Implementing Job Control Applications*

112993 Most applications do not need to be aware of job control signals and operations; the intuitively  
 112994 correct behavior happens by default. However, sometimes an application can inadvertently  
 112995 interfere with normal job control processing, or an application may choose to overtly effect job  
 112996 control in cooperation with normal shell procedures.

112997 An application can inadvertently subvert job control processing by “blindly” altering the  
 112998 handling of signals. A common application error is to learn how many signals the system  
 112999 supports and to ignore or catch them all. Such an application makes the assumption that it does  
 113000 not know what this signal is, but knows the right handling action for it. The system may  
 113001 initialize the handling of job control stop signals so that they are being ignored. This allows  
 113002 shells that do not support job control to inherit and propagate these settings and hence to be  
 113003 immune to stop signals. A job control shell will set the handling to the default action and  
 113004 propagate this, allowing processes to stop. In doing so, the job control shell is taking  
 113005 responsibility for restarting the stopped applications. If an application wishes to catch the stop  
 113006 signals itself, it should first determine their inherited handling states. If a stop signal is being  
 113007 ignored, the application should continue to ignore it. This is directly analogous to the  
 113008 recommended handling of SIGINT described in the referenced UNIX Programmer’s Manual.

113009 If an application is reading the terminal and has disabled the interpretation of special characters  
 113010 (by clearing the ISIG flag), the terminal I/O driver will not send SIGTSTP when the suspend  
 113011 character is typed. Such an application can simulate the effect of the suspend character by  
 113012 recognizing it and sending SIGTSTP to its process group as the terminal driver would have  
 113013 done. Note that the signal is sent to the process group, not just to the application itself; this  
 113014 ensures that other processes in the job also stop. (Note also that other processes in the job could  
 113015 be children, siblings, or even ancestors.) Applications should not assume that the suspend  
 113016 character is `<control>-Z` (or any particular value); they should retrieve the current setting at  
 113017 startup.

113018 *Implementing Job Control Systems*

113019 The intent in adding 4.2 BSD-style job control functionality was to adopt the necessary 4.2 BSD  
 113020 programmatic interface with only minimal changes to resolve syntactic or semantic conflicts  
 113021 with System V or to close recognized security holes. The goal was to maximize the ease of  
 113022 providing both conforming implementations and Conforming POSIX.1 Applications.

113023 It is only useful for a process to be affected by job control signals if it is the descendant of a job  
 113024 control shell. Otherwise, there will be nothing that continues the stopped process.

113025 POSIX.1 does not specify how controlling terminal access is affected by a user logging out (that  
 113026 is, by a controlling process terminating). 4.2 BSD uses the *vhangup()* function to prevent any  
 113027 access to the controlling terminal through file descriptors opened prior to logout. System V does  
 113028 not prevent controlling terminal access through file descriptors opened prior to logout (except  
 113029 for the case of the special file, */dev/tty*). Some implementations choose to make processes  
 113030 immune from job control after logout (that is, such processes are always treated as if in the  
 113031 foreground); other implementations continue to enforce foreground/background checks after  
 113032 logout. Therefore, a Conforming POSIX.1 Application should not attempt to access the  
 113033 controlling terminal after logout since such access is unreliable. If an implementation chooses to  
 113034 deny access to a controlling terminal after its controlling process exits, POSIX.1 requires a certain  
 113035 type of behavior (see [Controlling Terminal](#), on page 3326).

113036 **Kernel\***

113037 See [System Call\\*](#) (on page 3342).

113038 **Library Routine\***

113039 See [System Call\\*](#) (on page 3342).

113040 **Logical Device\***

113041 Implementation-defined.

113042 **Map**

113043 The definition of map is included to clarify the usage of mapped pages in the description of the  
 113044 behavior of process memory locking.

113045 **Memory-Resident**

113046 The term “memory-resident” is historically understood to mean that the so-called resident pages  
 113047 are actually present in the physical memory of the computer system and are immune from  
 113048 swapping, paging, copy-on-write faults, and so on. This is the actual intent of POSIX.1-200x  
 113049 in the process memory locking section for implementations where this is logical. But for some  
 113050 implementations—primarily mainframes—actually locking pages into primary storage is not  
 113051 advantageous to other system objectives, such as maximizing throughput. For such  
 113052 implementations, memory locking is a “hint” to the implementation that the application wishes  
 113053 to avoid situations that would cause long latencies in accessing memory. Furthermore, there are  
 113054 other implementation-defined issues with minimizing memory access latencies that “memory  
 113055 residency” does not address—such as MMU reload faults. The definition attempts to  
 113056 accommodate various implementations while allowing conforming applications to specify to the  
 113057 implementation that they want or need the best memory access times that the implementation  
 113058 can provide.

113059 **Memory Object\***

113060 The term “memory object” usually implies shared memory. If the object is the same as a  
 113061 filename in the file system name space of the implementation, it is expected that the data written  
 113062 into the memory object be preserved on disk. A memory object may also apply to a physical  
 113063 device on an implementation. In this case, writes to the memory object are sent to the controller  
 113064 for the device and reads result in control registers being returned.

113065 **Mount Point\***

113066 The directory on which a “mounted file system” is mounted. This term, like *mount()* and  
 113067 *umount()*, was not included because it was implementation-defined.

113068 **Mounted File System\***

113069 See [File System](#) (on page 3327).

113070 **Name**

113071 There are no explicit limits in POSIX.1-200x on the sizes of names, words (see the definition of  
 113072 word in the Base Definitions volume of POSIX.1-200x), lines, or other objects. However, other  
 113073 implicit limits do apply: shell script lines produced by many of the standard utilities cannot  
 113074 exceed {LINE\_MAX} and the sum of exported variables comes under the {ARG\_MAX} limit.  
 113075 Historical shells dynamically allocate memory for names and words and parse incoming lines a  
 113076 character at a time. Lines cannot have an arbitrary {LINE\_MAX} limit because of historical  
 113077 practice, such as *makefiles*, where *make* removes the <newline>s associated with the commands  
 113078 for a target and presents the shell with one very long line. The text on INPUT FILES in XCU  
 113079 [Section 1.4](#) (on page 2235) does allow a shell to run out of memory, but it cannot have arbitrary  
 113080 programming limits.

113081 **Native Implementation\***

113082 This refers to an implementation of POSIX.1 that interfaces directly to an operating system  
 113083 kernel; see also *hosted implementation*. A similar concept is a native UNIX system, which would  
 113084 be a kernel derived from one of the original UNIX system products.

113085 **Nice Value**

113086 This definition is not intended to suggest that all processes in a system have priorities that are  
 113087 comparable. Scheduling policy extensions, such as adding realtime priorities, make the notion of  
 113088 a single underlying priority for all scheduling policies problematic. Some implementations may  
 113089 implement the features related to *nice* to affect all processes on the system, others to affect just  
 113090 the general time-sharing activities implied by POSIX.1-200x, and others may have no effect at all.  
 113091 Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of  
 113092 implementation strategies is possible.

113093 **Open File Description**

113094 An “open file description”, as it is currently named, describes how a file is being accessed. What  
 113095 is currently called a “file descriptor” is actually just an identifier or “handle”; it does not  
 113096 actually describe anything.

113097 The following alternate names were discussed:

- 113098 • For “open file description”:
- 113099 “open instance”, “file access description”, “open file information”, and “file access  
 113100 information”.

- 113101           • For “file descriptor”:  
 113102           “file handle”, “file number” (cf., *fileno()*). Some historical implementations use the term  
 113103           “file table entry”.

#### 113104           **Orphaned Process Group**

113105           Historical implementations have a concept of an orphaned process, which is a process whose  
 113106           parent process has exited. When job control is in use, it is necessary to prevent processes from  
 113107           being stopped in response to interactions with the terminal after they no longer are controlled by  
 113108           a job control-cognizant program. Because signals generated by the terminal are sent to a process  
 113109           group and not to individual processes, and because a signal may be provoked by a process that  
 113110           is not orphaned, but sent to another process that is orphaned, it is necessary to define an  
 113111           orphaned process group. The definition assumes that a process group will be manipulated as a  
 113112           group and that the job control-cognizant process controlling the group is outside of the group  
 113113           and is the parent of at least one process in the group (so that state changes may be reported via  
 113114           *waitpid()*). Therefore, a group is considered to be controlled as long as at least one process in the  
 113115           group has a parent that is outside of the process group, but within the session.

113116           This definition of orphaned process groups ensures that a session leader’s process group is  
 113117           always considered to be orphaned, and thus it is prevented from stopping in response to  
 113118           terminal signals.

#### 113119           **Page**

113120           The term “page” is defined to support the description of the behavior of memory mapping for  
 113121           shared memory and memory mapped files, and the description of the behavior of process  
 113122           memory locking. It is not intended to imply that shared memory/file mapping and memory  
 113123           locking are applicable only to “paged” architectures. For the purposes of POSIX.1-200x,  
 113124           whatever the granularity on which an architecture supports mapping or locking, this is  
 113125           considered to be a “page”. If an architecture cannot support the memory mapping or locking  
 113126           functions specified by POSIX.1-200x on any granularity, then these options will not be  
 113127           implemented on the architecture.

#### 113128           **Passwd File\***

113129           Implementation-defined; see [User Database](#) (on page 3344).

#### 113130           **Parent Directory**

113131           There may be more than one directory entry pointing to a given directory in some  
 113132           implementations. The wording here identifies that exactly one of those is the parent directory. In  
 113133           pathname resolution, dot-dot is identified as the way that the unique directory is identified.  
 113134           (That is, the parent directory is the one to which dot-dot points.) In the case of a remote file  
 113135           system, if the same file system is mounted several times, it would appear as if they were distinct  
 113136           file systems (with interesting synchronization properties).

#### 113137           **Pipe**

113138           It proved convenient to define a pipe as a special case of a FIFO, even though historically the  
 113139           latter was not introduced until System III and does not exist at all in 4.3 BSD.

113140 **Portable Filename Character Set**

113141 The encoding of this character set is not specified—specifically, ASCII is not required. But the  
 113142 implementation must provide a unique character code for each of the printable graphics  
 113143 specified by POSIX.1; see also [Section A.4.6](#) (on page 3346).

113144 Situations where characters beyond the portable filename character set (or historically ASCII or  
 113145 the ISO/IEC 646:1991 standard) would be used (in a context where the portable filename  
 113146 character set or the ISO/IEC 646:1991 standard is required by POSIX.1) are expected to be  
 113147 common. Although such a situation renders the use technically non-compliant, mutual  
 113148 agreement among the users of an extended character set will make such use portable between  
 113149 those users. Such a mutual agreement could be formalized as an optional extension to POSIX.1.  
 113150 (Making it required would eliminate too many possible systems, as even those systems using the  
 113151 ISO/IEC 646:1991 standard as a base character set extend their character sets for Western  
 113152 Europe and the rest of the world in different ways.)

113153 Nothing in POSIX.1 is intended to preclude the use of extended characters where interchange is  
 113154 not required or where mutual agreement is obtained. It has been suggested that in several places  
 113155 “should” be used instead of “shall”. Because (in the worst case) use of any character beyond the  
 113156 portable filename character set would render the program or data not portable to all possible  
 113157 systems, no extensions are permitted in this context.

113158 **Process Lifetime**

113159 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/5 is applied, adding *fork()*, *posix\_spawn()*,  
 113160 *posix\_spawnp()*, and *vfork()* to the list of functions.

113161 **Process Termination**

113162 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/6 is applied, rewording the definition to  
 113163 address the “passive exit” on termination of the last thread or the *\_Exit()* function.

113164 **Regular File**

113165 POSIX.1 does not intend to preclude the addition of structuring data (for example, record  
 113166 lengths) in the file, as long as such data is not visible to an application that uses the features  
 113167 described in POSIX.1.

113168 **Root Directory**

113169 This definition permits the operation of *chroot()*, even though that function is not in POSIX.1; see  
 113170 also [Section A.4.5](#) (on page 3346).

113171 **Root File System\***

113172 Implementation-defined.

113173 **Root of a File System\***

113174 Implementation-defined; see [Mount Point\\*](#) (on page 3333).

113175 **Signal**

113176 The definition implies a double meaning for the term. Although a signal is an event, common  
113177 usage implies that a signal is an identifier of the class of event.

113178 **Superuser\***

113179 This concept, with great historical significance to UNIX system users, has been replaced with the  
113180 notion of appropriate privileges.

113181 **Supplementary Group ID**

113182 The POSIX.1-1990 standard is inconsistent in its treatment of supplementary groups. The  
113183 definition of supplementary group ID explicitly permits the effective group ID to be included in  
113184 the set, but wording in the description of the *setuid()* and *setgid()* functions states: “Any  
113185 supplementary group IDs of the calling process remain unchanged by these function calls”. In  
113186 the case of *setgid()* this contradicts that definition. In addition, some felt that the unspecified  
113187 behavior in the definition of supplementary group IDs adds unnecessary portability problems.  
113188 The standard developers considered several solutions to this problem:

- 113189 1. Reword the description of *setgid()* to permit it to change the supplementary group IDs to  
113190 reflect the new effective group ID. A problem with this is that it adds more “may”s to the  
113191 wording and does not address the portability problems of this optional behavior.
- 113192 2. Mandate the inclusion of the effective group ID in the supplementary set (giving  
113193 {NGROUPS\_MAX} a minimum value of 1). This is the behavior of 4.4 BSD. In that  
113194 system, the effective group ID is the first element of the array of supplementary group  
113195 IDs (there is no separate copy stored, and changes to the effective group ID are made only  
113196 in the supplementary group set). By convention, the initial value of the effective group ID  
113197 is duplicated elsewhere in the array so that the initial value is not lost when executing a  
113198 set-group-ID program.
- 113199 3. Change the definition of supplementary group ID to exclude the effective group ID and  
113200 specify that the effective group ID does not change the set of supplementary group IDs.  
113201 This is the behavior of 4.2 BSD, 4.3 BSD, and System V Release 4.
- 113202 4. Change the definition of supplementary group ID to exclude the effective group ID, and  
113203 require that *getgroups()* return the union of the effective group ID and the supplementary  
113204 group IDs.
- 113205 5. Change the definition of {NGROUPS\_MAX} to be one more than the number of  
113206 supplementary group IDs, so it continues to be the number of values returned by  
113207 *getgroups()* and existing applications continue to work. This alternative is effectively the  
113208 same as the second (and might actually have the same implementation).

113209 The standard developers decided to permit either 2 or 3. The effective group ID is orthogonal to  
113210 the set of supplementary group IDs, and it is implementation-defined whether *getgroups()*  
113211 returns this. If the effective group ID is returned with the set of supplementary group IDs, then  
113212 all changes to the effective group ID affect the supplementary group set returned by *getgroups()*.  
113213 It is permissible to eliminate duplicates from the list returned by *getgroups()*. However, if a  
113214 group ID is contained in the set of supplementary group IDs, setting the group ID to that value  
113215 and then to a different value should not remove that value from the supplementary group IDs.

113216 The definition of supplementary group IDs has been changed to not include the effective group  
113217 ID. This simplifies permanent rationale and makes the relevant functions easier to understand.  
113218 The *getgroups()* function has been modified so that it can, on an implementation-defined basis,  
113219 return the effective group ID. By making this change, functions that modify the effective group  
113220 ID do not need to discuss adding to the supplementary group list; the only view into the

113221 supplementary group list that the application developer has is through the *getgroups()* function. |

### 113222 **Symbolic Constant**

113223 Earlier versions of this standard used a variety of terms other than “macro” for many of the +  
 113224 constants defined in headers, and it was not clear in which of these cases they were required to +  
 113225 be macros or not, or to be pre-processor constants (i.e., usable in **#if**) or not. In cases where the +  
 113226 symbols had a reserved prefix or suffix, there was often inconsistency between whether the +  
 113227 prefix/suffix was reserved only for macros or for any use, and whether the term “macro” or a +  
 113228 different term was used in the descriptions of the symbols. There were also some unintentional +  
 113229 differences from the ISO C standard. +

113230 One of the most commonly used terms was “symbolic constant”. This has now been designated +  
 113231 as the default term to be used wherever appropriate, and a formal definition of the term has +  
 113232 been added giving the exact requirements for symbols that are described as symbolic constants. +

113233 The standard developers have performed a major rationalization of the header descriptions of +  
 113234 symbols with constant values according to the following policy: +

- 113235 • Where symbols are from the ISO C standard, the wording from the ISO C standard (or +  
 113236 equivalent, in cases where the exact wording is not appropriate) is used to describe them. +
- 113237 • For all other constants, the first choice is to use “symbolic constant” when the +  
 113238 requirements for the symbol are a reasonably close fit with those of the term. +

113239 The description of the symbol can override individual requirements for symbolic +  
 113240 constants; e.g., to specify a non-integer type, or to add a requirement that the symbol is +  
 113241 usable in **#if** preprocessor directives. +

- 113242 • When neither of the above apply, the exact requirements are stated in the description. +  
 113243 (Note that macros are not required to be usable in **#if**, or even to expand to constant +  
 113244 expressions, unless explicitly stated.) +

- 113245 • In cases where there is a reserved prefix or suffix, if the symbol(s) with that prefix/suffix +  
 113246 are from the ISO C standard and are required to be macros, or if the symbol is required to +  
 113247 be usable in **#if**, then the prefix/suffix is reserved for use only as macros. If the symbol(s) +  
 113248 are “symbolic constants” and not required to be usable in **#if**, the prefix/suffix is reserved +  
 113249 for any use except in a few special cases. +

113250 Where a constant is required to be a macro but is also allowed to be another type of constant +  
 113251 such as an enumeration constant, on implementations which do define it as another type of +  
 113252 constant the macro is typically defined as follows: +

```
113253 #define macro_name macro_name +
```

113254 This allows applications to use **#ifdef**, etc. to determine whether the macro is defined, but the +  
 113255 macro is not usable in **#if** preprocessor directives because the preprocessor will treat the +  
 113256 unexpanded word *macro\_name* as having the value zero. +

### 113257 **Symbolic Link**

113258 Many implementations associate no attributes, including ownership with symbolic links. +  
 113259 Security experts encouraged consideration for defining these attributes as optional. +  
 113260 Consideration was given to changing *utime()* to allow modification of the times for a symbolic +  
 113261 link, or as an alternative adding an *lutime()* interface. Modifications to *chown()* were also +  
 113262 considered: allow changing symbolic link ownership or alternatively adding *lchown()*. As a +  
 113263 result of alignment with the Single UNIX Specification, the *lchown()* function is included as part +  
 113264 of the XSI option and XSI-conformant systems may support an owner and a group associated +  
 113265 with a symbolic link. There was no consensus to define further attributes for symbolic links, +

113266 and for systems not supporting the XSI option only the file type bits in the *st\_mode* member and  
113267 the *st\_size* member of the **stat** structure are required to be applicable to symbolic links.

113268 Historical implementations were followed when determining which interfaces should apply to  
113269 symbolic links. Interfaces that historically followed symbolic links include *chmod()*, *link()*, and  
113270 *utime()*. Interfaces that historically do not follow symbolic links include *chown()*, *lstat()*,  
113271 *readlink()*, *rename()*, *remove()*, *rmdir()*, and *unlink()*. POSIX.1-200x deviates from historical  
113272 practice only in the case of *chown()*. Because there is no requirement for systems not supporting  
113273 the XSI extension that there is an association of ownership with symbolic links, there was no  
113274 interface in the base standard to change ownership. In addition, other implementations of  
113275 symbolic links have modified *chown()* to follow symbolic links.

113276 In the case of symbolic links, POSIX.1-200x states that a trailing slash is considered to be the final  
113277 component of a pathname rather than the pathname component that preceded it. This is the  
113278 behavior of historical implementations. For example, for */a/b* and */a/b/*, if */a/b* is a symbolic link  
113279 to a directory, then */a/b* refers to the symbolic link, and */a/b/* is the same as */a/b/.*, which is the  
113280 directory to which the symbolic link points.

113281 For multi-level security purposes, it is possible to have the link read mode govern permission  
113282 for the *readlink()* function. It is also possible that the read permissions of the directory containing  
113283 the link be used for this purpose. Implementations may choose to use either of these methods;  
113284 however, this is not current practice and neither method is specified.

113285 Several reasons were advanced for requiring that when a symbolic link is used as the source  
113286 argument to the *link()* function, the resulting link will apply to the file named by the contents of  
113287 the symbolic link rather than to the symbolic link itself. This is the case in historical  
113288 implementations. This action was preferred, as it supported the traditional idea of persistence  
113289 with respect to the target of a hard link. This decision is appropriate in light of a previous  
113290 decision not to require association of attributes with symbolic links, thereby allowing  
113291 implementations which do not use inodes. Opposition centered on the lack of symmetry on the  
113292 part of the *link()* and *unlink()* function pair with respect to symbolic links.

113293 Because a symbolic link and its referenced object coexist in the file system name space, confusion  
113294 can arise in distinguishing between the link itself and the referenced object. Historically, utilities  
113295 and system calls have adopted their own link following conventions in a somewhat *ad hoc*  
113296 fashion. Rules for a uniform approach are outlined here, although historical practice has been  
113297 adhered to as much as was possible. To promote consistent system use, user-written utilities are  
113298 encouraged to follow these same rules.

113299 Symbolic links are handled either by operating on the link itself, or by operating on the object  
113300 referenced by the link. In the latter case, an application or system call is said to “follow” the link.  
113301 Symbolic links may reference other symbolic links, in which case links are dereferenced until an  
113302 object that is not a symbolic link is found, a symbolic link that references a file that does not exist  
113303 is found, or a loop is detected. (Current implementations do not detect loops, but have a limit on  
113304 the number of symbolic links that they will dereference before declaring it an error.)

113305 There are four domains for which default symbolic link policy is established in a system. In  
113306 almost all cases, there are utility options that override this default behavior. The four domains  
113307 are as follows:

- 113308 1. Symbolic links specified to system calls that take filename arguments
- 113309 2. Symbolic links specified as command line filename arguments to utilities that are not  
113310 performing a traversal of a file hierarchy
- 113311 3. Symbolic links referencing files not of type directory, specified to utilities that are  
113312 performing a traversal of a file hierarchy

- 113313 4. Symbolic links referencing files of type directory, specified to utilities that are performing  
113314 a traversal of a file hierarchy

113315 *First Domain*

113316 The first domain is considered in earlier rationale.

113317 *Second Domain*

113318 The reason this category is restricted to utilities that are not traversing the file hierarchy is that  
113319 some standard utilities take an option that specifies a hierarchical traversal, but by default  
113320 operate on the arguments themselves. Generally, users specifying the option for a file hierarchy  
113321 traversal wish to operate on a single, physical hierarchy, and therefore symbolic links, which  
113322 may reference files outside of the hierarchy, are ignored. For example, *chown owner file* is a  
113323 different operation from the same command with the **-R** option specified. In this example, the  
113324 behavior of the command *chown owner file* is described here, while the behavior of the command  
113325 *chown -R owner file* is described in the third and fourth domains.

113326 The general rule is that the utilities in this category follow symbolic links named as arguments.

113327 Exceptions in the second domain are:

- 113328 • The *mv* and *rm* utilities do not follow symbolic links named as arguments, but respectively  
113329 attempt to rename or delete them.
- 113330 • The *ls* utility is also an exception to this rule. For compatibility with historical systems,  
113331 when the **-R** option is not specified, the *ls* utility follows symbolic links named as  
113332 arguments if the **-L** option is specified or if the **-F**, **-d**, or **-l** options are not specified. (If  
113333 the **-L** option is specified, *ls* always follows symbolic links; it is the only utility where the  
113334 **-L** option affects its behavior even though a tree walk is not being performed.)

113335 All other standard utilities, when not traversing a file hierarchy, always follow symbolic links  
113336 named as arguments.

113337 Historical practice is that the **-h** option is specified if standard utilities are to act upon symbolic  
113338 links instead of upon their targets. Examples of commands that have historically had a **-h** option  
113339 for this purpose are the *chgrp*, *chown*, *file*, and *test* utilities.

113340 *Third Domain*

113341 The third domain is symbolic links, referencing files not of type directory, specified to utilities  
113342 that are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
113343 command line filename arguments or encountered during the traversal.)

113344 The intention of the Shell and Utilities volume of POSIX.1-200x is that the operation that the  
113345 utility is performing is applied to the symbolic link itself, if that operation is applicable to  
113346 symbolic links. The reason that the operation is not required is that symbolic links in some  
113347 implementations do not have such attributes as a file owner, and therefore the *chown* operation  
113348 would be meaningless. If symbolic links on the system have an owner, it is the intention that the  
113349 utility *chown* cause the owner of the symbolic link to change. If symbolic links do not have an  
113350 owner, the symbolic link should be ignored. Specifically, by default, no change should be made  
113351 to the file referenced by the symbolic link.

113352 *Fourth Domain*

113353 The fourth domain is symbolic links referencing files of type directory, specified to utilities that  
 113354 are performing a traversal of a file hierarchy. (This includes symbolic links specified as  
 113355 command line filename arguments or encountered during the traversal.)

113356 Most standard utilities do not, by default, indirect into the file hierarchy referenced by the  
 113357 symbolic link. (The Shell and Utilities volume of POSIX.1-200x uses the informal term “physical  
 113358 walk” to describe this case. The case where the utility does indirect through the symbolic link is  
 113359 termed a “logical walk”.)

113360 There are three reasons for the default to be a physical walk:

- 113361 1. With very few exceptions, a physical walk has been the historical default on UNIX  
 113362 systems supporting symbolic links. Because some utilities (that is, *rm*) must default to a  
 113363 physical walk, regardless, changing historical practice in this regard would be confusing  
 113364 to users and needlessly incompatible.
- 113365 2. For systems where symbolic links have the historical file attributes (that is, *owner*, *group*,  
 113366 *mode*), defaulting to a logical traversal would require the addition of a new option to the  
 113367 commands to modify the attributes of the link itself. This is painful and more complex  
 113368 than the alternatives.
- 113369 3. There is a security issue with defaulting to a logical walk. Historically, the command  
 113370 *chown -R user file* has been safe for the superuser because *setuid* and *setgid* bits were lost  
 113371 when the ownership of the file was changed. If the walk were logical, changing  
 113372 ownership would no longer be safe because a user might have inserted a symbolic link  
 113373 pointing to any file in the tree. Again, this would necessitate the addition of an option to  
 113374 the commands doing hierarchy traversal to not indirect through the symbolic links, and  
 113375 historical scripts doing recursive walks would instantly become security problems. While  
 113376 this is mostly an issue for system administrators, it is preferable to not have different  
 113377 defaults for different classes of users.

113378 However, the standard developers agreed to leave it unspecified to achieve consensus.

113379 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 113380 traversal to follow any symbolic links named on the command line, regardless of the type of file  
 113381 they reference, by specifying the **-H** (for half logical) option. This option is intended to make the  
 113382 command line name space look like the logical name space.

113383 As consistently as possible, users may cause standard utilities performing a file hierarchy  
 113384 traversal to follow any symbolic links named on the command line as well as any symbolic links  
 113385 encountered during the traversal, regardless of the type of file they reference, by specifying the  
 113386 **-L** (for logical) option. This option is intended to make the entire name space look like the  
 113387 logical name space.

113388 For consistency, implementors are encouraged to use the **-P** (for “physical”) flag to specify the  
 113389 physical walk in utilities that do logical walks by default for whatever reason. The only standard  
 113390 utilities that require the **-P** option are *cd* and *pwd*; see the note below.

113391 When one or more of the **-H**, **-L**, and **-P** flags can be specified, the last one specified determines  
 113392 the behavior of the utility. This permits users to alias commands so that the default behavior is a  
 113393 logical walk and then override that behavior on the command line.

113394 *Exceptions in the Third and Fourth Domains*

113395 The *ls* and *rm* utilities are exceptions to these rules. The *rm* utility never follows symbolic links  
 113396 and does not support the **-H**, **-L**, or **-P** options. Some historical versions of *ls* always followed  
 113397 symbolic links given on the command line whether the **-L** option was specified or not.

113398 Historical versions of *ls* did not support the **-H** option. In POSIX.1-200x, unless one of the **-H** or  
113399 **-L** options is specified, the *ls* utility only follows symbolic links to directories that are given as  
113400 operands. The *ls* utility does not support the **-P** option.

113401 The Shell and Utilities volume of POSIX.1-200x requires that the standard utilities *ls*, *find*, and  
113402 *pax* detect infinite loops when doing logical walks; that is, a directory, or more commonly a  
113403 symbolic link, that refers to an ancestor in the current file hierarchy. If the file system itself is  
113404 corrupted, causing the infinite loop, it may be impossible to recover. Because *find* and *ls* are often  
113405 used in system administration and security applications, they should attempt to recover and  
113406 continue as best as they can. The *pax* utility should terminate because the archive it was creating  
113407 is by definition corrupted. Other, less vital, utilities should probably simply terminate as well.  
113408 Implementations are strongly encouraged to detect infinite loops in all utilities.

113409 Historical practice is shown in [Table A-1](#) (on page 3342). The heading **SVID3** stands for the  
113410 Third Edition of the System V Interface Definition.

113411 Historically, several shells have had built-in versions of the *pwd* utility. In some of these shells,  
113412 *pwd* reported the physical path, and in others, the logical path. Implementations of the shell  
113413 corresponding to POSIX.1-200x must report the logical path by default. Earlier versions of this  
113414 standard did not require the *pwd* utility to be a built-in utility. Now that *pwd* is required to set an  
113415 environment variable in the current shell execution environment, it must be a built-in utility.

113416 The *cd* command is required, by default, to treat the filename dot-dot logically. Implementors are  
113417 required to support the **-P** flag in *cd* so that users can have their current environment handled  
113418 physically. In 4.3 BSD, *chgrp* during tree traversal changed the group of the symbolic link, not  
113419 the target. Symbolic links in 4.4 BSD do not have *owner*, *group*, *mode*, or other standard UNIX  
113420 system file attributes.

113421 **Table A-1** Historical Practice for Symbolic Links

| Utility             | SVID3   | 4.3 BSD | 4.4 BSD | POSIX | Comments                                |
|---------------------|---------|---------|---------|-------|-----------------------------------------|
| 113422 <i>cd</i>    |         |         |         | -L    | Treat ". ." logically.                  |
| 113423 <i>cd</i>    |         |         |         | -P    | Treat ". ." physically.                 |
| 113424 <i>chgrp</i> |         |         | -H      | -H    | Follow command line symlinks.           |
| 113425 <i>chgrp</i> |         |         | -h      | -L    | Follow symlinks.                        |
| 113426 <i>chgrp</i> | -h      |         |         | -h    | Affect the symlink.                     |
| 113427 <i>chmod</i> |         |         |         |       | Affect the symlink.                     |
| 113428 <i>chmod</i> |         |         | -H      |       | Follow command line symlinks.           |
| 113429 <i>chmod</i> |         |         | -h      |       | Follow symlinks.                        |
| 113430 <i>chown</i> |         |         | -H      | -H    | Follow command line symlinks.           |
| 113431 <i>chown</i> |         |         | -h      | -L    | Follow symlinks.                        |
| 113432 <i>chown</i> | -h      |         |         | -h    | Affect the symlink.                     |
| 113433 <i>cp</i>    |         |         | -H      | -H    | Follow command line symlinks.           |
| 113434 <i>cp</i>    |         |         | -h      | -L    | Follow symlinks.                        |
| 113435 <i>cpio</i>  | -L      |         | -L      |       | Follow symlinks.                        |
| 113436 <i>du</i>    |         |         | -H      | -H    | Follow command line symlinks.           |
| 113437 <i>du</i>    |         |         | -h      | -L    | Follow symlinks.                        |
| 113438 <i>file</i>  | -h      |         |         | -h    | Affect the symlink.                     |
| 113439 <i>find</i>  |         |         | -H      | -H    | Follow command line symlinks.           |
| 113440 <i>find</i>  |         |         | -h      | -L    | Follow symlinks.                        |
| 113441 <i>find</i>  | -follow |         | -follow |       | Follow symlinks.                        |
| 113442 <i>ln</i>    | -s      | -s      | -s      | -s    | Create a symbolic link.                 |
| 113443 <i>ls</i>    | -L      | -L      | -L      | -L    | Follow symlinks.                        |
| 113444 <i>ls</i>    |         |         |         | -H    | Follow command line symlinks.           |
| 113445 <i>mv</i>    |         |         |         |       | Operates on the symlink.                |
| 113446 <i>pax</i>   |         |         | -H      | -H    | Follow command line symlinks.           |
| 113447 <i>pax</i>   |         |         | -h      | -L    | Follow symlinks.                        |
| 113448 <i>pwd</i>   |         |         |         | -L    | Printed path may contain symlinks.      |
| 113449 <i>pwd</i>   |         |         |         | -P    | Printed path will not contain symlinks. |
| 113450 <i>rm</i>    |         |         |         |       | Operates on the symlink.                |
| 113451 <i>tar</i>   |         |         | -H      |       | Follow command line symlinks.           |
| 113452 <i>tar</i>   |         | -h      | -h      |       | Follow symlinks.                        |
| 113453 <i>test</i>  | -h      |         | -h      | -h    | Affect the symlink.                     |

113455 **Synchronously-Generated Signal**

113456 Those signals that may be generated synchronously include SIGABRT, SIGBUS, SIGILL, SIGFPE,  
113457 SIGPIPE, and SIGSEGV.

113458 Any signal sent via the *raise()* function or a *kill()* function targeting the current process is also  
113459 considered synchronous.

113460 **System Call\***

113461 The distinction between a "system call" and a "library routine" is an implementation detail that  
113462 may differ between implementations and has thus been excluded from POSIX.1.

113463 See "Interface, Not Implementation" in the Preface.

- 113464           **System Console**
- 113465           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/7 is applied, changing from “An  
113466 implementation-defined device” to “A device”.
- 113467           **System Databases**
- 113468           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/9 is applied, rewording the definition to  
113469 reference the existing definitions for “group database” and “user database”.
- 113470           **System Process**
- 113471           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/8 is applied, rewording the definition to  
113472 remove the requirement for an implementation to define the object.
- 113473           **System Reboot**
- 113474           A “system reboot” is an event initiated by an unspecified circumstance that causes all processes  
113475 (other than special system processes) to be terminated in an implementation-defined manner,  
113476 after which any changes to the state and contents of files created or written to by a Conforming  
113477 POSIX.1 Application prior to the event are implementation-defined.
- 113478           IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/10 is applied, changing “An  
113479 implementation-defined sequence of events” to “An unspecified sequence of events”.
- 113480           **Synchronized I/O Data (and File) Integrity Completion**
- 113481           These terms specify that for synchronized read operations, pending writes must be successfully  
113482 completed before the read operation can complete. This is motivated by two circumstances.  
113483 Firstly, when synchronizing processes can access the same file, but not share common buffers  
113484 (such as for a remote file system), this requirement permits the reading process to guarantee that  
113485 it can read data written remotely. Secondly, having data written synchronously is insufficient to  
113486 guarantee the order with respect to a subsequent write by a reading process, and thus this extra  
113487 read semantic is necessary.
- 113488           **Text File**
- 113489           The term “text file” does not prevent the inclusion of control or other non-printable characters  
113490 (other than NUL). Therefore, standard utilities that list text files as inputs or outputs are either  
113491 able to process the special characters or they explicitly describe their limitations within their  
113492 individual descriptions. The definition of “text file” has caused controversy. The only difference  
113493 between text and binary files is that text files have lines of less than {LINE\_MAX} bytes, with no  
113494 NUL characters, each terminated by a <newline>. The definition allows a file with a single  
113495 <newline>, but not a totally empty file, to be called a text file. If a file ends with an incomplete  
113496 line it is not strictly a text file by this definition. The <newline> referred to in POSIX.1-200x is not  
113497 some generic line separator, but a single character; files created on systems where they use  
113498 multiple characters for ends of lines are not portable to all conforming systems without some  
113499 translation process unspecified by POSIX.1-200x.

113500 **Thread**

113501 POSIX.1-200x defines a thread to be a flow of control within a process. Each thread has a  
 113502 minimal amount of private state; most of the state associated with a process is shared among all  
 113503 of the threads in the process. While most multi-thread extensions to POSIX have taken this  
 113504 approach, others have made different decisions.

113505 **Note:** The choice to put threads within a process does not constrain implementations to implement  
 113506 threads in that manner. However, all functions have to behave as though threads share the  
 113507 indicated state information with the process from which they were created.

113508 Threads need to share resources in order to cooperate. Memory has to be widely shared between  
 113509 threads in order for the threads to cooperate at a fine level of granularity. Threads keep data  
 113510 structures and the locks protecting those data structures in shared memory. For a data structure  
 113511 to be usefully shared between threads, such structures should not refer to any data that can only  
 113512 be interpreted meaningfully by a single thread. Thus, any system resources that might be  
 113513 referred to in data structures need to be shared between all threads. File descriptors, pathnames,  
 113514 and pointers to stack variables are all things that programmers want to share between their  
 113515 threads. Thus, the file descriptor table, the root directory, the current working directory, and the  
 113516 address space have to be shared.

113517 Library implementations are possible as long as the effective behavior is as if system services  
 113518 invoked by one thread do not suspend other threads. This may be difficult for some library  
 113519 implementations on systems that do not provide asynchronous facilities.

113520 See [Section B.2.9](#) (on page 3463) for additional rationale.

113521 **Thread ID**

113522 See [Section B.2.9.2](#) (on page 3480) for additional rationale.

113523 **Thread-Safe Function**

113524 All functions required by POSIX.1-200x need to be thread-safe; see [Section A.4.17](#) (on page 3353)  
 113525 and [Section B.2.9.1](#) (on page 3477) for additional rationale.

113526 **User Database**

113527 There are no references in POSIX.1-200x to a “passwd file” or a “group file”, and there is no  
 113528 requirement that the *group* or *passwd* databases be kept in files containing editable text. Many  
 113529 large timesharing systems use *passwd* databases that are hashed for speed. Certain security  
 113530 classifications prohibit certain information in the *passwd* database from being publicly readable.

113531 The term “encoded” is used instead of “encrypted” in order to avoid the implementation  
 113532 connotations (such as reversibility or use of a particular algorithm) of the latter term.

113533 The *getgrent()*, *setgrent()*, *endgrent()*, *getpwent()*, *setpwent()*, and *endpwent()* functions are not  
 113534 included as part of the base standard because they provide a linear database search capability  
 113535 that is not generally useful (the *getpwuid()*, *getpwnam()*, *getgrgid()*, and *getgrnam()* functions are  
 113536 provided for keyed lookup) and because in certain distributed systems, especially those with  
 113537 different authentication domains, it may not be possible or desirable to provide an application  
 113538 with the ability to browse the system databases indiscriminately. They are provided on XSI-  
 113539 conformant systems due to their historical usage by many existing applications.

113540 A change from historical implementations is that the structures used by these functions have  
 113541 fields of the types **gid\_t** and **uid\_t**, which are required to be defined in the **<sys/types.h>** header.  
 113542 POSIX.1-200x requires implementations to ensure that these types are defined by inclusion of  
 113543 **<grp.h>** and **<pwd.h>**, respectively, without imposing any name space pollution or errors from  
 113544 redefinition of types.

113545 POSIX.1-200x is silent about the content of the strings containing user or group names. These  
 113546 could be digit strings. POSIX.1-200x is also silent as to whether such digit strings bear any  
 113547 relationship to the corresponding (numeric) user or group ID.

113548 *Database Access*

113549 The thread-safe versions of the user and group database access functions return values in user-  
 113550 supplied buffers instead of possibly using static data areas that may be overwritten by each call.

113551 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/11 is applied, removing the words “of  
 113552 implementation-defined format”.

113553 **Virtual Processor\***

113554 The term “virtual processor” was chosen as a neutral term describing all kernel-level  
 113555 schedulable entities, such as processes, Mach tasks, or lightweight processes. Implementing  
 113556 threads using multiple processes as virtual processors, or implementing multiplexed threads  
 113557 above a virtual processor layer, should be possible, provided some mechanism has also been  
 113558 implemented for sharing state between processes or virtual processors. Many systems may also  
 113559 wish to provide implementations of threads on systems providing “shared processes” or  
 113560 “variable-weight processes”. It was felt that exposing such implementation details would  
 113561 severely limit the type of systems upon which the threads interface could be supported and  
 113562 prevent certain types of valid implementations. It was also determined that a virtual processor  
 113563 interface was out of the scope of the Rationale (Informative) volume of POSIX.1-200x.

113564 **XSI**

113565 This is included to allow POSIX.1-200x to be adopted as an IEEE standard and an Open Group  
 113566 Technical Standard, serving both the POSIX and the Single UNIX Specification in a core set of  
 113567 volumes.

113568 The term “XSI” has been used for 10 years in connection with the XPG series and the first and  
 113569 second versions of the base volumes of the Single UNIX Specification. The XSI margin code was  
 113570 introduced to denote the extended or more restrictive semantics beyond POSIX that are  
 113571 applicable to UNIX systems.

## 113572 **A.4 General Concepts**

113573 The general concepts are similar in nature to the definitions section, with the exception that a  
 113574 term defined in general concepts can contain normative requirements.

### 113575 **A.4.1 Concurrent Execution**

113576 There is no additional rationale provided for this section.

### 113577 **A.4.2 Directory Protection**

113578 There is no additional rationale provided for this section.

### 113579 A.4.3 Extended Security Controls

113580 Allowing an implementation to define extended security controls enables the use of  
 113581 POSIX.1-200x in environments that require different or more rigorous security than that  
 113582 provided in POSIX.1. Extensions are allowed in two areas: privilege and file access permissions.  
 113583 The semantics of these areas have been defined to permit extensions with reasonable, but not  
 113584 exact, compatibility with all existing practices. For example, the elimination of the superuser  
 113585 definition precludes identifying a process as privileged or not by virtue of its effective user ID.

### 113586 A.4.4 File Access Permissions

113587 A process should not try to anticipate the result of an attempt to access data by *a priori* use of  
 113588 these rules. Rather, it should make the attempt to access data and examine the return value (and  
 113589 possibly *errno* as well), or use *access()*. An implementation may include other security  
 113590 mechanisms in addition to those specified in POSIX.1, and an access attempt may fail because of  
 113591 those additional mechanisms, even though it would succeed according to the rules given in this  
 113592 section. (For example, the user's security level might be lower than that of the object of the  
 113593 access attempt.) The supplementary group IDs provide another reason for a process to not  
 113594 attempt to anticipate the result of an access attempt.

113595 Since the current standard does not specify a method for opening a directory for searching, it is  
 113596 unspecified whether search permission on the *fd* argument to *openat()* and related functions is  
 113597 based on whether the directory was opened with search mode or on the current permissions  
 113598 allowed by the directory at the time a search is performed. When there is existing practice that  
 113599 supports opening directories for searching, it is expected that these functions will be modified to  
 113600 specify that the search permissions will be granted based on the file access modes of the  
 113601 directory's file descriptor identified by *fd*, and not on the mode of the directory at the time the  
 113602 directory is searched.

### 113603 A.4.5 File Hierarchy

113604 Though the file hierarchy is commonly regarded to be a tree, POSIX.1 does not define it as such  
 113605 for three reasons:

- 113606 1. Links may join branches.
- 113607 2. In some network implementations, there may be no single absolute root directory; see  
 113608 *pathname resolution*.
- 113609 3. With symbolic links, the file system need not be a tree or even a directed acyclic graph.

### 113610 A.4.6 Filenames

113611 Historically, certain filenames have been reserved. This list includes **core**, **/etc/passwd**, and so  
 113612 on. Conforming applications should avoid these.

113613 Most historical implementations prohibit case folding in filenames; that is, treating uppercase  
 113614 and lowercase alphabetic characters as identical. However, some consider case folding desirable:

- 113615 • For user convenience
- 113616 • For ease-of-implementation of the POSIX.1 interface as a hosted system on some popular  
 113617 operating systems

113618 Variants, such as maintaining case distinctions in filenames, but ignoring them in comparisons,  
 113619 have been suggested. Methods of allowing escaped characters of the case opposite the default  
 113620 have been proposed.

- 113621 Many reasons have been expressed for not allowing case folding, including:
- 113622 • No solid evidence has been produced as to whether case-sensitivity or case-insensitivity is  
113623 more convenient for users.
  - 113624 • Making case-insensitivity a POSIX.1 implementation option would be worse than either  
113625 having it or not having it, because:
    - 113626 — More confusion would be caused among users.
    - 113627 — Application developers would have to account for both cases in their code.
    - 113628 — POSIX.1 implementors would still have other problems with native file systems, such  
113629 as short or otherwise constrained filenames or pathnames, and the lack of  
113630 hierarchical directory structure.
  - 113631 • Case folding is not easily defined in many European languages, both because many of  
113632 them use characters outside the US ASCII alphabetic set, and because:
    - 113633 — In Spanish, the digraph "ll" is considered to be a single letter, the capitalized form  
113634 of which may be either "Ll" or "LL", depending on context.
    - 113635 — In French, the capitalized form of a letter with an accent may or may not retain the  
113636 accent, depending on the country in which it is written.
    - 113637 — In German, the sharp ess may be represented as a single character resembling a  
113638 Greek beta ( $\beta$ ) in lowercase, but as the digraph "SS" in uppercase.
    - 113639 — In Greek, there are several lowercase forms of some letters; the one to use depends on  
113640 its position in the word. Arabic has similar rules.
  - 113641 • Many East Asian languages, including Japanese, Chinese, and Korean, do not distinguish  
113642 case and are sometimes encoded in character sets that use more than one byte per  
113643 character.
  - 113644 • Multiple character codes may be used on the same machine simultaneously. There are  
113645 several ISO character sets for European alphabets. In Japan, several Japanese character  
113646 codes are commonly used together, sometimes even in filenames; this is evidently also the  
113647 case in China. To handle case insensitivity, the kernel would have to at least be able to  
113648 distinguish for which character sets the concept made sense.
  - 113649 • The file system implementation historically deals only with bytes, not with characters,  
113650 except for slash and the null byte.
  - 113651 • The purpose of POSIX.1 is to standardize the common, existing definition, not to change it.  
113652 Mandating case-insensitivity would make all historical implementations non-standard.
  - 113653 • Not only the interface, but also application programs would need to change, counter to the  
113654 purpose of having minimal changes to existing application code.
  - 113655 • At least one of the original developers of the UNIX system has expressed objection in the  
113656 strongest terms to either requiring case-insensitivity or making it an option, mostly on the  
113657 basis that POSIX.1 should not hinder portability of application programs across related  
113658 implementations in order to allow compatibility with unrelated operating systems.
- 113659 Two proposals were entertained regarding case folding in filenames:
- 113660 1. Remove all wording that previously permitted case folding.
- 113661 Rationale Case folding is inconsistent with portable filename character set definition  
113662 and filename definition (all characters except slash and null). No known  
113663 implementations allowing all characters except slash and null also do case

- 113664 folding.
- 113665 2. Change “though this practice is not recommended:” to “although this practice is strongly  
113666 discouraged.”
- 113667 Rationale If case folding must be included in POSIX.1, the wording should be stronger  
113668 to discourage the practice.
- 113669 The consensus selected the first proposal. Otherwise, a conforming application would have to  
113670 assume that case folding would occur when it was not wanted, but that it would not occur when  
113671 it was wanted.

#### 113672 **A.4.7 Filename Portability**

113673 Filenames should be constructed from the portable filename character set because the use of  
113674 other characters can be confusing or ambiguous in certain contexts. (For example, the use of a  
113675 colon ( ‘ : ’ ) in a pathname could cause ambiguity if that pathname were included in a *PATH*  
113676 definition.)

113677 The constraint on use of the hyphen character as the first character of a portable filename is a  
113678 constraint on application behavior and not on implementations, since applications might not  
113679 work as expected when such a filename is passed as a command line argument.

#### 113680 **A.4.8 File Times Update**

113681 This section reflects the actions of historical implementations. The times are not updated  
113682 immediately, but are only marked for update by the functions. An implementation may update  
113683 these times immediately.

113684 The accuracy of the time update values is intentionally left unspecified so that systems can  
113685 control the bandwidth of a possible covert channel.

113686 The wording was carefully chosen to make it clear that there is no requirement that the  
113687 conformance document contain information that might incidentally affect file timestamps. Any  
113688 function that performs pathname resolution might update several last data access timestamps. |  
113689 Functions such as *getpwnam()* and *getgrnam()* might update the last data access timestamp of |  
113690 some specific file or files. It is intended that these are not required to be documented in the |  
113691 conformance document, but they should appear in the system documentation.

#### 113692 **A.4.9 Host and Network Byte Order**

113693 There is no additional rationale provided for this section.

#### 113694 **A.4.10 Measurement of Execution Time**

113695 The methods used to measure the execution time of processes and threads, and the precision of  
113696 these measurements, may vary considerably depending on the software architecture of the  
113697 implementation, and on the underlying hardware. Implementations can also make tradeoffs  
113698 between the scheduling overhead and the precision of the execution time measurements.  
113699 POSIX.1-200x does not impose any requirement on the accuracy of the execution time; it instead  
113700 specifies that the measurement mechanism and its precision are implementation-defined.

113701 **A.4.11 Memory Synchronization**

113702 In older multi-processors, access to memory by the processors was strictly multiplexed. This  
 113703 meant that a processor executing program code interrogates or modifies memory in the order  
 113704 specified by the code and that all the memory operation of all the processors in the system  
 113705 appear to happen in some global order, though the operation histories of different processors are  
 113706 interleaved arbitrarily. The memory operations of such machines are said to be sequentially  
 113707 consistent. In this environment, threads can synchronize using ordinary memory operations. For  
 113708 example, a producer thread and a consumer thread can synchronize access to a circular data  
 113709 buffer as follows:

```
113710 int rdptr = 0;
113711 int wrptr = 0;
113712 data_t buf[BUFSIZE];

113713 Thread 1:
113714 while (work_to_do) {
113715 int next;
113716
113717 buf[wrptr] = produce();
113718 next = (wrptr + 1) % BUFSIZE;
113719 while (rdptr == next)
113720 ;
113721 wrptr = next;
113722 }

113723 Thread 2:
113724 while (work_to_do) {
113725 while (rdptr == wrptr)
113726 ;
113727 consume(buf[rdptr]);
113728 rdptr = (rdptr + 1) % BUFSIZE;
113729 }
```

113729 In modern multi-processors, these conditions are relaxed to achieve greater performance. If one  
 113730 processor stores values in location A and then location B, then other processors loading data  
 113731 from location B and then location A may see the new value of B but the old value of A. The  
 113732 memory operations of such machines are said to be weakly ordered. On these machines, the  
 113733 circular buffer technique shown in the example will fail because the consumer may see the new  
 113734 value of *wrptr* but the old value of the data in the buffer. In such machines, synchronization can  
 113735 only be achieved through the use of special instructions that enforce an order on memory  
 113736 operations. Most high-level language compilers only generate ordinary memory operations to  
 113737 take advantage of the increased performance. They usually cannot determine when memory  
 113738 operation order is important and generate the special ordering instructions. Instead, they rely on  
 113739 the programmer to use synchronization primitives correctly to ensure that modifications to a  
 113740 location in memory are ordered with respect to modifications and/or access to the same location  
 113741 in other threads. Access to read-only data need not be synchronized. The resulting program is  
 113742 said to be data race-free.

113743 Synchronization is still important even when accessing a single primitive variable (for example,  
 113744 an integer). On machines where the integer may not be aligned to the bus data width or be  
 113745 larger than the data width, a single memory load may require multiple memory cycles. This  
 113746 means that it may be possible for some parts of the integer to have an old value while other  
 113747 parts have a newer value. On some processor architectures this cannot happen, but portable  
 113748 programs cannot rely on this.

113749 In summary, a portable multi-threaded program, or a multi-process program that shares

113750 writable memory between processes, has to use the synchronization primitives to synchronize  
 113751 data access. It cannot rely on modifications to memory being observed by other threads in the  
 113752 order written in the application or even on modification of a single variable being seen  
 113753 atomically.

113754 Conforming applications may only use the functions listed to synchronize threads of control  
 113755 with respect to memory access. There are many other candidates for functions that might also be  
 113756 used. Examples are: signal sending and reception, or pipe writing and reading. In general, any  
 113757 function that allows one thread of control to wait for an action caused by another thread of  
 113758 control is a candidate. POSIX.1-200x does not require these additional functions to synchronize  
 113759 memory access since this would imply the following:

- 113760 • All these functions would have to be recognized by advanced compilation systems so that
- 113761 memory operations and calls to these functions are not reordered by optimization.
- 113762 • All these functions would potentially have to have memory synchronization instructions
- 113763 added, depending on the particular machine.
- 113764 • The additional functions complicate the model of how memory is synchronized and make
- 113765 automatic data race detection techniques impractical.

113766 Formal definitions of the memory model were rejected as unreadable by the vast majority of  
 113767 programmers. In addition, most of the formal work in the literature has concentrated on the  
 113768 memory as provided by the hardware as opposed to the application programmer through the  
 113769 compiler and runtime system. It was believed that a simple statement intuitive to most  
 113770 programmers would be most effective. POSIX.1-200x defines functions that can be used to  
 113771 synchronize access to memory, but it leaves open exactly how one relates those functions to the  
 113772 semantics of each function as specified elsewhere in POSIX.1-200x. POSIX.1-200x also does not  
 113773 make a formal specification of the partial ordering in time that the functions can impose, as that  
 113774 is implied in the description of the semantics of each function. It simply states that the  
 113775 programmer has to ensure that modifications do not occur “simultaneously” with other access  
 113776 to a memory location.

113777 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/4 is applied, adding a new paragraph  
 113778 beneath the table of functions: “The *pthread\_once()* function shall synchronize memory for the  
 113779 first call in each thread for a given **pthread\_once\_t** object.”.

#### 113780 A.4.12 Pathname Resolution

113781 It is necessary to differentiate between the definition of pathname and the concept of pathname  
 113782 resolution with respect to the handling of trailing slashes. By specifying the behavior here, it is  
 113783 not possible to provide an implementation that is conforming but extends all interfaces that  
 113784 handle pathnames to also handle strings that are not legal pathnames (because they have  
 113785 trailing slashes).

113786 Pathnames that end with one or more trailing slash characters must refer to directory paths. |  
 113787 Earlier versions of this standard were not specific about the distinction between trailing slashes |  
 113788 on files and directories, and both were permitted.

113789 Two types of implementation have been prevalent; those that ignored trailing slash characters  
 113790 on all pathnames regardless, and those that permitted them only on existing directories.

113791 POSIX.1-200x requires that a pathname with a trailing slash character be treated as if it had a  
 113792 trailing " / . " everywhere.

113793 Note that this change does not break any conforming applications; since there were two different  
 113794 types of implementation, no application could have portably depended on either behavior. This  
 113795 change does however require some implementations to be altered to remain compliant.

113796 Substantial discussion over a three-year period has shown that the benefits to application  
113797 developers outweighs the disadvantages for some vendors.

113798 On a historical note, some early applications automatically appended a `'/'` to every path.  
113799 Rather than fix the applications, the system implementation was modified to accept this  
113800 behavior by ignoring any trailing slash.

113801 Each directory has exactly one parent directory which is represented by the name **dot-dot** in the  
113802 first directory. No other directory, regardless of linkages established by symbolic links, is  
113803 considered the parent directory by POSIX.1-200x.

113804 There are two general categories of interfaces involving pathname resolution: those that follow  
113805 the symbolic link, and those that do not. There are several exceptions to this rule; for example,  
113806 `open(path,O_CREAT|O_EXCL)` will fail when `path` names a symbolic link. However, in all other  
113807 situations, the `open()` function will follow the link.

113808 What the filename **dot-dot** refers to relative to the root directory is implementation-defined. In  
113809 Version 7 it refers to the root directory itself; this is the behavior mentioned in POSIX.1-200x. In  
113810 some networked systems the construction `././hostname/` is used to refer to the root directory of  
113811 another host, and POSIX.1 permits this behavior.

113812 Other networked systems use the construct `//hostname` for the same purpose; that is, a double  
113813 initial slash is used. There is a potential problem with existing applications that create full  
113814 pathnames by taking a trunk and a relative pathname and making them into a single string  
113815 separated by `'/'`, because they can accidentally create networked pathnames when the trunk is  
113816 `'/'`. This practice is not prohibited because such applications can be made to conform by  
113817 simply changing to use `"/"` as a separator instead of `'/'`:

- 113818 • If the trunk is `'/'`, the full pathname will begin with `"/"` (the initial `'/'` and the  
113819 separator `"/"`). This is the same as `'/'`, which is what is desired. (This is the general  
113820 case of making a relative pathname into an absolute one by prefixing with `"/"` instead  
113821 of `'/'`.)
- 113822 • If the trunk is `"/A"`, the result is `"/A//..."`; since non-leading sequences of two or more  
113823 slashes are treated as a single slash, this is equivalent to the desired `"/A/..."`.
- 113824 • If the trunk is `"//A"`, the implementation-defined semantics will apply. (The multiple  
113825 slash rule would apply.)

113826 Application developers should avoid generating pathnames that start with `"/"`.  
113827 Implementations are strongly encouraged to avoid using this special interpretation since a  
113828 number of applications currently do not follow this practice and may inadvertently generate  
113829 `"//..."`.

113830 The term "root directory" is only defined in POSIX.1 relative to the process. In some  
113831 implementations, there may be no absolute root directory. The initialization of the root directory  
113832 of a process is implementation-defined.

#### 113833 A.4.13 Process ID Reuse

113834 There is no additional rationale provided for this section.

113835 **A.4.14 Scheduling Policy**

113836 There is no additional rationale provided for this section.

113837 **A.4.15 Seconds Since the Epoch**

113838 Coordinated Universal Time (UTC) includes leap seconds. However, in POSIX time (seconds  
 113839 since the Epoch), leap seconds are ignored (not applied) to provide an easy and compatible  
 113840 method of computing time differences. Broken-down POSIX time is therefore not necessarily  
 113841 UTC, despite its appearance.

113842 As of September 2000, 24 leap seconds had been added to UTC since the Epoch, 1 January, 1970.  
 113843 Historically, one leap second is added every 15 months on average, so this offset can be expected  
 113844 to grow steadily with time.

113845 Most systems' notion of "time" is that of a continuously increasing value, so this value should  
 113846 increase even during leap seconds. However, not only do most systems not keep track of leap  
 113847 seconds, but most systems are probably not synchronized to any standard time reference.  
 113848 Therefore, it is inappropriate to require that a time represented as seconds since the Epoch  
 113849 precisely represent the number of seconds between the referenced time and the Epoch.

113850 It is sufficient to require that applications be allowed to treat this time as if it represented the  
 113851 number of seconds between the referenced time and the Epoch. It is the responsibility of the  
 113852 vendor of the system, and the administrator of the system, to ensure that this value represents  
 113853 the number of seconds between the referenced time and the Epoch as closely as necessary for the  
 113854 application being run on that system.

113855 It is important that the interpretation of time names and seconds since the Epoch values be  
 113856 consistent across conforming systems; that is, it is important that all conforming systems  
 113857 interpret "536 457 599 seconds since the Epoch" as 59 seconds, 59 minutes, 23 hours 31 December  
 113858 1986, regardless of the accuracy of the system's idea of the current time. The expression is given  
 113859 to ensure a consistent interpretation, not to attempt to specify the calendar. The relationship  
 113860 between *tm\_yday* and the day of week, day of month, and month is in accordance with the  
 113861 Gregorian calendar, and so is not specified in POSIX.1.

113862 Consistent interpretation of seconds since the Epoch can be critical to certain types of distributed  
 113863 applications that rely on such timestamps to synchronize events. The accrual of leap seconds in a  
 113864 time standard is not predictable. The number of leap seconds since the Epoch will likely  
 113865 increase. POSIX.1 is more concerned about the synchronization of time between applications of  
 113866 astronomically short duration.

113867 Note that *tm\_yday* is zero-based, not one-based, so the day number in the example above is 364.  
 113868 Note also that the division is an integer division (discarding remainder) as in the C language.

113869 Note also that the meaning of *gmtime()*, *localtime()*, and *mkttime()* is specified in terms of this  
 113870 expression. However, the ISO C standard computes *tm\_yday* from *tm\_mday*, *tm\_mon*, and *tm\_year*  
 113871 in *mkttime()*. Because it is stated as a (bidirectional) relationship, not a function, and because the  
 113872 conversion between month-day-year and day-of-year dates is presumed well known and is also  
 113873 a relationship, this is not a problem.

113874 Implementations that implement **time\_t** as a signed 32-bit integer will overflow in 2038. The  
 113875 data size for **time\_t** is as per the ISO C standard definition, which is implementation-defined.

113876 See also [Epoch](#) (on page 3327).

113877 The topic of whether seconds since the Epoch should account for leap seconds has been debated  
 113878 on a number of occasions, and each time consensus was reached (with acknowledged dissent  
 113879 each time) that the majority of users are best served by treating all days identically. (That is, the

113880 majority of applications were judged to assume a single length—as measured in seconds since  
 113881 the Epoch—for all days. Thus, leap seconds are not applied to seconds since the Epoch.) Those  
 113882 applications which do care about leap seconds can determine how to handle them in whatever  
 113883 way those applications feel is best. This was particularly emphasized because there was  
 113884 disagreement about what the best way of handling leap seconds might be. It is a practical  
 113885 impossibility to mandate that a conforming implementation must have a fixed relationship to  
 113886 any particular official clock (consider isolated systems, or systems performing “reruns” by  
 113887 setting the clock to some arbitrary time).

113888 Note that as a practical consequence of this, the length of a second as measured by some external  
 113889 standard is not specified. This unspecified second is nominally equal to an International System  
 113890 (SI) second in duration. Applications must be matched to a system that provides the particular  
 113891 handling of external time in the way required by the application.

113892 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/12 is applied, making an editorial  
 113893 correction to the paragraph commencing “How any changes to the value of seconds ...”.

#### 113894 **A.4.16 Semaphore**

113895 There is no additional rationale provided for this section.

#### 113896 **A.4.17 Thread-Safety**

113897 Where the interface of a function required by POSIX.1-200x precludes thread-safety, an alternate  
 113898 thread-safe form is provided. The names of these thread-safe forms are the same as the non-  
 113899 thread-safe forms with the addition of the suffix “\_r”. The suffix “\_r” is historical, where the  
 113900 ‘r’ stood for “reentrant”.

113901 In some cases, thread-safety is provided by restricting the arguments to an existing function.

113902 See also [Section B.2.9.1](#) (on page 3477).

#### 113903 **A.4.18 Tracing**

113904 Refer to [Section B.2.11](#) (on page 3492).

#### 113905 **A.4.19 Treatment of Error Conditions for Mathematical Functions**

113906 There is no additional rationale provided for this section.

#### 113907 **A.4.20 Treatment of NaN Arguments for Mathematical Functions**

113908 There is no additional rationale provided for this section.

#### 113909 **A.4.21 Utility**

113910 There is no additional rationale provided for this section.

113911 **A.4.22 Variable Assignment**

113912 There is no additional rationale provided for this section.

113913 **A.5 File Format Notation**

113914 The notation for spaces allows some flexibility for application output. Note that an empty  
 113915 character position in *format* represents one or more <blank>s on the output (not *white space*,  
 113916 which can include <newline>s). Therefore, another utility that reads that output as its input  
 113917 must be prepared to parse the data using *scanf()*, *awk*, and so on. The 'Δ' character is used  
 113918 when exactly one <space> is output.

113919 The treatment of integers and spaces is different from the *printf()* function in that they can be  
 113920 surrounded with <blank>s. This was done so that, given a format such as:

113921 `"%d\n", <foo>`113922 the implementation could use a *printf()* call such as:113923 `printf("%6d\n", foo);`113924 and still conform. This notation is thus somewhat like *scanf()* in addition to *printf()*.

113925 The *printf()* function was chosen as a model because most of the standard developers were  
 113926 familiar with it. One difference from the C function *printf()* is that the *l* and *h* conversion  
 113927 specifier characters are not used. As expressed by the Shell and Utilities volume of  
 113928 POSIX.1-200x, there is no differentiation between decimal values for type **int**, type **long**, or type  
 113929 **short**. The conversion specifications `%d` or `%i` should be interpreted as an arbitrary length  
 113930 sequence of digits. Also, no distinction is made between single precision and double precision  
 113931 numbers (**float** or **double** in C). These are simply referred to as floating-point numbers.

113932 Many of the output descriptions in the Shell and Utilities volume of POSIX.1-200x use the term  
 113933 "line", such as:

113934 `"%s", <input line>`

113935 Since the definition of *line* includes the trailing <newline> already, there is no need to include a  
 113936 '\n' in the format; a double <newline> would otherwise result.

113937 **A.6 Character Set**113938 **A.6.1 Portable Character Set**

113939 The portable character set is listed in full so there is no dependency on the ISO/IEC 646: 1991  
 113940 standard (or historically ASCII) encoded character set, although the set is identical to the  
 113941 characters defined in the International Reference version of the ISO/IEC 646: 1991 standard.

113942 POSIX.1-200x poses no requirement that multiple character sets or codesets be supported,  
 113943 leaving this as a marketing differentiation for implementors. Although multiple charmap files  
 113944 are supported, it is the responsibility of the implementation to provide the file(s); if only one is  
 113945 provided, only that one will be accessible using the *localedef -f* option.

113946 The statement about invariance in codesets for the portable character set is worded to avoid  
 113947 precluding implementations where multiple incompatible codesets are available (for instance,  
 113948 ASCII and EBCDIC). The standard utilities cannot be expected to produce predictable results if

113949 they access portable characters that vary on the same implementation.

113950 Not all character sets need include the portable character set, but each locale must include it. For  
 113951 example, a Japanese-based locale might be supported by a mixture of character sets: JIS X 0201  
 113952 Roman (a Japanese version of the ISO/IEC 646:1991 standard), JIS X 0208, and JIS X 0201  
 113953 Katakana. Not all of these character sets include the portable characters, but at least one does  
 113954 (JIS X 0201 Roman).

## 113955 **A.6.2 Character Encoding**

113956 Encoding mechanisms based on single shifts, such as the EUC encoding used in some Asian and  
 113957 other countries, can be supported via the current charmap mechanism. With single-shift  
 113958 encoding, each character is preceded by a shift code (SS2 or SS3). A complete EUC code,  
 113959 consisting of the portable character set (G0) and up to three additional character sets (G1, G2,  
 113960 G3), can be described using the current charmap mechanism; the encoding for each character in  
 113961 additional character sets G2 and G3 must then include their single-shift code. Other mechanisms  
 113962 to support locales based on encoding mechanisms such as locking shift are not addressed by this  
 113963 volume of POSIX.1-200x.

## 113964 **A.6.3 C Language Wide-Character Codes**

113965 The standard does not specify how wide characters are encoded or provide a method for  
 113966 defining wide characters in a charmap. It specifies ways of translating between wide characters  
 113967 and multi-byte characters. The standard does not prevent an extension from providing a method  
 113968 to define wide characters.

113969 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/13 is applied, adding a statement that the  
 113970 standard has no means of defining a wide-character codeset.

## 113971 **A.6.4 Character Set Description File**

113972 IEEE PASC Interpretation 1003.2 #196 is applied, removing three lines of text dealing with  
 113973 ranges of symbolic names using position constant values which had been erroneously included  
 113974 in the final IEEE P1003.2b draft standard.

113975 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/14 is applied, correcting the example and  
 113976 adding a statement that the standard provides no means of defining a wide-character codeset.

113977 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/15 is applied, allowing the value zero for  
 113978 the width value of **WIDTH** and **WIDTH\_DEFAULT**. This is required to cover some existing  
 113979 locales.

### 113980 **A.6.4.1 State-Dependent Character Encodings**

113981 A requirement was considered that would force utilities to eliminate any redundant locking  
 113982 shifts, but this was left as a quality of implementation issue.

113983 This change satisfies the following requirement from the ISO POSIX-2:1993 standard, Annex  
 113984 H.1:

113985 *The support of state-dependent (shift encoding) character sets should be addressed fully. See |*  
 113986 *descriptions of these in XBD Section 6.2 (on page 114). If such character encodings are supported, |*  
 113987 *it is expected that this will impact XBD Section 6.2 (on page 114), Chapter 7 (on page 121), |*  
 113988 *Chapter 9 (on page 167), and the comm, cut, diff, grep, head, join, paste, and tail utilities.*

113989 The character set description file provides:

113990 • The capability to describe character set attributes (such as collation order or character  
 113991 classes) independent of character set encoding, and using only the characters in the  
 113992 portable character set. This makes it possible to create generic *localedef* source files for all  
 113993 codesets that share the portable character set (such as the ISO 8859 family or IBM Extended  
 113994 ASCII).

113995 • Standardized symbolic names for all characters in the portable character set, making it  
 113996 possible to refer to any such character regardless of encoding.

113997 Implementations are free to choose their own symbolic names, as long as the names identified  
 113998 by the Base Definitions volume of POSIX.1-200x are also defined; this provides support for  
 113999 already existing “character names”.

114000 The names selected for the members of the portable character set follow the  
 114001 ISO/IEC 8859-1:1998 standard and the ISO/IEC 10646-1:2000 standard. However, several  
 114002 commonly used UNIX system names occur as synonyms in the list:

- 114003 • The historical UNIX system names are used for control characters.
- 114004 • The word “slash” is given in addition to “solidus”.
- 114005 • The word “backslash” is given in addition to “reverse-solidus”.
- 114006 • The word “hyphen” is given in addition to “hyphen-minus”.
- 114007 • The word “period” is given in addition to “full-stop”.
- 114008 • For digits, the word “digit” is eliminated.
- 114009 • For letters, the words “Latin Capital Letter” and “Latin Small Letter” are eliminated.
- 114010 • The words “left brace” and “right brace” are given in addition to “left-curly-bracket” and  
 114011 “right-curly-bracket”.
- 114012 • The names of the digits are preferred over the numbers to avoid possible confusion  
 114013 between ‘0’ and ‘O’, and between ‘1’ and ‘l’ (one and the letter ell).

114014 The names for the control characters in XBD [Chapter 6](#) (on page 111) were taken from the  
 114015 ISO/IEC 4873:1991 standard.

114016 The charmap file was introduced to resolve problems with the portability of, especially, *localedef*  
 114017 sources. POSIX.1-200x assumes that the portable character set is constant across all locales, but  
 114018 does not prohibit implementations from supporting two incompatible codings, such as both  
 114019 ASCII and EBCDIC. Such dual-support implementations should have all charmaps and *localedef*  
 114020 sources encoded using one portable character set, in effect cross-compiling for the other  
 114021 environment. Naturally, charmaps (and *localedef* sources) are only portable without  
 114022 transformation between systems using the same encodings for the portable character set. They  
 114023 can, however, be transformed between two sets using only a subset of the actual characters (the  
 114024 portable character set). However, the particular coded character set used for an application or an  
 114025 implementation does not necessarily imply different characteristics or collation; on the contrary,  
 114026 these attributes should in many cases be identical, regardless of codeset. The charmap provides  
 114027 the capability to define a common locale definition for multiple codesets (the same *localedef*  
 114028 source can be used for codesets with different extended characters; the ability in the charmap to  
 114029 define empty names allows for characters missing in certain codesets).

114030 The `<escape_char>` declaration was added at the request of the international community to ease  
 114031 the creation of portable charmap files on terminals not implementing the default backslash  
 114032 escape. The `<comment_char>` declaration was added at the request of the international  
 114033 community to eliminate the potential confusion between the number sign and the pound sign.

114034 The octal number notation with no leading zero required was selected to match those of *awk* and

114035 *tr* and is consistent with that used by *localedef*. To avoid confusion between an octal constant and  
 114036 the back-references used in *localedef* source, the octal, hexadecimal, and decimal constants must  
 114037 contain at least two digits. As single-digit constants are relatively rare, this should not impose  
 114038 any significant hardship. Provision is made for more digits to account for systems in which the  
 114039 byte size is larger than 8 bits. For example, a Unicode (ISO/IEC 10646-1:2000 standard) system  
 114040 that has defined 16-bit bytes may require six octal, four hexadecimal, and five decimal digits.

114041 The decimal notation is supported because some newer international standards define character  
 114042 values in decimal, rather than in the old column/row notation.

114043 The charmap identifies the coded character sets supported by an implementation. At least one  
 114044 charmap must be provided, but no implementation is required to provide more than one.  
 114045 Likewise, implementations can allow users to generate new charmaps (for instance, for a new  
 114046 version of the ISO 8859 family of coded character sets), but does not have to do so. If users are  
 114047 allowed to create new charmaps, the system documentation describes the rules that apply (for  
 114048 instance, “only coded character sets that are supersets of the ISO/IEC 646:1991 standard IRV, no  
 114049 multi-byte characters”).

114050 This addition of the **WIDTH** specification satisfies the following requirement from the  
 114051 ISO POSIX-2:1993 standard, Annex H.1:

114052 (9) *The definition of column position relies on the implementation’s knowledge of the integral*  
 114053 *width of the characters. The charmap or LC\_CTYPE locale definitions should be enhanced to*  
 114054 *allow application specification of these widths.*

114055 The character “width” information was first considered for inclusion under *LC\_CTYPE* but was  
 114056 moved because it is more closely associated with the information in the charmap than  
 114057 information in the locale source (cultural conventions information). Concerns were raised that  
 114058 formalizing this type of information is moving the locale source definition from the codeset-  
 114059 independent entity that it was designed to be to a repository of codeset-specific information. A  
 114060 similar issue occurred with the `<code_set_name>`, `<mb_cur_max>`, and `<mb_cur_min>`  
 114061 information, which was resolved to reside in the charmap definition.

114062 The width definition was added to the IEEE P1003.2b draft standard with the intent that the  
 114063 *wcswidth()* and/or *wcwidth()* functions (currently specified in the System Interfaces volume of  
 114064 POSIX.1-200x) be the mechanism to retrieve the character width information.

## 114065 **A.7 Locale**

### 114066 **A.7.1 General**

114067 The description of locales is based on work performed in the UniForum Technical Committee,  
 114068 Subcommittee on Internationalization. Wherever appropriate, keywords are taken from the  
 114069 ISO C standard or the X/Open Portability Guide.

114070 The value used to specify a locale with environment variables is the name specified as the *name*  
 114071 operand to the *localedef* utility when the locale was created. This provides a verifiable method to  
 114072 create and invoke a locale.

114073 The “object” definitions need not be portable, as long as “source” definitions are. Strictly  
 114074 speaking, source definitions are portable only between implementations using the same  
 114075 character set(s). Such source definitions, if they use symbolic names only, easily can be ported  
 114076 between systems using different codesets, as long as the characters in the portable character set

114077 (see XBD Section 6.1, on page 111) have common values between the codesets; this is frequently |  
 114078 the case in historical implementations. Of source, this requires that the symbolic names used for |  
 114079 characters outside the portable character set be identical between character sets. The definition |  
 114080 of symbolic names for characters is outside the scope of POSIX.1-200x, but is certainly within the |  
 114081 scope of other standards organizations.

114082 Applications can select the desired locale by invoking the *setlocale()* function (or equivalent) |  
 114083 with the appropriate value. If the function is invoked with an empty string, the value of the |  
 114084 corresponding environment variable is used. If the environment variable is not set or is set to the |  
 114085 empty string, the implementation sets the appropriate environment as defined in XBD Chapter 8 |  
 114086 (on page 159).

## 114087 A.7.2 POSIX Locale

114088 The POSIX locale is equal to the C locale. To avoid being classified as a C-language function, the |  
 114089 name has been changed to the POSIX locale; the environment variable value can be either |  
 114090 "POSIX" or, for historical reasons, "C".

114091 The POSIX definitions mirror the historical UNIX system behavior.

114092 The use of symbolic names for characters in the tables does not imply that the POSIX locale must |  
 114093 be described using symbolic character names, but merely that it may be advantageous to do so.

## 114094 A.7.3 Locale Definition

114095 The decision to separate the file format from the *localedef* utility description was only partially |  
 114096 editorial. Implementations may provide other interfaces than *localedef*. Requirements on "the |  
 114097 utility", mostly concerning error messages, are described in this way because they are meant to |  
 114098 affect the other interfaces implementations may provide as well as *localedef*.

114099 The text about POSIX2\_LOCALEDEF does not mean that internationalization is optional; only |  
 114100 that the functionality of the *localedef* utility is. REs, for instance, must still be able to recognize, |  
 114101 for example, character class expressions such as "[[:alpha:]]". A possible analogy is with |  
 114102 an applications development environment; while all conforming implementations must be |  
 114103 capable of executing applications, not all need to have the development environment installed. |  
 114104 The assumption is that the capability to modify the behavior of utilities (and applications) via |  
 114105 locale settings must be supported. If the *localedef* utility is not present, then the only choice is to |  
 114106 select an existing (presumably implementation-documented) locale. An implementation could, |  
 114107 for example, choose to support only the POSIX locale, which would in effect limit the amount of |  
 114108 changes from historical implementations quite drastically. The *localedef* utility is still required, |  
 114109 but would always terminate with an exit code indicating that no locale could be created. |  
 114110 Supported locales must be documented using the syntax defined in this chapter. (This ensures |  
 114111 that users can accurately determine what capabilities are provided. If the implementation |  
 114112 decides to provide additional capabilities to the ones in this chapter, that is already provided |  
 114113 for.)

114114 If the option is present (that is, locales can be created), then the *localedef* utility must be capable |  
 114115 of creating locales based on the syntax and rules defined in this chapter. This does not mean that |  
 114116 the implementation cannot also provide alternate means for creating locales.

114117 The octal, decimal, and hexadecimal notations are the same employed by the charmap facility |  
 114118 (see XBD Section 6.4, on page 115). To avoid confusion between an octal constant and a back- |  
 114119 reference, the octal, hexadecimal, and decimal constants must contain at least two digits. As |  
 114120 single-digit constants are relatively rare, this should not impose any significant hardship. |  
 114121 Provision is made for more digits to account for systems in which the byte size is larger than 8 |  
 114122 bits. For example, a Unicode (see the ISO/IEC 10646-1:2000 standard) system that has defined |

114123 16-bit bytes may require six octal, four hexadecimal, and five decimal digits. As with the  
 114124 charmap file, multi-byte characters are described in the locale definition file using “big-endian”  
 114125 notation for reasons of portability. There is no requirement that the internal representation in the  
 114126 computer memory be in this same order.

114127 One of the guidelines used for the development of this volume of POSIX.1-200x is that  
 114128 characters outside the invariant part of the ISO/IEC 646:1991 standard should not be used in  
 114129 portable specifications. The backslash character is not in the invariant part; the number sign is,  
 114130 but with multiple representations: as a number sign, and as a pound sign. As far as general  
 114131 usage of these symbols, they are covered by the “grandfather clause”, but for newly defined  
 114132 interfaces, the WG15 POSIX working group has requested that POSIX provide alternate  
 114133 representations. Consequently, while the default escape character remains the backslash and the  
 114134 default comment character is the number sign, implementations are required to recognize  
 114135 alternative representations, identified in the applicable source file via the `<escape_char>` and  
 114136 `<comment_char>` keywords.

### 114137 A.7.3.1 *LC\_CTYPE*

114138 The *LC\_CTYPE* category is primarily used to define the encoding-independent aspects of a  
 114139 character set, such as character classification. In addition, certain encoding-dependent  
 114140 characteristics are also defined for an application via the *LC\_CTYPE* category. POSIX.1-200x  
 114141 does not mandate that the encoding used in the locale is the same as the one used by the  
 114142 application because an implementation may decide that it is advantageous to define locales in a  
 114143 system-wide encoding rather than having multiple, logically identical locales in different  
 114144 encodings, and to convert from the application encoding to the system-wide encoding on usage.  
 114145 Other implementations could require encoding-dependent locales.

114146 In either case, the *LC\_CTYPE* attributes that are directly dependent on the encoding, such as  
 114147 `<mb_cur_max>` and the display width of characters, are not user-specifiable in a locale source  
 114148 and are consequently not defined as keywords.

114149 Implementations may define additional keywords or extend the *LC\_CTYPE* mechanism to allow  
 114150 application-defined keywords.

114151 The text “The ellipsis specification shall only be valid within a single encoded character set” is  
 114152 present because it is possible to have a locale supported by multiple character encodings, as  
 114153 explained in the rationale for XBD [Section 6.1](#) (on page 111). An example given there is of a  
 114154 possible Japanese-based locale supported by a mixture of the character sets JIS X 0201 Roman,  
 114155 JIS X 0208, and JIS X 0201 Katakana. Attempting to express a range of characters across these sets  
 114156 is not logical and the implementation is free to reject such attempts.

114157 As the *LC\_CTYPE* character classes are based on the ISO C standard character class definition,  
 114158 the category does not support multi-character elements. For instance, the German character  
 114159 `<sharp-s>` is traditionally classified as a lowercase letter. There is no corresponding uppercase  
 114160 letter; in proper capitalization of German text, the `<sharp-s>` will be replaced by “SS”; that is, by  
 114161 two characters. This kind of conversion is outside the scope of the **toupper** and **tolower**  
 114162 keywords.

114163 Where POSIX.1-200x specifies that only certain characters can be specified, as for the keywords  
 114164 **digit** and **xdigit**, the specified characters must be from the portable character set, as shown. As  
 114165 an example, only the Arabic digits 0 through 9 are acceptable as digits.

114166 The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included  
 114167 characters. These only need to be specified if the character values (that is, encoding) differs from  
 114168 the implementation default values. It is not possible to define a locale without these  
 114169 automatically included characters unless some implementation extension is used to prevent  
 114170 their inclusion. Such a definition would not be a proper superset of the C locale, and thus, it

114171 might not be possible for the standard utilities to be implemented as programs conforming to  
114172 the ISO C standard.

114173 The definition of character class **digit** requires that only ten characters—the ones defining  
114174 digits—can be specified; alternate digits (for example, Hindi or Kanji) cannot be specified here.  
114175 However, the encoding may vary if an implementation supports more than one encoding.

114176 The definition of character class **xdigit** requires that the characters included in character class  
114177 **digit** are included here also and allows for different symbols for the hexadecimal digits 10  
114178 through 15.

114179 The inclusion of the **charclass** keyword satisfies the following requirement from the  
114180 ISO POSIX-2: 1993 standard, Annex H.1:

114181 (3) *The LC\_CTYPE (2.5.2.1) locale definition should be enhanced to allow user-specified additional*  
114182 *character classes, similar in concept to the ISO C standard Multibyte Support Extension (MSE)*  
114183 *iswctype() function.*

114184 This keyword was previously included in The Open Group specifications and is now mandated  
114185 in the Shell and Utilities volume of POSIX.1-200x.

114186 The symbolic constant {CHARCLASS\_NAME\_MAX} was also adopted from The Open Group  
114187 specifications. Applications portability is enhanced by the use of symbolic constants.

#### 114188 A.7.3.2 LC\_COLLATE

114189 The rules governing collation depend to some extent on the use. At least five different levels of  
114190 increasingly complex collation rules can be distinguished:

- 114191 1. *Byte/machine code order*: This is the historical collation order in the UNIX system and many  
114192 proprietary operating systems. Collation is here performed character by character,  
114193 without any regard to context. The primary virtue is that it usually is quite fast and also  
114194 completely deterministic; it works well when the native machine collation sequence  
114195 matches the user expectations.
- 114196 2. *Character order*: On this level, collation is also performed character by character, without  
114197 regard to context. The order between characters is, however, not determined by the code  
114198 values, but on the expectations by the user of the “correct” order between characters. In  
114199 addition, such a (simple) collation order can specify that certain characters collate equally  
114200 (for example, uppercase and lowercase letters).
- 114201 3. *String ordering*: On this level, entire strings are compared based on relatively  
114202 straightforward rules. Several “passes” may be required to determine the order between  
114203 two strings. Characters may be ignored in some passes, but not in others; the strings may  
114204 be compared in different directions; and simple string substitutions may be performed  
114205 before strings are compared. This level is best described as “dictionary” ordering; it is  
114206 based on the spelling, not the pronunciation, or meaning, of the words.
- 114207 4. *Text search ordering*: This is a further refinement of the previous level, best described as  
114208 “telephone book ordering”; some common homonyms (words spelled differently but  
114209 with the same pronunciation) are collated together; numbers are collated as if they were  
114210 spelled out, and so on.
- 114211 5. *Semantic-level ordering*: Words and strings are collated based on their meaning; entire  
114212 words (such as “the”) are eliminated; the ordering is not deterministic. This usually  
114213 requires special software and is highly dependent on the intended use.

114214 While the historical collation order formally is at level 1, for the English language it corresponds

114215 roughly to elements at level 2. The user expects to see the output from the *ls* utility sorted very  
 114216 much as it would be in a dictionary. While telephone book ordering would be an optimal goal  
 114217 for standard collation, this was ruled out as the order would be language-dependent.  
 114218 Furthermore, a requirement was that the order must be determined solely from the text string  
 114219 and the collation rules; no external information (for example, “pronunciation dictionaries”)  
 114220 could be required.

114221 As a result, the goal for the collation support is at level 3. This also matches the requirements for  
 114222 the Canadian collation order, as well as other, known collation requirements for alphabetic  
 114223 scripts. It specifically rules out collation based on pronunciation rules or based on semantic  
 114224 analysis of the text.

114225 The syntax for the *LC\_COLLATE* category source meets the requirements for level 3 and has  
 114226 been verified to produce the correct result with examples based on French, Canadian, and  
 114227 Danish collation order. Because it supports multi-character collating elements, it is also capable  
 114228 of supporting collation in codesets where a character is expressed using non-spacing characters  
 114229 followed by the base character (such as the ISO/IEC 6937:2001 standard).

114230 The directives that can be specified in an operand to the **order\_start** keyword are based on the  
 114231 requirements specified in several proposed standards and in customary use. The following is a  
 114232 rephrasing of rules defined for “lexical ordering in English and French” by the Canadian  
 114233 Standards Association (the text in square brackets is rephrased):

- 114234 • Once special characters [punctuation] have been removed from original strings, the  
 114235 ordering is determined by scanning forwards (left to right) [disregarding case and  
 114236 diacriticals].
- 114237 • In case of equivalence, special characters are once again removed from original strings and  
 114238 the ordering is determined by scanning backwards (starting from the rightmost character  
 114239 of the string and back), character by character [disregarding case but considering  
 114240 diacriticals].
- 114241 • In case of repeated equivalence, special characters are removed again from original strings  
 114242 and the ordering is determined by scanning forwards, character by character [considering  
 114243 both case and diacriticals].
- 114244 • If there is still an ordering equivalence after the first three rules have been applied, then  
 114245 only special characters and the position they occupy in the string are considered to  
 114246 determine ordering. The string that has a special character in the lowest position comes  
 114247 first. If two strings have a special character in the same position, the character [with the  
 114248 lowest collation value] comes first. In case of equality, the other special characters are  
 114249 considered until there is a difference or until all special characters have been exhausted.

114250 It is estimated that this part of POSIX.1-200x covers the requirements for all European  
 114251 languages, and no particular problems are anticipated with Slavic or Middle East character sets.

114252 The Far East (particularly Japanese/Chinese) collations are often based on contextual  
 114253 information and pronunciation rules (the same ideogram can have different meanings and  
 114254 different pronunciations). Such collation, in general, falls outside the desired goal of  
 114255 POSIX.1-200x. There are, however, several other collation rules (stroke/radical or “most  
 114256 common pronunciation”) that can be supported with the mechanism described here.

114257 The character order is defined by the order in which characters and elements are specified  
 114258 between the **order\_start** and **order\_end** keywords. Weights assigned to the characters and  
 114259 elements define the collation sequence; in the absence of weights, the character order is also the  
 114260 collation sequence.

114261 The **position** keyword provides the capability to consider, in a compare, the relative position of

114262 characters not subject to **IGNORE**. As an example, consider the two strings "o-ring" and  
 114263 "or-ing". Assuming the hyphen is subject to **IGNORE** on the first pass, the two strings  
 114264 compare equal, and the position of the hyphen is immaterial. On second pass, all characters  
 114265 except the hyphen are subject to **IGNORE**, and in the normal case the two strings would again  
 114266 compare equal. By taking position into account, the first collates before the second.

### 114267 A.7.3.3 LC\_MONETARY

114268 The currency symbol does not appear in *LC\_MONETARY* because it is not defined in the C  
 114269 locale of the ISO C standard.

114270 The ISO C standard limits the size of decimal points and thousands delimiters to single-byte  
 114271 values. In locales based on multi-byte coded character sets, this cannot be enforced;  
 114272 POSIX.1-200x does not prohibit such characters, but makes the behavior unspecified (in the text  
 114273 "In contexts where other standards ...").

114274 The grouping specification is based on, but not identical to, the ISO C standard. The -1 indicates  
 114275 that no further grouping is performed; the equivalent of {CHAR\_MAX} in the ISO C standard.

114276 The text "the value is not available in the locale" is taken from the ISO C standard and is used  
 114277 instead of the "unspecified" text in early proposals. There is no implication that omitting these  
 114278 keywords or assigning them values of " " or -1 produces unspecified results; such omissions or  
 114279 assignments eliminate the effects described for the keyword or produce zero-length strings, as  
 114280 appropriate.

114281 The locale definition is an extension of the ISO C standard *localeconv()* specification. In  
 114282 particular, rules on how **currency\_symbol** is treated are extended to also cover **int\_curr\_symbol**,  
 114283 and **p\_sep\_by\_space** and **n\_sep\_by\_space** have been augmented with the value 2, which places  
 114284 a <space> between the sign and the symbol. This has been updated to match the  
 114285 ISO/IEC 9899:1999 standard requirements and is an incompatible change from UNIX 98 and the  
 114286 ISO POSIX-2 standard and the ISO POSIX-1:1996 standard requirements. The following table  
 114287 shows the result of various combinations:

|                   |                 | p_sep_by_space |           |          |
|-------------------|-----------------|----------------|-----------|----------|
|                   |                 | 2              | 1         | 0        |
| p_cs_precedes = 1 | p_sign_posn = 0 | (\$1,25)       | (\$ 1.25) | (\$1.25) |
|                   | p_sign_posn = 1 | + \$1.25       | +\$ 1.25  | +\$1.25  |
|                   | p_sign_posn = 2 | \$1.25 +       | \$ 1.25+  | \$1.25+  |
|                   | p_sign_posn = 3 | + \$1.25       | +\$ 1.25  | +\$1.25  |
|                   | p_sign_posn = 4 | \$ +1.25       | +\$ 1.25  | +\$1.25  |
| p_cs_precedes = 0 | p_sign_posn = 0 | (1.25 \$)      | (1.25 \$) | (1.25\$) |
|                   | p_sign_posn = 1 | +1.25 \$       | +1.25 \$  | +1.25\$  |
|                   | p_sign_posn = 2 | 1.25\$ +       | 1.25 \$+  | 1.25\$+  |
|                   | p_sign_posn = 3 | 1.25+ \$       | 1.25 +\$  | 1.25+\$  |
|                   | p_sign_posn = 4 | 1.25\$ +       | 1.25 \$+  | 1.25\$+  |

114300 The following is an example of the interpretation of the **mon\_grouping** keyword. Assuming that  
 114301 the value to be formatted is 123 456 789 and the **mon\_thousands\_sep** is ' ', then the following  
 114302 table shows the result. The third column shows the equivalent string in the ISO C standard that  
 114303 would be used by the *localeconv()* function to accommodate this grouping.

|        | mon_grouping | Formatted Value | ISO C String |
|--------|--------------|-----------------|--------------|
| 114304 | 3;-1         | 123456'789      | "\3\177"     |
| 114305 | 3            | 123'456'789     | "\3"         |
| 114306 | 3;2;-1       | 1234'56'789     | "\3\2\177"   |
| 114307 | 3;2          | 12'34'56'789    | "\3\2"       |
| 114308 | -1           | 123456789       | "\177"       |

114310 In these examples, the octal value of {CHAR\_MAX} is 177.

114311 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/6 adds a correction that permits the Euro  
114312 currency symbol and addresses extensibility. The correction is stated using the term "should"  
114313 intentionally, in order to make this a recommendation rather than a restriction on  
114314 implementations. This allows for flexibility in implementations on how they handle future  
114315 currency symbol additions.

114316 IEEE Std 1003.1-2001/Cor 1-2002, tem XBD/TC1/D6/5 is applied, adding the `int_[np]_*` values  
114317 to the POSIX locale definition of `LC_MONETARY`.

114318 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/16 is applied, updating the descriptions  
114319 of `p_sep_by_space`, `n_sep_by_space`, `int_p_sep_by_space`, and `int_n_sep_by_space` to match  
114320 the description of these keywords in the ISO C standard and the System Interfaces volume of  
114321 POSIX.1-200x, `localeconv()`.

#### 114322 A.7.3.4 `LC_NUMERIC`

114323 See the rationale for `LC_MONETARY` for a description of the behavior of grouping.

#### 114324 A.7.3.5 `LC_TIME`

114325 Although certain of the conversion specifications in the POSIX locale (such as the name of the  
114326 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
114327 using these conversion specifications may need to adjust the capitalization if the output is going  
114328 to be used at the beginning of a sentence.

114329 The `LC_TIME` descriptions of `abday`, `day`, `mon`, and `abmon` imply a Gregorian style calendar  
114330 (7-day weeks, 12-month years, leap years, and so on). Formatting time strings for other types of  
114331 calendars is outside the scope of POSIX.1-200x.

114332 While the ISO 8601:2000 standard numbers the weekdays starting with Monday, historical  
114333 practice is to use the Sunday as the first day. Rather than change the order and introduce  
114334 potential confusion, the days must be specified beginning with Sunday; previous references to  
114335 "first day" have been removed. Note also that the Shell and Utilities volume of POSIX.1-200x  
114336 `date` utility supports numbering compliant with the ISO 8601:2000 standard.

114337 As specified under `date` in the Shell and Utilities volume of POSIX.1-200x and `strftime()` in the  
114338 System Interfaces volume of POSIX.1-200x, the conversion specifications corresponding to the  
114339 optional keywords consist of a modifier followed by a traditional conversion specification (for  
114340 instance, `%Ex`). If the optional keywords are not supported by the implementation or are  
114341 unspecified for the current locale, these modified conversion specifications are treated as the  
114342 traditional conversion specifications. For example, assume the following keywords:

```
114343 alt_digits "0th"; "1st"; "2nd"; "3rd"; "4th"; "5th"; \
114344 "6th"; "7th"; "8th"; "9th"; "10th"

114345 d_fmt "The %Od day of %B in %Y"
```

114346 On July 4th 1776, the `%x` conversion specifications would result in "The 4th day of July  
114347 in 1776", while on July 14th 1789 it would result in "The 14 day of July in 1789". It

114348 can be noted that the above example is for illustrative purposes only; the %O modifier is  
114349 primarily intended to provide for Kanji or Hindi digits in *date* formats.

114350 The following is an example for Japan that supports the current plus last three Emperors and  
114351 reverts to Western style numbering for years prior to the Meiji era. The example also allows for  
114352 the custom of using a special name for the first year of an era instead of using 1. (The examples  
114353 substitute romaji where kanji should be used.)

```
114354 era_d_fmt "%EY%mgatsu%dnichi (%a)"
114355 era "+:2:1990/01/01:+*:Heisei:%EC%Eynen";\
114356 "+:1:1989/01/08:1989/12/31:Heisei:%ECgannen";\
114357 "+:2:1927/01/01:1989/01/07:Shouwa:%EC%Eynen";\
114358 "+:1:1926/12/25:1926/12/31:Shouwa:%ECgannen";\
114359 "+:2:1913/01/01:1926/12/24:Taishou:%EC%Eynen";\
114360 "+:1:1912/07/30:1912/12/31:Taishou:%ECgannen";\
114361 "+:2:1869/01/01:1912/07/29:Meiji:%EC%Eynen";\
114362 "+:1:1868/09/08:1868/12/31:Meiji:%ECgannen";\
114363 "-:1868:1868/09/07:-*::%Ey"
```

114364 Assuming that the current date is September 21, 1991, a request to *date* or *strftime()* would yield  
114365 the following results:

```
114366 %Ec - Heisei3nen9gatsu2lnichi (Sat) 14:39:26
114367 %EC - Heisei
114368 %Ex - Heisei3nen9gatsu2lnichi (Sat)
114369 %Ey - 3
114370 %EY - Heisei3nen
```

114371 Example era definitions for the Republic of China:

```
114372 era "+:2:1913/01/01:+*:ChungHwaMingGuo:%EC%EyNen";\
114373 "+:1:1912/1/1:1912/12/31:ChungHwaMingGuo:%EYuenNen";\
114374 "+:1:1911/12/31:-*:MingChien:%EC%EyNen"
```

114375 Example definitions for the Christian Era:

```
114376 era "+:1:0001/01/01:+*:AD:%EC %Ey";\
114377 "+:1:-0001/12/31:-*:BC:%Ey %EC"
```

#### 114378 A.7.3.6 LC\_MESSAGES

114379 The **yesstr** and **nostr** locale keywords and the YESSTR and NOSTR *langinfo* items were formerly  
114380 used to match user affirmative and negative responses. In POSIX.1-200x, the **yesexpr**, **noexpr**,  
114381 YESEXPR, and NOEXPR extended regular expressions have replaced them. Applications  
114382 should use the general locale-based messaging facilities to issue prompting messages which  
114383 include sample desired responses.

### 114384 A.7.4 Locale Definition Grammar

114385 There is no additional rationale provided for this section.

114386 A.7.4.1 *Locale Lexical Conventions*

114387 There is no additional rationale provided for this section.

114388 A.7.4.2 *Locale Grammar*

114389 There is no additional rationale provided for this section.

114390 **A.7.5 Locale Definition Example**

114391 The following is an example of a locale definition file that could be used as input to the *localedef*  
 114392 utility. It assumes that the utility is executed with the *-f* option, naming a charmap file with (at  
 114393 least) the following content:

```

114394 CHARMAP
114395 <space> \x20
114396 <dollar> \x24
114397 <A> \101
114398 <a> \141
114399 <A-acute> \346
114400 <a-acute> \365
114401 <A-grave> \300
114402 <a-grave> \366
114403 \142
114404 <C> \103
114405 <c> \143
114406 <c-cedilla> \347
114407 <d> \x64
114408 <H> \110
114409 <h> \150
114410 <eszet> \xb7
114411 <s> \x73
114412 <z> \x7a
114413 END CHARMAP

```

114414 It should not be taken as complete or to represent any actual locale, but only to illustrate the  
 114415 syntax.

```

114416 #
114417 LC_CTYPE
114418 lower <a>;;<c>;<c-cedilla>;<d>;...;<z>
114419 upper A;B;C;Ç;...;Z
114420 space \x20;\x09;\x0a;\x0b;\x0c;\x0d
114421 blank \040;\011
114422 toupper (<a>,<A>);(b,B);(c,C);(ç,Ç);(d,D);(z,Z)
114423 END LC_CTYPE
114424 #
114425 LC_COLLATE
114426 #
114427 # The following example of collation is based on
114428 # Canadian standard Z243.4.1-1998, "Canadian Alphanumeric
114429 # Ordering Standard for Character Sets of CSA Z234.4 Standard".
114430 # (Other parts of this example locale definition file do not
114431 # purport to relate to Canada, or to any other real culture.)
114432 # The proposed standard defines a 4-weight collation, such that
114433 # in the first pass, characters are compared without regard to

```

```

114434 # case or accents; in the second pass, backwards-compare without
114435 # regard to case; in the third pass, forwards-compare without
114436 # regard to diacriticals. In the 3 first passes, non-alphabetic
114437 # characters are ignored; in the fourth pass, only special
114438 # characters are considered, such that "The string that has a
114439 # special character in the lowest position comes first. If two
114440 # strings have a special character in the same position, the
114441 # collation value of the special character determines ordering.
114442 #
114443 # Only a subset of the character set is used here; mostly to
114444 # illustrate the set-up.
114445 #
114446 collating-symbol <NULL>
114447 collating-symbol <LOW_VALUE>
114448 collating-symbol <LOWER-CASE>
114449 collating-symbol <SUBSCRIPT-LOWER>
114450 collating-symbol <SUPERSCRIPT-LOWER>
114451 collating-symbol <UPPER-CASE>
114452 collating-symbol <NO-ACCENT>
114453 collating-symbol <PECULIAR>
114454 collating-symbol <LIGATURE>
114455 collating-symbol <ACUTE>
114456 collating-symbol <GRAVE>
114457 # Further collating-symbols follow.
114458 #
114459 # Properly, the standard does not include any multi-character
114460 # collating elements; the one below is added for completeness.
114461 #
114462 collating_element <ch> from "<c><h>"
114463 collating_element <CH> from "<C><H>"
114464 collating_element <Ch> from "<C><h>"
114465 #
114466 order_start forward;backward;forward;forward,position
114467 #
114468 # Collating symbols are specified first in the sequence to allocate
114469 # basic collation values to them, lower than that of any character.
114470 <NULL>
114471 <LOW_VALUE>
114472 <LOWER-CASE>
114473 <SUBSCRIPT-LOWER>
114474 <SUPERSCRIPT-LOWER>
114475 <UPPER-CASE>

## 114564 A.8 Environment Variables

### 114565 A.8.1 Environment Variable Definition

114566 The variable *environ* is not intended to be declared in any header, but rather to be declared by  
 114567 the user for accessing the array of strings that is the environment. This is the traditional usage of  
 114568 the symbol. Putting it into a header could break some programs that use the symbol for their  
 114569 own purposes.

114570 The decision to restrict conforming systems to the use of digits, uppercase letters, and  
 114571 underscores for environment variable names allows applications to use lowercase letters in their  
 114572 environment variable names without conflicting with any conforming system.

114573 In addition to the obvious conflict with the shell syntax for positional parameter substitution,  
 114574 some historical applications (including some shells) exclude names with leading digits from the  
 114575 environment.

## 114576 A.8.2 Internationalization Variables

114577 Utilities conforming to the Shell and Utilities volume of POSIX.1-200x and written in standard C  
114578 can access the locale variables by issuing the following call:

```
114579 setlocale(LC_ALL, " ")
```

114580 If this were omitted, the ISO C standard specifies that the C locale would be used.

114581 The DESCRIPTION of *setlocale()* requires that when setting all categories of a locale, if the value  
114582 of any of the environment variable searches yields a locale that is not supported (and non-null),  
114583 the *setlocale()* function returns a null pointer and the locale of the process is unchanged.

114584 For the standard utilities, if any of the environment variables are invalid, it makes sense to  
114585 default to an implementation-defined, consistent locale environment. It is more confusing for a  
114586 user to have partial settings occur in case of a mistake. All utilities would then behave in one  
114587 language/cultural environment. Furthermore, it provides a way of forcing the whole  
114588 environment to be the implementation-defined default. Disastrous results could occur if a  
114589 pipeline of utilities partially uses the environment variables in different ways. In this case, it  
114590 would be appropriate for utilities that use *LANG* and related variables to exit with an error if  
114591 any of the variables are invalid. For example, users typing individual commands at a terminal  
114592 might want *date* to work if *LC\_MONETARY* is invalid as long as *LC\_TIME* is valid. Since these  
114593 are conflicting reasonable alternatives, POSIX.1-200x leaves the results unspecified if the locale  
114594 environment variables would not produce a complete locale matching the specification of the  
114595 user.

114596 The locale settings of individual categories cannot be truly independent and still guarantee  
114597 correct results. For example, when collating two strings, characters must first be extracted from  
114598 each string (governed by *LC\_CTYPE*) before being mapped to collating elements (governed by  
114599 *LC\_COLLATE*) for comparison. That is, if *LC\_CTYPE* is causing parsing according to the rules of  
114600 a large, multi-byte code set (potentially returning 20 000 or more distinct character codeset  
114601 values), but *LC\_COLLATE* is set to handle only an 8-bit codeset with 256 distinct characters,  
114602 meaningful results are obviously impossible.

114603 The *LC\_MESSAGES* variable affects the language of messages generated by the standard  
114604 utilities.

114605 The description of the environment variable names starting with the characters "LC\_"  
114606 acknowledges the fact that the interfaces presented may be extended as new international  
114607 functionality is required. In the ISO C standard, names preceded by "LC\_" are reserved in the  
114608 name space for future categories.

114609 To avoid name clashes, new categories and environment variables are divided into two  
114610 classifications: "implementation-independent" and "implementation-defined".

114611 Implementation-independent names will have the following format:

```
114612 LC_NAME
```

114613 where *NAME* is the name of the new category and environment variable. Capital letters must be  
114614 used for implementation-independent names.

114615 Implementation-defined names must be in lowercase letters, as below:

```
114616 LC_name
```

### 114617 A.8.3 Other Environment Variables

#### 114618 COLUMNS, LINES

114619 The default values for the number of column positions, *COLUMNS*, and screen height, *LINES*,  
 114620 are unspecified because historical implementations use different methods to determine values  
 114621 corresponding to the size of the screen in which the utility is run. This size is typically known to  
 114622 the implementation through the value of *TERM*, or by more elaborate methods such as  
 114623 extensions to the *stty* utility or knowledge of how the user is dynamically resizing windows on a  
 114624 bit-mapped display terminal. Users should not need to set these variables in the environment  
 114625 unless there is a specific reason to override the default behavior of the implementation, such as  
 114626 to display data in an area arbitrarily smaller than the terminal or window. Values for these  
 114627 variables that are not decimal integers greater than zero are implicitly undefined values; it is  
 114628 unnecessary to enumerate all of the possible values outside of the acceptable set.

#### 114629 LOGNAME

114630 In most implementations, the value of such a variable is easily forged, so security-critical  
 114631 applications should rely on other means of determining user identity. *LOGNAME* is required to  
 114632 be constructed from the portable filename character set for reasons of interchange. No diagnostic  
 114633 condition is specified for violating this rule, and no requirement for enforcement exists. The  
 114634 intent of the requirement is that if extended characters are used, the “guarantee” of portability  
 114635 implied by a standard is void.

#### 114636 PATH

114637 Many historical implementations of the Bourne shell do not interpret a trailing colon to  
 114638 represent the current working directory and are thus non-conforming. The C Shell and the  
 114639 KornShell conform to POSIX.1-200x on this point. The usual name of dot may also be used to  
 114640 refer to the current working directory.

114641 Many implementations historically have used a default value of */bin* and */usr/bin* for the *PATH*  
 114642 variable. POSIX.1-200x does not mandate this default path be identical to that retrieved from  
 114643 *getconf PATH* because it is likely that the standardized utilities may be provided in another  
 114644 directory separate from the directories used by some historical applications.

#### 114645 SHELL

114646 The *SHELL* variable names the preferred shell of the user; it is a guide to applications. There is  
 114647 no direct requirement that that shell conform to POSIX.1-200x; that decision should rest with the  
 114648 user. It is the intention of the standard developers that alternative shells be permitted, if the user  
 114649 chooses to develop or acquire one. An operating system that builds its shell into the “kernel” in  
 114650 such a manner that alternative shells would be impossible does not conform to the spirit of  
 114651 POSIX.1-200x.

#### 114652 TZ

114653 The quoted form of the timezone variable allows timezone names of the form UTC+1 (or any  
 114654 name that contains the character plus ('+'), the character minus ('-'), or digits), which may be  
 114655 appropriate for countries that do not have an official timezone name. It would be coded as  
 114656 <UTC+1>+1<UTC+2>, which would cause *std* to have a value of UTC+1 and *dst* a value of  
 114657 UTC+2, each with a length of 5 characters. This does not appear to conflict with any existing  
 114658 usage. The characters '<' and '>' were chosen for quoting because they are easier to parse  
 114659 visually than a quoting character that does not provide some sense of bracketing (and in a string  
 114660 like this, such bracketing is helpful). They were also chosen because they do not need special  
 114661 treatment when assigning to the *TZ* variable. Users are often confused by embedding quotes in a

114662 string. Because '`<`' and '`>`' are meaningful to the shell, the whole string would have to be  
 114663 quoted, but that is easily explained. (Parentheses would have presented the same problems.)  
 114664 Although the '`>`' symbol could have been permitted in the string by either escaping it or  
 114665 doubling it, it seemed of little value to require that. This could be provided as an extension if  
 114666 there was a need. Timezone names of this new form lead to a requirement that the value of  
 114667 `{_POSIX_TZNAME_MAX}` change from 3 to 6.

114668 Since the *TZ* environment variable is usually inherited by all applications started by a user after  
 114669 the value of the *TZ* environment variable is changed and since many applications run using the  
 114670 C or POSIX locale, using characters that are not in the portable character set in the *std* and *dst*  
 114671 fields could cause unexpected results.

114672 The format of the *TZ* environment variable is changed in Issue 6 to allow for the quoted form, as  
 114673 defined in earlier versions of the ISO POSIX-1 standard.

114674 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/7 is applied, adding the *ctime\_r()* and  
 114675 *localtime\_r()* functions to the list of functions that use the *TZ* environment variable.

## 114676 A.9 Regular Expressions

114677 Rather than repeating the description of REs for each utility supporting REs, the standard  
 114678 developers preferred a common, comprehensive description of regular expressions in one place.  
 114679 The most common behavior is described here, and exceptions or extensions to this are  
 114680 documented for the respective utilities, as appropriate.

114681 The BRE corresponds to the *ed* or historical *grep* type, and the ERE corresponds to the historical  
 114682 *egrep* type (now *grep -E*).

114683 The text is based on the *ed* description and substantially modified, primarily to aid developers  
 114684 and others in the understanding of the capabilities and limitations of REs. Much of this was  
 114685 influenced by internationalization requirements.

114686 It should be noted that the definitions in this section do not cover the *tr* utility; the *tr* syntax does  
 114687 not employ REs.

114688 The specification of REs is particularly important to internationalization because pattern  
 114689 matching operations are very basic operations in business and other operations. The syntax and  
 114690 rules of REs are intended to be as intuitive as possible to make them easy to understand and use.  
 114691 The historical rules and behavior do not provide that capability to non-English language users,  
 114692 and do not provide the necessary support for commonly used characters and language  
 114693 constructs. It was necessary to provide extensions to the historical RE syntax and rules to  
 114694 accommodate other languages.

114695 As they are limited to bracket expressions, the rationale for these modifications is in XBD [Section](#)  
 114696 [9.3.5](#) (on page 170).

### 114697 A.9.1 Regular Expression Definitions

114698 It is possible to determine what strings correspond to subexpressions by recursively applying  
 114699 the leftmost longest rule to each subexpression, but only with the proviso that the overall match  
 114700 is leftmost longest. For example, matching "`\(ac*\\)c*d[ac]*\1`" against *acdacaaa* matches  
 114701 *acdacaaa* (with `\1=a`); simply matching the longest match for "`\(ac*\\)`" would yield `\1=ac`, but  
 114702 the overall match would be smaller (*acdac*). Conceptually, the implementation must examine  
 114703 every possible match and among those that yield the leftmost longest total matches, pick the one  
 114704 that does the longest match for the leftmost subexpression, and so on. Note that this means that  
 114705 matching by subexpressions is context-dependent: a subexpression within a larger RE may

114706 match a different string from the one it would match as an independent RE, and two instances of  
 114707 the same subexpression within the same larger RE may match different lengths even in similar  
 114708 sequences of characters. For example, in the ERE "(a.\*b)(a.\*b)", the two identical  
 114709 subexpressions would match four and six characters, respectively, of *accbaccccb*.

114710 The definition of single character has been expanded to include also collating elements  
 114711 consisting of two or more characters; this expansion is applicable only when a bracket  
 114712 expression is included in the BRE or ERE. An example of such a collating element may be the  
 114713 Dutch *ij*, which collates as a 'y'. In some encodings, a ligature "i with j" exists as a character  
 114714 and would represent a single-character collating element. In another encoding, no such ligature  
 114715 exists, and the two-character sequence *ij* is defined as a multi-character collating element.  
 114716 Outside brackets, the *ij* is treated as a two-character RE and matches the same characters in a  
 114717 string. Historically, a bracket expression only matched a single character. The ISO POSIX-2: 1993  
 114718 standard required bracket expressions like "[<sup>^</sup>[:lower:]]" to match multi-character collating  
 114719 elements such as "*ij*". However, this requirement led to behavior that many users did not  
 114720 expect and that could not feasibly be mimicked in user code, and it was rarely if ever  
 114721 implemented correctly. The current standard leaves it unspecified whether a bracket expression  
 114722 matches a multi-character collating element, allowing both historical and ISO POSIX-2: 1993  
 114723 standard implementations to conform.

114724 Also, in the current standard, it is unspecified whether character class expressions like  
 114725 "[[:lower:]]" can include multi-character collating elements like "*ij*"; hence  
 114726 "[[:lower:]]" can match "*ij*", and "[<sup>^</sup>[:lower:]]" can fail to match "*ij*". Common  
 114727 practice is for a character class expression to match a collating element if it matches the collating  
 114728 element's first character.

## 114729 A.9.2 Regular Expression General Requirements

114730 The definition of which sequence is matched when several are possible is based on the leftmost-  
 114731 longest rule historically used by deterministic recognizers. This rule is easier to define and  
 114732 describe, and arguably more useful, than the first-match rule historically used by non-  
 114733 deterministic recognizers. It is thought that dependencies on the choice of rule are rare; carefully  
 114734 contrived examples are needed to demonstrate the difference.

114735 A formal expression of the leftmost-longest rule is:

114736 The search is performed as if all possible suffixes of the string were tested for a prefix  
 114737 matching the pattern; the longest suffix containing a matching prefix is chosen, and the  
 114738 longest possible matching prefix of the chosen suffix is identified as the matching  
 114739 sequence.

114740 Historically, most RE implementations only match lines, not strings. However, that is more an  
 114741 effect of the usage than of an inherent feature of REs themselves. Consequently, POSIX.1-200x  
 114742 does not regard <newline>s as special; they are ordinary characters, and both a period and a  
 114743 non-matching list can match them. Those utilities (like *grep*) that do not allow <newline>s to  
 114744 match are responsible for eliminating any <newline> from strings before matching against the  
 114745 RE. The *regcomp()* function, however, can provide support for such processing without violating  
 114746 the rules of this section.

114747 Some implementations of *egrep* have had very limited flexibility in handling complex EREs.  
 114748 POSIX.1-200x does not attempt to define the complexity of a BRE or ERE, but does place a lower  
 114749 limit on it—any RE must be handled, as long as it can be expressed in 256 bytes or less. (Of  
 114750 course, this does not place an upper limit on the implementation.) There are historical programs  
 114751 using a non-deterministic-recognizer implementation that should have no difficulty with this  
 114752 limit. It is possible that a good approach would be to attempt to use the faster, but more limited,  
 114753 deterministic recognizer for simple expressions and to fall back on the non-deterministic

114754 recognizer for those expressions requiring it. Non-deterministic implementations must be  
 114755 careful to observe the rules on which match is chosen; the longest match, not the first match,  
 114756 starting at a given character is used.

114757 The term “invalid” highlights a difference between this section and some others: POSIX.1-200x  
 114758 frequently avoids mandating of errors for syntax violations because they can be used by  
 114759 implementors to trigger extensions. However, the authors of the internationalization features of  
 114760 REs wanted to mandate errors for certain conditions to identify usage problems or non-portable  
 114761 constructs. These are identified within this rationale as appropriate. The remaining syntax  
 114762 violations have been left implicitly or explicitly undefined. For example, the BRE construct  
 114763 “\{1, 2, 3\}” does not comply with the grammar. A conforming application cannot rely on it  
 114764 producing an error nor matching the literal characters “\{1, 2, 3\}”.

114765 The term “undefined” was used in favor of “unspecified” because many of the situations are  
 114766 considered errors on some implementations, and the standard developers considered that  
 114767 consistency throughout the section was preferable to mixing undefined and unspecified.

### 114768 **A.9.3 Basic Regular Expressions**

114769 There is no additional rationale provided for this section.

#### 114770 *A.9.3.1 BREs Matching a Single Character or Collating Element*

114771 There is no additional rationale provided for this section.

#### 114772 *A.9.3.2 BRE Ordinary Characters*

114773 There is no additional rationale provided for this section.

#### 114774 *A.9.3.3 BRE Special Characters*

114775 There is no additional rationale provided for this section.

#### 114776 *A.9.3.4 Periods in BREs*

114777 There is no additional rationale provided for this section.

#### 114778 *A.9.3.5 RE Bracket Expression*

114779 Range expressions are, historically, an integral part of REs. However, the requirements of  
 114780 “natural language behavior” and portability do conflict. In the POSIX locale, ranges must be  
 114781 treated according to the collating sequence and include such characters that fall within the range  
 114782 based on that collating sequence, regardless of character values. In other locales, ranges have  
 114783 unspecified behavior.

114784 Some historical implementations allow range expressions where the ending range point of one  
 114785 range is also the starting point of the next (for instance, “[a-m-o]”). This behavior should not  
 114786 be permitted, but to avoid breaking historical implementations, it is now *undefined* whether it is  
 114787 a valid expression and how it should be interpreted.

114788 Current practice in *awk* and *lex* is to accept escape sequences in bracket expressions as per XBD  
 114789 [Table 5-1](#) (on page 108), while the normal ERE behavior is to regard such a sequence as  
 114790 consisting of two characters. Allowing the *awk/lex* behavior in EREs would change the normal  
 114791 behavior in an unacceptable way; it is expected that *awk* and *lex* will decode escape sequences in  
 114792 EREs before passing them to *regcomp()* or comparable routines. Each utility describes the escape  
 114793 sequences it accepts as an exception to the rules in this section; the list is not the same, for  
 114794 historical reasons.

114795 As noted previously, the new syntax and rules have been added to accommodate other  
114796 languages than English. The remainder of this section describes the rationale for these  
114797 modifications.

114798 In the POSIX locale, a regular expression that starts with a range expression matches a set of  
114799 strings that are contiguously sorted, but this is not necessarily true in other locales. For example,  
114800 a French locale might have the following behavior:

```
114801 $ ls
114802 alpha Alpha estimé ESTIMÉ été eurêka
114803 $ ls [a-e]*
114804 alpha Alpha estimé eurêka
```

114805 Such disagreements between matching and contiguous sorting are unavoidable because POSIX  
114806 sorting cannot be implemented in terms of a deterministic finite-state automaton (DFA), but  
114807 range expressions by design are implementable in terms of DFAs.

114808 Historical implementations used native character order to interpret range expressions. The  
114809 ISO POSIX-2:1993 standard instead required collating element order (CEO): the order that  
114810 collating elements were specified between the **order\_start** and **order\_end** keywords in the  
114811 *LC\_COLLATE* category of the current locale. CEO had some advantages in portability over the  
114812 native character order, but it also had some disadvantages:

- 114813 • CEO could not feasibly be mimicked in user code, leading to inconsistencies between  
114814 POSIX matchers and matchers in popular user programs like Emacs, *ksh*, and Perl.
- 114815 • CEO caused range expressions to match accented and capitalized letters contrary to many  
114816 users' expectations. For example, "[a-e]" typically matched both 'E' and 'á' but  
114817 neither 'A' nor 'é'.
- 114818 • CEO was not consistent across implementations. In practice, CEO was often less portable  
114819 than native character order. For example, it was common for the CEOs of two  
114820 implementation-supplied locales to disagree, even if both locales were named "da\_DK".

114821 Because of these problems, some implementations of regular expressions continued to use native  
114822 character order. Others used the collation sequence, which is more consistent with sorting than  
114823 either CEO or native order, but which departs further from the traditional POSIX semantics  
114824 because it generally requires "[a-e]" to match either 'A' or 'E' but not both. As a result of  
114825 this kind of implementation variation, programmers who wanted to write portable regular  
114826 expressions could not rely on the ISO POSIX-2:1993 standard guarantees in practice.

114827 While revising the standard, lengthy consideration was given to proposals to attack this problem  
114828 by adding an API for querying the CEO to allow user-mode matchers, but none of these  
114829 proposals had implementation experience and none achieved consensus. Leaving the standard  
114830 alone was also considered, but rejected due to the problems described above.

114831 The current standard leaves unspecified the behavior of a range expression outside the POSIX  
114832 locale. This makes it clearer that conforming applications should avoid range expressions  
114833 outside the POSIX locale, and it allows implementations and compatible user-mode matchers to  
114834 interpret range expressions using native order, CEO, collation sequence, or other, more  
114835 advanced techniques. The concerns which led to this change were raised in IEEE PASC  
114836 interpretation 1003.2 #43 and others, and related to ambiguities in the specification of how  
114837 multi-character collating elements should be handled in range expressions. These ambiguities  
114838 had led to multiple interpretations of the specification, in conflicting ways, which led to varying  
114839 implementations. As noted above, efforts were made to resolve the differences, but no solution  
114840 has been found that would be specific enough to allow for portable software while not  
114841 invalidating existing implementations.

114842 The standard developers recognize that collating elements are important, such elements being  
 114843 common in several European languages; for example, 'ch' or 'll' in traditional Spanish;  
 114844 'aa' in several Scandinavian languages. Existing internationalized implementations have  
 114845 processed, and continue to process, these elements in range expressions. Efforts are expected to  
 114846 continue in the future to find a way to define the behavior of these elements precisely and  
 114847 portably.

114848 The ISO POSIX-2:1993 standard required "[b-a]" to be an invalid expression in the POSIX  
 114849 locale, but this requirement has been relaxed in this version of the standard so that "[b-a]" can  
 114850 instead be treated as a valid expression that does not match any string.

#### 114851 A.9.3.6 BREs Matching Multiple Characters

114852 The limit of nine back-references to subexpressions in the RE is based on the use of a single-digit  
 114853 identifier; increasing this to multiple digits would break historical applications. This does not  
 114854 imply that only nine subexpressions are allowed in REs. The following is a valid BRE with ten  
 114855 subexpressions:

```
114856 \(\(\(ab\) *c\) *d\)\(ef\) *\(\(gh\)\{2\}\(ij\) *\(\(kl\) *\(\(mn\) *\(\(op\) *\(\(qr\) *
```

114857 The standard developers regarded the common historical behavior, which supported " $n^*$ ", but  
 114858 not " $n\{\min, \max\}$ ", " $\{...\}$ ", or " $\{...\}\{\min, \max\}$ ", as a non-intentional  
 114859 result of a specific implementation, and they supported both duplication and interval  
 114860 expressions following subexpressions and back-references.

114861 The changes to the processing of the back-reference expression remove an unspecified or  
 114862 ambiguous behavior in the Shell and Utilities volume of POSIX.1-200x, aligning it with the  
 114863 requirements specified for the *regcomp()* expression, and is the result of PASC Interpretation  
 114864 1003.2-92 #43 submitted for the ISO POSIX-2:1993 standard.

#### 114865 A.9.3.7 BRE Precedence

114866 There is no additional rationale provided for this section.

#### 114867 A.9.3.8 BRE Expression Anchoring

114868 Often, the dollar sign is viewed as matching the ending <newline> in text files. This is not  
 114869 strictly true; the <newline> is typically eliminated from the strings to be matched, and the dollar  
 114870 sign matches the terminating null character.

114871 The ability of '^', '\$', and '\*' to be non-special in certain circumstances may be confusing to  
 114872 some programmers, but this situation was changed only in a minor way from historical practice  
 114873 to avoid breaking many historical scripts. Some consideration was given to making the use of  
 114874 the anchoring characters undefined if not escaped and not at the beginning or end of strings.  
 114875 This would cause a number of historical BREs, such as " $2^10$ ", " $\$HOME$ ", and " $\$1.35$ ", that  
 114876 relied on the characters being treated literally, to become invalid.

114877 However, one relatively uncommon case was changed to allow an extension used on some  
 114878 implementations. Historically, the BREs " $\^foo$ " and " $\{^foo\}$ " did not match the same  
 114879 string, despite the general rule that subexpressions and entire BREs match the same strings. To  
 114880 increase consensus, POSIX.1-200x has allowed an extension on some implementations to treat  
 114881 these two cases in the same way by declaring that anchoring *may* occur at the beginning or end  
 114882 of a subexpression. Therefore, portable BREs that require a literal circumflex at the beginning or  
 114883 a dollar sign at the end of a subexpression must escape them. Note that a BRE such as  
 114884 " $a\{^bc\}$ " will either match " $a^bc$ " or nothing on different systems under the rules.

114885 ERE anchoring has been different from BRE anchoring in all historical systems. An unescaped  
 114886 anchor character has never matched its literal counterpart outside a bracket expression. Some

114887 implementations treated "foo\$bar" as a valid expression that never matched anything; others  
114888 treated it as invalid. POSIX.1-200x mandates the former, valid unmatched behavior.

114889 Some implementations have extended the BRE syntax to add alternation. For example, the  
114890 subexpression "\ (foo\$ | bar\ )" would match either "foo" at the end of the string or "bar"  
114891 anywhere. The extension is triggered by the use of the undefined "\|" sequence. Because the  
114892 BRE is undefined for portable scripts, the extending system is free to make other assumptions,  
114893 such that the '\$' represents the end-of-line anchor in the middle of a subexpression. If it were  
114894 not for the extension, the '\$' would match a literal dollar sign under the rules.

#### 114895 A.9.4 Extended Regular Expressions

114896 As with BREs, the standard developers decided to make the interpretation of escaped ordinary  
114897 characters undefined.

114898 The right parenthesis is not listed as an ERE special character because it is only special in the  
114899 context of a preceding left parenthesis. If found without a preceding left parenthesis, the right  
114900 parenthesis has no special meaning.

114901 The interval expression, "{m,n}", has been added to EREs. Historically, the interval expression  
114902 has only been supported in some ERE implementations. The standard developers estimated that  
114903 the addition of interval expressions to EREs would not decrease consensus and would also make  
114904 BREs more of a subset of EREs than in many historical implementations.

114905 It was suggested that, in addition to interval expressions, back-references ('\n') should also be  
114906 added to EREs. This was rejected by the standard developers as likely to decrease consensus.

114907 In historical implementations, multiple duplication symbols are usually interpreted from left to  
114908 right and treated as additive. As an example, "a+b" matches zero or more instances of 'a'  
114909 followed by a 'b'. In POSIX.1-200x, multiple duplication symbols are undefined; that is, they  
114910 cannot be relied upon for conforming applications. One reason for this is to provide some scope  
114911 for future enhancements.

114912 The precedence of operations differs between EREs and those in *lex*; in *lex*, for historical reasons,  
114913 interval expressions have a lower precedence than concatenation.

##### 114914 A.9.4.1 EREs Matching a Single Character or Collating Element

114915 There is no additional rationale provided for this section.

##### 114916 A.9.4.2 ERE Ordinary Characters

114917 There is no additional rationale provided for this section.

114919 There is no additional rationale provided for this section.

##### 114920 A.9.4.4 Periods in EREs

114921 There is no additional rationale provided for this section.

## 114922 A.9.4.5 ERE Bracket Expression

114923 There is no additional rationale provided for this section.

## 114924 A.9.4.6 EREs Matching Multiple Characters

114925 There is no additional rationale provided for this section.

## 114926 A.9.4.7 ERE Alternation

114927 There is no additional rationale provided for this section.

## 114928 A.9.4.8 ERE Precedence

114929 There is no additional rationale provided for this section.

## 114930 A.9.4.9 ERE Expression Anchoring

114931 There is no additional rationale provided for this section.

114932 **A.9.5 Regular Expression Grammar**

114933 The grammars are intended to represent the range of acceptable syntaxes available to  
 114934 conforming applications. There are instances in the text where undefined constructs are  
 114935 described; as explained previously, these allow implementation extensions. There is no intended  
 114936 requirement that an implementation extension must somehow fit into the grammars shown  
 114937 here.

114938 The BRE grammar does not permit L\_ANCHOR or R\_ANCHOR inside "\(" and "\)" (which  
 114939 implies that '^' and '\$' are ordinary characters). This reflects the semantic limits on the  
 114940 application, as noted in XBD Section 9.3.8 (on page 173). Implementations are permitted to  
 114941 extend the language to interpret '^' and '\$' as anchors in these locations, and as such,  
 114942 conforming applications cannot use unescaped '^' and '\$' in positions inside "\(" and "\)"  
 114943 that might be interpreted as anchors.

114944 The ERE grammar does not permit several constructs that XBD Section 9.4.2 (on page 174) and  
 114945 Section 9.4.3 (on page 174) specify as having undefined results:

- 114946 • ORD\_CHAR preceded by '\\'
- 114947 • ERE\_dupl\_symbol(s) appearing first in an ERE, or immediately following '|', '^', or '('
- 114948 • '{' not part of a valid ERE\_dupl\_symbol
- 114949 • '|' appearing first or last in an ERE, or immediately following '|' or '(', or  
 114950 immediately preceding ')'

114951 Implementations are permitted to extend the language to allow these. Conforming applications  
 114952 cannot use such constructs.

## 114953 A.9.5.1 BRE/ERE Grammar Lexical Conventions

114954 There is no additional rationale provided for this section.

114955 A.9.5.2 *RE and Bracket Expression Grammar*

114956 The removal of the *Back\_open\_paren Back\_close\_paren* option from the *nondupl\_RE* specification is  
 114957 the result of PASC Interpretation 1003.2-92 #43 submitted for the ISO POSIX-2:1993 standard.  
 114958 Although the grammar required support for null subexpressions, this section does not describe  
 114959 the meaning of, and historical practice did not support, this construct.

114960 A.9.5.3 *ERE Grammar*

114961 There is no additional rationale provided for this section.

114962 **A.10 Directory Structure and Devices**114963 **A.10.1 Directory Structure and Files**

114964 A description of the historical */usr/tmp* was omitted, removing any concept of differences in  
 114965 emphasis between the */* and */usr* directories. The descriptions of */bin*, */usr/bin*, */lib*, and */usr/lib*  
 114966 were omitted because they are not useful for applications. In an early draft, a distinction was  
 114967 made between system and application directory usage, but this was not found to be useful.

114968 The directories */* and */dev* are included because the notion of a hierarchical directory structure is  
 114969 key to other information presented elsewhere in POSIX.1-200x. In early drafts, it was argued that  
 114970 special devices and temporary files could conceivably be handled without a directory structure  
 114971 on some implementations. For example, the system could treat the characters *"/tmp"* as a  
 114972 special token that would store files using some non-POSIX file system structure. This notion was  
 114973 rejected by the standard developers, who required that all the files in this section be  
 114974 implemented via POSIX file systems.

114975 The */tmp* directory is retained in POSIX.1-200x to accommodate historical applications that  
 114976 assume its availability. Implementations are encouraged to provide suitable directory names in  
 114977 the environment variable *TMPDIR* and applications are encouraged to use the contents of  
 114978 *TMPDIR* for creating temporary files.

114979 The standard files */dev/null* and */dev/tty* are required to be both readable and writable to allow  
 114980 applications to have the intended historical access to these files.

114981 The standard file */dev/console* has been added for alignment with the Single UNIX  
 114982 Specification.

114983 **A.10.2 Output Devices and Terminal Types**

114984 IEEE Std 1003.1-2001/Cor 2-2004, item XBD/TC2/D6/17 is applied, making it clear that the  
 114985 requirements for documenting terminal support are in the system documentation.

## A.11 General Terminal Interface

If the implementation does not support this interface on any device types, it should behave as if it were being used on a device that is not a terminal device (in most cases *errno* will be set to [ENOTTY] on return from functions defined by this interface). This is based on the fact that many applications are written to run both interactively and in some non-interactive mode, and they adapt themselves at runtime. Requiring that they all be modified to test an environment variable to determine whether they should try to adapt is unnecessary. On a system that provides no general terminal interface, providing all the entry points as stubs that return [ENOTTY] (or an equivalent, as appropriate) has the same effect and requires no changes to the application.

Although the needs of both interface implementors and application developers were addressed throughout POSIX.1-200x, this section pays more attention to the needs of the latter. This is because, while many aspects of the programming interface can be hidden from the user by the application developer, the terminal interface is usually a large part of the user interface. Although to some extent the application developer can build missing features or work around inappropriate ones, the difficulties of doing that are greater in the terminal interface than elsewhere. For example, efficiency prohibits the average program from interpreting every character passing through it in order to simulate character erase, line kill, and so on. These functions should usually be done by the operating system, possibly at the interrupt level.

The *tc\**() functions were introduced as a way of avoiding the problems inherent in the traditional *ioctl*() function and in variants of it that were proposed. For example, *tcsetattr*() is specified in place of the use of the TCSETA *ioctl*() command function. This allows specification of all the arguments in a manner consistent with the ISO C standard unlike the varying third argument of *ioctl*(), which is sometimes a pointer (to any of many different types) and sometimes an *int*.

The advantages of this new method include:

- It allows strict type checking.
- The direction of transfer of control data is explicit.
- Portable capabilities are clearly identified.
- The need for a general interface routine is avoided.
- Size of the argument is well-defined (there is only one type).

The disadvantages include:

- No historical implementation used the new method.
- There are many small routines instead of one general-purpose one.
- The historical parallel with *fcntl*() is broken.

The issue of modem control was excluded from POSIX.1-200x on the grounds that:

- It was concerned with setting and control of hardware timers.
- The appropriate timers and settings vary widely internationally.
- Feedback from European computer manufacturers indicated that this facility was not consistent with European needs and that specification of such a facility was not a requirement for portability.

115027 **A.11.1 Interface Characteristics**115028 *A.11.1.1 Opening a Terminal Device File*

115029 There is no additional rationale provided for this section.

115030 *A.11.1.2 Process Groups*

115031 There is a potential race when the members of the foreground process group on a terminal leave  
 115032 that process group, either by exit or by changing process groups. After the last process exits the  
 115033 process group, but before the foreground process group ID of the terminal is changed (usually  
 115034 by a job control shell), it would be possible for a new process to be created with its process ID  
 115035 equal to the terminal's foreground process group ID. That process might then become the  
 115036 process group leader and accidentally be placed into the foreground on a terminal that was not  
 115037 necessarily its controlling terminal. As a result of this problem, the controlling terminal is  
 115038 defined to not have a foreground process group during this time.

115039 The cases where a controlling terminal has no foreground process group occur when all  
 115040 processes in the foreground process group either terminate and are waited for or join other  
 115041 process groups via *setpgid()* or *setsid()*. If the process group leader terminates, this is the first  
 115042 case described; if it leaves the process group via *setpgid()*, this is the second case described (a  
 115043 process group leader cannot successfully call *setsid()*). When one of those cases causes a  
 115044 controlling terminal to have no foreground process group, it has two visible effects on  
 115045 applications. The first is the value returned by *tcgetpgrp()*. The second (which occurs only in the  
 115046 case where the process group leader terminates) is the sending of signals in response to special  
 115047 input characters. The intent of POSIX.1-200x is that no process group be wrongly identified as  
 115048 the foreground process group by *tcgetpgrp()* or unintentionally receive signals because of  
 115049 placement into the foreground.

115050 In 4.3 BSD, the old process group ID continues to be used to identify the foreground process  
 115051 group and is returned by the function equivalent to *tcgetpgrp()*. In that implementation it is  
 115052 possible for a newly created process to be assigned the same value as a process ID and then form  
 115053 a new process group with the same value as a process group ID. The result is that the new  
 115054 process group would receive signals from this terminal for no apparent reason, and  
 115055 POSIX.1-200x precludes this by forbidding a process group from entering the foreground in this  
 115056 way. It would be more direct to place part of the requirement made by the last sentence under  
 115057 *fork()*, but there is no convenient way for that section to refer to the value that *tcgetpgrp()*  
 115058 returns, since in this case there is no process group and thus no process group ID.

115059 One possibility for a conforming implementation is to behave similarly to 4.3 BSD, but to  
 115060 prevent this reuse of the ID, probably in the implementation of *fork()*, as long as it is in use by  
 115061 the terminal.

115062 Another possibility is to recognize when the last process stops using the terminal's foreground  
 115063 process group ID, which is when the process group lifetime ends, and to change the terminal's  
 115064 foreground process group ID to a reserved value that is never used as a process ID or process  
 115065 group ID. (See the definition of *process group lifetime* in the definitions section.) The process ID  
 115066 can then be reserved until the terminal has another foreground process group.

115067 The 4.3 BSD implementation permits the leader (and only member) of the foreground process  
 115068 group to leave the process group by calling the equivalent of *setpgid()* and to later return,  
 115069 expecting to return to the foreground. There are no known application needs for this behavior,  
 115070 and POSIX.1-200x neither requires nor forbids it (except that it is forbidden for session leaders)  
 115071 by leaving it unspecified.

115072 A.11.1.3 *The Controlling Terminal*

115073 POSIX.1-200x does not specify a mechanism by which to allocate a controlling terminal. This is  
 115074 normally done by a system utility (such as *getty*) and is considered an administrative feature  
 115075 outside the scope of POSIX.1-200x.

115076 Historical implementations allocate controlling terminals on certain *open()* calls. Since *open()* is  
 115077 part of POSIX.1, its behavior had to be dealt with. The traditional behavior is not required  
 115078 because it is not very straightforward or flexible for either implementations or applications.  
 115079 However, because of its prevalence, it was not practical to disallow this behavior either. Thus, a  
 115080 mechanism was standardized to ensure portable, predictable behavior in *open()*.

115081 Some historical implementations deallocate a controlling terminal on the last system-wide close.  
 115082 This behavior is neither required nor prohibited. Even on implementations that do provide this  
 115083 behavior, applications generally cannot depend on it due to its system-wide nature.

115084 A.11.1.4 *Terminal Access Control*

115085 The access controls described in this section apply only to a process that is accessing its  
 115086 controlling terminal. A process accessing a terminal that is not its controlling terminal is  
 115087 effectively treated the same as a member of the foreground process group. While this may seem  
 115088 unintuitive, note that these controls are for the purpose of job control, not security, and job  
 115089 control relates only to the controlling terminal of a process. Normal file access permissions  
 115090 handle security.

115091 If the process calling *read()* or *write()* is in a background process group that is orphaned, it is not  
 115092 desirable to stop the process group, as it is no longer under the control of a job control shell that  
 115093 could put it into the foreground again. Accordingly, calls to *read()* or *write()* functions by such  
 115094 processes receive an immediate error return. This is different from 4.2 BSD, which kills orphaned  
 115095 processes that receive terminal stop signals.

115096 The foreground/background/orphaned process group check performed by the terminal driver  
 115097 must be repeatedly performed until the calling process moves into the foreground or until the  
 115098 process group of the calling process becomes orphaned. That is, when the terminal driver  
 115099 determines that the calling process is in the background and should receive a job control signal,  
 115100 it sends the appropriate signal (SIGTTIN or SIGTTOU) to every process in the process group of  
 115101 the calling process and then it allows the calling process to immediately receive the signal. The  
 115102 latter is typically performed by blocking the process so that the signal is immediately noticed.  
 115103 Note, however, that after the process finishes receiving the signal and control is returned to the  
 115104 driver, the terminal driver must re-execute the foreground/background/orphaned process  
 115105 group check. The process may still be in the background, either because it was continued in the  
 115106 background by a job control shell, or because it caught the signal and did nothing.

115107 The terminal driver repeatedly performs the foreground/background/orphaned process group  
 115108 checks whenever a process is about to access the terminal. In the case of *write()* or the control  
 115109 *tc\*()* functions, the check is performed at the entry of the function. In the case of *read()*, the  
 115110 check is performed not only at the entry of the function, but also after blocking the process to  
 115111 wait for input characters (if necessary). That is, once the driver has determined that the process  
 115112 calling the *read()* function is in the foreground, it attempts to retrieve characters from the input  
 115113 queue. If the queue is empty, it blocks the process waiting for characters. When characters are  
 115114 available and control is returned to the driver, the terminal driver must return to the repeated  
 115115 foreground/background/orphaned process group check again. The process may have moved  
 115116 from the foreground to the background while it was blocked waiting for input characters.

115117 *A.11.1.5 Input Processing and Reading Data*

115118 There is no additional rationale provided for this section.

115119 *A.11.1.6 Canonical Mode Input Processing*115120 The term “character” is intended here. ERASE should erase the last character, not the last byte.  
115121 In the case of multi-byte characters, these two may be different.115122 4.3 BSD has a WERASE character that erases the last “word” typed (but not any preceding  
115123 <blank>s or <tab>s). A word is defined as a sequence of non-<blank>s, with <tab>s counted as  
115124 <blank>s. Like ERASE, WERASE does not erase beyond the beginning of the line. This  
115125 WERASE feature has not been specified in POSIX.1 because it is difficult to define in the  
115126 international environment. It is only useful for languages where words are delimited by  
115127 <blank>s. In some ideographic languages, such as Japanese and Chinese, words are not  
115128 delimited at all. The WERASE character should presumably go back to the beginning of a  
115129 sentence in those cases; practically, this means it would not be used much for those languages.115130 It should be noted that there is a possible inherent deadlock if the application and  
115131 implementation conflict on the value of {MAX\_CANON}. With ICANON set (if IXOFF is  
115132 enabled) and more than {MAX\_CANON} characters transmitted without a <linefeed>,  
115133 transmission will be stopped, the <linefeed> (or <carriage-return> when ICRLF is set) will never  
115134 arrive, and the *read()* will never be satisfied.115135 An application should not set IXOFF if it is using canonical mode unless it knows that (even in  
115136 the face of a transmission error) the conditions described previously cannot be met or unless it  
115137 is prepared to deal with the possible deadlock in some other way, such as timeouts.115138 It should also be noted that this can be made to happen in non-canonical mode if the trigger  
115139 value for sending IXOFF is less than VMIN and VTIME is zero.115140 *A.11.1.7 Non-Canonical Mode Input Processing*

115141 Some points to note about MIN and TIME:

- 115142 1. The interactions of MIN and TIME are not symmetric. For example, when MIN>0 and
- 
- 115143 TIME=0, TIME has no effect. However, in the opposite case where MIN=0 and TIME>0,
- 
- 115144 both MIN and TIME play a role in that MIN is satisfied with the receipt of a single
- 
- 115145 character.
- 
- 115146 2. Also note that in case A (MIN>0, TIME>0), TIME represents an inter-character timer,
- 
- 115147 while in case C (MIN=0, TIME>0), TIME represents a read timer.

115148 These two points highlight the dual purpose of the MIN/TIME feature. Cases A and B, where  
115149 MIN>0, exist to handle burst-mode activity (for example, file transfer programs) where a  
115150 program would like to process at least MIN characters at a time. In case A, the inter-character  
115151 timer is activated by a user as a safety measure; in case B, it is turned off.115152 Cases C and D exist to handle single-character timed transfers. These cases are readily adaptable  
115153 to screen-based applications that need to know if a character is present in the input queue before  
115154 refreshing the screen. In case C, the read is timed; in case D, it is not.115155 Another important note is that MIN is always just a minimum. It does not denote a record  
115156 length. That is, if a program does a read of 20 bytes, MIN is 10, and 25 characters are present, 20  
115157 characters are returned to the user. In the special case of MIN=0, this still applies: if more than  
115158 one character is available, they all will be returned immediately.

115159 *A.11.1.8 Writing Data and Output Processing*

115160 There is no additional rationale provided for this section.

115161 *A.11.1.9 Special Characters*

115162 There is no additional rationale provided for this section.

115163 *A.11.1.10 Modem Disconnect*

115164 There is no additional rationale provided for this section.

115165 *A.11.1.11 Closing a Terminal Device File*115166 POSIX.1-200x does not specify that a *close()* on a terminal device file include the equivalent of a  
115167 call to *tcflow(fd,TCOON)*.115168 An implementation that discards output at the time *close()* is called after reporting the return  
115169 value to the *write()* call that data was written does not conform with POSIX.1-200x. An  
115170 application has functions such as *tcdrain()*, *tcflush()*, and *tcflow()* available to obtain the detailed  
115171 behavior it requires with respect to flushing of output.115172 At the time of the last close on a terminal device, an application relinquishes any ability to exert  
115173 flow control via *tcflow()*.115174 **A.11.2 Parameters that Can be Set**115175 *A.11.2.1 The termios Structure*115176 This structure is part of an interface that, in general, retains the historic grouping of flags.  
115177 Although a more optimal structure for implementations may be possible, the degree of change  
115178 to applications would be significantly larger.115179 *A.11.2.2 Input Modes*115180 Some historical implementations treated a long break as multiple events, as many as one per  
115181 character time. The wording in POSIX.1 explicitly prohibits this.115182 Although the ISTRIP flag is normally superfluous with today's terminal hardware and software,  
115183 it is historically supported. Therefore, applications may be using ISTRIP, and there is no  
115184 technical problem with supporting this flag. Also, applications may wish to receive only 7-bit  
115185 input bytes and may not be connected directly to the hardware terminal device (for example,  
115186 when a connection traverses a network).115187 Also, there is no requirement in general that the terminal device ensures that high-order bits  
115188 beyond the specified character size are cleared. ISTRIP provides this function for 7-bit  
115189 characters, which are common.115190 In dealing with multi-byte characters, the consequences of a parity error in such a character, or  
115191 in an escape sequence affecting the current character set, are beyond the scope of POSIX.1 and  
115192 are best dealt with by the application processing the multi-byte characters.

115193 A.11.2.3 *Output Modes*

115194 POSIX.1 does not describe postprocessing of output to a terminal or detailed control of that from  
 115195 a conforming application. (That is, translation of <newline> to <carriage-return> followed by  
 115196 <linefeed> or <tab> processing.) There is nothing that a conforming application should do to its  
 115197 output for a terminal because that would require knowledge of the operation of the terminal. It  
 115198 is the responsibility of the operating system to provide postprocessing appropriate to the output  
 115199 device, whether it is a terminal or some other type of device.

115200 Extensions to POSIX.1 to control the type of postprocessing already exist and are expected to  
 115201 continue into the future. The control of these features is primarily to adjust the interface between  
 115202 the system and the terminal device so the output appears on the display correctly. This should  
 115203 be set up before use by any application.

115204 In general, both the input and output modes should not be set absolutely, but rather modified  
 115205 from the inherited state.

115206 A.11.2.4 *Control Modes*

115207 This section could be misread that the symbol "CSIZE" is a title in the **termios** *c\_flag* field.  
 115208 Although it does serve that function, it is also a required symbol, as a literal reading of POSIX.1  
 115209 (and the caveats about typography) would indicate.

115210 A.11.2.5 *Local Modes*

115211 Non-canonical mode is provided to allow fast bursts of input to be read efficiently while still  
 115212 allowing single-character input.

115213 The ECHONL function historically has been in many implementations. Since there seems to be  
 115214 no technical problem with supporting ECHONL, it is included in POSIX.1 to increase consensus.

115215 The alternate behavior possible when ECHOK or ECHOE are specified with ICANON is  
 115216 permitted as a compromise depending on what the actual terminal hardware can do. Erasing  
 115217 characters and lines is preferred, but is not always possible.

115218 A.11.2.6 *Special Control Characters*

115219 Permitting VMIN and VTIME to overlap with VEOF and VEOL was a compromise for historical  
 115220 implementations. Only when backwards-compatibility of object code is a serious concern to an  
 115221 implementor should an implementation continue this practice. Correct applications that work  
 115222 with the overlap (at the source level) should also work if it is not present, but not the reverse.

115223 **A.12 Utility Conventions**115224 **A.12.1 Utility Argument Syntax**

115225 The standard developers considered that recent trends toward diluting the SYNOPSIS sections  
 115226 of historical reference pages to the equivalent of:

115227 `command [options][operands]`

115228 were a disservice to the reader. Therefore, considerable effort was placed into rigorous  
 115229 definitions of all the command line arguments and their interrelationships. The relationships  
 115230 depicted in the synopses are normative parts of POSIX.1-200x; this information is sometimes  
 115231 repeated in textual form, but that is only for clarity within context.

115232 The use of “undefined” for conflicting argument usage and for repeated usage of the same  
 115233 option is meant to prevent conforming applications from using conflicting arguments or  
 115234 repeated options unless specifically allowed (as is the case with *ls*, which allows simultaneous,  
 115235 repeated use of the *-C*, *-l*, and *-1* options). Many historical implementations will tolerate this  
 115236 usage, choosing either the first or the last applicable argument. This tolerance can continue, but  
 115237 conforming applications cannot rely upon it. (Other implementations may choose to print usage  
 115238 messages instead.)

115239 The use of “undefined” for conflicting argument usage also allows an implementation to make  
 115240 reasonable extensions to utilities where the implementor considers mutually-exclusive options  
 115241 according to POSIX.1-200x to have a sensible meaning and result.

115242 POSIX.1-200x does not define the result of a command when an option-argument or operand is  
 115243 not followed by ellipses and the application specifies more than one of that option-argument or  
 115244 operand. This allows an implementation to define valid (although non-standard) behavior for  
 115245 the utility when more than one such option or operand is specified.

115246 The requirements for option-arguments are summarized as follows:

|                                      | SYNOPSIS Shows:                |                            |
|--------------------------------------|--------------------------------|----------------------------|
|                                      | <i>-a arg</i>                  | <i>-c[arg]</i>             |
| Conforming application uses:         | <i>-a arg</i>                  | <i>-carg</i> or <i>-c</i>  |
| System supports:                     | <i>-a arg</i> and <i>-aarg</i> | <i>-carg</i> and <i>-c</i> |
| Non-conforming applications may use: | <i>-aarg</i>                   | N/A                        |

115252 Earlier versions of this standard included obsolescent syntax which showed some options with  
 115253 (mandatory) adjacent option-arguments in the SYNOPSIS for some utilities. These have since  
 115254 been removed. For all options with mandatory option-arguments, the SYNOPSIS now shows  
 115255 <blank>s between the option and the option-argument; however, historical usage has not been  
 115256 consistent in this area; therefore, <blank>s are required to be used by conforming applications  
 115257 and to be handled by all implementations, but implementations are also required to handle an  
 115258 adjacent option-argument in order to preserve backwards-compatibility for old scripts. One of  
 115259 the justifications for selecting the multiple-argument method was that the single-argument case  
 115260 is inherently ambiguous when the option-argument can legitimately be a null string.

115261 POSIX.1-200x explicitly states that digits are permitted as operands and option-arguments. The  
 115262 lower and upper bounds for the values of the numbers used for operands and option-arguments  
 115263 were derived from the ISO C standard values for {LONG\_MIN} and {LONG\_MAX}. The  
 115264 requirement on the standard utilities is that numbers in the specified range do not cause a  
 115265 syntax error, although the specification of a number need not be semantically correct for a  
 115266 particular operand or option-argument of a utility. For example, the specification of:

115267 `dd obs=3000000000`

115268 would yield undefined behavior for the application and could be a syntax error because the  
 115269 number 3 000 000 000 is outside of the range  $-2\ 147\ 483\ 647$  to  $+2\ 147\ 483\ 647$ . On the other hand:

115270 `dd obs=2000000000`

115271 may cause some error, such as “blocksize too large”, rather than a syntax error.

### 115272 A.12.2 Utility Syntax Guidelines

115273 This section is based on the rules listed in the SVID. It was included for two reasons:

- 115274 1. The individual utility descriptions in XCU [Chapter 4](#) (on page 2343) needed a set of  
115275 common (although not universal) actions on which they could anchor their descriptions  
115276 of option and operand syntax. Most of the standard utilities actually do use these  
115277 guidelines, and many of their historical implementations use the *getopt()* function for  
115278 their parsing. Therefore, it was simpler to cite the rules and merely identify exceptions.
- 115279 2. Developers of conforming applications need suggested guidelines if the POSIX  
115280 community is to avoid the chaos of historical UNIX system command syntax.

115281 It is recommended that all *future* utilities and applications use these guidelines to enhance “user  
115282 portability”. The fact that some historical utilities could not be changed (to avoid breaking  
115283 historical applications) should not deter this future goal.

115284 The voluntary nature of the guidelines is highlighted by repeated uses of the word *should*  
115285 throughout. This usage should not be misinterpreted to imply that utilities that claim  
115286 conformance in their OPTIONS sections do not always conform.

115287 Guidelines 1 and 2 encourage utility writers to use only characters from the portable character  
115288 set because use of locale-specific characters may make the utility inaccessible from other locales.  
115289 Use of uppercase letters is discouraged due to problems associated with porting utilities to  
115290 systems that do not distinguish between uppercase and lowercase characters in filenames. Use  
115291 of non-alphanumeric characters is discouraged due to the number of utilities that treat non-  
115292 alphanumeric characters in “special” ways depending on context (such as the shell using  
115293 whitespace characters to delimit arguments, various quote characters for quoting, the dollar sign  
115294 to introduce variable expansion, etc.).

115295 In XCU [Section 2.9.1](#) (on page 2263), it is further stated that a command used in the Shell  
115296 Command Language cannot be named with a trailing colon.

115297 Guideline 3 was changed to allow alphanumeric characters (letters and digits) from the  
115298 character set to allow compatibility with historical usage. Historical practice allows the use of  
115299 digits wherever practical, and there are no portability issues that would prohibit the use of  
115300 digits. In fact, from an internationalization viewpoint, digits (being non-language-dependent)  
115301 are preferable over letters (a `-2` is intuitively self-explanatory to any user, while in the `-f filename`  
115302 the letter ‘`f`’ is a mnemonic aid only to speakers of Latin-based languages where “filename”  
115303 happens to translate to a word that begins with ‘`f`’). Since Guideline 3 still retains the word  
115304 “single”, multi-digit options are not allowed. Instances of historical utilities that used them have  
115305 been marked obsolescent, with the numbers being changed from option names to option-  
115306 arguments.

115307 It was difficult to achieve a satisfactory solution to the problem of name space in option  
115308 characters. When the standard developers desired to extend the historical `cc` utility to accept  
115309 ISO C standard programs, they found that all of the portable alphabet was already in use by  
115310 various vendors. Thus, they had to devise a new name, `c89` (now superseded by `c99`), rather than  
115311 something like `cc -X`. There were suggestions that implementors be restricted to providing  
115312 extensions through various means (such as using a plus sign as the option delimiter or using  
115313 option characters outside the alphanumeric set) that would reserve all of the remaining  
115314 alphanumeric characters for future POSIX standards. These approaches were resisted because  
115315 they lacked the historical style of UNIX systems. Furthermore, if a vendor-provided option  
115316 should become commonly used in the industry, it would be a candidate for standardization. It  
115317 would be desirable to standardize such a feature using historical practice for the syntax (the  
115318 semantics can be standardized with any syntax). This would not be possible if the syntax was  
115319 one reserved for the vendor. However, since the standardization process may lead to minor

115320 changes in the semantics, it may prove to be better for a vendor to use a syntax that will not be  
115321 affected by standardization.

115322 Guideline 8 includes the concept of comma-separated lists in a single argument. It is up to the  
115323 utility to parse such a list itself because *getopt()* just returns the single string. This situation was  
115324 retained so that certain historical utilities would not violate the guidelines. Applications  
115325 preparing for international use should be aware of an occasional problem with comma-  
115326 separated lists: in some locales, the comma is used as the radix character. Thus, if an application  
115327 is preparing operands for a utility that expects a comma-separated list, it should avoid  
115328 generating non-integer values through one of the means that is influenced by setting the  
115329 *LC\_NUMERIC* variable (such as *awk*, *bc*, *printf*, or *printf()*).

115330 Unless explicitly stated otherwise in the utility description, Guideline 9 requires applications to  
115331 put options before operands, and requires utilities to accept any such usage without  
115332 misinterpreting operands as options. For example, if an implementation of the *printf* utility  
115333 supports a *-e* option as an extension, the command:

```
115334 printf %s -e
```

115335 must output the string "-e" without interpreting the *-e* as an option. Similarly, the command:

```
115336 ls myfile -l
```

115337 must interpret the *-l* argument as a second file operand, not as a *-l* option.

115338 Applications calling any utility with a first operand starting with '-' should usually specify *--*,  
115339 as indicated by Guideline 10, to mark the end of the options. This is true even if the SYNOPSIS  
115340 in the Shell and Utilities volume of POSIX.1-200x does not specify any options; implementations  
115341 may provide options as extensions to the Shell and Utilities volume of POSIX.1-200x. The  
115342 standard utilities that do not support Guideline 10 indicate that fact in the OPTIONS section of  
115343 the utility description.

115344 Guideline 7 allows any string to be an option-argument; an option-argument can begin with any  
115345 character, can be *-* or *--*, and can be an empty string. For example, the commands *pr -h -*, *pr -h*  
115346 *--*, *pr -h -d*, *pr -h +2*, and *pr -h ''* contain the option-arguments *-*, *--*, *-d*, *+2*, and an empty  
115347 string, respectively. Conversely, the command *pr -h -- -d* treats *-d* as an option, not as an  
115348 argument, because the *--* is an option-argument here, not a delimiter.

115349 Guideline 11 was modified to clarify that the order of different options should not matter  
115350 relative to one another. However, the order of repeated options that also have option-arguments  
115351 may be significant; therefore, such options are required to be interpreted in the order that they  
115352 are specified. The *make* utility is an instance of a historical utility that uses repeated options in  
115353 which the order is significant. Multiple files are specified by giving multiple instances of the *-f*  
115354 option; for example:

```
115355 make -f common_header -f specific_rules target
```

115356 Guideline 13 does not imply that all of the standard utilities automatically accept the operand  
115357 '-' to mean standard input or output, nor does it specify the actions of the utility upon  
115358 encountering multiple '-' operands. It simply says that, by default, '-' operands are not used  
115359 for other purposes in the file reading or writing (but not when using *stat()*, *unlink()*, *touch*, and  
115360 so on) utilities. In earlier versions of this standard, all information concerning actual treatment of  
115361 the '-' operand is found in the individual utility sections. Many implementations, however,  
115362 treated '-' as standard input or output and many applications depended on this behavior even  
115363 though it was not standard. This behavior is now implementation-defined. Portable applications  
115364 should not use '-' to mean standard input or output unless it is explicitly stated to do so in the  
115365 utility description and they should always use './-' if they intend to refer to a file named '-'  
115366 in the current working directory.

115367 Guideline 14 is intended to prohibit implementations that would treat the command `ls -l -d` as if  
115368 it were `ls -- -l -d` or `ls -l -- -d`.

115369 The standard permits implementations to have extensions that violate the Utility Syntax  
115370 Guidelines so long as when the utility is used in line with the forms defined by the standard it  
115371 follows the Utility Syntax Guidelines. Thus, `head-42file` and `ls--help` are permitted extensions.  
115372 The intent is to allow extensions so long as the standard form is accepted and follows the  
115373 guidelines.

115374 An area of concern was that as implementations mature, implementation-defined utilities and  
115375 implementation-defined utility options will result. The idea was expressed that there needed to  
115376 be a standard way, say an environment variable or some such mechanism, to identify  
115377 implementation-defined utilities separately from standard utilities that may have the same  
115378 name. It was decided that there already exist several ways of dealing with this situation and that  
115379 it is outside of the scope to attempt to standardize in the area of non-standard items. A method  
115380 that exists on some historical implementations is the use of the so-called `/local/bin` or  
115381 `/usr/local/bin` directory to separate local or additional copies or versions of utilities. Another  
115382 method that is also used is to isolate utilities into completely separate domains. Still another  
115383 method to ensure that the desired utility is being used is to request the utility by its full  
115384 pathname. There are many approaches to this situation; the examples given above serve to  
115385 illustrate that there is more than one.

## 115386 A.13 Headers

### 115387 A.13.1 Format of Entries

115388 Each header reference page has a common layout of sections describing the interface. This  
115389 layout is similar to the manual page or “man” page format shipped with most UNIX systems,  
115390 and each header has sections describing the SYNOPSIS and DESCRIPTION. These are the two  
115391 sections that relate to conformance.

115392 Additional sections are informative, and add considerable information for the application  
115393 developer. APPLICATION USAGE sections provide additional caveats, issues, and  
115394 recommendations to the developer. RATIONALE sections give additional information on the  
115395 decisions made in defining the interface.

115396 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
115397 the future, and often cautions the developer to architect the code to account for a change in this  
115398 area. Note that a future directions statement should not be taken as a commitment to adopt a  
115399 feature or interface in the future.

115400 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
115401 changed.

115402 Option labels and margin markings in the page can be useful in guiding the application  
115403 developer.

115404 **A.13.2 Removed Headers in Issue 7**

115405 The headers removed in Issue 7 (from the Issue 6 base document) are as follows:

115406 

| Removed Headers in Issue 7       |                                 |
|----------------------------------|---------------------------------|
| <code>&lt;sys/timeb.h&gt;</code> | <code>&lt;ucontext.h&gt;</code> |

115418

The change history is provided as an informative section, to track changes from earlier versions of this standard.

115419

115420

The following sections describe changes made to the System Interfaces volume of POSIX.1-200x since Issue 6 of the base document. The CHANGE HISTORY section for each entry details the technical changes that have been made to that entry from Issue 5. Changes between earlier versions of the base document and Issue 5 are not included.

115421

115422

115423

115424

**Changes from Issue 6 to Issue 7 (POSIX.1-200x)**

115425

The following list summarizes the major changes that were made in the System Interfaces volume of POSIX.1-200x from Issue 6 to Issue 7:

115426

115427

- The Open Group Technical Standard, 2006, Extended API Set Part 1 is incorporated.

115428

- The Open Group Technical Standard, 2006, Extended API Set Part 2 is incorporated.

115429

- The Open Group Technical Standard, 2006, Extended API Set Part 3 is incorporated.

115430

- The Open Group Technical Standard, 2006, Extended API Set Part 4 is incorporated.

115431

- Existing functionality is aligned with ISO/IEC 9899:1999, Programming Languages — C, ISO/IEC 9899:1999/Cor.2:2004(E)

115432

115433

- Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses to ISO/IEC defect reports against ISO/IEC 9945 are applied.

115434

115435

- The Open Group corrigenda and resolutions are applied.

115436

- Features, marked legacy or obsolescent in the base document, have been considered for removal in this version.

115437

115438

- The options within the standard have been revised.

115439 **New Features in Issue 7**

115440 The functions first introduced in Issue 7 (over the Issue 6 base document) are as follows:

| New Functions in Issue 7 |                      |                                      |
|--------------------------|----------------------|--------------------------------------|
| 115441                   |                      |                                      |
| 115442                   | <i>alphasort()</i>   | <i>iswctype_l()</i>                  |
| 115443                   | <i>dirfd()</i>       | <i>iswdigit_l()</i>                  |
| 115444                   | <i>dprintf()</i>     | <i>iswgraph_l()</i>                  |
| 115445                   | <i>duplocale()</i>   | <i>iswlower_l()</i>                  |
| 115446                   | <i>faccessat()</i>   | <i>iswprint_l()</i>                  |
| 115447                   | <i>fchmodat()</i>    | <i>iswpunct_l()</i>                  |
| 115448                   | <i>fchownat()</i>    | <i>iswspace_l()</i>                  |
| 115449                   | <i>fdopendir()</i>   | <i>iswupper_l()</i>                  |
| 115450                   | <i>fexecve()</i>     | <i>iswxdigit_l()</i>                 |
| 115451                   | <i>fnmopen()</i>     | <i>isxdigit_l()</i>                  |
| 115452                   | <i>freelocale()</i>  | <i>linkat()</i>                      |
| 115453                   | <i>fstatat()</i>     | <i>mbsnrto wcs()</i>                 |
| 115454                   | <i>futimens()</i>    | <i>mkdirat()</i>                     |
| 115455                   | <i>getdelim()</i>    | <i>mkdtemp()</i>                     |
| 115456                   | <i>getline()</i>     | <i>mkffloat()</i>                    |
| 115457                   | <i>isalnum_l()</i>   | <i>mknodat()</i>                     |
| 115458                   | <i>isalpha_l()</i>   | <i>newlocale()</i>                   |
| 115459                   | <i>isblank_l()</i>   | <i>openat()</i>                      |
| 115460                   | <i>iscntrl_l()</i>   | <i>open_memstream()</i>              |
| 115461                   | <i>isdigit_l()</i>   | <i>psiginfo()</i>                    |
| 115462                   | <i>isgraph_l()</i>   | <i>psignal()</i>                     |
| 115463                   | <i>islower_l()</i>   | <i>pthread_mutexattr_getrobust()</i> |
| 115464                   | <i>isprint_l()</i>   | <i>pthread_mutexattr_setrobust()</i> |
| 115465                   | <i>ispunct_l()</i>   | <i>pthread_mutex_consistent()</i>    |
| 115466                   | <i>isspace_l()</i>   | <i>readlinkat()</i>                  |
| 115467                   | <i>isupper_l()</i>   | <i>renameat()</i>                    |
| 115468                   | <i>iswalnum_l()</i>  | <i>scandir()</i>                     |
| 115469                   | <i>iswalphal_l()</i> | <i>stpncpy()</i>                     |
| 115470                   | <i>iswblank_l()</i>  | <i>stpncpy()</i>                     |
| 115471                   | <i>iswcntrl_l()</i>  | <i>strcasecmp_l()</i>                |
|                          |                      | <i>strcoll_l()</i>                   |
|                          |                      | <i>strfmon_l()</i>                   |
|                          |                      | <i>strncasecmp_l()</i>               |
|                          |                      | <i>strndup()</i>                     |
|                          |                      | <i>strlen()</i>                      |
|                          |                      | <i>strsignal()</i>                   |
|                          |                      | <i>strxfrm_l()</i>                   |
|                          |                      | <i>symlinkat()</i>                   |
|                          |                      | <i>tolower_l()</i>                   |
|                          |                      | <i>toupper_l()</i>                   |
|                          |                      | <i>towctrans_l()</i>                 |
|                          |                      | <i>towlower()</i>                    |
|                          |                      | <i>towupper()</i>                    |
|                          |                      | <i>unlinkat()</i>                    |
|                          |                      | <i>uselocale()</i>                   |
|                          |                      | <i>utimensat()</i>                   |
|                          |                      | <i>wcpcpy()</i>                      |
|                          |                      | <i>wcpncpy()</i>                     |
|                          |                      | <i>wcscasecmp()</i>                  |
|                          |                      | <i>wcscasecmp_l()</i>                |
|                          |                      | <i>wcscoll_l()</i>                   |
|                          |                      | <i>wcsdup()</i>                      |
|                          |                      | <i>wcsncasecmp()</i>                 |
|                          |                      | <i>wcsncasecmp_l()</i>               |
|                          |                      | <i>wcsnlen()</i>                     |
|                          |                      | <i>wcsnrto mbs()</i>                 |
|                          |                      | <i>wcsxfrm_l()</i>                   |
|                          |                      | <i>wctrans_l()</i>                   |
|                          |                      | <i>wctype_l()</i>                    |

115472 **Newly Mandated Functions in Issue 7**115473 The functions that were previously part of an option group but are now mandatory in Issue 7 are  
115474 as follows:

115475

## Newly Mandated Functions in Issue 7

|        |                                         |                                      |                                     |
|--------|-----------------------------------------|--------------------------------------|-------------------------------------|
| 115476 | <i>aio_cancel()</i>                     | <i>pthread_atfork()</i>              | <i>pthread_rwlock_tryrdlock()</i>   |
| 115477 | <i>aio_error()</i>                      | <i>pthread_attr_destroy()</i>        | <i>pthread_rwlock_trywrlock()</i>   |
| 115478 | <i>aio_fsync()</i>                      | <i>pthread_attr_getdetachstate()</i> | <i>pthread_rwlock_unlock()</i>      |
| 115479 | <i>aio_read()</i>                       | <i>pthread_attr_getguardsize()</i>   | <i>pthread_rwlock_wrlock()</i>      |
| 115480 | <i>aio_return()</i>                     | <i>pthread_attr_getschedparam()</i>  | <i>pthread_rwlockattr_destroy()</i> |
| 115481 | <i>aio_suspend()</i>                    | <i>pthread_attr_init()</i>           | <i>pthread_rwlockattr_init()</i>    |
| 115482 | <i>aio_write()</i>                      | <i>pthread_attr_setdetachstate()</i> | <i>pthread_self()</i>               |
| 115483 | <i>asctime_r()</i>                      | <i>pthread_attr_setguardsize()</i>   | <i>pthread_setcancelstate()</i>     |
| 115484 | <i>catclose()</i>                       | <i>pthread_attr_setschedparam()</i>  | <i>pthread_setcanceltype()</i>      |
| 115485 | <i>catgets()</i>                        | <i>pthread_barrier_destroy()</i>     | <i>pthread_setspecific()</i>        |
| 115486 | <i>catopen()</i>                        | <i>pthread_barrier_init()</i>        | <i>pthread_spin_destroy()</i>       |
| 115487 | <i>clock_getres()</i>                   | <i>pthread_barrier_wait()</i>        | <i>pthread_spin_init()</i>          |
| 115488 | <i>clock_gettime()</i>                  | <i>pthread_barrierattr_destroy()</i> | <i>pthread_spin_lock()</i>          |
| 115489 | <i>clock_nanosleep()</i>                | <i>pthread_barrierattr_init()</i>    | <i>pthread_spin_trylock()</i>       |
| 115490 | <i>clock_settime()</i>                  | <i>pthread_cancel()</i>              | <i>pthread_spin_unlock()</i>        |
| 115491 | <i>ctime_r()</i>                        | <i>pthread_cleanup_pop()</i>         | <i>pthread_testcancel()</i>         |
| 115492 | <i>dlclose()</i>                        | <i>pthread_cleanup_push()</i>        | <i>putc_unlocked()</i>              |
| 115493 | <i>dlderror()</i>                       | <i>pthread_cond_broadcast()</i>      | <i>putchar_unlocked()</i>           |
| 115494 | <i>dlopen()</i>                         | <i>pthread_cond_destroy()</i>        | <i>pwrite()</i>                     |
| 115495 | <i>dlsym()</i>                          | <i>pthread_cond_init()</i>           | <i>rand_r()</i>                     |
| 115496 | <i>fehdir()</i>                         | <i>pthread_cond_signal()</i>         | <i>readdir_r()</i>                  |
| 115497 | <i>flockfile()</i>                      | <i>pthread_cond_timedwait()</i>      | <i>sem_close()</i>                  |
| 115498 | <i>fstatvfs()</i>                       | <i>pthread_cond_wait()</i>           | <i>sem_destroy()</i>                |
| 115499 | <i>ftrylockfile()</i>                   | <i>pthread_condattr_destroy()</i>    | <i>sem_getvalue()</i>               |
| 115500 | <i>funlockfile()</i>                    | <i>pthread_condattr_getclock()</i>   | <i>sem_init()</i>                   |
| 115501 | <i>getc_unlocked()</i>                  | <i>pthread_condattr_init()</i>       | <i>sem_open()</i>                   |
| 115502 | <i>getchar_unlocked()</i>               | <i>pthread_condattr_setclock()</i>   | <i>sem_post()</i>                   |

| 115512 | <i>iconv()</i>                          | <i>pthread_mutex_init()</i>          | <i>strcasemp()</i>                  |
| 115513 | <i>iconv_close()</i>                    | <i>pthread_mutex_lock()</i>          | <i>strdup()</i>                     |
| 115514 | <i>iconv_open()</i>                     | <i>pthread_mutex_timedlock()</i>     | <i>strerror_r()</i>                 |
| 115515 | <i>lchown()</i>                         | <i>pthread_mutex_trylock()</i>       | <i>strfnon()</i>                    |
| 115516 | <i>lio_listio()</i>                     | <i>pthread_mutex_unlock()</i>        | <i>strncasemp()</i>                 |
| 115517 | <i>localtime_r()</i>                    | <i>pthread_mutexattr_destroy()</i>   | <i>strtok_r()</i>                   |
| 115518 | <i>mkstemp()</i>                        | <i>pthread_mutexattr_gettype()</i>   | <i>tcgetsid()</i>                   |
| 115519 | <i>mmap()</i>                           | <i>pthread_mutexattr_init()</i>      | <i>timer_create()</i>               |
| 115520 | <i>mprotect()</i>                       | <i>pthread_mutexattr_settype()</i>   | <i>timer_delete()</i>               |
| 115521 | <i>munmap()</i>                         | <i>pthread_once()</i>                | <i>timer_getoverrun()</i>           |
| 115522 | <i>nanosleep()</i>                      | <i>pthread_rwlock_destroy()</i>      | <i>timer_gettime()</i>              |
| 115523 | <i>nl_langinfo()</i>                    | <i>pthread_rwlock_init()</i>         | <i>timer_settime()</i>              |
| 115524 | <i>poll()</i>                           | <i>pthread_rwlock_rdlock()</i>       | <i>truncate()</i>                   |
| 115525 | <i>posix_trace_timedgetnext_event()</i> | <i>pthread_rwlock_timedrdlock()</i>  | <i>ttyname_r()</i>                  |
| 115526 | <i>pread()</i>                          | <i>pthread_rwlock_timedwrlock()</i>  | <i>waitid()</i>                     |

115527 **Obsolescent Functions in Issue 7**

115528 The base functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are  
 115529 as follows:

| 115530 <b>Obsolescent Base Functions in Issue 7</b> |                 |
|-----------------------------------------------------|-----------------|
| 115531 <i>asctime()</i>                             | <i>gets()</i>   |
| 115532 <i>asctime_r()</i>                           | <i>rand_r()</i> |
| 115533 <i>ctime()</i>                               | <i>tmpnam()</i> |
| 115534 <i>ctime_r()</i>                             |                 |

115535 The XSI functions moved to obsolescent status in Issue 7 (from the Issue 6 base document) are as  
 115536 follows:

| 115537 <b>Obsolescent XSI Functions in Issue 7</b> |                                 |                       |
|----------------------------------------------------|---------------------------------|-----------------------|
| 115538 <i>_longjmp()</i>                           | <i>pthread_getconcurrency()</i> | <i>sigset()</i>       |
| 115539 <i>_setjmp()</i>                            | <i>pthread_setconcurrency()</i> | <i>siginterrupt()</i> |
| 115540 <i>_tolower()</i>                           | <i>setitimer()</i>              | <i>tempnam()</i>      |
| 115541 <i>_toupper()</i>                           | <i>setpgrp()</i>                | <i>toascii()</i>      |
| 115542 <i>ftw()</i>                                | <i>sighold()</i>                | <i>ulimit()</i>       |
| 115543 <i>getitimer()</i>                          | <i>sigignore()</i>              | <i>utime()</i>        |
| 115544 <i>gettimeofday()</i>                       | <i>sigpause()</i>               |                       |
| 115545 <i>isascii()</i>                            | <i>sigrelse()</i>               |                       |

115546 **Removed Functions and Symbols in Issue 7**

115547 The functions and symbols removed in Issue 7 (from the Issue 6 base document) are as follows:

| 115548 <b>Removed Functions and Symbols in Issue 7</b> |                                    |                      |
|--------------------------------------------------------|------------------------------------|----------------------|
| 115549 <i>bcmp()</i>                                   | <i>gethostbyaddr()</i>             | <i>rindex()</i>      |
| 115550 <i>bcopy()</i>                                  | <i>gethostbyname()</i>             | <i>scalb()</i>       |
| 115551 <i>bsd_signal()</i>                             | <i>getwd()</i>                     | <i>setcontext()</i>  |
| 115552 <i>bzero()</i>                                  | <i>h_errno</i>                     | <i>swapcontext()</i> |
| 115553 <i>ecvt()</i>                                   | <i>index()</i>                     | <i>ualarm()</i>      |
| 115554 <i>fcvt()</i>                                   | <i>makecontext()</i>               | <i>usleep()</i>      |
| 115555 <i>ftime()</i>                                  | <i>mktemp()</i>                    | <i>vfork()</i>       |
| 115556 <i>gcvt()</i>                                   | <i>pthread_attr_getstackaddr()</i> | <i>wcs wcs()</i>     |
| 115557 <i>getcontext()</i>                             | <i>pthread_attr_setstackaddr()</i> |                      |

115558 **B.1.2 Relationship to Other Formal Standards**

115559 There is no additional rationale provided for this section.

115560 **B.1.3 Format of Entries**

115561 Each system interface reference page has a common layout of sections describing the interface.  
 115562 This layout is similar to the manual page or “man” page format shipped with most UNIX  
 115563 systems, and each header has sections describing the SYNOPSIS, DESCRIPTION, RETURN  
 115564 VALUE, and ERRORS. These are the four sections that relate to conformance.

115565 Additional sections are informative, and add considerable information for the application  
 115566 developer. EXAMPLES sections provide example usage. APPLICATION USAGE sections  
 115567 provide additional caveats, issues, and recommendations to the developer. RATIONALE  
 115568 sections give additional information on the decisions made in defining the interface.

115569 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
 115570 the future, and often cautions the developer to architect the code to account for a change in this  
 115571 area. Note that a future directions statement should not be taken as a commitment to adopt a  
 115572 feature or interface in the future.

115573 The CHANGE HISTORY section describes when the interface was introduced, and how it has  
 115574 changed.

115575 Option labels and margin markings in the page can be useful in guiding the application  
 115576 developer.

## 115577 B.2 General Information

### 115578 B.2.1 Use and Implementation of Functions

115579 The information concerning the use of functions was adapted from a description in the ISO C  
 115580 standard. Here is an example of how an application program can protect itself from functions  
 115581 that may or may not be macros, rather than true functions:

115582 The *atoi()* function may be used in any of several ways:

- 115583 • By use of its associated header (possibly generating a macro expansion):

```
115584 #include <stdlib.h>
115585 /* ... */
115586 i = atoi(str);
```

- 115587 • By use of its associated header (assuredly generating a true function call):

```
115588 #include <stdlib.h>
115589 #undef atoi
115590 /* ... */
115591 i = atoi(str);
```

115592 or:

```
115593 #include <stdlib.h>
115594 /* ... */
115595 i = (atoi) (str);
```

- 115596 • By explicit declaration:

```
115597 extern int atoi (const char *);
115598 /* ... */
115599 i = atoi(str);
```

- 115600 • By implicit declaration:

```
115601 /* ... */
115602 i = atoi(str);
```

115603 (Assuming no function prototype is in scope. This is not allowed by the ISO C standard for  
 115604 functions with variable arguments; furthermore, parameter type conversion “widening” is  
 115605 subject to different rules in this case.)

115606 Note that the ISO C standard reserves names starting with ‘\_’ for the compiler. Therefore, the  
 115607 compiler could, for example, implement an intrinsic, built-in function *\_asm\_builtin\_atoi()*, which  
 115608 it recognized and expanded into inline assembly code. Then, in **<stdlib.h>**, there could be the

115609 following:

```
115610 #define atoi(X) _asm_builtin_atoi(X)
```

115611 The user's "normal" call to `atoi()` would then be expanded inline, but the implementor would  
 115612 also be required to provide a callable function named `atoi()` for use when the application  
 115613 requires it; for example, if its address is to be stored in a function pointer variable.

## 115614 B.2.2 The Compilation Environment

### 115615 B.2.2.1 POSIX.1 Symbols

115616 This and the following section address the issue of "name space pollution". The ISO C standard  
 115617 requires that the name space beyond what it reserves not be altered except by explicit action of  
 115618 the application developer. This section defines the actions to add the POSIX.1 symbols for those  
 115619 headers where both the ISO C standard and POSIX.1 need to define symbols, and also where the  
 115620 XSI option extends the base standard.

115621 When headers are used to provide symbols, there is a potential for introducing symbols that the  
 115622 application developer cannot predict. Ideally, each header should only contain one set of  
 115623 symbols, but this is not practical for historical reasons. Thus, the concept of feature test macros is  
 115624 included. Two feature test macros are explicitly defined by POSIX.1-200x; it is expected that  
 115625 future versions may add to this.

115626 **Note:** Feature test macros allow an application to announce to the implementation its desire to have  
 115627 certain symbols and prototypes exposed. They should not be confused with the version test  
 115628 macros and constants for options in `<unistd.h>` which are the implementation's way of  
 115629 announcing functionality to the application.

115630 It is further intended that these feature test macros apply only to the headers specified by  
 115631 POSIX.1-200x. Implementations are expressly permitted to make visible symbols not specified  
 115632 by POSIX.1-200x, within both POSIX.1 and other headers, under the control of feature test  
 115633 macros that are not defined by POSIX.1-200x.

#### 115634 The `_POSIX_C_SOURCE` Feature Test Macro

115635 Since `_POSIX_SOURCE` specified by the POSIX.1-1990 standard did not have a value associated  
 115636 with it, the `_POSIX_C_SOURCE` macro replaces it, allowing an application to inform the system  
 115637 of the version of the standard to which it conforms. This symbol will allow implementations to  
 115638 support various versions of this standard simultaneously. For instance, when either  
 115639 `_POSIX_SOURCE` is defined or `_POSIX_C_SOURCE` is defined as 1, the system should make  
 115640 visible the same name space as permitted and required by the POSIX.1-1990 standard. When  
 115641 `_POSIX_C_SOURCE` is defined, the state of `_POSIX_SOURCE` is completely irrelevant.

115642 It is expected that C bindings to future POSIX standards will define new values for  
 115643 `_POSIX_C_SOURCE`, with each new value reserving the name space for that new standard, plus  
 115644 all earlier POSIX standards.

115645 **The \_XOPEN\_SOURCE Feature Test Macro**

115646 The feature test macro `_XOPEN_SOURCE` is provided as the announcement mechanism for the  
 115647 application that it requires functionality from the Single UNIX Specification. `_XOPEN_SOURCE`  
 115648 must be defined to the value 700 before the inclusion of any header to enable the functionality in  
 115649 the Single UNIX Specification. Its definition subsumes the use of `_POSIX_SOURCE` and  
 115650 `_POSIX_C_SOURCE`.

115651 An extract of code from a conforming application, that appears before any **#include** statements,  
 115652 is given below:

```
115653 #define _XOPEN_SOURCE 700 /* Single UNIX Specification, Version x */
115654 #include ...
```

115655 Note that the definition of `_XOPEN_SOURCE` with the value 700 makes the definition of  
 115656 `_POSIX_C_SOURCE` redundant and it can safely be omitted.

115657 **B.2.2.2 The Name Space**

115658 The reservation of identifiers is paraphrased from the ISO C standard. The text is included  
 115659 because it needs to be part of POSIX.1-200x, regardless of possible changes in future versions of  
 115660 the ISO C standard.

115661 These identifiers may be used by implementations, particularly for feature test macros.  
 115662 Implementations should not use feature test macro names that might be reasonably used by a  
 115663 standard.

115664 Including headers more than once is a reasonably common practice, and it should be carried  
 115665 forward from the ISO C standard. More significantly, having definitions in more than one  
 115666 header is explicitly permitted. Where the potential declaration is “benign” (the same definition  
 115667 twice) the declaration can be repeated, if that is permitted by the compiler. (This is usually true  
 115668 of macros, for example.) In those situations where a repetition is not benign (for example,  
 115669 **typedefs**), conditional compilation must be used. The situation actually occurs both within the  
 115670 ISO C standard and within POSIX.1: `time_t` should be in `<sys/types.h>`, and the ISO C standard  
 115671 mandates that it be in `<time.h>`.

115672 The area of name space pollution *versus* additions to structures is difficult because of the macro  
 115673 structure of C. The following discussion summarizes all the various problems with and  
 115674 objections to the issue.

115675 Note the phrase “user-defined macro”. Users are not permitted to define macro names (or any  
 115676 other name) beginning with “\_`[A-Z]`”. Thus, the conflict cannot occur for symbols reserved  
 115677 to the vendor’s name space, and the permission to add fields automatically applies, without  
 115678 qualification, to those symbols.

- 115679 1. Data structures (and unions) need to be defined in headers by implementations to meet  
 115680 certain requirements of POSIX.1 and the ISO C standard.
- 115681 2. The structures defined by POSIX.1 are typically minimal, and any practical  
 115682 implementation would wish to add fields to these structures either to hold additional  
 115683 related information or for backwards-compatibility (or both). Future standards (and *de*  
 115684 *facto* standards) would also wish to add to these structures. Issues of field alignment  
 115685 make it impractical (at least in the general case) to simply omit fields when they are not  
 115686 defined by the particular standard involved.

115687 The `dirent` structure is an example of such a minimal structure (although one could argue  
 115688 about whether the other fields need visible names). The `st_rdev` field of most  
 115689 implementations’ `stat` structure is a common example where extension is needed and

115690 where a conflict could occur.

115691 3. Fields in structures are in an independent name space, so the addition of such fields  
115692 presents no problem to the C language itself in that such names cannot interact with  
115693 identically named user symbols because access is qualified by the specific structure name.

115694 4. There is an exception to this: macro processing is done at a lexical level. Thus, symbols  
115695 added to a structure might be recognized as user-provided macro names at the location  
115696 where the structure is declared. This only can occur if the user-provided name is declared  
115697 as a macro before the header declaring the structure is included. The user's use of the  
115698 name after the declaration cannot interfere with the structure because the symbol is  
115699 hidden and only accessible through access to the structure. Presumably, the user would  
115700 not declare such a macro if there was an intention to use that field name.

115701 5. Macros from the same or a related header might use the additional fields in the structure,  
115702 and those field names might also collide with user macros. Although this is a less  
115703 frequent occurrence, since macros are expanded at the point of use, no constraint on the  
115704 order of use of names can apply.

115705 6. An "obvious" solution of using names in the reserved name space and then redefining  
115706 them as macros when they should be visible does not work because this has the effect of  
115707 exporting the symbol into the general name space. For example, given a (hypothetical)  
115708 system-provided header `<h.h>`, and two parts of a C program in `a.c` and `b.c`, in header  
115709 `<h.h>`:

```
115710 struct foo {
115711 int __i;
115712 }
115713 #ifdef _FEATURE_TEST
115714 #define i __i;
115715 #endif
```

115716 In file `a.c`:

```
115717 #include h.h
115718 extern int i;
115719 ...
```

115720 In file `b.c`:

```
115721 extern int i;
115722 ...
```

115723 The symbol that the user thinks of as `i` in both files has an external name of `__i` in `a.c`; the  
115724 same symbol `i` in `b.c` has an external name `i` (ignoring any hidden manipulations the  
115725 compiler might perform on the names). This would cause a mysterious name resolution  
115726 problem when `a.o` and `b.o` are linked.

115727 Simply avoiding definition then causes alignment problems in the structure.

115728 A structure of the form:

```
115729 struct foo {
115730 union {
115731 int __i;
115732 #ifdef _FEATURE_TEST
115733 int i;
115734 #endif
115735 } __ii;
```

115736

}

115737

does not work because the name of the logical field *i* is `__i.i`, and introduction of a macro to restore the logical name immediately reintroduces the problem discussed previously (although its manifestation might be more immediate because a syntax error would result if a recursive macro did not cause it to fail first).

115738

115739

115740

115741

7. A more workable solution would be to declare the structure:

115742

```
struct foo {
```

115743

```
#ifdef _FEATURE_TEST
```

115744

```
 int i;
```

115745

```
#else
```

115746

```
 int __i;
```

115747

```
#endif
```

115748

}

115749

However, if a macro (particularly one required by a standard) is to be defined that uses this field, two must be defined: one that uses *i*, the other that uses `__i`. If more than one additional field is used in a macro and they are conditional on distinct combinations of features, the complexity goes up as  $2^n$ .

115750

115751

115752

115753

All this leaves a difficult situation: vendors must provide very complex headers to deal with what is conceptually simple and safe—adding a field to a structure. It is the possibility of user-provided macros with the same name that makes this difficult.

115754

115755

115756

Several alternatives were proposed that involved constraining the user's access to part of the name space available to the user (as specified by the ISO C standard). In some cases, this was only until all the headers had been included. There were two proposals discussed that failed to achieve consensus:

115757

115758

115759

115760

1. Limiting it for the whole program.

115761

2. Restricting the use of identifiers containing only uppercase letters until after all system headers had been included. It was also pointed out that because macros might wish to access fields of a structure (and macro expansion occurs totally at point of use) restricting names in this way would not protect the macro expansion, and thus the solution was inadequate.

115762

115763

115764

115765

115766

It was finally decided that reservation of symbols would occur, but as constrained.

115767

The current wording also allows the addition of fields to a structure, but requires that user macros of the same name not interfere. This allows vendors to do one of the following:

115768

115769

- Not create the situation (do not extend the structures with user-accessible names or use the solution in (7) above)

115770

115771

- Extend their compilers to allow some way of adding names to structures and macros safely

115772

There are at least two ways that the compiler might be extended: add new preprocessor directives that turn off and on macro expansion for certain symbols (without changing the value of the macro) and a function or lexical operation that suppresses expansion of a word. The latter seems more flexible, particularly because it addresses the problem in macros as well as in declarations.

115773

115774

115775

115776

115777

The following seems to be a possible implementation extension to the C language that will do this: any token that during macro expansion is found to be preceded by three '#' symbols shall not be further expanded in exactly the same way as described for macros that expand to their own name as in Section 3.8.3.4 of the ISO C standard. A vendor may also wish to implement this as an operation that is lexically a function, which might be implemented as:

115778

115779

115780

115781

115782 `#define __safe_name(x) ###x`

115783 Using a function notation would insulate vendors from changes in standards until such a  
115784 functionality is standardized (if ever). Standardization of such a function would be valuable  
115785 because it would then permit third parties to take advantage of it portably in software they may  
115786 supply.

115787 The symbols that are “explicitly permitted, but not required by POSIX.1-200x” include those  
115788 classified below. (That is, the symbols classified below might, but are not required to, be present  
115789 when `_POSIX_C_SOURCE` is defined to have the value `200xxL`.)

- 115790 • Symbols in `<limits.h>` and `<unistd.h>` that are defined to indicate support for options or  
115791 limits that are constant at compile-time
- 115792 • Symbols in the name space reserved for the implementation by the ISO C standard
- 115793 • Symbols in a name space reserved for a particular type of extension (for example, type  
115794 names ending with `_t` in `<sys/types.h>`)
- 115795 • Additional members of structures or unions whose names do not reduce the name space  
115796 reserved for applications

115797 Since both implementations and future versions of this standard and other POSIX standards  
115798 may use symbols in the reserved spaces described in these tables, there is a potential for name  
115799 space clashes. To avoid future name space clashes when adding symbols, implementations  
115800 should not use the `posix_`, `POSIX_`, or `_POSIX_` prefixes.

115801 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/2 is applied, deleting the entries `POSIX_`,  
115802 `_POSIX_`, and `posix_` from the column of allowed name space prefixes for use by an  
115803 implementation in the first table. The presence of these prefixes was contradicting later text  
115804 which states that: “The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by XCU  
115805 [Chapter 2](#) (on page 2245) and other POSIX standards. Implementations may add symbols to the  
115806 headers shown in the following table, provided the identifiers ... do not use the reserved  
115807 prefixes `posix_`, `POSIX_`, or `_POSIX_`.”

115808 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/3 is applied, correcting the reserved  
115809 macro prefix from: “`PRI[a-z]`, `SCN[a-z]`” to: “`PRI[Xa-z]`, `SCN[Xa-z]`” in the second table. The  
115810 change was needed since the ISO C standard allows implementations to define macros of the  
115811 form `PRI` or `SCN` followed by any lowercase letter or ‘`x`’ in `<inttypes.h>`. (The  
115812 ISO/IEC 9899:1999 standard, Subclause 7.26.4.)

115813 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/4 is applied, adding a new section listing  
115814 reserved names for the `<stdint.h>` header. This change is for alignment with the ISO C standard.

115815 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/2 is applied, making it clear that  
115816 implementations are permitted to have symbols with the prefix `_POSIX_` visible in any header.

115817 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/3 is applied, updating the table of  
115818 allowed macro prefixes to include the prefix `FP_[A-Z]` for `<math.h>`. This text is added for  
115819 consistency with the `<math.h>` reference page in the Base Definitions volume of POSIX.1-200x  
115820 which permits additional implementation-defined floating-point classifications.

115821 Austin Group Interpretation 1003.1-2001 #048 is applied, reserving `SEEK_` in the name space.

### 115822 B.2.3 Error Numbers

115823 It was the consensus of the standard developers that to allow the conformance document to state  
115824 that an error occurs and under what conditions, but to disallow a statement that it never occurs,  
115825 does not make sense. It could be implied by the current wording that this is allowed, but to  
115826 reduce the possibility of future interpretation requests, it is better to make an explicit statement.

115827 The ISO C standard requires that *errno* be an assignable lvalue. Originally, the definition in  
115828 POSIX.1 was stricter than that in the ISO C standard, **extern int *errno***, in order to support  
115829 historical usage. In a multi-threaded environment, implementing *errno* as a global variable  
115830 results in non-deterministic results when accessed. It is required, however, that *errno* work as a  
115831 per-thread error reporting mechanism. In order to do this, a separate *errno* value has to be  
115832 maintained for each thread. The following section discusses the various alternative solutions  
115833 that were considered.

115834 In order to avoid this problem altogether for new functions, these functions avoid using *errno*  
115835 and, instead, return the error number directly as the function return value; a return value of zero  
115836 indicates that no error was detected.

115837 For any function that can return errors, the function return value is not used for any purpose  
115838 other than for reporting errors. Even when the output of the function is scalar, it is passed  
115839 through a function argument. While it might have been possible to allow some scalar outputs to  
115840 be coded as negative function return values and mixed in with positive error status returns, this  
115841 was rejected—using the return value for a mixed purpose was judged to be of limited use and  
115842 error prone.

115843 Checking the value of *errno* alone is not sufficient to determine the existence or type of an error,  
115844 since it is not required that a successful function call clear *errno*. The variable *errno* should only  
115845 be examined when the return value of a function indicates that the value of *errno* is meaningful.  
115846 In that case, the function is required to set the variable to something other than zero.

115847 The variable *errno* is never set to zero by any function call; to do so would contradict the ISO C  
115848 standard.

115849 POSIX.1 requires (in the ERRORS sections of function descriptions) certain error values to be set  
115850 in certain conditions because many existing applications depend on them. Some error numbers,  
115851 such as [EFAULT], are entirely implementation-defined and are noted as such in their  
115852 description in the ERRORS section. This section otherwise allows wide latitude to the  
115853 implementation in handling error reporting.

115854 Some of the ERRORS sections in POSIX.1-200x have two subsections. The first:

115855 “The function shall fail if:”

115856 could be called the “mandatory” section.

115857 The second:

115858 “The function may fail if:”

115859 could be informally known as the “optional” section.

115860 Attempting to infer the quality of an implementation based on whether it detects optional error  
115861 conditions is not useful.

115862 Following each one-word symbolic name for an error, there is a description of the error. The  
115863 rationale for some of the symbolic names follows:

|        |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 115864 | [ECANCELED]    | This spelling was chosen as being more common.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 115865 | [EFAULT]       | Most historical implementations do not catch an error and set <i>errno</i> when an invalid address is given to the functions <i>wait()</i> , <i>time()</i> , or <i>times()</i> . Some implementations cannot reliably detect an invalid address. And most systems that detect invalid addresses will do so only for a system call, not for a library routine.                                                                                                                                                                                                                                                                                                                                                                                         |
| 115866 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115867 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115868 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115869 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115870 | [EFTYPE]       | This error code was proposed in earlier proposals as “Inappropriate operation for file type”, meaning that the operation requested is not appropriate for the file specified in the function call. This code was proposed, although the same idea was covered by [ENOTTY], because the connotations of the name would be misleading. It was pointed out that the <i>fcntl()</i> function uses the error code [EINVAL] for this notion, and hence all instances of [EFTYPE] were changed to this code.                                                                                                                                                                                                                                                 |
| 115871 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| 115877 | [EINTR]        | POSIX.1 prohibits conforming implementations from restarting interrupted system calls of conforming applications unless the SA_RESTART flag is in effect for the signal. However, it does not require that [EINTR] be returned when another legitimate value may be substituted; for example, a partial transfer count when <i>read()</i> or <i>write()</i> are interrupted. This is only given when the signal-catching function returns normally as opposed to returns by mechanisms like <i>longjmp()</i> or <i>siglongjmp()</i> .                                                                                                                                                                                                                 |

| 115895 | [ENAMETOOLONG] | When a symbolic link is encountered during pathname resolution, the contents of that symbolic link are used to create a new pathname. The standard developers intended to allow, but not require, that implementations enforce the restriction of {PATH_MAX} on the result of this pathname substitution.                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 115907 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115908 | [ENOTTY]       | The symbolic name for this error is derived from a time when device control was done by <i>ioctl()</i> and that operation was only permitted on a terminal interface. The term “TTY” is derived from “teletypewriter”, the devices to                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 115909 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 115910 |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

- 115911 which this error originally applied.
- 115912 [EOVERFLOW] Most of the uses of this error code are related to large file support. Typically,  
115913 these cases occur on systems which support multiple programming  
115914 environments with different sizes for `off_t`, but they may also occur in  
115915 connection with remote file systems.
- 115916 In addition, when different programming environments have different widths  
115917 for types such as `int` and `uid_t`, several functions may encounter a condition  
115918 where a value in a particular environment is too wide to be represented. In  
115919 that case, this error should be raised. For example, suppose the currently  
115920 running process has 64-bit `int`, and file descriptor 9 223 372 036 854 775 807 is  
115921 open and does not have the `close-on-exec` flag set. If the process then uses  
115922 `execl()` to `exec` a file compiled in a programming environment with 32-bit `int`,  
115923 the call to `execl()` can fail with `errno` set to [EOVERFLOW]. A similar failure  
115924 can occur with `execl()` if any of the user IDs or any of the group IDs to be  
115925 assigned to the new process image are out of range for the executed file's  
115926 programming environment.
- 115927 Note, however, that this condition cannot occur for functions that are  
115928 explicitly described as always being successful, such as `getpid()`.
- 115929 [EPIPE] This condition normally generates the signal SIGPIPE; the error is returned if  
115930 the signal does not terminate the process.
- 115931 [EROFS] In historical implementations, attempting to `unlink()` or `rmdir()` a mount point  
115932 would generate an [EBUSY] error. An implementation could be envisioned  
115933 where such an operation could be performed without error. In this case, if  
115934 either the directory entry or the actual data structures reside on a read-only file  
115935 system, [EROFS] is the appropriate error to generate. (For example, changing  
115936 the link count of a file on a read-only file system could not be done, as is  
115937 required by `unlink()`, and thus an error should be reported.)
- 115938 Three error numbers, [EDOM], [EILSEQ], and [ERANGE], were added to this section primarily  
115939 for consistency with the ISO C standard.

#### 115940 Alternative Solutions for Per-Thread `errno`

115941 The usual implementation of `errno` as a single global variable does not work in a multi-threaded  
115942 environment. In such an environment, a thread may make a POSIX.1 call and get a `-1` error  
115943 return, but before that thread can check the value of `errno`, another thread might have made a  
115944 second POSIX.1 call that also set `errno`. This behavior is unacceptable in robust programs. There  
115945 were a number of alternatives that were considered for handling the `errno` problem:

- 115946 • Implement `errno` as a per-thread integer variable.
- 115947 • Implement `errno` as a service that can access the per-thread error number.
- 115948 • Change all POSIX.1 calls to accept an extra status argument and avoid setting `errno`.
- 115949 • Change all POSIX.1 calls to raise a language exception.

115950 The first option offers the highest level of compatibility with existing practice but requires  
115951 special support in the linker, compiler, and/or virtual memory system to support the new  
115952 concept of thread private variables. When compared with current practice, the third and fourth  
115953 options are much cleaner, more efficient, and encourage a more robust programming style, but  
115954 they require new versions of all of the POSIX.1 functions that might detect an error. The second  
115955 option offers compatibility with existing code that uses the `<errno.h>` header to define the  
115956 symbol `errno`. In this option, `errno` may be a macro defined:

```

115957 #define errno (*__errno())
115958 extern int *__errno();

```

115959 This option may be implemented as a per-thread variable whereby an *errno* field is allocated in  
 115960 the user space object representing a thread, and whereby the function `__errno()` makes a system  
 115961 call to determine the location of its user space object and returns the address of the *errno* field of  
 115962 that object. Another implementation, one that avoids calling the kernel, involves allocating  
 115963 stacks in chunks. The stack allocator keeps a side table indexed by chunk number containing a  
 115964 pointer to the thread object that uses that chunk. The `__errno()` function then looks at the stack  
 115965 pointer, determines the chunk number, and uses that as an index into the chunk table to find its  
 115966 thread object and thus its private value of *errno*. On most architectures, this can be done in four  
 115967 to five instructions. Some compilers may wish to implement `__errno()` inline to improve  
 115968 performance.

### 115969 Disallowing Return of the [EINTR] Error Code

115970 Many blocking interfaces defined by POSIX.1-200x may return [EINTR] if interrupted during  
 115971 their execution by a signal handler. Blocking interfaces introduced under the threads  
 115972 functionality do not have this property. Instead, they require that the interface appear to be  
 115973 atomic with respect to interruption. In particular, clients of blocking interfaces need not handle  
 115974 any possible [EINTR] return as a special case since it will never occur. If it is necessary to restart  
 115975 operations or complete incomplete operations following the execution of a signal handler, this is  
 115976 handled by the implementation, rather than by the application.

115977 Requiring applications to handle [EINTR] errors on blocking interfaces has been shown to be a  
 115978 frequent source of often unreproducible bugs, and it adds no compelling value to the available  
 115979 functionality. Thus, blocking interfaces introduced for use by multi-threaded programs do not  
 115980 use this paradigm. In particular, in none of the functions `flockfile()`, `pthread_cond_timedwait()`,  
 115981 `pthread_cond_wait()`, `pthread_join()`, `pthread_mutex_lock()`, and `sigwait()` did providing [EINTR]  
 115982 returns add value, or even particularly make sense. Thus, these functions do not provide for an  
 115983 [EINTR] return, even when interrupted by a signal handler. The same arguments can be applied  
 115984 to `sem_wait()`, `sem_trywait()`, `sigwaitinfo()`, and `sigtimedwait()`, but implementations are  
 115985 permitted to return [EINTR] error codes for these functions for compatibility with earlier  
 115986 versions of this standard. Applications cannot rely on calls to these functions returning [EINTR]  
 115987 error codes when signals are delivered to the calling thread, but they should allow for the  
 115988 possibility.

115989 Austin Group Interpretation 1003.1-2001 #050 is applied, allowing [ENOTSUP] and  
 115990 [EOPNOTSUPP] to be the same values.

#### 115991 B.2.3.1 Additional Error Numbers

115992 The ISO C standard defines the name space for implementations to add additional error  
 115993 numbers.

### 115994 B.2.4 Signal Concepts

115995 Historical implementations of signals, using the `signal()` function, have shortcomings that make  
 115996 them unreliable for many application uses. Because of this, a new signal mechanism, based very  
 115997 closely on the one of 4.2 BSD and 4.3 BSD, was added to POSIX.1.

115998 **Signal Names**

115999 The restriction on the actual type used for **sigset\_t** is intended to guarantee that these objects can  
 116000 always be assigned, have their address taken, and be passed as parameters by value. It is not  
 116001 intended that this type be a structure including pointers to other data structures, as that could  
 116002 impact the portability of applications performing such operations. A reasonable implementation  
 116003 could be a structure containing an array of some integer type.

116004 The signals described in POSIX.1-200x must have unique values so that they may be named as  
 116005 parameters of **case** statements in the body of a C-language **switch** clause. However,  
 116006 implementation-defined signals may have values that overlap with each other or with signals  
 116007 specified in POSIX.1-200x. An example of this is SIGABRT, which traditionally overlaps some  
 116008 other signal, such as SIGIOT.

116009 SIGKILL, SIGTERM, SIGUSR1, and SIGUSR2 are ordinarily generated only through the explicit  
 116010 use of the *kill()* function, although some implementations generate SIGKILL under  
 116011 extraordinary circumstances. SIGTERM is traditionally the default signal sent by the *kill*  
 116012 command.

116013 The signals SIGBUS, SIGEMT, SIGIOT, SIGTRAP, and SIGSYS were omitted from POSIX.1  
 116014 because their behavior is implementation-defined and could not be adequately categorized.  
 116015 Conforming implementations may deliver these signals, but must document the circumstances  
 116016 under which they are delivered and note any restrictions concerning their delivery. The signals  
 116017 SIGFPE, SIGILL, and SIGSEGV are similar in that they also generally result only from  
 116018 programming errors. They were included in POSIX.1 because they do indicate three relatively  
 116019 well-categorized conditions. They are all defined by the ISO C standard and thus would have to  
 116020 be defined by any system with an ISO C standard binding, even if not explicitly included in  
 116021 POSIX.1.

116022 There is very little that a Conforming POSIX.1 Application can do by catching, ignoring, or  
 116023 masking any of the signals SIGILL, SIGTRAP, SIGIOT, SIGEMT, SIGBUS, SIGSEGV, SIGSYS, or  
 116024 SIGFPE. They will generally be generated by the system only in cases of programming errors.  
 116025 While it may be desirable for some robust code (for example, a library routine) to be able to  
 116026 detect and recover from programming errors in other code, these signals are not nearly sufficient  
 116027 for that purpose. One portable use that does exist for these signals is that a command interpreter  
 116028 can recognize them as the cause of termination of a process (with *wait()*) and print an  
 116029 appropriate message. The mnemonic tags for these signals are derived from their PDP-11 origin.

116030 The signals SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU, and SIGCONT are provided for job control  
 116031 and are unchanged from 4.2 BSD. The signal SIGCHLD is also typically used by job control  
 116032 shells to detect children that have terminated or, as in 4.2 BSD, stopped.

116033 Some implementations, including System V, have a signal named SIGCLD, which is similar to  
 116034 SIGCHLD in 4.2 BSD. POSIX.1 permits implementations to have a single signal with both  
 116035 names. POSIX.1 carefully specifies ways in which conforming applications can avoid the  
 116036 semantic differences between the two different implementations. The name SIGCHLD was  
 116037 chosen for POSIX.1 because most current application usages of it can remain unchanged in  
 116038 conforming applications. SIGCLD in System V has more cases of semantics that POSIX.1 does  
 116039 not specify, and thus applications using it are more likely to require changes in addition to the  
 116040 name change.

116041 The signals SIGUSR1 and SIGUSR2 are commonly used by applications for notification of  
 116042 exceptional behavior and are described as “reserved as application-defined” so that such use is  
 116043 not prohibited. Implementations should not generate SIGUSR1 or SIGUSR2, except when  
 116044 explicitly requested by *kill()*. It is recommended that libraries not use these two signals, as such  
 116045 use in libraries could interfere with their use by applications calling the libraries. If such use is  
 116046 unavoidable, it should be documented. It is prudent for non-portable libraries to use non-

116047 standard signals to avoid conflicts with use of standard signals by portable libraries.

116048 There is no portable way for an application to catch or ignore non-standard signals. Some  
 116049 implementations define the range of signal numbers, so applications can install signal-catching  
 116050 functions for all of them. Unfortunately, implementation-defined signals often cause problems  
 116051 when caught or ignored by applications that do not understand the reason for the signal. While  
 116052 the desire exists for an application to be more robust by handling all possible signals (even those  
 116053 only generated by *kill()*), no existing mechanism was found to be sufficiently portable to include  
 116054 in POSIX.1. The value of such a mechanism, if included, would be diminished given that  
 116055 SIGKILL would still not be catchable.

116056 A number of new signal numbers are reserved for applications because the two user signals  
 116057 defined by POSIX.1 are insufficient for many realtime applications. A range of signal numbers is  
 116058 specified, rather than an enumeration of additional reserved signal names, because different  
 116059 applications and application profiles will require a different number of application signals. It is  
 116060 not desirable to burden all application domains and therefore all implementations with the  
 116061 maximum number of signals required by all possible applications. Note that in this context,  
 116062 signal numbers are essentially different signal priorities.

116063 The relatively small number of required additional signals, `{_POSIX_RTSIG_MAX}`, was chosen  
 116064 so as not to require an unreasonably large signal mask/set. While this number of signals  
 116065 defined in POSIX.1 will fit in a single 32-bit word signal mask, it is recognized that most existing  
 116066 implementations define many more signals than are specified in POSIX.1 and, in fact, many  
 116067 implementations have already exceeded 32 signals (including the “null signal”). Support of  
 116068 `{_POSIX_RTSIG_MAX}` additional signals may push some implementation over the single 32-bit  
 116069 word line, but is unlikely to push any implementations that are already over that line beyond  
 116070 the 64-signal line.

#### 116071 B.2.4.1 *Signal Generation and Delivery*

116072 The terms defined in this section are not used consistently in documentation of historical  
 116073 systems. Each signal can be considered to have a lifetime beginning with generation and ending  
 116074 with delivery or acceptance. The POSIX.1 definition of “delivery” does not exclude ignored  
 116075 signals; this is considered a more consistent definition. This revised text in several parts of  
 116076 POSIX.1-200x clarifies the distinct semantics of asynchronous signal delivery and synchronous  
 116077 signal acceptance. The previous wording attempted to categorize both under the term  
 116078 “delivery”, which led to conflicts over whether the effects of asynchronous signal delivery  
 116079 applied to synchronous signal acceptance.

116080 Signals generated for a process are delivered to only one thread. Thus, if more than one thread  
 116081 is eligible to receive a signal, one has to be chosen. The choice of threads is left entirely up to the  
 116082 implementation both to allow the widest possible range of conforming implementations and to  
 116083 give implementations the freedom to deliver the signal to the “easiest possible” thread should  
 116084 there be differences in ease of delivery between different threads.

116085 Note that should multiple delivery among cooperating threads be required by an application,  
 116086 this can be trivially constructed out of the provided single-delivery semantics. The construction  
 116087 of a *sigwait\_multiple()* function that accomplishes this goal is presented with the rationale for  
 116088 *sigwaitinfo()*.

116089 Implementations should deliver unblocked signals as soon after they are generated as possible.  
 116090 However, it is difficult for POSIX.1 to make specific requirements about this, beyond those in  
 116091 *kill()* and *sigprocmask()*. Even on systems with prompt delivery, scheduling of higher priority  
 116092 processes is always likely to cause delays.

116093 In general, the interval between the generation and delivery of unblocked signals cannot be  
 116094 detected by an application. Thus, references to pending signals generally apply to blocked,

116095 pending signals. An implementation registers a signal as pending on the process when no  
116096 thread has the signal unblocked and there are no threads blocked in a *sigwait()* function for that  
116097 signal. Thereafter, the implementation delivers the signal to the first thread that unblocks the  
116098 signal or calls a *sigwait()* function on a signal set containing this signal rather than choosing the  
116099 recipient thread at the time the signal is sent.

116100 In the 4.3 BSD system, signals that are blocked and set to SIG\_IGN are discarded immediately  
116101 upon generation. For a signal that is ignored as its default action, if the action is SIG\_DFL and  
116102 the signal is blocked, a generated signal remains pending. In the 4.1 BSD system and in  
116103 System V Release 3 (two other implementations that support a somewhat similar signal  
116104 mechanism), all ignored blocked signals remain pending if generated. Because it is not normally  
116105 useful for an application to simultaneously ignore and block the same signal, it was unnecessary  
116106 for POSIX.1 to specify behavior that would invalidate any of the historical implementations.

116107 There is one case in some historical implementations where an unblocked, pending signal does  
116108 not remain pending until it is delivered. In the System V implementation of *signal()*, pending  
116109 signals are discarded when the action is set to SIG\_DFL or a signal-catching routine (as well as  
116110 to SIG\_IGN). Except in the case of setting SIGCHLD to SIG\_DFL, implementations that do this  
116111 do not conform completely to POSIX.1. Some earlier proposals for POSIX.1 explicitly stated this,  
116112 but these statements were redundant due to the requirement that functions defined by POSIX.1  
116113 not change attributes of processes defined by POSIX.1 except as explicitly stated.

116114 POSIX.1 specifically states that the order in which multiple, simultaneously pending signals are  
116115 delivered is unspecified. This order has not been explicitly specified in historical  
116116 implementations, but has remained quite consistent and been known to those familiar with the  
116117 implementations. Thus, there have been cases where applications (usually system utilities) have  
116118 been written with explicit or implicit dependencies on this order. Implementors and others  
116119 porting existing applications may need to be aware of such dependencies.

116120 When there are multiple pending signals that are not blocked, implementations should arrange  
116121 for the delivery of all signals at once, if possible. Some implementations stack calls to all pending  
116122 signal-catching routines, making it appear that each signal-catcher was interrupted by the next  
116123 signal. In this case, the implementation should ensure that this stacking of signals does not  
116124 violate the semantics of the signal masks established by *sigaction()*. Other implementations  
116125 process at most one signal when the operating system is entered, with remaining signals saved  
116126 for later delivery. Although this practice is widespread, this behavior is neither standardized  
116127 nor endorsed. In either case, implementations should attempt to deliver signals associated with  
116128 the current state of the process (for example, SIGFPE) before other signals, if possible.

116129 In 4.2 BSD and 4.3 BSD, it is not permissible to ignore or explicitly block SIGCONT, because if  
116130 blocking or ignoring this signal prevented it from continuing a stopped process, such a process  
116131 could never be continued (only killed by SIGKILL). However, 4.2 BSD and 4.3 BSD do block  
116132 SIGCONT during execution of its signal-catching function when it is caught, creating exactly  
116133 this problem. A proposal was considered to disallow catching SIGCONT in addition to ignoring  
116134 and blocking it, but this limitation led to objections. The consensus was to require that  
116135 SIGCONT always continue a stopped process when generated. This removed the need to  
116136 disallow ignoring or explicit blocking of the signal; note that SIG\_IGN and SIG\_DFL are  
116137 equivalent for SIGCONT.

## 116138 B.2.4.2 Realtime Signal Generation and Delivery

116139 The realtime signals functionality is required in this version of the standard for the following  
 116140 reasons:

- 116141 • The **sigevent** structure is used by other POSIX.1 functions that result in asynchronous  
 116142 event notifications to specify the notification mechanism to use and other information  
 116143 needed by the notification mechanism. POSIX.1-200x defines only three symbolic values  
 116144 for the notification mechanism:
  - 116145 — SIGEV\_NONE is used to indicate that no notification is required when the event  
 116146 occurs. This is useful for applications that use asynchronous I/O with polling for  
 116147 completion.
  - 116148 — SIGEV\_SIGNAL indicates that a signal is generated when the event occurs.
  - 116149 — SIGEV\_THREAD provides for “callback functions” for asynchronous notifications  
 116150 done by a function call within the context of a new thread. This provides a multi-  
 116151 threaded process with a more natural means of notification than signals.

116152 The primary difficulty with previous notification approaches has been to specify the  
 116153 environment of the notification routine.

- 116154 — One approach is to limit the notification routine to call only functions permitted in a  
 116155 signal handler. While the list of permissible functions is clearly stated, this is overly  
 116156 restrictive.
- 116157 — A second approach is to define a new list of functions or classes of functions that are  
 116158 explicitly permitted or not permitted. This would give a programmer more lists to  
 116159 deal with, which would be awkward.
- 116160 — The third approach is to define completely the environment for execution of the  
 116161 notification function. A clear definition of an execution environment for notification  
 116162 is provided by executing the notification function in the environment of a newly  
 116163 created thread.

116164 Implementations may support additional notification mechanisms by defining new values  
 116165 for *sigev\_notify*.

116166 For a notification type of SIGEV\_SIGNAL, the other members of the **sigevent** structure  
 116167 defined by POSIX.1-200x specify the realtime signal—that is, the signal number and  
 116168 application-defined value that differentiates between occurrences of signals with the same  
 116169 number—that will be generated when the event occurs. The structure is defined in  
 116170 **<signal.h>**, even though the structure is not directly used by any of the signal functions,  
 116171 because it is part of the signals interface used by the POSIX.1b “client functions”. When the  
 116172 client functions include **<signal.h>** to define the signal names, the **sigevent** structure will  
 116173 also be defined.

116174 An application-defined value passed to the signal handler is used to differentiate between  
 116175 different “events” instead of requiring that the application use different signal numbers for  
 116176 several reasons:

- 116177 — Realtime applications potentially handle a very large number of different events.  
 116178 Requiring that implementations support a correspondingly large number of distinct  
 116179 signal numbers will adversely impact the performance of signal delivery because the  
 116180 signal masks to be manipulated on entry and exit to the handlers will become large.
- 116181 — Event notifications are prioritized by signal number (the rationale for this is  
 116182 explained in the following paragraphs) and the use of different signal numbers to  
 116183 differentiate between the different event notifications overloads the signal number

116184 more than has already been done. It also requires that the application developer  
116185 make arbitrary assignments of priority to events that are logically of equal priority.

116186 A union is defined for the application-defined value so that either an integer constant or a  
116187 pointer can be portably passed to the signal-catching function. On some architectures a  
116188 pointer cannot be cast to an **int** and *vice versa*.

116189 Use of a structure here with an explicit notification type discriminant rather than explicit  
116190 parameters to realtime functions, or embedded in other realtime structures, provides for  
116191 future extensions to POSIX.1-200x. Additional, perhaps more efficient, notification  
116192 mechanisms can be supported for existing realtime function interfaces, such as timers and  
116193 asynchronous I/O, by extending the **sigevent** structure appropriately. The existing  
116194 realtime function interfaces will not have to be modified to use any such new notification  
116195 mechanism. The revised text concerning the SIGEV\_SIGNAL value makes consistent the  
116196 semantics of the members of the **sigevent** structure, particularly in the definitions of  
116197 *lio\_listio()* and *aio\_fsync()*. For uniformity, other revisions cause this specification to be  
116198 referred to rather than inaccurately duplicated in the descriptions of functions and  
116199 structures using the **sigevent** structure. The revised wording does not relax the  
116200 requirement that the signal number be in the range SIGRTMIN to SIGRTMAX to guarantee  
116201 queuing and passing of the application value, since that requirement is still implied by the  
116202 signal names.

116203 • POSIX.1-200x is intentionally vague on whether “non-realtime” signal-generating  
116204 mechanisms can result in a **siginfo\_t** being supplied to the handler on delivery. In one  
116205 existing implementation, a **siginfo\_t** is posted on signal generation, even though the  
116206 implementation does not support queuing of multiple occurrences of a signal. It is not the  
116207 intent of POSIX.1-200x to preclude this, independent of the mandate to define signals that  
116208 do support queuing. Any interpretation that appears to preclude this is a mistake in the  
116209 reading or writing of the standard.

116210 • Signals handled by realtime signal handlers might be generated by functions or conditions  
116211 that do not allow the specification of an application-defined value and do not queue.  
116212 POSIX.1-200x specifies the *si\_code* member of the **siginfo\_t** structure used in existing  
116213 practice and defines additional codes so that applications can detect whether an  
116214 application-defined value is present or not. The code SI\_USER for *kill()*-generated signals  
116215 is adopted from existing practice.

116216 • The *sigaction()* *sa\_flags* value SA\_SIGINFO tells the implementation that the signal-  
116217 catching function expects two additional arguments. When the flag is not set, a single  
116218 argument, the signal number, is passed as specified by POSIX.1-200x. Although  
116219 POSIX.1-200x does not explicitly allow the *info* argument to the handler function to be  
116220 NULL, this is existing practice. This provides for compatibility with programs whose  
116221 signal-catching functions are not prepared to accept the additional arguments.  
116222 POSIX.1-200x is explicitly unspecified as to whether signals actually queue when  
116223 SA\_SIGINFO is not set for a signal, as there appear to be no benefits to applications in  
116224 specifying one behavior or another. One existing implementation queues a **siginfo\_t** on  
116225 each signal generation, unless the signal is already pending, in which case the  
116226 implementation discards the new **siginfo\_t**; that is, the queue length is never greater than  
116227 one. This implementation only examines SA\_SIGINFO on signal delivery, discarding the  
116228 queued **siginfo\_t** if its delivery was not requested.

116229 POSIX.1-200x specifies several new values for the *si\_code* member of the **siginfo\_t**  
116230 structure. In existing practice, a *si\_code* value of less than or equal to zero indicates that the  
116231 signal was generated by a process via the *kill()* function. In existing practice, values of  
116232 *si\_code* that provide additional information for implementation-generated signals, such as  
116233 SIGFPE or SIGSEGV, are all positive. Thus, if implementations define the new constants

116234 specified in POSIX.1-200x to be negative numbers, programs written to use existing  
 116235 practice will not break. POSIX.1-200x chose not to attempt to specify existing practice  
 116236 values of *si\_code* other than SI\_USER both because it was deemed beyond the scope of  
 116237 POSIX.1-200x and because many of the values in existing practice appear to be platform  
 116238 and implementation-defined. But, POSIX.1-200x does specify that if an implementation—  
 116239 for example, one that does not have existing practice in this area—chooses to define  
 116240 additional values for *si\_code*, these values have to be different from the values of the  
 116241 symbols specified by POSIX.1-200x. This will allow conforming applications to  
 116242 differentiate between signals generated by one of the POSIX.1b asynchronous events and  
 116243 those generated by other implementation events in a manner compatible with existing  
 116244 practice.

116245 The unique values of *si\_code* for the POSIX.1b asynchronous events have implications for  
 116246 implementations of, for example, asynchronous I/O or message passing in user space  
 116247 library code. Such an implementation will be required to provide a hidden interface to the  
 116248 signal generation mechanism that allows the library to specify the standard values of  
 116249 *si\_code*.

116250 Existing practice also defines additional members of **siginfo\_t**, such as the process ID and  
 116251 user ID of the sending process for *kill()*-generated signals. These members were deemed  
 116252 not necessary to meet the requirements of realtime applications and are not specified by  
 116253 POSIX.1-200x. Neither are they precluded.

116254 The third argument to the signal-catching function, *context*, is left undefined by  
 116255 POSIX.1-200x, but is specified in the interface because it matches existing practice for the  
 116256 SA\_SIGINFO flag. It was considered undesirable to require a separate implementation for  
 116257 SA\_SIGINFO for POSIX conformance on implementations that already support the two  
 116258 additional parameters.

116259 • The requirement to deliver lower numbered signals in the range SIGRTMIN to SIGRTMAX  
 116260 first, when multiple unblocked signals are pending, results from several considerations:

116261 — A method is required to prioritize event notifications. The signal number was chosen  
 116262 instead of, for instance, associating a separate priority with each request, because an  
 116263 implementation has to check pending signals at various points and select one for  
 116264 delivery when more than one is pending. Specifying a selection order is the minimal  
 116265 additional semantic that will achieve prioritized delivery. If a separate priority were  
 116266 to be associated with queued signals, it would be necessary for an implementation to  
 116267 search all non-empty, non-blocked signal queues and select from among them the  
 116268 pending signal with the highest priority. This would significantly increase the cost of  
 116269 and decrease the determinism of signal delivery.

116270 — Given the specified selection of the lowest numeric unblocked pending signal,  
 116271 preemptive priority signal delivery can be achieved using signal numbers and signal  
 116272 masks by ensuring that the *sa\_mask* for each signal number blocks all signals with a  
 116273 higher numeric value.

116274 For realtime applications that want to use only the newly defined realtime signal  
 116275 numbers without interference from the standard signals, this can be achieved by  
 116276 blocking all of the standard signals in the thread signal mask and in the *sa\_mask*  
 116277 installed by the signal action for the realtime signal handlers.

116278 POSIX.1-200x explicitly leaves unspecified the ordering of signals outside of the range of  
 116279 realtime signals and the ordering of signals within this range with respect to those outside  
 116280 the range. It was believed that this would unduly constrain implementations or standards  
 116281 in the future definition of new signals.

## 116282 B.2.4.3 Signal Actions

116283 Early proposals mentioned SIGCONT as a second exception to the rule that signals are not  
 116284 delivered to stopped processes until continued. Because POSIX.1-200x now specifies that  
 116285 SIGCONT causes the stopped process to continue when it is generated, delivery of SIGCONT is  
 116286 not prevented because a process is stopped, even without an explicit exception to this rule.

116287 Ignoring a signal by setting the action to SIG\_IGN (or SIG\_DFL for signals whose default action  
 116288 is to ignore) is not the same as installing a signal-catching function that simply returns. Invoking  
 116289 such a function will interrupt certain system functions that block processes (for example, *wait()*,  
 116290 *sigsuspend()*, *pause()*, *read()*, *write()*) while ignoring a signal has no such effect on the process.

116291 Historical implementations discard pending signals when the action is set to SIG\_IGN.  
 116292 However, they do not always do the same when the action is set to SIG\_DFL and the default  
 116293 action is to ignore the signal. POSIX.1-200x requires this for the sake of consistency and also for  
 116294 completeness, since the only signal this applies to is SIGCHLD, and POSIX.1-200x disallows  
 116295 setting its action to SIG\_IGN.

116296 Some implementations (System V, for example) assign different semantics for SIGCLD  
 116297 depending on whether the action is set to SIG\_IGN or SIG\_DFL. Since POSIX.1 requires that the  
 116298 default action for SIGCHLD be to ignore the signal, applications should always set the action to  
 116299 SIG\_DFL in order to avoid SIGCHLD.

116300 Whether or not an implementation allows SIG\_IGN as a SIGCHLD disposition to be inherited  
 116301 across a call to one of the *exec* family of functions or *posix\_spawn()* is explicitly left as  
 116302 unspecified. This change was made as a result of IEEE PASC Interpretation 1003.1 #132, and  
 116303 permits the implementation to decide between the following alternatives:

- 116304 • Unconditionally leave SIGCHLD set to SIG\_IGN, in which case the implementation would  
 116305 not allow applications that assume inheritance of SIG\_DFL to conform to POSIX.1-200x  
 116306 without change. The implementation would, however, retain an ability to control  
 116307 applications that create child processes but never call on the *wait* family of functions,  
 116308 potentially filling up the process table.
- 116309 • Unconditionally reset SIGCHLD to SIG\_DFL, in which case the implementation would  
 116310 allow applications that assume inheritance of SIG\_DFL to conform. The implementation  
 116311 would, however, lose an ability to control applications that spawn child processes but  
 116312 never reap them.
- 116313 • Provide some mechanism, not specified in POSIX.1-200x, to control inherited SIGCHLD  
 116314 dispositions.

116315 Some implementations (System V, for example) will deliver a SIGCLD signal immediately when  
 116316 a process establishes a signal-catching function for SIGCLD when that process has a child that  
 116317 has already terminated. Other implementations, such as 4.3 BSD, do not generate a new  
 116318 SIGCHLD signal in this way. In general, a process should not attempt to alter the signal action  
 116319 for the SIGCHLD signal while it has any outstanding children. However, it is not always  
 116320 possible for a process to avoid this; for example, shells sometimes start up processes in pipelines  
 116321 with other processes from the pipeline as children. Processes that cannot ensure that they have  
 116322 no children when altering the signal action for SIGCHLD thus need to be prepared for, but not  
 116323 depend on, generation of an immediate SIGCHLD signal.

116324 The default action of the stop signals (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is to stop a  
 116325 process that is executing. If a stop signal is delivered to a process that is already stopped, it has  
 116326 no effect. In fact, if a stop signal is generated for a stopped process whose signal mask blocks the  
 116327 signal, the signal will never be delivered to the process since the process must receive a  
 116328 SIGCONT, which discards all pending stop signals, in order to continue executing.

116329 The SIGCONT signal continues a stopped process even if SIGCONT is blocked (or ignored).  
 116330 However, if a signal-catching routine has been established for SIGCONT, it will not be entered  
 116331 until SIGCONT is unblocked.

116332 If a process in an orphaned process group stops, it is no longer under the control of a job control  
 116333 shell and hence would not normally ever be continued. Because of this, orphaned processes that  
 116334 receive terminal-related stop signals (SIGTSTP, SIGTTIN, SIGTTOU, but not SIGSTOP) must not  
 116335 be allowed to stop. The goal is to prevent stopped processes from languishing forever. (As  
 116336 SIGSTOP is sent only via *kill()*, it is assumed that the process or user sending a SIGSTOP can  
 116337 send a SIGCONT when desired.) Instead, the system must discard the stop signal. As an  
 116338 extension, it may also deliver another signal in its place. 4.3 BSD sends a SIGKILL, which is  
 116339 overly effective because SIGKILL is not catchable. Another possible choice is SIGHUP. 4.3 BSD  
 116340 also does this for orphaned processes (processes whose parent has terminated) rather than for  
 116341 members of orphaned process groups; this is less desirable because job control shells manage  
 116342 process groups. POSIX.1 also prevents SIGTTIN and SIGTTOU signals from being generated for  
 116343 processes in orphaned process groups as a direct result of activity on a terminal, preventing  
 116344 infinite loops when *read()* and *write()* calls generate signals that are discarded; see [Section](#)  
 116345 [A.11.1.4](#) (on page 3381). A similar restriction on the generation of SIGTSTP was considered, but  
 116346 that would be unnecessary and more difficult to implement due to its asynchronous nature.

116347 Although POSIX.1 requires that signal-catching functions be called with only one argument,  
 116348 there is nothing to prevent conforming implementations from extending POSIX.1 to pass  
 116349 additional arguments, as long as Strictly Conforming POSIX.1 Applications continue to compile  
 116350 and execute correctly. Most historical implementations do, in fact, pass additional, signal-  
 116351 specific arguments to certain signal-catching routines.

116352 There was a proposal to change the declared type of the signal handler to:

```
116353 void func (int sig, ...);
```

116354 The usage of ellipses ("...") is ISO C standard syntax to indicate a variable number of  
 116355 arguments. Its use was intended to allow the implementation to pass additional information to  
 116356 the signal handler in a standard manner.

116357 Unfortunately, this construct would require all signal handlers to be defined with this syntax  
 116358 because the ISO C standard allows implementations to use a different parameter passing  
 116359 mechanism for variable parameter lists than for non-variable parameter lists. Thus, all existing  
 116360 signal handlers in all existing applications would have to be changed to use the variable syntax  
 116361 in order to be standard and portable. This is in conflict with the goal of Minimal Changes to  
 116362 Existing Application Code.

116363 When terminating a process from a signal-catching function, processes should be aware of any  
 116364 interpretation that their parent may make of the status returned by *wait()*, *waitid()*, or *waitpid()*.  
 116365 In particular, a signal-catching function should not call *exit(0)* or *\_exit(0)* unless it wants to  
 116366 indicate successful termination. A non-zero argument to *exit()* or *\_exit()* can be used to indicate  
 116367 unsuccessful termination. Alternatively, the process can use *kill()* to send itself a fatal signal  
 116368 (first ensuring that the signal is set to the default action and not blocked). See also the  
 116369 RATIONALE section of the *\_exit()* function.

116370 The behavior of *unsafe* functions, as defined by this section, is undefined when they are invoked  
 116371 from signal-catching functions in certain circumstances. The behavior of reentrant functions, as  
 116372 defined by this section, is as specified by POSIX.1, regardless of invocation from a signal-  
 116373 catching function. This is the only intended meaning of the statement that reentrant functions  
 116374 may be used in signal-catching functions without restriction. Applications must still consider all  
 116375 effects of such functions on such things as data structures, files, and process state. In particular,  
 116376 application developers need to consider the restrictions on interactions when interrupting  
 116377 *sleep()* (see *sleep()*) and interactions among multiple handles for a file description. The fact that

116378 any specific function is listed as reentrant does not necessarily mean that invocation of that  
116379 function from a signal-catching function is recommended.

116380 In order to prevent errors arising from interrupting non-reentrant function calls, applications  
116381 should protect calls to these functions either by blocking the appropriate signals or through the  
116382 use of some programmatic semaphore. POSIX.1 does not address the more general problem of  
116383 synchronizing access to shared data structures. Note in particular that even the “safe” functions  
116384 may modify the global variable *errno*; the signal-catching function may want to save and restore  
116385 its value. The same principles apply to the reentrancy of application routines and asynchronous  
116386 data access.

116387 Note that *longjmp()* and *siglongjmp()* are not in the list of reentrant functions. This is because the  
116388 code executing after *longjmp()* or *siglongjmp()* can call any unsafe functions with the same  
116389 danger as calling those unsafe functions directly from the signal handler. Applications that use  
116390 *longjmp()* or *siglongjmp()* out of signal handlers require rigorous protection in order to be  
116391 portable. Many of the other functions that are excluded from the list are traditionally  
116392 implemented using either the C language *malloc()* or *free()* functions or the ISO C standard I/O  
116393 library, both of which traditionally use data structures in a non-reentrant manner. Because any  
116394 combination of different functions using a common data structure can cause reentrancy  
116395 problems, POSIX.1 does not define the behavior when any unsafe function is called in a signal  
116396 handler that interrupts any unsafe function.

116397 The only realtime extension to signal actions is the addition of the additional parameters to the  
116398 signal-catching function. This extension has been explained and motivated in the previous  
116399 section. In making this extension, though, developers of POSIX.1b ran into issues relating to  
116400 function prototypes. In response to input from the POSIX.1 standard developers, members were  
116401 added to the **sigaction** structure to specify function prototypes for the newer signal-catching  
116402 function specified by POSIX.1b. These members follow changes that are being made to POSIX.1.  
116403 Note that POSIX.1-200x explicitly states that these fields may overlap so that a union can be  
116404 defined. This enabled existing implementations of POSIX.1 to maintain binary-compatibility  
116405 when these extensions were added.

116406 The **siginfo\_t** structure was adopted for passing the application-defined value to match existing  
116407 practice, but the existing practice has no provision for an application-defined value, so this was  
116408 added. Note that POSIX normally reserves the “\_t” type designation for opaque types. The  
116409 **siginfo\_t** structure breaks with this convention to follow existing practice and thus promote  
116410 portability. Standardization of the existing practice for the other members of this structure may  
116411 be addressed in the future.

116412 Although it is not explicitly visible to applications, there are additional semantics for signal  
116413 actions implied by queued signals and their interaction with other POSIX.1b realtime functions.  
116414 Specifically:

- 116415 • It is not necessary to queue signals whose action is SIG\_IGN.
- 116416 • For implementations that support POSIX.1b timers, some interaction with the timer  
116417 functions at signal delivery is implied to manage the timer overrun count.

116418 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/5 is applied, reordering the RTS shaded  
116419 text under the third and fourth paragraphs of the SIG\_DFL description. This corrects an earlier  
116420 editorial error in this section.

116421 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/6 is applied, adding the *abort()* function  
116422 to the list of async-cancel-safe functions.

116423 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/4 is applied, adding the *socketmark()*  
116424 function to the list of functions that shall be either reentrant or non-interruptible by signals and  
116425 shall be async-signal-safe.

116426 **B.2.4.4** *Signal Effects on Other Functions*

116427 The most common behavior of an interrupted function after a signal-catching function returns is  
 116428 for the interrupted function to give an [EINTR] error unless the SA\_RESTART flag is in effect for  
 116429 the signal. However, there are a number of specific exceptions, including *sleep()* and certain  
 116430 situations with *read()* and *write()*.

116431 The historical implementations of many functions defined by POSIX.1-200x are not interruptible,  
 116432 but delay delivery of signals generated during their execution until after they complete. This is  
 116433 never a problem for functions that are guaranteed to complete in a short (imperceptible to a  
 116434 human) period of time. It is normally those functions that can suspend a process indefinitely or  
 116435 for long periods of time (for example, *wait()*, *pause()*, *sigsuspend()*, *sleep()*, or *read()/write()* on a  
 116436 slow device like a terminal) that are interruptible. This permits applications to respond to  
 116437 interactive signals or to set timeouts on calls to most such functions with *alarm()*. Therefore,  
 116438 implementations should generally make such functions (including ones defined as extensions)  
 116439 interruptible.

116440 Functions not mentioned explicitly as interruptible may be so on some implementations,  
 116441 possibly as an extension where the function gives an [EINTR] error. There are several functions  
 116442 (for example, *getpid()*, *getuid()*) that are specified as never returning an error, which can thus  
 116443 never be extended in this way.

116444 If a signal-catching function returns while the SA\_RESTART flag is in effect, an interrupted  
 116445 function is restarted at the point it was interrupted. Conforming applications cannot make  
 116446 assumptions about the internal behavior of interrupted functions, even if the functions are  
 116447 async-signal-safe. For example, suppose the *read()* function is interrupted with SA\_RESTART in  
 116448 effect, the signal-catching function closes the file descriptor being read from and returns, and the  
 116449 *read()* function is then restarted; in this case the application cannot assume that the *read()*  
 116450 function will give an [EBADF] error, since *read()* might have checked the file descriptor for  
 116451 validity before being interrupted.

116452 **B.2.5** **Standard I/O Streams**116453 **B.2.5.1** *Interaction of File Descriptors and Standard I/O Streams*

116454 There is no additional rationale provided for this section.

116455 **B.2.5.2** *Stream Orientation and Encoding Rules*

116456 There is no additional rationale provided for this section.

116457 **B.2.6** **STREAMS**

116458 STREAMS are included into POSIX.1-200x as part of the alignment with the Single UNIX  
 116459 Specification, but marked as an option in recognition that not all systems may wish to  
 116460 implement the facility. The option within POSIX.1-200x is denoted by the XSR margin marker.  
 116461 The standard developers made this option independent of the XSI option. In this version of the  
 116462 standard this option is marked obsolescent.

116463 STREAMS are a method of implementing network services and other character-based  
 116464 input/output mechanisms, with the STREAM being a full-duplex connection between a process  
 116465 and a device. STREAMS provides direct access to protocol modules, and optional protocol  
 116466 modules can be interposed between the process-end of the STREAM and the device-driver at the  
 116467 device-end of the STREAM. Pipes can be implemented using the STREAMS mechanism, so they  
 116468 can provide process-to-process as well as process-to-device communications.

116469 This section introduces STREAMS I/O, the message types used to control them, an overview of  
116470 the priority mechanism, and the interfaces used to access them.

#### 116471 B.2.6.1 Accessing STREAMS

116472 There is no additional rationale provided for this section.

### 116473 B.2.7 XSI Interprocess Communication

116474 There are two forms of IPC supported as options in POSIX.1-200x. The traditional System V IPC  
116475 routines derived from the SVID—that is, the *msg\**(), *sem\**(), and *shm\**() interfaces—are  
116476 mandatory on XSI-conformant systems. Thus, all XSI-conformant systems provide the same  
116477 mechanisms for manipulating messages, shared memory, and semaphores.

116478 In addition, the POSIX Realtime Extension provides an alternate set of routines for those systems  
116479 supporting the appropriate options.

116480 The application developer is presented with a choice: the System V interfaces or the POSIX  
116481 interfaces (loosely derived from the Berkeley interfaces). The XSI profile prefers the System V  
116482 interfaces, but the POSIX interfaces may be more suitable for realtime or other performance-  
116483 sensitive applications.

#### 116484 B.2.7.1 IPC General Information

116485 General information that is shared by all three mechanisms is described in this section. The  
116486 common permissions mechanism is briefly introduced, describing the mode bits, and how they  
116487 are used to determine whether or not a process has access to read or write/alter the appropriate  
116488 instance of one of the IPC mechanisms. All other relevant information is contained in the  
116489 reference pages themselves.

116490 The semaphore type of IPC allows processes to communicate through the exchange of  
116491 semaphore values. A semaphore is a positive integer. Since many applications require the use of  
116492 more than one semaphore, XSI-conformant systems have the ability to create sets or arrays of  
116493 semaphores.

116494 Calls to support semaphores include:

116495 *semctl*(), *semget*(), *semop*()

116496 Semaphore sets are created by using the *semget*() function.

116497 The message type of IPC allows processes to communicate through the exchange of data stored  
116498 in buffers. This data is transmitted between processes in discrete portions known as messages.

116499 Calls to support message queues include:

116500 *msgctl*(), *msgget*(), *msgrcv*(), *msgsnd*()

116501 The shared memory type of IPC allows two or more processes to share memory and  
116502 consequently the data contained therein. This is done by allowing processes to set up access to a  
116503 common memory address space. This sharing of memory provides a fast means of exchange of  
116504 data between processes.

116505 Calls to support shared memory include:

116506 *shmctl*(), *shmdt*(), *shmget*()

116507 The *ftok*() interface is also provided.

## B.2.8 Realtime

### Advisory Information

POSIX.1b contains an Informative Annex with proposed interfaces for “realtime files”. These interfaces could determine groups of the exact parameters required to do “direct I/O” or “extents”. These interfaces were objected to by a significant portion of the balloting group as too complex. A conforming application had little chance of correctly navigating the large parameter space to match its desires to the system. In addition, they only applied to a new type of file (realtime files) and they told the implementation exactly what to do as opposed to advising the implementation on application behavior and letting it optimize for the system the (portable) application was running on. For example, it was not clear how a system that had a disk array should set its parameters.

There seemed to be several overall goals:

- Optimizing sequential access
- Optimizing caching behavior
- Optimizing I/O data transfer
- Preallocation

The advisory interfaces, *posix\_fadvise()* and *posix\_madvise()*, satisfy the first two goals. The `POSIX_FADV_SEQUENTIAL` and `POSIX_MADV_SEQUENTIAL` advice tells the implementation to expect serial access. Typically the system will prefetch the next several serial accesses in order to overlap I/O. It may also free previously accessed serial data if memory is tight. If the application is not doing serial access it can use `POSIX_FADV_WILLNEED` and `POSIX_MADV_WILLNEED` to accomplish I/O overlap, as required. When the application advises `POSIX_FADV_RANDOM` or `POSIX_MADV_RANDOM` behavior, the implementation usually tries to fetch a minimum amount of data with each request and it does not expect much locality. `POSIX_FADV_DONTNEED` and `POSIX_MADV_DONTNEED` allow the system to free up caching resources as the data will not be required in the near future.

`POSIX_FADV_NOREUSE` tells the system that caching the specified data is not optimal. For file I/O, the transfer should go directly to the user buffer instead of being cached internally by the implementation. To portably perform direct disk I/O on all systems, the application must perform its I/O transfers according to the following rules:

1. The user buffer should be aligned according to the `{POSIX_REC_XFER_ALIGN} pathconf()` variable.
2. The number of bytes transferred in an I/O operation should be a multiple of the `{POSIX_ALLOC_SIZE_MIN} pathconf()` variable.
3. The offset into the file at the start of an I/O operation should be a multiple of the `{POSIX_ALLOC_SIZE_MIN} pathconf()` variable.
4. The application should ensure that all threads which open a given file specify `POSIX_FADV_NOREUSE` to be sure that there is no unexpected interaction between threads using buffered I/O and threads using direct I/O to the same file.

In some cases, a user buffer must be properly aligned in order to be transferred directly to/from the device. The `{POSIX_REC_XFER_ALIGN} pathconf()` variable tells the application the proper alignment.

The preallocation goal is met by the space control function, *posix\_fallocate()*. The application can use *posix\_fallocate()* to guarantee no `[ENOSPC]` errors and to improve performance by prepaying any overhead required for block allocation.

116553 Implementations may use information conveyed by a previous *posix\_fadvise()* call to influence  
 116554 the manner in which allocation is performed. For example, if an application did the following  
 116555 calls:

```
116556 fd = open("file");
116557 posix_fadvise(fd, offset, len, POSIX_FADV_SEQUENTIAL);
116558 posix_fallocate(fd, len, size);
```

116559 an implementation might allocate the file contiguously on disk.

116560 Finally, the *pathconf()* variables {POSIX\_REC\_MIN\_XFER\_SIZE},  
 116561 {POSIX\_REC\_MAX\_XFER\_SIZE}, and {POSIX\_REC\_INCR\_XFER\_SIZE} tell the application a  
 116562 range of transfer sizes that are recommended for best I/O performance.

116563 Where bounded response time is required, the vendor can supply the appropriate settings of the  
 116564 advisories to achieve a guaranteed performance level.

116565 The interfaces meet the goals while allowing applications using regular files to take advantage  
 116566 of performance optimizations. The interfaces tell the implementation expected application  
 116567 behavior which the implementation can use to optimize performance on a particular system  
 116568 with a particular dynamic load.

116569 The *posix\_memalign()* function was added to allow for the allocation of specifically aligned  
 116570 buffers; for example, for {POSIX\_REC\_XFER\_ALIGN}.

116571 The working group also considered the alternative of adding a function which would return an  
 116572 aligned pointer to memory within a user-supplied buffer. This was not considered to be the best  
 116573 method, because it potentially wastes large amounts of memory when buffers need to be aligned  
 116574 on large alignment boundaries.

## 116575 Message Passing

116576 This section provides the rationale for the definition of the message passing interface in  
 116577 POSIX.1-200x. This is presented in terms of the objectives, models, and requirements imposed  
 116578 upon this interface.

- 116579 • Objectives

116580 Many applications, including both realtime and database applications, require a means of  
 116581 passing arbitrary amounts of data between cooperating processes comprising the overall  
 116582 application on one or more processors. Many conventional interfaces for interprocess  
 116583 communication are insufficient for realtime applications in that efficient and deterministic  
 116584 data passing methods cannot be implemented. This has prompted the definition of  
 116585 message passing interfaces providing these facilities:

- 116586 — Open a message queue.
- 116587 — Send a message to a message queue.
- 116588 — Receive a message from a queue, either synchronously or asynchronously.
- 116589 — Alter message queue attributes for flow and resource control.

116590 It is assumed that an application may consist of multiple cooperating processes and that  
 116591 these processes may wish to communicate and coordinate their activities. The message  
 116592 passing facility described in POSIX.1-200x allows processes to communicate through  
 116593 system-wide queues. These message queues are accessed through names that may be  
 116594 pathnames. A message queue can be opened for use by multiple sending and/or multiple  
 116595 receiving processes.

- 116596
- Background on Embedded Applications
- 116597 Interprocess communication utilizing message passing is a key facility for the construction  
116598 of deterministic, high-performance realtime applications. The facility is present in all  
116599 realtime systems and is the framework upon which the application is constructed. The  
116600 performance of the facility is usually a direct indication of the performance of the resulting  
116601 application.
- 116602 Realtime applications, especially for embedded systems, are typically designed around the  
116603 performance constraints imposed by the message passing mechanisms. Applications for  
116604 embedded systems are typically very tightly constrained. Application developers expect to  
116605 design and control the entire system. In order to minimize system costs, the writer will  
116606 attempt to use all resources to their utmost and minimize the requirement to add  
116607 additional memory or processors.
- 116608 The embedded applications usually share address spaces and only a simple message  
116609 passing mechanism is required. The application can readily access common data incurring  
116610 only mutual-exclusion overheads. The models desired are the simplest possible with the  
116611 application building higher-level facilities only when needed.
- Requirements
- 116612 The following requirements determined the features of the message passing facilities  
116613 defined in POSIX.1-200x:  
116614
- Naming of Message Queues
- 116615 The mechanism for gaining access to a message queue is a pathname evaluated in a  
116616 context that is allowed to be a file system name space, or it can be independent of  
116617 any file system. This is a specific attempt to allow implementations based on either  
116618 method in order to address both embedded systems and to also allow  
116619 implementation in larger systems.  
116620
- 116621 The interface of `mq_open()` is defined to allow but not require the access control and  
116622 name conflicts resulting from utilizing a file system for name resolution. All required  
116623 behavior is specified for the access control case. Yet a conforming implementation,  
116624 such as an embedded system kernel, may define that there are no distinctions  
116625 between users and may define that all processes have all access privileges.
- Embedded System Naming
- 116626 Embedded systems need to be able to utilize independent name spaces for accessing  
116627 the various system objects. They typically do not have a file system, precluding its  
116628 utilization as a common name resolution mechanism. The modularity of an  
116629 embedded system limits the connections between separate mechanisms that can be  
116630 allowed.  
116631
- 116632 Embedded systems typically do not have any access protection. Since the system  
116633 does not support the mixing of applications from different areas, and usually does  
116634 not even have the concept of an authorization entity, access control is not useful.
- Large System Naming
- 116635 On systems with more functionality, the name resolution must support the ability to  
116636 use the file system as the name resolution mechanism/object storage medium and to  
116637 have control over access to the objects. Utilizing the pathname space can result in  
116638 further errors when the names conflict with other objects.  
116639

## 116640 — Fixed Size of Messages

116641 The interfaces impose a fixed upper bound on the size of messages that can be sent to  
 116642 a specific message queue. The size is set on an individual queue basis and cannot be  
 116643 changed dynamically.

116644 The purpose of the fixed size is to increase the ability of the system to optimize the  
 116645 implementation of *mq\_send()* and *mq\_receive()*. With fixed sizes of messages and  
 116646 fixed numbers of messages, specific message blocks can be pre-allocated. This  
 116647 eliminates a significant amount of checking for errors and boundary conditions.  
 116648 Additionally, an implementation can optimize data copying to maximize  
 116649 performance. Finally, with a restricted range of message sizes, an implementation is  
 116650 better able to provide deterministic operations.

## 116651 — Prioritization of Messages

116652 Message prioritization allows the application to determine the order in which  
 116653 messages are received. Prioritization of messages is a key facility that is provided by  
 116654 most realtime kernels and is heavily utilized by the applications. The major purpose  
 116655 of having priorities in message queues is to avoid priority inversions in the message  
 116656 system, where a high-priority message is delayed behind one or more lower-priority  
 116657 messages. This allows the applications to be designed so that they do not need to be  
 116658 interrupted in order to change the flow of control when exceptional conditions occur.  
 116659 The prioritization does add additional overhead to the message operations in those  
 116660 cases it is actually used but a clever implementation can optimize for the FIFO case to  
 116661 make that more efficient.

## 116662 — Asynchronous Notification

116663 The interface supports the ability to have a task asynchronously notified of the  
 116664 availability of a message on the queue. The purpose of this facility is to allow the task  
 116665 to perform other functions and yet still be notified that a message has become  
 116666 available on the queue.

116667 To understand the requirement for this function, it is useful to understand two  
 116668 models of application design: a single task performing multiple functions and  
 116669 multiple tasks performing a single function. Each of these models has advantages.

116670 Asynchronous notification is required to build the model of a single task performing  
 116671 multiple operations. This model typically results from either the expectation that  
 116672 interruption is less expensive than utilizing a separate task or from the growth of the  
 116673 application to include additional functions.

116674 **Semaphores**

116675 Semaphores are a high-performance process synchronization mechanism. Semaphores are  
 116676 named by null-terminated strings of characters.

116677 A semaphore is created using the *sem\_init()* function or the *sem\_open()* function with the  
 116678 *O\_CREAT* flag set in *oflag*.

116679 To use a semaphore, a process has to first initialize the semaphore or inherit an open descriptor  
 116680 for the semaphore via *fork()*.

116681 A semaphore preserves its state when the last reference is closed. For example, if a semaphore  
 116682 has a value of 13 when the last reference is closed, it will have a value of 13 when it is next  
 116683 opened.

116684 When a semaphore is created, an initial state for the semaphore has to be provided. This value is

116685 a non-negative integer. Negative values are not possible since they indicate the presence of  
 116686 blocked processes. The persistence of any of these objects across a system crash or a system  
 116687 reboot is undefined. Conforming applications must not depend on any sort of persistence across  
 116688 a system reboot or a system crash.

116689 • Models and Requirements

116690 A realtime system requires synchronization and communication between the processes  
 116691 comprising the overall application. An efficient and reliable synchronization mechanism  
 116692 has to be provided in a realtime system that will allow more than one schedulable process  
 116693 mutually-exclusive access to the same resource. This synchronization mechanism has to  
 116694 allow for the optimal implementation of synchronization or systems implementors will  
 116695 define other, more cost-effective methods.

116696 At issue are the methods whereby multiple processes (tasks) can be designed and  
 116697 implemented to work together in order to perform a single function. This requires  
 116698 interprocess communication and synchronization. A semaphore mechanism is the lowest  
 116699 level of synchronization that can be provided by an operating system.

116700 A semaphore is defined as an object that has an integral value and a set of blocked  
 116701 processes associated with it. If the value is positive or zero, then the set of blocked  
 116702 processes is empty; otherwise, the size of the set is equal to the absolute value of the  
 116703 semaphore value. The value of the semaphore can be incremented or decremented by any  
 116704 process with access to the semaphore and must be done as an indivisible operation. When  
 116705 a semaphore value is less than or equal to zero, any process that attempts to lock it again  
 116706 will block or be informed that it is not possible to perform the operation.

116707 A semaphore may be used to guard access to any resource accessible by more than one  
 116708 schedulable task in the system. It is a global entity and not associated with any particular  
 116709 process. As such, a method of obtaining access to the semaphore has to be provided by the  
 116710 operating system. A process that wants access to a critical resource (section) has to wait on  
 116711 the semaphore that guards that resource. When the semaphore is locked on behalf of a  
 116712 process, it knows that it can utilize the resource without interference by any other  
 116713 cooperating process in the system. When the process finishes its operation on the resource,  
 116714 leaving it in a well-defined state, it posts the semaphore, indicating that some other  
 116715 process may now obtain the resource associated with that semaphore.

116716 In this section, mutexes and condition variables are specified as the synchronization  
 116717 mechanisms between threads.

116718 These primitives are typically used for synchronizing threads that share memory in a  
 116719 single process. However, this section provides an option allowing the use of these  
 116720 synchronization interfaces and objects between processes that share memory, regardless of  
 116721 the method for sharing memory.

116722 Much experience with semaphores shows that there are two distinct uses of  
 116723 synchronization: locking, which is typically of short duration; and waiting, which is  
 116724 typically of long or unbounded duration. These distinct usages map directly onto mutexes  
 116725 and condition variables, respectively.

116726 Semaphores are provided in POSIX.1-200x primarily to provide a means of  
 116727 synchronization for processes; these processes may or may not share memory. Mutexes  
 116728 and condition variables are specified as synchronization mechanisms between threads;  
 116729 these threads always share (some) memory. Both are synchronization paradigms that have  
 116730 been in widespread use for a number of years. Each set of primitives is particularly well  
 116731 matched to certain problems.

116732 With respect to binary semaphores, experience has shown that condition variables and

116733 mutexes are easier to use for many synchronization problems than binary semaphores. The  
 116734 primary reason for this is the explicit appearance of a Boolean predicate that specifies  
 116735 when the condition wait is satisfied. This Boolean predicate terminates a loop, including  
 116736 the call to *pthread\_cond\_wait()*. As a result, extra wakeups are benign since the predicate  
 116737 governs whether the thread will actually proceed past the condition wait. With stateful  
 116738 primitives, such as binary semaphores, the wakeup in itself typically means that the wait is  
 116739 satisfied. The burden of ensuring correctness for such waits is thus placed on *all* signalers  
 116740 of the semaphore rather than on an *explicitly coded* Boolean predicate located at the  
 116741 condition wait. Experience has shown that the latter creates a major improvement in safety  
 116742 and ease-of-use.

116743 Counting semaphores are well matched to dealing with producer/consumer problems,  
 116744 including those that might exist between threads of different processes, or between a signal  
 116745 handler and a thread. In the former case, there may be little or no memory shared by the  
 116746 processes; in the latter case, one is not communicating between co-equal threads, but  
 116747 between a thread and an interrupt-like entity. It is for these reasons that POSIX.1-200x  
 116748 allows semaphores to be used by threads.

116749 Mutexes and condition variables have been effectively used with and without priority  
 116750 inheritance, priority ceiling, and other attributes to synchronize threads that share  
 116751 memory. The efficiency of their implementation is comparable to or better than that of  
 116752 other synchronization primitives that are sometimes harder to use (for example, binary  
 116753 semaphores). Furthermore, there is at least one known implementation of Ada tasking that  
 116754 uses these primitives. Mutexes and condition variables together constitute an appropriate,  
 116755 sufficient, and complete set of inter-thread synchronization primitives.

116756 Efficient multi-threaded applications require high-performance synchronization  
 116757 primitives. Considerations of efficiency and generality require a small set of primitives  
 116758 upon which more sophisticated synchronization functions can be built.

116759 • Standardization Issues

116760 It is possible to implement very high-performance semaphores using test-and-set  
 116761 instructions on shared memory locations. The library routines that implement such a high-  
 116762 performance interface have to properly ensure that a *sem\_wait()* or *sem\_trywait()*  
 116763 operation that cannot be performed will issue a blocking semaphore system call or properly report  
 116764 the condition to the application. The same interface to the application program would be  
 116765 provided by a high-performance implementation.

116766 **B.2.8.1 Realtime Signals**

116767 **Realtime Signals Extension**

116768 This portion of the rationale presents models, requirements, and standardization issues relevant  
 116769 to the Realtime Signals Extension. This extension provides the capability required to support  
 116770 reliable, deterministic, asynchronous notification of events. While a new mechanism,  
 116771 unencumbered by the historical usage and semantics of POSIX.1 signals, might allow for a more  
 116772 efficient implementation, the application requirements for event notification can be met with a  
 116773 small number of extensions to signals. Therefore, a minimal set of extensions to signals to  
 116774 support the application requirements is specified.

116775 The realtime signal extensions specified in this section are used by other realtime functions  
 116776 requiring asynchronous notification:

116777 • Models

116778 The model supported is one of multiple cooperating processes, each of which handles  
 116779 multiple asynchronous external events. Events represent occurrences that are generated as

116780 the result of some activity in the system. Examples of occurrences that can constitute an  
116781 event include:

- 116782 — Completion of an asynchronous I/O request
- 116783 — Expiration of a POSIX.1b timer
- 116784 — Arrival of an interprocess message
- 116785 — Generation of a user-defined event

116786 Processing of these events may occur synchronously via polling for event notifications or  
116787 asynchronously via a software interrupt mechanism. Existing practice for this model is  
116788 well established for traditional proprietary realtime operating systems, realtime  
116789 executives, and realtime extended POSIX-like systems.

116790 A contrasting model is that of “cooperating sequential processes” where each process  
116791 handles a single priority of events via polling. Each process blocks while waiting for  
116792 events, and each process depends on the preemptive, priority-based process scheduling  
116793 mechanism to arbitrate between events of different priority that need to be processed  
116794 concurrently. Existing practice for this model is also well established for small realtime  
116795 executives that typically execute in an unprotected physical address space, but it is just  
116796 emerging in the context of a fuller function operating system with multiple virtual address  
116797 spaces.

116798 It could be argued that the cooperating sequential process model, and the facilities  
116799 supported by the POSIX Threads Extension obviate a software interrupt model. But, even  
116800 with the cooperating sequential process model, the need has been recognized for a  
116801 software interrupt model to handle exceptional conditions and process aborting, so the  
116802 mechanism must be supported in any case. Furthermore, it is not the purview of  
116803 POSIX.1-200x to attempt to convince realtime practitioners that their current application  
116804 models based on software interrupts are “broken” and should be replaced by the  
116805 cooperating sequential process model. Rather, it is the charter of POSIX.1-200x to provide  
116806 standard extensions to mechanisms that support existing realtime practice.

#### 116807 • Requirements

116808 This section discusses the following realtime application requirements for asynchronous  
116809 event notification:

- 116810 — Reliable delivery of asynchronous event notification

116811 The events notification mechanism guarantees delivery of an event notification.  
116812 Asynchronous operations (such as asynchronous I/O and timers) that complete  
116813 significantly after they are invoked have to guarantee that delivery of the event  
116814 notification can occur at the time of completion.

- 116815 — Prioritized handling of asynchronous event notifications

116816 The events notification mechanism supports the assigning of a user function as an  
116817 event notification handler. Furthermore, the mechanism supports the preemption of  
116818 an event handler function by a higher priority event notification and supports the  
116819 selection of the highest priority pending event notification when multiple  
116820 notifications (of different priority) are pending simultaneously.

116821 The model here is based on hardware interrupts. Asynchronous event handling  
116822 allows the application to ensure that time-critical events are immediately processed  
116823 when delivered, without the indeterminism of being at a random location within a  
116824 polling loop. Use of handler priority allows the specification of how handlers are  
116825 interrupted by other higher priority handlers.

- 116826 — Differentiation between multiple occurrences of event notifications of the same type
- 116827 The events notification mechanism passes an application-defined value to the event  
116828 handler function. This value can be used for a variety of purposes, such as enabling  
116829 the application to identify which of several possible events of the same type (for  
116830 example, timer expirations) has occurred.
- 116831 — Polled reception of asynchronous event notifications
- 116832 The events notification mechanism supports blocking and non-blocking polls for  
116833 asynchronous event notification.
- 116834 The polled mode of operation is often preferred over the interrupt mode by those  
116835 practitioners accustomed to this model. Providing support for this model facilitates  
116836 the porting of applications based on this model to POSIX.1b conforming systems.
- 116837 — Deterministic response to asynchronous event notifications
- 116838 The events notification mechanism does not preclude implementations that provide  
116839 deterministic event dispatch latency and minimizes the number of system calls  
116840 needed to use the event facilities during realtime processing.
- 116841 • Rationale for Extension
- 116842 POSIX.1 signals have many of the characteristics necessary to support the asynchronous  
116843 handling of event notifications, and the Realtime Signals Extension addresses the  
116844 following deficiencies in the POSIX.1 signal mechanism:
- 116845 — Signals do not support reliable delivery of event notification. Subsequent  
116846 occurrences of a pending signal are not guaranteed to be delivered.
- 116847 — Signals do not support prioritized delivery of event notifications. The order of signal  
116848 delivery when multiple unblocked signals are pending is undefined.
- 116849 — Signals do not support the differentiation between multiple signals of the same type.

### 116850 B.2.8.2 Asynchronous I/O

116851 Many applications need to interact with the I/O subsystem in an asynchronous manner. The  
116852 asynchronous I/O mechanism provides the ability to overlap application processing and I/O  
116853 operations initiated by the application. The asynchronous I/O mechanism allows a single  
116854 process to perform I/O simultaneously to a single file multiple times or to multiple files  
116855 multiple times.

#### 116856 Overview

116857 Asynchronous I/O operations proceed in logical parallel with the processing done by the  
116858 application after the asynchronous I/O has been initiated. Other than this difference,  
116859 asynchronous I/O behaves similarly to normal I/O using *read()*, *write()*, *lseek()*, and *fsync()*.  
116860 The effect of issuing an asynchronous I/O request is as if a separate thread of execution were to  
116861 perform atomically the implied *lseek()* operation, if any, and then the requested I/O operation  
116862 (either *read()*, *write()*, or *fsync()*). There is no seek implied with a call to *aio\_fsync()*. Concurrent  
116863 asynchronous operations and synchronous operations applied to the same file update the file as  
116864 if the I/O operations had proceeded serially.

116865 When asynchronous I/O completes, a signal can be delivered to the application to indicate the  
116866 completion of the I/O. This signal can be used to indicate that buffers and control blocks used  
116867 for asynchronous I/O can be reused. Signal delivery is not required for an asynchronous  
116868 operation and may be turned off on a per-operation basis by the application. Signals may also be  
116869 synchronously polled using *aio\_suspend()*, *sigtimedwait()*, or *sigwaitinfo()*.

116870 Normal I/O has a return value and an error status associated with it. Asynchronous I/O  
 116871 returns a value and an error status when the operation is first submitted, but that only relates to  
 116872 whether the operation was successfully queued up for servicing. The I/O operation itself also  
 116873 has a return status and an error value. To allow the application to retrieve the return status and  
 116874 the error value, functions are provided that, given the address of an asynchronous I/O control  
 116875 block, yield the return and error status associated with the operation. Until an asynchronous I/O  
 116876 operation is done, its error status is [EINPROGRESS]. Thus, an application can poll for  
 116877 completion of an asynchronous I/O operation by waiting for the error status to become equal to  
 116878 a value other than [EINPROGRESS]. The return status of an asynchronous I/O operation is  
 116879 undefined so long as the error status is equal to [EINPROGRESS].

116880 Storage for asynchronous operation return and error status may be limited. Submission of  
 116881 asynchronous I/O operations may fail if this storage is exceeded. When an application retrieves  
 116882 the return status of a given asynchronous operation, therefore, any system-maintained storage  
 116883 used for this status and the error status may be reclaimed for use by other asynchronous  
 116884 operations.

116885 Asynchronous I/O can be performed on file descriptors that have been enabled for POSIX.1b  
 116886 synchronized I/O. In this case, the I/O operation still occurs asynchronously, as defined herein;  
 116887 however, the asynchronous operation I/O in this case is not completed until the I/O has reached  
 116888 either the state of synchronized I/O data integrity completion or synchronized I/O file integrity  
 116889 completion, depending on the sort of synchronized I/O that is enabled on the file descriptor.

## 116890 Models

116891 Three models illustrate the use of asynchronous I/O: a journalization model, a data acquisition  
 116892 model, and a model of the use of asynchronous I/O in supercomputing applications.

- 116893 • Journalization Model

116894 Many realtime applications perform low-priority journalizing functions. Journalizing  
 116895 requires that logging records be queued for output without blocking the initiating process.

- 116896 • Data Acquisition Model

116897 A data acquisition process may also serve as a model. The process has two or more  
 116898 channels delivering intermittent data that must be read within a certain time. The process  
 116899 issues one asynchronous read on each channel. When one of the channels needs data  
 116900 collection, the process reads the data and posts it through an asynchronous write to  
 116901 secondary memory for future processing.

- 116902 • Supercomputing Model

116903 The supercomputing community has used asynchronous I/O much like that specified in  
 116904 POSIX.1 for many years. This community requires the ability to perform multiple I/O  
 116905 operations to multiple devices with a minimal number of entries to “the system”; each  
 116906 entry to “the system” provokes a major delay in operations when compared to the normal  
 116907 progress made by the application. This existing practice motivated the use of combined  
 116908 *lseek()* and *read()* or *write()* calls, as well as the *lio\_listio()* call. Another common practice is  
 116909 to disable signal notification for I/O completion, and simply poll for I/O completion at  
 116910 some interval by which the I/O should be completed. Likewise, interfaces like *aio\_cancel()*  
 116911 have been in successful commercial use for many years. Note also that an underlying  
 116912 implementation of asynchronous I/O will require the ability, at least internally, to cancel  
 116913 outstanding asynchronous I/O, at least when the process exits. (Consider an asynchronous  
 116914 read from a terminal, when the process intends to exit immediately.)

116915 **Requirements**

116916 Asynchronous input and output for realtime implementations have these requirements:

- 116917 • The ability to queue multiple asynchronous read and write operations to a single open
- 116918 instance. Both sequential and random access should be supported.
- 116919 • The ability to queue asynchronous read and write operations to multiple open instances.
- 116920 • The ability to obtain completion status information by polling and/or asynchronous event
- 116921 notification.
- 116922 • Asynchronous event notification on asynchronous I/O completion is optional.
- 116923 • It has to be possible for the application to associate the event with the *aiocbp* for the
- 116924 operation that generated the event.
- 116925 • The ability to cancel queued requests.
- 116926 • The ability to wait upon asynchronous I/O completion in conjunction with other types of
- 116927 events.
- 116928 • The ability to accept an *aio\_read()* and an *aio\_cancel()* for a device that accepts a *read()*, and
- 116929 the ability to accept an *aio\_write()* and an *aio\_cancel()* for a device that accepts a *write()*.
- 116930 This does not imply that the operation is asynchronous.

116931 **Standardization Issues**

116932 The following issues are addressed by the standardization of asynchronous I/O:

## 116933 • Rationale for New Interface

116934 Non-blocking I/O does not satisfy the needs of either realtime or high-performance  
 116935 computing models; these models require that a process overlap program execution and  
 116936 I/O processing. Realtime applications will often make use of direct I/O to or from the  
 116937 address space of the process, or require synchronized (unbuffered) I/O; they also require  
 116938 the ability to overlap this I/O with other computation. In addition, asynchronous I/O  
 116939 allows an application to keep a device busy at all times, possibly achieving greater  
 116940 throughput. Supercomputing and database architectures will often have specialized  
 116941 hardware that can provide true asynchrony underlying the logical asynchrony provided  
 116942 by this interface. In addition, asynchronous I/O should be supported by all types of files  
 116943 and devices in the same manner.

## 116944 • Effect of Buffering

116945 If asynchronous I/O is performed on a file that is buffered prior to being actually written  
 116946 to the device, it is possible that asynchronous I/O will offer no performance advantage  
 116947 over normal I/O; the cycles *stolen* to perform the asynchronous I/O will be taken away  
 116948 from the running process and the I/O will occur at interrupt time. This potential lack of  
 116949 gain in performance in no way obviates the need for asynchronous I/O by realtime  
 116950 applications, which very often will use specialized hardware support, multiple processors,  
 116951 and/or unbuffered, synchronized I/O.

116952 **B.2.8.3 Memory Management**

116953 All memory management and shared memory definitions are located in the `<sys/mman.h>`  
 116954 header. This is for alignment with historical practice.

116955 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/7 is applied, correcting the shading and  
 116956 margin markers in the introduction to Section 2.8.3.1.

116957 **Memory Locking Functions**

116958 This portion of the rationale presents models, requirements, and standardization issues relevant  
116959 to process memory locking.

## 116960 • Models

116961 Realtime systems that conform to POSIX.1-200x are expected (and desired) to be supported  
116962 on systems with demand-paged virtual memory management, non-paged swapping  
116963 memory management, and physical memory systems with no memory management  
116964 hardware. The general case, however, is the demand-paged, virtual memory system with  
116965 each POSIX process running in a virtual address space. Note that this includes  
116966 architectures where each process resides in its own virtual address space and architectures  
116967 where the address space of each process is only a portion of a larger global virtual address  
116968 space.

116969 The concept of memory locking is introduced to eliminate the indeterminacy introduced  
116970 by paging and swapping, and to support an upper bound on the time required to access  
116971 the memory mapped into the address space of a process. Ideally, this upper bound will be  
116972 the same as the time required for the processor to access “main memory”, including any  
116973 address translation and cache miss overheads. But some implementations—primarily on  
116974 mainframes—will not actually force locked pages to be loaded and held resident in main  
116975 memory. Rather, they will handle locked pages so that accesses to these pages will meet the  
116976 performance metrics for locked process memory in the implementation. Also, although it  
116977 is not, for example, the intention that this interface, as specified, be used to lock process  
116978 memory into “cache”, it is conceivable that an implementation could support a large static  
116979 RAM memory and define this as “main memory” and use a large[r] dynamic RAM as  
116980 “backing store”. These interfaces could then be interpreted as supporting the locking of  
116981 process memory into the static RAM. Support for multiple levels of backing store would  
116982 require extensions to these interfaces.

116983 Implementations may also use memory locking to guarantee a fixed translation between  
116984 virtual and physical addresses where such is beneficial to improving determinacy for  
116985 direct-to/from-process input/output. POSIX.1-200x does not guarantee to the application  
116986 that the virtual-to-physical address translations, if such exist, are fixed, because such  
116987 behavior would not be implementable on all architectures on which implementations of  
116988 POSIX.1-200x are expected. But POSIX.1-200x does mandate that an implementation  
116989 define, for the benefit of potential users, whether or not locking guarantees fixed  
116990 translations.

116991 Memory locking is defined with respect to the address space of a process. Only the pages  
116992 mapped into the address space of a process may be locked by the process, and when the  
116993 pages are no longer mapped into the address space—for whatever reason—the locks  
116994 established with respect to that address space are removed. Shared memory areas warrant  
116995 special mention, as they may be mapped into more than one address space or mapped  
116996 more than once into the address space of a process; locks may be established on pages  
116997 within these areas with respect to several of these mappings. In such a case, the lock state  
116998 of the underlying physical pages is the logical OR of the lock state with respect to each of  
116999 the mappings. Only when all such locks have been removed are the shared pages  
117000 considered unlocked.

117001 In recognition of the page granularity of Memory Management Units (MMU), and in order  
117002 to support locking of ranges of address space, memory locking is defined in terms of  
117003 “page” granularity. That is, for the interfaces that support an address and size specification  
117004 for the region to be locked, the address must be on a page boundary, and all pages mapped  
117005 by the specified range are locked, if valid. This means that the length is implicitly rounded

117006 up to a multiple of the page size. The page size is implementation-defined and is available  
117007 to applications as a compile-time symbolic constant or at runtime via *sysconf()*.

117008 A “real memory” POSIX.1b implementation that has no MMU could elect not to support  
117009 these interfaces, returning [ENOSYS]. But an application could easily interpret this as  
117010 meaning that the implementation would unconditionally page or swap the application  
117011 when such is not the case. It is the intention of POSIX.1-200x that such a system could  
117012 define these interfaces as “NO-OPs”, returning success without actually performing any  
117013 function except for mandated argument checking.

117014 • Requirements

117015 For realtime applications, memory locking is generally considered to be required as part of  
117016 application initialization. This locking is performed after an application has been loaded  
117017 (that is, *exec'd*) and the program remains locked for its entire lifetime. But to support  
117018 applications that undergo major mode changes where, in one mode, locking is required,  
117019 but in another it is not, the specified interfaces allow repeated locking and unlocking of  
117020 memory within the lifetime of a process.

117021 When a realtime application locks its address space, it should not be necessary for the  
117022 application to then “touch” all of the pages in the address space to guarantee that they are  
117023 resident or else suffer potential paging delays the first time the page is referenced. Thus,  
117024 POSIX.1-200x requires that the pages locked by the specified interfaces be resident when  
117025 the locking functions return successfully.

117026 Many architectures support system-managed stacks that grow automatically when the  
117027 current extent of the stack is exceeded. A realtime application has a requirement to be able  
117028 to “preallocate” sufficient stack space and lock it down so that it will not suffer page faults  
117029 to grow the stack during critical realtime operation. There was no consensus on a portable  
117030 way to specify how much stack space is needed, so POSIX.1-200x supports no specific  
117031 interface for preallocating stack space. But an application can portably lock down a specific  
117032 amount of stack space by specifying *MCL\_FUTURE* in a call to *mlockall()* and then calling  
117033 a dummy function that declares an automatic array of the desired size.

117034 Memory locking for realtime applications is also generally considered to be an “all or  
117035 nothing” proposition. That is, the entire process, or none, is locked down. But, for  
117036 applications that have well-defined sections that need to be locked and others that do not,  
117037 POSIX.1-200x supports an optional set of interfaces to lock or unlock a range of process  
117038 addresses. Reasons for locking down a specific range include:

117039 — An asynchronous event handler function that must respond to external events in a  
117040 deterministic manner such that page faults cannot be tolerated

117041 — An input/output “buffer” area that is the target for direct-to-process I/O, and the  
117042 overhead of implicit locking and unlocking for each I/O call cannot be tolerated

117043 Finally, locking is generally viewed as an “application-wide” function. That is, the  
117044 application is globally aware of which regions are locked and which are not over time. This  
117045 is in contrast to a function that is used temporarily within a “third party” library routine  
117046 whose function is unknown to the application, and therefore must have no “side effects”.  
117047 The specified interfaces, therefore, do not support “lock stacking” or “lock nesting” within  
117048 a process. But, for pages that are shared between processes or mapped more than once  
117049 into a process address space, “lock stacking” is essentially mandated by the requirement  
117050 that unlocking of pages that are mapped by more than one process or more than once by  
117051 the same process does not affect locks established on the other mappings.

117052 There was some support for “lock stacking” so that locking could be transparently used in  
117053 functions or opaque modules. But the consensus was not to burden all implementations

117054 with lock stacking (and reference counting), and an implementation option was proposed.  
 117055 There were strong objections to the option because applications would have to support  
 117056 both options in order to remain portable. The consensus was to eliminate lock stacking  
 117057 altogether, primarily through overwhelming support for the System V “m[un]lock[all]”  
 117058 interface on which POSIX.1-200x is now based.

117059 Locks are not inherited across *fork()*s because some implementations implement *fork()* by  
 117060 creating new address spaces for the child. In such an implementation, requiring locks to be  
 117061 inherited would lead to new situations in which a fork would fail due to the inability of  
 117062 the system to lock sufficient memory to lock both the parent and the child. The consensus  
 117063 was that there was no benefit to such inheritance. Note that this does not mean that locks  
 117064 are removed when, for instance, a thread is created in the same address space.

117065 Similarly, locks are not inherited across *exec* because some implementations implement *exec*  
 117066 by unmapping all of the pages in the address space (which, by definition, removes the  
 117067 locks on these pages), and maps in pages of the *exec*'d image. In such an implementation,  
 117068 requiring locks to be inherited would lead to new situations in which *exec* would fail.  
 117069 Reporting this failure would be very cumbersome to detect in time to report to the calling  
 117070 process, and no appropriate mechanism exists for informing the *exec*'d process of its status.

117071 It was determined that, if the newly loaded application required locking, it was the  
 117072 responsibility of that application to establish the locks. This is also in keeping with the  
 117073 general view that it is the responsibility of the application to be aware of all locks that are  
 117074 established.

117075 There was one request to allow (not mandate) locks to be inherited across *fork()*, and a  
 117076 request for a flag, *MCL\_INHERIT*, that would specify inheritance of memory locks across  
 117077 *execs*. Given the difficulties raised by this and the general lack of support for the feature in  
 117078 POSIX.1-200x, it was not added. POSIX.1-200x does not preclude an implementation from  
 117079 providing this feature for administrative purposes, such as a “run” command that will  
 117080 lock down and execute a specified application. Additionally, the rationale for the objection  
 117081 equated *fork()* with creating a thread in the address space. POSIX.1-200x does not mandate  
 117082 releasing locks when creating additional threads in an existing process.

117083 • Standardization Issues

117084 One goal of POSIX.1-200x is to define a set of primitives that provide the necessary  
 117085 functionality for realtime applications, with consideration for the needs of other  
 117086 application domains where such were identified, which is based to the extent possible on  
 117087 existing industry practice.

117088 The Memory Locking option is required by many realtime applications to tune  
 117089 performance. Such a facility is accomplished by placing constraints on the virtual memory  
 117090 system to limit paging of time of the process or of critical sections of the process. This  
 117091 facility should not be used by most non-realtime applications.

117092 Optional features provided in POSIX.1-200x allow applications to lock selected address  
 117093 ranges with the caveat that the process is responsible for being aware of the page  
 117094 granularity of locking and the unnested nature of the locks.

117095

**Mapped Files Functions**

117096

117097

117098

117099

117100

117101

117102

The memory mapped files functionality provides a mechanism that allows a process to access files by directly incorporating file data into its address space. Once a file is “mapped” into a process address space, the data can be manipulated by instructions as memory. The use of mapped files can significantly reduce I/O data movement since file data does not have to be copied into process data buffers as in *read()* and *write()*. If more than one process maps a file, its contents are shared among them. This provides a low overhead mechanism by which processes can synchronize and communicate.

117103

- Historical Perspective

117104

117105

117106

117107

Realtime applications have historically been implemented using a collection of cooperating processes or tasks. In early systems, these processes ran on bare hardware (that is, without an operating system) with no memory relocation or protection. The application paradigms that arose from this environment involve the sharing of data between the processes.

117108

117109

117110

117111

When realtime systems were implemented on top of vendor-supplied operating systems, the paradigm or performance benefits of direct access to data by multiple processes was still deemed necessary. As a result, operating systems that claim to support realtime applications must support the shared memory paradigm.

117112

117113

117114

117115

117116

117117

117118

117119

Additionally, a number of realtime systems provide the ability to map specific sections of the physical address space into the address space of a process. This ability is required if an application is to obtain direct access to memory locations that have specific properties (for example, refresh buffers or display devices, dual ported memory locations, DMA target locations). The use of this ability is common enough to warrant some degree of standardization of its interface. This ability overlaps the general paradigm of shared memory in that, in both instances, common global objects are made addressable by individual processes or tasks.

117120

117121

117122

Finally, a number of systems also provide the ability to map process addresses to files. This provides both a general means of sharing persistent objects, and using files in a manner that optimizes memory and swapping space usage.

117123

117124

117125

117126

117127

117128

Simple shared memory is clearly a special case of the more general file mapping capability. In addition, there is relatively widespread agreement and implementation of the file mapping interface. In these systems, many different types of objects can be mapped (for example, files, memory, devices, and so on) using the same mapping interfaces. This approach both minimizes interface proliferation and maximizes the generality of programs using the mapping interfaces.

117129

- Memory Mapped Files Usage

117130

117131

117132

117133

117134

117135

117136

117137

117138

A memory object can be concurrently mapped into the address space of one or more processes. The *mmap()* and *munmap()* functions allow a process to manipulate their address space by mapping portions of memory objects into it and removing them from it. When multiple processes map the same memory object, they can share access to the underlying data. Implementations may restrict the size and alignment of mappings to be on *page-size* boundaries. The page size, in bytes, is the value of the system-configurable variable {PAGESIZE}, typically accessed by calling *sysconf()* with a *name* argument of *\_SC\_PAGESIZE*. If an implementation has no restrictions on size or alignment, it may specify a 1-byte page size.

117139

117140

117141

To map memory, a process first opens a memory object. The *ftruncate()* function can be used to contract or extend the size of the memory object even when the object is currently mapped. If the memory object is extended, the contents of the extended areas are zeros.

117142 After opening a memory object, the application maps the object into its address space  
 117143 using the *mmap()* function call. Once a mapping has been established, it remains mapped  
 117144 until unmapped with *munmap()*, even if the memory object is closed. The *mprotect()*  
 117145 function can be used to change the memory protections initially established by *mmap()*.

117146 A *close()* of the file descriptor, while invalidating the file descriptor itself, does not unmap  
 117147 any mappings established for the memory object. The address space, including all mapped  
 117148 regions, is inherited on *fork()*. The entire address space is unmapped on process  
 117149 termination or by successful calls to any of the *exec* family of functions.

117150 The *msync()* function is used to force mapped file data to permanent storage.

117151 • Effects on Other Functions

117152 With memory mapped files, the operation of the *open()*, *creat()*, and *unlink()* functions are  
 117153 a natural result of using the file system name space to map the global names for memory  
 117154 objects.

117155 The *ftruncate()* function can be used to set the length of a sharable memory object.

117156 The meaning of *stat()* fields other than the size and protection information is undefined on  
 117157 implementations where memory objects are not implemented using regular files. When  
 117158 regular files are used, the times reflect when the implementation updated the file image of  
 117159 the data, not when a process updated the data in memory.

117160 The operations of *fdopen()*, *write()*, *read()*, and *lseek()* were made unspecified for objects  
 117161 opened with *shm\_open()*, so that implementations that did not implement memory objects  
 117162 as regular files would not have to support the operation of these functions on shared  
 117163 memory objects.

117164 The behavior of memory objects with respect to *close()*, *dup()*, *dup2()*, *open()*, *close()*,  
 117165 *fork()*, *\_exit()*, and the *exec* family of functions is the same as the behavior of the existing  
 117166 practice of the *mmap()* function.

117167 A memory object can still be referenced after a close. That is, any mappings made to the  
 117168 file are still in effect, and reads and writes that are made to those mappings are still valid  
 117169 and are shared with other processes that have the same mapping. Likewise, the memory  
 117170 object can still be used if any references remain after its name(s) have been deleted. Any  
 117171 references that remain after a close must not appear to the application as file descriptors.

117172 This is existing practice for *mmap()* and *close()*. In addition, there are already mappings  
 117173 present (text, data, stack) that do not have open file descriptors. The text mapping in  
 117174 particular is considered a reference to the file containing the text. The desire was to treat all  
 117175 mappings by the process uniformly. Also, many modern implementations use *mmap()* to  
 117176 implement shared libraries, and it would not be desirable to keep file descriptors for each  
 117177 of the many libraries an application can use. It was felt there were many other existing  
 117178 programs that used this behavior to free a file descriptor, and thus POSIX.1-200x could not  
 117179 forbid it and still claim to be using existing practice.

117180 For implementations that implement memory objects using memory only, memory objects  
 117181 will retain the memory allocated to the file after the last close and will use that same  
 117182 memory on the next open. Note that closing the memory object is not the same as deleting  
 117183 the name, since the memory object is still defined in the memory object name space.

117184 The locks of *fcntl()* do not block any read or write operation, including read or write access  
 117185 to shared memory or mapped files. In addition, implementations that only support shared  
 117186 memory objects should not be required to implement record locks. The reference to *fcntl()*  
 117187 is added to make this point explicitly. The other *fcntl()* commands are useful with shared  
 117188 memory objects.

117189 The size of pages that mapping hardware may be able to support may be a configurable  
 117190 value, or it may change based on hardware implementations. The addition of the  
 117191 `_SC_PAGESIZE` parameter to the `sysconf()` function is provided for determining the  
 117192 mapping page size at runtime.

### 117193 Shared Memory Functions

117194 Implementations may support the Shared Memory Objects option independently of memory  
 117195 mapped files. Shared memory objects are named regions of storage that may be independent of  
 117196 the file system and can be mapped into the address space of one or more processes to allow  
 117197 them to share the associated memory.

- 117198 • Requirements

117199 Shared memory is used to share data among several processes, each potentially running at  
 117200 different priority levels, responding to different inputs, or performing separate tasks.  
 117201 Shared memory is not just simply providing common access to data, it is providing the  
 117202 fastest possible communication between the processes. With one memory write operation,  
 117203 a process can pass information to as many processes as have the memory region mapped.

117204 As a result, shared memory provides a mechanism that can be used for all other  
 117205 interprocess communication facilities. It may also be used by an application for  
 117206 implementing more sophisticated mechanisms than semaphores and message queues.

117207 The need for a shared memory interface is obvious for virtual memory systems, where the  
 117208 operating system is directly preventing processes from accessing each other's data.  
 117209 However, in unprotected systems, such as those found in some embedded controllers, a  
 117210 shared memory interface is needed to provide a portable mechanism to allocate a region of  
 117211 memory to be shared and then to communicate the address of that region to other  
 117212 processes.

117213 This, then, provides the minimum functionality that a shared memory interface must have  
 117214 in order to support realtime applications: to allocate and name an object to be mapped into  
 117215 memory for potential sharing (`open()` or `shm_open()`), and to make the memory object  
 117216 available within the address space of a process (`mmap()`). To complete the interface, a  
 117217 mechanism to release the claim of a process on a shared memory object (`munmap()`) is also  
 117218 needed, as well as a mechanism for deleting the name of a sharable object that was  
 117219 previously created (`unlink()` or `shm_unlink()`).

117220 After a mapping has been established, an implementation should not have to provide  
 117221 services to maintain that mapping. All memory writes into that area will appear  
 117222 immediately in the memory mapping of that region by any other processes.

117223 Thus, requirements include:

- 117224 — Support creation of sharable memory objects and the mapping of these objects into  
 117225 the address space of a process.
- 117226 — Sharable memory objects should be accessed by global names accessible from all  
 117227 processes.
- 117228 — Support the mapping of specific sections of physical address space (such as a  
 117229 memory mapped device) into the address space of a process. This should not be  
 117230 done by the process specifying the actual address, but again by an implementation-  
 117231 defined global name (such as a special device name) dedicated to this purpose.
- 117232 — Support the mapping of discrete portions of these memory objects.

- 117233 — Support for minimum hardware configurations that contain no physical media on
- 117234 which to store shared memory contents permanently.
- 117235 — The ability to preallocate the entire shared memory region so that minimum
- 117236 hardware configurations without virtual memory support can guarantee contiguous
- 117237 space.
- 117238 — The maximizing of performance by not requiring functionality that would require
- 117239 implementation interaction above creating the shared memory area and returning
- 117240 the mapping.

117241 Note that the above requirements do not preclude:

- 117242 — The sharable memory object from being implemented using actual files on an actual
- 117243 file system.
- 117244 — The global name that is accessible from all processes being restricted to a file system
- 117245 area that is dedicated to handling shared memory.
- 117246 — An implementation not providing implementation-defined global names for the
- 117247 purpose of physical address mapping.

#### 117248 • Shared Memory Objects Usage

117249 If the Shared Memory Objects option is supported, a shared memory object may be  
 117250 created, or opened if it already exists, with the *shm\_open()* function. If the shared memory  
 117251 object is created, it has a length of zero. The *ftruncate()* function can be used to set the size  
 117252 of the shared memory object after creation. The *shm\_unlink()* function removes the name  
 117253 for a shared memory object created by *shm\_open()*.

#### 117254 • Shared Memory Overview

117255 The shared memory facility defined by POSIX.1-200x usually results in memory locations  
 117256 being added to the address space of the process. The implementation returns the address  
 117257 of the new space to the application by means of a pointer. This works well in languages  
 117258 like C. However, in languages without pointer types it will not work. In the bindings for  
 117259 such a language, either a special COMMON section will need to be defined (which is  
 117260 unlikely), or the binding will have to allow existing structures to be mapped. The  
 117261 implementation will likely have to place restrictions on the size and alignment of such  
 117262 structures or will have to map a suitable region of the address space of the process into the  
 117263 memory object, and thus into other processes. These are issues for that particular language  
 117264 binding. For POSIX.1-200x, however, the practice will not be forbidden, merely undefined.

117265 Two potentially different name spaces are used for naming objects that may be mapped  
 117266 into process address spaces. When using memory mapped files, files may be accessed via  
 117267 *open()*. When the Shared Memory Objects option is supported, sharable memory objects  
 117268 that might not be files may be accessed via the *shm\_open()* function. These operations are  
 117269 not mutually-exclusive.

117270 Some implementations supporting the Shared Memory Objects option may choose to  
 117271 implement the shared memory object name space as part of the file system name space.  
 117272 There are several reasons for this:

- 117273 — It allows applications to prevent name conflicts by use of the directory structure.
- 117274 — It uses an existing mechanism for accessing global objects and prevents the creation
- 117275 of a new mechanism for naming global objects.

117276 In such implementations, memory objects can be implemented using regular files, if that is  
 117277 what the implementation chooses. The *shm\_open()* function can be implemented as an

117278 *open()* call in a fixed directory followed by a call to *fcntl()* to set *FD\_CLOEXEC*. The  
117279 *shm\_unlink()* function can be implemented as an *unlink()* call.

117280 On the other hand, it is also expected that small embedded systems that support the  
117281 Shared Memory Objects option may wish to implement shared memory without having  
117282 any file systems present. In this case, the implementations may choose to use a simple  
117283 string valued name space for shared memory regions. The *shm\_open()* function permits  
117284 either type of implementation.

117285 Some implementations have hardware that supports protection of mapped data from  
117286 certain classes of access and some do not. Systems that supply this functionality support  
117287 the memory protection functionality.

117288 Some implementations restrict size, alignment, and protections to be on *page-size*  
117289 boundaries. If an implementation has no restrictions on size or alignment, it may specify a  
117290 1-byte page size. Applications on implementations that do support larger pages must be  
117291 cognizant of the page size since this is the alignment and protection boundary.

117292 Simple embedded implementations may have a 1-byte page size and only support the  
117293 Shared Memory Objects option. This provides simple shared memory between processes  
117294 without requiring mapping hardware.

117295 POSIX.1-200x specifically allows a memory object to remain referenced after a close  
117296 because that is existing practice for the *mmap()* function.

### 117297 **Typed Memory Functions**

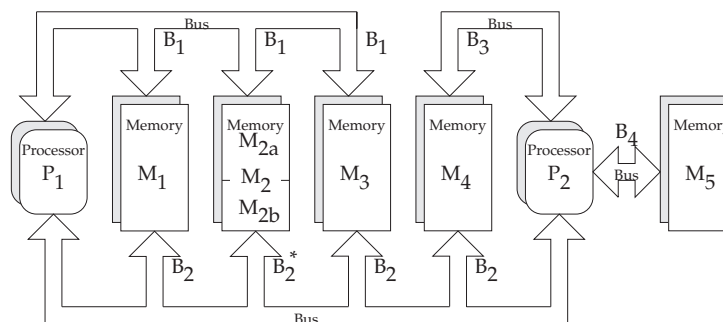

117298 Implementations may support the Typed Memory Objects option without supporting either the  
117299 Shared Memory option or memory mapped files. Types memory objects are pools of specialized  
117300 storage, different from the main memory resource normally used by a processor to hold code  
117301 and data, that can be mapped into the address space of one or more processes.

- 117302 • **Model**

117303 Realtime systems conforming to one of the POSIX.13 realtime profiles are expected (and  
117304 desired) to be supported on systems with more than one type or pool of memory (for  
117305 example, SRAM, DRAM, ROM, EPROM, EEPROM), where each type or pool of memory  
117306 may be accessible by one or more processors via one or more buses (ports). Memory  
117307 mapped files, shared memory objects, and the language-specific storage allocation  
117308 operators (*malloc()* for the ISO C standard, *new* for ISO Ada) fail to provide application  
117309 program interfaces versatile enough to allow applications to control their utilization of  
117310 such diverse memory resources. The typed memory interfaces *posix\_typed\_mem\_open()*,  
117311 *posix\_mem\_offset()*, *posix\_typed\_mem\_get\_info()*, *mmap()*, and *munmap()* defined herein  
117312 support the model of typed memory described below.

117313 For purposes of this model, a system comprises several processors (for example,  $P_1$  and  
117314  $P_2$ ), several physical memory pools (for example,  $M_1$ ,  $M_2$ ,  $M_{2a}$ ,  $M_{2b}$ ,  $M_3$ ,  $M_4$ , and  $M_5$ ), and  
117315 several buses or “ports” (for example,  $B_1$ ,  $B_2$ ,  $B_3$ , and  $B_4$ ) interconnecting the various  
117316 processors and memory pools in some system-specific way. Notice that some memory  
117317 pools may be contained in others (for example,  $M_{2a}$  and  $M_{2b}$  are contained in  $M_2$ ).

117318 **Figure B-1** (on page 3436) shows an example of such a model. In a system like this, an  
117319 application should be able to perform the following operations:

\* All addresses in pool M<sub>2</sub> (comprising pools M<sub>2a</sub> and M<sub>2b</sub>) accessible via port B<sub>1</sub>.  
 Addresses in pool M<sub>2b</sub> are also accessible via port B<sub>2</sub>.  
 Addresses in pool M<sub>2a</sub> are *not* accessible via port B<sub>2</sub>.

117320

**Figure B-1** Example of a System with Typed Memory

117321

— Typed Memory Allocation

117322

117323

117324

117325

117326

117327

An application should be able to allocate memory dynamically from the desired pool using the desired bus, and map it into the address space of a process. For example, processor P<sub>1</sub> can allocate some portion of memory pool M<sub>1</sub> through port B<sub>1</sub>, treating all unmapped subareas of M<sub>1</sub> as a heap-storage resource from which memory may be allocated. This portion of memory is mapped into address space of the process, and subsequently deallocated when unmapped from all processes.

117328

— Using the Same Storage Region from Different Busses

117329

117330

117331

117332

117333

An application process with a mapped region of storage that is accessed from one bus should be able to map that same storage area at another address (subject to page size restrictions detailed in *mmap()*), to allow it to be accessed from another bus. For example, processor P<sub>1</sub> may wish to access the same region of memory pool M<sub>2b</sub> both through ports B<sub>1</sub> and B<sub>2</sub>.

117334

— Sharing Typed Memory Regions

117335

117336

117337

117338

117339

117340

117341

117342

117343

117344

117345

117346

117347

Several application processes running on the same or different processors may wish to share a particular region of a typed memory pool. Each process or processor may wish to access this region through different buses. For example, processor P<sub>1</sub> may want to share a region of memory pool M<sub>4</sub> with processor P<sub>2</sub>, and they may be required to use buses B<sub>2</sub> and B<sub>3</sub>, respectively, to minimize bus contention. A problem arises here when a process allocates and maps a portion of fragmented memory and then wants to share this region of memory with another process, either in the same processor or different processors. The solution adopted is to allow the first process to find out the memory map (offsets and lengths) of all the different fragments of memory that were mapped into its address space, by repeatedly calling *posix\_mem\_offset()*. Then, this process can pass the offsets and lengths obtained to the second process, which can then map the same memory fragments into its address space.

117348

— Contiguous Allocation

117349

117350

The problem of finding the memory map of the different fragments of the memory pool that were mapped into logically contiguous addresses of a given process can be

117351 solved by requesting contiguous allocation. For example, a process in  $P_1$  can allocate  
 117352 10 Kbytes of physically contiguous memory from  $M_3-B_1$ , and obtain the offset (within  
 117353 pool  $M_3$ ) of this block of memory. Then, it can pass this offset (and the length) to a  
 117354 process in  $P_2$  using some interprocess communication mechanism. The second  
 117355 process can map the same block of memory by using the offset transferred and  
 117356 specifying  $M_3-B_2$ .

117357 — Unallocated Mapping

117358 Any subarea of a memory pool that is mapped to a process, either as the result of an  
 117359 allocation request or an explicit mapping, is normally unavailable for allocation.  
 117360 Special processes such as debuggers, however, may need to map large areas of a  
 117361 typed memory pool, yet leave those areas available for allocation.

117362 Typed memory allocation and mapping has to coexist with storage allocation operators  
 117363 like *malloc()*, but systems are free to choose how to implement this coexistence. For  
 117364 example, it may be system configuration-dependent if all available system memory is  
 117365 made part of one of the typed memory pools or if some part will be restricted to  
 117366 conventional allocation operators. Equally system configuration-dependent may be the  
 117367 availability of operators like *malloc()* to allocate storage from certain typed memory pools.  
 117368 It is not excluded to configure a system such that a given named pool,  $P_1$ , is in turn split  
 117369 into non-overlapping named subpools. For example,  $M_1-B_1$ ,  $M_2-B_1$ , and  $M_3-B_1$  could also be  
 117370 accessed as one common pool  $M_{123}-B_1$ . A call to *malloc()* on  $P_1$  could work on such a larger  
 117371 pool while full optimization of memory usage by  $P_1$  would require typed memory  
 117372 allocation at the subpool level.

117373 • Existing Practice

117374 OS-9 provides for the naming (numbering) and prioritization of memory types by a system  
 117375 administrator. It then provides APIs to request memory allocation of typed (colored)  
 117376 memory by number, and to generate a bus address from a mapped memory address  
 117377 (translate). When requesting colored memory, the user can specify type 0 to signify  
 117378 allocation from the first available type in priority order.

117379 HP-RT presents interfaces to map different kinds of storage regions that are visible through  
 117380 a VME bus, although it does not provide allocation operations. It also provides functions  
 117381 to perform address translation between VME addresses and virtual addresses. It represents  
 117382 a VME-bus unique solution to the general problem.

117383 The PSOS approach is similar (that is, based on a pre-established mapping of bus address  
 117384 ranges to specific memories) with a concept of segments and regions (regions dynamically  
 117385 allocated from a heap which is a special segment). Therefore, PSOS does not fully address  
 117386 the general allocation problem either. PSOS does not have a “process”-based model, but  
 117387 more of a “thread”-only-based model of multi-tasking. So mapping to a process address  
 117388 space is not an issue.

117389 QNX uses the System V approach of opening specially named devices (shared memory  
 117390 segments) and using *mmap()* to then gain access from the process. They do not address  
 117391 allocation directly, but once typed shared memory can be mapped, an “allocation  
 117392 manager” process could be written to handle requests for allocation.

117393 The System V approach also included allocation, implemented by opening yet other  
 117394 special “devices” which allocate, rather than appearing as a whole memory object.

117395 The Orkid realtime kernel interface definition has operations to manage memory “regions”  
 117396 and “pools”, which are areas of memory that may reflect the differing physical nature of  
 117397 the memory. Operations to allocate memory from these regions and pools are also  
 117398 provided.

- 117399 • Requirements
- 117400 Existing practice in SVID-derived UNIX systems relies on functionality similar to *mmap()*  
117401 and its related interfaces to achieve mapping and allocation of typed memory. However,  
117402 the issue of sharing typed memory (allocated or mapped) and the complication of multiple  
117403 ports are not addressed in any consistent way by existing UNIX system practice. Part of  
117404 this functionality is existing practice in specialized realtime operating systems. In order to  
117405 solidify the capabilities implied by the model above, the following requirements are  
117406 imposed on the interface:
- 117407 — Identification of Typed Memory Pools and Ports
- 117408 All processes (running in all processors) in the system are able to identify a particular  
117409 (system configured) typed memory pool accessed through a particular (system  
117410 configured) port by a name. That name is a member of a name space common to all  
117411 these processes, but need not be the same name space as that containing ordinary  
117412 filenames. The association between memory pools/ports and corresponding names  
117413 is typically established when the system is configured. The “open” operation for  
117414 typed memory objects should be distinct from the *open()* function, for consistency  
117415 with other similar services, but implementable on top of *open()*. This implies that the  
117416 handle for a typed memory object will be a file descriptor.
- 117417 — Allocation and Mapping of Typed Memory
- 117418 Once a typed memory object has been identified by a process, it is possible to both  
117419 map user-selected subareas of that object into process address space and to map  
117420 system-selected (that is, dynamically allocated) subareas of that object, with user-  
117421 specified length, into process address space. It is also possible to determine the  
117422 maximum length of memory allocation that may be requested from a given typed  
117423 memory object.
- 117424 — Sharing Typed Memory
- 117425 Two or more processes are able to share portions of typed memory, either user-  
117426 selected or dynamically allocated. This requirement applies also to dynamically  
117427 allocated regions of memory that are composed of several non-contiguous pieces.
- 117428 — Contiguous Allocation
- 117429 For dynamic allocation, it is the user’s option whether the system is required to  
117430 allocate a contiguous subarea within the typed memory object, or whether it is  
117431 permitted to allocate discontinuous fragments which appear contiguous in the  
117432 process mapping. Contiguous allocation simplifies the process of sharing allocated  
117433 typed memory, while discontinuous allocation allows for potentially better recovery  
117434 of deallocated typed memory.
- 117435 — Accessing Typed Memory Through Different Ports
- 117436 Once a subarea of a typed memory object has been mapped, it is possible to  
117437 determine the location and length corresponding to a user-selected portion of that  
117438 object within the memory pool. This location and length can then be used to remap  
117439 that portion of memory for access from another port. If the referenced portion of  
117440 typed memory was allocated discontinuously, the length thus determined may be  
117441 shorter than anticipated, and the user code must adapt to the value returned.
- 117442 — Deallocation
- 117443 When a previously mapped subarea of typed memory is no longer mapped by any  
117444 process in the system—as a result of a call or calls to *munmap()*—that subarea

117445 becomes potentially reusable for dynamic allocation; actual reuse of the subarea is a  
 117446 function of the dynamic typed memory allocation policy.

117447 — Unallocated Mapping

117448 It must be possible to map user-selected subareas of a typed memory object without  
 117449 marking that subarea as unavailable for allocation. This option is not the default  
 117450 behavior, and requires appropriate privilege.

117451 • Scenario

117452 The following scenario will serve to clarify the use of the typed memory interfaces.

117453 Process A running on  $P_1$  (see Figure B-1, on page 3436) wants to allocate some memory  
 117454 from memory pool  $M_2$ , and it wants to share this portion of memory with process B  
 117455 running on  $P_2$ . Since  $P_2$  only has access to the lower part of  $M_2$ , both processes will use the  
 117456 memory pool named  $M_{2b}$  which is the part of  $M_2$  that is accessible both from  $P_1$  and  $P_2$ . The  
 117457 operations that both processes need to perform are shown below:

117458 — Allocating Typed Memory

117459 Process A calls `posix_typed_mem_open()` with the name `/typed.m2b-b1` and a `tflag` of  
 117460 `POSIX_TYPED_MEM_ALLOCATE` to get a file descriptor usable for allocating from  
 117461 pool  $M_{2b}$  accessed through port  $B_1$ . It then calls `mmap()` with this file descriptor  
 117462 requesting a length of 4096 bytes. The system allocates two discontinuous blocks of  
 117463 sizes 1024 and 3072 bytes within  $M_{2b}$ . The `mmap()` function returns a pointer to a  
 117464 4096-byte array in process A's logical address space, mapping the allocated blocks  
 117465 contiguously. Process A can then utilize the array, and store data in it.

117466 — Determining the Location of the Allocated Blocks

117467 Process A can determine the lengths and offsets (relative to  $M_{2b}$ ) of the two blocks  
 117468 allocated, by using the following procedure: First, process A calls `posix_mem_offset()`  
 117469 with the address of the first element of the array and length 4096. Upon return, the  
 117470 offset and length (1024 bytes) of the first block are returned. A second call to  
 117471 `posix_mem_offset()` is then made using the address of the first element of the array  
 117472 plus 1024 (the length of the first block), and a new length of 4096-1024. If there were  
 117473 more fragments allocated, this procedure could have been continued within a loop  
 117474 until the offsets and lengths of all the blocks were obtained. Notice that this relatively  
 117475 complex procedure can be avoided if contiguous allocation is requested (by opening  
 117476 the typed memory object with the `tflag`  
 117477 `POSIX_TYPED_MEM_ALLOCATE_CONTIG`).

117478 — Sharing Data Across Processes

117479 Process A passes the two offset values and lengths obtained from the  
 117480 `posix_mem_offset()` calls to process B running on  $P_2$ , via some form of interprocess  
 117481 communication. Process B can gain access to process A's data by calling  
 117482 `posix_typed_mem_open()` with the name `/typed.m2b-b2` and a `tflag` of zero, then using  
 117483 two `mmap()` calls on the resulting file descriptor to map the two subareas of that  
 117484 typed memory object to its own address space.

117485 • Rationale for no `mem_alloc()` and `mem_free()`

117486 The standard developers had originally proposed a pair of new flags to `mmap()` which,  
 117487 when applied to a typed memory object descriptor, would cause `mmap()` to allocate  
 117488 dynamically from an unallocated and unmapped area of the typed memory object.  
 117489 Deallocation was similarly accomplished through the use of `munmap()`. This was rejected  
 117490 by the ballot group because it excessively complicated the (already rather complex)

117491 *mmap()* interface and introduced semantics useful only for typed memory, to a function  
 117492 which must also map shared memory and files. They felt that a memory allocator should  
 117493 be built on top of *mmap()* instead of being incorporated within the same interface, much as  
 117494 the ISO C standard libraries build *malloc()* on top of the virtual memory mapping  
 117495 functions *brk()* and *sbrk()*. This would eliminate the complicated semantics involved with  
 117496 unmapping only part of an allocated block of typed memory.

117497 To attempt to achieve ballot group consensus, typed memory allocation and deallocation  
 117498 was first migrated from *mmap()* and *munmap()* to a pair of complementary functions  
 117499 modeled on the ISO C standard *malloc()* and *free()*. The *mem\_alloc()* function specified  
 117500 explicitly the typed memory object (typed memory pool/access port) from which  
 117501 allocation takes place, unlike *malloc()* where the memory pool and port are unspecified.  
 117502 The *mem\_free()* function handled deallocation. These new semantics still met all of the  
 117503 requirements detailed above without modifying the behavior of *mmap()* except to allow it  
 117504 to map specified areas of typed memory objects. An implementation would have been free  
 117505 to implement *mem\_alloc()* and *mem\_free()* over *mmap()*, through *mmap()*, or independently  
 117506 but cooperating with *mmap()*.

117507 The ballot group was queried to see if this was an acceptable alternative, and while there  
 117508 was some agreement that it achieved the goal of removing the complicated semantics of  
 117509 allocation from the *mmap()* interface, several balloters realized that it just created two  
 117510 additional functions that behaved, in great part, like *mmap()*. These balloters proposed an  
 117511 alternative which has been implemented here in place of a separate *mem\_alloc()* and  
 117512 *mem\_free()*. This alternative is based on four specific suggestions:

- 117513 1. The *posix\_typed\_mem\_open()* function should provide a flag which specifies  
 117514 "allocate on *mmap()*" (otherwise, *mmap()* just maps the underlying object). This  
 117515 allows things roughly similar to */dev/zero* versus */dev/swap*. Two such flags have  
 117516 been implemented, one of which forces contiguous allocation.
- 117517 2. The *posix\_mem\_offset()* function is acceptable because it can be applied usefully to  
 117518 mapped objects in general. It should return the file descriptor of the underlying  
 117519 object.
- 117520 3. The *mem\_get\_info()* function in an earlier draft should be renamed  
 117521 *posix\_typed\_mem\_get\_info()* because it is not generally applicable to memory objects.  
 117522 It should probably return the file descriptor's allocation attribute. The renaming of  
 117523 the function has been implemented, but having it return a piece of information  
 117524 which is readily known by an application without this function has been rejected.  
 117525 Its whole purpose is to query the typed memory object for attributes that are not  
 117526 user-specified, but determined by the implementation.
- 117527 4. There should be no separate *mem\_alloc()* or *mem\_free()* functions. Instead, using  
 117528 *mmap()* on a typed memory object opened with an "allocate on *mmap()*" flag  
 117529 should be used to force allocation. These are precisely the semantics defined in the  
 117530 current draft.

117531 • Rationale for no Typed Memory Access Management

117532 The working group had originally defined an additional interface (and an additional kind  
 117533 of object: typed memory master) to establish and dissolve mappings to typed memory on  
 117534 behalf of devices or processors which were independent of the operating system and had  
 117535 no inherent capability to directly establish mappings on their own. This was to have  
 117536 provided functionality similar to device driver interfaces such as *physio()* and their  
 117537 underlying bus-specific interfaces (for example, *mballoc()*) which serve to set up and break  
 117538 down DMA pathways, and derive mapped addresses for use by hardware devices and  
 117539 processor cards.

117540 The ballot group felt that this was beyond the scope of POSIX.1 and its amendments.  
 117541 Furthermore, the removal of interrupt handling interfaces from a preceding amendment  
 117542 (the IEEE Std 1003.1d-1999) during its balloting process renders these typed memory  
 117543 access management interfaces an incomplete solution to portable device management from  
 117544 a user process; it would be possible to initiate a device transfer to/from typed memory, but  
 117545 impossible to handle the transfer-complete interrupt in a portable way.

117546 To achieve ballot group consensus, all references to typed memory access management  
 117547 capabilities were removed. The concept of portable interfaces from a device driver to both  
 117548 operating system and hardware is being addressed by the Uniform Driver Interface (UDI)  
 117549 industry forum, with formal standardization deferred until proof of concept and industry-  
 117550 wide acceptance and implementation.

#### 117551 B.2.8.4 Process Scheduling

117552 IEEE PASC Interpretation 1003.1 #96 has been applied, adding the `pthread_setschedprio()`  
 117553 function. This was added since previously there was no way for a thread to lower its own  
 117554 priority without going to the tail of the threads list for its new priority. This capability is  
 117555 necessary to bound the duration of priority inversion encountered by a thread.

117556 The following portion of the rationale presents models, requirements, and standardization  
 117557 issues relevant to process scheduling; see also [Section B.2.9.4](#) (on page 3480).

117558 In an operating system supporting multiple concurrent processes, the system determines the  
 117559 order in which processes execute to meet implementation-defined goals. For time-sharing  
 117560 systems, the goal is to enhance system throughput and promote fairness; the application is  
 117561 provided with little or no control over this sequencing function. While this is acceptable and  
 117562 desirable behavior in a time-sharing system, it is inappropriate in a realtime system; realtime  
 117563 applications must specifically control the execution sequence of their concurrent processes in  
 117564 order to meet externally defined response requirements.

117565 In POSIX.1-200x, the control over process sequencing is provided using a concept of scheduling  
 117566 policies. These policies, described in detail in this section, define the behavior of the system  
 117567 whenever processor resources are to be allocated to competing processes. Only the behavior of  
 117568 the policy is defined; conforming implementations are free to use any mechanism desired to  
 117569 achieve the described behavior.

- 117570 • Models

117571 In an operating system supporting multiple concurrent processes, the system determines  
 117572 the order in which processes execute and might force long-running processes to yield to  
 117573 other processes at certain intervals. Typically, the scheduling code is executed whenever an  
 117574 event occurs that might alter the process to be executed next.

117575 The simplest scheduling strategy is a “first-in, first-out” (FIFO) dispatcher. Whenever a  
 117576 process becomes runnable, it is placed on the end of a ready list. The process at the front of  
 117577 the ready list is executed until it exits or becomes blocked, at which point it is removed  
 117578 from the list. This scheduling technique is also known as “run-to-completion” or “run-to-  
 117579 block”.

117580 A natural extension to this scheduling technique is the assignment of a “non-migrating  
 117581 priority” to each process. This policy differs from strict FIFO scheduling in only one  
 117582 respect: whenever a process becomes runnable, it is placed at the end of the list of  
 117583 processes runnable at that priority level. When selecting a process to run, the system  
 117584 always selects the first process from the highest priority queue with a runnable process.  
 117585 Thus, when a process becomes unblocked, it will preempt a running process of lower  
 117586 priority without otherwise altering the ready list. Further, if a process elects to alter its

117587 priority, it is removed from the ready list and reinserted, using its new priority, according  
117588 to the policy above.

117589 While the above policy might be considered unfriendly in a time-sharing environment in  
117590 which multiple users require more balanced resource allocation, it could be ideal in a  
117591 realtime environment for several reasons. The most important of these is that it is  
117592 deterministic: the highest-priority process is always run and, among processes of equal  
117593 priority, the process that has been runnable for the longest time is executed first. Because of  
117594 this determinism, cooperating processes can implement more complex scheduling simply  
117595 by altering their priority. For instance, if processes at a single priority were to reschedule  
117596 themselves at fixed time intervals, a time-slice policy would result.

117597 In a dedicated operating system in which all processes are well-behaved realtime  
117598 applications, non-migrating priority scheduling is sufficient. However, many existing  
117599 implementations provide for more complex scheduling policies.

117600 POSIX.1-200x specifies a linear scheduling model. In this model, every process in the  
117601 system has a priority. The system scheduler always dispatches a process that has the  
117602 highest (generally the most time-critical) priority among all runnable processes in the  
117603 system. As long as there is only one such process, the dispatching policy is trivial. When  
117604 multiple processes of equal priority are eligible to run, they are ordered according to a  
117605 strict run-to-completion (FIFO) policy.

117606 The priority is represented as a positive integer and is inherited from the parent process.  
117607 For processes running under a fixed priority scheduling policy, the priority is never altered  
117608 except by an explicit function call.

117609 It was determined arbitrarily that larger integers correspond to “higher priorities”.

117610 Certain implementations might impose restrictions on the priority ranges to which  
117611 processes can be assigned. There also can be restrictions on the set of policies to which  
117612 processes can be set.

117613 • Requirements

117614 Realtime processes require that scheduling be fast and deterministic, and that it guarantees  
117615 to preempt lower priority processes.

117616 Thus, given the linear scheduling model, realtime processes require that they be run at a  
117617 priority that is higher than other processes. Within this framework, realtime processes are  
117618 free to yield execution resources to each other in a completely portable and  
117619 implementation-defined manner.

117620 As there is a generally perceived requirement for processes at the same priority level to  
117621 share processor resources more equitably, provisions are made by providing a scheduling  
117622 policy (that is, SCHED\_RR) intended to provide a timeslice-like facility.

117623 **Note:** The following topics assume that low numeric priority implies low scheduling criticality  
117624 and *vice versa*.

117625 • Rationale for New Interface

117626 Realtime applications need to be able to determine when processes will run in relation to  
117627 each other. It must be possible to guarantee that a critical process will run whenever it is  
117628 runnable; that is, whenever it wants to for as long as it needs. SCHED\_FIFO satisfies this  
117629 requirement. Additionally, SCHED\_RR was defined to meet a realtime requirement for a  
117630 well-defined time-sharing policy for processes at the same priority.

117631 It would be possible to use the BSD *setpriority()* and *getpriority()* functions by redefining  
117632 the meaning of the “nice” parameter according to the scheduling policy currently in use by

117633 the process. The System V *nice()* interface was felt to be undesirable for realtime because it  
 117634 specifies an adjustment to the “nice” value, rather than setting it to an explicit value.  
 117635 Realtime applications will usually want to set priority to an explicit value. Also, System V  
 117636 *nice()* does not allow for changing the priority of another process.

117637 With the POSIX.1b interfaces, the traditional “nice” value does not affect the SCHED\_FIFO  
 117638 or SCHED\_RR scheduling policies. If a “nice” value is supported, it is implementation-  
 117639 defined whether it affects the SCHED\_OTHER policy.

117640 An important aspect of POSIX.1-200x is the explicit description of the queuing and  
 117641 preemption rules. It is critical, to achieve deterministic scheduling, that such rules be  
 117642 stated clearly in POSIX.1-200x.

117643 POSIX.1-200x does not address the interaction between priority and swapping. The issues  
 117644 involved with swapping and virtual memory paging are extremely implementation-  
 117645 defined and would be nearly impossible to standardize at this point. The proposed  
 117646 scheduling paradigm, however, fully describes the scheduling behavior of runnable  
 117647 processes, of which one criterion is that the working set be resident in memory. Assuming  
 117648 the existence of a portable interface for locking portions of a process in memory, paging  
 117649 behavior need not affect the scheduling of realtime processes.

117650 POSIX.1-200x also does not address the priorities of “system” processes. In general, these  
 117651 processes should always execute in low-priority ranges to avoid conflict with other  
 117652 realtime processes. Implementations should document the priority ranges in which system  
 117653 processes run.

117654 The default scheduling policy is not defined. The effect of I/O interrupts and other system  
 117655 processing activities is not defined. The temporary lending of priority from one process to  
 117656 another (such as for the purposes of affecting freeing resources) by the system is not  
 117657 addressed. Preemption of resources is not addressed. Restrictions on the ability of a  
 117658 process to affect other processes beyond a certain level (influence levels) is not addressed.

117659 The rationale used to justify the simple time-quantum scheduler is that it is common  
 117660 practice to depend upon this type of scheduling to ensure “fair” distribution of processor  
 117661 resources among portions of the application that must interoperate in a serial fashion. Note  
 117662 that POSIX.1-200x is silent with respect to the setting of this time quantum, or whether it is  
 117663 a system-wide value or a per-process value, although it appears that the prevailing  
 117664 realtime practice is for it to be a system-wide value.

117665 In a system with  $N$  processes at a given priority, all processor-bound, in which the time  
 117666 quantum is equal for all processes at a specific priority level, the following assumptions  
 117667 are made of such a scheduling policy:

- 117668 1. A time quantum  $Q$  exists and the current process will own control of the processor  
 117669 for at least a duration of  $Q$  and will have the processor for a duration of  $Q$ .
- 117670 2. The  $N$ th process at that priority will control a processor within a duration of  $(N-1)$   
 117671  $\times Q$ .

117672 These assumptions are necessary to provide equal access to the processor and bounded  
 117673 response from the application.

117674 The assumptions hold for the described scheduling policy only if no system overhead,  
 117675 such as interrupt servicing, is present. If the interrupt servicing load is non-zero, then one  
 117676 of the two assumptions becomes fallacious, based upon how  $Q$  is measured by the system.

117677 If  $Q$  is measured by clock time, then the assumption that the process obtains a duration  $Q$   
 117678 processor time is false if interrupt overhead exists. Indeed, a scenario can be constructed  
 117679 with  $N$  processes in which a single process undergoes complete processor starvation if a

117680 peripheral device, such as an analog-to-digital converter, generates significant interrupt  
117681 activity periodically with a period of  $N \times Q$ .

117682 If  $Q$  is measured as actual processor time, then the assumption that the  $N$ th process runs in  
117683 within the duration  $(N-1) \times Q$  is false.

117684 It should be noted that SCHED\_FIFO suffers from interrupt-based delay as well. However,  
117685 for SCHED\_FIFO, the implied response of the system is “as soon as possible”, so that the  
117686 interrupt load for this case is a vendor selection and not a compliance issue.

117687 With this in mind, it is necessary either to complete the definition by including bounds on  
117688 the interrupt load, or to modify the assumptions that can be made about the scheduling  
117689 policy.

117690 Since the motivation of inclusion of the policy is common usage, and since current  
117691 applications do not enjoy the luxury of bounded interrupt load, item (2) above is sufficient  
117692 to express existing application needs and is less restrictive in the standard definition. No  
117693 difference in interface is necessary.

117694 In an implementation in which the time quantum is equal for all processes at a specific  
117695 priority, our assumptions can then be restated as:

- 117696 — A time quantum  $Q$  exists, and a processor-bound process will be rescheduled after a  
117697 duration of, at most,  $Q$ . Time quantum  $Q$  may be defined in either wall clock time or  
117698 execution time.
- 117699 — In general, the  $N$ th process of a priority level should wait no longer than  $(N-1) \times Q$   
117700 time to execute, assuming no processes exist at higher priority levels.
- 117701 — No process should wait indefinitely.

117702 For implementations supporting per-process time quanta, these assumptions can be  
117703 readily extended.

#### 117704 **Sporadic Server Scheduling Policy**

117705 The sporadic server is a mechanism defined for scheduling aperiodic activities in time-critical  
117706 realtime systems. This mechanism reserves a certain bounded amount of execution capacity for  
117707 processing aperiodic events at a high priority level. Any aperiodic events that cannot be  
117708 processed within the bounded amount of execution capacity are executed in the background at a  
117709 low priority level. Thus, a certain amount of execution capacity can be guaranteed to be  
117710 available for processing periodic tasks, even under burst conditions in the arrival of aperiodic  
117711 processing requests (that is, a large number of requests in a short time interval). The sporadic  
117712 server also simplifies the schedulability analysis of the realtime system, because it allows  
117713 aperiodic processes or threads to be treated as if they were periodic. The sporadic server was  
117714 first described by Sprunt, et al.

117715 The key concept of the sporadic server is to provide and limit a certain amount of computation  
117716 capacity for processing aperiodic events at their assigned normal priority, during a time interval  
117717 called the “replenishment period”. Once the entity controlled by the sporadic server mechanism  
117718 is initialized with its period and execution-time budget attributes, it preserves its execution  
117719 capacity until an aperiodic request arrives. The request will be serviced (if there are no higher  
117720 priority activities pending) as long as there is execution capacity left. If the request is completed,  
117721 the actual execution time used to service it is subtracted from the capacity, and a replenishment  
117722 of this amount of execution time is scheduled to happen one replenishment period after the  
117723 arrival of the aperiodic request. If the request is not completed, because there is no execution  
117724 capacity left, then the aperiodic process or thread is assigned a lower background priority. For  
117725 each portion of consumed execution capacity the execution time used is replenished after one

117726 replenishment period. At the time of replenishment, if the sporadic server was executing at a  
 117727 background priority level, its priority is elevated to the normal level. Other similar  
 117728 replenishment policies have been defined, but the one presented here represents a compromise  
 117729 between efficiency and implementation complexity.

117730 The interface that appears in this section defines a new scheduling policy for threads and  
 117731 processes that behaves according to the rules of the sporadic server mechanism. Scheduling  
 117732 attributes are defined and functions are provided to allow the user to set and get the parameters  
 117733 that control the scheduling behavior of this mechanism, namely the normal and low priority, the  
 117734 replenishment period, the maximum number of pending replenishment operations, and the  
 117735 initial execution-time budget.

117736 • Scheduling Aperiodic Activities

117737 Virtually all realtime applications are required to process aperiodic activities. In many  
 117738 cases, there are tight timing constraints that the response to the aperiodic events must  
 117739 meet. Usual timing requirements imposed on the response to these events are:

- 117740 — The effects of an aperiodic activity on the response time of lower priority activities  
 117741 must be controllable and predictable.
- 117742 — The system must provide the fastest possible response time to aperiodic events.
- 117743 — It must be possible to take advantage of all the available processing bandwidth not  
 117744 needed by time-critical activities to enhance average-case response times to aperiodic  
 117745 events.

117746 Traditional methods for scheduling aperiodic activities are background processing, polling  
 117747 tasks, and direct event execution:

- 117748 — Background processing consists of assigning a very low priority to the processing of  
 117749 aperiodic events. It utilizes all the available bandwidth in the system that has not  
 117750 been consumed by higher priority threads. However, it is very difficult, or  
 117751 impossible, to meet requirements on average-case response time, because the  
 117752 aperiodic entity has to wait for the execution of all other entities which have higher  
 117753 priority.
- 117754 — Polling consists of creating a periodic process or thread for servicing aperiodic  
 117755 requests. At regular intervals, the polling entity is started and its services  
 117756 accumulated pending aperiodic requests. If no aperiodic requests are pending, the  
 117757 polling entity suspends itself until its next period. Polling allows the aperiodic  
 117758 requests to be processed at a higher priority level. However, worst and average-case  
 117759 response times of polling entities are a direct function of the polling period, and there  
 117760 is execution overhead for each polling period, even if no event has arrived. If the  
 117761 deadline of the aperiodic activity is short compared to the inter-arrival time, the  
 117762 polling frequency must be increased to guarantee meeting the deadline. For this case,  
 117763 the increase in frequency can dramatically reduce the efficiency of the system and,  
 117764 therefore, its capacity to meet all deadlines. Yet, polling represents a good way to  
 117765 handle a large class of practical problems because it preserves system predictability,  
 117766 and because the amortized overhead drops as load increases.
- 117767 — Direct event execution consists of executing the aperiodic events at a high fixed-  
 117768 priority level. Typically, the aperiodic event is processed by an interrupt service  
 117769 routine as soon as it arrives. This technique provides predictable response times for  
 117770 aperiodic events, but makes the response times of all lower priority activities  
 117771 completely unpredictable under burst arrival conditions. Therefore, if the density of  
 117772 aperiodic event arrivals is unbounded, it may be a dangerous technique for time-  
 117773 critical systems. Yet, for those cases in which the physics of the system imposes a

- 117774 bound on the event arrival rate, it is probably the most efficient technique.
- 117775 — The sporadic server scheduling algorithm combines the predictability of the polling  
117776 approach with the short response times of the direct event execution. Thus, it allows  
117777 systems to meet an important class of application requirements that cannot be met by  
117778 using the traditional approaches. Multiple sporadic servers with different attributes  
117779 can be applied to the scheduling of multiple classes of aperiodic events, each with  
117780 different kinds of timing requirements, such as individual deadlines, average  
117781 response times, and so on. It also has many other interesting applications for  
117782 realtime, such as scheduling producer/consumer tasks in time-critical systems,  
117783 limiting the effects of faults on the estimation of task execution-time requirements,  
117784 and so on.
- 117785 • Existing Practice
 

117786 The sporadic server has been used in different kinds of applications, including military  
117787 avionics, robot control systems, industrial automation systems, and so on. There are  
117788 examples of many systems that cannot be successfully scheduled using the classic  
117789 approaches, such as direct event execution, or polling, and are schedulable using a  
117790 sporadic server scheduler. The sporadic server algorithm itself can successfully schedule  
117791 all systems scheduled with direct event execution or polling.

117792 The sporadic server scheduling policy has been implemented as a commercial product in  
117793 the run-time system of the Verdex Ada compiler. There are also many applications that  
117794 have used a much less efficient application-level sporadic server. These realtime  
117795 applications would benefit from a sporadic server scheduler implemented at the scheduler  
117796 level.
  - 117797 • Library-Level *versus* Kernel-Level Implementation
 

117798 The sporadic server interface described in this section requires the sporadic server policy  
117799 to be implemented at the same level as the scheduler. This means that the process sporadic  
117800 server must be implemented at the kernel level and the thread sporadic server policy  
117801 implemented at the same level as the thread scheduler; that is, kernel or library level.

117802 In an earlier interface for the sporadic server, this mechanism was implementable at a  
117803 different level than the scheduler. This feature allowed the implementor to choose between  
117804 an efficient scheduler-level implementation, or a simpler user or library-level  
117805 implementation. However, the working group considered that this interface made the use  
117806 of sporadic servers more complex, and that library-level implementations would lack some  
117807 of the important functionality of the sporadic server, namely the limitation of the actual  
117808 execution time of aperiodic activities. The working group also felt that the interface  
117809 described in this chapter does not preclude library-level implementations of threads  
117810 intended to provide efficient low-overhead scheduling for those threads that are not  
117811 scheduled under the sporadic server policy.
  - 117812 • Range of Scheduling Priorities
 

117813 Each of the scheduling policies supported in POSIX.1-200x has an associated range of  
117814 priorities. The priority ranges for each policy might or might not overlap with the priority  
117815 ranges of other policies. For time-critical realtime applications it is usual for periodic and  
117816 aperiodic activities to be scheduled together in the same processor. Periodic activities will  
117817 usually be scheduled using the SCHED\_FIFO scheduling policy, while aperiodic activities  
117818 may be scheduled using SCHED\_SPORADIC. Since the application developer will require  
117819 complete control over the relative priorities of these activities in order to meet his timing  
117820 requirements, it would be desirable for the priority ranges of SCHED\_FIFO and  
117821 SCHED\_SPORADIC to overlap completely. Therefore, although POSIX.1-200x does not

117822 require any particular relationship between the different priority ranges, it is  
117823 recommended that these two ranges should coincide.

117824 • Dynamically Setting the Sporadic Server Policy

117825 Several members of the working group requested that implementations should not be  
117826 required to support dynamically setting the sporadic server scheduling policy for a thread.  
117827 The reason is that this policy may have a high overhead for library-level implementations  
117828 of threads, and if threads are allowed to dynamically set this policy, this overhead can be  
117829 experienced even if the thread does not use that policy. By disallowing the dynamic setting  
117830 of the sporadic server scheduling policy, these implementations can accomplish efficient  
117831 scheduling for threads using other policies. If a strictly conforming application needs to  
117832 use the sporadic server policy, and is therefore willing to pay the overhead, it must set this  
117833 policy at the time of thread creation.

117834 • Limitation of the Number of Pending Replenishments

117835 The number of simultaneously pending replenishment operations must be limited for each  
117836 sporadic server for two reasons: an unlimited number of replenishment operations would  
117837 need an unlimited number of system resources to store all the pending replenishment  
117838 operations; on the other hand, in some implementations each replenishment operation will  
117839 represent a source of priority inversion (just for the duration of the replenishment  
117840 operation) and thus, the maximum amount of replenishments must be bounded to  
117841 guarantee bounded response times. The way in which the number of replenishments is  
117842 bounded is by lowering the priority of the sporadic server to *sched\_ss\_low\_priority* when  
117843 the number of pending replenishments has reached its limit. In this way, no new  
117844 replenishments are scheduled until the number of pending replenishments decreases.

117845 In the sporadic server scheduling policy defined in POSIX.1-200x, the application can  
117846 specify the maximum number of pending replenishment operations for a single sporadic  
117847 server, by setting the value of the *sched\_ss\_max\_repl* scheduling parameter. This value must  
117848 be between one and `{SS_REPL_MAX}`, which is a maximum limit imposed by the  
117849 implementation. The limit `{SS_REPL_MAX}` must be greater than or equal to  
117850 `{_POSIX_SS_REPL_MAX}`, which is defined to be four in POSIX.1-200x. The minimum  
117851 limit of four was chosen so that an application can at least guarantee that four different  
117852 aperiodic events can be processed during each interval of length equal to the  
117853 replenishment period.

117854 B.2.8.5 Clocks and Timers

117855 • Clocks

117856 POSIX.1-200x and the ISO C standard both define functions for obtaining system time.  
117857 Implicit behind these functions is a mechanism for measuring passage of time. This  
117858 specification makes this mechanism explicit and calls it a clock. The `CLOCK_REALTIME`  
117859 clock required by POSIX.1-200x is a higher resolution version of the clock that maintains  
117860 POSIX.1 system time. This is a “system-wide” clock, in that it is visible to all processes  
117861 and, were it possible for multiple processes to all read the clock at the same time, they  
117862 would see the same value.

117863 An extensible interface was defined, with the ability for implementations to define  
117864 additional clocks. This was done because of the observation that many realtime platforms  
117865 support multiple clocks, and it was desired to fit this model within the standard interface.  
117866 But implementation-defined clocks need not represent actual hardware devices, nor are  
117867 they necessarily system-wide.

- Timers

Two timer types are required for a system to support realtime applications:

1. One-shot

A one-shot timer is a timer that is armed with an initial expiration time, either relative to the current time or at an absolute time (based on some timing base, such as time in seconds and nanoseconds since the Epoch). The timer expires once and then is disarmed. With the specified facilities, this is accomplished by setting the *it\_value* member of the *value* argument to the desired expiration time and the *it\_interval* member to zero.

2. Periodic

A periodic timer is a timer that is armed with an initial expiration time, again either relative or absolute, and a repetition interval. When the initial expiration occurs, the timer is reloaded with the repetition interval and continues counting. With the specified facilities, this is accomplished by setting the *it\_value* member of the *value* argument to the desired initial expiration time and the *it\_interval* member to the desired repetition interval.

For both of these types of timers, the time of the initial timer expiration can be specified in two ways:

1. Relative (to the current time)
2. Absolute

- Examples of Using Realtime Timers

In the diagrams below, *S* indicates a program schedule, *R* shows a schedule method request, and *E* suggests an internal operating system event.

- Periodic Timer: Data Logging

During an experiment, it might be necessary to log realtime data periodically to an internal buffer or to a mass storage device. With a periodic scheduling method, a logging module can be started automatically at fixed time intervals to log the data.

Program schedule is requested every 10 seconds.

[Time (in Seconds)]

To achieve this type of scheduling using the specified facilities, one would allocate a per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an initial expiration value and a repetition interval of 10 seconds.

- One-shot Timer (Relative Time): Device Initialization

In an emission test environment, large sample bags are used to capture the exhaust from a vehicle. The exhaust is purged from these bags before each and every test. With a one-shot timer, a module could initiate the purge function and then suspend itself for a predetermined period of time while the sample bags are prepared.

Program schedule requested 20 seconds after call is issued.

117911 -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+----->  
 117912 5 10 15 20 25 30 35 40 45 50 55

117913 [Time (in Seconds)]

117914 To achieve this type of scheduling using the specified facilities, one would allocate a  
 117915 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 117916 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag reset, and with an  
 117917 initial expiration value of 20 seconds and a repetition interval of zero.

117918 Note that if the program wishes merely to suspend itself for the specified interval, it  
 117919 could more easily use `nanosleep()`.

117920 — One-shot Timer (Absolute Time): Data Transmission

117921 The results from an experiment are often moved to a different system within a  
 117922 network for postprocessing or archiving. With an absolute one-shot timer, a module  
 117923 that moves data from a test-cell computer to a host computer can be automatically  
 117924 scheduled on a daily basis.

117925 Program schedule requested for 2:30 a.m.

117926 R S  
 117927 -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+----->  
 117928 23:00 23:30 24:00 00:30 01:00 01:30 02:00 02:30 03:00

117929 [Time of Day]

117930 To achieve this type of scheduling using the specified facilities, a per-process timer  
 117931 would be allocated based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 117932 armed via a call to `timer_settime()` with the `TIMER_ABSTIME` flag set, and an initial  
 117933 expiration value equal to 2:30 a.m. of the next day.

117934 — Periodic Timer (Relative Time): Signal Stabilization

117935 Some measurement devices, such as emission analyzers, do not respond  
 117936 instantaneously to an introduced sample. With a periodic timer with a relative initial  
 117937 expiration time, a module that introduces a sample and records the average response  
 117938 could suspend itself for a predetermined period of time while the signal is stabilized  
 117939 and then sample at a fixed rate.

117940 Program schedule requested 15 seconds after call is issued and every 2 seconds  
 117941 thereafter.

117942 R S S S S S S S S S S S S S S S S S S S S S S S S S  
 117943 -----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+----->  
 117944 5 10 15 20 25 30 35 40 45 50 55

117945 [Time (in Seconds)]

117946 To achieve this type of scheduling using the specified facilities, one would allocate a  
 117947 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 117948 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag reset, and with an  
 117949 initial expiration value of 15 seconds and a repetition interval of 2 seconds.

117950 — Periodic Timer (Absolute Time): Work Shift-related Processing

117951 Resource utilization data is useful when time to perform experiments is being  
 117952 scheduled at a facility. With a periodic timer with an absolute initial expiration time,  
 117953 a module can be scheduled at the beginning of a work shift to gather resource  
 117954 utilization data throughout the shift. This data can be used to allocate resources

117955 effectively to minimize bottlenecks and delays and maximize facility throughput.  
 117956 Program schedule requested for 2:00 a.m. and every 15 minutes thereafter.  
 117957 R S S S S S S  
 117958 -----+-----+-----+-----+-----+-----+-----+-----+----->  
 117959 23:00 23:30 24:00 00:30 01:00 01:30 02:00 02:30 03:00

117960 [Time of Day]

117961 To achieve this type of scheduling using the specified facilities, one would allocate a  
 117962 per-process timer based on clock ID `CLOCK_REALTIME`. Then the timer would be  
 117963 armed via a call to `timer_settime()` with `TIMER_ABSTIME` flag set, and with an initial  
 117964 expiration value equal to 2:00 a.m. and a repetition interval equal to 15 minutes.

117965 • Relationship of Timers to Clocks

117966 The relationship between clocks and timers armed with an absolute time is  
 117967 straightforward: a timer expiration signal is requested when the associated clock reaches  
 117968 or exceeds the specified time. The relationship between clocks and timers armed with a  
 117969 relative time (an interval) is less obvious, but not unintuitive. In this case, a timer  
 117970 expiration signal is requested when the specified interval, *as measured by the associated clock*,  
 117971 has passed. For the required `CLOCK_REALTIME` clock, this allows timer expiration  
 117972 signals to be requested at specified “wall clock” times (absolute), or when a specified  
 117973 interval of “realtime” has passed (relative). For an implementation-defined clock—say, a  
 117974 process virtual time clock—timer expirations could be requested when the process has  
 117975 used a specified total amount of virtual time (absolute), or when it has used a specified  
 117976 *additional* amount of virtual time (relative).

117977 The interfaces also allow flexibility in the implementation of the functions. For example, an  
 117978 implementation could convert all absolute times to intervals by subtracting the clock value  
 117979 at the time of the call from the requested expiration time and “counting down” at the  
 117980 supported resolution. Or it could convert all relative times to absolute expiration time by  
 117981 adding in the clock value at the time of the call and comparing the clock value to the  
 117982 expiration time at the supported resolution. Or it might even choose to maintain absolute  
 117983 times as absolute and compare them to the clock value at the supported resolution for  
 117984 absolute timers, and maintain relative times as intervals and count them down at the  
 117985 resolution supported for relative timers. The choice will be driven by efficiency  
 117986 considerations and the underlying hardware or software clock implementation.

117987 • Data Definitions for Clocks and Timers

117988 POSIX.1-200x uses a time representation capable of supporting nanosecond resolution  
 117989 timers for the following reasons:

- 117990 — To enable POSIX.1-200x to represent those computer systems already using  
 117991 nanosecond or submicrosecond resolution clocks.
- 117992 — To accommodate those per-process timers that might need nanoseconds to specify an  
 117993 absolute value of system-wide clocks, even though the resolution of the per-process  
 117994 timer may only be milliseconds, or *vice versa*.
- 117995 — Because the number of nanoseconds in a second can be represented in 32 bits.

117996 Time values are represented in the `timespec` structure. The `tv_sec` member is of type `time_t`  
 117997 so that this member is compatible with time values used by POSIX.1 functions and the  
 117998 ISO C standard. The `tv_nsec` member is a **signed long** in order to simplify and clarify code  
 117999 that decrements or finds differences of time values. Note that because 1 billion (number of  
 118000 nanoseconds per second) is less than half of the value representable by a signed 32-bit

118001 value, it is always possible to add two valid fractional seconds represented as integral  
118002 nanoseconds without overflowing the signed 32-bit value.

118003 A maximum allowable resolution for the CLOCK\_REALTIME clock of 20 ms (1/50  
118004 seconds) was chosen to allow line frequency clocks in European countries to be  
118005 conforming. 60 Hz clocks in the U.S. will also be conforming, as will finer granularity  
118006 clocks, although a Strictly Conforming Application cannot assume a granularity of less  
118007 than 20 ms (1/50 seconds).

118008 The minimum allowable maximum time allowed for the CLOCK\_REALTIME clock and  
118009 the function *nanosleep()*, and timers created with *clock\_id=CLOCK\_REALTIME*, is  
118010 determined by the fact that the *tv\_sec* member is of type **time\_t**.

118011 POSIX.1-200x specifies that timer expirations must not be delivered early, and *nanosleep()*  
118012 must not return early due to quantization error. POSIX.1-200x discusses the various  
118013 implementations of *alarm()* in the rationale and states that implementations that do not  
118014 allow alarm signals to occur early are the most appropriate, but refrained from mandating  
118015 this behavior. Because of the importance of predictability to realtime applications,  
118016 POSIX.1-200x takes a stronger stance.

118017 The standard developers considered using a time representation that differs from  
118018 POSIX.1b in the second 32 bit of the 64-bit value. Whereas POSIX.1b defines this field as a  
118019 fractional second in nanoseconds, the other methodology defines this as a binary fraction  
118020 of one second, with the radix point assumed before the most significant bit.

118021 POSIX.1b is a software, source-level standard and most of the benefits of the alternate  
118022 representation are enjoyed by hardware implementations of clocks and algorithms. It was  
118023 felt that mandating this format for POSIX.1b clocks and timers would unnecessarily  
118024 burden the application developer with writing, possibly non-portable, multiple precision  
118025 arithmetic packages to perform conversion between binary fractions and integral units  
118026 such as nanoseconds, milliseconds, and so on.

### 118027 **Rationale for the Monotonic Clock**

118028 For those applications that use time services to achieve realtime behavior, changing the value of  
118029 the clock on which these services rely may cause erroneous timing behavior. For these  
118030 applications, it is necessary to have a monotonic clock which cannot run backwards, and which  
118031 has a maximum clock jump that is required to be documented by the implementation.  
118032 Additionally, it is desirable (but not required by POSIX.1-200x) that the monotonic clock  
118033 increases its value uniformly. This clock should not be affected by changes to the system time;  
118034 for example, to synchronize the clock with an external source or to account for leap seconds.  
118035 Such changes would cause errors in the measurement of time intervals for those time services  
118036 that use the absolute value of the clock.

118037 One could argue that by defining the behavior of time services when the value of a clock is  
118038 changed, deterministic realtime behavior can be achieved. For example, one could specify that  
118039 relative time services should be unaffected by changes in the value of a clock. However, there are  
118040 time services that are based upon an absolute time, but that are essentially intended as relative  
118041 time services. For example, *pthread\_cond\_timedwait()* uses an absolute time to allow it to wake  
118042 up after the required interval despite spurious wakeups. Although sometimes the  
118043 *pthread\_cond\_timedwait()* timeouts are absolute in nature, there are many occasions in which they  
118044 are relative, and their absolute value is determined from the current time plus a relative time  
118045 interval. In this latter case, if the clock changes while the thread is waiting, the wait interval will  
118046 not be the expected length. If a *pthread\_cond\_timedwait()* function were created that would take a  
118047 relative time, it would not solve the problem because to retain the intended “deadline” a thread  
118048 would need to compensate for latency due to the spurious wakeup, and preemption between

118049 wakeup and the next wait.

118050 The solution is to create a new monotonic clock, whose value does not change except for the  
 118051 regular ticking of the clock, and use this clock for implementing the various relative timeouts  
 118052 that appear in the different POSIX interfaces, as well as allow *pthread\_cond\_timedwait()* to choose  
 118053 this new clock for its timeout. A new *clock\_nanosleep()* function is created to allow an application  
 118054 to take advantage of this newly defined clock. Notice that the monotonic clock may be  
 118055 implemented using the same hardware clock as the system clock.

118056 Relative timeouts for *sigtimedwait()* and *aio\_suspend()* have been redefined to use the monotonic  
 118057 clock, if present. The *alarm()* function has not been redefined, because the same effect but with  
 118058 better resolution can be achieved by creating a timer (for which the appropriate clock may be  
 118059 chosen).

118060 The *pthread\_cond\_timedwait()* function has been treated in a different way, compared to other  
 118061 functions with absolute timeouts, because it is used to wait for an event, and thus it may have a  
 118062 deadline, while the other timeouts are generally used as an error recovery mechanism, and for  
 118063 them the use of the monotonic clock is not so important. Since the desired timeout for the  
 118064 *pthread\_cond\_timedwait()* function may either be a relative interval or an absolute time of day  
 118065 deadline, a new initialization attribute has been created for condition variables to specify the  
 118066 clock that is used for measuring the timeout in a call to *pthread\_cond\_timedwait()*. In this way, if  
 118067 a relative timeout is desired, the monotonic clock will be used; if an absolute deadline is  
 118068 required instead, the *CLOCK\_REALTIME* or another appropriate clock may be used. This  
 118069 capability has not been added to other functions with absolute timeouts because for those  
 118070 functions the expected use of the timeout is mostly to prevent errors, and not so often to meet  
 118071 precise deadlines. As a consequence, the complexity of adding this capability is not justified by  
 118072 its perceived application usage.

118073 The *nanosleep()* function has not been modified with the introduction of the monotonic clock.  
 118074 Instead, a new *clock\_nanosleep()* function has been created, in which the desired clock may be  
 118075 specified in the function call.

118076 • History of Resolution Issues

118077 Due to the shift from relative to absolute timeouts in IEEE Std 1003.1d-1999, the  
 118078 amendments to the *sem\_timedwait()*, *pthread\_mutex\_timedlock()*, *mq\_timedreceive()*, and  
 118079 *mq\_timedsend()* functions of that standard have been removed. Those amendments  
 118080 specified that *CLOCK\_MONOTONIC* would be used for the (relative) timeouts if the  
 118081 Monotonic Clock option was supported.

118082 Having these functions continue to be tied solely to *CLOCK\_MONOTONIC* would not  
 118083 work. Since the absolute value of a time value obtained from *CLOCK\_MONOTONIC* is  
 118084 unspecified, under the absolute timeouts interface, applications would behave differently  
 118085 depending on whether the Monotonic Clock option was supported or not (because the  
 118086 absolute value of the clock would have different meanings in either case).

118087 Two options were considered:

- 118088 1. Leave the current behavior unchanged, which specifies the *CLOCK\_REALTIME*  
 118089 clock for these (absolute) timeouts, to allow portability of applications between  
 118090 implementations supporting or not the Monotonic Clock option.
- 118091 2. Modify these functions in the way that *pthread\_cond\_timedwait()* was modified to  
 118092 allow a choice of clock, so that an application could use *CLOCK\_REALTIME* when  
 118093 it is trying to achieve an absolute timeout and *CLOCK\_MONOTONIC* when it is  
 118094 trying to achieve a relative timeout.

118095 It was decided that the features of *CLOCK\_MONOTONIC* are not as critical to these

118096 functions as they are to `pthread_cond_timedwait()`. The `pthread_cond_timedwait()` function is  
 118097 given a relative timeout; the timeout may represent a deadline for an event. When these  
 118098 functions are given relative timeouts, the timeouts are typically for error recovery  
 118099 purposes and need not be so precise.

118100 Therefore, it was decided that these functions should be tied to `CLOCK_REALTIME` and  
 118101 not complicated by being given a choice of clock.

## 118102 Execution Time Monitoring

- 118103 • Introduction

118104 The main goals of the execution time monitoring facilities defined in this chapter are to  
 118105 measure the execution time of processes and threads and to allow an application to  
 118106 establish CPU time limits for these entities.

118107 The analysis phase of time-critical realtime systems often relies on the measurement of  
 118108 execution times of individual threads or processes to determine whether the timing  
 118109 requirements will be met. Also, performance analysis techniques for soft deadline realtime  
 118110 systems rely heavily on the determination of these execution times. The execution time  
 118111 monitoring functions provide application developers with the ability to measure these  
 118112 execution times online and open the possibility of dynamic execution-time analysis and  
 118113 system reconfiguration, if required.

118114 The second goal of allowing an application to establish execution time limits for individual  
 118115 processes or threads and detecting when they overrun allows program robustness to be  
 118116 increased by enabling online checking of the execution times.

118117 If errors are detected—possibly because of erroneous program constructs, the existence of  
 118118 errors in the analysis phase, or a burst of event arrivals—online detection and recovery is  
 118119 possible in a portable way. This feature can be extremely important for many time-critical  
 118120 applications. Other applications require trapping CPU-time errors as a normal way to exit  
 118121 an algorithm; for instance, some realtime artificial intelligence applications trigger a  
 118122 number of independent inference processes of varying accuracy and speed, limit how long  
 118123 they can run, and pick the best answer available when time runs out. In many periodic  
 118124 systems, overrun processes are simply restarted in the next resource period, after necessary  
 118125 end-of-period actions have been taken. This allows algorithms that are inherently data-  
 118126 dependent to be made predictable.

118127 The interface that appears in this chapter defines a new type of clock, the CPU-time clock,  
 118128 which measures execution time. Each process or thread can invoke the clock and timer  
 118129 functions defined in POSIX.1 to use them. Functions are also provided to access the CPU-  
 118130 time clock of other processes or threads to enable remote monitoring of these clocks.  
 118131 Monitoring of threads of other processes is not supported, since these threads are not  
 118132 visible from outside of their own process with the interfaces defined in POSIX.1.

- 118133 • Execution Time Monitoring Interface

118134 The clock and timer interface defined in POSIX.1 historically only defined one clock, which  
 118135 measures wall-clock time. The requirements for measuring execution time of processes and  
 118136 threads, and setting limits to their execution time by detecting when they overrun, can be  
 118137 accomplished with that interface if a new kind of clock is defined. These new clocks  
 118138 measure execution time, and one is associated with each process and with each thread. The  
 118139 clock functions currently defined in POSIX.1 can be used to read and set these CPU-time  
 118140 clocks, and timers can be created using these clocks as their timing base. These timers can  
 118141 then be used to send a signal when some specified execution time has been exceeded. The  
 118142 CPU-time clocks of each process or thread can be accessed by using the symbols

118143 CLOCK\_PROCESS\_CPUTIME\_ID or CLOCK\_THREAD\_CPUTIME\_ID.

118144 The clock and timer interface defined in POSIX.1 and extended with the new kind of CPU-  
 118145 time clock would only allow processes or threads to access their own CPU-time clocks.  
 118146 However, many realtime systems require the possibility of monitoring the execution time  
 118147 of processes or threads from independent monitoring entities. In order to allow  
 118148 applications to construct independent monitoring entities that do not require cooperation  
 118149 from or modification of the monitored entities, two functions have been added:  
 118150 *clock\_getcpuclockid()*, for accessing CPU-time clocks of other processes, and  
 118151 *pthread\_getcpuclockid()*, for accessing CPU-time clocks of other threads. These functions  
 118152 return the clock identifier associated with the process or thread specified in the call. These  
 118153 clock IDs can then be used in the rest of the clock function calls.

118154 The clocks accessed through these functions could also be used as a timing base for the  
 118155 creation of timers, thereby allowing independent monitoring entities to limit the CPU time  
 118156 consumed by other entities. However, this possibility would imply additional complexity  
 118157 and overhead because of the need to maintain a timer queue for each process or thread, to  
 118158 store the different expiration times associated with timers created by different processes or  
 118159 threads. The working group decided this additional overhead was not justified by  
 118160 application requirements. Therefore, creation of timers attached to the CPU-time clocks of  
 118161 other processes or threads has been specified as implementation-defined.

118162 • Overhead Considerations

118163 The measurement of execution time may introduce additional overhead in the thread  
 118164 scheduling, because of the need to keep track of the time consumed by each of these  
 118165 entities. In library-level implementations of threads, the efficiency of scheduling could be  
 118166 somehow compromised because of the need to make a kernel call, at each context switch,  
 118167 to read the process CPU-time clock. Consequently, a thread creation attribute called *cpu-  
 118168 clock-requirement* was defined, to allow threads to disconnect their respective CPU-time  
 118169 clocks. However, the Ballot Group considered that this attribute itself introduced some  
 118170 overhead, and that in current implementations it was not worth the effort. Therefore, the  
 118171 attribute was deleted, and thus thread CPU-time clocks are required for all threads if the  
 118172 Thread CPU-Time Clocks option is supported.

118173 • Accuracy of CPU-Time Clocks

118174 The mechanism used to measure the execution time of processes and threads is specified in  
 118175 POSIX.1-200x as implementation-defined. The reason for this is that both the underlying  
 118176 hardware and the implementation architecture have a very strong influence on the  
 118177 accuracy achievable for measuring CPU time. For some implementations, the specification  
 118178 of strict accuracy requirements would represent very large overheads, or even the  
 118179 impossibility of being implemented.

118180 Since the mechanism for measuring execution time is implementation-defined, realtime  
 118181 applications will be able to take advantage of accurate implementations using a portable  
 118182 interface. Of course, strictly conforming applications cannot rely on any particular degree  
 118183 of accuracy, in the same way as they cannot rely on a very accurate measurement of wall  
 118184 clock time. There will always exist applications whose accuracy or efficiency requirements  
 118185 on the implementation are more rigid than the values defined in POSIX.1-200x or any  
 118186 other standard.

118187 In any case, there is a minimum set of characteristics that realtime applications would  
 118188 expect from most implementations. One such characteristic is that the sum of all the  
 118189 execution times of all the threads in a process equals the process execution time, when no  
 118190 CPU-time clocks are disabled. This need not always be the case because implementations  
 118191 may differ in how they account for time during context switches. Another characteristic is

118192 that the sum of the execution times of all processes in a system equals the number of  
 118193 processors, multiplied by the elapsed time, assuming that no processor is idle during that  
 118194 elapsed time. However, in some implementations it might not be possible to relate CPU  
 118195 time to elapsed time. For example, in a heterogeneous multi-processor system in which  
 118196 each processor runs at a different speed, an implementation may choose to define each  
 118197 “second” of CPU time to be a certain number of “cycles” that a CPU has executed.

118198 • Existing Practice

118199 Measuring and limiting the execution time of each concurrent activity are common  
 118200 features of most industrial implementations of realtime systems. Almost all critical  
 118201 realtime systems are currently built upon a cyclic executive. With this approach, a regular  
 118202 timer interrupt kicks off the next sequence of computations. It also checks that the current  
 118203 sequence has completed. If it has not, then some error recovery action can be undertaken  
 118204 (or at least an overrun is avoided). Current software engineering principles and the  
 118205 increasing complexity of software are driving application developers to implement these  
 118206 systems on multi-threaded or multi-process operating systems. Therefore, if a POSIX  
 118207 operating system is to be used for this type of application, then it must offer the same level  
 118208 of protection.

118209 Execution time clocks are also common in most UNIX implementations, although these  
 118210 clocks usually have requirements different from those of realtime applications. The  
 118211 POSIX.1 *times()* function supports the measurement of the execution time of the calling  
 118212 process, and its terminated child processes. This execution time is measured in clock ticks  
 118213 and is supplied as two different values with the user and system execution times,  
 118214 respectively. BSD supports the function *getrusage()*, which allows the calling process to get  
 118215 information about the resources used by itself and/or all of its terminated child processes.  
 118216 The resource usage includes user and system CPU time. Some UNIX systems have options  
 118217 to specify high resolution (up to one microsecond) CPU-time clocks using the *times()* or  
 118218 the *getrusage()* functions.

118219 The *times()* and *getrusage()* interfaces do not meet important realtime requirements, such  
 118220 as the possibility of monitoring execution time from a different process or thread, or the  
 118221 possibility of detecting an execution time overrun. The latter requirement is supported in  
 118222 some UNIX implementations that are able to send a signal when the execution time of a  
 118223 process has exceeded some specified value. For example, BSD defines the functions  
 118224 *getitimer()* and *setitimer()*, which can operate either on a realtime clock (wall-clock), or on  
 118225 virtual-time or profile-time clocks which measure CPU time in two different ways. These  
 118226 functions do not support access to the execution time of other processes.

118227 IBM’s MVS operating system supports per-process and per-thread execution time clocks. It  
 118228 also supports limiting the execution time of a given process.

118229 Given all this existing practice, the working group considered that the POSIX.1 clocks and  
 118230 timers interface was appropriate to meet most of the requirements that realtime  
 118231 applications have for execution time clocks. Functions were added to get the CPU time  
 118232 clock IDs, and to allow/disallow the thread CPU-time clocks (in order to preserve the  
 118233 efficiency of some implementations of threads).

118234 • Clock Constants

118235 The definition of the manifest constants `CLOCK_PROCESS_CPUTIME_ID` and  
 118236 `CLOCK_THREAD_CPUTIME_ID` allows processes or threads, respectively, to access their  
 118237 own execution-time clocks. However, given a process or thread, access to its own  
 118238 execution-time clock is also possible if the clock ID of this clock is obtained through a call  
 118239 to *clock\_getcpuclockid()* or *pthread\_getcpuclockid()*. Therefore, these constants are not  
 118240 necessary and could be deleted to make the interface simpler. Their existence saves one

118241 system call in the first access to the CPU-time clock of each process or thread. The working  
 118242 group considered this issue and decided to leave the constants in POSIX.1-200x because  
 118243 they are closer to the POSIX.1b use of clock identifiers.

118244 • Library Implementations of Threads

118245 In library implementations of threads, kernel entities and library threads can coexist. In  
 118246 this case, if the CPU-time clocks are supported, most of the clock and timer functions will  
 118247 need to have two implementations: one in the thread library, and one in the system calls  
 118248 library. The main difference between these two implementations is that the thread library  
 118249 implementation will have to deal with clocks and timers that reside in the thread space,  
 118250 while the kernel implementation will operate on timers and clocks that reside in kernel  
 118251 space. In the library implementation, if the clock ID refers to a clock that resides in the  
 118252 kernel, a kernel call will have to be made. The correct version of the function can be chosen  
 118253 by specifying the appropriate order for the libraries during the link process.

118254 • History of Resolution Issues: Deletion of the *enable* Attribute

118255 In early proposals, consideration was given to inclusion of an attribute called *enable* for  
 118256 CPU-time clocks. This would allow implementations to avoid the overhead of measuring  
 118257 execution time for those processes or threads for which this measurement was not  
 118258 required. However, this is unnecessary since processes are already required to measure  
 118259 execution time by the POSIX.1 *times()* function. Consequently, the *enable* attribute is not  
 118260 present.

118261 **Rationale Relating to Timeouts**

118262 • Requirements for Timeouts

118263 Realtime systems which must operate reliably over extended periods without human  
 118264 intervention are characteristic in embedded applications such as avionics, machine control,  
 118265 and space exploration, as well as more mundane applications such as cable TV, security  
 118266 systems, and plant automation. A multi-tasking paradigm, in which many independent  
 118267 and/or cooperating software functions relinquish the processor(s) while waiting for a  
 118268 specific stimulus, resource, condition, or operation completion, is very useful in producing  
 118269 well engineered programs for such systems. For such systems to be robust and fault-  
 118270 tolerant, expected occurrences that are unduly delayed or that never occur must be  
 118271 detected so that appropriate recovery actions may be taken. This is difficult if there is no  
 118272 way for a task to regain control of a processor once it has relinquished control (blocked)  
 118273 awaiting an occurrence which, perhaps because of corrupted code, hardware malfunction,  
 118274 or latent software bugs, will not happen when expected. Therefore, the common practice  
 118275 in realtime operating systems is to provide a capability to time out such blocking services.  
 118276 Although there are several methods to achieve this already defined by POSIX, none are as  
 118277 reliable or efficient as initiating a timeout simultaneously with initiating a blocking service.  
 118278 This is especially critical in hard-realtime embedded systems because the processors  
 118279 typically have little time reserve, and allowed fault recovery times are measured in  
 118280 milliseconds rather than seconds.

118281 The working group largely agreed that such timeouts were necessary and ought to become  
 118282 part of POSIX.1-200x, particularly vendors of realtime operating systems whose customers  
 118283 had already expressed a strong need for timeouts. There was some resistance to inclusion  
 118284 of timeouts in POSIX.1-200x because the desired effect, fault tolerance, could, in theory, be  
 118285 achieved using existing facilities and alternative software designs, but there was no  
 118286 compelling evidence that realtime system designers would embrace such designs at the  
 118287 sacrifice of performance and/or simplicity.

- 118288 • Which Services should be Timed Out?

118289 Originally, the working group considered the prospect of providing timeouts on all  
 118290 blocking services, including those currently existing in POSIX.1, POSIX.1b, and POSIX.1c,  
 118291 and future interfaces to be defined by other working groups, as sort of a general policy.  
 118292 This was rather quickly rejected because of the scope of such a change, and the fact that  
 118293 many of those services would not normally be used in a realtime context. More traditional  
 118294 timesharing solutions to timeout would suffice for most of the POSIX.1 interfaces, while  
 118295 others had asynchronous alternatives which, while more complex to utilize, would be  
 118296 adequate for some realtime and all non-realtime applications.

118297 The list of potential candidates for timeouts was narrowed to the following for further  
 118298 consideration:

- 118299 — POSIX.1b
- 118300 — *sem\_wait()*
  - 118301 — *mq\_receive()*
  - 118302 — *mq\_send()*
  - 118303 — *lio\_listio()*
  - 118304 — *aio\_suspend()*
  - 118305 — *sigwait()* (timeout already implemented by *sigtimedwait()*)
- 118306 — POSIX.1c
- 118307 — *pthread\_mutex\_lock()*
  - 118308 — *pthread\_join()*
  - 118309 — *pthread\_cond\_wait()*
  - 118310 (timeout already implemented by *pthread\_cond\_timedwait()*)
- 118311 — POSIX.1
- 118312 — *read()*
  - 118313 — *write()*

118314 After further review by the working group, the *lio\_listio()*, *read()*, and *write()* functions (all  
 118315 forms of blocking synchronous I/O) were eliminated from the list because of the  
 118316 following:

- 118317 — Asynchronous alternatives exist
- 118318 — Timeouts can be implemented, albeit non-portably, in device drivers
- 118319 — A strong desire not to introduce modifications to POSIX.1 interfaces

118320 The working group ultimately rejected *pthread\_join()* since both that interface and a timed  
 118321 variant of that interface are non-minimal and may be implemented as a function. See  
 118322 below for a library implementation of *pthread\_join()*.

118323 Thus, there was a consensus among the working group members to add timeouts to 4 of  
 118324 the remaining 5 functions (the timeout for *aio\_suspend()* was ultimately added directly to  
 118325 POSIX.1b, while the others were added by POSIX.1d). However, *pthread\_mutex\_lock()*  
 118326 remained contentious.

118327 Many feel that *pthread\_mutex\_lock()* falls into the same class as the other functions; that is,  
 118328 it is desirable to time out a mutex lock because a mutex may fail to be unlocked due to

errant or corrupted code in a critical section (looping or branching outside of the unlock code), and therefore is equally in need of a reliable, simple, and efficient timeout. In fact, since mutexes are intended to guard small critical sections, most `pthread_mutex_lock()` calls would be expected to obtain the lock without blocking nor utilizing any kernel service, even in implementations of threads with global contention scope; the timeout alternative need only be considered after it is determined that the thread must block.

Those opposed to timing out mutexes feel that the very simplicity of the mutex is compromised by adding a timeout semantic, and that to do so is senseless. They claim that if a timed mutex is really deemed useful by a particular application, then it can be constructed from the facilities already in POSIX.1b and POSIX.1c. The following two C-language library implementations of mutex locking with timeout represent the solutions offered (in both implementations, the timeout parameter is specified as absolute time, not relative time as in the proposed POSIX.1c interfaces).

#### • Spinlock Implementation

```

118343 #include <pthread.h>
118344 #include <time.h>
118345 #include <errno.h>

118346 int pthread_mutex_timedlock(pthread_mutex_t *mutex,
118347 const struct timespec *timeout)
118348 {
118349 struct timespec timenow;
118350 while (pthread_mutex_trylock(mutex) == EBUSY)
118351 {
118352 clock_gettime(CLOCK_REALTIME, &timenow);
118353 if (timespec_cmp(&timenow, timeout) >= 0)
118354 {
118355 return ETIMEDOUT;
118356 }
118357 pthread_yield();
118358 }
118359 return 0;
118360 }

```

The Spinlock implementation is generally unsuitable for any application using priority-based thread scheduling policies such as `SCHED_FIFO` or `SCHED_RR`, since the mutex could currently be held by a thread of lower priority within the same allocation domain, but since the waiting thread never blocks, only threads of equal or higher priority will ever run, and the mutex cannot be unlocked. Setting priority inheritance or priority ceiling protocol on the mutex does not solve this problem, since the priority of a mutex owning thread is only boosted if higher priority threads are blocked waiting for the mutex; clearly not the case for this spinlock.

#### • Condition Wait Implementation

```

118370 #include <pthread.h>
118371 #include <time.h>
118372 #include <errno.h>

118373 struct timed_mutex
118374 {
118375 int locked;
118376 pthread_mutex_t mutex;

```

```

118377 pthread_cond_t cond;
118378 };
118379 typedef struct timed_mutex timed_mutex_t;
118380 int timed_mutex_lock(timed_mutex_t *tm,
118381 const struct timespec *timeout)
118382 {
118383 int timedout=FALSE;
118384 int error_status;
118385
118386 pthread_mutex_lock(&tm->mutex);
118387
118388 while (tm->locked && !timedout)
118389 {
118390 if ((error_status=pthread_cond_timedwait(&tm->cond,
118391 &tm->mutex,
118392 timeout))!=0)
118393 {
118394 if (error_status==ETIMEDOUT) timedout = TRUE;
118395 }
118396 }
118397
118398 if(timedout)
118399 {
118400 pthread_mutex_unlock(&tm->mutex);
118401 return ETIMEDOUT;
118402 }
118403 else
118404 {
118405 tm->locked = TRUE;
118406 pthread_mutex_unlock(&tm->mutex);
118407 return 0;
118408 }
118409 }
118410 void timed_mutex_unlock(timed_mutex_t *tm)
118411 {
118412 pthread_mutex_lock(&tm->mutex); / for case assignment not atomic /
118413 tm->locked = FALSE;
118414 pthread_mutex_unlock(&tm->mutex);
118415 pthread_cond_signal(&tm->cond);
118416 }

```

118414 The Condition Wait implementation effectively substitutes the *pthread\_cond\_timedwait()*  
118415 function (which is currently timed out) for the desired *pthread\_mutex\_timedlock()*. Since  
118416 waits on condition variables currently do not include protocols which avoid priority  
118417 inversion, this method is generally unsuitable for realtime applications because it does not  
118418 provide the same priority inversion protection as the untimed *pthread\_mutex\_lock()*. Also,  
118419 for any given implementations of the current mutex and condition variable primitives, this  
118420 library implementation has a performance cost at least 2.5 times that of the untimed  
118421 *pthread\_mutex\_lock()* even in the case where the timed mutex is readily locked without  
118422 blocking (the interfaces required for this case are shown in bold). Even in uniprocessors or  
118423 where assignment is atomic, at least an additional *pthread\_cond\_signal()* is required.  
118424 *pthread\_mutex\_timedlock()* could be implemented at effectively no performance penalty in  
118425 this case because the timeout parameters need only be considered after it is determined  
118426 that the mutex cannot be locked immediately.

118427 Thus it has not yet been shown that the full semantics of mutex locking with timeout can  
 118428 be efficiently and reliably achieved using existing interfaces. Even if the existence of an  
 118429 acceptable library implementation were proven, it is difficult to justify why the interface  
 118430 itself should not be made portable, especially considering approval for the other four  
 118431 timeouts.

118432 • Rationale for Library Implementation of *pthread\_timedjoin()*

118433 Library implementation of *pthread\_timedjoin()*:

```

118434 /*
118435 * Construct a thread variety entirely from existing functions
118436 * with which a join can be done, allowing the join to time out.
118437 */
118438 #include <pthread.h>
118439 #include <time.h>
118440
118441 struct timed_thread {
118442 pthread_t t;
118443 pthread_mutex_t m;
118444 int exiting;
118445 pthread_cond_t exit_c;
118446 void *(*start_routine)(void *arg);
118447 void *arg;
118448 void *status;
118449 };
118450
118451 typedef struct timed_thread *timed_thread_t;
118452 static pthread_key_t timed_thread_key;
118453 static pthread_once_t timed_thread_once = PTHREAD_ONCE_INIT;
118454
118455 static void timed_thread_init()
118456 {
118457 pthread_key_create(&timed_thread_key, NULL);
118458 }
118459
118460 static void *timed_thread_start_routine(void *args)
118461 /*
118462 * Routine to establish thread-specific data value and run the actual
118463 * thread start routine which was supplied to timed_thread_create().
118464 */
118465 {
118466 timed_thread_t tt = (timed_thread_t) args;
118467 pthread_once(&timed_thread_once, timed_thread_init);
118468 pthread_setspecific(timed_thread_key, (void *)tt);
118469 timed_thread_exit((tt->start_routine)(tt->arg));
118470 }
118471
118472 int timed_thread_create(timed_thread_t ttp, const pthread_attr_t *attr,
118473 void *(*start_routine)(void *), void *arg)
118474 /*
118475 * Allocate a thread which can be used with timed_thread_join().
118476 */
118477 {
118478 timed_thread_t tt;

```

```

118474 int result;
118475 tt = (timed_thread_t) malloc(sizeof(struct timed_thread));
118476 pthread_mutex_init(&tt->m, NULL);
118477 tt->exiting = FALSE;
118478 pthread_cond_init(&tt->exit_c, NULL);
118479 tt->start_routine = start_routine;
118480 tt->arg = arg;
118481 tt->status = NULL;
118482
118483 if ((result = pthread_create(&tt->t, attr,
118484 timed_thread_start_routine, (void *)tt)) != 0) {
118485 free(tt);
118486 return result;
118487 }
118488 pthread_detach(tt->t);
118489 ttp = tt;
118490 return 0;
118491 }
118492
118493 int timed_thread_join(timed_thread_t tt,
118494 struct timespec *timeout,
118495 void **status)
118496 {
118497 int result;
118498 pthread_mutex_lock(&tt->m);
118499 result = 0;
118500 /*
118501 * Wait until the thread announces that it is exiting,
118502 * or until timeout.
118503 */
118504 while (result == 0 && ! tt->exiting) {
118505 result = pthread_cond_timedwait(&tt->exit_c, &tt->m, timeout);
118506 }
118507 pthread_mutex_unlock(&tt->m);
118508 if (result == 0 && tt->exiting) {
118509 *status = tt->status;
118510 free((void *)tt);
118511 return result;
118512 }
118513 return result;
118514 }
118515
118516 void timed_thread_exit(void *status)
118517 {
118518 timed_thread_t tt;
118519 void *specific;
118520
118521 if ((specific=pthread_getspecific(timed_thread_key)) == NULL){
118522 /*
118523 * Handle cases which won't happen with correct usage.
118524 */
118525 pthread_exit(NULL);
118526 }

```

```

118523 tt = (timed_thread_t) specific;
118524 pthread_mutex_lock(&tt->m);
118525 /*
118526 * Tell a joiner that we're exiting.
118527 */
118528 tt->status = status;
118529 tt->exiting = TRUE;
118530 pthread_cond_signal(&tt->exit_c);
118531 pthread_mutex_unlock(&tt->m);
118532 /*
118533 * Call pthread exit() to call destructors and really
118534 * exit the thread.
118535 */
118536 pthread_exit(NULL);
118537 }

```

118538 The *pthread\_join()* C-language example shown above demonstrates that it is possible,  
 118539 using existing pthread facilities, to construct a variety of thread which allows for joining  
 118540 such a thread, but which allows the join operation to time out. It does this by using a  
 118541 *pthread\_cond\_timedwait()* to wait for the thread to exit. A **timed\_thread\_t** descriptor  
 118542 structure is used to pass parameters from the creating thread to the created thread, and  
 118543 from the exiting thread to the joining thread. This implementation is roughly equivalent to  
 118544 what a normal *pthread\_join()* implementation would do, with the single change being that  
 118545 *pthread\_cond\_timedwait()* is used in place of a simple *pthread\_cond\_wait()*.

118546 Since it is possible to implement such a facility entirely from existing pthread interfaces,  
 118547 and with roughly equal efficiency and complexity to an implementation which would be  
 118548 provided directly by a pthreads implementation, it was the consensus of the working  
 118549 group members that any *pthread\_timedjoin()* facility would be unnecessary, and should not  
 118550 be provided.

#### 118551 • Form of the Timeout Interfaces

118552 The working group considered a number of alternative ways to add timeouts to blocking  
 118553 services. At first, a system interface which would specify a one-shot or persistent timeout  
 118554 to be applied to subsequent blocking services invoked by the calling process or thread was  
 118555 considered because it allowed all blocking services to be timed out in a uniform manner  
 118556 with a single additional interface; this was rather quickly rejected because it could easily  
 118557 result in the wrong services being timed out.

118558 It was suggested that a timeout value might be specified as an attribute of the object  
 118559 (semaphore, mutex, message queue, and so on), but there was no consensus on this, either  
 118560 on a case-by-case basis or for all timeouts.

118561 Looking at the two existing timeouts for blocking services indicates that the working  
 118562 group members favor a separate interface for the timed version of a function. However,  
 118563 *pthread\_cond\_timedwait()* utilizes an absolute timeout value while *sigtimedwait()* uses a  
 118564 relative timeout value. The working group members agreed that relative timeout values  
 118565 are appropriate where the timeout mechanism's primary use was to deal with an  
 118566 unexpected or error situation, but they are inappropriate when the timeout must expire at  
 118567 a particular time, or before a specific deadline. For the timeouts being introduced in  
 118568 POSIX.1-200x, the working group considered allowing both relative and absolute timeouts  
 118569 as is done with POSIX.1b timers, but ultimately favored the simpler absolute timeout form.

118570 An absolute time measure can be easily implemented on top of an interface that specifies  
 118571 relative time, by reading the clock, calculating the difference between the current time and

118572 the desired wake-up time, and issuing a relative timeout call. But there is a race condition  
118573 with this approach because the thread could be preempted after reading the clock, but  
118574 before making the timed-out call; in this case, the thread would be awakened later than it  
118575 should and, thus, if the wake-up time represented a deadline, it would miss it.

118576 There is also a race condition when trying to build a relative timeout on top of an interface  
118577 that specifies absolute timeouts. In this case, the clock would have to be read to calculate  
118578 the absolute wake-up time as the sum of the current time plus the relative timeout interval.  
118579 In this case, if the thread is preempted after reading the clock but before making the timed-  
118580 out call, the thread would be awakened earlier than desired.

118581 But the race condition with the absolute timeouts interface is not as bad as the one that  
118582 happens with the relative timeout interface, because there are simple workarounds. For the  
118583 absolute timeouts interface, if the timing requirement is a deadline, the deadline can still  
118584 be met because the thread woke up earlier than the deadline. If the timeout is just used as  
118585 an error recovery mechanism, the precision of timing is not really important. If the timing  
118586 requirement is that between actions A and B a minimum interval of time must elapse, the  
118587 absolute timeout interface can be safely used by reading the clock after action A has been  
118588 started. It could be argued that, since the call with the absolute timeout is atomic from the  
118589 application point of view, it is not possible to read the clock after action A, if this action is  
118590 part of the timed-out call. But looking at the nature of the calls for which timeouts are  
118591 specified (locking a mutex, waiting for a semaphore, waiting for a message, or waiting  
118592 until there is space in a message queue), the timeouts that an application would build on  
118593 these actions would not be triggered by these actions themselves, but by some other  
118594 external action. For example, if waiting for a message to arrive to a message queue, and  
118595 waiting for at least 20 milliseconds, this time interval would start to be counted from some  
118596 event that would trigger both the action that produces the message, as well as the action  
118597 that waits for the message to arrive, and not by the wait-for-message operation itself. In  
118598 this case, the workaround proposed above could be used.

118599 For these reasons, the absolute timeout is preferred over the relative timeout interface.

## 118600 B.2.9 Threads

118601 Threads will normally be more expensive than subroutines (or functions, routines, and so on) if  
118602 specialized hardware support is not provided. Nevertheless, threads should be sufficiently  
118603 efficient to encourage their use as a medium to fine-grained structuring mechanism for  
118604 parallelism in an application. Structuring an application using threads then allows it to take  
118605 immediate advantage of any underlying parallelism available in the host environment. This  
118606 means implementors are encouraged to optimize for fast execution at the possible expense of  
118607 efficient utilization of storage. For example, a common thread creation technique is to cache  
118608 appropriate thread data structures. That is, rather than releasing system resources, the  
118609 implementation retains these resources and reuses them when the program next asks to create a  
118610 new thread. If this reuse of thread resources is to be possible, there has to be very little unique  
118611 state associated with each thread, because any such state has to be reset when the thread is  
118612 reused.

118613 **Thread Creation Attributes**

118614 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to  
 118615 support probable future standardization in these areas without requiring that the interface itself  
 118616 be changed.

118617 Attributes objects provide clean isolation of the configurable aspects of threads. For example,  
 118618 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When  
 118619 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects  
 118620 can help by allowing the changes to be isolated in a single place, rather than being spread across  
 118621 every instance of thread creation.

118622 Attributes objects can be used to set up *classes* of threads with similar attributes; for example,  
 118623 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes  
 118624 can be defined in a single place and then referenced wherever threads need to be created.  
 118625 Changes to “class” decisions become straightforward, and detailed analysis of each  
 118626 *pthread\_create()* call is not required.

118627 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had  
 118628 been specified as structures, adding new attributes would force recompilation of all multi-  
 118629 threaded programs when the attributes objects are extended; this might not be possible if  
 118630 different program components were supplied by different vendors.

118631 Additionally, opaque attributes objects present opportunities for improving performance.  
 118632 Argument validity can be checked once when attributes are set, rather than each time a thread is  
 118633 created. Implementations will often need to cache kernel objects that are expensive to create.  
 118634 Opaque attributes objects provide an efficient mechanism to detect when cached objects become  
 118635 invalid due to attribute changes.

118636 Because assignment is not necessarily defined on a given opaque type, implementation-defined  
 118637 default values cannot be defined in a portable way. The solution to this problem is to allow  
 118638 attribute objects to be initialized dynamically by attributes object initialization functions, so that  
 118639 default values can be supplied automatically by the implementation.

118640 The following proposal was provided as a suggested alternative to the supplied attributes:

- 118641 1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to  
 118642 the initialization routines (*pthread\_create()*, *pthread\_mutex\_init()*, *pthread\_cond\_init()*). The  
 118643 parameter containing the flags should be an opaque type for extensibility. If no flags are  
 118644 set in the parameter, then the objects are created with default characteristics. An  
 118645 implementation may specify implementation-defined flag values and associated  
 118646 behavior.
- 118647 2. If further specialization of mutexes and condition variables is necessary, implementations  
 118648 may specify additional procedures that operate on the **pthread\_mutex\_t** and  
 118649 **pthread\_cond\_t** objects (instead of on attributes objects).

118650 The difficulties with this solution are:

- 118651 1. A bitmask is not opaque if bits have to be set into bit-vector attributes objects using  
 118652 explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**,  
 118653 application programmers need to know the location of each bit. If bits are set or read by  
 118654 encapsulation (that is, *get\*()* or *set\*()* functions), then the bitmask is merely an  
 118655 implementation of attributes objects as currently defined and should not be exposed to  
 118656 the programmer.
- 118657 2. Many attributes are not Boolean or very small integral values. For example, scheduling  
 118658 policy may be placed in 3 bits or 4 bits, but priority requires 5 bits or more, thereby taking  
 118659 up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this,

118660 the bitmask can only reasonably control whether particular attributes are set or not, and it  
 118661 cannot serve as the repository of the value itself. The value needs to be specified as a  
 118662 function parameter (which is non-extensible), or by setting a structure field (which is non-  
 118663 opaque), or by *get\**() and *set\**() functions (making the bitmask a redundant addition to  
 118664 the attributes objects).

118665 Stack size is defined as an optional attribute because the very notion of a stack is inherently  
 118666 machine-dependent. Some implementations may not be able to change the size of the stack, for  
 118667 example, and others may not need to because stack pages may be discontinuous and can be  
 118668 allocated and released on demand.

118669 The attribute mechanism has been designed in large measure for extensibility. Future extensions  
 118670 to the attribute mechanism or to any attributes object defined in POSIX.1-200x have to be done  
 118671 with care so as not to affect binary-compatibility.

118672 Attribute objects, even if allocated by means of dynamic allocation functions such as *malloc*(),  
 118673 may have their size fixed at compile time. This means, for example, a *pthread\_create*() in an  
 118674 implementation with extensions to the **pthread\_attr\_t** cannot look beyond the area that the  
 118675 binary application assumes is valid. This suggests that implementations should maintain a size  
 118676 field in the attributes object, as well as possibly version information, if extensions in different  
 118677 directions (possibly by different vendors) are to be accommodated.

### 118678 Thread Implementation Models

118679 There are various thread implementation models. At one end of the spectrum is the “library-  
 118680 thread model”. In such a model, the threads of a process are not visible to the operating system  
 118681 kernel, and the threads are not kernel-scheduled entities. The process is the only kernel-  
 118682 scheduled entity. The process is scheduled onto the processor by the kernel according to the  
 118683 scheduling attributes of the process. The threads are scheduled onto the single kernel-scheduled  
 118684 entity (the process) by the runtime library according to the scheduling attributes of the threads.  
 118685 A problem with this model is that it constrains concurrency. Since there is only one kernel-  
 118686 scheduled entity (namely, the process), only one thread per process can execute at a time. If the  
 118687 thread that is executing blocks on I/O, then the whole process blocks.

118688 At the other end of the spectrum is the “kernel-thread model”. In this model, all threads are  
 118689 visible to the operating system kernel. Thus, all threads are kernel-scheduled entities, and all  
 118690 threads can concurrently execute. The threads are scheduled onto processors by the kernel  
 118691 according to the scheduling attributes of the threads. The drawback to this model is that the  
 118692 creation and management of the threads entails operating system calls, as opposed to subroutine  
 118693 calls, which makes kernel threads heavier weight than library threads.

118694 Hybrids of these two models are common. A hybrid model offers the speed of library threads  
 118695 and the concurrency of kernel threads. In hybrid models, a process has some (relatively small)  
 118696 number of kernel scheduled entities associated with it. It also has a potentially much larger  
 118697 number of library threads associated with it. Some library threads may be bound to kernel-  
 118698 scheduled entities, while the other library threads are multiplexed onto the remaining kernel-  
 118699 scheduled entities. There are two levels of thread scheduling:

- 118700 1. The runtime library manages the scheduling of (unbound) library threads onto kernel-  
 118701 scheduled entities.
- 118702 2. The kernel manages the scheduling of kernel-scheduled entities onto processors.

118703 For this reason, a hybrid model is referred to as a two-level threads scheduling model. In this  
 118704 model, the process can have multiple concurrently executing threads; specifically, it can have as  
 118705 many concurrently executing threads as it has kernel-scheduled entities.

118706 **Thread-Specific Data**

118707 Many applications require that a certain amount of context be maintained on a per-thread basis  
 118708 across procedure calls. A common example is a multi-threaded library routine that allocates  
 118709 resources from a common pool and maintains an active resource list for each thread. The thread-  
 118710 specific data interface provided to meet these needs may be viewed as a two-dimensional array  
 118711 of values with keys serving as the row index and thread IDs as the column index (although the  
 118712 implementation need not work this way).

## 118713 • Models

118714 Three possible thread-specific data models were considered:

## 118715 1. No Explicit Support

118716 A standard thread-specific data interface is not strictly necessary to support  
 118717 applications that require per-thread context. One could, for example, provide a hash  
 118718 function that converted a **pthread\_t** into an integer value that could then be used to  
 118719 index into a global array of per-thread data pointers. This hash function, in  
 118720 conjunction with *pthread\_self()*, would be all the interface required to support a  
 118721 mechanism of this sort. Unfortunately, this technique is cumbersome. It can lead to  
 118722 duplicated code as each set of cooperating modules implements their own per-  
 118723 thread data management schemes.

118724 2. Single (**void \***) Pointer

118725 Another technique would be to provide a single word of per-thread storage and a  
 118726 pair of functions to fetch and store the value of this word. The word could then hold  
 118727 a pointer to a block of per-thread memory. The allocation, partitioning, and general  
 118728 use of this memory would be entirely up to the application. Although this method  
 118729 is not as problematic as technique 1, it suffers from interoperability problems. For  
 118730 example, all modules using the per-thread pointer would have to agree on a  
 118731 common usage protocol.

## 118732 3. Key/Value Mechanism

118733 This method associates an opaque key (for example, stored in a variable of type  
 118734 **pthread\_key\_t**) with each per-thread datum. These keys play the role of identifiers  
 118735 for per-thread data. This technique is the most generic and avoids the problems  
 118736 noted above, albeit at the cost of some complexity.

118737 The primary advantage of the third model is its information hiding properties. Modules  
 118738 using this model are free to create and use their own key(s) independent of all other such  
 118739 usage, whereas the other models require that all modules that use thread-specific context  
 118740 explicitly cooperate with all other such modules. The data-independence provided by the  
 118741 third model is worth the additional interface.

## 118742 • Requirements

118743 It is important that it be possible to implement the thread-specific data interface without  
 118744 the use of thread private memory. To do otherwise would increase the weight of each  
 118745 thread, thereby limiting the range of applications for which the threads interfaces provided  
 118746 by POSIX.1-200x is appropriate.

118747 The values that one binds to the key via *pthread\_setspecific()* may, in fact, be pointers to  
 118748 shared storage locations available to all threads. It is only the key/value bindings that are  
 118749 maintained on a per-thread basis, and these can be kept in any portion of the address space  
 118750 that is reserved for use by the calling thread (for example, on the stack). Thus, no per-  
 118751 thread MMU state is required to implement the interface. On the other hand, there is

118752 nothing in the interface specification to preclude the use of a per-thread MMU state if it is  
 118753 available (for example, the key values returned by *pthread\_key\_create()* could be thread  
 118754 private memory addresses).

118755 • Standardization Issues

118756 Thread-specific data is a requirement for a usable thread interface. The binding described  
 118757 in this section provides a portable thread-specific data mechanism for languages that do  
 118758 not directly support a thread-specific storage class. A binding to POSIX.1-200x for a  
 118759 language that does include such a storage class need not provide this specific interface.

118760 If a language were to include the notion of thread-specific storage, it would be desirable  
 118761 (but *not* required) to provide an implementation of the pthreads thread-specific data  
 118762 interface based on the language feature. For example, assume that a compiler for a C-like  
 118763 language supports a *private* storage class that provides thread-specific storage. Something  
 118764 similar to the following macros might be used to effect a compatible implementation:

```
118765 #define pthread_key_t private void *
118766 #define pthread_key_create(key) /* no-op */
118767 #define pthread_setspecific(key,value) (key)=(value)
118768 #define pthread_getspecific(key) (key)
```

118769 **Note:** For the sake of clarity, this example ignores destructor functions. A correct  
 118770 implementation would have to support them.

118771 **Barriers**

118772 • Background

118773 Barriers are typically used in parallel DO/FOR loops to ensure that all threads have  
 118774 reached a particular stage in a parallel computation before allowing any to proceed to the  
 118775 next stage. Highly efficient implementation is possible on machines which support a  
 118776 “Fetch and Add” operation as described in the referenced Almasi and Gottlieb (1989).

118777 The use of return value PTHREAD\_BARRIER\_SERIAL\_THREAD is shown in the  
 118778 following example:

```
118779 if ((status=pthread_barrier_wait(&barrier)) ==
118780 PTHREAD_BARRIER_SERIAL_THREAD) {
118781 ...serial section
118782 }
118783 else if (status != 0) {
118784 ...error processing
118785 }
118786 status=pthread_barrier_wait(&barrier);
118787 ...
```

118788 This behavior allows a serial section of code to be executed by one thread as soon as all  
 118789 threads reach the first barrier. The second barrier prevents the other threads from  
 118790 proceeding until the serial section being executed by the one thread has completed.

118791 Although barriers can be implemented with mutexes and condition variables, the  
 118792 referenced Almasi and Gottlieb (1989) provides ample illustration that such  
 118793 implementations are significantly less efficient than is possible. While the relative  
 118794 efficiency of barriers may well vary by implementation, it is important that they be  
 118795 recognized in the POSIX.1-200x to facilitate applications portability while providing the  
 118796 necessary freedom to implementors.

- 118797
- Lack of Timeout Feature
- 118798 Alternate versions of most blocking routines have been provided to support watchdog  
118799 timeouts. No alternate interface of this sort has been provided for barrier waits for the  
118800 following reasons:
- Multiple threads may use different timeout values, some of which may be indefinite.  
118801 It is not clear which threads should break through the barrier with a timeout error if  
118802 and when these timeouts expire.
  - The barrier may become unusable once a thread breaks out of a *pthread\_barrier\_wait()*  
118803 with a timeout error. There is, in general, no way to guarantee the consistency of a  
118804 barrier's internal data structures once a thread has timed out of a  
118805 *pthread\_barrier\_wait()*. Even the inclusion of a special barrier reinitialization function  
118806 would not help much since it is not clear how this function would affect the behavior  
118807 of threads that reach the barrier between the original timeout and the call to the  
118808 reinitialization function.
- 118809  
118810

## 118811 Spin Locks

- Background
- 118812
- 118813 Spin locks represent an extremely low-level synchronization mechanism suitable primarily  
118814 for use on shared memory multi-processors. It is typically an atomically modified Boolean  
118815 value that is set to one when the lock is held and to zero when the lock is freed.
- 118816 When a caller requests a spin lock that is already held, it typically spins in a loop testing  
118817 whether the lock has become available. Such spinning wastes processor cycles so the lock  
118818 should only be held for short durations and not across sleep/block operations. Callers  
118819 should unlock spin locks before calling sleep operations.
- 118820 Spin locks are available on a variety of systems. The functions included in POSIX.1-200x  
118821 are an attempt to standardize that existing practice.
- Lack of Timeout Feature
- 118822
- 118823 Alternate versions of most blocking routines have been provided to support watchdog  
118824 timeouts. No alternate interface of this sort has been provided for spin locks for the  
118825 following reasons:
- It is impossible to determine appropriate timeout intervals for spin locks in a  
118826 portable manner. The amount of time one can expect to spend spin-waiting is  
118827 inversely proportional to the degree of parallelism provided by the system.  
118828
- 118829 It can vary from a few cycles when each competing thread is running on its own  
118830 processor, to an indefinite amount of time when all threads are multiplexed on a  
118831 single processor (which is why spin locking is not advisable on uniprocessors).
- When used properly, the amount of time the calling thread spends waiting on a spin  
118832 lock should be considerably less than the time required to set up a corresponding  
118833 watchdog timer. Since the primary purpose of spin locks is to provide a low-  
118834 overhead synchronization mechanism for multi-processors, the overhead of a  
118835 timeout mechanism was deemed unacceptable.  
118836
- 118837 It was also suggested that an additional *count* argument be provided (on the  
118838 *pthread\_spin\_lock()* call) in lieu of a true timeout so that a spin lock call could fail gracefully  
118839 if it was unable to apply the lock after *count* attempts. This idea was rejected because it is  
118840 not existing practice. Furthermore, the same effect can be obtained with  
118841 *pthread\_spin\_trylock()*, as illustrated below:

```

118842 int n = MAX_SPIN;
118843 while (--n >= 0)
118844 {
118845 if (!pthread_spin_try_lock(...))
118846 break;
118847 }
118848 if (n >= 0)
118849 {
118850 /* Successfully acquired the lock */
118851 }
118852 else
118853 {
118854 /* Unable to acquire the lock */
118855 }

```

118856 • *process-shared* Attribute

118857 The initialization functions associated with most POSIX synchronization objects (for  
118858 example, mutexes, barriers, and read-write locks) take an attributes object with a *process-*  
118859 *shared* attribute that specifies whether or not the object is to be shared across processes. In  
118860 the draft corresponding to the first balloting round, two separate initialization functions  
118861 are provided for spin locks, however: one for spin locks that were to be shared across  
118862 processes (*spin\_init()*), and one for locks that were only used by multiple threads within a  
118863 single process (*pthread\_spin\_init()*). This was done so as to keep the overhead associated  
118864 with spin waiting to an absolute minimum. However, the balloting group requested that,  
118865 since the overhead associated to a bit check was small, spin locks should be consistent with  
118866 the rest of the synchronization primitives, and thus the *process-shared* attribute was  
118867 introduced for spin locks.

118868 • Spin Locks *versus* Mutexes

118869 It has been suggested that mutexes are an adequate synchronization mechanism and spin  
118870 locks are not necessary. Locking mechanisms typically must trade off the processor  
118871 resources consumed while setting up to block the thread and the processor resources  
118872 consumed by the thread while it is blocked. Spin locks require very little resources to set  
118873 up the blocking of a thread. Existing practice is to simply loop, repeating the atomic  
118874 locking operation until the lock is available. While the resources consumed to set up  
118875 blocking of the thread are low, the thread continues to consume processor resources while  
118876 it is waiting.

118877 On the other hand, mutexes may be implemented such that the processor resources  
118878 consumed to block the thread are large relative to a spin lock. After detecting that the  
118879 mutex lock is not available, the thread must alter its scheduling state, add itself to a set of  
118880 waiting threads, and, when the lock becomes available again, undo all of this before taking  
118881 over ownership of the mutex. However, while a thread is blocked by a mutex, no processor  
118882 resources are consumed.

118883 Therefore, spin locks and mutexes may be implemented to have different characteristics.  
118884 Spin locks may have lower overall overhead for very short-term blocking, and mutexes  
118885 may have lower overall overhead when a thread will be blocked for longer periods of time.  
118886 The presence of both interfaces allows implementations with these two different  
118887 characteristics, both of which may be useful to a particular application.

118888 It has also been suggested that applications can build their own spin locks from the  
118889 *pthread\_mutex\_trylock()* function:

118890           while (pthread\_mutex\_trylock(&mutex));

118891           The apparent simplicity of this construct is somewhat deceiving, however. While the actual  
118892           wait is quite efficient, various guarantees on the integrity of mutex objects (for example,  
118893           priority inheritance rules) may add overhead to the successful path of the trylock  
118894           operation that is not required of spin locks. One could, of course, add an attribute to the  
118895           mutex to bypass such overhead, but the very act of finding and testing this attribute  
118896           represents more overhead than is found in the typical spin lock.

118897           The need to hold spin lock overhead to an absolute minimum also makes it impossible to  
118898           provide guarantees against starvation similar to those provided for mutexes or read-write  
118899           locks. The overhead required to implement such guarantees (for example, disabling  
118900           preemption before spinning) may well exceed the overhead of the spin wait itself by many  
118901           orders of magnitude. If a “safe” spin wait seems desirable, it can always be provided  
118902           (albeit at some performance cost) via appropriate mutex attributes.

### 118903           **Robust Mutexes**

118904           Robust mutexes are intended to protect applications that use mutexes to protect data shared  
118905           between different processes. If a process is terminated by a signal while a thread is holding a  
118906           mutex, there is no chance for the process to clean up after it. Waiters for the locked mutex might  
118907           wait indefinitely.

118908           With robust mutexes the problem can be solved: whenever a fatal signal terminates a process,  
118909           current or future waiters of the mutex are notified about this fact. The locking function provides  
118910           notification of this condition through the error condition [EOWNERDEAD]. A thread then has  
118911           the chance to clean up the state protected by the mutex and mark the state as consistent again by  
118912           a call to *pthread\_mutex\_consistent()*.

118913           Pre-existing implementations have used the semantics of robust mutexes for a variety of  
118914           situations, some of them not defined in the standard. Where a normally terminated process (i.e.,  
118915           when one thread calls *exit()*) causes notification of other waiters of robust mutexes if the mutex  
118916           is locked by any thread in the process. This behavior is defined in the standard and makes sense  
118917           because no thread other than the thread calling *exit()* has the chance to clean up its data.

118918           If a thread is terminated by cancellation or if it calls *pthread\_exit()*, the situation is different. In  
118919           both these situations the thread has the chance to clean up after itself by registering appropriate  
118920           cleanup handlers. There is no real reason to demand that other waiters for a robust mutex the  
118921           terminating thread owns are notified. The committee felt that this is actively encouraging bad  
118922           practice because programmers are tempted to rely on the robust mutex semantics instead of  
118923           correctly cleaning up after themselves.

118924           Therefore, the standard does not require notification of other waiters at the time a thread is  
118925           terminated while the process continues to run. The mutex is still recognized as being locked by  
118926           the process (with the thread gone it makes no sense to refer to the thread owning the mutex).  
118927           Therefore, a terminating process will cause notifications about the dead owner to be sent to all  
118928           waiters. This delay in the notification is not required, but programmers cannot rely on prompt  
118929           notification after a thread is terminated.

118930           For the same reason is it not required that an implementation supports robust mutexes that are  
118931           not shared between processes. If a robust mutex is used only within one process, all the cleanup  
118932           can be performed by the threads themselves by registering appropriate cleanup handlers. Fatal  
118933           signals are of no importance in this case because after the signal is delivered there is no thread  
118934           remaining to use the mutex.

118935           Some implementations might choose to support intra-process robust mutexes and they might  
118936           also send notification of a dead owner right after the previous owner died. But applications

118937 must not rely on this. Applications should only use robust mutexes for the purpose of handling  
 118938 fatal signals in situations where inter-process mutexes are in use.

### 118939 Supported Threads Functions

118940 On POSIX-conforming systems, the following symbolic constants are always conforming:

118941 `_POSIX_READER_WRITER_LOCKS`  
 118942 `_POSIX_THREADS`

118943 Therefore, the following threads functions are always supported:

|                                                   |                                              |
|---------------------------------------------------|----------------------------------------------|
| 118944 <code>pthread_atfork()</code>              | <code>pthread_mutex_destroy()</code>         |
| 118945 <code>pthread_attr_destroy()</code>        | <code>pthread_mutex_init()</code>            |
| 118946 <code>pthread_attr_getdetachstate()</code> | <code>pthread_mutex_lock()</code>            |
| 118947 <code>pthread_attr_getguardsize()</code>   | <code>pthread_mutex_trylock()</code>         |
| 118948 <code>pthread_attr_getschedparam()</code>  | <code>pthread_mutex_unlock()</code>          |
| 118949 <code>pthread_attr_init()</code>           | <code>pthread_mutexattr_destroy()</code>     |
| 118950 <code>pthread_attr_setdetachstate()</code> | <code>pthread_mutexattr_getpshared()</code>  |
| 118951 <code>pthread_attr_setguardsize()</code>   | <code>pthread_mutexattr_gettype()</code>     |
| 118952 <code>pthread_attr_setschedparam()</code>  | <code>pthread_mutexattr_init()</code>        |
| 118953 <code>pthread_cancel()</code>              | <code>pthread_mutexattr_setpshared()</code>  |
| 118954 <code>pthread_cleanup_pop()</code>         | <code>pthread_mutexattr_settype()</code>     |
| 118955 <code>pthread_cleanup_push()</code>        | <code>pthread_once()</code>                  |
| 118956 <code>pthread_cond_broadcast()</code>      | <code>pthread_rwlock_destroy()</code>        |
| 118957 <code>pthread_cond_destroy()</code>        | <code>pthread_rwlock_init()</code>           |
| 118958 <code>pthread_cond_init()</code>           | <code>pthread_rwlock_rdlock()</code>         |
| 118959 <code>pthread_cond_signal()</code>         | <code>pthread_rwlock_tryrdlock()</code>      |
| 118960 <code>pthread_cond_timedwait()</code>      | <code>pthread_rwlock_trywrlock()</code>      |
| 118961 <code>pthread_cond_wait()</code>           | <code>pthread_rwlock_unlock()</code>         |
| 118962 <code>pthread_condattr_destroy()</code>    | <code>pthread_rwlock_wrlock()</code>         |
| 118963 <code>pthread_condattr_getpshared()</code> | <code>pthread_rwlockattr_destroy()</code>    |
| 118964 <code>pthread_condattr_init()</code>       | <code>pthread_rwlockattr_getpshared()</code> |
| 118965 <code>pthread_condattr_setpshared()</code> | <code>pthread_rwlockattr_init()</code>       |
| 118966 <code>pthread_create()</code>              | <code>pthread_rwlockattr_setpshared()</code> |
| 118967 <code>pthread_detach()</code>              | <code>pthread_self()</code>                  |
| 118968 <code>pthread_equal()</code>               | <code>pthread_setcancelstate()</code>        |
| 118969 <code>pthread_exit()</code>                | <code>pthread_setcanceltype()</code>         |
| 118970 <code>pthread_getconcurrency()</code>      | <code>pthread_setconcurrency()</code>        |
| 118971 <code>pthread_getspecific()</code>         | <code>pthread_setspecific()</code>           |
| 118972 <code>pthread_join()</code>                | <code>pthread_sigmask()</code>               |
| 118973 <code>pthread_key_create()</code>          | <code>pthread_testcancel()</code>            |
| 118974 <code>pthread_key_delete()</code>          | <code>sigwait()</code>                       |
| 118975 <code>pthread_kill()</code>                |                                              |

118976 On POSIX-conforming systems, the symbolic constant `_POSIX_THREAD_SAFE_FUNCTIONS` is  
118977 always defined. Therefore, the following functions are always supported:

|        |                                 |                                 |
|--------|---------------------------------|---------------------------------|
| 118978 | <code>asctime_r()</code>        | <code>getpwuid_r()</code>       |
| 118979 | <code>ctime_r()</code>          | <code>gmtime_r()</code>         |
| 118980 | <code>flockfile()</code>        | <code>localtime_r()</code>      |
| 118981 | <code>ftrylockfile()</code>     | <code>putc_unlocked()</code>    |
| 118982 | <code>funlockfile()</code>      | <code>putchar_unlocked()</code> |
| 118983 | <code>getc_unlocked()</code>    | <code>rand_r()</code>           |
| 118984 | <code>getchar_unlocked()</code> | <code>readdir_r()</code>        |
| 118985 | <code>getgrgid_r()</code>       | <code>strerror_r()</code>       |
| 118986 | <code>getgrnam_r()</code>       | <code>strtok_r()</code>         |
| 118987 | <code>getpwnam_r()</code>       |                                 |

### 118988 Threads Extensions

118989 The following extensions to the IEEE P1003.1c draft standard are now supported in  
118990 POSIX.1-200x as part of the alignment with the Single UNIX Specification:

- 118991 • Extended mutex attribute types
- 118992 • Read-write locks and attributes (also introduced by the IEEE Std 1003.1j-2000 amendment)
- 118993 • Thread concurrency level
- 118994 • Thread stack guard size
- 118995 • Parallel I/O
- 118996 • Robust mutexes

118997 These extensions carefully follow the threads programming model specified in POSIX.1c. As  
118998 with POSIX.1c, all the new functions return zero if successful; otherwise, an error number is  
118999 returned to indicate the error.

119000 The concept of attribute objects was introduced in POSIX.1c to allow implementations to extend  
119001 POSIX.1-200x without changing the existing interfaces. Attribute objects were defined for  
119002 threads, mutexes, and condition variables. Attributes objects are defined as implementation-  
119003 defined opaque types to aid extensibility, and functions are defined to allow attributes to be set  
119004 or retrieved. This model has been followed when adding the new type attribute of  
119005 `pthread_mutexattr_t` or the new read-write lock attributes object `pthread_rwlockattr_t`.

- 119006 • Extended Mutex Attributes

119007 POSIX.1c defines a mutex attributes object as an implementation-defined opaque object of  
119008 type `pthread_mutexattr_t`, and specifies a number of attributes which this object must  
119009 have and a number of functions which manipulate these attributes. These attributes  
119010 include *detachstate*, *inheritsched*, *schedparam*, *schedpolicy*, *contentionscope*, *stackaddr*, and  
119011 *stacksize*.

119012 The System Interfaces volume of POSIX.1-200x specifies another mutex attribute called  
119013 *type*. The *type* attribute allows applications to specify the behavior of mutex locking  
119014 operations in situations where POSIX.1c behavior is undefined. The OSF DCE threads  
119015 implementation, based on Draft 4 of POSIX.1c, specified a similar attribute. Note that the  
119016 names of the attributes have changed somewhat from the OSF DCE threads  
119017 implementation.

119018 The System Interfaces volume of POSIX.1-200x also extends the specification of the  
119019 following POSIX.1c functions which manipulate mutexes:

119020 `pthread_mutex_lock()`  
 119021 `pthread_mutex_trylock()`  
 119022 `pthread_mutex_unlock()`

119023 to take account of the new mutex attribute type and to specify behavior which was  
 119024 declared as undefined in POSIX.1c. How a calling thread acquires or releases a mutex now  
 119025 depends upon the mutex *type* attribute.

119026 The *type* attribute can have the following values:

119027 PTHREAD\_MUTEX\_NORMAL

119028 Basic mutex with no specific error checking built in. Does not report a deadlock error.

119029 PTHREAD\_MUTEX\_RECURSIVE

119030 Allows any thread to recursively lock a mutex. The mutex must be unlocked an equal  
 119031 number of times to release the mutex.

119032 PTHREAD\_MUTEX\_ERRORCHECK

119033 Detects and reports simple usage errors; that is, an attempt to unlock a mutex that is  
 119034 not locked by the calling thread or that is not locked at all, or an attempt to relock a  
 119035 mutex the thread already owns.

119036 PTHREAD\_MUTEX\_DEFAULT

119037 The default mutex type. May be mapped to any of the above mutex types or may be  
 119038 an implementation-defined type.

119039 *Normal* mutexes do not detect deadlock conditions; for example, a thread will hang if it  
 119040 tries to relock a normal mutex that it already owns. Attempting to unlock a mutex locked  
 119041 by another thread, or unlocking an unlocked mutex, results in undefined behavior. Normal  
 119042 mutexes will usually be the fastest type of mutex available on a platform but provide the  
 119043 least error checking.

119044 *Recursive* mutexes are useful for converting old code where it is difficult to establish clear  
 119045 boundaries of synchronization. A thread can relock a recursive mutex without first  
 119046 unlocking it. The relocking deadlock which can occur with normal mutexes cannot occur  
 119047 with this type of mutex. However, multiple locks of a recursive mutex require the same  
 119048 number of unlocks to release the mutex before another thread can acquire the mutex.  
 119049 Furthermore, this type of mutex maintains the concept of an owner. Thus, a thread  
 119050 attempting to unlock a recursive mutex which another thread has locked returns with an  
 119051 error. A thread attempting to unlock a recursive mutex that is not locked returns with an  
 119052 error. Never use a recursive mutex with condition variables because the implicit unlock  
 119053 performed by `pthread_cond_wait()` or `pthread_cond_timedwait()` will not actually release the  
 119054 mutex if it had been locked multiple times.

119055 *Errorcheck* mutexes provide error checking and are useful primarily as a debugging aid. A  
 119056 thread attempting to relock an errorcheck mutex without first unlocking it returns with an  
 119057 error. Again, this type of mutex maintains the concept of an owner. Thus, a thread  
 119058 attempting to unlock an errorcheck mutex which another thread has locked returns with  
 119059 an error. A thread attempting to unlock an errorcheck mutex that is not locked also returns  
 119060 with an error. It should be noted that errorcheck mutexes will almost always be much  
 119061 slower than normal mutexes due to the extra state checks performed.

119062 The default mutex type provides implementation-defined error checking. The default  
 119063 mutex may be mapped to one of the other defined types or may be something entirely  
 119064 different. This enables each vendor to provide the mutex semantics which the vendor feels  
 119065 will be most useful to their target users. Most vendors will probably choose to make  
 119066 normal mutexes the default so as to give applications the benefit of the fastest type of

- 119067 mutexes available on their platform. Check your implementation's documentation.
- 119068 An application developer can use any of the mutex types almost interchangeably as long  
119069 as the application does not depend upon the implementation detecting (or failing to  
119070 detect) any particular errors. Note that a recursive mutex can be used with condition  
119071 variable waits as long as the application never recursively locks the mutex.
- 119072 Two functions are provided for manipulating the *type* attribute of a mutex attributes object.  
119073 This attribute is set or returned in the *type* parameter of these functions. The  
119074 *pthread\_mutexattr\_settype()* function is used to set a specific type value while  
119075 *pthread\_mutexattr\_gettype()* is used to return the type of the mutex. Setting the *type*  
119076 attribute of a mutex attributes object affects only mutexes initialized using that mutex  
119077 attributes object. Changing the *type* attribute does not affect mutexes previously initialized  
119078 using that mutex attributes object.
- 119079 • Read-Write Locks and Attributes
- 119080 The read-write locks introduced have been harmonized with those in IEEE Std  
119081 1003.1j-2000; see also [Section B.2.9.6](#) (on page 3489).
- 119082 Read-write locks (also known as reader-writer locks) allow a thread to exclusively lock  
119083 some shared data while updating that data, or allow any number of threads to have  
119084 simultaneous read-only access to the data.
- 119085 Unlike a mutex, a read-write lock distinguishes between reading data and writing data. A  
119086 mutex excludes all other threads. A read-write lock allows other threads access to the data,  
119087 providing no thread is modifying the data. Thus, a read-write lock is less primitive than  
119088 either a mutex-condition variable pair or a semaphore.
- 119089 Application developers should consider using a read-write lock rather than a mutex to  
119090 protect data that is frequently referenced but seldom modified. Most threads (readers) will  
119091 be able to read the data without waiting and will only have to block when some other  
119092 thread (a writer) is in the process of modifying the data. Conversely a thread that wants to  
119093 change the data is forced to wait until there are no readers. This type of lock is often used  
119094 to facilitate parallel access to data on multi-processor platforms or to avoid context  
119095 switches on single processor platforms where multiple threads access the same data.
- 119096 If a read-write lock becomes unlocked and there are multiple threads waiting to acquire  
119097 the write lock, the implementation's scheduling policy determines which thread acquires  
119098 the read-write lock for writing. If there are multiple threads blocked on a read-write lock  
119099 for both read locks and write locks, it is unspecified whether the readers or a writer  
119100 acquire the lock first. However, for performance reasons, implementations often favor  
119101 writers over readers to avoid potential writer starvation.
- 119102 A read-write lock object is an implementation-defined opaque object of type  
119103 **pthread\_rwlock\_t** as defined in **<pthread.h>**. There are two different sorts of locks  
119104 associated with a read-write lock: a read lock and a write lock.
- 119105 The *pthread\_rwlockattr\_init()* function initializes a read-write lock attributes object with the  
119106 default value for all the attributes defined in the implementation. After a read-write lock  
119107 attributes object has been used to initialize one or more read-write locks, changes to the  
119108 read-write lock attributes object, including destruction, do not affect previously initialized  
119109 read-write locks.
- 119110 Implementations must provide at least the read-write lock attribute *process-shared*. This  
119111 attribute can have the following values:

- 119112 PTHREAD\_PROCESS\_SHARED  
 119113 Any thread of any process that has access to the memory where the read-write lock  
 119114 resides can manipulate the read-write lock.
- 119115 PTHREAD\_PROCESS\_PRIVATE  
 119116 Only threads created within the same process as the thread that initialized the read-  
 119117 write lock can manipulate the read-write lock. This is the default value.
- 119118 The *pthread\_rwlockattr\_setpshared()* function is used to set the *process-shared* attribute of an  
 119119 initialized read-write lock attributes object while the function  
 119120 *pthread\_rwlockattr\_getpshared()* obtains the current value of the *process-shared* attribute.
- 119121 A read-write lock attributes object is destroyed using the *pthread\_rwlockattr\_destroy()*  
 119122 function. The effect of subsequent use of the read-write lock attributes object is undefined.
- 119123 A thread creates a read-write lock using the *pthread\_rwlock\_init()* function. The attributes  
 119124 of the read-write lock can be specified by the application developer; otherwise, the default  
 119125 implementation-defined read-write lock attributes are used if the pointer to the read-write  
 119126 lock attributes object is NULL. In cases where the default attributes are appropriate, the  
 119127 PTHREAD\_RWLOCK\_INITIALIZER macro can be used to initialize statically allocated  
 119128 read-write locks.
- 119129 A thread which wants to apply a read lock to the read-write lock can use either  
 119130 *pthread\_rwlock\_rdlock()* or *pthread\_rwlock\_tryrdlock()*. If *pthread\_rwlock\_rdlock()* is used, the  
 119131 thread acquires a read lock if a writer does not hold the write lock and there are no writers  
 119132 blocked on the write lock. If a read lock is not acquired, the calling thread blocks until it  
 119133 can acquire a lock. However, if *pthread\_rwlock\_tryrdlock()* is used, the function returns  
 119134 immediately with the error [EBUSY] if any thread holds a write lock or there are blocked  
 119135 writers waiting for the write lock.
- 119136 A thread which wants to apply a write lock to the read-write lock can use either of two  
 119137 functions: *pthread\_rwlock\_wrlock()* or *pthread\_rwlock\_trywrlock()*. If *pthread\_rwlock\_wrlock()*  
 119138 is used, the thread acquires the write lock if no other reader or writer threads hold the  
 119139 read-write lock. If the write lock is not acquired, the thread blocks until it can acquire the  
 119140 write lock. However, if *pthread\_rwlock\_trywrlock()* is used, the function returns  
 119141 immediately with the error [EBUSY] if any thread is holding either a read or a write lock.
- 119142 The *pthread\_rwlock\_unlock()* function is used to unlock a read-write lock object held by the  
 119143 calling thread. Results are undefined if the read-write lock is not held by the calling thread.  
 119144 If there are other read locks currently held on the read-write lock object, the read-write  
 119145 lock object remains in the read locked state but without the current thread as one of its  
 119146 owners. If this function releases the last read lock for this read-write lock object, the read-  
 119147 write lock object is put in the unlocked read state. If this function is called to release a write  
 119148 lock for this read-write lock object, the read-write lock object is put in the unlocked state.
- 119149 • Thread Concurrency Level
- 119150 On threads implementations that multiplex user threads onto a smaller set of kernel  
 119151 execution entities, the system attempts to create a reasonable number of kernel execution  
 119152 entities for the application upon application startup.
- 119153 On some implementations, these kernel entities are retained by user threads that block in  
 119154 the kernel. Other implementations do not *timeslice* user threads so that multiple compute-  
 119155 bound user threads can share a kernel thread. On such implementations, some  
 119156 applications may use up all the available kernel execution entities before their user-space  
 119157 threads are used up. The process may be left with user threads capable of doing work for  
 119158 the application but with no way to schedule them.

119159 The `pthread_setconcurrency()` function enables an application to request more kernel  
 119160 entities; that is, specify a desired concurrency level. However, this function merely  
 119161 provides a hint to the implementation. The implementation is free to ignore this request or  
 119162 to provide some other number of kernel entities. If an implementation does not multiplex  
 119163 user threads onto a smaller number of kernel execution entities, the  
 119164 `pthread_setconcurrency()` function has no effect.

119165 The `pthread_setconcurrency()` function may also have an effect on implementations where  
 119166 the kernel mode and user mode schedulers cooperate to ensure that ready user threads are  
 119167 not prevented from running by other threads blocked in the kernel.

119168 The `pthread_getconcurrency()` function always returns the value set by a previous call to  
 119169 `pthread_setconcurrency()`. However, if `pthread_setconcurrency()` was not previously called,  
 119170 this function returns zero to indicate that the threads implementation is maintaining the  
 119171 concurrency level.

119172 • Thread Stack Guard Size

119173 DCE threads introduced the concept of a “thread stack guard size”. Most thread  
 119174 implementations add a region of protected memory to a thread’s stack, commonly known  
 119175 as a “guard region”, as a safety measure to prevent stack pointer overflow in one thread  
 119176 from corrupting the contents of another thread’s stack. The default size of the guard  
 119177 regions attribute is {PAGESIZE} bytes and is implementation-defined.

119178 Some application developers may wish to change the stack guard size. When an  
 119179 application creates a large number of threads, the extra page allocated for each stack may  
 119180 strain system resources. In addition to the extra page of memory, the kernel’s memory  
 119181 manager has to keep track of the different protections on adjoining pages. When this is a  
 119182 problem, the application developer may request a guard size of 0 bytes to conserve system  
 119183 resources by eliminating stack overflow protection.

119184 Conversely an application that allocates large data structures such as arrays on the stack  
 119185 may wish to increase the default guard size in order to detect stack overflow. If a thread  
 119186 allocates two pages for a data array, a single guard page provides little protection against  
 119187 thread stack overflows since the thread can corrupt adjoining memory beyond the guard  
 119188 page.

119189 The System Interfaces volume of POSIX.1-200x defines a new attribute of a thread  
 119190 attributes object; that is, the `guardsize` attribute which allows applications to specify the size  
 119191 of the guard region of a thread’s stack.

119192 Two functions are provided for manipulating a thread’s stack guard size. The  
 119193 `pthread_attr_setguardsize()` function sets the thread `guardsize` attribute, and the  
 119194 `pthread_attr_getguardsize()` function retrieves the current value.

119195 An implementation may round up the requested guard size to a multiple of the  
 119196 configurable system variable {PAGESIZE}. In this case, `pthread_attr_getguardsize()` returns  
 119197 the guard size specified by the previous `pthread_attr_setguardsize()` function call and not  
 119198 the rounded up value.

119199 If an application is managing its own thread stacks using the `stackaddr` attribute, the  
 119200 `guardsize` attribute is ignored and no stack overflow protection is provided. In this case, it is  
 119201 the responsibility of the application to manage stack overflow along with stack allocation.

119202 • Parallel I/O

119203 Suppose two or more threads independently issue read requests on the same file. To read  
 119204 specific data from a file, a thread must first call `lseek()` to seek to the proper offset in the  
 119205 file, and then call `read()` to retrieve the required data. If more than one thread does this at

119206 the same time, the first thread may complete its seek call, but before it gets a chance to  
 119207 issue its read call a second thread may complete its seek call, resulting in the first thread  
 119208 accessing incorrect data when it issues its read call. One workaround is to lock the file  
 119209 descriptor while seeking and reading or writing, but this reduces parallelism and adds  
 119210 overhead.

119211 Instead, the System Interfaces volume of POSIX.1-200x provides two functions to make  
 119212 seek/read and seek/write operations atomic. The file descriptor's current offset is  
 119213 unchanged, thus allowing multiple read and write operations to proceed in parallel. This  
 119214 improves the I/O performance of threaded applications. The *pread()* function is used to do  
 119215 an atomic read of data from a file into a buffer. Conversely, the *pwrite()* function does an  
 119216 atomic write of data from a buffer to a file.

#### 119217 B.2.9.1 Thread-Safety

119218 All functions required by POSIX.1-200x need to be thread-safe. Implementations have to  
 119219 provide internal synchronization when necessary in order to achieve this goal. In certain cases—  
 119220 for example, most floating-point implementations—context switch code may have to manage  
 119221 the writable shared state.

119222 While a read from a pipe of  $\{\text{PIPE\_MAX}\} * 2$  bytes may not generate a single atomic and thread-  
 119223 safe stream of bytes, it should generate “several” (individually atomic) thread-safe streams of  
 119224 bytes. Similarly, while reading from a terminal device may not generate a single atomic and  
 119225 thread-safe stream of bytes, it should generate some finite number of (individually atomic) and  
 119226 thread-safe streams of bytes. That is, concurrent calls to read for a pipe, FIFO, or terminal device  
 119227 are not allowed to result in corrupting the stream of bytes or other internal data. However,  
 119228 *read()*, in these cases, is not required to return a single contiguous and atomic stream of bytes.

119229 It is not required that all functions provided by POSIX.1-200x be either async-cancel-safe or  
 119230 async-signal-safe.

119231 As it turns out, some functions are inherently not thread-safe; that is, their interface  
 119232 specifications preclude reentrancy. For example, some functions (such as *asctime()*) return a  
 119233 pointer to a result stored in memory space allocated by the function on a per-process basis. Such  
 119234 a function is not thread-safe, because its result can be overwritten by successive invocations.  
 119235 Other functions, while not inherently non-thread-safe, may be implemented in ways that lead to  
 119236 them not being thread-safe. For example, some functions (such as *rand()*) store state information  
 119237 (such as a seed value, which survives multiple function invocations) in memory space allocated  
 119238 by the function on a per-process basis. The implementation of such a function is not thread-safe  
 119239 if the implementation fails to synchronize invocations of the function and thus fails to protect  
 119240 the state information. The problem is that when the state information is not protected,  
 119241 concurrent invocations can interfere with one another (for example, applications using *rand()*  
 119242 may see the same seed value).

#### 119243 Thread-Safety and Locking of Existing Functions

119244 Originally, POSIX.1 was not designed to work in a multi-threaded environment, and some  
 119245 implementations of some existing functions will not work properly when executed concurrently.  
 119246 To provide routines that will work correctly in an environment with threads (“thread-safe”), two  
 119247 problems need to be solved:

- 119248 1. Routines that maintain or return pointers to static areas internal to the routine (which  
 119249 may now be shared) need to be modified. The routines *ttyname()* and *localtime()* are  
 119250 examples.

119251 2. Routines that access data space shared by more than one thread need to be modified. The  
119252 *malloc()* function and the *stdio* family routines are examples.

119253 There are a variety of constraints on these changes. The first is compatibility with the existing  
119254 versions of these functions—non-thread-safe functions will continue to be in use for some time,  
119255 as the original interfaces are used by existing code. Another is that the new thread-safe versions  
119256 of these functions represent as small a change as possible over the familiar interfaces provided  
119257 by the existing non-thread-safe versions. The new interfaces should be independent of any  
119258 particular threads implementation. In particular, they should be thread-safe without depending  
119259 on explicit thread-specific memory. Finally, there should be minimal performance penalty due to  
119260 the changes made to the functions.

119261 It is intended that the list of functions from POSIX.1 that cannot be made thread-safe and for  
119262 which corrected versions are provided be complete.

#### 119263 *Thread-Safety and Locking Solutions*

119264 Many of the POSIX.1 functions were thread-safe and did not change at all. However, some  
119265 functions (for example, the math functions typically found in **libm**) are not thread-safe because  
119266 of writable shared global state. For instance, in IEEE Std 754-1985 floating-point  
119267 implementations, the computation modes and flags are global and shared.

119268 Some functions are not thread-safe because a particular implementation is not reentrant,  
119269 typically because of a non-essential use of static storage. These require only a new  
119270 implementation.

119271 Thread-safe libraries are useful in a wide range of parallel (and asynchronous) programming  
119272 environments, not just within pthreads. In order to be used outside the context of pthreads,  
119273 however, such libraries still have to use some synchronization method. These could either be  
119274 independent of the pthread synchronization operations, or they could be a subset of the pthread  
119275 interfaces. Either method results in thread-safe library implementations that can be used without  
119276 the rest of pthreads.

119277 Some functions, such as the *stdio* family interface and dynamic memory allocation functions  
119278 such as *malloc()*, are inter-dependent routines that share resources (for example, buffers) across  
119279 related calls. These require synchronization to work correctly, but they do not require any  
119280 change to their external (user-visible) interfaces.

119281 In some cases, such as *getc()* and *putc()*, adding synchronization is likely to create an  
119282 unacceptable performance impact. In this case, slower thread-safe synchronized functions are to  
119283 be provided, but the original, faster (but unsafe) functions (which may be implemented as  
119284 macros) are retained under new names. Some additional special-purpose synchronization  
119285 facilities are necessary for these macros to be usable in multi-threaded programs. This also  
119286 requires changes in **<stdio.h>**.

119287 The other common reason that functions are unsafe is that they return a pointer to static storage,  
119288 making the functions non-thread-safe. This has to be changed, and there are three natural  
119289 choices:

119290 1. Return a pointer to thread-specific storage

119291 This could incur a severe performance penalty on those architectures with a costly  
119292 implementation of the thread-specific data interface.

119293 A variation on this technique is to use *malloc()* to allocate storage for the function output  
119294 and return a pointer to this storage. This technique may also have an undesirable  
119295 performance impact, however, and a simplistic implementation requires that the user  
119296 program explicitly free the storage object when it is no longer needed. This technique is  
119297 used by some existing POSIX.1 functions. With careful implementation for infrequently

119298 used functions, there may be little or no performance or storage penalty, and the  
119299 maintenance of already-standardized interfaces is a significant benefit.

119300 2. Return the actual value computed by the function

119301 This technique can only be used with functions that return pointers to structures—  
119302 routines that return character strings would have to wrap their output in an enclosing  
119303 structure in order to return the output on the stack. There is also a negative performance  
119304 impact inherent in this solution in that the output value has to be copied twice before it  
119305 can be used by the calling function: once from the called routine's local buffers to the top  
119306 of the stack, then from the top of the stack to the assignment target. Finally, many older  
119307 compilers cannot support this technique due to a historical tendency to use internal static  
119308 buffers to deliver the results of structure-valued functions.

119309 3. Have the caller pass the address of a buffer to contain the computed value

119310 The only disadvantage of this approach is that extra arguments have to be provided by  
119311 the calling program. It represents the most efficient solution to the problem, however,  
119312 and, unlike the *malloc()* technique, it is semantically clear.

119313 There are some routines (often groups of related routines) whose interfaces are inherently non-  
119314 thread-safe because they communicate across multiple function invocations by means of static  
119315 memory locations. The solution is to redesign the calls so that they are thread-safe, typically by  
119316 passing the needed data as extra parameters. Unfortunately, this may require major changes to  
119317 the interface as well.

119318 A floating-point implementation using IEEE Std 754-1985 is a case in point. A less problematic  
119319 example is the *rand48* family of pseudo-random number generators. The functions *getrgid()*,  
119320 *getgrnam()*, *getpwnam()*, and *getpwuid()* are another such case.

119321 The problems with *errno* are discussed in [Alternative Solutions for Per-Thread \*errno\*](#) (on page  
119322 3405).

119323 Some functions can be thread-safe or not, depending on their arguments. These include the  
119324 *tmpnam()* and *ctermid()* functions. These functions have pointers to character strings as  
119325 arguments. If the pointers are not NULL, the functions store their results in the character string;  
119326 however, if the pointers are NULL, the functions store their results in an area that may be static  
119327 and thus subject to overwriting by successive calls. These should only be called by multi-thread  
119328 applications when their arguments are non-NULL.

119329 *Asynchronous Safety and Thread-Safety*

119330 A floating-point implementation has many modes that effect rounding and other aspects of  
119331 computation. Functions in some math library implementations may change the computation  
119332 modes for the duration of a function call. If such a function call is interrupted by a signal or  
119333 cancellation, the floating-point state is not required to be protected.

119334 There is a significant cost to make floating-point operations async-cancel-safe or async-signal-  
119335 safe; accordingly, neither form of async safety is required.

119336 *Functions Returning Pointers to Static Storage*

119337 For those functions that are not thread-safe because they return values in fixed size statically  
119338 allocated structures, alternate “\_r” forms are provided that pass a pointer to an explicit result  
119339 structure. Those that return pointers into library-allocated buffers have forms provided with  
119340 explicit buffer and length parameters.

119341 For functions that return pointers to library-allocated buffers, it makes sense to provide “\_r”  
119342 versions that allow the application control over allocation of the storage in which results are  
119343 returned. This allows the state used by these functions to be managed on an application-specific

119344 basis, supporting per-thread, per-process, or other application-specific sharing relationships.

119345 Early proposals had provided “\_r” versions for functions that returned pointers to variable-size  
 119346 buffers without providing a means for determining the required buffer size. This would have  
 119347 made using such functions exceedingly clumsy, potentially requiring iteratively calling them  
 119348 with increasingly larger guesses for the amount of storage required. Hence, *sysconf()* variables  
 119349 have been provided for such functions that return the maximum required buffer size.

119350 Thus, the rule that has been followed by POSIX.1-200x when adapting single-threaded non-  
 119351 thread-safe functions is as follows: all functions returning pointers to library-allocated storage  
 119352 should have “\_r” versions provided, allowing the application control over the storage  
 119353 allocation. Those with variable-sized return values accept both a buffer address and a length  
 119354 parameter. The *sysconf()* variables are provided to supply the appropriate buffer sizes when  
 119355 required. Implementors are encouraged to apply the same rule when adapting their own  
 119356 existing functions to a pthreads environment.

#### 119357 B.2.9.2 Thread IDs

119358 Separate applications should communicate through well-defined interfaces and should not  
 119359 depend on each other’s implementation. For example, if a programmer decides to rewrite the  
 119360 *sort* utility using multiple threads, it should be easy to do this so that the interface to the *sort*  
 119361 utility does not change. Consider that if the user causes SIGINT to be generated while the *sort*  
 119362 utility is running, keeping the same interface means that the entire *sort* utility is killed, not just  
 119363 one of its threads. As another example, consider a realtime application that manages a reactor.  
 119364 Such an application may wish to allow other applications to control the priority at which it  
 119365 watches the control rods. One technique to accomplish this is to write the ID of the thread  
 119366 watching the control rods into a file and allow other programs to change the priority of that  
 119367 thread as they see fit. A simpler technique is to have the reactor process accept IPCs  
 119368 (Interprocess Communication messages) from other processes, telling it at a semantic level what  
 119369 priority the program should assign to watching the control rods. This allows the programmer  
 119370 greater flexibility in the implementation. For example, the programmer can change the  
 119371 implementation from having one thread per rod to having one thread watching all of the rods  
 119372 without changing the interface. Having threads live inside the process means that the  
 119373 implementation of a process is invisible to outside processes (excepting debuggers and system  
 119374 management tools).

119375 Threads do not provide a protection boundary. Every thread model allows threads to share  
 119376 memory with other threads and encourages this sharing to be widespread. This means that one  
 119377 thread can wipe out memory that is needed for the correct functioning of other threads that are  
 119378 sharing its memory. Consequently, providing each thread with its own user and/or group IDs  
 119379 would not provide a protection boundary between threads sharing memory.

#### 119380 B.2.9.3 Thread Mutexes

119381 There is no additional rationale provided for this section.

#### 119382 B.2.9.4 Thread Scheduling

##### 119383 • Scheduling Implementation Models

119384 The following scheduling implementation models are presented in terms of threads and  
 119385 “kernel entities”. This is to simplify exposition of the models, and it does not imply that  
 119386 an implementation actually has an identifiable “kernel entity”.

119387 A kernel entity is not defined beyond the fact that it has scheduling attributes that are used

119388 to resolve contention with other kernel entities for execution resources. A kernel entity  
 119389 may be thought of as an envelope that holds a thread or a separate kernel thread. It is not a  
 119390 conventional process, although it shares with the process the attribute that it has a single  
 119391 thread of control; it does not necessarily imply an address space, open files, and so on. It is  
 119392 better thought of as a primitive facility upon which conventional processes and threads  
 119393 may be constructed.

119394 — System Thread Scheduling Model

119395 This model consists of one thread per kernel entity. The kernel entity is solely  
 119396 responsible for scheduling thread execution on one or more processors. This model  
 119397 schedules all threads against all other threads in the system using the scheduling  
 119398 attributes of the thread.

119399 — Process Scheduling Model

119400 A generalized process scheduling model consists of two levels of scheduling. A  
 119401 threads library creates a pool of kernel entities, as required, and schedules threads to  
 119402 run on them using the scheduling attributes of the threads. Typically, the size of the  
 119403 pool is a function of the simultaneously runnable threads, not the total number of  
 119404 threads. The kernel then schedules the kernel entities onto processors according to  
 119405 their scheduling attributes, which are managed by the threads library. This set model  
 119406 potentially allows a wide range of mappings between threads and kernel entities.

119407 • System and Process Scheduling Model Performance

119408 There are a number of important implications on the performance of applications using  
 119409 these scheduling models. The process scheduling model potentially provides lower  
 119410 overhead for making scheduling decisions, since there is no need to access kernel-level  
 119411 information or functions and the set of schedulable entities is smaller (only the threads  
 119412 within the process).

119413 On the other hand, since the kernel is also making scheduling decisions regarding the  
 119414 system resources under its control (for example, CPU(s), I/O devices, memory), decisions  
 119415 that do not take thread scheduling parameters into account can result in unspecified  
 119416 delays for realtime application threads, causing them to miss maximum response time  
 119417 limits.

119418 • Rate Monotonic Scheduling

119419 Rate monotonic scheduling was considered, but rejected for standardization in the context  
 119420 of pthreads. A sporadic server policy is included.

119421 • Scheduling Options

119422 In POSIX.1-200x, the basic thread scheduling functions are defined under the threads  
 119423 functionality, so that they are required of all threads implementations. However, there are  
 119424 no specific scheduling policies required by this functionality to allow for conforming  
 119425 thread implementations that are not targeted to realtime applications.

119426 Specific standard scheduling policies are defined to be under the Thread Execution  
 119427 Scheduling option, and they are specifically designed to support realtime applications by  
 119428 providing predictable resource-sharing sequences. The name of this option was chosen to  
 119429 emphasize that this functionality is defined as appropriate for realtime applications that  
 119430 require simple priority-based scheduling.

119431 It is recognized that these policies are not necessarily satisfactory for some multi-processor  
 119432 implementations, and work is ongoing to address a wider range of scheduling behaviors.  
 119433 The interfaces have been chosen to create abundant opportunity for future scheduling

119434 policies to be implemented and standardized based on this interface. In order to  
119435 standardize a new scheduling policy, all that is required (from the standpoint of thread  
119436 scheduling attributes) is to define a new policy name, new members of the thread  
119437 attributes object, and functions to set these members when the scheduling policy is equal  
119438 to the new value.

#### 119439 **Scheduling Contention Scope**

119440 In order to accommodate the requirement for realtime response, each thread has a scheduling  
119441 contention scope attribute. Threads with a system scheduling contention scope have to be  
119442 scheduled with respect to all other threads in the system. These threads are usually bound to a  
119443 single kernel entity that reflects their scheduling attributes and are directly scheduled by the  
119444 kernel.

119445 Threads with a process scheduling contention scope need be scheduled only with respect to the  
119446 other threads in the process. These threads may be scheduled within the process onto a pool of  
119447 kernel entities. The implementation is also free to bind these threads directly to kernel entities  
119448 and let them be scheduled by the kernel. Process scheduling contention scope allows the  
119449 implementation the most flexibility and is the default if both contention scopes are supported  
119450 and none is specified.

119451 Thus, the choice by implementors to provide one or the other (or both) of these scheduling  
119452 models is driven by the need of their supported application domains for worst-case (that is,  
119453 realtime) response, or average-case (non-realtime) response.

#### 119454 **Scheduling Allocation Domain**

119455 The SCHED\_FIFO and SCHED\_RR scheduling policies take on different characteristics on a  
119456 multi-processor. Other scheduling policies are also subject to changed behavior when executed  
119457 on a multi-processor. The concept of scheduling allocation domain determines the set of  
119458 processors on which the threads of an application may run. By considering the application's  
119459 processor scheduling allocation domain for its threads, scheduling policies can be defined in  
119460 terms of their behavior for varying processor scheduling allocation domain values. It is  
119461 conceivable that not all scheduling allocation domain sizes make sense for all scheduling  
119462 policies on all implementations. The concept of scheduling allocation domain, however, is a  
119463 useful tool for the description of multi-processor scheduling policies.

119464 The "process control" approach to scheduling obtains significant performance advantages from  
119465 dynamic scheduling allocation domain sizes when it is applicable.

119466 Non-Uniform Memory Access (NUMA) multi-processors may use a system scheduling structure  
119467 that involves reassignment of threads among scheduling allocation domains. In NUMA  
119468 machines, a natural model of scheduling is to match scheduling allocation domains to clusters of  
119469 processors. Load balancing in such an environment requires changing the scheduling allocation  
119470 domain to which a thread is assigned.

#### 119471 **Scheduling Documentation**

119472 Implementation-provided scheduling policies need to be completely documented in order to be  
119473 useful. This documentation includes a description of the attributes required for the policy, the  
119474 scheduling interaction of threads running under this policy and all other supported policies, and  
119475 the effects of all possible values for processor scheduling allocation domain. Note that for the  
119476 implementor wishing to be minimally-compliant, it is (minimally) acceptable to define the  
119477 behavior as undefined.

**119478 Scheduling Contention Scope Attribute**

119479 The scheduling contention scope defines how threads compete for resources. Within  
119480 POSIX.1-200x, scheduling contention scope is used to describe only how threads are scheduled  
119481 in relation to one another in the system. That is, either they are scheduled against all other  
119482 threads in the system (“system scope”) or only against those threads in the process (“process  
119483 scope”). In fact, scheduling contention scope may apply to additional resources, including  
119484 virtual timers and profiling, which are not currently considered by POSIX.1-200x.

**119485 Mixed Scopes**

119486 If only one scheduling contention scope is supported, the scheduling decision is straightforward.  
119487 To perform the processor scheduling decision in a mixed scope environment, it is necessary to  
119488 map the scheduling attributes of the thread with process-wide contention scope to the same  
119489 attribute space as the thread with system-wide contention scope.

119490 Since a conforming implementation has to support one and may support both scopes, it is useful  
119491 to discuss the effects of such choices with respect to example applications. If an implementation  
119492 supports both scopes, mixing scopes provides a means of better managing system-level (that is,  
119493 kernel-level) and library-level resources. In general, threads with system scope will require the  
119494 resources of a separate kernel entity in order to guarantee the scheduling semantics. On the  
119495 other hand, threads with process scope can share the resources of a kernel entity while  
119496 maintaining the scheduling semantics.

119497 The application is free to create threads with dedicated kernel resources, and other threads that  
119498 multiplex kernel resources. Consider the example of a window server. The server allocates two  
119499 threads per widget: one thread manages the widget user interface (including drawing), while  
119500 the other thread takes any required application action. This allows the widget to be “active”  
119501 while the application is computing. A screen image may be built from thousands of widgets. If  
119502 each of these threads had been created with system scope, then most of the kernel-level  
119503 resources might be wasted, since only a few widgets are active at any one time. In addition,  
119504 mixed scope is particularly useful in a window server where one thread with high priority and  
119505 system scope handles the mouse so that it tracks well. As another example, consider a database  
119506 server. For each of the hundreds or thousands of clients supported by a large server, an  
119507 equivalent number of threads will have to be created. If each of these threads were system scope,  
119508 the consequences would be the same as for the window server example above. However, the  
119509 server could be constructed so that actual retrieval of data is done by several dedicated threads.  
119510 Dedicated threads that do work for all clients frequently justify the added expense of system  
119511 scope. If it were not permissible to mix system and process threads in the same process, this type  
119512 of solution would not be possible.

**119513 Dynamic Thread Scheduling Parameters Access**

119514 In many time-constrained applications, there is no need to change the scheduling attributes  
119515 dynamically during thread or process execution, since the general use of these attributes is to  
119516 reflect directly the time constraints of the application. Since these time constraints are generally  
119517 imposed to meet higher-level system requirements, such as accuracy or availability, they  
119518 frequently should remain unchanged during application execution.

119519 However, there are important situations in which the scheduling attributes should be changed.  
119520 Generally, this will occur when external environmental conditions exist in which the time  
119521 constraints change. Consider, for example, a space vehicle major mode change, such as the  
119522 change from ascent to descent mode, or the change from the space environment to the  
119523 atmospheric environment. In such cases, the frequency with which many of the sensors or  
119524 actuators need to be read or written will change, which will necessitate a priority change. In  
119525 other cases, even the existence of a time constraint might be temporary, necessitating not just a

119526 priority change, but also a policy change for ongoing threads or processes. For this reason, it is  
 119527 critical that the interface should provide functions to change the scheduling parameters  
 119528 dynamically, but, as with many of the other realtime functions, it is important that applications  
 119529 use them properly to avoid the possibility of unnecessarily degrading performance.

119530 In providing functions for dynamically changing the scheduling behavior of threads, there were  
 119531 two options: provide functions to get and set the individual scheduling parameters of threads,  
 119532 or provide a single interface to get and set all the scheduling parameters for a given thread  
 119533 simultaneously. Both approaches have merit. Access functions for individual parameters allow  
 119534 simpler control of thread scheduling for simple thread scheduling parameters. However, a single  
 119535 function for setting all the parameters for a given scheduling policy is required when first setting  
 119536 that scheduling policy. Since the single all-encompassing functions are required, it was decided  
 119537 to leave the interface as minimal as possible. Note that simpler functions (such as  
 119538 *pthread\_setprio()* for threads running under the priority-based schedulers) can be easily defined  
 119539 in terms of the all-encompassing functions.

119540 If the *pthread\_setschedparam()* function executes successfully, it will have set all of the scheduling  
 119541 parameter values indicated in *param*; otherwise, none of the scheduling parameters will have  
 119542 been modified. This is necessary to ensure that the scheduling of this and all other threads  
 119543 continues to be consistent in the presence of an erroneous scheduling parameter.

119544 The [EPERM] error value is included in the list of possible *pthread\_setschedparam()* error returns  
 119545 as a reflection of the fact that the ability to change scheduling parameters increases risks to the  
 119546 implementation and application performance if the scheduling parameters are changed  
 119547 improperly. For this reason, and based on some existing practice, it was felt that some  
 119548 implementations would probably choose to define specific permissions for changing either a  
 119549 thread's own or another thread's scheduling parameters. POSIX.1-200x does not include  
 119550 portable methods for setting or retrieving permissions, so any such use of permissions is  
 119551 completely unspecified.

#### 119552 **Mutex Initialization Scheduling Attributes**

119553 In a priority-driven environment, a direct use of traditional primitives like mutexes and  
 119554 condition variables can lead to unbounded priority inversion, where a higher priority thread can  
 119555 be blocked by a lower priority thread, or set of threads, for an unbounded duration of time. As a  
 119556 result, it becomes impossible to guarantee thread deadlines. Priority inversion can be bounded  
 119557 and minimized by the use of priority inheritance protocols. This allows thread deadlines to be  
 119558 guaranteed even in the presence of synchronization requirements.

119559 Two useful but simple members of the family of priority inheritance protocols are the basic  
 119560 priority inheritance protocol and the priority ceiling protocol emulation. Under the Basic  
 119561 Priority Inheritance protocol (governed by the Non-Robust Mutex Priority Inheritance option), a  
 119562 thread that is blocking higher priority threads executes at the priority of the highest priority  
 119563 thread that it blocks. This simple mechanism allows priority inversion to be bounded by the  
 119564 duration of critical sections and makes timing analysis possible.

119565 Under the Priority Ceiling Protocol Emulation protocol (governed by the Thread Priority  
 119566 Protection option), each mutex has a priority ceiling, usually defined as the priority of the  
 119567 highest priority thread that can lock the mutex. When a thread is executing inside critical  
 119568 sections, its priority is unconditionally increased to the highest of the priority ceilings of all the  
 119569 mutexes owned by the thread. This protocol has two very desirable properties in uni-processor  
 119570 systems. First, a thread can be blocked by a lower priority thread for at most the duration of one  
 119571 single critical section. Furthermore, when the protocol is correctly used in a single processor, and  
 119572 if threads do not become blocked while owning mutexes, mutual deadlocks are prevented.

119573 The priority ceiling emulation can be extended to multiple processor environments, in which

119574 case the values of the priority ceilings will be assigned depending on the kind of mutex that is  
 119575 being used: local to only one processor, or global, shared by several processors. Local priority  
 119576 ceilings will be assigned the usual way, equal to the priority of the highest priority thread that  
 119577 may lock that mutex. Global priority ceilings will usually be assigned a priority level higher  
 119578 than all the priorities assigned to any of the threads that reside in the involved processors to  
 119579 avoid the effect called remote blocking.

#### 119580 **Change the Priority Ceiling of a Mutex**

119581 In order for the priority protect protocol to exhibit its desired properties of bounding priority  
 119582 inversion and avoidance of deadlock, it is critical that the ceiling priority of a mutex be the same  
 119583 as the priority of the highest thread that can ever hold it, or higher. Thus, if the priorities of the  
 119584 threads using such mutexes never change dynamically, there is no need ever to change the  
 119585 priority ceiling of a mutex.

119586 However, if a major system mode change results in an altered response time requirement for one  
 119587 or more application threads, their priority has to change to reflect it. It will occasionally be the  
 119588 case that the priority ceilings of mutexes held also need to change. While changing priority  
 119589 ceilings should generally be avoided, it is important that POSIX.1-200x provide these interfaces  
 119590 for those cases in which it is necessary.

#### 119591 **B.2.9.5 Thread Cancellation**

119592 Many existing threads packages have facilities for canceling an operation or canceling a thread.  
 119593 These facilities are used for implementing user requests (such as the CANCEL button in a  
 119594 window-based application), for implementing OR parallelism (for example, telling the other  
 119595 threads to stop working once one thread has found a forced mate in a parallel chess program), or  
 119596 for implementing the ABORT mechanism in Ada.

119597 POSIX programs traditionally have used the signal mechanism combined with either *longjmp()*  
 119598 or polling to cancel operations. Many POSIX programmers have trouble using these facilities to  
 119599 solve their problems efficiently in a single-threaded process. With the introduction of threads,  
 119600 these solutions become even more difficult to use.

119601 The main issues with implementing a cancellation facility are specifying the operation to be  
 119602 canceled, cleanly releasing any resources allocated to that operation, controlling when the target  
 119603 notices that it has been canceled, and defining the interaction between asynchronous signals and  
 119604 cancellation.

#### 119605 **Specifying the Operation to Cancel**

119606 Consider a thread that calls through five distinct levels of program abstraction and then, inside  
 119607 the lowest-level abstraction, calls a function that suspends the thread. (An abstraction boundary  
 119608 is a layer at which the client of the abstraction sees only the service being provided and can  
 119609 remain ignorant of the implementation. Abstractions are often layered, each level of abstraction  
 119610 being a client of the lower-level abstraction and implementing a higher-level abstraction.)  
 119611 Depending on the semantics of each abstraction, one could imagine wanting to cancel only the  
 119612 call that causes suspension, only the bottom two levels, or the operation being done by the entire  
 119613 thread. Canceling operations at a finer grain than the entire thread is difficult because threads  
 119614 are active and they may be run in parallel on a multi-processor. By the time one thread can make  
 119615 a request to cancel an operation, the thread performing the operation may have completed that  
 119616 operation and gone on to start another operation whose cancellation is not desired. Thread IDs  
 119617 are not reused until the thread has exited, and either it was created with the *Attr detachstate*  
 119618 attribute set to *PTHREAD\_CREATE\_DETACHED* or the *pthread\_join()* or *pthread\_detach()*  
 119619 function has been called for that thread. Consequently, a thread cancellation will never be  
 119620 misdirected when the thread terminates. For these reasons, the canceling of operations is done at

119621 the granularity of the thread. Threads are designed to be inexpensive enough so that a separate  
119622 thread may be created to perform each separately cancelable operation; for example, each  
119623 possibly long running user request.

119624 For cancellation to be used in existing code, cancellation scopes and handlers will have to be  
119625 established for code that needs to release resources upon cancellation, so that it follows the  
119626 programming discipline described in the text.

### 119627 **A Special Signal Versus a Special Interface**

119628 Two different mechanisms were considered for providing the cancellation interfaces. The first  
119629 was to provide an interface to direct signals at a thread and then to define a special signal that  
119630 had the required semantics. The other alternative was to use a special interface that delivered the  
119631 correct semantics to the target thread.

119632 The solution using signals produced a number of problems. It required the implementation to  
119633 provide cancellation in terms of signals whereas a perfectly valid (and possibly more efficient)  
119634 implementation could have both layered on a low-level set of primitives. There were so many  
119635 exceptions to the special signal (it cannot be used with *kill()*, no POSIX.1 interfaces can be used  
119636 with it) that it was clearly not a valid signal. Its semantics on delivery were also completely  
119637 different from any existing POSIX.1 signal. As such, a special interface that did not mandate the  
119638 implementation and did not confuse the semantics of signals and cancellation was felt to be the  
119639 better solution.

### 119640 **Races Between Cancellation and Resuming Execution**

119641 Due to the nature of cancellation, there is generally no synchronization between the thread  
119642 requesting the cancellation of a blocked thread and events that may cause that thread to resume  
119643 execution. For this reason, and because excess serialization hurts performance, when both an  
119644 event that a thread is waiting for has occurred and a cancellation request has been made and  
119645 cancellation is enabled, POSIX.1-200x explicitly allows the implementation to choose between  
119646 returning from the blocking call or acting on the cancellation request.

### 119647 **Interaction of Cancellation with Asynchronous Signals**

119648 A typical use of cancellation is to acquire a lock on some resource and to establish a cancellation  
119649 cleanup handler for releasing the resource when and if the thread is canceled.

119650 A correct and complete implementation of cancellation in the presence of asynchronous signals  
119651 requires considerable care. An implementation has to push a cancellation cleanup handler on the  
119652 cancellation cleanup stack while maintaining the integrity of the stack data structure. If an  
119653 asynchronously-generated signal is posted to the thread during a stack operation, the signal  
119654 handler cannot manipulate the cancellation cleanup stack. As a consequence, asynchronous  
119655 signal handlers may not cancel threads or otherwise manipulate the cancellation state of a  
119656 thread. Threads may, of course, be canceled by another thread that used a *sigwait()* function to  
119657 wait synchronously for an asynchronous signal.

119658 In order for cancellation to function correctly, it is required that asynchronous signal handlers  
119659 not change the cancellation state. This requires that some elements of existing practice, such as  
119660 using *longjmp()* to exit from an asynchronous signal handler implicitly, be prohibited in cases  
119661 where the integrity of the cancellation state of the interrupt thread cannot be ensured.

119662 **Thread Cancellation Overview**

## 119663 • Cancellability States

119664 The three possible cancellability states (disabled, deferred, and asynchronous) are encoded  
 119665 into two separate bits ((disable, enable) and (deferred, asynchronous)) to allow them to be  
 119666 changed and restored independently. For instance, short code sequences that will not block  
 119667 sometimes disable cancellability on entry and restore the previous state upon exit.  
 119668 Likewise, long or unbounded code sequences containing no convenient explicit  
 119669 cancellation points will sometimes set the cancellability type to asynchronous on entry and  
 119670 restore the previous value upon exit.

## 119671 • Cancellation Points

119672 Cancellation points are points inside of certain functions where a thread has to act on any  
 119673 pending cancellation request when cancellability is enabled. For functions in the “shall  
 119674 occur” list, a cancellation check must be performed on every call regardless of whether,  
 119675 absent the cancellation, the call would have blocked. For functions in the “may occur” list,  
 119676 a cancellation check may be performed on some calls but not others; i.e., whether or not a  
 119677 cancellation point occurs when one of these functions is being executed can depend on  
 119678 current conditions.

119679 The idea was considered of allowing implementations to define whether blocking calls  
 119680 such as *read()* should be cancellation points. It was decided that it would adversely affect  
 119681 the design of conforming applications if blocking calls were not cancellation points  
 119682 because threads could be left blocked in an uncancelable state.

119683 There are several important blocking routines that are specifically not made cancellation  
 119684 points:

119685 — *pthread\_mutex\_lock()*

119686 If *pthread\_mutex\_lock()* were a cancellation point, every routine that called it would  
 119687 also become a cancellation point (that is, any routine that touched shared state would  
 119688 automatically become a cancellation point). For example, *malloc()*, *free()*, and *rand()*  
 119689 would become cancellation points under this scheme. Having too many cancellation  
 119690 points makes programming very difficult, leading to either much disabling and  
 119691 restoring of cancellability or much difficulty in trying to arrange for reliable cleanup  
 119692 at every possible place.

119693 Since *pthread\_mutex\_lock()* is not a cancellation point, threads could result in being  
 119694 blocked uninterruptibly for long periods of time if mutexes were used as a general  
 119695 synchronization mechanism. As this is normally not acceptable, mutexes should only  
 119696 be used to protect resources that are held for small fixed lengths of time where not  
 119697 being able to be canceled will not be a problem. Resources that need to be held  
 119698 exclusively for long periods of time should be protected with condition variables.

119699 — *pthread\_barrier\_wait()*

119700 Canceling a barrier wait will render a barrier unusable. Similar to a barrier timeout  
 119701 (which the standard developers rejected), there is no way to guarantee the  
 119702 consistency of a barrier’s internal data structures if a barrier wait is canceled.

119703 — *pthread\_spin\_lock()*

119704 As with mutexes, spin locks should only be used to protect resources that are held for  
 119705 small fixed lengths of time where not being cancelable will not be a problem.

119706 Every library routine should specify whether or not it includes any cancellation points.  
 119707 Typically, only those routines that may block or compute indefinitely need to include

119708 cancellation points.

119709 Correctly coded routines only reach cancellation points after having set up a cancellation  
119710 cleanup handler to restore invariants if the thread is canceled at that point. Being  
119711 cancelable only at specified cancellation points allows programmers to keep track of  
119712 actions needed in a cancellation cleanup handler more easily. A thread should only be  
119713 made asynchronously cancelable when it is not in the process of acquiring or releasing  
119714 resources or otherwise in a state from which it would be difficult or impossible to recover.

119715 • Thread Cancellation Cleanup Handlers

119716 The cancellation cleanup handlers provide a portable mechanism, easy to implement, for  
119717 releasing resources and restoring invariants. They are easier to use than signal handlers  
119718 because they provide a stack of cancellation cleanup handlers rather than a single handler,  
119719 and because they have an argument that can be used to pass context information to the  
119720 handler.

119721 The alternative to providing these simple cancellation cleanup handlers (whose only use is  
119722 for cleaning up when a thread is canceled) is to define a general exception package that  
119723 could be used for handling and cleaning up after hardware traps and software-detected  
119724 errors. This was too far removed from the charter of providing threads to handle  
119725 asynchrony. However, it is an explicit goal of POSIX.1-200x to be compatible with existing  
119726 exception facilities and languages having exceptions.

119727 The interaction of this facility and other procedure-based or language-level exception  
119728 facilities is unspecified in this version of POSIX.1-200x. However, it is intended that it be  
119729 possible for an implementation to define the relationship between these cancellation  
119730 cleanup handlers and Ada, C++, or other language-level exception handling facilities.

119731 It was suggested that the cancellation cleanup handlers should also be called when the  
119732 process exits or calls the *exec* function. This was rejected partly due to the performance  
119733 problem caused by having to call the cancellation cleanup handlers of every thread before  
119734 the operation could continue. The other reason was that the only state expected to be  
119735 cleaned up by the cancellation cleanup handlers would be the intraprocess state. Any  
119736 handlers that are to clean up the interprocess state would be registered with *atexit()*. There  
119737 is the orthogonal problem that the *exec* functions do not honor the *atexit()* handlers, but  
119738 resolving this is beyond the scope of POSIX.1-200x.

119739 • Async-Cancel Safety

119740 A function is said to be async-cancel-safe if it is written in such a way that entering the  
119741 function with asynchronous cancelability enabled will not cause any invariants to be  
119742 violated, even if a cancellation request is delivered at any arbitrary instruction. Functions  
119743 that are async-cancel-safe are often written in such a way that they need to acquire no  
119744 resources for their operation and the visible variables that they may write are strictly  
119745 limited.

119746 Any routine that gets a resource as a side effect cannot be made async-cancel-safe (for  
119747 example, *malloc()*). If such a routine were called with asynchronous cancelability enabled,  
119748 it might acquire the resource successfully, but as it was returning to the client, it could act  
119749 on a cancellation request. In such a case, the application would have no way of knowing  
119750 whether the resource was acquired or not.

119751 Indeed, because many interesting routines cannot be made async-cancel-safe, most library  
119752 routines in general are not async-cancel-safe. Every library routine should specify whether  
119753 or not it is async-cancel safe so that programmers know which routines can be called from  
119754 code that is asynchronously cancelable.

119755 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/8 is applied, adding the *pselect()* function  
119756 to the list of functions with cancellation points.

119757 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/5 is applied, adding the *fdatasync()*  
119758 function into the table of functions that shall have cancellation points.

119759 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/6 is applied, adding the numerous  
119760 functions into the table of functions that may have cancellation points.

119761 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/7 is applied, clarifying the requirements  
119762 in Thread Cancellation Cleanup Handlers.

#### 119763 B.2.9.6 Thread Read-Write Locks

##### 119764 Background

119765 Read-write locks are often used to allow parallel access to data on multi-processors, to avoid  
119766 context switches on uni-processors when multiple threads access the same data, and to protect  
119767 data structures that are frequently accessed (that is, read) but rarely updated (that is, written).  
119768 The in-core representation of a file system directory is a good example of such a data structure.  
119769 One would like to achieve as much concurrency as possible when searching directories, but limit  
119770 concurrent access when adding or deleting files.

119771 Although read-write locks can be implemented with mutexes and condition variables, such  
119772 implementations are significantly less efficient than is possible. Therefore, this synchronization  
119773 primitive is included in POSIX.1-200x for the purpose of allowing more efficient  
119774 implementations in multi-processor systems.

##### 119775 Queuing of Waiting Threads

119776 The *pthread\_rwlock\_unlock()* function description states that one writer or one or more readers  
119777 must acquire the lock if it is no longer held by any thread as a result of the call. However, the  
119778 function does not specify which thread(s) acquire the lock, unless the Thread Execution  
119779 Scheduling option is supported.

119780 The standard developers considered the issue of scheduling with respect to the queuing of  
119781 threads blocked on a read-write lock. The question turned out to be whether POSIX.1-200x  
119782 should require priority scheduling of read-write locks for threads whose execution scheduling  
119783 policy is priority-based (for example, SCHED\_FIFO or SCHED\_RR). There are tradeoffs  
119784 between priority scheduling, the amount of concurrency achievable among readers, and the  
119785 prevention of writer and/or reader starvation.

119786 For example, suppose one or more readers hold a read-write lock and the following threads  
119787 request the lock in the listed order:

```
119788 pthread_rwlock_wrlock() - Low priority thread writer_a
119789 pthread_rwlock_rdlock() - High priority thread reader_a
119790 pthread_rwlock_rdlock() - High priority thread reader_b
119791 pthread_rwlock_rdlock() - High priority thread reader_c
```

119792 When the lock becomes available, should *writer\_a* block the high priority readers? Or, suppose a  
119793 read-write lock becomes available and the following are queued:

```
119794 pthread_rwlock_rdlock() - Low priority thread reader_a
119795 pthread_rwlock_rdlock() - Low priority thread reader_b
119796 pthread_rwlock_rdlock() - Low priority thread reader_c
119797 pthread_rwlock_wrlock() - Medium priority thread writer_a
119798 pthread_rwlock_rdlock() - High priority thread reader_d
```

119799 If priority scheduling is applied then *reader\_d* would acquire the lock and *writer\_a* would block  
 119800 the remaining readers. But should the remaining readers also acquire the lock to increase  
 119801 concurrency? The solution adopted takes into account that when the Thread Execution  
 119802 Scheduling option is supported, high priority threads may in fact starve low priority threads  
 119803 (the application developer is responsible in this case for designing the system in such a way that  
 119804 this starvation is avoided). Therefore, POSIX.1-200x specifies that high priority readers take  
 119805 precedence over lower priority writers. However, to prevent writer starvation from threads of  
 119806 the same or lower priority, writers take precedence over readers of the same or lower priority.

119807 Priority inheritance mechanisms are non-trivial in the context of read-write locks. When a high  
 119808 priority writer is forced to wait for multiple readers, for example, it is not clear which subset of  
 119809 the readers should inherit the writer's priority. Furthermore, the internal data structures that  
 119810 record the inheritance must be accessible to all readers, and this implies some sort of  
 119811 serialization that could negate any gain in parallelism achieved through the use of multiple  
 119812 readers in the first place. Finally, existing practice does not support the use of priority  
 119813 inheritance for read-write locks. Therefore, no specification of priority inheritance or priority  
 119814 ceiling is attempted. If reliable priority-scheduled synchronization is absolutely required, it can  
 119815 always be obtained through the use of mutexes.

#### 119816 **Comparison to *fcntl()* Locks**

119817 The read-write locks and the *fcntl()* locks in POSIX.1-200x share a common goal: increasing  
 119818 concurrency among readers, thus increasing throughput and decreasing delay.

119819 However, the read-write locks have two features not present in the *fcntl()* locks. First, under  
 119820 priority scheduling, read-write locks are granted in priority order. Second, also under priority  
 119821 scheduling, writer starvation is prevented by giving writers preference over readers of equal or  
 119822 lower priority.

119823 Also, read-write locks can be used in systems lacking a file system, such as those conforming to  
 119824 the minimal realtime system profile of IEEE Std 1003.13-1998.

#### 119825 **History of Resolution Issues**

119826 Based upon some balloting objections, early drafts specified the behavior of threads waiting on a  
 119827 read-write lock during the execution of a signal handler, as if the thread had not called the lock  
 119828 operation. However, this specified behavior would require implementations to establish  
 119829 internal signal handlers even though this situation would be rare, or never happen for many  
 119830 programs. This would introduce an unacceptable performance hit in comparison to the little  
 119831 additional functionality gained. Therefore, the behavior of read-write locks and signals was  
 119832 reverted back to its previous mutex-like specification.

#### 119833 *B.2.9.7 Thread Interactions with Regular File Operations*

119834 There is no additional rationale provided for this section.

#### 119835 *B.2.9.8 Use of Application-Managed Thread Stacks*

119836 IEEE Std 1003.1-2001/Cor 2-2004, item XSH/TC2/D6/8 is applied, adding this new section. It  
 119837 was added to make it clear that the current standard does not allow an application to determine  
 119838 when a stack can be reclaimed. This may be addressed in a future version.

119839 **B.2.10 Sockets**

119840 The base document for the sockets interfaces in POSIX.1-200x is the XNS, Issue 5.2 specification.  
 119841 This was primarily chosen as it aligns with IPv6. Additional material has been added from  
 119842 IEEE Std 1003.1g-2000, notably socket concepts, raw sockets, the *pselect()* function, the  
 119843 *socketmark()* function, and the `<sys/select.h>` header.

119844 *B.2.10.1 Address Families*

119845 There is no additional rationale provided for this section.

119846 *B.2.10.2 Addressing*

119847 There is no additional rationale provided for this section.

119848 *B.2.10.3 Protocols*

119849 There is no additional rationale provided for this section.

119850 *B.2.10.4 Routing*

119851 There is no additional rationale provided for this section.

119852 *B.2.10.5 Interfaces*

119853 There is no additional rationale provided for this section.

119854 *B.2.10.6 Socket Types*

119855 The type **socklen\_t** was invented to cover the range of implementations seen in the field. The  
 119856 intent of **socklen\_t** is to be the type for all lengths that are naturally bounded in size; that is, that  
 119857 they are the length of a buffer which cannot sensibly become of massive size: network addresses,  
 119858 host names, string representations of these, ancillary data, control messages, and socket options  
 119859 are examples. Truly boundless sizes are represented by **size\_t** as in *read()*, *write()*, and so on.

119860 All **socklen\_t** types were originally (in BSD UNIX) of type **int**. During the development of  
 119861 POSIX.1-200x, it was decided to change all buffer lengths to **size\_t**, which appears at face value  
 119862 to make sense. When dual mode 32/64-bit systems came along, this choice unnecessarily  
 119863 complicated system interfaces because **size\_t** (with **long**) was a different size under ILP32 and  
 119864 LP64 models. Reverting to **int** would have happened except that some implementations had  
 119865 already shipped 64-bit-only interfaces. The compromise was a type which could be defined to be  
 119866 any size by the implementation: **socklen\_t**.

119867 *B.2.10.7 Socket I/O Mode*

119868 There is no additional rationale provided for this section.

119869 *B.2.10.8 Socket Owner*

119870 There is no additional rationale provided for this section.

119871 *B.2.10.9 Socket Queue Limits*

119872 There is no additional rationale provided for this section.

119873 *B.2.10.10 Pending Error*

119874 There is no additional rationale provided for this section.

119875 *B.2.10.11 Socket Receive Queue*

119876 There is no additional rationale provided for this section.

119877 *B.2.10.12 Socket Out-of-Band Data State*

119878 There is no additional rationale provided for this section.

119879 *B.2.10.13 Connection Indication Queue*

119880 There is no additional rationale provided for this section.

119881 *B.2.10.14 Signals*

119882 There is no additional rationale provided for this section.

119883 *B.2.10.15 Asynchronous Errors*

119884 There is no additional rationale provided for this section.

119885 *B.2.10.16 Use of Options*

119886 There is no additional rationale provided for this section.

119887 *B.2.10.17 Use of Sockets for Local UNIX Connections*

119888 There is no additional rationale provided for this section.

119889 *B.2.10.18 Use of Sockets over Internet Protocols*

119890 A raw socket allows privileged users direct access to a protocol; for example, raw access to the  
 119891 IP and ICMP protocols is possible through raw sockets. Raw sockets are intended for  
 119892 knowledgeable applications that wish to take advantage of some protocol feature not directly  
 119893 accessible through the other sockets interfaces.

119894 *B.2.10.19 Use of Sockets over Internet Protocols Based on IPv4*

119895 There is no additional rationale provided for this section.

119896 *B.2.10.20 Use of Sockets over Internet Protocols Based on IPv6*

119897 The Open Group Base Resolution bwg2001-012 is applied, clarifying that IPv6 implementations  
 119898 are required to support use of AF\_INET6 sockets over IPv4.

119899 **B.2.11 Tracing**

119900 The organization of the tracing rationale differs from the traditional rationale in that this tracing  
 119901 rationale text is written against the trace interface as a whole, rather than against the individual  
 119902 components of the trace interface or the normative section in which those components are  
 119903 defined. Therefore the sections below do not parallel the sections of normative text in  
 119904 POSIX.1-200x.

## 119905 B.2.11.1 Objectives

119906 The intended uses of tracing are application-system debugging during system development, as a  
 119907 “flight recorder” for maintenance of fielded systems, and as a performance measurement tool.  
 119908 In all of these intended uses, the vendor-supplied computer system and its software are, for this  
 119909 discussion, assumed error-free; the intent being to debug the user-written and/or third-party  
 119910 application code, and their interactions. Clearly, problems with the vendor-supplied system and  
 119911 its software will be uncovered from time to time, but this is a byproduct of the primary activity,  
 119912 debugging user code.

119913 Another need for defining a trace interface in POSIX stems from the objective to provide an  
 119914 efficient portable way to perform benchmarks. Existing practice shows that such interfaces are  
 119915 commonly used in a variety of systems but with little commonality. As part of the benchmarking  
 119916 needs, two aspects within the trace interface must be considered.

119917 The first, and perhaps more important one, is the qualitative aspect.

119918 The second is the quantitative aspect.

## 119919 • Qualitative Aspect

119920 To better understand this aspect, let us consider an example. Suppose that you want to  
 119921 organize a number of actions to be performed during the day. Some of these actions are  
 119922 known at the beginning of the day. Some others, which may be more or less important,  
 119923 will be triggered by reading your mail. During the day you will make some phone calls  
 119924 and synchronously receive some more information. Finally you will receive asynchronous  
 119925 phone calls that also will trigger actions. If you, or somebody else, examines your day at  
 119926 work, you, or he, can discover that you have not efficiently organized your work. For  
 119927 instance, relative to the phone calls you made, would it be preferable to make some of  
 119928 these early in the morning? Or to delay some others until the end of the day? Relative to  
 119929 the phone calls you have received, you might find that somebody you called in the  
 119930 morning has called you 10 times while you were performing some important work. To  
 119931 examine, afterwards, your day at work, you record in sequence all the trace events relative  
 119932 to your work. This should give you a chance of organizing your next day at work.

119933 This is the qualitative aspect of the trace interface. The user of a system needs to keep a  
 119934 trace of particular points the application passes through, so that he can eventually make  
 119935 some changes in the application and/or system configuration, to give the application a  
 119936 chance of running more efficiently.

## 119937 • Quantitative Aspect

119938 This aspect concerns primarily realtime applications, where missed deadlines can be  
 119939 undesirable. Although there are, in POSIX.1-200x, some interfaces useful for such  
 119940 applications (timeouts, execution time monitoring, and so on), there are no APIs to aid in  
 119941 the tuning of a realtime application’s behavior (**timespec** in timeouts, length of message  
 119942 queues, duration of driver interrupt service routine, and so on). The tuning of an  
 119943 application needs a means of recording timestamped important trace events during  
 119944 execution in order to analyze offline, and eventually, to tune some realtime features  
 119945 (redesign the system with less functionalities, readjust timeouts, redesign driver interrupts,  
 119946 and so on).

119947 **Detailed Objectives**

119948 Objectives were defined to build the trace interface and are kept for historical interest. Although  
 119949 some objectives are not fully respected in this trace interface, the concept of the POSIX trace  
 119950 interface assumes the following points:

- 119951 1. It must be possible to trace both system and user trace events concurrently.
- 119952 2. It must be possible to trace per-process trace events and also to trace system trace events  
 119953 which are unrelated to any particular process. A per-process trace event is either user-  
 119954 initiated or system-initiated.
- 119955 3. It must be possible to control tracing on a per-process basis from either inside or outside  
 119956 the process.
- 119957 4. It must be possible to control tracing on a per-thread basis from inside the enclosing  
 119958 process.
- 119959 5. Trace points must be controllable by trace event type ID from inside and outside of the  
 119960 process. Multiple trace points can have the same trace event type ID, and will be  
 119961 controlled jointly.
- 119962 6. Recording of trace events is dependent on both trace event type ID and the  
 119963 process/thread. Both must be enabled in order to record trace events. System trace events  
 119964 may or may not be handled differently.
- 119965 7. The API must not mandate the ability to control tracing for more than one process at the  
 119966 same time.
- 119967 8. There is no objective for trace control on anything bigger than a process; for example,  
 119968 group or session.
- 119969 9. Trace propagation and control:
  - 119970 a. Trace propagation across *fork()* is optional; the default is to not trace a child  
 119971 process.
  - 119972 b. Trace control must span *pthread\_create()* operations; that is, if a process is being  
 119973 traced, any thread will be traced as well if this thread allows tracing. The default is  
 119974 to allow tracing.
- 119975 10. Trace control must not span *exec* or *posix\_spawn()* operations.
- 119976 11. A triggering API is not required. The triggering API is the ability to command or stop  
 119977 tracing based on the occurrence of a specific trace event other than a  
 119978 POSIX\_TRACE\_START trace event or a POSIX\_TRACE\_STOP trace event.
- 119979 12. Trace log entries must have timestamps of implementation-defined resolution.  
 119980 Implementations are exhorted to support at least microsecond resolution. When a trace  
 119981 log entry is retrieved, it must have timestamp, PC address, PID, and TID of the entity that  
 119982 generated the trace event.
- 119983 13. Independently developed code should be able to use trace facilities without coordination  
 119984 and without conflict.
- 119985 14. Even if the trace points in the trace calls are not unique, the trace log entries (after any  
 119986 processing) must be uniquely identified as to trace point.
- 119987 15. There must be a standard API to read the trace stream.

- 119988 16. The format of the trace stream and the trace log is opaque and unspecified.
- 119989 17. It must be possible to read a completed trace, if recorded on some suitable non-volatile  
119990 storage, even subsequent to a power cycle or subsequent cold boot of the system.
- 119991 18. Support of analysis of a trace log while it is being formed is implementation-defined.
- 119992 19. The API must allow the application to write trace stream identification information into  
119993 the trace stream and to be able to retrieve it, without it being overwritten by trace entries,  
119994 even if the trace stream is full.
- 119995 20. It must be possible to specify the destination of trace data produced by trace events.
- 119996 21. It must be possible to have different trace streams, and for the tracing enabled by one  
119997 trace stream to be completely independent of the tracing of another trace stream.
- 119998 22. It must be possible to trace events from threads in different CPUs.
- 119999 23. The API must support one or more trace streams per-system, and one or more trace  
120000 streams per-process, up to an implementation-defined set of per-system and per-process  
120001 maximums.
- 120002 24. It must be possible to determine the order in which the trace events happened, without  
120003 necessarily depending on the clock, up to an implementation-defined time resolution.
- 120004 25. For performance reasons, the trace event point call(s) must be implementable as a macro  
120005 (see the ISO POSIX-1: 1996 standard, 1.3.4, Statement 2).
- 120006 26. POSIX.1-200x must not define the trace points which a conforming system must  
120007 implement, except for trace points used in the control of tracing.
- 120008 27. The APIs must be thread-safe, and trace points should be lock-free (that is, not require a  
120009 lock to gain exclusive access to some resource).
- 120010 28. The user-provided information associated with a trace event is variable-sized, up to some  
120011 maximum size.
- 120012 29. Bounds on record and trace stream sizes:
- 120013 a. The API must permit the application to declare the upper bounds on the length of  
120014 an application data record. The system must return the limit it used. The limit used  
120015 may be smaller than requested.
- 120016 b. The API must permit the application to declare the upper bounds on the size of  
120017 trace streams. The system must return the limit it used. The limit used may be  
120018 different, either larger or smaller, than requested.
- 120019 30. The API must be able to pass any fundamental data type, and a structured data type  
120020 composed only of fundamental types. The API must be able to pass data by reference,  
120021 given only as an address and a length. Fundamental types are the POSIX.1 types (see the  
120022 **<sys/types.h>** header) plus those defined in the ISO C standard.
- 120023 31. The API must apply the POSIX notions of ownership and permission to recorded trace  
120024 data, corresponding to the sources of that data.

120025 **Comments on Objectives**

120026 **Note:** In the following comments, numbers in square brackets refer to the above objectives.

120027 It is necessary to be able to obtain a trace stream for a complete activity. Thus there is a  
 120028 requirement to be able to trace both application and system trace events. A per-process trace  
 120029 event is either user-initiated, like the *write()* function, or system-initiated, like a timer expiration.  
 120030 There is also a need to be able to trace the activity of an entire process even when it has threads  
 120031 in multiple CPUs. To avoid excess trace activity, it is necessary to be able to control tracing on a  
 120032 trace event type basis.

120033 [Objectives 1,2,5,22]

120034 There is a need to be able to control tracing on a per-process basis, both from inside and outside  
 120035 the process; that is, a process can start a trace activity on itself or any other process. There is also  
 120036 the perceived need to allow the definition of a maximum number of trace streams per system.

120037 [Objectives 3,23]

120038 From within a process, it is necessary to be able to control tracing on a per-thread basis. This  
 120039 provides an additional filtering capability to keep the amount of traced data to a minimum. It  
 120040 also allows for less ambiguity as to the origin of trace events. It is recognized that thread-level  
 120041 control is only valid from within the process itself. It is also desirable to know the maximum  
 120042 number of trace streams per process that can be started. The API should not require thread  
 120043 synchronization or mandate priority inversions that would cause the thread to block. However,  
 120044 the API must be thread-safe.

120045 [Objectives 4,23,24,27]

120046 There was no perceived objective to control tracing on anything larger than a process; for  
 120047 example, a group or session. Also, the ability to start or stop a trace activity on multiple  
 120048 processes atomically may be very difficult or cumbersome in some implementations.

120049 [Objectives 6,8]

120050 It is also necessary to be able to control tracing by trace event type identifier, sometimes called a  
 120051 trace hook ID. However, there is no mandated set of system trace events, since such trace points  
 120052 are implementation-defined. The API must not require from the operating system facilities that  
 120053 are not standard.

120054 [Objectives 6,26]

120055 Trace control must span *fork()* and *pthread\_create()*. If not, there will be no way to ensure that an  
 120056 application's activity is entirely traced. The newly forked child would not be able to turn on its  
 120057 tracing until after it obtained control after the fork, and trace control externally would be even  
 120058 more problematic.

120059 [Objective 9]

120060 Since *exec* and *posix\_spawn()* represent a complete change in the execution of a task (a new  
 120061 program), trace control need not persist over an *exec* or *posix\_spawn()*.

120062 [Objective 10]

120063 Where trace activities are started on multiple processes, these trace activities should not interfere  
 120064 with each other.

120065 [Objective 21]

120066 There is no need for a triggering objective, primarily for performance reasons; see also [Section](#)  
 120067 [B.2.11.8](#) (on page 3516), rationale on triggering.

120068 [Objective 11]

120069 It must be possible to determine the origin of each traced event. The process and thread  
 120070 identifiers for each trace event are needed. Also there was a perceived need for a user-specifiable  
 120071 origin, but it was felt that this would create too much overhead.

120072 [Objectives 12,14]

- 120073 An allowance must be made for trace points to come embedded in software components from  
120074 several different sources and vendors without requiring coordination.  
120075 [Objective 13]
- 120076 There is a requirement to be able to uniquely identify trace points that may have the same trace  
120077 stream identifier. This is only necessary when a trace report is produced.  
120078 [Objectives 12,14]
- 120079 Tracing is a very performance-sensitive activity, and will therefore likely be implemented at a  
120080 low level within the system. Hence the interface must not mandate any particular buffering or  
120081 storage method. Therefore, a standard API is needed to read a trace stream. Also the interface  
120082 must not mandate the format of the trace data, and the interface must not assume a trace storage  
120083 method. Due to the possibility of a monolithic kernel and the possible presence of multiple  
120084 processes capable of running trace activities, the two kinds of trace events may be stored in two  
120085 separate streams for performance reasons. A mandatory dump mechanism, common in some  
120086 existing practice, has been avoided to allow the implementation of this set of functions on small  
120087 realtime profiles for which the concept of a file system is not defined. The trace API calls should  
120088 be implemented as macros.  
120089 [Objectives 15,16,25,30]
- 120090 Since a trace facility is a valuable service tool, the output (or log) of a completed trace stream  
120091 that is written to permanent storage must be readable on other systems of the type that  
120092 produced the trace log. Note that there is no objective to be able to interpret a trace log that was  
120093 not successfully completed.  
120094 [Objectives 17,18,19]
- 120095 For trace streams written to permanent storage, a way to specify the destination of the trace  
120096 stream is needed.  
120097 [Objective 20]
- 120098 There is a requirement to be able to depend on the ordering of trace events up to some  
120099 implementation-defined time interval. For example, there is a need to know the time period  
120100 during which, if trace events are closer together, their ordering is unspecified. Events that occur  
120101 within an interval smaller than this resolution may or may not be read back in the correct order.  
120102 [Objective 24]
- 120103 The application should be able to know how much data can be traced. When trace event types  
120104 can be filtered, the application should be able to specify the approximate maximum amount of  
120105 data that will be traced in a trace event so resources can be more efficiently allocated.  
120106 [Objectives 28,29]
- 120107 Users should not be able to trace data to which they would not normally have access. System  
120108 trace events corresponding to a process/thread should be associated with the ownership of that  
120109 process/thread.  
120110 [Objective 31]

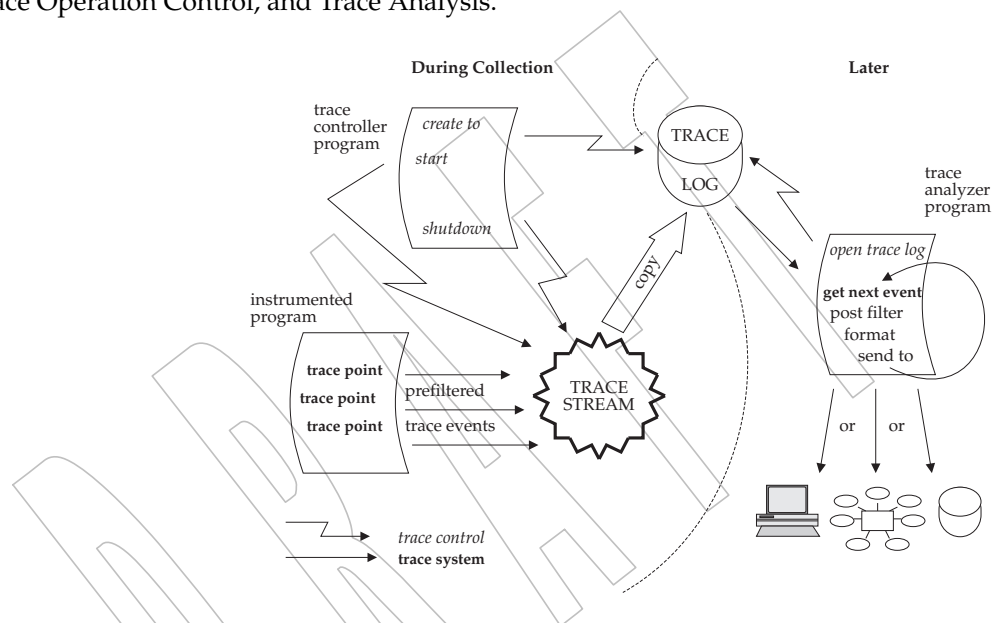

## 120111 B.2.11.2 Trace Model

120112 **Introduction**

120113 The model is based on two base entities: the “Trace Stream” and the “Trace Log”, and a recorded  
 120114 unit called the “Trace Event”. The possibility of using Trace Streams and Trace Logs separately  
 120115 gives two use dimensions and solves both the performance issue and the full-information  
 120116 system issue. In the case of a trace stream without log, specific information, although reduced in  
 120117 quantity, is required to be registered, in a possibly small realtime system, with as little overhead  
 120118 as possible. The Trace Log option has been added for small realtime systems. In the case of a  
 120119 trace stream with log, considerable complex application-specific information needs to be  
 120120 collected.

120121 **Trace Model Description**

120122 The trace model can be examined for three different subfunctions: Application Instrumentation,  
 120123 Trace Operation Control, and Trace Analysis.

120124 **Figure B-2** Trace System Overview: for Offline Analysis

120125 Each of these subfunctions requires specific characteristics of the trace mechanism API.

- 120126 • Application Instrumentation

120127 When instrumenting an application, the programmer is not concerned about the future use  
 120128 of the trace events in the trace stream or the trace log, the full policy of the trace stream, or  
 120129 the eventual pre-filtering of trace events. But he is concerned about the correct  
 120130 determination of the specific trace event type identifier, regardless of how many  
 120131 independent libraries are used in the same user application; see [Figure B-2](#) and [Figure B-3](#)  
 120132 (on page 3499).

120133 This trace API provides the necessary operations to accomplish this subfunction. This is  
 120134 done by providing functions to associate a programmer-defined name with an  
 120135 implementation-defined trace event type identifier (see the `posix_trace_eventid_open()`  
 120136 function), and to send this trace event into a potential trace stream (see the  
 120137 `posix_trace_event()` function).

120138

- Trace Operation Control

120139

120140

120141

120142

When controlling the recording of trace events in a trace stream, the programmer is concerned with the correct initialization of the trace mechanism (that is, the sizing of the trace stream), the correct retention of trace events in a permanent storage, the correct dynamic recording of trace events, and so on.

120143

120144

This trace API provides the necessary material to permit this efficiently. This is done by providing functions to initialize a new trace stream, and optionally a trace log:

120145

- Trace Stream Attributes Object Initialization (see *posix\_trace\_attr\_init()*)

120146

120147

- Functions to Retrieve or Set Information About a Trace Stream (see *posix\_trace\_attr\_getgenversion()*)

120148

120149

- Functions to Retrieve or Set the Behavior of a Trace Stream (see *posix\_trace\_attr\_getinherited()*)

120150

120151

- Functions to Retrieve or Set Trace Stream Size Attributes (see *posix\_trace\_attr\_getmaxusereventsize()*)

120152

120153

- Trace Stream Initialization, Flush, and Shutdown from a Process (see *posix\_trace\_create()*)

120154

- Clear Trace Stream and Trace Log (see *posix\_trace\_clear()*)

120155

To select the trace event types that are to be traced:

120156

- Manipulate Trace Event Type Identifier (see *posix\_trace\_trid\_eventid\_open()*)

120157

- Iterate over a Mapping of Trace Event Type (see *posix\_trace\_eventtypelist\_getnext\_id()*)

120158

- Manipulate Trace Event Type Sets (see *posix\_trace\_eventset\_empty()*)

120159

- Set Filter of an Initialized Trace Stream (see *posix\_trace\_set\_filter()*)

120160

To control the execution of an active trace stream:

120161

- Trace Start and Stop (see *posix\_trace\_start()*)

120162

120163

- Functions to Retrieve the Trace Attributes or Trace Statuses (see *posix\_trace\_get\_attr()*)

120164

- Trace Analysis

Once correctly recorded, on permanent storage or not, an ultimate activity consists of the analysis of the recorded information. If the recorded data is on permanent storage, a specific open operation is required to associate a trace stream to a trace log.

The first intent of the group was to request the presence of a system identification structure in the trace stream attribute. This was, for the application, to allow some portable way to process the recorded information. However, there is no requirement that the **utsname** structure, on which this system identification was based, be portable from one machine to another, so the contents of the attribute cannot be interpreted correctly by an application conforming to POSIX.1-200x.

This modification has been incorporated and requests that some unspecified information be recorded in the trace log in order to fail opening it if the analysis process and the controller process were running in different types of machine, but does not request that this information be accessible to the application. This modification has implied a modification in the *posix\_trace\_open()* function error code returns.

This trace API provides functions to:

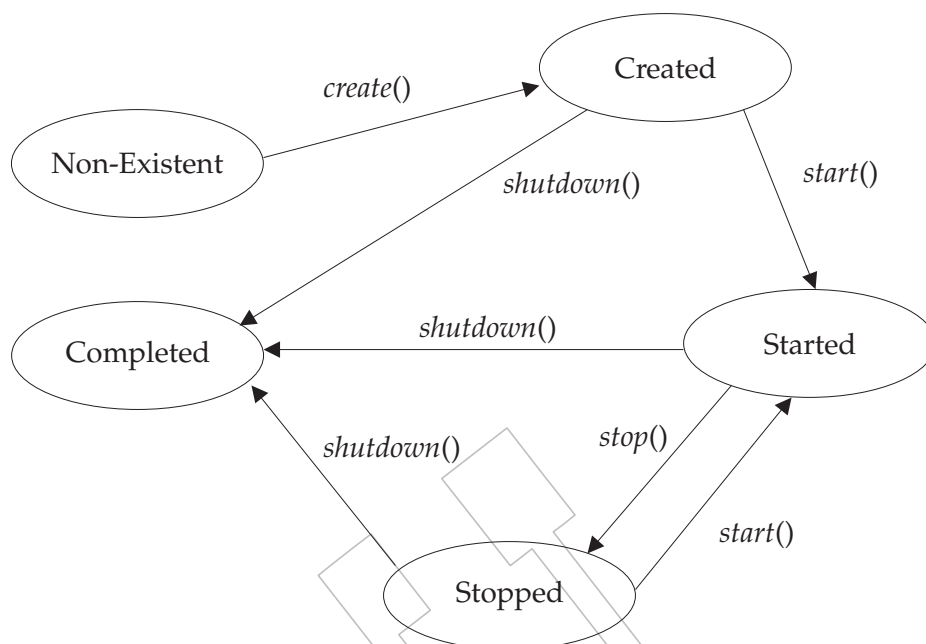

- Extract trace stream identification attributes (see *posix\_trace\_attr\_getgenversion()*)
- Extract trace stream behavior attributes (see *posix\_trace\_attr\_getinherited()*)
- Extract trace event, stream, and log size attributes (see *posix\_trace\_attr\_getmaxusereventsized()*)
- Look up trace event type names (see *posix\_trace\_eventid\_get\_name()*)
- Iterate over trace event type identifiers (see *posix\_trace\_eventtypelist\_getnext\_id()*)
- Open, rewind, and close a trace log (see *posix\_trace\_open()*)
- Read trace stream attributes and status (see *posix\_trace\_get\_attr()*)
- Read trace events (see *posix\_trace\_getnext\_event()*)

Due to the following two reasons:

1. The requirement that the trace system must not add unacceptable overhead to the traced process and so that the trace event point execution must be fast
2. The traced application does not care about tracing errors

the trace system cannot return any internal error to the application. Internal error conditions can range from unrecoverable errors that will force the active trace stream to abort, to small errors that can affect the quality of tracing without aborting the trace stream. The group decided to define a system trace event to report to the analysis process such internal errors. It is not the intention of POSIX.1-200x to require an implementation to report an internal error that corrupts or terminates tracing operation. The implementor is free to decide which internal documented errors, if any, the trace system is able to report.

120201

**States of a Trace Stream**

120202

**Figure B-4** Trace System Overview: States of a Trace Stream

120203

120204

120205

120206

120207

120208

120209

120210

120211

**Figure B-4** shows the different states an active trace stream passes through. After the `posix_trace_create()` function call, a trace stream becomes `CREATED` and a trace stream is associated for the future collection of trace events. The status of the trace stream is `POSIX_TRACE_SUSPENDED`. The state becomes `STARTED` after a call to the `posix_trace_start()` function, and the status becomes `POSIX_TRACE_RUNNING`. In this state, all trace events that are not filtered out will be stored into the trace stream. After a call to `posix_trace_stop()`, the trace stream becomes `STOPPED` (and the status `POSIX_TRACE_SUSPENDED`). In this state, no new trace events will be recorded in the trace stream, but previously recorded trace events may continue to be read.

120212

120213

120214

120215

120216

After a call to `posix_trace_shutdown()`, the trace stream is in the state `COMPLETED`. The trace stream no longer exists but, if the Trace Log option is supported, all the information contained in it has been logged. If a log object has not been associated with the trace stream at the creation, it is the responsibility of the trace controller process to not shut the trace stream down while trace events remain to be read in the stream.

120217

**Tracing All Processes**

120218

120219

120220

120221

Some implementations have a tracing subsystem with the ability to trace all processes. This is useful to debug some types of device drivers such as those for ATM or X25 adapters. These types of adapters are used by several independent processes, that are not issued from the same process.

120222

120223

120224

120225

The POSIX trace interface does not define any constant or option to create a trace stream tracing all processes. POSIX.1 does not prevent this type of implementation and an implementor is free to add this capability. Nevertheless, the trace interface allows tracing of all the system trace events and all the processes issued from the same process.

120226 If such a tracing system capability has to be implemented, when a trace stream is created, it is  
 120227 recommended that a constant named `POSIX_TRACE_ALLPROC` be used instead of the process  
 120228 identifier in the argument of the `posix_trace_create()` or `posix_trace_create_withlog()` function. A  
 120229 possible value for `POSIX_TRACE_ALLPROC` may be `-1` instead of a real process identifier.

120230 The implementor has to be aware that there is some impact on the tracing behavior as defined in  
 120231 the POSIX trace interface. For example:

- 120232 • If the default value for the inheritance attribute is set to  
 120233 `POSIX_TRACE_CLOSE_FOR_CHILD`, the implementation has to stop tracing for the child  
 120234 process.
- 120235 • The trace controller which is creating this type of trace stream must have the appropriate  
 120236 privilege to trace all the processes.

### 120237 Trace Storage

120238 The model is based on two types of trace events: system trace events and user-defined trace  
 120239 events. The internal representation of trace events is implementation-defined, and so the  
 120240 implementor is free to choose the more suitable, practical, and efficient way to design the  
 120241 internal management of trace events. For the timestamping operation, the model does not  
 120242 impose the `CLOCK_REALTIME` or any other clock. The buffering allocation and operation  
 120243 follow the same principle. The implementor is free to use one or more buffers to record trace  
 120244 events; the interface assumes only a logical trace stream of sequentially recorded trace events.  
 120245 Regarding flushing of trace events, the interface allows the definition of a trace log object which  
 120246 typically can be a file. But the group was also aware of defining functions to permit the use of  
 120247 this interface in small realtime systems, which may not have general file system capabilities. For  
 120248 instance, the three functions `posix_trace_getnext_event()` (blocking),  
 120249 `posix_trace_timedgetnext_event()` (blocking with timeout), and `posix_trace_trygetnext_event()` (non-  
 120250 blocking) are proposed to read the recorded trace events.

120251 The policy to be used when the trace stream becomes full also relies on common practice:

- 120252 • For an active trace stream, the `POSIX_TRACE_LOOP` trace stream policy permits  
 120253 automatic overrun (overwrite of oldest trace events) while waiting for some user-defined  
 120254 condition to cause tracing to stop. By contrast, the `POSIX_TRACE_UNTIL_FULL` trace  
 120255 stream policy requires the system to stop tracing when the trace stream is full. However, if  
 120256 the trace stream that is full is at least partially emptied by a call to the `posix_trace_flush()`  
 120257 function or by calls to the `posix_trace_getnext_event()` function, the trace system will  
 120258 automatically resume tracing.

120259 If the Trace Log option is supported, the operation of the `POSIX_TRACE_FLUSH` policy is  
 120260 an extension of the `POSIX_TRACE_UNTIL_FULL` policy. The automatic free operation (by  
 120261 flushing to the associated trace log) is added.

- 120262 • If a log is associated with the trace stream and this log is a regular file, these policies also  
 120263 apply for the log. One more policy, `POSIX_TRACE_APPEND`, is defined to allow  
 120264 indefinite extension of the log. Since the log destination can be any device or pseudo-  
 120265 device, the implementation may not be able to manipulate the destination as required by  
 120266 POSIX.1-200x. For this reason, the behavior of the log full policy may be unspecified  
 120267 depending on the trace log type.

120268 The current trace interface does not define a service to preallocate space for a trace log file,  
 120269 because this space can be preallocated by means of a call to the `posix_fallocate()` function.  
 120270 This function could be called after the file has been opened, but before the trace stream is  
 120271 created. The `posix_fallocate()` function ensures that any required storage for regular file data  
 120272 is allocated on the file system storage media. If `posix_fallocate()` returns successfully,

120273 subsequent writes to the specified file data will not fail due to the lack of free space on the  
 120274 file system storage media. Besides trace events, a trace stream also includes trace attributes  
 120275 and the mapping from trace event names to trace event type identifiers. The implementor  
 120276 is free to choose how to store the trace attributes and the trace event type map, but must  
 120277 ensure that this information is not lost when a trace stream overrun occurs.

### 120278 B.2.11.3 Trace Programming Examples

120279 Several programming examples are presented to show the code of the different possible  
 120280 subfunctions using a trace subsystem. All these programs need to include the `<trace.h>` header.  
 120281 In the examples shown, error checking is omitted for more simplicity.

### 120282 Trace Operation Control

120283 These examples show the creation of a trace stream for another process; one which is already  
 120284 trace instrumented. All the default trace stream attributes are used to simplify programming in  
 120285 the first example. The second example shows more possibilities.

#### 120286 First Example

```

120287 /* Caution. Error checks omitted */
120288 {
120289 trace_attr_t attr;
120290 pid_t pid = traced_process_pid;
120291 int fd;
120292 trace_id_t trid;
120293
120294 - - - - -
120295 /* Initialize trace stream attributes */
120296 posix_trace_attr_init(&attr);
120297 /* Open a trace log */
120298 fd=open("/tmp/mytracelog",...);
120299 /*
120300 * Create a new trace associated with a log
120301 * and with default attributes
120302 */
120303 posix_trace_create_withlog(pid, &attr, fd, &trid);
120304 /* Trace attribute structure can now be destroyed */
120305 posix_trace_attr_destroy(&attr);
120306 /* Start of trace event recording */
120307 posix_trace_start(trid);
120308 - - - - -
120309 /* Duration of tracing */
120310 - - - - -
120311 - - - - -
120312 /* Stop and shutdown of trace activity */
120313 posix_trace_shutdown(trid);
120314 - - - - -
120315 }

```

120316 **Second Example**

120317 Between the initialization of the trace stream attributes and the creation of the trace stream, these  
 120318 trace stream attributes may be modified; see [Trace Stream Attribute Manipulation](#) (on page  
 120319 3507) for a specific programming example. Between the creation and the start of the trace  
 120320 stream, the event filter may be set; after the trace stream is started, the event filter may be  
 120321 changed. The setting of an event set and the change of a filter is shown in [Create a Trace Event  
 120322 Type Set and Change the Trace Event Type Filter](#) (on page 3508).

```

120323 /* Caution. Error checks omitted */
120324 {
120325 trace_attr_t attr;
120326 pid_t pid = traced_process_pid;
120327 int fd;
120328 trace_id_t trid;
120329 - - - - -
120330 /* Initialize trace stream attributes */
120331 posix_trace_attr_init(&attr);
120332 /* Attr default may be changed at this place; see example */
120333 - - - - -
120334 /* Create and open a trace log with R/W user access */
120335 fd=open("/tmp/mytracelog",O_WRONLY|O_CREAT,S_IRUSR|S_IWUSR);
120336 /* Create a new trace associated with a log */
120337 posix_trace_create_withlog(pid, &attr, fd, &trid);
120338 /*
120339 * If the Trace Filter option is supported
120340 * trace event type filter default may be changed at this place;
120341 * see example about changing the trace event type filter
120342 */
120343 posix_trace_start(trid);
120344 - - - - -
120345 /*
120346 * If you have an uninteresting part of the application
120347 * you can stop temporarily.
120348 *
120349 * posix_trace_stop(trid);
120350 * - - - - -
120351 * - - - - -
120352 * posix_trace_start(trid);
120353 */
120354 - - - - -
120355 /*
120356 * If the Trace Filter option is supported
120357 * the current trace event type filter can be changed
120358 * at any time (see example about how to set
120359 * a trace event type filter)
120360 */
120361 - - - - -
120362 /* Stop the recording of trace events */
120363 posix_trace_stop(trid);
120364 /* Shutdown the trace stream */
120365 posix_trace_shutdown(trid);
120366 /*

```

```

120367 * Destroy trace stream attributes; attr structure may have
120368 * been used during tracing to fetch the attributes
120369 */
120370 posix_trace_attr_destroy(&attr);
120371 - - - - -
120372 }

```

### 120373 Application Instrumentation

120374 This example shows an instrumented application. The code is included in a block of instructions,  
 120375 perhaps a function from a library. Possibly in an initialization part of the instrumented  
 120376 application, two user trace event names are mapped to two trace event type identifiers  
 120377 (function `posix_trace_eventid_open()`). Then two trace points are programmed.

```

120378 /* Caution. Error checks omitted */
120379 {
120380 trace_event_id_t eventid1, eventid2;
120381 - - - - -
120382 /* Initialization of two trace event type ids */
120383 posix_trace_eventid_open("my_first_event",&eventid1);
120384 posix_trace_eventid_open("my_second_event",&eventid2);
120385 - - - - -
120386 - - - - -
120387 - - - - -
120388 /* Trace point */
120389 posix_trace_event(eventid1,NULL,0);
120390 - - - - -
120391 /* Trace point */
120392 posix_trace_event(eventid2,NULL,0);
120393 - - - - -
120394 }

```

### 120395 Trace Analyzer

120396 This example shows the manipulation of a trace log resulting from the dumping of a completed  
 120397 trace stream. All the default attributes are used to simplify programming, and data associated  
 120398 with a trace event is not shown in the first example. The second example shows more  
 120399 possibilities.

#### 120400 First Example

```

120401 /* Caution. Error checks omitted */
120402 {
120403 int fd;
120404 trace_id_t trid;
120405 posix_trace_event_info trace_event;
120406 char trace_event_name[TRACE_EVENT_NAME_MAX];
120407 int return_value;
120408 size_t returndatasize;
120409 int lost_event_number;
120410 - - - - -
120411 /* Open an existing trace log */
120412 fd=open("/tmp/tracelog", O_RDONLY);

```

```

120413 /* Open a trace stream on the open log */
120414 posix_trace_open(fd, &trid);
120415 /* Read a trace event */
120416 posix_trace_getnext_event(trid, &trace_event,
120417 NULL, 0, &returndatasize,&return_value);

120418 /* Read and print all trace event names out in a loop */
120419 while (return_value == NULL)
120420 {
120421 /*
120422 * Get the name of the trace event associated
120423 * with trid trace ID
120424 */
120425 posix_trace_eventid_get_name(trid, trace_event.event_id,
120426 trace_event_name);
120427 /* Print the trace event name out */
120428 printf("%s\n",trace_event_name);
120429 /* Read a trace event */
120430 posix_trace_getnext_event(trid, &trace_event,
120431 NULL, 0, &returndatasize,&return_value);
120432 }

120433 /* Close the trace stream */
120434 posix_trace_close(trid);
120435 /* Close the trace log */
120436 close(fd);
120437 }

```

### 120438 Second Example

120439 The complete example includes the two other examples in [Retrieve Information from a Trace Log](#) (on page 3509) and in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3510). For example, the *maxdatasize* variable is set in [Retrieve the List of Trace Event Types Used in a Trace Log](#) (on page 3510).

```

120443 /* Caution. Error checks omitted */
120444 {
120445 int fd;
120446 trace_id_t trid;
120447 posix_trace_event_info trace_event;
120448 char trace_event_name[TRACE_EVENT_NAME_MAX];
120449 char * data;
120450 size_t maxdatasize=1024, returndatasize;
120451 int return_value;
120452 - - - - -

120453 /* Open an existing trace log */
120454 fd=open("/tmp/tracelog", O_RDONLY);
120455 /* Open a trace stream on the open log */
120456 posix_trace_open(fd, &trid);
120457 /*
120458 * Retrieve information about the trace stream which
120459 * was dumped in this trace log (see example)
120460 */
120461 - - - - -

```

```

120462 /* Allocate a buffer for trace event data */
120463 data=(char *)malloc(maxdatasize);
120464 /*
120465 * Retrieve the list of trace events used in this
120466 * trace log (see example)
120467 */
120468 - - - - -
120469 /* Read and print all trace event names and data out in a loop */
120470 while (1)
120471 {
120472 posix_trace_getnext_event(trid, &trace_event,
120473 data, maxdatasize, &returndatasize,&return_value);
120474 if (return_value != NULL) break;
120475 /*
120476 * Get the name of the trace event type associated
120477 * with trid trace ID
120478 */
120479 posix_trace_eventid_get_name(trid, trace_event.event_id,
120480 trace_event_name);
120481 {
120482 int i;
120483
120484 /* Print the trace event name out */
120485 printf("%s: ", trace_event_name);
120486 /* Print the trace event data out */
120487 for (i=0; i<returndatasize, i++) printf("%02.2X",
120488 (unsigned char)data[i]);
120489 printf("\n");
120490 }
120491 /* Close the trace stream */
120492 posix_trace_close(trid);
120493 /* The buffer data is deallocated */
120494 free(data);
120495 /* Now the file can be closed */
120496 close(fd);
120497 }

```

### Several Programming Manipulations

The following examples show some typical sets of operations needed in some contexts.

#### Trace Stream Attribute Manipulation

This example shows the manipulation of a trace stream attribute object in order to change the default value provided by a previous *posix\_trace\_attr\_init()* call.

```

120503 /* Caution. Error checks omitted */
120504 {
120505 trace_attr_t attr;
120506 size_t logsize=100000;
120507 - - - - -
120508 /* Initialize trace stream attributes */

```

```

120509 posix_trace_attr_init(&attr);
120510 /* Set the trace name in the attributes structure */
120511 posix_trace_attr_setname(&attr, "my_trace");
120512 /* Set the trace full policy */
120513 posix_trace_attr_setstreamfullpolicy(&attr, POSIX_TRACE_LOOP);
120514 /* Set the trace log size */
120515 posix_trace_attr_setlogsize(&attr, logsize);
120516 - - - - -
120517 }

```

#### 120518 Create a Trace Event Type Set and Change the Trace Event Type Filter

120519 This example is valid only if the Trace Event Filter option is supported. This example shows the  
 120520 manipulation of a trace event type set in order to change the trace event type filter for an  
 120521 existing active trace stream, which may be just-created, running, or suspended. Some sets of  
 120522 trace event types are well-known, such as the set of trace event types not associated with a  
 120523 process, some trace event types are just-built trace event types for this trace stream; one trace  
 120524 event type is the predefined trace event error type which is deleted from the trace event type set.

```

120525 /* Caution. Error checks omitted */
120526 {
120527 trace_id_t trid = existing_trace;
120528 trace_event_set_t set;
120529 trace_event_id_t trace_event1, trace_event2;
120530 - - - - -
120531 /* Initialize to an empty set of trace event types */
120532 /* (not strictly required because posix_trace_event_set_fill() */
120533 /* will ignore the prior contents of the event set.) */
120534 posix_trace_eventset_emptyset(&set);
120535 /*
120536 * Fill the set with all system trace events
120537 * not associated with a process
120538 */
120539 posix_trace_eventset_fill(&set, POSIX_TRACE_WOPID_EVENTS);
120540 /*
120541 * Get the trace event type identifier of the known trace event name
120542 * my_first_event for the trid trace stream
120543 */
120544 posix_trace_trid_eventid_open(trid, "my_first_event", &trace_event1);
120545 /* Add the set with this trace event type identifier */
120546 posix_trace_eventset_add_event(trace_event1, &set);
120547 /*
120548 * Get the trace event type identifier of the known trace event name
120549 * my_second_event for the trid trace stream
120550 */
120551 posix_trace_trid_eventid_open(trid, "my_second_event", &trace_event2);
120552 /* Add the set with this trace event type identifier */
120553 posix_trace_eventset_add_event(trace_event2, &set);
120554 - - - - -
120555 /* Delete the system trace event POSIX_TRACE_ERROR from the set */
120556 posix_trace_eventset_del_event(POSIX_TRACE_ERROR, &set);
120557 - - - - -

```

```

120558 /* Modify the trace stream filter making it equal to the new set */
120559 posix_trace_set_filter(trid, &set, POSIX_TRACE_SET_EVENTSET);
120560 - - - - -
120561 /*
120562 * Now trace_event1, trace_event2, and all system trace event types
120563 * not associated with a process, except for the POSIX_TRACE_ERROR
120564 * system trace event type, are filtered out of (not recorded in) the
120565 * existing trace stream.
120566 */
120567 }

```

### 120568 Retrieve Information from a Trace Log

120569 This example shows how to extract information from a trace log, the dump of a trace stream.  
 120570 This code:

- 120571 • Asks if the trace stream has lost trace events
- 120572 • Extracts the information about the version of the trace subsystem which generated this  
 120573 trace log
- 120574 • Retrieves the maximum size of trace event data; this may be used to dynamically allocate  
 120575 an array for extracting trace event data from the trace log without overflow

```

120576 /* Caution. Error checks omitted */
120577 {
120578 struct posix_trace_status_info statusinfo;
120579 trace_attr_t attr;
120580 trace_id_t trid = existing_trace;
120581 size_t maxdatasize;
120582 char genversion[TRACE_NAME_MAX];
120583 - - - - -
120584 /* Get the trace stream status */
120585 posix_trace_get_status(trid, &statusinfo);
120586 /* Detect an overrun condition */
120587 if (statusinfo.posix_stream_overrun_status == POSIX_TRACE_OVERRUN)
120588 printf("trace events have been lost\n");
120589 /* Get attributes from the trid trace stream */
120590 posix_trace_get_attr(trid, &attr);
120591 /* Get the trace generation version from the attributes */
120592 posix_trace_attr_getgenversion(&attr, genversion);
120593 /* Print the trace generation version out */
120594 printf("Information about Trace Generator:%s\n",genversion);
120595 /* Get the trace event max data size from the attributes */
120596 posix_trace_attr_getmaxdatasize(&attr, &maxdatasize);
120597 /* Print the trace event max data size out */
120598 printf("Maximum size of associated data:%d\n",maxdatasize);
120599 /* Destroy the trace stream attributes */
120600 posix_trace_attr_destroy(&attr);
120601 }

```

120602 **Retrieve the List of Trace Event Types Used in a Trace Log**

120603 This example shows the retrieval of a trace stream's trace event type list. This operation may be  
 120604 very useful if you are interested only in tracking the type of trace events in a trace log.

```

120605 /* Caution. Error checks omitted */
120606 {
120607 trace_id_t trid = existing_trace;
120608 trace_event_id_t event_id;
120609 char event_name[TRACE_EVENT_NAME_MAX];
120610 int return_value;
120611 - - - - -
120612 /*
120613 * In a loop print all existing trace event names out
120614 * for the trid trace stream
120615 */
120616 while (1)
120617 {
120618 posix_trace_eventtypelist_getnext_id(trid, &event_id
120619 &return_value);
120620 if (return_value != NULL) break;
120621 /*
120622 * Get the name of the trace event associated
120623 * with trid trace ID
120624 */
120625 posix_trace_eventid_get_name(trid, event_id, event_name);
120626 /* Print the name out */
120627 printf("%s\n", event_name);
120628 }
120629 }

```

120630

## B.2.11.4 Rationale on Trace for Debugging

120631

Figure B-5 Trace Another Process

120632

120633

120634

120635

120636

120637

Among the different possibilities offered by the trace interface defined in POSIX.1-200x, the debugging of an application is the most interesting one. Typical operations in the controlling debugger process are to filter trace event types, to get trace events from the trace stream, to stop the trace stream when the debugged process is executing uninteresting code, to start the trace stream when some interesting point is reached, and so on. The interface defined in POSIX.1-200x should define all the necessary base functions to allow this dynamic debug handling.

120638

120639

120640

120641

Figure B-5 shows an example in which the trace stream is created after the call to the *fork()* function. If the user does not want to lose trace events, some synchronization mechanism (represented in the figure) may be needed before calling the *exec* function, to give the parent a chance to create the trace stream before the child begins the execution of its trace points.

120642

## B.2.11.5 Rationale on Trace Event Type Name Space

120643

120644

120645

120646

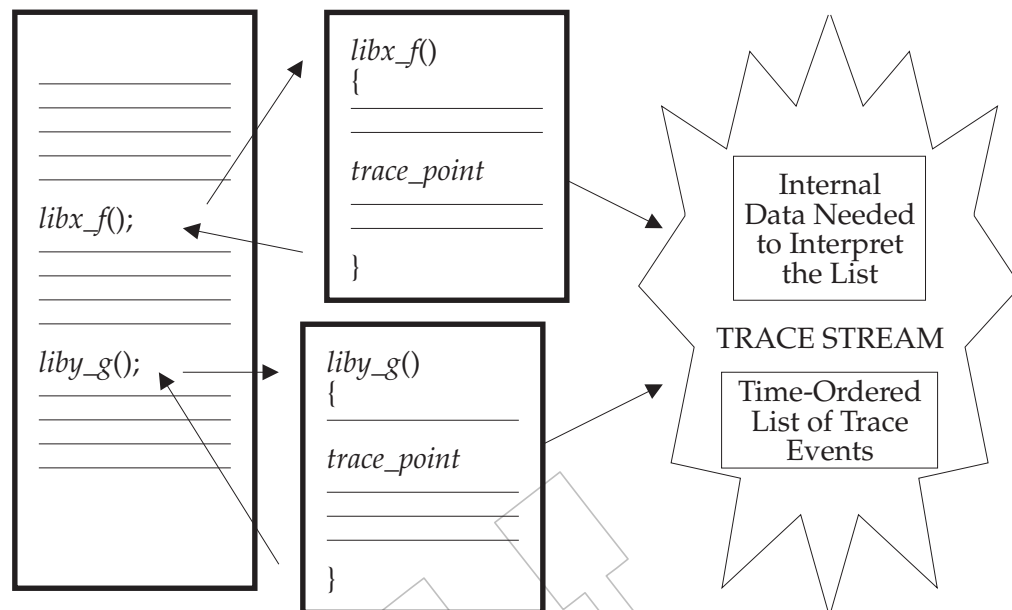

120647

120648

120649

120650

At first, the working group was in favor of the representation of a trace event type by an integer (*event\_name*). It seems that existing practice shows the weakness of such a representation. The collision of trace event types is the main problem that cannot be simply resolved using this sort of representation. Suppose, for example, that a third party designs an instrumented library. The user does not have the source of this library and wants to trace his application which uses in some part the third-party library. There is no means for him to know what are the trace event types used in the instrumented library so he has some chance of duplicating some of them and thus to obtain a contaminated tracing of his application.

120651 **Figure B-6** Trace Name Space Overview: With Third-Party Library

120652 There are requirements to allow program images containing pieces from various vendors to be  
 120653 traced without also requiring those of any other vendors to coordinate their uses of the trace  
 120654 facility, and especially the naming of their various trace event types and trace point IDs. The  
 120655 chosen solution is to provide a very large name space, large enough so that the individual  
 120656 vendors can give their trace types and tracepoint IDs sufficiently long and descriptive names  
 120657 making the occurrence of collisions quite unlikely. The probability of collision is thus made  
 120658 sufficiently low so that the problem may, as a practical matter, be ignored. By requirement, the  
 120659 consequence of collisions will be a slight ambiguity in the trace streams; tracing will continue in  
 120660 spite of collisions and ambiguities. “The show must go on”. The *posix\_prog\_address* member of  
 120661 the **posix\_trace\_event\_info** structure is used to allow trace streams to be unambiguously  
 120662 interpreted, despite the fact that trace event types and trace event names need not be unique.

120663 The *posix\_trace\_eventid\_open()* function is required to allow the instrumented third-party library  
 120664 to get a valid trace event type identifier for its trace event names. This operation is, somehow,  
 120665 an allocation, and the group was aware of proposing some deallocation mechanism which the  
 120666 instrumented application could use to recover the resources used by a trace event type identifier.  
 120667 This would have given the instrumented application the benefit of being capable of reusing a  
 120668 possible minimum set of trace event type identifiers, but also the inconvenience to have,  
 120669 possibly in the same trace stream, one trace event type identifier identifying two different trace  
 120670 event types. After some discussions the group decided to not define such a function which  
 120671 would make this API thicker for little benefit, the user having always the possibility of adding  
 120672 identification information in the *data* member of the trace event structure.

120673 The set of the trace event type identifiers the controlling process wants to filter out is initialized  
 120674 in the trace mechanism using the function *posix\_trace\_set\_filter()*, setting the arguments  
 120675 according to the definitions explained in *posix\_trace\_set\_filter()*. This operation can be done  
 120676 statically (when the trace is in the STOPPED state) or dynamically (when the trace is in the  
 120677 STARTED state). The preparation of the filter is normally done using the function defined in  
 120678 *posix\_trace\_eventtypelist\_getnext\_id()* and eventually the function  
 120679 *posix\_trace\_eventtypelist\_rewind()* in order to know (before the recording) the list of the potential

120680 set of trace event types that can be recorded. In the case of an active trace stream, this list may  
 120681 not be exhaustive. Actually, the target process may not have yet called the function  
 120682 *posix\_trace\_eventid\_open()*. But it is a common practice, for a controlling process, to prepare the  
 120683 filtering of a future trace stream before its start. Therefore the user must have a way to get the  
 120684 trace event type identifier corresponding to a well-known trace event name before its future  
 120685 association by the pre-cited function. This is done by calling the *posix\_trace\_trid\_eventid\_open()*  
 120686 function, given the trace stream identifier and the trace name, and described hereafter. Because  
 120687 this trace event type identifier is associated with a trace stream identifier, where a unique  
 120688 process has initialized two or more traces, the implementation is expected to return the same  
 120689 trace event type identifier for successive calls to *posix\_trace\_trid\_eventid\_open()* with different  
 120690 trace stream identifiers. The *posix\_trace\_eventid\_get\_name()* function is used by the controller  
 120691 process to identify, by the name, the trace event type returned by a call to the  
 120692 *posix\_trace\_eventtypelist\_getnext\_id()* function.

120693 Afterwards, the set of trace event types is constructed using the functions defined in  
 120694 *posix\_trace\_eventset\_empty()*, *posix\_trace\_eventset\_fill()*, *posix\_trace\_eventset\_add()*, and  
 120695 *posix\_trace\_eventset\_del()*.

120696 A set of functions is provided devoted to the manipulation of the trace event type identifier and  
 120697 names for an active trace stream. All these functions require the trace stream identifier argument  
 120698 as the first parameter. The opacity of the trace event type identifier implies that the user cannot  
 120699 associate directly its well-known trace event name with the system-associated trace event type  
 120700 identifier.

120701 The *posix\_trace\_trid\_eventid\_open()* function allows the application to get the system trace event  
 120702 type identifier back from the system, given its well-known trace event name. This function is  
 120703 useful only when a controlling process needs to specify specific events to be filtered.

120704 The *posix\_trace\_eventid\_get\_name()* function allows the application to obtain a trace event name  
 120705 given its trace event type identifier. One possible use of this function is to identify the type of a  
 120706 trace event retrieved from the trace stream, and print it. The easiest way to implement this  
 120707 requirement, is to use a single trace event type map for all the processes whose maps are  
 120708 required to be identical. A more difficult way is to attempt to keep multiple maps identical at  
 120709 every call to *posix\_trace\_eventid\_open()* and *posix\_trace\_trid\_eventid\_open()*.

#### 120710 B.2.11.6 Rationale on Trace Events Type Filtering

120711 The most basic rationale for runtime and pre-registration filtering (selection/rejection) of trace  
 120712 event types is to prevent choking of the trace collection facility, and/or overloading of the  
 120713 computer system. Any worthwhile trace facility can bring even the largest computer to its  
 120714 knees. Otherwise, everything would be recorded and filtered after the fact; it would be much  
 120715 simpler, but impractical.

120716 To achieve debugging, measurement, or whatever the purpose of tracing, the filtering of trace  
 120717 event types is an important part of trace analysis. Due to the fact that the trace events are put  
 120718 into a trace stream and probably logged afterwards into a file, different levels of filtering—that  
 120719 is, rejection of trace event types—are possible.

120720 **Filtering of Trace Event Types Before Tracing**

120721 This function, represented by the `posix_trace_set_filter()` function in POSIX.1-200x (see  
 120722 `posix_trace_set_filter()`), selects, before or during tracing, the set of trace event types to be filtered  
 120723 out. It should be possible also (as OSF suggested in their ETAP trace specifications) to select the  
 120724 kernel trace event types to be traced in a system-wide fashion. These two functionalities are  
 120725 called the pre-filtering of trace event types.

120726 The restriction on the actual type used for the `trace_event_set_t` type is intended to guarantee  
 120727 that these objects can always be assigned, have their address taken, and be passed by value as  
 120728 parameters. It is not intended that this type be a structure including pointers to other data  
 120729 structures, as that could impact the portability of applications performing such operations. A  
 120730 reasonable implementation could be a structure containing an array of integer types.

120731 **Filtering of Trace Event Types at Runtime**

120732 It is possible to build this functionality using the `posix_trace_set_filter()` function. A privileged  
 120733 process or a privileged thread can get trace events from the trace stream of another process or  
 120734 thread, and thus specify the type of trace events to record into a file, using implementation-  
 120735 defined methods and interfaces. This functionality, called inline filtering of trace event types, is  
 120736 used for runtime analysis of trace streams.

120737 **Post-Mortem Filtering of Trace Event Types**

120738 The word “post-mortem” is used here to indicate that some unanticipated situation occurs  
 120739 during execution that does not permit a pre or inline filtering of trace events and that it is  
 120740 necessary to record all trace event types to have a chance to discover the problem afterwards.  
 120741 When the program stops, all the trace events recorded previously can be analyzed in order to  
 120742 find the solution. This functionality could be named the post-filtering of trace event types.

120743 **Discussions about Trace Event Type-Filtering**

120744 After long discussions with the parties involved in the process of defining the trace interface, it  
 120745 seems that the sensitivity to the filtering problem is different, but everybody agrees that the level  
 120746 of the overhead introduced during the tracing operation depends on the filtering method  
 120747 elected. If the time that it takes the trace event to be recorded can be neglected, the overhead  
 120748 introduced by the filtering process can be classified as follows:

120749 Pre-filtering      System and process/thread-level overhead

120750 Inline-filtering    Process/thread-level overhead

120751 Post-filtering     No overhead; done offline

120752 The pre-filtering could be named “critical realtime” filtering in the sense that the filtering of  
 120753 trace event type is manageable at the user level so the user can lower to a minimum the filtering  
 120754 overhead at some user selected level of priority for the inline filtering, or delay the filtering to  
 120755 after execution for the post-filtering. The counterpart of this solution is that the size of the trace  
 120756 stream must be sufficient to record all the trace events. The advantage of the pre-filtering is that  
 120757 the utilization of the trace stream is optimized.

120758 Only pre-filtering is defined by POSIX.1-200x. However, great care must be taken in specifying  
 120759 pre-filtering, so that it does not impose unacceptable overhead. Moreover, it is necessary to  
 120760 isolate all the functionality relative to the pre-filtering.

120761 The result of this rationale is to define a new option, the Trace Event Filter option, not  
 120762 necessarily implemented in small realtime systems, where system overhead is minimized to the  
 120763 extent possible.

120764 B.2.11.7 Tracing, *pthread* API

120765 The objective to be able to control tracing for individual threads may be in conflict with the  
 120766 efficiency expected in threads with a *contentionscope* attribute of `PTHREAD_SCOPE_PROCESS`.  
 120767 For these threads, context switches from one thread that has tracing enabled to another thread  
 120768 that has tracing disabled may require a kernel call to inform the kernel whether it has to trace  
 120769 system events executed by that thread or not. For this reason, it was proposed that the ability to  
 120770 enable or disable tracing for `PTHREAD_SCOPE_PROCESS` threads be made optional, through  
 120771 the introduction of a Trace Scope Process option. A trace implementation which did not  
 120772 implement the Trace Scope Process option would not honor the tracing-state attribute of a thread  
 120773 with `PTHREAD_SCOPE_PROCESS`; it would, however, honor the tracing-state attribute of a  
 120774 thread with `PTHREAD_SCOPE_SYSTEM`. This proposal was rejected as:

- 120775 1. Removing desired functionality (per-thread trace control)
- 120776 2. Introducing counter-intuitive behavior for the tracing-state attribute
- 120777 3. Mixing logically orthogonal ideas (thread scheduling and thread tracing)
- 120778 [Objective 4]

120779 Finally, to solve this complex issue, this API does not provide `pthread_gettracingstate()`,  
 120780 `pthread_settracingstate()`, `pthread_attr_gettracingstate()`, and `pthread_attr_settracingstate()`  
 120781 interfaces. These interfaces force the thread implementation to add to the weight of the thread  
 120782 and cause a revision of the threads libraries, just to support tracing. Worse yet,  
 120783 `posix_trace_event()` must always test this per-thread variable even in the common case where it is  
 120784 not used at all. Per-thread tracing is easy to implement using existing interfaces where  
 120785 necessary; see the following example.

120786 **Example**

```

120787 /* Caution. Error checks omitted */
120788 static pthread_key_t my_key;
120789 static trace_event_id_t my_event_id;
120790 static pthread_once_t my_once = PTHREAD_ONCE_INIT;
120791
120792 void my_init(void)
120793 {
120794 (void) pthread_key_create(&my_key, NULL);
120795 (void) posix_trace_eventid_open("my", &my_event_id);
120796 }
120797
120798 int get_trace_flag(void)
120799 {
120800 pthread_once(&my_once, my_init);
120801 return (pthread_getspecific(my_key) != NULL);
120802 }
120803
120804 void set_trace_flag(int f)
120805 {
120806 pthread_once(&my_once, my_init);
120807 pthread_setspecific(my_key, f? &my_event_id: NULL);
120808 }
120809
120810 fn()
120811 {
120812 if (get_trace_flag())
120813 posix_trace_event(my_event_id, ...)
120814 }

```

120811 The above example does not implement third-party state setting.

120812 Lastly, per-thread tracing works poorly for threads with PTHREAD\_SCOPE\_PROCESS  
120813 contention scope. These “library” threads have minimal interaction with the kernel and would  
120814 have to explicitly set the attributes whenever they are context switched to a new kernel thread in  
120815 order to trace system events. Such state was explicitly avoided in POSIX threads to keep  
120816 PTHREAD\_SCOPE\_PROCESS threads lightweight.

120817 The reason that keeping PTHREAD\_SCOPE\_PROCESS threads lightweight is important is that  
120818 such threads can be used not just for simple multi-processors but also for co-routine style  
120819 programming (such as discrete event simulation) without inventing a new threads paradigm.  
120820 Adding extra runtime cost to thread context switches will make using POSIX threads less  
120821 attractive in these situations.

#### 120822 B.2.11.8 Rationale on Triggering

120823 The ability to start or stop tracing based on the occurrence of specific trace event types has been  
120824 proposed as a parallel to similar functionality appearing in logic analyzers. Such triggering, in  
120825 order to be very useful, should be based not only on the trace event type, but on trace event-  
120826 specific data, including tests of user-specified fields for matching or threshold values.

120827 Such a facility is unnecessary where the buffering of the stream is not a constraint, since such  
120828 checks can be performed offline during post-mortem analysis.

120829 For example, a large system could incorporate a daemon utility to collect the trace records from  
120830 memory buffers and spool them to secondary storage for later analysis. In the instances where  
120831 resources are truly limited, such as embedded applications, the application incorporation of  
120832 application code to test the circumstances of a trace event and call the trace point only if needed  
120833 is usually straightforward.

120834 For performance reasons, the *posix\_trace\_event()* function should be implemented using a macro,  
120835 so if the trace is inactive, the trace event point calls are latent code and must cost no more than a  
120836 scalar test.

120837 The API proposed in POSIX.1-200x does not include any triggering functionality.

#### 120838 B.2.11.9 Rationale on Timestamp Clock

120839 It has been suggested that the tracing mechanism should include the possibility of specifying the  
120840 clock to be used in timestamping the trace events. When application trace events must be  
120841 correlated to remote trace events, such a facility could provide a global time reference not  
120842 available from a local clock. Further, the application may be driven by timers based on a clock  
120843 different from that used for the timestamp, and the correlation of the trace to those untraced  
120844 timer activities could be an important part of the analysis of the application.

120845 However, the tracing mechanism needs to be fast and just the provision of such an option can  
120846 materially affect its performance. Leaving aside the performance costs of reading some clocks,  
120847 this notion is also ill-defined when kernel trace events are to be traced by two applications  
120848 making use of different tracing clocks. This can even happen within a single application where  
120849 different parts of the application are served by different clocks. Another complication can occur  
120850 when a clock is maintained strictly at the user level and is unavailable at the kernel level.

120851 It is felt that the benefits of a selectable trace clock do not match its costs. Applications that wish  
120852 to correlate clocks other than the default tracing clock can include trace events with sample  
120853 values of those other clocks, allowing correlation of timestamps from the various independent  
120854 clocks. In any case, such a technique would be required when applications are sensitive to  
120855 multiple clocks.

120856 **B.2.11.10 Rationale on Different Overrun Conditions**

120857 The analysis of the dynamic behavior of the trace mechanism shows that different overrun  
 120858 conditions may occur. The API must provide a means to manage such conditions in a portable  
 120859 way.

120860 **Overrun in Trace Streams Initialized with POSIX\_TRACE\_LOOP Policy**

120861 In this case, the user of the trace mechanism is interested in using the trace stream with  
 120862 POSIX\_TRACE\_LOOP policy to record trace events continuously, but ideally without losing any  
 120863 trace events. The online analyzer process must get the trace events at a mean speed equivalent to  
 120864 the recording speed. Should the trace stream become full, a trace stream overrun occurs. This  
 120865 condition is detected by getting the status of the active trace stream (function  
 120866 `posix_trace_get_status()`) and looking at the member `posix_stream_overrun_status` of the read  
 120867 **posix\_stream\_status** structure. In addition, two predefined trace event types are defined:

- 120868 1. The beginning of a trace overflow, to locate the beginning of an overflow when reading a  
 120869 trace stream
- 120870 2. The end of a trace overflow, to locate the end of an overflow, when reading a trace stream

120871 As a timestamp is associated with these predefined trace events, it is possible to know the  
 120872 duration of the overflow.

120873 **Overrun in Dumping Trace Streams into Trace Logs**

120874 The user lets the trace mechanism dump the trace stream initialized with  
 120875 POSIX\_TRACE\_FLUSH policy automatically into a trace log. If the dump operation is slower  
 120876 than the recording of trace events, the trace stream can overrun. This condition is detected by  
 120877 getting the status of the active trace stream (the `posix_trace_get_status()` function) and looking at  
 120878 the member `posix_stream_overrun_status` of the read **posix\_stream\_status** structure. This overrun  
 120879 indicates that the trace mechanism is not able to operate in this mode at this speed. It is the  
 120880 responsibility of the user to modify one of the trace parameters (the stream size or the trace  
 120881 event type filter, for instance) to avoid such overrun conditions, if overruns are to be prevented.  
 120882 The same already predefined trace event types (see [Overrun in Trace Streams Initialized with  
 120883 POSIX\\_TRACE\\_LOOP Policy](#)) are used to detect and to know the duration of an overflow.

120884 **Reading an Active Trace Stream**

120885 Although this trace API allows one to read an active trace stream with log while it is tracing, this  
 120886 feature can lead to false overflow origin interpretation: the trace log or the reader of the trace  
 120887 stream. Reading from an active trace stream with log is thus non-portable, and has been left  
 120888 unspecified.

120889 **B.2.12 Data Types**120890 **B.2.12.1 Defined Types**

120891 The requirement that additional types defined in this section end in “\_t” was prompted by the  
 120892 problem of name space pollution. It is difficult to define a type (where that type is not one  
 120893 defined by POSIX.1-200x) in one header file and use it in another without adding symbols to the  
 120894 name space of the program. To allow implementors to provide their own types, all conforming  
 120895 applications are required to avoid symbols ending in “\_t”, which permits the implementor to  
 120896 provide additional types. Because a major use of types is in the definition of structure members,  
 120897 which can (and in many cases must) be added to the structures defined in POSIX.1-200x, the

120898 need for additional types is compelling.

120899 The types, such as **ushort** and **ulong**, which are in common usage, are not defined in  
 120900 POSIX.1-200x (although **ushort\_t** would be permitted as an extension). They can be added to  
 120901 **<sys/types.h>** using a feature test macro (see [Section B.2.2.1](#), on page 3398). A suggested symbol  
 120902 for these is **\_SYSIII**. Similarly, the types like **u\_short** would probably be best controlled by **\_BSD**.

120903 Some of these symbols may appear in other headers; see [Section B.2.2.2](#) (on page 3399).

120904 **dev\_t** This type may be made large enough to accommodate host-locality considerations  
 120905 of networked systems.

120906 This type must be arithmetic. Earlier proposals allowed this to be non-arithmetic  
 120907 (such as a structure) and provided a *samefile()* function for comparison.

120908 **gid\_t** Some implementations had separated **gid\_t** from **uid\_t** before POSIX.1 was  
 120909 completed. It would be difficult for them to coalesce them when it was  
 120910 unnecessary. Additionally, it is quite possible that user IDs might be different from  
 120911 group IDs because the user ID might wish to span a heterogeneous network,  
 120912 where the group ID might not.

120913 For current implementations, the cost of having a separate **gid\_t** will be only  
 120914 lexical.

120915 **mode\_t** This type was chosen so that implementations could choose the appropriate  
 120916 integer type, and for compatibility with the ISO C standard. 4.3 BSD uses  
 120917 **unsigned short** and the SVID uses **ushort**, which is the same. Historically, only the  
 120918 low-order sixteen bits are significant.

120919 **nlink\_t** This type was introduced in place of **short** for *st\_nlink* (see the **<sys/stat.h>** header)  
 120920 in response to an objection that **short** was too small.

120921 **off\_t** This type is used only in *lseek()*, *fcntl()*, and **<sys/stat.h>**. Many implementations  
 120922 would have difficulties if it were defined as anything other than **long**. Requiring  
 120923 an integer type limits the capabilities of *lseek()* to four gigabytes. The ISO C  
 120924 standard supplies routines that use larger types; see *fgetpos()* and *fsetpos()*. XSI-  
 120925 conformant systems provide the *fseeko()* and *ftello()* functions that use larger types.

120926 **pid\_t** The inclusion of this symbol was controversial because it is tied to the issue of the  
 120927 representation of a process ID as a number. From the point of view of a  
 120928 conforming application, process IDs should be “magic cookies”<sup>7</sup> that are produced  
 120929 by calls such as *fork()*, used by calls such as *waitpid()* or *kill()*, and not otherwise  
 120930 analyzed (except that the sign is used as a flag for certain operations).

120931 The concept of a {PID\_MAX} value interacted with this in early proposals. Treating  
 120932 process IDs as an opaque type both removes the requirement for {PID\_MAX} and  
 120933 allows systems to be more flexible in providing process IDs that span a large range  
 120934 of values, or a small one.

120935 Since the values in **uid\_t**, **gid\_t**, and **pid\_t** will be numbers generally, and  
 120936 potentially both large in magnitude and sparse, applications that are based on  
 120937 arrays of objects of this type are unlikely to be fully portable in any case. Solutions  
 120938 that treat them as magic cookies will be portable.

120939 {CHILD\_MAX} precludes the possibility of a “toy implementation”, where there

---

120940 7. An historical term meaning: “An opaque object, or token, of determinate size, whose significance is known only to the entity which  
 120941 created it. An entity receiving such a token from the generating entity may only make such use of the ‘cookie’ as is defined and permitted  
 120942 by the supplying entity.”

|        |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 120944 | <b>ssize_t</b>  | This is intended to be a signed analog of <b>size_t</b> . The wording is such that an implementation may either choose to use a longer type or simply to use the signed version of the type that underlies <b>size_t</b> . All functions that return <b>ssize_t</b> ( <i>read()</i> and <i>write()</i> ) describe as “implementation-defined” the result of an input exceeding {SSIZE_MAX}. It is recognized that some implementations might have <b>ints</b> that are smaller than <b>size_t</b> . A conforming application would be constrained not to perform I/O in pieces larger than {SSIZE_MAX}, but a conforming application using extensions would be able to use the full range if the implementation provided an extended range, while still having a single type-compatible interface. |

| 120955 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 120956 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 120957 | <b>uid_t</b>    | Before the addition of this type, the data types used to represent these values varied throughout early proposals. The <b>&lt;sys/stat.h&gt;</b> header defined these values as type <b>short</b> , the <b>&lt;passwd.h&gt;</b> file (now <b>&lt;pwd.h&gt;</b> and <b>&lt;grp.h&gt;</b> ) used an <b>int</b> , and <i>getuid()</i> returned an <b>int</b> . In response to a strong objection to the inconsistent definitions, all the types were switched to <b>uid_t</b> .                                                                                                                                                                                                                                                                                                                       |
| 120958 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 120961 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 120962 |                 | In practice, those historical implementations that use varying types of this sort can typedef <b>uid_t</b> to <b>short</b> with no serious consequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 120963 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 120964 |                 | The problem associated with this change concerns object compatibility after structure size changes. Since most implementations will define <b>uid_t</b> as a <b>short</b> , the only substantive change will be a reduction in the size of the <b>passwd</b> structure. Consequently, implementations with an overriding concern for object compatibility can pad the structure back to its current size. For that reason, this problem was not considered critical enough to warrant the addition of a separate type to POSIX.1.                                                                                                                                                                                                                                                                  |
| 120965 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 120974 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 120975 | <b>B.2.12.2</b> | <i>The char Type</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 120976 |                 | POSIX.1-200x explicitly requires that a <b>char</b> type is exactly one byte (8 bits).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 120977 | <b>B.2.12.3</b> | <i>Pointer Types</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 120978 |                 | POSIX.1-200x explicitly requires implementations to convert pointers to <b>void *</b> and back with no                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 120979 |                 | loss of information. This is an extension over the ISO C standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 120980 B.3 System Interfaces

120981 See the RATIONALE sections on the individual reference pages.

### 120982 B.3.1 System Interfaces Removed in this Version

120983 The following section contains a list of the interfaces removed in POSIX.1-200x, together with  
 120984 advice for application developers on the alternative interfaces that should be used for maximum  
 120985 portability.

#### 120986 B.3.1.1 *bcmp*

120987 Applications are recommended to use the *memcmp()* function instead of this function.

120988 For maximum portability, it is recommended to replace the function call to *bcmp()* as follows:

```
120989 #define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))
```

#### 120990 B.3.1.2 *bcopy*

120991 Applications are recommended to use the *memmove()* function instead of this function.

120992 The following are approximately equivalent (note the order of the arguments):

```
120993 bcopy(s1,s2,n) ~ memmove(s2,s1,n)
```

120994 For maximum portability, it is recommended to replace the function call to *bcopy()* as follows:

```
120995 #define bcopy(b1,b2,len) (void)(memmove((b2), (b1), (len)))
```

#### 120996 B.3.1.3 *bsd\_signal*

120997 Applications are recommended to use the *sigaction()* function instead of this function.

120998 The *bsd\_signal()* function was supplied as a migration path for the BSD *signal()* function for  
 120999 simple applications that installed a single-argument signal handler function.

121000 Historically, the *bsd\_signal()* function differs from *signal()* in that the SA\_RESTART flag is set  
 121001 and the SA\_RESETHAND flag is clear when *bsd\_signal()* is used. The state of these flags is not  
 121002 specified for *signal()*.

#### 121003 B.3.1.4 *bzero*

121004 Applications are recommended to use the *memset()* function instead of this function.

121005 For maximum portability, it is recommended to replace the function call to *bzero()* as follows:

```
121006 #define bzero(b,len) (void)(memset((b), '\0', (len)))
```

#### 121007 B.3.1.5 *ecvt, fcvt, gcvt*

121008 Applications are recommended to use the *sprintf()* function instead of these functions.

121009 The *sprintf()* function is required by ISO C and is thus more portable.

121010 B.3.1.6 *ftime*

121011 Applications are recommended to use the *time()* function to determine the current time.  
 121012 Realtime applications should use *clock\_gettime()* to determine the current time.

121013 B.3.1.7 *getcontext, makecontext, swapcontext*

121014 Due to portability issues with these functions, especially with the manipulation of contexts,  
 121015 applications are recommended to be rewritten to use POSIX threads.

121016 B.3.1.8 *gethostbyaddr, gethostbyname*

121017 Applications are recommended to use the *getaddrinfo()* and *getnameinfo()* functions instead of  
 121018 these functions.

121019 The *gethostbyaddr()* and *gethostbyname()* functions may return pointers to static data, which may  
 121020 be overwritten by subsequent calls to any of these functions. The suggested replacements do not  
 121021 have this problem and are also IPv6-capable.

121022 B.3.1.9 *getwd*

121023 Applications are recommended to use the *getcwd()* function to determine the current working  
 121024 directory.

121025 B.3.1.10 *h\_errno*

121026 Applications are recommended not to use this error return code. Previously it was set by the  
 121027 *gethostbyname()* and *gethostbyaddr()* functions.

121028 B.3.1.11 *index*

121029 Applications are recommended to use the *strchr()* function instead of this function.

121030 For maximum portability, it is recommended to replace the function call to *index()* as follows:

```
121031 #define index(a,b) strchr((a),(b))
```

121032 B.3.1.12 *makecontext*

121033 Applications using the *getcontext()*, *makecontext()*, and *swapcontext()* functions should be  
 121034 rewritten to use POSIX threads.

121035 B.3.1.13 *mktemp*

121036 Applications are recommended to use the *mkstemp()* function instead of this function.

121037 The *mktemp()* function makes an application vulnerable to possible security problems since  
 121038 between the time a pathname is created and the file opened, it is possible for some other process  
 121039 to create a file with the same name. The *mkstemp()* function does not have this vulnerability.

121040 B.3.1.14 *pthread\_attr\_getstackaddr, pthread\_attr\_setstackaddr*

121041 Applications are recommended to use the *pthread\_attr\_setstack()* and *pthread\_attr\_getstack()*  
 121042 functions instead of these functions.

121043 There are a number of ambiguities in the specification of the *stackaddr* attribute that makes  
 121044 portable use of these interfaces impossible.

121045 **B.3.1.15** *rindex*121046 Applications are recommended to use the *strchr()* function instead of this function.121047 For maximum portability, it is recommended to replace the function call to *rindex()* as follows:121048 

```
#define rindex(a,b) strchr((a),(b))
```

121049 **B.3.1.16** *scalb*121050 Applications are recommended to use either *scalbln()*, *scalblnf()*, or *scalblnl()* instead of these  
121051 functions.121052 The behavior for the *scalb()* function was only defined when the *n* argument is an integer, a  
121053 NaN, or Inf. The behavior of other values for the *n* argument was unspecified.121054 **B.3.1.17** *ualarm*121055 Applications are recommended to use *timer\_create()*, *timer\_delete()*, *timer\_getoverrun()*,  
121056 *timer\_gettime()*, or *timer\_settime()* instead of this function.121057 **B.3.1.18** *usleep*121058 Applications are recommended to use the *nanosleep()* function instead of this function.121059 **B.3.1.19** *vfork*121060 Applications are recommended to use the *fork()* function instead of this function.121061 The *vfork()* function was previously under-specified.121062 **B.3.1.20** *wcs wcs*121063 Applications are recommended to use the *wcsstr()* function instead of this function.121064 The *wcsstr()* function is technically equivalent and is portable across all ISO C implementations.121065 **B.3.2 Examples for Spawn**121066 The following long examples are provided in the Rationale (Informative) volume of  
121067 POSIX.1-200x as a supplement to the reference page for *posix\_spawn()*.121068 **Example Library Implementation of Spawn**121069 The *posix\_spawn()* or *posix\_spawnnp()* functions provide the following:

- 121070 • Simply start a process executing a process image. This is the simplest application for  
121071 process creation, and it may cover most executions of *fork()*.
- 121072 • Support I/O redirection, including pipes.
- 121073 • Run the child under a user and group ID in the domain of the parent.
- 121074 • Run the child at any priority in the domain of the parent.

121075 The *posix\_spawn()* or *posix\_spawnnp()* functions do not cover every possible use of the *fork()*  
121076 function, but they do span the common applications: typical use by a shell and a login utility.121077 The price for an application is that before it calls *posix\_spawn()* or *posix\_spawnnp()*, the parent  
121078 must adjust to a state that *posix\_spawn()* or *posix\_spawnnp()* can map to the desired state for the  
121079 child. Environment changes require the parent to save some of its state and restore it afterwards.  
121080 The effective behavior of a successful invocation of *posix\_spawn()* is as if the operation were

```

121081 implemented with POSIX operations as follows:
121082 #include <sys/types.h>
121083 #include <stdlib.h>
121084 #include <stdio.h>
121085 #include <unistd.h>
121086 #include <sched.h>
121087 #include <fcntl.h>
121088 #include <signal.h>
121089 #include <errno.h>
121090 #include <string.h>
121091 #include <signal.h>
121092
121093 /* #include <spawn.h> */
121094 /*****
121095 /* Things that could be defined in spawn.h */
121096 /*****
121097 typedef struct
121098 {
121099 short posix_attr_flags;
121100 #define POSIX_SPAWN_SETPGROUP 0x1
121101 #define POSIX_SPAWN_SETSIGMASK 0x2

121477 attr->posix_attr_sigdefault = *sigdefault;
121478 return 0;
121479 }

```

121480 **I/O Redirection with Spawn**

121481 I/O redirection with *posix\_spawn()* or *posix\_spawnnp()* is accomplished by crafting a *file\_actions*  
121482 argument to effect the desired redirection. Such a redirection follows the general outline of the  
121483 following example:

```
121484 /* To redirect new standard output (fd 1) to a file, */
121485 /* and redirect new standard input (fd 0) from my fd socket_pair[1], */
121486 /* and close my fd socket_pair[0] in the new process. */
121487 posix_spawn_file_actions_t file_actions;
121488 posix_spawn_file_actions_init(&file_actions);
121489 posix_spawn_file_actions_addopen(&file_actions, 1, "newout", ...);
121490 posix_spawn_file_actions_dup2(&file_actions, socket_pair[1], 0);
121491 posix_spawn_file_actions_close(&file_actions, socket_pair[0]);
121492 posix_spawn_file_actions_close(&file_actions, socket_pair[1]);
121493 posix_spawn(..., &file_actions, ...);
121494 posix_spawn_file_actions_destroy(&file_actions);
```

121495 **Spawning a Process Under a New User ID**

121496 Spawning a process under a new user ID follows the outline shown in the following example:

```
121497 Save = getuid();
121498 setuid(newid);
121499 posix_spawn(...);
121500 setuid(Save);
```

# Rationale for Shell and Utilities

121506

121507

## C.1 Introduction

121509

### C.1.1 Change History

The change history is provided as an informative section, to track changes from earlier versions of this standard.

The following sections describe changes made to the Shell and Utilities volume of POSIX.1-200x since Issue 6 of the base document. The CHANGE HISTORY section for each utility describes technical changes made to that utility from Issue 5. Changes between earlier versions of the base document and Issue 5 are not included.

#### Changes from Issue 6 to Issue 7 (POSIX.1-200x)

The following list summarizes the major changes that were made in the Shell and Utilities volume of POSIX.1-200x from Issue 6 to Issue 7:

- Austin Group defect reports, IEEE Interpretations against IEEE Std 1003.1, and responses to ISO/IEC defect reports against ISO/IEC 9945 are applied.
- The Open Group corrigenda and resolutions are applied.
- Features, marked legacy or obsolescent in the base document, have been considered for removal in this version.
- A review of the use of fixed path filenames within the standard has been undertaken; for example, the *at*, *batch*, and *crontab* utilities previously had a requirement for use of the directory */usr/lib/cron*.
- The options within the standard have been revised.
  - The Batch Environment Services and Utilities option is marked obsolescent.
  - The UUCP utilities option is added.
  - The User Portability Utilities option is revised so that only the *bg*, *ex*, *fc*, *fg*, *jobs*, *more*, *talk*, and *vi* utilities are included, the rest being moved to the Base.

#### New Features in Issue 7

There are no new utilities in Issue 7.

121534

121535 **C.1.2 Relationship to Other Documents**121536 **C.1.2.1 System Interfaces**

121537 It has been pointed out that the Shell and Utilities volume of POSIX.1-200x assumes that a great  
 121538 deal of functionality from the System Interfaces volume of POSIX.1-200x is present, but never  
 121539 states exactly how much (and strictly does not need to since both are mandated on a conforming  
 121540 system). This section is an attempt to clarify the assumptions.

121541 **File Read, Write, and Creation**

121542 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/2 is applied, updating Table 1-1.

121543 **File Removal**

121544 This is intended to be a summary of the *unlink()* and *rmdir()* requirements. Note that it is  
 121545 possible using the *unlink()* function for item 4. to occur.

121546 **C.1.2.2 Concepts Derived from the ISO C Standard**

121547 This section was introduced to address the issue that there was insufficient detail presented by  
 121548 such utilities as *awk* or *sh* about their procedural control statements and their methods of  
 121549 performing arithmetic functions.

121550 The ISO C standard was selected as a model because most historical implementations of the  
 121551 standard utilities were written in C. Thus, it was more likely that they would act in the desired  
 121552 manner without modification.

121553 Using the ISO C standard is primarily a notational convenience so that the many procedural  
 121554 languages in the Shell and Utilities volume of POSIX.1-200x would not have to be rigorously  
 121555 described in every aspect. Its selection does not require that the standard utilities be written in  
 121556 Standard C; they could be written in Common Usage C, Ada, Pascal, assembler language, or  
 121557 anything else.

121558 The sizes of the various numeric values refer to C-language data types that are allowed to be  
 121559 different sizes by the ISO C standard. Thus, like a C-language application, a shell application  
 121560 cannot rely on their exact size. However, it can rely on their minimum sizes expressed in the  
 121561 ISO C standard, such as {LONG\_MAX} for a **long** type.

121562 The behavior on overflow is undefined for ISO C standard arithmetic. Therefore, the standard  
 121563 utilities can use “bignum” representation for integers so that there is no fixed maximum unless  
 121564 otherwise stated in the utility description. Similarly, standard utilities can use infinite-precision  
 121565 representations for floating-point arithmetic, as long as these representations exceed the ISO C  
 121566 standard requirements.

121567 This section addresses only the issue of semantics; it is not intended to specify syntax. For  
 121568 example, the ISO C standard requires that 0L be recognized as an integer constant equal to zero,  
 121569 but utilities such as *awk* and *sh* are not required to recognize 0L (though they are allowed to, as  
 121570 an extension).

121571 The ISO C standard requires that a C compiler must issue a diagnostic for constants that are too  
 121572 large to represent. Most standard utilities are not required to issue these diagnostics; for  
 121573 example, the command:

121574 `diff -C 2147483648 file1 file2`

121575 has undefined behavior, and the *diff* utility is not required to issue a diagnostic even if the

121576 number 2 147 483 648 cannot be represented.

### 121577 C.1.3 Utility Limits

121578 This section grew out of an idea that originated with the original POSIX.1, in the tables of system  
 121579 limits for the *sysconf()* and *pathconf()* functions. The idea being that a conforming application  
 121580 can be written to use the most restrictive values that a minimal system can provide, but it should  
 121581 not have to. The values provided represent compromises so that some vendors can use  
 121582 historically limited versions of UNIX system utilities. They are the highest values that a strictly  
 121583 conforming application can assume, given no other information.

121584 However, by using the *getconf* utility or the *sysconf()* function, the elegant application can be  
 121585 tailored to more liberal values on some of the specific instances of specific implementations.

121586 There is no explicitly stated requirement that an implementation provide finite limits for any of  
 121587 these numeric values; the implementation is free to provide essentially unbounded capabilities  
 121588 (where it makes sense), stopping only at reasonable points such as {ULONG\_MAX} (from the  
 121589 ISO C standard). Therefore, applications desiring to tailor themselves to the values on a  
 121590 particular implementation need to be ready for possibly huge values; it may not be a good idea  
 121591 to allocate blindly a buffer for an input line based on the value of {LINE\_MAX}, for instance.  
 121592 However, unlike the System Interfaces volume of POSIX.1-200x, there is no set of limits that  
 121593 return a special indication meaning “unbounded”. The implementation should always return an  
 121594 actual number, even if the number is very large.

121595 The statement:

121596 “It is not guaranteed that the application ...”

121597 is an indication that many of these limits are designed to ensure that implementors design their  
 121598 utilities without arbitrary constraints related to unimaginative programming. There are certainly  
 121599 conditions under which combinations of options can cause failures that would not render an  
 121600 implementation non-conforming. For example, {EXPR\_NEST\_MAX} and {ARG\_MAX} could  
 121601 collide when expressions are large; combinations of {BC\_SCALE\_MAX} and {BC\_DIM\_MAX}  
 121602 could exceed virtual memory.

121603 In the Shell and Utilities volume of POSIX.1-200x, the notion of a limit being guaranteed for the  
 121604 process lifetime, as it is in the System Interfaces volume of POSIX.1-200x, is not as useful to a  
 121605 shell script. The *getconf* utility is probably a process itself, so the guarantee would be without  
 121606 value. Therefore, the Shell and Utilities volume of POSIX.1-200x requires the guarantee to be for  
 121607 the session lifetime. This will mean that many vendors will either return very conservative  
 121608 values or possibly implement *getconf* as a built-in.

121609 It may seem confusing to have limits that apply only to a single utility grouped into one global  
 121610 section. However, the alternative, which would be to disperse them out into their utility  
 121611 description sections, would cause great difficulty when *sysconf()* and *getconf* were described.  
 121612 Therefore, the standard developers chose the global approach.

121613 Each language binding could provide symbol names that are slightly different from those shown  
 121614 here. For example, the C-Language Binding option adds a leading underscore to the symbols as  
 121615 a prefix.

121616 The following comments describe selection criteria for the symbols and their values:

121617 {ARG\_MAX}

121618 This is defined by the System Interfaces volume of POSIX.1-200x. Unfortunately, it is very  
 121619 difficult for a conforming application to deal with this value, as it does not know how much  
 121620 of its argument space is being consumed by the environment variables of the user.

- 121621 {BC\_BASE\_MAX}  
 121622 {BC\_DIM\_MAX}  
 121623 {BC\_SCALE\_MAX}  
 121624 These were originally one value, {BC\_SCALE\_MAX}, but it was unreasonable to link all  
 121625 three concepts into one limit.
- 121626 {CHILD\_MAX}  
 121627 This is defined by the System Interfaces volume of POSIX.1-200x.
- 121628 {COLL\_WEIGHTS\_MAX}  
 121629 The weights assigned to **order** can be considered as “passes” through the collation  
 121630 algorithm.
- 121631 {EXPR\_NEST\_MAX}  
 121632 The value for expression nesting was borrowed from the ISO C standard.
- 121633 {LINE\_MAX}  
 121634 This is a global limit that affects all utilities, unless otherwise noted. The {MAX\_CANON}  
 121635 value from the System Interfaces volume of POSIX.1-200x may further limit input lines from  
 121636 terminals. The {LINE\_MAX} value was the subject of much debate and is a compromise  
 121637 between those who wished to have unlimited lines and those who understood that many  
 121638 historical utilities were written with fixed buffers. Frequently, utility writers selected the  
 121639 UNIX system constant BUFSIZ to allocate these buffers; therefore, some utilities were  
 121640 limited to 512 bytes for I/O lines, while others achieved 4096 bytes or greater.
- 121641 It should be noted that {LINE\_MAX} applies only to input line length; there is no  
 121642 requirement in POSIX.1-200x that limits the length of output lines. Utilities such as *awk*, *sed*,  
 121643 and *paste* could theoretically construct lines longer than any of the input lines they received,  
 121644 depending on the options used or the instructions from the application. They are not  
 121645 required to truncate their output to {LINE\_MAX}. It is the responsibility of the application  
 121646 to deal with this. If the output of one of those utilities is to be piped into another of the  
 121647 standard utilities, line length restrictions will have to be considered; the *fold* utility, among  
 121648 others, could be used to ensure that only reasonable line lengths reach utilities or  
 121649 applications.
- 121650 {LINK\_MAX}  
 121651 This is defined by the System Interfaces volume of POSIX.1-200x.
- 121652 {MAX\_CANON}  
 121653 {MAX\_INPUT}  
 121654 {NAME\_MAX}  
 121655 {NGROUPS\_MAX}  
 121656 {OPEN\_MAX}  
 121657 {PATH\_MAX}  
 121658 {PIPE\_BUF}
- 121659 These limits are defined by the System Interfaces volume of POSIX.1-200x. Note that the  
 121660 byte lengths described by some of these values continue to represent bytes, even if the  
 121661 applicable character set uses a multi-byte encoding.
- 121662 {RE\_DUP\_MAX}  
 121663 The value selected is consistent with historical practice. Although the name implies that it  
 121664 applies to all REs, only BREs use the interval notation  $\{m,n\}$  addressed by this limit.
- 121665 {POSIX2\_SYMLINKS}  
 121666 The {POSIX2\_SYMLINKS} variable indicates that the underlying operating system supports  
 121667 the creation of symbolic links in specific directories. Many of the utilities defined in  
 121668 POSIX.1-200x that deal with symbolic links do not depend on this value. For example, a

121669 utility that follows symbolic links (or does not, as the case may be) will only be affected by a  
 121670 symbolic link if it encounters one. Presumably, a file system that does not support symbolic  
 121671 links will not contain any. This variable does affect such utilities as *ln -s* and *pax* that  
 121672 attempt to create symbolic links.

121673 There are different limits associated with command lines and input to utilities, depending on the  
 121674 method of invocation. In the case of a C program *exec*-ing a utility, {ARG\_MAX} is the  
 121675 underlying limit. In the case of the shell reading a script and *exec*-ing a utility, {LINE\_MAX}  
 121676 limits the length of lines the shell is required to process, and {ARG\_MAX} will still be a limit. If a  
 121677 user is entering a command on a terminal to the shell, requesting that it invoke the utility,  
 121678 {MAX\_INPUT} may restrict the length of the line that can be given to the shell to a value below  
 121679 {LINE\_MAX}.

121680 When an option is supported, *getconf* returns a value of 1. For example, when C development is  
 121681 supported:

```
121682 if ["$(getconf POSIX2_C_DEV)" -eq 1]; then
121683 echo C supported
121684 fi
```

121685 The *sysconf()* function in the C-Language Binding option would return 1.

121686 The following comments describe selection criteria for the symbols and their values:

```
121687 POSIX2_C_BIND
121688 POSIX2_C_DEV
121689 POSIX2_FORT_DEV
121690 POSIX2_FORT_RUN
121691 POSIX2_SW_DEV
121692 POSIX2_UPE
```

121693 It is possible for some (usually privileged) operations to remove utilities that support these  
 121694 options or otherwise to render these options unsupported. The header files, the *sysconf()*  
 121695 function, or the *getconf* utility will not necessarily detect such actions, in which case they  
 121696 should not be considered as rendering the implementation non-conforming. A test suite  
 121697 should not attempt tests such as:

```
121698 rm /usr/bin/c99
121699 getconf POSIX2_C_DEV
```

```
121700 POSIX2_LOCALEDEF
```

121701 This symbol was introduced to allow implementations to restrict supported locales to only  
 121702 those supplied by the implementation.

121703 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/2 is applied, deleting the entry for  
 121704 {POSIX2\_VERSION} since it is not a utility limit minimum value.

121705 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/3 is applied, changing the text in Utility  
 121706 Limits from: "utility (see *getconf*) through the *sysconf()* function defined in the System Interfaces  
 121707 volume of POSIX.1-200x. The literal names shown in Table 1-3 apply only to the *getconf* utility;  
 121708 the high-level language binding describes the exact form of each name to be used by the  
 121709 interfaces in that binding." to: "utility (see *getconf*).".

121710 **C.1.4 Grammar Conventions**

121711 There is no additional rationale provided for this section.

121712 **C.1.5 Utility Description Defaults**121713 This section is arranged with headings in the same order as all the utility descriptions. It is a  
121714 collection of related and unrelated information concerning:

- 121715 1. The default actions of utilities
- 
- 121716 2. The meanings of notations used in POSIX.1-200x that are specific to individual utility
- 
- 121717 sections

121718 Although this material may seem out of place here, it is important that this information appear  
121719 before any of the utilities to be described later.121720 **NAME**

121721 There is no additional rationale provided for this section.

121722 **SYNOPSIS**

121723 There is no additional rationale provided for this section.

121724 **DESCRIPTION**

121725 There is no additional rationale provided for this section.

121726 **OPTIONS**121727 Although it has not always been possible, the standard developers tried to avoid repeating  
121728 information to reduce the risk that duplicate explanations could each be modified differently.121729 The need to recognize `--` is required because conforming applications need to shield their  
121730 operands from any arbitrary options that the implementation may provide as an extension. For  
121731 example, if the standard utility *foo* is listed as taking no options, and the application needed to  
121732 give it a pathname with a leading hyphen, it could safely do it as:121733 `foo -- -myfile`121734 and avoid any problems with `-m` used as an extension.121735 **OPERANDS**121736 The usage of `-` is never shown in the SYNOPSIS. Similarly, the usage of `--` is never shown.121737 The requirement for processing operands in command-line order is to avoid a “WeirdNIX”  
121738 utility that might choose to sort the input files alphabetically, by size, or by directory order.  
121739 Although this might be acceptable for some utilities, in general the programmer has a right to  
121740 know exactly what order will be chosen.121741 Some of the standard utilities take multiple *file* operands and act as if they were processing the  
121742 concatenation of those files. For example:121743 `asa file1 file2`

121744 and:

121745 `cat file1 file2 | asa`

121746 have similar results when questions of file access, errors, and performance are ignored. Other

121747 utilities such as *grep* or *wc* have completely different results in these two cases. This latter type of  
 121748 utility is always identified in its DESCRIPTION or OPERANDS sections, whereas the former is  
 121749 not. Although it might be possible to create a general assertion about the former case, the  
 121750 following points must be addressed:

- 121751 • Access times for the files might be different in the operand case *versus* the *cat* case.
- 121752 • The utility may have error messages that are cognizant of the input filename, and this  
 121753 added value should not be suppressed. (As an example, *awk* sets a variable with the  
 121754 filename at each file boundary.)

## 121755 STDIN

121756 There is no additional rationale provided for this section.

## 121757 INPUT FILES

121758 A conforming application cannot assume the following three commands are equivalent:

```
121759 tail -n +2 file
121760 (sed -n 1q; cat) < file
121761 cat file | (sed -n 1q; cat)
```

121762 The second command is equivalent to the first only when the file is seekable. In the third  
 121763 command, if the file offset in the open file description were not unspecified, *sed* would have to  
 121764 be implemented so that it read from the pipe 1 byte at a time or it would have to employ some  
 121765 method to seek backwards on the pipe. Such functionality is not defined currently in POSIX.1  
 121766 and does not exist on all historical systems. Other utilities, such as *head*, *read*, and *sh*, have similar  
 121767 properties, so the restriction is described globally in this section.

121768 The definition of “text file” is strictly enforced for input to the standard utilities; very few of  
 121769 them list exceptions to the undefined results called for here. (Of course, “undefined” here does  
 121770 not mean that historical implementations necessarily have to change to start indicating error  
 121771 conditions. Conforming applications cannot rely on implementations succeeding or failing when  
 121772 non-text files are used.)

121773 The utilities that allow line continuation are generally those that accept input languages, rather  
 121774 than pure data. It would be unusual for an input line of this type to exceed {LINE\_MAX} bytes  
 121775 and unreasonable to require that the implementation allow unlimited accumulation of multiple  
 121776 lines, each of which could reach {LINE\_MAX}. Thus, for a conforming application the total of all  
 121777 the continued lines in a set cannot exceed {LINE\_MAX}.

121778 The format description is intended to be sufficiently rigorous to allow other applications to  
 121779 generate these input files. However, since <blank>s can legitimately be included in some of the  
 121780 fields described by the standard utilities, particularly in locales other than the POSIX locale, this  
 121781 intent is not always realized.

## 121782 ENVIRONMENT VARIABLES

121783 There is no additional rationale provided for this section.

121784 **ASYNCHRONOUS EVENTS**

121785 Because there is no language prohibiting it, a utility is permitted to catch a signal, perform some  
 121786 additional processing (such as deleting temporary files), restore the default signal action (or  
 121787 action inherited from the parent process), and resignal itself.

121788 **STDOUT**

121789 The format description is intended to be sufficiently rigorous to allow post-processing of output  
 121790 by other programs, particularly by an *awk* or *lex* parser.

121791 **STDERR**

121792 This section does not describe error messages that refer to incorrect operation of the utility.  
 121793 Consider a utility that processes program source code as its input. This section is used to  
 121794 describe messages produced by a correctly operating utility that encounters an error in the  
 121795 program source code on which it is processing. However, a message indicating that the utility  
 121796 had insufficient memory in which to operate would not be described.

121797 Some utilities have traditionally produced warning messages without returning a non-zero exit  
 121798 status; these are specifically noted in their sections. Other utilities shall not write to standard  
 121799 error if they complete successfully, unless the implementation provides some sort of extension to  
 121800 increase the verbosity or debugging level.

121801 The format descriptions are intended to be sufficiently rigorous to allow post-processing of  
 121802 output by other programs.

121803 **OUTPUT FILES**

121804 The format description is intended to be sufficiently rigorous to allow post-processing of output  
 121805 by other programs, particularly by an *awk* or *lex* parser.

121806 Receipt of the SIGQUIT signal should generally cause termination (unless in some debugging  
 121807 mode) that would bypass any attempted recovery actions.

121808 **EXTENDED DESCRIPTION**

121809 There is no additional rationale provided for this section.

121810 **EXIT STATUS**

121811 Note the additional discussion of exit values in *Exit Status for Commands* in the *sh* utility. It  
 121812 describes requirements for returning exit values greater than 125.

121813 A utility may list zero as a successful return, 1 as a failure for a specific reason, and greater than  
 121814 1 as “an error occurred”. In this case, unspecified conditions may cause a 2 or 3, or other value,  
 121815 to be returned. A strictly conforming application should be written so that it tests for successful  
 121816 exit status values (zero in this case), rather than relying upon the single specific error value listed  
 121817 in POSIX.1-200x. In that way, it will have maximum portability, even on implementations with  
 121818 extensions.

121819 The standard developers are aware that the general non-enumeration of errors makes it difficult  
 121820 to write test suites that test the *incorrect* operation of utilities. There are some historical  
 121821 implementations that have expended effort to provide detailed status messages and a helpful  
 121822 environment to bypass or explain errors, such as prompting, retrying, or ignoring unimportant  
 121823 syntax errors; other implementations have not. Since there is no realistic way to mandate system  
 121824 behavior in cases of undefined application actions or system problems—in a manner acceptable  
 121825 to all cultures and environments—attention has been limited to the correct operation of utilities

121826 by the conforming application. Furthermore, the conforming application does not need detailed  
121827 information concerning errors that it caused through incorrect usage or that it cannot correct.

121828 There is no description of defaults for this section because all of the standard utilities specify  
121829 something (or explicitly state “Unspecified”) for exit status.

#### 121830 **CONSEQUENCES OF ERRORS**

121831 Several actions are possible when a utility encounters an error condition, depending on the  
121832 severity of the error and the state of the utility. Included in the possible actions of various  
121833 utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; and  
121834 validity checking of the file system or directory.

121835 The text about recursive traversing is meant to ensure that utilities such as *find* process as many  
121836 files in the hierarchy as they can. They should not abandon all of the hierarchy at the first error  
121837 and resume with the next command-line operand, but should attempt to keep going.

#### 121838 **APPLICATION USAGE**

121839 This section provides additional caveats, issues, and recommendations to the developer.

#### 121840 **EXAMPLES**

121841 This section provides sample usage.

#### 121842 **RATIONALE**

121843 There is no additional rationale provided for this section.

#### 121844 **FUTURE DIRECTIONS**

121845 FUTURE DIRECTIONS sections act as pointers to related work that may impact the interface in  
121846 the future, and often cautions the developer to architect the code to account for a change in this  
121847 area. Note that a future directions statement should not be taken as a commitment to adopt a  
121848 feature or interface in the future.

#### 121849 **SEE ALSO**

121850 There is no additional rationale provided for this section.

#### 121851 **CHANGE HISTORY**

121852 There is no additional rationale provided for this section.

### 121853 **C.1.6 Considerations for Utilities in Support of Files of Arbitrary Size**

121854 This section is intended to clarify the requirements for utilities in support of large files.

121855 The utilities listed in this section are utilities which are used to perform administrative tasks  
121856 such as to create, move, copy, remove, change the permissions, or measure the resources of a file.  
121857 They are useful both as end-user tools and as utilities invoked by applications during software  
121858 installation and operation.

121859 The *chgrp*, *chmod*, *chown*, *ln*, and *rm* utilities probably require use of large file-capable versions of  
121860 *stat()*, *lstat()*, *ftw()*, and the **stat** structure.

121861 The *cat*, *cksum*, *cmp*, *cp*, *dd*, *mv*, *sum*, and *touch* utilities probably require use of large file-capable  
121862 versions of *creat()*, *open()*, and *fopen()*.

121863 The *cat*, *cksum*, *cmp*, *dd*, *df*, *du*, *ls*, and *sum* utilities may require writing large integer values. For

121864 example:

- 121865 • The *cat* utility might have a `-n` option which counts <newline>s.
- 121866 • The *cksum* and *ls* utilities report file sizes.
- 121867 • The *cmp* utility reports the line number at which the first difference occurs, and also has a
- 121868 `-l` option which reports file offsets.
- 121869 • The *dd*, *df*, *du*, *ls*, and *sum* utilities report block counts.

121870 The *dd*, *find*, and *test* utilities may need to interpret command arguments that contain 64-bit  
 121871 values. For *dd*, the arguments include `skip=n`, `seek=n`, and `count=n`. For *find*, the arguments  
 121872 include `-sizen`. For *test*, the arguments are those associated with algebraic comparisons.

121873 The *df* utility might need to access large file systems with *statofs*().

121874 The *ulimit* utility will need to use large file-capable versions of *getrlimit*() and *setrlimit*() and be  
 121875 able to read and write large integer values.

### 121876 C.1.7 Built-In Utilities

121877 All of these utilities can be *exec*-ed. There is no requirement that these utilities are actually built  
 121878 into the shell itself, but many shells need the capability to do so because XCU Section 2.9.1.1 (on  
 121879 page 2264) requires that they be found prior to the *PATH* search. The shell could satisfy its  
 121880 requirements by keeping a list of the names and directly accessing the file-system versions  
 121881 regardless of *PATH*. Providing all of the required functionality for those such as *cd* or *read* would  
 121882 be more difficult.

121883 There were originally three justifications for allowing the omission of *exec*-able versions:

- 121884 1. It would require wasting space in the file system, at the expense of very small systems.  
 121885 However, it has been pointed out that all 16 utilities in the table can be provided with 16  
 121886 links to a single-line shell script:

```
121887 $0 "$@"
```

- 121888 2. It is not logical to require invocation of utilities such as *cd* because they have no value  
 121889 outside the shell environment or cannot be useful in a child process. However, counter-  
 121890 examples always seemed to be available for even the most unusual cases:

```
121891 find . -type d -exec cd {} \; -exec foo {} \;

 121892 (which invokes "foo" on accessible directories)
```

```
121893 ps ... | sed ... | xargs kill
```

```
121894 find . -exec true \; -a ...

 121895 (where "true" is used for temporary debugging)
```

- 121896 3. It is confusing to have a utility such as *kill* that can easily be in the file system in the base  
 121897 standard, but that requires built-in status for the User Portability Utilities option (for the  
 121898 % job control job ID notation). It was decided that it was more appropriate to describe the  
 121899 required functionality (rather than the implementation) to the system implementors and  
 121900 let them decide how to satisfy it.

121901 On the other hand, it was realized that any distinction like this between utilities was not useful  
 121902 to applications, and that the cost to correct it was small. These arguments were ultimately the  
 121903 most effective.

121904 There were varying reasons for including utilities in the table of built-ins:

- 121905 *alias, fc, unalias*  
 121906 The functionality of these utilities is performed more simply within the shell itself and that  
 121907 is the model most historical implementations have used.
- 121908 *bg, fg, jobs*  
 121909 All of the job control-related utilities are eligible for built-in status because that is the model  
 121910 most historical implementations have used.
- 121911 *cd, getopts, newgrp, read, umask, wait*  
 121912 The functionality of these utilities is performed more simply within the context of the  
 121913 current process. An example can be taken from the usage of the *cd* utility. The purpose of  
 121914 the *cd* utility is to change the working directory for subsequent operations. The actions of *cd*  
 121915 affect the process in which *cd* is executed and all subsequent child processes of that process.  
 121916 Based on the POSIX standard process model, changes in the process environment of a child  
 121917 process have no effect on the parent process. If the *cd* utility were executed from a child  
 121918 process, the working directory change would be effective only in the child process. Child  
 121919 processes initiated subsequent to the child process that executed the *cd* utility would not  
 121920 have a changed working directory relative to the parent process.
- 121921 *command*  
 121922 This utility was placed in the table primarily to protect scripts that are concerned about  
 121923 their *PATH* being manipulated. The "secure" shell script example in the *command* utility in  
 121924 the Shell and Utilities volume of POSIX.1-200x would not be possible if a *PATH* change  
 121925 retrieved an alien version of *command*. (An alternative would have been to implement  
 121926 *getconf* as a built-in, but the standard developers considered that it carried too many  
 121927 changing configuration strings to require in the shell.)
- 121928 *kill* Since *kill* provides optional job control functionality using shell notation (%1, %2, and so on),  
 121929 some implementations would find it extremely difficult to provide this outside the shell.
- 121930 *true, false*  
 121931 These are in the table as a courtesy to programmers who wish to use the "while true"  
 121932 shell construct without protecting *true* from *PATH* searches. (It is acknowledged that  
 121933 "while : " also works, but the idiom with *true* is historically pervasive.)
- 121934 All utilities, including those in the table, are accessible via the *system()* and *popen()* functions in  
 121935 the System Interfaces volume of POSIX.1-200x. There are situations where the return  
 121936 functionality of *system()* and *popen()* is not desirable. Applications that require the exit status of  
 121937 the invoked utility will not be able to use *system()* or *popen()*, since the exit status returned is  
 121938 that of the command language interpreter rather than that of the invoked utility. The alternative  
 121939 for such applications is the use of the *exec* family.

## 121940 C.2 Shell Command Language

### 121941 C.2.1 Shell Introduction

121942 The System V shell was selected as the starting point for the Shell and Utilities volume of  
121943 POSIX.1-200x. The BSD C shell was excluded from consideration for the following reasons:

- 121944 • Most historically portable shell scripts assume the Version 7 Bourne shell, from which the  
121945 System V shell is derived.
- 121946 • The majority of tutorial materials on shell programming assume the System V shell.

121947 The construct "#!" is reserved for implementations wishing to provide that extension. If it were  
121948 not reserved, the Shell and Utilities volume of POSIX.1-200x would disallow it by forcing it to be  
121949 a comment. As it stands, a strictly conforming application must not use "#!" as the first two  
121950 characters of the file.

### 121951 C.2.2 Quoting

121952 There is no additional rationale provided for this section.

#### 121953 C.2.2.1 Escape Character (Backslash)

121954 There is no additional rationale provided for this section.

#### 121955 C.2.2.2 Single-Quotes

121956 A backslash cannot be used to escape a single-quote in a single-quoted string. An embedded  
121957 quote can be created by writing, for example: "'a'\''b'", which yields "a'b". (See XCU  
121958 [Section 2.6.5](#) (on page 2258) for a better understanding of how portions of words are either split  
121959 into fields or remain concatenated.) A single token can be made up of concatenated partial  
121960 strings containing all three kinds of quoting or escaping, thus permitting any combination of  
121961 characters.

#### 121962 C.2.2.3 Double-Quotes

121963 The escaped <newline> used for line continuation is removed entirely from the input and is not  
121964 replaced by any white space. Therefore, it cannot serve as a token separator.

121965 In double-quoting, if a backslash is immediately followed by a character that would be  
121966 interpreted as having a special meaning, the backslash is deleted and the subsequent character is  
121967 taken literally. If a backslash does not precede a character that would have a special meaning, it  
121968 is left in place unmodified and the character immediately following it is also left unmodified.  
121969 Thus, for example:

121970 "\\$" → \$

121971 "\a" → \a

121972 It would be desirable to include the statement "The characters from an enclosed "\${" to the  
121973 matching '}' shall not be affected by the double quotes", similar to the one for "\$()".  
121974 However, historical practice in the System V shell prevents this.

121975 The requirement that double-quotes be matched inside "\${...}" within double-quotes and the  
121976 rule for finding the matching '}' in XCU [Section 2.6.2](#) (on page 2254) eliminate several subtle  
121977 inconsistencies in expansion for historical shells in rare cases; for example:

121978 "\${foo-bar }

121979 yields **bar** when **foo** is not defined, and is an invalid substitution when **foo** is defined, in many  
 121980 historical shells. The differences in processing the "\${...}" form have led to inconsistencies  
 121981 between historical systems. A consequence of this rule is that single-quotes cannot be used to  
 121982 quote the '}' within "\${...}"; for example:

```
121983 unset bar
121984 foo="${bar-'}'"
```

121985 is invalid because the "\${...}" substitution contains an unpaired unescaped single-quote. The  
 121986 backslash can be used to escape the '}' in this example to achieve the desired result:

```
121987 unset bar
121988 foo="${bar-\}]"
```

121989 The differences in processing the "\${...}" form have led to inconsistencies between the  
 121990 historical System V shell, BSD, and KornShells, and the text in the Shell and Utilities volume of  
 121991 POSIX.1-200x is an attempt to converge them without breaking too many applications. The only  
 121992 alternative to this compromise between shells would be to make the behavior unspecified  
 121993 whenever the literal characters ' ', '{', '}', and '"' appear within "\${...}". To write a  
 121994 portable script that uses these values, a user would have to assign variables; for example:

```
121995 squote=\` dquote=\" lbrace='{` rbrace='}'
121996 ${foo-$squote$rbrace$squote}
```

121997 rather than:

```
121998 ${foo-"'}'"}
```

121999 Some implementations have allowed the end of the word to terminate the backquoted command  
 122000 substitution, such as in:

```
122001 "`echo hello"
```

122002 This usage is undefined; the matching backquote is required by the Shell and Utilities volume of  
 122003 POSIX.1-200x. The other undefined usage can be illustrated by the example:

```
122004 sh -c '` echo "foo`'
```

122005 The description of the recursive actions involving command substitution can be illustrated with  
 122006 an example. Upon recognizing the introduction of command substitution, the shell parses input  
 122007 (in a new context), gathering the source for the command substitution until an unbalanced ')' or  
 122008 or '`' is located. For example, in the following:

```
122009 echo "$(date; echo "

122010 one")"
```

122011 the double-quote following the *echo* does not terminate the first double-quote; it is part of the  
 122012 command substitution script. Similarly, in:

```
122013 echo "$(echo *)"
```

122014 the asterisk is not quoted since it is inside command substitution; however:

```
122015 echo "$(echo "*")"
```

122016 is quoted (and represents the asterisk character itself).

122017 **C.2.3 Token Recognition**

122018 The "(" and ")" symbols are control operators in the KornShell, used for an alternative  
 122019 syntax of an arithmetic expression command. A conforming application cannot use "(" as a  
 122020 single token (with the exception of the "\$(" form for shell arithmetic).

122021 On some implementations, the symbol "(" is a control operator; its use produces unspecified  
 122022 results. Applications that wish to have nested subshells, such as:

```
122023 ((echo Hello);(echo World))
```

122024 must separate the "(" characters into two tokens by including white space between them.  
 122025 Some systems may treat these as invalid arithmetic expressions instead of subshells.

122026 Certain combinations of characters are invalid in portable scripts, as shown in the grammar.  
 122027 Implementations may use these combinations (such as "|&") as valid control operators. Portable  
 122028 scripts cannot rely on receiving errors in all cases where this volume of POSIX.1-200x indicates  
 122029 that a syntax is invalid.

122030 The (3) rule about combining characters to form operators is not meant to preclude systems from  
 122031 extending the shell language when characters are combined in otherwise invalid ways.  
 122032 Conforming applications cannot use invalid combinations, and test suites should not penalize  
 122033 systems that take advantage of this fact. For example, the unquoted combination "|&" is not  
 122034 valid in a POSIX script, but has a specific KornShell meaning.

122035 The (10) rule about '#' as the current character is the first in the sequence in which a new token  
 122036 is being assembled. The '#' starts a comment only when it is at the beginning of a token. This  
 122037 rule is also written to indicate that the search for the end-of-comment does not consider escaped  
 122038 <newline> specially, so that a comment cannot be continued to the next line.

122039 **C.2.3.1 Alias Substitution**

122040 The alias capability was added because it is widely used in historical implementations by  
 122041 interactive users.

122042 The definition of "alias name" precludes an alias name containing a slash character. Since the  
 122043 text applies to the command words of simple commands, reserved words (in their proper  
 122044 places) cannot be confused with aliases.

122045 The placement of alias substitution in token recognition makes it clear that it precedes all of the  
 122046 word expansion steps.

122047 An example concerning trailing <blank>s and reserved words follows. If the user types:

```
122048 $ alias foo="/bin/ls "

 122049 $ alias while="/ "
```

122050 The effect of executing:

```
122051 $ while true

 122052 > do

 122053 > echo "Hello, World"

 122054 > done
```

122055 is a never-ending sequence of "Hello, World" strings to the screen. However, if the user  
 122056 types:

```
122057 $ foo while
```

122058 the result is an *ls* listing of /. Since the alias substitution for **foo** ends in a <space>, the next word  
 122059 is checked for alias substitution. The next word, **while**, has also been aliased, so it is substituted

122060 as well. Since it is not in the proper position as a command word, it is not recognized as a  
122061 reserved word.

122062 If the user types:

122063 `$ foo; while`

122064 `while` retains its normal reserved-word properties.

## 122065 C.2.4 Reserved Words

122066 All reserved words are recognized syntactically as such in the contexts described. However, note  
122067 that `in` is the only meaningful reserved word after a `case` or `for`; similarly, `in` is not meaningful as  
122068 the first word of a simple command.

122069 Reserved words are recognized only when they are delimited (that is, meet the definition of XBD  
122070 Section 3.438, on page 94), whereas operators are themselves delimiters. For instance, `' ( ' and  
122071 ' ) '` are control operators, so that no `<space>` is needed in `(list)`. However, `' { ' and ' } '`  
122072 are reserved words in `{ list; }`, so that in this case the leading `<space>` and semicolon are required.

122073 The list of unspecified reserved words is from the KornShell, so conforming applications cannot  
122074 use them in places a reserved word would be recognized. This list contained `time` in early  
122075 proposals, but it was removed when the `time` utility was selected for the Shell and Utilities  
122076 volume of POSIX.1-200x.

122077 There was a strong argument for promoting braces to operators (instead of reserved words), so  
122078 they would be syntactically equivalent to subshell operators. Concerns about compatibility  
122079 outweighed the advantages of this approach. Nevertheless, conforming applications should  
122080 consider quoting `' { ' and ' } '` when they represent themselves.

122081 The restriction on ending a name with a colon is to allow future implementations that support  
122082 named labels for flow control; see the RATIONALE for the `break` built-in utility.

122083 It is possible that a future version of the Shell and Utilities volume of POSIX.1-200x may require  
122084 that `' { ' and ' } '` be treated individually as control operators, although the token `" { } "` will  
122085 probably be a special-case exemption from this because of the often-used `find{ }` construct.

## 122086 C.2.5 Parameters and Variables

### 122087 C.2.5.1 Positional Parameters

122088 There is no additional rationale provided for this section.

### 122089 C.2.5.2 Special Parameters

122090 Most historical implementations implement subshells by forking; thus, the special parameter  
122091 `' $ '`  does not necessarily represent the process ID of the shell process executing the commands  
122092 since the subshell execution environment preserves the value of `' $ '` .

122093 If a subshell were to execute a background command, the value of `" $! "` for the parent would  
122094 not change. For example:

```
122095 (
122096 date &
122097 echo $!
122098)
122099 echo $!
```

122100 would echo two different values for "\$!".

122101 The "\$-" special parameter can be used to save and restore *set* options:

```
122102 Save=$(echo $- | sed 's/[ics]//g')
122103 ...
122104 set +aCefnuvx
122105 if [-n "$Save"]; then
122106 set -$Save
122107 fi
```

122108 The three options are removed using *sed* in the example because they may appear in the value of  
122109 "\$-" (from the *sh* command line), but are not valid options to *set*.

122110 The descriptions of parameters '\*' and '@' assume the reader is familiar with the field |  
122111 splitting discussion in XCU Section 2.6.5 (on page 2258) and understands that portions of the |  
122112 word remain concatenated unless there is some reason to split them into separate fields.

122113 Some examples of the '\*' and '@' properties, including the concatenation aspects:

```
122114 set "abc" "def ghi" "jkl"
122115 echo $* => "abc" "def" "ghi" "jkl"
122116 echo "$*" => "abc def ghi jkl"
122117 echo $@ => "abc" "def" "ghi" "jkl"
```

122118 but:

```
122119 echo "$@" => "abc" "def ghi" "jkl"
122120 echo "xx$@yy" => "xxabc" "def ghi" "jkl"yy"
122121 echo "$@$@" => "abc" "def ghi" "jklabc" "def ghi" "jkl"
```

122122 In the preceding examples, the double-quote characters that appear after the "=>" do not  
122123 appear in the output and are used only to illustrate word boundaries.

122124 The following example illustrates the effect of setting *IFS* to a null string:

```
122125 $ IFS=
122126 $ set foo bar bam
122127 $ echo "$@"
122128 foo bar bam
122129 $ echo "$*"
122130 foobarbam
122131 $ unset IFS
122132 $ echo "$*"
122133 foo bar bam
```

### 122134 C.2.5.3 Shell Variables

122135 See the discussion of *IFS* in Section C.2.6.5 (on page 3557) and the RATIONALE for the *sh* utility.

122136 The prohibition on *LC\_CTYPE* changes affecting lexical processing protects the shell  
122137 implementor (and the shell programmer) from the ill effects of changing the definition of  
122138 <blank> or the set of alphabetic characters in the current environment. It would probably not be  
122139 feasible to write a compiled version of a shell script without this rule. The rule applies only to  
122140 the current invocation of the shell and its subshells—invoking a shell script or performing *exec*  
122141 *sh* would subject the new shell to the changes in *LC\_CTYPE*.

122142 Other common environment variables used by historical shells are not specified by the Shell and  
122143 Utilities volume of POSIX.1-200x, but they should be reserved for the historical uses.

|        |                |                                                                                                         |
|--------|----------------|---------------------------------------------------------------------------------------------------------|
| 122144 |                | Tilde expansion for components of <i>PATH</i> in an assignment such as:                                 |
| 122145 |                | <code>PATH=~hlj/bin:~dwc/bin:\$PATH</code>                                                              |
| 122146 |                | is a feature of some historical shells and is allowed by the wording of XCU Section 2.6.1 (on page      |
| 122147 |                | 2253). Note that the tildes are expanded during the assignment to <i>PATH</i> , not when <i>PATH</i> is |
| 122148 |                | accessed during command search.                                                                         |
| 122149 |                | The following entries represent additional information about variables included in the Shell and        |
| 122150 |                | Utilities volume of POSIX.1-200x, or rationale for common variables in use by shells that have          |
| 122151 |                | been excluded:                                                                                          |
| 122152 | —              | (Underscore.) While underscore is historical practice, its overloaded usage in                          |
| 122153 |                | the KornShell is confusing, and it has been omitted from the Shell and Utilities                        |
| 122154 |                | volume of POSIX.1-200x.                                                                                 |
| 122155 | <i>ENV</i>     | This variable can be used to set aliases and other items local to the invocation                        |
| 122156 |                | of a shell. The file referred to by <i>ENV</i> differs from <i>\$HOME/.profile</i> in that              |
| 122157 |                | <i>.profile</i> is typically executed at session start-up, whereas the <i>ENV</i> file is               |
| 122158 |                | executed at the beginning of each shell invocation. The <i>ENV</i> value is                             |
| 122159 |                | interpreted in a manner similar to a dot script, in that the commands are                               |
| 122160 |                | executed in the current environment and the file needs to be readable, but not                          |
| 122161 |                | executable. However, unlike dot scripts, no <i>PATH</i> searching is performed. This                    |
| 122162 |                | is used as a guard against Trojan Horse security breaches.                                              |
| 122163 | <i>ERRNO</i>   | This variable was omitted from the Shell and Utilities volume of POSIX.1-200x                           |
| 122164 |                | because the values of error numbers are not defined in POSIX.1-200x in a                                |
| 122165 |                | portable manner.                                                                                        |
| 122166 | <i>FCEDIT</i>  | Since this variable affects only the <i>fc</i> utility, it has been omitted from this more              |
| 122167 |                | global place. The value of <i>FCEDIT</i> does not affect the command-line editing                       |
| 122168 |                | mode in the shell; see the description of <i>set -o vi</i> in the <i>set</i> built-in utility.          |
| 122169 | <i>PS1</i>     | This variable is used for interactive prompts. Historically, the “superuser”                            |
| 122170 |                | has had a prompt of ‘#’. Since privileges are not required to be monolithic, it                         |
| 122171 |                | is difficult to define which privileges should cause the alternate prompt.                              |
| 122172 |                | However, a sufficiently powerful user should be reminded of that power by                               |
| 122173 |                | having an alternate prompt.                                                                             |
| 122174 | <i>PS3</i>     | This variable is used by the KornShell for the <i>select</i> command. Since the POSIX                   |
| 122175 |                | shell does not include <i>select</i> , <i>PS3</i> was omitted.                                          |
| 122176 | <i>PS4</i>     | This variable is used for shell debugging. For example, the following script:                           |
| 122177 |                | <code>PS4=' [ \${LINENO} ]+ '</code>                                                                    |
| 122178 |                | <code>set -x</code>                                                                                     |
| 122179 |                | <code>echo Hello</code>                                                                                 |
| 122180 |                | writes the following to standard error:                                                                 |
| 122181 |                | <code>[3]+ echo Hello</code>                                                                            |
| 122182 | <i>RANDOM</i>  | This pseudo-random number generator was not seen as being useful to                                     |
| 122183 |                | interactive users.                                                                                      |
| 122184 | <i>SECONDS</i> | Although this variable is sometimes used with <i>PS1</i> to allow the display of the                    |
| 122185 |                | current time in the prompt of the user, it is not one that would be manipulated                         |
| 122186 |                | frequently enough by an interactive user to include in the Shell and Utilities                          |
| 122187 |                | volume of POSIX.1-200x.                                                                                 |

## 122188 C.2.6 Word Expansions

122189 Step (2) refers to the “portions of fields generated by step (1)”. For example, if the word being  
 122190 expanded were "\$x+\$y" and IFS=+, the word would be split only if "\$x" or "\$y" contained  
 122191 '+'; the '+' in the original word was not generated by step (1).

122192 IFS is used for performing field splitting on the results of parameter and command substitution;  
 122193 it is not used for splitting all fields. Earlier versions of the shell used it for splitting all fields  
 122194 during field splitting, but this has severe problems because the shell can no longer parse its own  
 122195 script. There are also important security implications caused by this behavior. All useful  
 122196 applications of IFS use it for parsing input of the *read* utility and for splitting the results of  
 122197 parameter and command substitution.

122198 The rule concerning expansion to a single field requires that if **foo=abc** and **bar=def**, that:

```
122199 "$foo" "$bar"
```

122200 expands to the single field:

```
122201 abcdef
```

122202 The rule concerning empty fields can be illustrated by:

```
122203 $ unset foo
122204 $ set $foo bar ' ' xyz "$foo" abc
122205 $ for i
122206 > do
122207 > echo "-$i-"
122208 > done
122209 -bar-
122210 --
122211 -xyz-
122212 --
122213 -abc-
```

122214 Step (1) indicates that parameter expansion, command substitution, and arithmetic expansion  
 122215 are all processed simultaneously as they are scanned. For example, the following is valid  
 122216 arithmetic:

```
122217 x=1
122218 echo $(($(echo 3)+$x))
```

122219 An early proposal stated that tilde expansion preceded the other steps, but this is not the case in  
 122220 known historical implementations; if it were, and if a referenced home directory contained a '\$'  
 122221 character, expansions would result within the directory name.

### 122222 C.2.6.1 Tilde Expansion

122223 Tilde expansion generally occurs only at the beginning of words, but an exception based on  
 122224 historical practice has been included:

```
122225 PATH=/posix/bin:~djk/bin
```

122226 This is eligible for tilde expansion because tilde follows a colon and none of the relevant  
 122227 characters is quoted. Consideration was given to prohibiting this behavior because any of the  
 122228 following are reasonable substitutes:

```
122229 PATH=$(printf %s ~karels/bin : ~bostic/bin)
122230 for Dir in ~maat/bin ~srb/bin ...
122231 do
```

122232           PATH=\${PATH:+\$PATH:}\$Dir  
122233 done

122234 In the first command, explicit colons are used for each directory. In all cases, the shell performs  
122235 tilde expansion on each directory because all are separate words to the shell.

122236 Note that expressions in operands such as:

122237 make -k mumble LIBDIR=~chet/lib

122238 do not qualify as shell variable assignments, and tilde expansion is not performed (unless the  
122239 command does so itself, which *make* does not).

122240 Because of the requirement that the word is not quoted, the following are not equivalent; only  
122241 the last causes tilde expansion:

122242 \~hlj/   ~h\lj/   ~"hlj"/   ~hlj\   ~hlj/

122243 In an early proposal, tilde expansion occurred following any unquoted equals sign or colon, but  
122244 this was removed because of its complexity and to avoid breaking commands such as:

122245 rcp hostname:~marc/.profile .

122246 A suggestion was made that the special sequence "\$~" should be allowed to force tilde  
122247 expansion anywhere. Since this is not historical practice, it has been left for future  
122248 implementations to evaluate. (The description in XCU [Section 2.2](#) (on page 2246) requires that a  
122249 dollar sign be quoted to represent itself, so the "\$~" combination is already unspecified.)

122250 The results of giving tilde with an unknown login name are undefined because the KornShell  
122251 "~+" and "~-" constructs make use of this condition, but in general it is an error to give an  
122252 incorrect login name with tilde. The results of having *HOME* unset are unspecified because  
122253 some historical shells treat this as an error.

### 122254 C.2.6.2 Parameter Expansion

122255 The rule for finding the closing '}' in "\${...}" is the one used in the KornShell and is  
122256 upwardly-compatible with the Bourne shell, which does not determine the closing '}' until the  
122257 word is expanded. The advantage of this is that incomplete expansions, such as:

122258 \${foo

122259 can be determined during tokenization, rather than during expansion.

122260 The string length and substring capabilities were included because of the demonstrated need for  
122261 them, based on their usage in other shells, such as C shell and KornShell.

122262 Historical versions of the KornShell have not performed tilde expansion on the word part of  
122263 parameter expansion; however, it is more consistent to do so.

### 122264 C.2.6.3 Command Substitution

122265 The "\$()" form of command substitution solves a problem of inconsistent behavior when using  
122266 backquotes. For example:

| Command              | Output |
|----------------------|--------|
| echo '\\$x'          | \\$x   |
| echo `echo '\\$x'`   | \$x    |
| echo \$(echo '\\$x') | \\$x   |

122271 Additionally, the backquoted syntax has historical restrictions on the contents of the embedded  
122272 command. While the newer "\$()" form can process any kind of valid embedded script, the

122273 backquoted form cannot handle some valid scripts that include backquotes. For example, these  
 122274 otherwise valid embedded scripts do not work in the left column, but do work on the right:

|        |                             |                             |
|--------|-----------------------------|-----------------------------|
| 122275 | echo `                      | echo \$(                    |
| 122276 | cat <<\eof                  | cat <<\eof                  |
| 122277 | a here-doc with `           | a here-doc with )           |
| 122278 | eof                         | eof                         |
| 122279 | `                           | )                           |
| 122280 | echo `                      | echo \$(                    |
| 122281 | echo abc # a comment with ` | echo abc # a comment with ) |
| 122282 | `                           | )                           |
| 122283 | echo `                      | echo \$(                    |
| 122284 | echo ` `                    | echo ` )                    |
| 122285 | `                           | )                           |

122286 Because of these inconsistent behaviors, the backquoted variety of command substitution is not  
 122287 recommended for new applications that nest command substitutions or attempt to embed  
 122288 complex scripts.

122289 The KornShell feature:

122290 If *command* is of the form `<word>`, *word* is expanded to generate a pathname, and the value  
 122291 of the command substitution is the contents of this file with any trailing `<newline>`  
 122292 deleted.

122293 was omitted from the Shell and Utilities volume of POSIX.1-200x because `$(cat word)` is an  
 122294 appropriate substitute. However, to prevent breaking numerous scripts relying on this feature, it  
 122295 is unspecified to have a script within `"$( )"` that has only redirections.

122296 The requirement to separate `"$( "` and `'('` when a single subshell is command-substituted is to  
 122297 avoid any ambiguities with arithmetic expansion.

122298 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/4 is applied, changing the text from: "If a  
 122299 command substitution occurs inside double-quotes, it shall not be performed on the results of  
 122300 the substitution." to: "If a command substitution occurs inside double-quotes, field splitting and  
 122301 pathname expansion shall not be performed on the results of the substitution.". The  
 122302 replacement text taken from the ISO POSIX-2:1993 standard is clearer about the items that are  
 122303 not performed.

122304 SD5-XCU-ERN-84 is applied, clarifying how the search for the matching backquote is satisfied.

#### 122305 C.2.6.4 Arithmetic Expansion

122306 The standard developers agreed that there was a strong desire for some kind of arithmetic  
 122307 evaluator to provide functionality similar to *expr*, that relating it to `'$'` makes it work well with  
 122308 the standard shell language and provides access to arithmetic evaluation in places where  
 122309 accessing a utility would be inconvenient.

122310 The syntax and semantics for arithmetic were revised for the ISO/IEC 9945-2:1993 standard.  
 122311 The language represents a simple subset of the previous arithmetic language (which was  
 122312 derived from the KornShell `"( )"` construct). The syntax was changed from that of a  
 122313 command denoted by `((expression))` to an expansion denoted by `$(expression)`. The new form is  
 122314 a dollar expansion `'$'` that evaluates the expression and substitutes the resulting value.  
 122315 Objections to the previous style of arithmetic included that it was too complicated, did not fit in  
 122316 well with the use of variables in the shell, and its syntax conflicted with subshells. The  
 122317 justification for the new syntax is that the shell is traditionally a macro language, and if a new

122318 feature is to be added, it should be accomplished by extending the capabilities presented by the  
 122319 current model of the shell, rather than by inventing a new one outside the model; adding a new  
 122320 dollar expansion was perceived to be the most intuitive and least destructive way to add such a  
 122321 new capability.

122322 The standard requires assignment operators to be supported (as listed in XCU Section 1.1.2, on  
 122323 page 2231), and since arithmetic expansions are not specified to be evaluated in a subshell  
 122324 environment, changes to variables there have to be in effect after the arithmetic expansion, just  
 122325 as in the parameter expansion "\$ {x=value}".

122326 Note, however, that "\$ (( x=5 ))" need not be equivalent to "\$ (( \$x=5 ))". If the value of  
 122327 the environment variable *x* is the string "y=", the expansion of "\$ (( x=5 ))" would set *x* to 5  
 122328 and output 5, but "\$ (( \$x=5 ))" would output 0 if the value of the environment variable *y* is  
 122329 not 5 and would output 1 if the environment variable *y* is 5. Similarly, if the value of the  
 122330 environment variable is 4, the expansion of "\$ (( x=5 ))" would still set *x* to 5 and output 5,  
 122331 but "\$ (( \$x=5 ))" (which would be equivalent to "\$ (( 4=5 ))") would yield a syntax  
 122332 error.

122333 In early proposals, a form `$(expression)` was used. It was functionally equivalent to the "\$ (( ))"  
 122334 of the current text, but objections were lodged that the 1988 KornShell had already implemented  
 122335 "\$ (( ))" and there was no compelling reason to invent yet another syntax. Furthermore, the  
 122336 "\$ [ ]" syntax had a minor incompatibility involving the patterns in **case** statements.

122337 The portion of the ISO C standard arithmetic operations selected corresponds to the operations  
 122338 historically supported in the KornShell. In addition to the exceptions listed in XCU Section 2.6.4  
 122339 (on page 2257), the use of the following are explicitly outside the scope of the rules defined in  
 122340 XCU Section 1.1.2.1 (on page 2231):

- The prefix operator '&' and the "[ ]", "->", and '.' operators.
- Casts

122343 It was concluded that the *test* command (I) was sufficient for the majority of relational arithmetic  
 122344 tests, and that tests involving complicated relational expressions within the shell are rare, yet  
 122345 could still be accommodated by testing the value of "\$ (( ))" itself. For example:

```
122346 # a complicated relational expression
122347 while ["$(((($x + $y)/($a * $b)) < ($foo*$bar)))" -ne 0]
```

122348 or better yet, the rare script that has many complex relational expressions could define a  
 122349 function like this:

```
122350 val() {
122351 return "$(!$1)"
122352 }
122353
```

and complicated tests would be less intimidating:

```
122354 while val "$(((($x + $y)/($a * $b)) < ($foo*$bar)))"
122355 do
122356 # some calculations
122357 done
```

122358 A suggestion that was not adopted was to modify *true* and *false* to take an optional argument,  
 122359 and *true* would exit true only if the argument was non-zero, and *false* would exit false only if the  
 122360 argument was non-zero:

```
122361 while true "$(($x > 5 && $y <= 25))"
```

122362 There is a minor portability concern with the new syntax. The example "\$ (( (2+2) ))" could have  
 122363 been intended to mean a command substitution of a utility named "2+2" in a subshell. The

122364 standard developers considered this to be obscure and isolated to some KornShell scripts  
 122365 (because "\$()" command substitution existed previously only in the KornShell). The text on  
 122366 command substitution requires that the "\$(" and '((' be separate tokens if this usage is  
 122367 needed.

122368 An example such as:

122369 `echo $((echo hi);(echo there))`

122370 should not be misinterpreted by the shell as arithmetic because attempts to balance the  
 122371 parentheses pairs would indicate that they are subshells. However, as indicated by XBD [Section](#)  
 122372 [3.112](#) (on page 49), a conforming application must separate two adjacent parentheses with white  
 122373 space to indicate nested subshells.

122374 The standard is intentionally silent about how a variable's numeric value in an expression is  
 122375 determined from its normal "sequence of bytes" value. It could be done as a text substitution, as  
 122376 a conversion like that performed by `strtol()`, or even recursive evaluation. Therefore, the only  
 122377 cases for which the standard is clear are those for which both conversions produce the same  
 122378 result. The cases where they give the same result are those where the sequence of bytes form a  
 122379 valid integer constant. Therefore, if a variable does not contain a valid integer constant, the  
 122380 behavior is unspecified.

122381 For the commands:

122382 `x=010; echo $((x += 1))`

122383 the output must be 9.

122384 For the commands:

122385 `x=' 1'; echo $((x += 1))`

122386 the results are unspecified.

122387 For the commands:

122388 `x=1+1; echo $((x += 1))`

122389 the results are unspecified.

122390 Although the ISO/IEC 9899:1999 standard now requires support for **long long** and allows  
 122391 extended integer types with higher ranks, POSIX.1-200x only requires arithmetic expansions to  
 122392 support **signed long** integer arithmetic. Implementations are encouraged to support signed  
 122393 integer values at least as large as the size of the largest file allowed on the implementation.

122394 Implementations are also allowed to perform floating-point evaluations as long as an  
 122395 application won't see different results for expressions that would not overflow **signed long**  
 122396 integer expression evaluation. (This includes appropriate truncation of results to integer values.)

122397 Changes made in response to IEEE PASC Interpretation 1003.2 #208 removed the requirement  
 122398 that the integer constant suffixes `l` and `L` had to be recognized. The ISO POSIX-2:1993 standard  
 122399 did not require the `u`, `u1`, `uL`, `U`, `U1`, `UL`, `lu`, `lU`, `Lu`, and `LU` suffixes since only signed integer  
 122400 arithmetic was required. Since all arithmetic expressions were treated as handling **signed long**  
 122401 integer types anyway, the `l` and `L` suffixes were redundant. No known scripts used them and  
 122402 some historic shells did not support them. When the ISO/IEC 9899:1999 standard was used as  
 122403 the basis for the description of arithmetic processing, the `ll` and `LL` suffixes and combinations  
 122404 were also not required. Implementations are still free to accept any or all of these suffixes, but  
 122405 are not required to do so.

122406 There was also some confusion as to whether the shell was required to recognize character  
 122407 constants. Syntactically, character constants were required to be recognized, but the

122408 requirements for the handling of backslash ('\`\`') and quote ('`''`') characters (needed to specify  
 122409 character constants) within an arithmetic expansion were ambiguous. Furthermore, no known  
 122410 shells supported them. Changes made in response to IEEE PASC Interpretation 1003.2 #208  
 122411 removed the requirement to support them (if they were indeed required before). POSIX.1-200x  
 122412 clearly does not require support for character constants.

122413 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/3 is applied, clarifying arithmetic  
 122414 expressions.

#### 122415 C.2.6.5 Field Splitting

122416 The operation of field splitting using *IFS*, as described in early proposals, was based on the way  
 122417 the KornShell splits words, but it is incompatible with other common versions of the shell.  
 122418 However, each has merit, and so a decision was made to allow both. If the *IFS* variable is unset  
 122419 or is `<space><tab><newline>`, the operation is equivalent to the way the System V shell splits  
 122420 words. Using characters outside the `<space><tab><newline>` set yields the KornShell behavior,  
 122421 where each of the non-`<space><tab><newline>`s is significant. This behavior, which affords the  
 122422 most flexibility, was taken from the way the original *awk* handled field splitting.

122423 Rule (3) can be summarized as a pseudo-ERE:

122424  $(s^*ns^* | s^+)$

122425 where *s* is an *IFS* white space character and *n* is a character in the *IFS* that is not white space.  
 122426 Any string matching that ERE delimits a field, except that the *s*<sup>+</sup> form does not delimit fields at  
 122427 the beginning or the end of a line. For example, if *IFS* is `<space>/<comma>/<tab>`, the string:

122428 `<space><space>red<space><space>, <space>white<space>blue`

122429 yields the three colors as the delimited fields.

#### 122430 C.2.6.6 Pathname Expansion

122431 There is no additional rationale provided for this section.

#### 122432 C.2.6.7 Quote Removal

122433 There is no additional rationale provided for this section.

### 122434 C.2.7 Redirection

122435 In the System Interfaces volume of POSIX.1-200x, file descriptors are integers in the range  
 122436 0–(`OPEN_MAX`–1). The file descriptors discussed in XCU Section 2.7 (on page 2259) are that  
 122437 same set of small integers.

122438 Having multi-digit file descriptor numbers for I/O redirection can cause some obscure  
 122439 compatibility problems. Specifically, scripts that depend on an example command:

122440 `echo 22>/dev/null`

122441 echoing "2" to standard error or "22" to standard output are no longer portable. However, the  
 122442 file descriptor number must still be delimited from the preceding text. For example:

122443 `cat file2>foo`

122444 writes the contents of **file2**, not the contents of **file**.

122445 The "`>|`" format of output redirection was adopted from the KornShell. Along with the  
 122446 *noclobber* option, set `-C`, it provides a safety feature to prevent inadvertent overwriting of  
 122447 existing files. (See the RATIONALE for the *pathchk* utility for why this step was taken.) The  
 122448 restriction on regular files is historical practice.

122449 The System V shell and the KornShell have differed historically on pathname expansion of *word*;  
 122450 the former never performed it, the latter only when the result was a single field (file). As a  
 122451 compromise, it was decided that the KornShell functionality was useful, but only as a shorthand  
 122452 device for interactive users. No reasonable shell script would be written with a command such  
 122453 as:

```
122454 cat foo > a*
```

122455 Thus, shell scripts are prohibited from doing it, while interactive users can select the shell with  
 122456 which they are most comfortable.

122457 The construct "2>&1" is often used to redirect standard error to the same file as standard  
 122458 output. Since the redirections take place beginning to end, the order of redirections is significant.  
 122459 For example:

```
122460 ls > foo 2>&1
```

122461 directs both standard output and standard error to file **foo**. However:

```
122462 ls 2>&1 > foo
```

122463 only directs standard output to file **foo** because standard error was duplicated as standard  
 122464 output before standard output was directed to file **foo**.

122465 The "<>" operator could be useful in writing an application that worked with several terminals,  
 122466 and occasionally wanted to start up a shell. That shell would in turn be unable to run  
 122467 applications that run from an ordinary controlling terminal unless it could make use of "<>"  
 122468 redirection. The specific example is a historical version of the pager *more*, which reads from  
 122469 standard error to get its commands, so standard input and standard output are both available  
 122470 for their usual usage. There is no way of saying the following in the shell without "<>":

```
122471 cat food | more - >/dev/tty03 2<>/dev/tty03
```

122472 Another example of "<>" is one that opens **/dev/tty** on file descriptor 3 for reading and writing:

```
122473 exec 3<> /dev/tty
```

122474 An example of creating a lock file for a critical code region:

```
122475 set -C
122476 until 2> /dev/null > lockfile
122477 do sleep 30
122478 done
122479 set +C
122480 perform critical function
122481 rm lockfile
```

122482 Since **/dev/null** is not a regular file, no error is generated by redirecting to it in *noclobber* mode.

122483 Tilde expansion is not performed on a here-document because the data is treated as if it were  
 122484 enclosed in double quotes.

### 122485 C.2.7.1 Redirecting Input

122486 There is no additional rationale provided for this section.

122487 C.2.7.2 *Redirecting Output*

122488 There is no additional rationale provided for this section.

122489 C.2.7.3 *Appending Redirected Output*

122490 Note that when a file is opened (even with the `O_APPEND` flag set), the initial file offset for that  
 122491 file is set to the beginning of the file. Some historic shells set the file offset to the current end-of-  
 122492 file when **append** mode shell redirection was used, but this is not allowed by POSIX.1-200x.

122493 C.2.7.4 *Here-Document*

122494 There is no additional rationale provided for this section.

122495 C.2.7.5 *Duplicating an Input File Descriptor*

122496 There is no additional rationale provided for this section.

122497 C.2.7.6 *Duplicating an Output File Descriptor*

122498 There is no additional rationale provided for this section.

122499 C.2.7.7 *Open File Descriptors for Reading and Writing*

122500 There is no additional rationale provided for this section.

122501 **C.2.8 Exit Status and Errors**122502 C.2.8.1 *Consequences of Shell Errors*

122503 There is no additional rationale provided for this section.

122504 C.2.8.2 *Exit Status for Commands*

122505 There is a historical difference in *sh* and *ksh* non-interactive error behavior. When a command  
 122506 named in a script is not found, some implementations of *sh* exit immediately, but *ksh* continues  
 122507 with the next command. Thus, the Shell and Utilities volume of POSIX.1-200x says that the shell  
 122508 “may” exit in this case. This puts a small burden on the programmer, who has to test for  
 122509 successful completion following a command if it is important that the next command not be  
 122510 executed if the previous command was not found. If it is important for the command to have  
 122511 been found, it was probably also important for it to complete successfully. The test for successful  
 122512 completion would not need to change.

122513 Historically, shells have returned an exit status of  $128+n$ , where  $n$  represents the signal number.  
 122514 Since signal numbers are not standardized, there is no portable way to determine which signal  
 122515 caused the termination. Also, it is possible for a command to exit with a status in the same range  
 122516 of numbers that the shell would use to report that the command was terminated by a signal.  
 122517 Implementations are encouraged to choose exit values greater than 256 to indicate programs that  
 122518 terminate by a signal so that the exit status cannot be confused with an exit status generated by a  
 122519 normal termination.

122520 Historical shells make the distinction between “utility not found” and “utility found but cannot  
 122521 execute” in their error messages. By specifying two seldomly used exit status values for these  
 122522 cases, 127 and 126 respectively, this gives an application the opportunity to make use of this  
 122523 distinction without having to parse an error message that would probably change from locale to  
 122524 locale. The *command*, *env*, *nohup*, and *xargs* utilities in the Shell and Utilities volume of

122525 POSIX.1-200x have also been specified to use this convention.

122526 When a command fails during word expansion or redirection, most historical implementations  
 122527 exit with a status of 1. However, there was some sentiment that this value should probably be  
 122528 much higher so that an application could distinguish this case from the more normal exit status  
 122529 values. Thus, the language “greater than zero” was selected to allow either method to be  
 122530 implemented.

## 122531 C.2.9 Shell Commands

122532 A description of an “empty command” was removed from an early proposal because it is only  
 122533 relevant in the cases of *sh -c " "*, *system(" ")*, or an empty shell-script file (such as the  
 122534 implementation of *true* on some historical systems). Since it is no longer mentioned in the Shell  
 122535 and Utilities volume of POSIX.1-200x, it falls into the silently unspecified category of behavior  
 122536 where implementations can continue to operate as they have historically, but conforming  
 122537 applications do not construct empty commands. (However, note that *sh* does explicitly state an  
 122538 exit status for an empty string or file.) In an interactive session or a script with other commands,  
 122539 extra <newline>s or semicolons, such as:

```
122540 $ false
122541 $
122542 $ echo $?
122543 1
```

122544 would not qualify as the empty command described here because they would be consumed by  
 122545 other parts of the grammar.

### 122546 C.2.9.1 Simple Commands

122547 The enumerated list is used only when the command is actually going to be executed. For  
 122548 example, in:

```
122549 true || $foo *
```

122550 no expansions are performed.

122551 The following example illustrates both how a variable assignment without a command name  
 122552 affects the current execution environment, and how an assignment with a command name only  
 122553 affects the execution environment of the command:

```
122554 $ x=red
122555 $ echo $x
122556 red
122557 $ export x
122558 $ sh -c 'echo $x'
122559 red
122560 $ x=blue sh -c 'echo $x'
122561 blue
122562 $ echo $x
122563 red
```

122564 This next example illustrates that redirections without a command name are still performed:

```
122565 $ ls foo
122566 ls: foo: no such file or directory
122567 $ > foo
122568 $ ls foo
122569 foo
```

122570 A command without a command name, but one that includes a command substitution, has an  
122571 exit status of the last command substitution that the shell performed. For example:

```
122572 if x=$(command)
122573 then ...
122574 fi
```

122575 An example of redirections without a command name being performed in a subshell shows that  
122576 the here-document does not disrupt the standard input of the **while** loop:

```
122577 IFS=:
122578 while read a b
122579 do echo $a
122580 <<-eof
122581 Hello
122582 eof
122583 done </etc/passwd
```

122584 Following are examples of commands without command names in AND-OR lists:

```
122585 > foo || {
122586 echo "error: foo cannot be created" >&2
122587 exit 1
122588 }
```

```
122589 # set saved if /vmunix.save exists
122590 test -f /vmunix.save && saved=1
```

122591 Command substitution and redirections without command names both occur in subshells, but  
122592 they are not necessarily the same ones. For example, in:

```
122593 exec 3> file
122594 var=$(echo foo >&3) 3>&1
```

122595 it is unspecified whether **foo** is echoed to the file or to standard output.

### 122596 Command Search and Execution

122597 This description requires that the shell can execute shell scripts directly, even if the underlying  
122598 system does not support the common "#!" interpreter convention. That is, if file **foo** contains  
122599 shell commands and is executable, the following executes **foo**:

```
122600 ./foo
```

122601 The command search shown here does not match all historical implementations. A more typical  
122602 sequence has been:

- 122603 • Any built-in (special or regular)
- 122604 • Functions
- 122605 • Path search for executable files

122606 But there are problems with this sequence. Since the programmer has no idea in advance which  
122607 utilities might have been built into the shell, a function cannot be used to override portably a  
122608 utility of the same name. (For example, a function named *cd* cannot be written for many  
122609 historical systems.) Furthermore, the *PATH* variable is partially ineffective in this case, and only  
122610 a pathname with a slash can be used to ensure a specific executable file is invoked.

122611 After the *execve()* failure described, the shell normally executes the file as a shell script. Some  
122612 implementations, however, attempt to detect whether the file is actually a script and not an

122613 executable from some other architecture. The method used by the KornShell is allowed by the  
122614 text that indicates non-text files may be bypassed.

122615 The sequence selected for the Shell and Utilities volume of POSIX.1-200x acknowledges that  
122616 special built-ins cannot be overridden, but gives the programmer full control over which  
122617 versions of other utilities are executed. It provides a means of suppressing function lookup (via  
122618 the *command* utility) for the user's own functions and ensures that any regular built-ins or  
122619 functions provided by the implementation are under the control of the path search. The  
122620 mechanisms for associating built-ins or functions with executable files in the path are not  
122621 specified by the Shell and Utilities volume of POSIX.1-200x, but the wording requires that if  
122622 either is implemented, the application is not able to distinguish a function or built-in from an  
122623 executable (other than in terms of performance, presumably). The implementation ensures that  
122624 all effects specified by the Shell and Utilities volume of POSIX.1-200x resulting from the  
122625 invocation of the regular built-in or function (interaction with the environment, variables, traps,  
122626 and so on) are identical to those resulting from the invocation of an executable file.

122627 IEEE Std 1003.1-2001/Cor 2-2004, item XCU/TC2/D6/4 is applied, updating the case where  
122628 *execve()* fails due to an error equivalent to the [ENOEXEC] error.

### 122629 Examples

122630 Consider three versions of the *ls* utility:

- 122631 1. The application includes a shell function named *ls*.
- 122632 2. The user writes a utility named *ls* and puts it in **/fred/bin**.
- 122633 3. The example implementation provides *ls* as a regular shell built-in that is invoked (either  
122634 by the shell or directly by *exec*) when the path search reaches the directory **/posix/bin**.

122635 If *PATH*=**/posix/bin**, various invocations yield different versions of *ls*:

| 122636 | Invocation                                             | Version of <i>ls</i> |
|--------|--------------------------------------------------------|----------------------|
| 122637 | <i>ls</i> (from within application script)             | (1) function         |
| 122638 | <i>command ls</i> (from within application script)     | (3) built-in         |
| 122639 | <i>ls</i> (from within makefile called by application) | (3) built-in         |
| 122640 | <i>system("ls")</i>                                    | (3) built-in         |
| 122641 | <i>PATH="/fred/bin:\$PATH" ls</i>                      | (2) user's version   |

### 122642 C.2.9.2 Pipelines

122643 Because pipeline assignment of standard input or standard output or both takes place before  
122644 redirection, it can be modified by redirection. For example:

```
122645 $ command1 2>&1 | command2
```

122646 sends both the standard output and standard error of *command1* to the standard input of  
122647 *command2*.

122648 The reserved word **!** allows more flexible testing using AND and OR lists.

122649 It was suggested that it would be better to return a non-zero value if any command in the  
122650 pipeline terminates with non-zero status (perhaps the bitwise-inclusive OR of all return values).  
122651 However, the choice of the last-specified command semantics are historical practice and would  
122652 cause applications to break if changed. An example of historical behavior:

```
122653 $ sleep 5 | (exit 4)
122654 $ echo $?
122655 4
```

```

122656 $ (exit 4) | sleep 5
122657 $ echo $?
122658 0

```

### 122659 C.2.9.3 Lists

122660 The equal precedence of "&&" and "||" is historical practice. The standard developers  
 122661 evaluated the model used more frequently in high-level programming languages, such as C, to  
 122662 allow the shell logical operators to be used for complex expressions in an unambiguous way, but  
 122663 they could not allow historical scripts to break in the subtle way unequal precedence might  
 122664 cause. Some arguments were posed concerning the "{" or "(" groupings that are required  
 122665 historically. There are some disadvantages to these groupings:

- 122666 • The "(" can be expensive, as they spawn other processes on some implementations. This  
 122667 performance concern is primarily an implementation issue.
- 122668 • The "{" braces are not operators (they are reserved words) and require a trailing space  
 122669 after each '{', and a semicolon before each}'. Most programmers (and certainly  
 122670 interactive users) have avoided braces as grouping constructs because of the problematic  
 122671 syntax required. Braces were not changed to operators because that would generate  
 122672 compatibility issues even greater than the precedence question; braces appear outside the  
 122673 context of a keyword in many shell scripts.

122674 IEEE PASC Interpretation 1003.2 #204 is applied, clarifying that the operators "&&" and "||"  
 122675 are evaluated with left associativity.

#### 122676 Asynchronous Lists

122677 The grammar treats a construct such as:

```
122678 foo & bar & bam &
```

122679 as one "asynchronous list", but since the status of each element is tracked by the shell, the term  
 122680 "element of an asynchronous list" was introduced to identify just one of the **foo**, **bar**, or **bam**  
 122681 portions of the overall list.

122682 Unless the implementation has an internal limit, such as {CHILD\_MAX}, on the retained process  
 122683 IDs, it would require unbounded memory for the following example:

```

122684 while true
122685 do foo & echo $!
122686 done

```

122687 The treatment of the signals SIGINT and SIGQUIT with asynchronous lists is described in XCU |  
 122688 [Section 2.11](#) (on page 2277).

122689 Since the connection of the input to the equivalent of /dev/null is considered to occur before  
 122690 redirections, the following script would produce no output:

```

122691 exec < /etc/passwd
122692 cat <&0 &
122693 wait

```

122694 **Sequential Lists**

122695 There is no additional rationale provided for this section.

122696 **AND Lists**

122697 There is no additional rationale provided for this section.

122698 **OR Lists**

122699 There is no additional rationale provided for this section.

122700 C.2.9.4 *Compound Commands*122701 **Grouping Commands**

122702 The semicolon shown in `{compound-list};` is an example of a control operator delimiting the } |  
 122703 reserved word. Other delimiters are possible, as shown in XCU [Section 2.10](#) (on page 2271);  
 122704 `<newline>` is frequently used.

122705 A proposal was made to use the **<do-done>** construct in all cases where command grouping in  
 122706 the current process environment is performed, identifying it as a construct for the grouping  
 122707 commands, as well as for shell functions. This was not included because the shell already has a  
 122708 grouping construct for this purpose ("`{ }`"), and changing it would have been counter-  
 122709 productive.

122710 **For Loop**

122711 The format is shown with generous usage of `<newline>`s. See the grammar in XCU [Section 2.10](#) |  
 122712 (on page 2271) for a precise description of where `<newline>`s and semicolons can be  
 122713 interchanged.

122714 Some historical implementations support '`{`' and '`}`' as substitutes for **do** and **done**. The  
 122715 standard developers chose to omit them, even as an obsolescent feature. (Note that these  
 122716 substitutes were only for the **for** command; the **while** and **until** commands could not use them  
 122717 historically because they are followed by compound-lists that may contain "`{ . . . }`" grouping  
 122718 commands themselves.)

122719 The reserved word pair **do ... done** was selected rather than **do ... od** (which would have  
 122720 matched the spirit of **if ... fi** and **case ... esac**) because *od* is already the name of a standard  
 122721 utility.

122722 PASC Interpretation 1003.2 #169 has been applied changing the grammar.

122723 **Case Conditional Construct**

122724 An optional left parenthesis before *pattern* was added to allow numerous historical KornShell  
 122725 scripts to conform. At one time, using the leading parenthesis was required if the **case** statement  
 122726 was to be embedded within a "`$( )`" command substitution; this is no longer the case with the  
 122727 POSIX shell. Nevertheless, many historical scripts use the left parenthesis, if only because it  
 122728 makes matching-parenthesis searching easier in *vi* and other editors. This is a relatively simple  
 122729 implementation change that is upwards-compatible for all scripts.

122730 Consideration was given to requiring *break* inside the *compound-list* to prevent falling through to  
 122731 the next pattern action list. This was rejected as being nonexistent practice. An interesting  
 122732 undocumented feature of the KornShell is that using "`;&`" instead of "`;;`" as a terminator  
 122733 causes the exact opposite behavior—the flow of control continues with the next *compound-list*.

122734 The pattern '`*'`', given as the last pattern in a **case** construct, is equivalent to the default case in

122735 a C-language **switch** statement.

122736 The grammar shows that reserved words can be used as patterns, even if one is the first word on  
122737 a line. Obviously, the reserved word **esac** cannot be used in this manner.

### 122738 **If Conditional Construct**

122739 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2271). |

### 122740 **While Loop**

122741 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2271). |

### 122742 **Until Loop**

122743 The precise format for the command syntax is described in XCU [Section 2.10](#) (on page 2271). |

### 122744 C.2.9.5 *Function Definition Command*

122745 The description of functions in an early proposal was based on the notion that functions should  
122746 behave like miniature shell scripts; that is, except for sharing variables, most elements of an  
122747 execution environment should behave as if they were a new execution environment, and  
122748 changes to these should be local to the function. For example, traps and options should be reset  
122749 on entry to the function, and any changes to them do not affect the traps or options of the caller.  
122750 There were numerous objections to this basic idea, and the opponents asserted that functions  
122751 were intended to be a convenient mechanism for grouping common commands that were to be  
122752 executed in the current execution environment, similar to the execution of the *dot* special  
122753 built-in.

122754 It was also pointed out that the functions described in that early proposal did not provide a local  
122755 scope for everything a new shell script would, such as the current working directory, or *umask*,  
122756 but instead provided a local scope for only a few select properties. The basic argument was that  
122757 if a local scope is needed for the execution environment, the mechanism already existed: the  
122758 application can put the commands in a new shell script and call that script. All historical shells  
122759 that implemented functions, other than the KornShell, have implemented functions that operate  
122760 in the current execution environment. Because of this, traps and options have a global scope  
122761 within a shell script. Local variables within a function were considered and included in another  
122762 early proposal (controlled by the special built-in *local*), but were removed because they do not fit  
122763 the simple model developed for functions and because there was some opposition to adding yet  
122764 another new special built-in that was not part of historical practice. Implementations should  
122765 reserve the identifier *local* (as well as *typeset*, as used in the KornShell) in case this local variable  
122766 mechanism is adopted in a future version of this standard. |

122767 A separate issue from the execution environment of a function is the availability of that function  
122768 to child shells. A few objectors maintained that just as a variable can be shared with child shells  
122769 by exporting it, so should a function. In early proposals, the *export* command therefore had a *-f*  
122770 flag for exporting functions. Functions that were exported were to be put into the environment  
122771 as *name(=value* pairs, and upon invocation, the shell would scan the environment for these and  
122772 automatically define these functions. This facility was strongly opposed and was omitted. Some  
122773 of the arguments against exportable functions were as follows:

- 122774 • There was little historical practice. The Ninth Edition shell provided them, but there was  
122775 controversy over how well it worked.
- 122776 • There are numerous security problems associated with functions appearing in the  
122777 environment of a user and overriding standard utilities or the utilities owned by the  
122778 application.

- 122779
- 122780
- There was controversy over requiring *make* to import functions, where it has historically used an *exec* function for many of its command line executions.
- 122781
- Functions can be big and the environment is of a limited size. (The counter-argument was that functions are no different from variables in terms of size: there can be big ones, and there can be small ones—and just as one does not export huge variables, one does not export huge functions. However, this might not apply to the average shell-function writer, who typically writes much larger functions than variables.)
- 122782
- 122783
- 122784
- 122785

122786 As far as can be determined, the functions in the Shell and Utilities volume of POSIX.1-200x  
122787 match those in System V. Earlier versions of the KornShell had two methods of defining  
122788 functions:

122789 `function fname { compound-list }`

122790 and:

122791 `fname() { compound-list }`

122792 The latter used the same definition as the Shell and Utilities volume of POSIX.1-200x, but  
122793 differed in semantics, as described previously. The current edition of the KornShell aligns the  
122794 latter syntax with the Shell and Utilities volume of POSIX.1-200x and keeps the former as is.

122795 The name space for functions is limited to that of a *name* because of historical practice.  
122796 Complications in defining the syntactic rules for the function definition command and in  
122797 dealing with known extensions such as the "@()" usage in the KornShell prevented the name  
122798 space from being widened to a *word*. Using functions to support synonyms such as the "!!"  
122799 and '%' usage in the C shell is thus disallowed to conforming applications, but acceptable as an  
122800 extension. For interactive users, the aliasing facilities in the Shell and Utilities volume of  
122801 POSIX.1-200x should be adequate for this purpose. It is recognized that the name space for  
122802 utilities in the file system is wider than that currently supported for functions, if the portable  
122803 filename character set guidelines are ignored, but it did not seem useful to mandate extensions  
122804 in systems for so little benefit to conforming applications.

122805 The "()" in the function definition command consists of two operators. Therefore, intermixing  
122806 <blank>s with the *fname*, '( ', and ' )' is allowed, but unnecessary.

122807 An example of how a function definition can be used wherever a simple command is allowed:

```
122808 # If variable i is equal to "yes",
122809 # define function foo to be ls -l
122810 #
122811 ["$i" = yes] && foo() {
122812 ls -l
122813 }
```

## 122814 C.2.10 Shell Grammar

122815 There are several subtle aspects of this grammar where conventional usage implies rules about  
122816 the grammar that in fact are not true.

122817 For *compound\_list*, only the forms that end in a *separator* allow a reserved word to be recognized,  
122818 so usually only a *separator* can be used where a compound list precedes a reserved word (such as  
122819 **Then**, **Else**, **Do**, and **Rbrace**). Explicitly requiring a separator would disallow such valid (if rare)  
122820 statements as:

```
122821 if (false) then (echo x) else (echo y) fi
```

122822 See the Note under special grammar rule (1).

122823 Concerning the third sentence of rule (1) (“Also, if the parser ...”):

122824 • This sentence applies rather narrowly: when a compound list is terminated by some clear  
122825 delimiter (such as the closing **fi** of an inner **if\_clause**) then it would apply; where the  
122826 compound list might continue (as in after a ‘;’), rule (7a) (and consequently the first  
122827 sentence of rule (1)) would apply. In many instances the two conditions are identical, but  
122828 this part of rule (1) does not give license to treating a **WORD** as a reserved word unless it  
122829 is in a place where a reserved word has to appear.

122830 • The statement is equivalent to requiring that when the LR(1) lookahead set contains  
122831 exactly one reserved word, it must be recognized if it is present. (Here “LR(1)” refers to the  
122832 theoretical concepts, not to any real parser generator.)

122833 For example, in the construct below, and when the parser is at the point marked with ‘^’,  
122834 the only next legal token is **then** (this follows directly from the grammar rules):

```
122835 if if...fi then ... fi
122836 ^
```

122837 At that point, the **then** must be recognized as a reserved word.

122838 (Depending on the parser generator actually used, “extra” reserved words may be in some  
122839 lookahead sets. It does not really matter if they are recognized, or even if any possible  
122840 reserved word is recognized in that state, because if it is recognized and is not in the  
122841 (theoretical) LR(1) lookahead set, an error is ultimately detected. In the example above, if  
122842 some other reserved word (for example, **while**) is also recognized, an error occurs later.

122843 This is approximately equivalent to saying that reserved words are recognized after other  
122844 reserved words (because it is after a reserved word that this condition occurs), but avoids  
122845 the “except for ...” list that would be required for **case**, **for**, and so on. (Reserved words  
122846 are of course recognized anywhere a *simple\_command* can appear, as well. Other rules take  
122847 care of the special cases of non-recognition, such as rule (4) for **case** statements.)

122848 Note that the body of here-documents are handled by token recognition (see XCU [Section 2.3](#), on  
122849 page 2247) and do not appear in the grammar directly. (However, the here-document I/O  
122850 redirection operator is handled as part of the grammar.)

122851 The start symbol of the grammar (**complete\_command**) represents either input from the  
122852 command line or a shell script. It is repeatedly applied by the interpreter to its input and  
122853 represents a single “chunk” of that input as seen by the interpreter.

#### 122854 C.2.10.1 Shell Grammar Lexical Conventions

122855 There is no additional rationale provided for this section.

#### 122856 C.2.10.2 Shell Grammar Rules

122857 There is no additional rationale provided for this section.

## 122858 C.2.11 Signals and Error Handling

122859 SD5-XCU-ERN-93 is applied, updating the first paragraph of XCU [Section 2.11](#) (on page 2277).

## 122860 C.2.12 Shell Execution Environment

122861 Some implementations have implemented the last stage of a pipeline in the current environment  
122862 so that commands such as:

```
122863 command | read foo
```

122864 set variable **foo** in the current environment. This extension is allowed, but not required;  
122865 therefore, a shell programmer should consider a pipeline to be in a subshell environment, but  
122866 not depend on it.

122867 In early proposals, the description of execution environment failed to mention that each  
122868 command in a multiple command pipeline could be in a subshell execution environment. For  
122869 compatibility with some historical shells, the wording was phrased to allow an implementation  
122870 to place any or all commands of a pipeline in the current environment. However, this means that  
122871 a POSIX application must assume each command is in a subshell environment, but not depend  
122872 on it.

122873 The wording about shell scripts is meant to convey the fact that describing “trap actions” can  
122874 only be understood in the context of the shell command language. Outside of this context, such  
122875 as in a C-language program, signals are the operative condition, not traps.

## 122876 C.2.13 Pattern Matching Notation

122877 Pattern matching is a simpler concept and has a simpler syntax than REs, as the former is  
122878 generally used for the manipulation of filenames, which are relatively simple collections of  
122879 characters, while the latter is generally used to manipulate arbitrary text strings of potentially  
122880 greater complexity. However, some of the basic concepts are the same, so this section points  
122881 liberally to the detailed descriptions in XBD [Chapter 9](#) (on page 167).

### 122882 C.2.13.1 Patterns Matching a Single Character

122883 Both quoting and escaping are described here because pattern matching must work in three  
122884 separate circumstances:

- 122885 1. Calling directly upon the shell, such as in pathname expansion or in a **case** statement. All  
122886 of the following match the string or file **abc**:

```
122887 abc "abc" a"b" c a\b c a[b] c a["b"] c a[\b] c a["\b"] c a?c a*c
```

122888 The following do not:

```
122889 "a?c" a*c a\[b]c
```

- 122890 2. Calling a utility or function without going through a shell, as described for *find* and the  
122891 *fnmatch()* function defined in the System Interfaces volume of POSIX.1-200x.
- 122892 3. Calling utilities such as *find*, *cpio*, *tar*, or *pax* through the shell command line. In this case,  
122893 shell quote removal is performed before the utility sees the argument. For example, in:

```
122894 find /bin -name "e\c[\h]o" -print
```

122895 after quote removal, the backslashes are presented to *find* and it treats them as escape  
122896 characters. Both precede ordinary characters, so the *c* and *h* represent themselves and *echo*  
122897 would be found on many historical systems (that have it in **/bin**). To find a filename that  
122898 contained shell special characters or pattern characters, both quoting and escaping are

122899 required, such as:

122900 `paX -r . . . "*"a\(\?"`

122901 to extract a filename ending with "a(?".

122902 Conforming applications are required to quote or escape the shell special characters (sometimes  
122903 called metacharacters). If used without this protection, syntax errors can result or  
122904 implementation extensions can be triggered. For example, the KornShell supports a series of  
122905 extensions based on parentheses in patterns.

122906 The restriction on a circumflex in a bracket expression is to allow implementations that support  
122907 pattern matching using the circumflex as the negation character in addition to the exclamation  
122908 mark. A conforming application must use something like "[\^!]" to match either character.

### 122909 C.2.13.2 Patterns Matching Multiple Characters

122910 Since each asterisk matches zero or more occurrences, the patterns "a\*b" and "a\*\*b" have  
122911 identical functionality.

#### 122912 Examples

122913 `a[bc]` Matches the strings "ab" and "ac".

122914 `a*d` Matches the strings "ad", "abd", and "abcd", but not the string "abc".

122915 `a*d*` Matches the strings "ad", "abcd", "abcdef", "aaaad", and "adddd".

122916 `*a*d` Matches the strings "ad", "abcd", "efabcd", "aaaad", and "adddd".

### 122917 C.2.13.3 Patterns Used for Filename Expansion

122918 The caveat about a slash within a bracket expression is derived from historical practice. The  
122919 pattern "a[b/c]d" does not match such pathnames as **abd** or **a/d**. On some implementations  
122920 (including those conforming to the Single UNIX Specification), it matched a pathname of  
122921 literally "a[b/c]d". On other systems, it produced an undefined condition (an unescaped '['  
122922 used outside a bracket expression). In this version, the XSI behavior is now required.

122923 Filenames beginning with a period historically have been specially protected from view on  
122924 UNIX systems. A proposal to allow an explicit period in a bracket expression to match a leading  
122925 period was considered; it is allowed as an implementation extension, but a conforming  
122926 application cannot make use of it. If this extension becomes popular in the future, it will be  
122927 considered for a future version of the Shell and Utilities volume of POSIX.1-200x.

122928 Historical systems have varied in their permissions requirements. To match **f\*/bar** has required  
122929 read permissions on the **f\*** directories in the System V shell, but the Shell and Utilities volume of  
122930 POSIX.1-200x, the C shell, and KornShell require only search permissions.

## 122931 C.2.14 Special Built-In Utilities

122932 See the RATIONALE sections on the individual reference pages.

## 122933 C.3 Batch Environment Services and Utilities

### 122934 Scope of the Batch Environment Services and Utilities Option

122935 This section summarizes the deliberations of the IEEE P1003.15 (Batch Environment) working  
 122936 group in the development of the Batch Environment Services and Utilities option, which covers  
 122937 a set of services and utilities defining a batch processing system.

122938 This informative section contains historical information concerning the contents of the  
 122939 amendment and describes why features were included or discarded by the working group.

### 122940 History of Batch Systems

122941 The supercomputing technical committee began as a “Birds Of a Feather” (BOF) at the January  
 122942 1987 Usenix meeting. There was enough general interest to form a supercomputing attachment  
 122943 to the /usr/group working groups. Several subgroups rapidly formed. Of those subgroups, the  
 122944 batch group was the most ambitious. The first early meetings were spent evaluating user needs  
 122945 and existing batch implementations.

122946 To evaluate user needs, individuals from the supercomputing community came and presented  
 122947 their needs. Common requests were flexibility, interoperability, control of resources, and ease-of-  
 122948 use. Backward-compatibility was not an issue. The working group then evaluated some existing  
 122949 systems. The following different systems were evaluated:

- 122950 • PROD
- 122951 • Convex Distributed Batch
- 122952 • NQS
- 122953 • CTSS
- 122954 • MDQS from Ballistics Research Laboratory (BRL)

122955 Finally, NQS was chosen as a model because it satisfied not only the most user requirements, but  
 122956 because it was public domain, already implemented on a variety of hardware platforms, and  
 122957 network-based.

### 122958 Historical Implementations of Batch Systems

122959 Deferred processing of work under the control of a scheduler has been a feature of most  
 122960 proprietary operating systems from the earliest days of multi-user systems in order to maximize  
 122961 utilization of the computer.

122962 The arrival of UNIX systems proved to be a dilemma to many hardware providers and users  
 122963 because it did not include the sophisticated batch facilities offered by the proprietary systems.  
 122964 This omission was rectified in 1986 by NASA Ames Research Center who developed the  
 122965 Network Queuing System (NQS) as a portable UNIX application that allowed the routing and  
 122966 processing of batch “jobs” in a network. To encourage its usage, the product was later put into  
 122967 the public domain. It was promptly picked up by UNIX hardware providers, and ported and  
 122968 developed for their respective hardware and UNIX implementations.

122969 Many major vendors, who traditionally offer a batch-dominated environment, ported the  
 122970 public-domain product to their systems, customized it to support the capabilities of their  
 122971 systems, and added many customer-requested features.

122972 Due to the strong hardware provider and customer acceptance of NQS, it was decided to use  
 122973 NQS as the basis for the POSIX Batch Environment amendment in 1987. Other batch systems  
 122974 considered at the time included CTSS, MDQS (a forerunner of NQS from the Ballistics Research  
 122975 Laboratory), and PROD (a Los Alamos Labs development). None were thought to have both the

122976 functionality and acceptability of NQS.

122977 **NQS Differences from the *at* utility**

122978 The base standard *at* and *batch* utilities are not sufficient to meet the batch processing needs in a  
122979 supercomputing environment and additional functionality in the areas of resource management,  
122980 job scheduling, system management, and control of output is required.

122981 **Batch Environment Services and Utilities Option Definitions**

122982 The concept of a batch job is closely related to a session with a session leader. The main  
122983 difference is that a batch job does not have a controlling terminal. There has been much debate  
122984 over whether to use the term “request” or “job”. Job was the final choice because of the  
122985 historical use of this term in the batch environment.

122986 The current definition for job identifiers is not sufficient with the model of destinations. The  
122987 current definition is:

122988 `sequence_number.originating_host`

122989 Using the model of destination, a host may include multiple batch nodes, the location of which  
122990 is identified uniquely by a name or directory service. If the current definition is used, batch  
122991 nodes running on the same host would have to coordinate their use of sequence numbers, as  
122992 sequence numbers are assigned by the originating host. The alternative is to use the originating  
122993 batch node name instead of the originating host name.

122994 The reasons for wishing to run more than one batch system per host could be the following.

122995 A test and production batch system are maintained on a single host. This is most likely in a  
122996 development facility, but could also arise when a site is moving from one version to another. The  
122997 new batch system could be installed as a test version that is completely separate from the  
122998 production batch system, so that problems can be isolated to the test system. Requiring the batch  
122999 nodes to coordinate their use of sequence numbers creates a dependency between the two  
123000 nodes, and that defeats the purpose of running two nodes.

123001 A site has multiple departments using a single host, with different management policies. An  
123002 example of contention might be in job selection algorithms. One group might want a FIFO type  
123003 of selection, while another group wishes to use a more complex algorithm based on resource  
123004 availability. Again, requiring the batch nodes to coordinate is an unnecessary binding.

123005 The proposal eventually accepted was to replace originating host with originating batch node.  
123006 This supplies sufficient granularity to ensure unique job identifiers. If more than one batch node  
123007 is on a particular host, they each have their own unique name.

123008 The queue portion of a destination is not part of the job identifier as these are not required to be  
123009 unique between batch nodes. For instance, two batch nodes may both have queues called small,  
123010 medium, and large. It is only the batch node name that is uniquely identifiable throughout the  
123011 batch system. The queue name has no additional function in this context.

123012 Assume there are three batch nodes, each of which has its own name server. On batch node one,  
123013 there are no queues. On batch node two, there are fifty queues. On batch node three, there are  
123014 forty queues. The system administrator for batch node one does not have to configure queues,  
123015 because there are none implemented. However, if a user wishes to send a job to either batch  
123016 node two or three, the system administrator for batch node one must configure a destination  
123017 that maps to the appropriate batch node and queue. If every queue is to be made accessible from  
123018 batch node one, the system administrator has to configure ninety destinations.

123019 To avoid requiring this, there should be a mechanism to allow a user to separate the destination  
123020 into a batch node name and a queue name. Then, an implementation that is configured to get to

123021 all the batch nodes does not need any more configuration to allow a user to get to all of the  
 123022 queues on all of the batch nodes. The node name is used to locate the batch node, while the  
 123023 queue name is sent unchanged to that batch node.

123024 The following are requirements that a destination identifier must be capable of providing:

- 123025 • The ability to direct a job to a queue in a particular batch node.
- 123026 • The ability to direct a job to a particular batch node.
- 123027 • The ability to group at a higher level than just one queue. This includes grouping similar  
 123028 queues across multiple batch nodes (this is a pipe queue).
- 123029 • The ability to group batch nodes. This allows a user to submit a job to a group name with  
 123030 no knowledge of the batch node configuration. This also provides aliasing as a special  
 123031 case. Aliasing is a group containing only one batch node name. The group name is the  
 123032 alias.

123033 In addition, the administrator has the following requirements:

- 123034 • The ability to control access to the queues.
- 123035 • The ability to control access to the batch nodes.
- 123036 • The ability to control access to groups of queues (pipe queues).
- 123037 • The ability to configure retry time intervals and durations.

123038 The requirements of the user are met by destination as explained in the following.

123039 The user has the ability to specify a queue name, which is known only to the batch node  
 123040 specified. There is no configuration of these queues required on the submitting node.

123041 The user has the ability to specify a batch node whose name is network-unique. The  
 123042 configuration required is that the batch node be defined as an application, just as other  
 123043 applications such as FTP are configured.

123044 Once a job reaches a queue, it can again become a user of the batch system. The batch node can  
 123045 choose to send the job to another batch node or queue or both. In other words, the routing is at  
 123046 an application level, and it is up to the batch system to choose where the job will be sent.  
 123047 Configuration is up to the batch node where the queue resides. This provides grouping of  
 123048 queues across batch nodes or within a batch node. The user submits the job to a queue, which by  
 123049 definition routes the job to other queues or nodes or both.

123050 A node name may be given to a naming service, which returns multiple addresses as opposed to  
 123051 just one. This provides grouping at a batch node level. This is a local issue, meaning that the  
 123052 batch node must choose only one of these addresses. The list of addresses is not sent with the  
 123053 job, and once the job is accepted on another node, there is no connection between the list and the  
 123054 job. The requirements of the administrator are met by destination as explained in the following.

123055 The control of queues is a batch system issue, and will be done using the batch administrative  
 123056 utilities.

123057 The control of nodes is a network issue, and will be done through whatever network facilities  
 123058 are available.

123059 The control of access to groups of queues (pipe queues) is covered by the control of any other  
 123060 queue. The fact that the job may then be sent to another destination is not relevant.

123061 The propagation of a job across more than one point-to-point connection was dropped because  
 123062 of its complexity and because all of the issues arising from this capability could not be resolved.  
 123063 It could be provided as additional functionality at some time in the future.

123064 The addition of *network* as a defined term was done to clarify the difference between a network  
 123065 of batch nodes as opposed to a network of hosts. A network of batch nodes is referred to as a  
 123066 batch system. The network refers to the actual host configuration. A single host may have  
 123067 multiple batch nodes.

123068 In the absence of a standard network naming convention, this option establishes its own  
 123069 convention for the sake of consistency and expediency. This is subject to change, should a future  
 123070 working group develop a standard naming convention for network pathnames.

### 123071 C.3.1 Batch General Concepts

123072 During the development of the Batch Environment Services and Utilities option, a number of  
 123073 topics were discussed at length which influenced the wording of the normative text but could  
 123074 not be included in the final text. The following items are some of the most significant terms and  
 123075 concepts of those discussed:

- 123076 • Small and Consistent Command Set

123077 Often, conventional utilities from UNIX systems have a very complicated utility syntax  
 123078 and usage. This can often result in confusion and errors when trying to use them. The  
 123079 Batch Environment Services and Utilities option utility set, on the other hand, has been  
 123080 paired to a small set of robust utilities with an orthogonal calling sequence.

- 123081 • Checkpoint/Restart

123082 This feature permits an already executing process to checkpoint or save its contents. Some  
 123083 implementations permit this at both the batch utility level (for example, checkpointing this  
 123084 job upon its abnormal termination) or from within the job itself via a system call. Support  
 123085 of checkpoint/restart is optional. A conscious, careful effort was made to make the *qsub*  
 123086 utility consistently refer to checkpoint/restart as optional functionality.

- 123087 • Rerunability

123088 When a user submits a job for batch processing, they can designate it “rerunnable” in that  
 123089 it will automatically resume execution from the start of the job if the machine on which it  
 123090 was executing crashes for some reason. The decision on whether the job will be rerun or  
 123091 not is entirely up to the submitter of the job and no decisions will be made within the batch  
 123092 system. A job that is rerunnable and has been submitted with the proper  
 123093 checkpoint/restart switch will first be checkpointed and execution begun from that point.  
 123094 Furthermore, use of the implementation-defined checkpoint/restart feature will not be  
 123095 defined in this context.

- 123096 • Error Codes

123097 All utilities exit with error status zero (0) if successful, one (1) if a user error occurred, and  
 123098 two (2) for an internal Batch Environment Services and Utilities option error.

- 123099 • Level of Portability

123100 Portability is specified at both the user, operator, and administrator levels. A conforming  
 123101 batch implementation prevents identical functionality and behavior at all these levels.  
 123102 Additionally, portable batch shell scripts with embedded Batch Environment Services and  
 123103 Utilities option utilities add an additional level of portability.

- 123104 • Resource Specification

123105 A small set of globally understood resources, such as memory and CPU time, is specified.  
 123106 All conforming batch implementations are able to process them in a manner consistent  
 123107 with the yet-to-be-developed resource management model. Resources not in this  
 123108 amendment set are ignored and passed along as part of the argument stream of the utility.

- 123109
- Queue Position
- 123110 Queue position is the place a job occupies in a queue. It is dependent on a variety of factors  
123111 such as submission time and priority. Since priority may be affected by the implementation  
123112 of fair share scheduling, the definition of queue position is implementation-defined.
- 123113
- Queue ID
- 123114 A numerical queue ID is an external requirement for purposes of accounting. The  
123115 identification number was chosen over queue name for processing convenience.
- 123116
- Job ID
- 123117 A common notion of “jobs” is a collection of processes whose process group cannot be  
123118 altered and is used for resource management and accounting. This concept is  
123119 implementation-defined and, as such, has been omitted from the batch amendment.
- 123120
- Bytes *versus* Words
- 123121 Except for one case, bytes are used as the standard unit for memory size. Furthermore, the  
123122 definition of a word varies from machine to machine. Therefore, bytes will be the default  
123123 unit of memory size.
- 123124
- Regular Expressions
- 123125 The standard definition of regular expressions is much too broad to be used in the batch  
123126 utility syntax. All that is needed is a simple concept of “all”; for example, delete all my jobs  
123127 from the named queue. For this reason, regular expressions have been eliminated from the  
123128 batch amendment.
- 123129
- Display Privacy
- 123130 How much data should be displayed locally through functions? Local policy dictates the  
123131 amount of privacy. Library functions must be used to create and enforce local policy.  
123132 Network and local *qstats* must reflect the policy of the server machine.
- 123133
- Remote Host Naming Convention
- 123134 It was decided that host names would be a maximum of 255 characters in length, with at  
123135 most 15 characters being shown in displays. The 255 character limit was chosen because it  
123136 is consistent with BSD. The 15-character limit was an arbitrary decision.
- 123137
- Network Administration
- 123138 Network administration is important, but is outside the scope of the batch amendment.  
123139 Network administration could be done with *rsh*. However, authentication becomes two-  
123140 sided.
- 123141
- Network Administration Philosophy
- 123142 Keep it simple. Centralized management should be possible. For example, Los Alamos  
123143 needs a dumb set of CPUs to be managed by a central system *versus* several  
123144 independently-managed systems as is the general case for the Batch Environment Services  
123145 and Utilities option.
- 123146
- Operator Utility Defaults (that is, Default Host, User, Account, and so on)
- 123147 It was decided that usability would override orthogonality and syntactic consistency.
- 123148
- The Batch System Manager and Operator Distinction
- 123149 The distinction between manager and operator is that operators can only control the flow  
123150 of jobs. A manager can alter the batch system configuration in addition to job flow. POSIX

123151 makes a distinction between user and system administrator but goes no further. The  
 123152 concepts of manager and operator privileges fall under local policy. The distinction  
 123153 between manager and operator is historical in batch environments, and the Batch  
 123154 Environment Services and Utilities option has continued that distinction.

123155 • The Batch System Administrator

123156 An administrator is equivalent to a batch system manager.

### 123157 C.3.2 Batch Services

123158 This rationale is provided as informative rather than normative text, to avoid placing  
 123159 requirements on implementors regarding the use of symbolic constants, but at the same time to  
 123160 give implementors a preferred practice for assigning values to these constants to promote  
 123161 interoperability.

123162 The *Checkpoint* and *Minimum\_Cpu\_Interval* attributes induce a variety of behavior depending  
 123163 upon their values. Some jobs cannot or should not be checkpointed. Other users will simply  
 123164 need to ensure job continuation across planned downtimes; for example, scheduled preventive  
 123165 maintenance. For users consuming expensive resources, or for jobs that run longer than the  
 123166 mean time between failures, however, periodic checkpointing may be essential. However,  
 123167 system administrators must be able to set minimum checkpoint intervals on a queue-by-queue  
 123168 basis to guard against, for example, naive users specifying interval values too small on memory-  
 123169 intensive jobs. Otherwise, system overhead would adversely affect performance.

123170 The use of symbolic constants, such as `NO_CHECKPOINT`, was introduced to lend a degree of  
 123171 formalism and portability to this option.

123172 Support for checkpointing is optional for servers. However, clients must provide for the `-c`  
 123173 option, since in a distributed environment the job may run on a server that does provide such  
 123174 support, even if the host of the client does not support the checkpoint feature.

123175 If the user does not specify the `-c` option, the default action is left unspecified by this option.  
 123176 Some implementations may wish to do checkpointing by default; others may wish to checkpoint  
 123177 only under an explicit request from the user.

123178 The *Priority* attribute has been made non-optional. All clients already had been required to  
 123179 support the `-p` option. The concept of prioritization is common in historical implementations.  
 123180 The default priority is left to the server to establish.

123181 The *Hold\_Types* attribute has been modified to allow for implementation-defined hold types to  
 123182 be passed to a batch server.

123183 It was the intent of the IEEE P1003.15 working group to mandate the support for the  
 123184 *Resource\_List* attribute in this option by referring to another amendment, specifically the  
 123185 IEEE P1003.1a draft standard. However, during the development of the IEEE P1003.1a draft  
 123186 standard this was excluded. As such this requirement has been removed from the normative  
 123187 text.

123188 The *Shell\_Path* attribute has been modified to accept a list of shell paths that are associated with  
 123189 a host. The name of the attribute has been changed to *Shell\_Path\_List*.

### 123190 C.3.3 Common Behavior for Batch Environment Utilities

123191 This section was defined to meet the goal of a “Small and Consistent Command Set” for this  
123192 option.

## 123193 C.4 Utilities

123194 For the utilities included in POSIX.1-200x, see the RATIONALE sections on the individual  
123195 reference pages.

### 123196 Exclusion of Utilities

123197 The set of utilities contained in POSIX.1-200x is drawn from the base documents, with one  
123198 addition: the *c99* utility. This section contains rationale for some of the deliberations that led to  
123199 this set of utilities, and why certain utilities were excluded.

123200 Many utilities were evaluated by the standard developers; more historical utilities were  
123201 excluded from the base documents than included. The following list contains many common  
123202 UNIX system utilities that were not included as mandatory utilities, in the User Portability  
123203 Utilities option, in the XSI option, or in one of the software development groups. It is logistically  
123204 difficult for this rationale to distribute correctly the reasons for not including a utility among the  
123205 various utility options. Therefore, this section covers the reasons for all utilities not included in  
123206 POSIX.1-200x.

123207 This rationale is limited to a discussion of only those utilities actively or indirectly evaluated by  
123208 the standard developers of the base documents, rather than the list of all known UNIX utilities  
123209 from all its variants.

123210 *adb* The intent of the various software development utilities was to assist in the  
123211 installation (rather than the actual development and debugging) of applications.  
123212 This utility is primarily a debugging tool. Furthermore, many useful aspects of *adb*  
123213 are very hardware-specific.

123214 *as* Assemblers are hardware-specific and are included implicitly as part of the  
123215 compilers in POSIX.1-200x.

123216 *banner* The only known use of this command is as part of the *lp* printer header pages. It  
123217 was decided that the format of the header is implementation-defined, so this utility  
123218 is superfluous to application portability.

123219 *calendar* This reminder service program is not useful to conforming applications.

123220 *cancel* The *lp* (line printer spooling) system specified is the most basic possible and did  
123221 not need this level of application control.

123222 *chroot* This is primarily of administrative use, requiring superuser privileges.

123223 *col* No utilities defined in POSIX.1-200x produce output requiring such a filter. The  
123224 *nroff* text formatter is present on many historical systems and will continue to  
123225 remain as an extension; *col* is expected to be shipped by all the systems that ship  
123226 *nroff*.

123227 *cpio* This has been replaced by *pax*, for reasons explained in the rationale for that utility.

123228 *cpp* This is subsumed by *c99*.

123229 *cu* This utility is terminal-oriented and is not useful from shell scripts or typical  
123230 application programs.

|        |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 123231 | <i>dc</i>     | The functionality of this utility can be provided by the <i>bc</i> utility; <i>bc</i> was selected because it was easier to use and had superior functionality. Although the historical versions of <i>bc</i> are implemented using <i>dc</i> as a base, POSIX.1-200x prescribes the interface and not the underlying mechanism used to implement it.                                                                                                                                                                                                                                                                                                                            |
| 123232 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123233 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123234 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123235 | <i>dircmp</i> | Although a useful concept, the historical output of this directory comparison program is not suitable for processing in application programs. Also, the <i>diff -r</i> command gives equivalent functionality.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 123236 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 123238 | <i>dis</i>    | Disassemblers are hardware-specific.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 123239 | <i>emacs</i>  | The community of <i>emacs</i> editing enthusiasts was adamant that the full <i>emacs</i> editor not be included in the base documents because they were concerned that an attempt to standardize this very powerful environment would encourage vendors to ship versions conforming strictly to the standard, but lacking the extensibility required by the community. The author of the original <i>emacs</i> program also expressed his desire to omit the program. Furthermore, there were a number of historical UNIX systems that did not include <i>emacs</i> , or included it without supporting it, but there were very few that did not include and support <i>vi</i> . |

| 123248 | <i>line</i>   | The functionality of <i>line</i> can be provided with <i>read</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 123249 | <i>lint</i>   | This technology is partially subsumed by <i>c99</i> . It is also hard to specify the degree of checking for possible error conditions in programs in any compiler, and specifying what <i>lint</i> would do in these cases is equally difficult.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 123250 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123251 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123252 |               | It is fairly easy to specify what a compiler does. It requires specifying the language, what it does with that language, and stating that the interpretation of any incorrect program is unspecified. Unfortunately, any description of <i>lint</i> is required to specify what to do with erroneous programs. Since the number of possible errors and questionable programming practices is infinite, one cannot require <i>lint</i> to detect all errors of any given class.                                                                                                                                                                                                   |
| 123253 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123254 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 123256 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123257 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 123258 |               | Additionally, some vendors complained that since many compilers are distributed in a binary form without a <i>lint</i> facility (because the ISO C standard does not require one), implementing the standard as a stand-alone product will be much harder. Rather than being able to build upon a standard compiler component (simply by providing <i>c99</i> as an interface), source to that compiler would most likely need to be modified to provide the <i>lint</i> functionality. This was considered a major burden on system providers for a very small gain to developers (users).                                                                                      |

| 123318 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 123319 |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|        |               |                                                                                                                                                                                                                                                                                                                                 |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 123320 | <i>spell</i>  | This utility is not useful from shell scripts or typical application programs. The <i>spell</i> utility was considered, but was omitted because there is no known technology that can be used to make it recognize general language for user-specified input without providing a complete dictionary along with the input file. |
| 123321 |               |                                                                                                                                                                                                                                                                                                                                 |
| 123322 |               |                                                                                                                                                                                                                                                                                                                                 |
| 123323 |               |                                                                                                                                                                                                                                                                                                                                 |
| 123324 | <i>su</i>     | This utility is not useful from shell scripts or typical application programs. (There was also sentiment to avoid security-related utilities.)                                                                                                                                                                                  |
| 123325 |               |                                                                                                                                                                                                                                                                                                                                 |
| 123326 | <i>sum</i>    | This utility was renamed <i>cksum</i> .                                                                                                                                                                                                                                                                                         |
| 123327 | <i>tar</i>    | This has been replaced by <i>pax</i> , for reasons explained in the rationale for that utility.                                                                                                                                                                                                                                 |
| 123328 | <i>unpack</i> | This compression program was considered inferior to <i>uncompress</i> .                                                                                                                                                                                                                                                         |
| 123329 | <i>wall</i>   | This utility is terminal-oriented and is not useful in shell scripts or typical applications. It is generally used only by system administrators.                                                                                                                                                                               |
| 123330 |               |                                                                                                                                                                                                                                                                                                                                 |

*The Institute of Electrical and Electronics Engineers, Inc.*

## Portability Considerations (Informative)

This section contains information to satisfy various international requirements:

- [Section D.1](#) describes perceived user requirements.
- [Section D.2](#) (on page 3586) indicates how the facilities of POSIX.1-200x satisfy those requirements.
- [Section D.3](#) (on page 3594) offers guidance to writers of profiles on how the configurable options, limits, and optional behavior of POSIX.1-200x should be cited in profiles.

### D.1 User Requirements

This section describes the user requirements that were perceived by the standard developers. The primary source for these requirements was an analysis of historical practice in widespread use, as typified by the base documents listed in [Section A.1.1](#) (on page 3313).

POSIX.1-200x addresses the needs of users requiring open systems solutions for source code portability of applications. It currently addresses users requiring open systems solutions for source-code portability of applications involving multi-programming and process management (creating processes, signaling, and so on); access to files and directories in a hierarchy of file systems (opening, reading, writing, deleting files, and so on); access to asynchronous communications ports and other special devices; access to information about other users of the system; facilities supporting applications requiring bounded (realtime) response.

The following users are identified for POSIX.1-200x:

- Those employing applications written in high-level languages, such as C, Ada, or FORTRAN.
- Users who desire conforming applications that do not necessarily require the characteristics of high-level languages (for example, the speed of execution of compiled languages or the relative security of source code intellectual property inherent in the compilation process).
- Users who desire conforming applications that can be developed quickly and can be modified readily without the use of compilers and other system components that may be unavailable on small systems or those without special application development capabilities.
- Users who interact with a system to achieve general-purpose time-sharing capabilities common to most business or government offices or academic environments: editing, filing, inter-user communications, printing, and so on.
- Users who develop applications for POSIX-conformant systems.
- Users who develop applications for UNIX systems.

An acknowledged restriction on applicable users is that they are limited to the group of individuals who are familiar with the style of interaction characteristic of historically-derived systems based on one of the UNIX operating systems (as opposed to other historical systems with different models, such as MS/DOS, Macintosh, VMS, MVS, and so on). Typical users

123375 would include program developers, engineers, or general-purpose time-sharing users.

123376 The requirements of users of POSIX.1-200x can be summarized as a single goal: *application source*  
 123377 *portability*. The requirements of the user are stated in terms of the requirements of portability of  
 123378 applications. This in turn becomes a requirement for a standardized set of syntax and semantics  
 123379 for operations commonly found on many operating systems.

123380 The following sections list the perceived requirements for application portability.

### 123381 **D.1.1 Configuration Interrogation**

123382 An application must be able to determine whether and how certain optional features are  
 123383 provided and to identify the system upon which it is running, so that it may appropriately adapt  
 123384 to its environment.

123385 Applications must have sufficient information to adapt to varying behaviors of the system.

### 123386 **D.1.2 Process Management**

123387 An application must be able to manage itself, either as a single process or as multiple processes.  
 123388 Applications must be able to manage other processes when appropriate.

123389 Applications must be able to identify, control, create, and delete processes, and there must be  
 123390 communication of information between processes and to and from the system.

123391 Applications must be able to use multiple flows of control with a process (threads) and  
 123392 synchronize operations between these flows of control.

### 123393 **D.1.3 Access to Data**

123394 Applications must be able to operate on the data stored on the system, access it, and transmit it  
 123395 to other applications. Information must have protection from unauthorized or accidental access  
 123396 or modification.

### 123397 **D.1.4 Access to the Environment**

123398 Applications must be able to access the external environment to communicate their input and  
 123399 results.

### 123400 **D.1.5 Access to Determinism and Performance Enhancements**

123401 Applications must have sufficient control of resource allocation to ensure the timeliness of  
 123402 interactions with external objects.

### 123403 **D.1.6 Operating System-Dependent Profile**

123404 The capabilities of the operating system may make certain optional characteristics of the base  
 123405 language in effect no longer optional, and this should be specified.

- 123406 **D.1.7 I/O Interaction**
- 123407 The interaction between the C language I/O subsystem (*stdio*) and the I/O subsystem of  
123408 POSIX.1-200x must be specified.
- 123409 **D.1.8 Internationalization Interaction**
- 123410 The effects of the environment of POSIX.1-200x on the internationalization facilities of the C  
123411 language must be specified.
- 123412 **D.1.9 C-Language Extensions**
- 123413 Certain functions in the C language must be extended to support the additional capabilities  
123414 provided by POSIX.1-200x.
- 123415 **D.1.10 Command Language**
- 123416 Users should be able to define procedures that combine simple tools and/or applications into  
123417 higher-level components that perform to the specific needs of the user. The user should be able  
123418 to store, recall, use, and modify these procedures. These procedures should employ a powerful  
123419 command language that is used for recurring tasks in conforming applications (scripts) in the  
123420 same way that it is used interactively to accomplish one-time tasks. The language and the  
123421 utilities that it uses must be consistent between systems to reduce errors and retraining.
- 123422 **D.1.11 Interactive Facilities**
- 123423 Use the system to accomplish individual tasks at an interactive terminal. The interface should be  
123424 consistent, intuitive, and offer usability enhancements to increase the productivity of terminal  
123425 users, reduce errors, and minimize retraining costs. Online documentation or usage assistance  
123426 should be available.
- 123427 **D.1.12 Accomplish Multiple Tasks Simultaneously**
- 123428 Access applications and interactive facilities from a single terminal without requiring serial  
123429 execution: switch between multiple interactive tasks; schedule one-time or periodic background  
123430 work; display the status of all work in progress or scheduled; influence the priority scheduling  
123431 of work, when authorized.
- 123432 **D.1.13 Complex Data Manipulation**
- 123433 Manipulate data in files in complex ways: sort, merge, compare, translate, edit, format, pattern  
123434 match, select subsets (strings, columns, fields, rows, and so on). These facilities should be  
123435 available to both conforming applications and interactive users.
- 123436 **D.1.14 File Hierarchy Manipulation**
- 123437 Create, delete, move/rename, copy, backup/archive, and display files and directories. These  
123438 facilities should be available to both conforming applications and interactive users.

123439 **D.1.15 Locale Configuration**

123440 Customize applications and interactive sessions for the cultural and language conventions of the  
 123441 user. Employ a wide variety of standard character encodings. These facilities should be available  
 123442 to both conforming applications and interactive users.

123443 **D.1.16 Inter-User Communication**

123444 Send messages or transfer files to other users on the same system or other systems on a network.  
 123445 These facilities should be available to both conforming applications and interactive users.

123446 **D.1.17 System Environment**

123447 Display information about the status of the system (activities of users and their interactive and  
 123448 background work, file system utilization, system time, configuration, and presence of optional  
 123449 facilities) and the environment of the user (terminal characteristics, and so on). Inform the  
 123450 system operator/administrator of problems. Control access to user files and other resources.

123451 **D.1.18 Printing**

123452 Output files on a variety of output device classes, accessing devices on local or network-  
 123453 connected systems. Control (or influence) the formatting, priority scheduling, and output  
 123454 distribution of work. These facilities should be available to both conforming applications and  
 123455 interactive users.

123456 **D.1.19 Software Development**

123457 Develop (create and manage source files, compile/interpret, debug) portable open systems  
 123458 applications and package them for distribution to, and updating of, other systems.

123459 **D.2 Portability Capabilities**

123460 This section describes the significant portability capabilities of POSIX.1-200x and indicates how  
 123461 the user requirements listed in [Section D.1](#) (on page 3583) are addressed. The capabilities are  
 123462 listed in the same format as the preceding user requirements; they are summarized below:

- 123463 • Configuration Interrogation
- 123464 • Process Management
- 123465 • Access to Data
- 123466 • Access to the Environment
- 123467 • Access to Determinism and Performance Enhancements
- 123468 • Operating System-Dependent Profile
- 123469 • I/O Interaction
- 123470 • Internationalization Interaction
- 123471 • C-Language Extensions
- 123472 • Command Language
- 123473 • Interactive Facilities

- 123474 • Accomplish Multiple Tasks Simultaneously
- 123475 • Complex Data Manipulation
- 123476 • File Hierarchy Manipulation
- 123477 • Locale Configuration
- 123478 • Inter-User Communication
- 123479 • System Environment
- 123480 • Printing
- 123481 • Software Development

### 123482 D.2.1 Configuration Interrogation

123483 The *uname()* operation provides basic identification of the system. The *sysconf()*, *pathconf()*, and  
 123484 *fpathconf()* functions and the *getconf* utility provide means to interrogate the implementation to  
 123485 determine how to adapt to the environment in which it is running. These values can be either  
 123486 static (indicating that all instances of the implementation have the same value) or dynamic  
 123487 (indicating that different instances of the implementation have the different values, or that the  
 123488 value may vary for other reasons, such as reconfiguration).

#### 123489 Unsatisfied Requirements

123490 None directly. However, as new areas are added, there will be a need for additional capability in  
 123491 this area.

### 123492 D.2.2 Process Management

123493 The *fork()*, *exec* family, *posix\_spawn()*, and *posix\_spawnp()* functions provide for the creation of  
 123494 new processes or the insertion of new applications into existing processes. The *\_Exit()*, *\_exit()*,  
 123495 *exit()*, and *abort()* functions allow for the termination of a process by itself. The *wait()*, *waitid()*,  
 123496 and *waitpid()* functions allow one process to deal with the termination of another.

123497 The *times()* function allows for basic measurement of times used by a process. Various  
 123498 functions, including *fstat()*, *getegid()*, *geteuid()*, *getgid()*, *getgrgid()*, *getgrnam()*, *getlogin()*,  
 123499 *getpid()*, *getppid()*, *getpwnam()*, *getpwuid()*, *getuid()*, *lstat()*, and *stat()*, provide for access to the  
 123500 identifiers of processes and the identifiers and names of owners of processes (and files).

123501 The various functions operating on environment variables provide for communication of  
 123502 information (primarily user-configurable defaults) from a parent to child processes.

123503 The operations on the current working directory control and interrogate the directory from  
 123504 which relative filename searches start. The *umask()* function controls the default protections  
 123505 applied to files created by the process.

123506 The *alarm()*, *pause()*, *sleep()*, *ualarm()*, and *usleep()* operations allow the process to suspend until  
 123507 a timer has expired or to be notified when a period of time has elapsed. The *time()* operation  
 123508 interrogates the current time and date.

123509 The signal mechanism provides for communication of events either from other processes or  
 123510 from the environment to the application, and the means for the application to control the effect  
 123511 of these events. The mechanism provides for external termination of a process and for a process  
 123512 to suspend until an event occurs. The mechanism also provides for a value to be associated with  
 123513 an event.

123514 Job control provides a means to group processes and control them as groups, and to control their

123515 access to the function between the user and the system (the “controlling terminal”). It also  
123516 provides the means to suspend and resume processes.

123517 The Process Scheduling option provides control of the scheduling and priority of a process.

123518 The Message Passing option provides a means for interprocess communication involving small  
123519 amounts of data.

123520 The Memory Management facilities provide control of memory resources and for the sharing of  
123521 memory. This functionality is mandatory on POSIX-conforming systems.

123522 The Threads facilities provide multiple flows of control with a process (threads),  
123523 synchronization between threads (including mutexes, barriers, and spin locks), association of  
123524 data with threads, and controlled cancellation of threads.

123525 The XSI interprocess communications functionality provide an alternate set of facilities to  
123526 manipulate semaphores, message queues, and shared memory. These are provided on XSI-  
123527 conformant systems to support conforming applications developed to run on UNIX systems.

### 123528 D.2.3 Access to Data

123529 The *open()*, *close()*, *fclose()*, *fopen()*, and *pipe()* functions provide for access to files and data.  
123530 Such files may be regular files, interprocess data channels (pipes), or devices. Additional types  
123531 of objects in the file system are permitted and are being contemplated for standardization.

123532 The *access()*, *chmod()*, *chown()*, *dup()*, *dup2()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*, *lstat()*,  
123533 *readlink()*, *realpath()*, *stat()*, and *utime()* functions allow for control and interrogation of file and  
123534 file-related objects (including symbolic links), and their ownership, protections, and timestamps.

123535 The *fgetc()*, *fputc()*, *fread()*, *fseek()*, *fsetpos()*, *fwrite()*, *getc()*, *getchar()*, *lseek()*, *putchar()*, *putc()*,  
123536 *read()*, and *write()* functions provide for data transfer from the application to files (in all their  
123537 forms).

123538 The *closedir()*, *link()*, *mkdir()*, *opendir()*, *readdir()*, *rename()*, *rmdir()*, *rewinddir()*, and *unlink()*  
123539 functions provide for a complete set of operations on directories. Directories can arbitrarily  
123540 contain other directories, and a single file can be mentioned in more than one directory.

123541 The *faccessat()*, *openat()*, *fchmodat()*, *fchownat()*, *fstatat()*, *linkat()*, *renameat()*, *readlinkat()*,  
123542 *symlinkat()*, and *unlinkat()* functions allow for race-free and thread-safe file access. The  
123543 motivation for the introduction of these functions was as follows:

- 123544 • Interfaces taking a pathname are limited by the maximum length of a pathname  
123545 (`_SC_PATH_MAX`). The absolute path of files can far exceed this length. The alternative  
123546 solution of changing the working directory and using relative pathnames is not thread-  
123547 safe.
- 123548 • A second motivation is that files accessed outside the current working directory are subject  
123549 to attacks caused by the race condition created by changing any of the elements of the  
123550 pathnames used.
- 123551 • A third motivation is to allow application code which makes use of a virtual current  
123552 working directory for each individual thread. In the alternative model there is only one  
123553 current working directory for all threads.

123554 The file-locking mechanism provides for advisory locking (protection during transactions) of  
123555 ranges of bytes (in effect, records) in a file.

123556 The *confstr()*, *fpathconf()*, *pathconf()*, and *sysconf()* functions provide for enquiry as to the  
123557 behavior of the system where variability is permitted.

123558 The asynchronous input and output functions *aio\_cancel()*, *aio\_error()*, *aio\_fsync()*, *aio\_read()*,

123559  *aio\_return()*,  *aio\_suspend()*,  *aio\_write()*, and  *lio\_listio()* provide for initiation and control of  
 123560 asynchronous data transfers.

123561 The Synchronized Input and Output option provides for assured commitment of data to media.

#### 123562 **D.2.4 Access to the Environment**

123563 The operations and types in XBD are provided for access to asynchronous serial devices. The  
 123564 primary intended use for these is the controlling terminal for the application (the interaction  
 123565 point between the user and the system). They are general enough to be used to control any  
 123566 asynchronous serial device. The functions are also general enough to be used with many other  
 123567 device types as a user interface when some emulation is provided.

123568 Less detailed access is provided for other device types, but in many instances an application  
 123569 need not know whether an object in the file system is a device or a regular file to operate  
 123570 correctly.

#### 123571 **Unsatisfied Requirements**

123572 Detailed control of common device classes, specifically magnetic tape, is not provided.

#### 123573 **D.2.5 Bounded (Realtime) Response**

123574 The realtime signal functions  *sigqueue()*,  *sigtimedwait()*, and  *sigwaitinfo()* provide queued signals  
 123575 and the prioritization of the handling of signals.

123576 The SCHED\_FIFO, SCHED\_SPORADIC, and SCHED\_RR scheduling policies provide control  
 123577 over processor allocation.

123578 The semaphore functions  *sem\_close()*,  *sem\_destroy()*,  *sem\_getvalue()*,  *sem\_init()*,  *sem\_open()*,  
 123579  *sem\_post()*,  *sem\_timedwait()*,  *sem\_trywait()*,  *sem\_unlink()*, and  *sem\_wait()* provide high-  
 123580 performance synchronization.

123581 The memory management functions provide memory locking for control of memory allocation,  
 123582 file mapping for high performance, and shared memory for high-performance interprocess  
 123583 communication. The Message Passing option provides for interprocess communication without  
 123584 being dependent on shared memory.

123585 The timers functions  *clock\_getres()*,  *clock\_gettime()*,  *clock\_settime()*,  *nanosleep()*,  *timer\_create()*,  
 123586  *timer\_delete()*,  *timer\_getoverrun()*,  *timer\_gettime()*, and  *timer\_settime()* provide functionality to  
 123587 manipulate clocks and timers and include a high resolution function called  *nanosleep()* with a  
 123588 finer resolution than the  *sleep()* function.

123589 The timeout functions —  *pthread\_mutex\_timedlock()*,  *pthread\_rwlock\_timedrdlock()*,  
 123590  *pthread\_rwlock\_timedwrlock()*, and  *sem\_timedwait()* — the Typed Memory Objects option and the  
 123591 Monotonic Clock option provide further facilities for applications to use to obtain predictable  
 123592 bounded response.

## 123593 D.2.6 Operating System-Dependent Profile

123594 POSIX.1-200x makes no distinction between text and binary files. The values of EXIT\_SUCCESS  
123595 and EXIT\_FAILURE are further defined.

### 123596 Unsatisfied Requirements

123597 None known, but the ISO C standard may contain some additional options that could be  
123598 specified.

## 123599 D.2.7 I/O Interaction

123600 POSIX.1-200x defines how each of the ISO C standard *stdio* functions interact with the POSIX.1  
123601 operations, typically specifying the behavior in terms of POSIX.1 operations.

### 123602 Unsatisfied Requirements

123603 None.

## 123604 D.2.8 Internationalization Interaction

123605 The POSIX.1-200x environment operations provide a means to define the environment for  
123606 *setlocale()* and time functions such as *ctime()*. The *tzset()* function is provided to set time  
123607 conversion information.

123608 The *nl\_langinfo()* function is provided to query locale-specific cultural settings.

123609 The multiple concurrent locale functions *duplocale()*, *freelocale()*, *is\*\_l()*, *newlocale()*,  
123610 *strcasecmp\_l()*, *strcoll\_l()*, *strfmon\_l()*, *strncasecmp\_l()*, *strxfrm\_l()*, *tolower\_l()*, *toupper\_l()*,  
123611 *towctrans\_l()*, *towlower\_l()*, *towupper\_l()*, *uselocale()*, *wscasecmp\_l()*, *wscoll\_l()*, *wscnscmp\_l()*,  
123612 *wcsxfrm\_l()*, *wctrans\_l()*, and *wctype\_l()* are provide to support per-thread locale information.

### 123613 Unsatisfied Requirements

123614 None.

## 123615 D.2.9 C-Language Extensions

123616 The *setjmp()* and *longjmp()* functions are not defined to be cognizant of the signal masks defined  
123617 for POSIX.1. The *sigsetjmp()* and *siglongjmp()* functions are provided to fill this gap.

123618 The *\_setjmp()* and *\_longjmp()* functions are provided as XSI options to support historic practice.

### 123619 Unsatisfied Requirements

123620 None.

## 123621 D.2.10 Command Language

123622 The shell command language, as described in XCU [Chapter 2](#) (on page 2245), is a common  
123623 language useful in batch scripts, through an API to high-level languages (for the C-Language  
123624 Binding option, *system()* and *popen()*) and through an interactive terminal (see the *sh* utility).  
123625 The shell language has many of the characteristics of a high-level language, but it has been  
123626 designed to be more suitable for user terminal entry and includes interactive debugging  
123627 facilities. Through the use of pipelining, many complex commands can be constructed from  
123628 combinations of data filters and other common components. Shell scripts can be created, stored,  
123629 recalled, and modified by the user with simple editors.

123630 In addition to the basic shell language, the following utilities offer features that simplify and  
 123631 enhance programmatic access to the utilities and provide features normally found only in high-  
 123632 level languages: *basename*, *bc*, *command*, *dirname*, *echo*, *env*, *expr*, *false*, *printf*, *read*, *sleep*, *tee*, *test*,  
 123633 *time\**,<sup>8</sup> *true*, *wait*, *xargs*, and all of the special built-in utilities in XCU Section 2.14 (on page 2280).

#### 123634 Unsatisfied Requirements

123635 None.

### 123636 D.2.11 Interactive Facilities

123637 The utilities offer a common style of command-line interface through conformance to the Utility  
 123638 Syntax Guidelines (see XBD Section 12.2, on page 201) and the common utility defaults (see XCU  
 123639 Section 1.4, on page 2235). The *sh* utility offers an interactive command-line history and editing  
 123640 facility.

123641 The following utilities can be used interactively as well as by scripts; *alias*, *fc*, *mailx*, *unalias*, and  
 123642 *write*.

123643 The following utilities in the User Portability Utilities option provide for interactive use: *ex*, *more*,  
 123644 and *vi*; the *man* utility offers online access to system documentation.

#### 123645 Unsatisfied Requirements

123646 The command line interface to individual utilities is as intuitive and consistent as historical  
 123647 practice allows. Work underway based on graphical user interfaces may be more suitable for  
 123648 novice or occasional users of the system.

### 123649 D.2.12 Accomplish Multiple Tasks Simultaneously

123650 The shell command language offers background processing through the asynchronous list  
 123651 command form; see XCU Section 2.9 (on page 2263).

123652 The *nohup* utility makes background processing more robust and usable.

123653 The *kill* utility can terminate background jobs.

123654 The following utilities support periodic job scheduling, control, and display: *at*, *batch*, *crontab*,  
 123655 *nice*, *ps*, and *renice*.

123656 When the User Portability Utilities option is supported, the following utilities allow  
 123657 manipulation of jobs: *bg*, *fg*, and *jobs*.

#### 123658 Unsatisfied Requirements

123659 Terminals with multiple windows may be more suitable for some multi-tasking interactive uses  
 123660 than the job control approach in POSIX.1-200x. See the comments on graphical user interfaces in  
 123661 Section D.2.11. The *nice* and *renice* utilities do not necessarily take advantage of complex system  
 123662 scheduling algorithms that are supported by the realtime options within POSIX.1-200x.

---

123663 8. The utilities listed with an asterisk here and later in this section are present only on systems which support the User Portability Utilities  
 123664 option. There may be further restrictions on the utilities offered with various configuration option combinations; see the individual utility  
 123665 descriptions.

123666 **D.2.13 Complex Data Manipulation**

123667 The following utilities address user requirements in this area: *asa*, *awk*, *bc*, *cmp*, *comm*, *csplit*, *cut*,  
 123668 *dd*, *diff*, *ed*, *ex\**, *expand*, *expr*, *find*, *fold*, *grep*, *head*, *join*, *od*, *paste*, *pr*, *printf*, *sed*, *sort*, *split*, *tabs*, *tail*, *tr*,  
 123669 *unexpand*, *uniq*, *uudecode*, *uuencode*, and *wc*.

123670 **Unsatisfied Requirements**

123671 Sophisticated text formatting utilities, such as *troff* or *TeX*, are not included. Standards work in  
 123672 the area of SGML may satisfy this.

123673 **D.2.14 File Hierarchy Manipulation**

123674 The following utilities address user requirements in this area: *basename*, *cd*, *chgrp*, *chmod*, *chown*,  
 123675 *cksum*, *cp*, *dd*, *df*, *diff*, *dirname*, *du*, *find*, *ls*, *ln*, *mkdir*, *mkfifo*, *mv*, *patch*, *pathchk*, *pax*, *pwd*, *rm*, *rmdir*,  
 123676 *test*, and *touch*.

123677 **Unsatisfied Requirements**

123678 Some graphical user interfaces offer more intuitive file manager components that allow file  
 123679 manipulation through the use of icons for novice users.

123680 **D.2.15 Locale Configuration**

123681 The standard utilities are affected by the various *LC\_* variables to achieve locale-dependent  
 123682 operation: character classification, collation sequences, regular expressions and shell pattern  
 123683 matching, date and time formats, numeric formatting, and monetary formatting. When the  
 123684 *POSIX2\_LOCALEDEF* option is supported, applications can provide their own locale definition  
 123685 files.

123686 The following utilities address user requirements in this area: *date*, *ed*, *ex\**, *find*, *grep*, *locale*,  
 123687 *localedef*, *more\**, *sed*, *sh*, *sort*, *tr*, *uniq*, and *vi\**.

123688 The *iconv()*, *iconv\_close()*, and *iconv\_open()* functions are available to allow an application to  
 123689 convert character data between supported character sets.

123690 The *genccat* utility and the *catopen()*, *catclose()*, and *catgets()* functions provide for message  
 123691 catalog manipulation.

123692 **Unsatisfied Requirements**

123693 Some aspects of multi-byte character and state-encoded character encodings have not yet been  
 123694 addressed. The C-language functions, such as *getopt()*, are generally limited to single-byte  
 123695 characters. The effect of the *LC\_MESSAGES* variable on message formats is only suggested at  
 123696 this time.

123697 **D.2.16 Inter-User Communication**

123698 The following utilities address user requirements in this area: *cksum*, *mailx*, *mesg*, *patch*, *pax*, *talk*,  
 123699 *uudecode*, *uuencode*, *who*, and *write*.

123700 The historical UUCP utilities are included as a separate UUCP Utilities option.

123701 **Unsatisfied Requirements**

123702 None.

123703 **D.2.17 System Environment**123704 The following utilities address user requirements in this area: *chgrp*, *chmod*, *chown*, *df*, *du*, *env*,  
123705 *getconf*, *id*, *logger*, *logname*, *mesg*, *newgrp*, *ps*, *stty*, *tput*, *tty*, *umask*, *uname*, and *who*.123706 The *closelog()*, *openlog()*, *setlogmask()*, and *syslog()* functions provide system logging facilities on  
123707 XSI-conformant systems; these are analogous to the *logger* utility.123708 **Unsatisfied Requirements**

123709 None.

123710 **D.2.18 Printing**123711 The following utilities address user requirements in this area: *pr* and *lp*.123712 **Unsatisfied Requirements**

123713 There are no features to control the formatting or scheduling of the print jobs.

123714 **D.2.19 Software Development**123715 The following utilities address user requirements in this area: *ar*, *asa*, *awk*, *c99*, *ctags*, *fort77*,  
123716 *getconf*, *getopts*, *lex*, *localedef*, *make*, *nm*, *od*, *patch*, *pax*, *strings*, *strip*, *time*, and *yacc*.123717 The *system()*, *popen()*, *pclose()*, *regcomp()*, *regex()*, *regerror()*, *regfree()*, *fnmatch()*, *getopt()*,  
123718 *glob()*, *globfree()*, *wordexp()*, and *wordfree()* functions allow C-language programmers to access  
123719 some of the interfaces used by the utilities, such as argument processing, regular expressions,  
123720 and pattern matching.123721 The SCCS source-code control system utilities are available on systems supporting the XSI  
123722 Development option.123723 **Unsatisfied Requirements**123724 There are no language-specific development tools related to languages other than C and  
123725 FORTRAN. The C tools are more complete and varied than the FORTRAN tools. There is no  
123726 data dictionary or other CASE-like development tools.123727 **D.2.20 Future Growth**123728 It is arguable whether or not all functionality to support applications is potentially within the  
123729 scope of POSIX.1-200x. As a simple matter of practicality, it cannot be. Areas such as graphics,  
123730 application domain-specific functionality, windowing, and so on, should be in unique standards.  
123731 As such, they are properly “Unsatisfied Requirements” in terms of providing fully conforming  
123732 applications, but ones which are outside the scope of POSIX.1-200x.123733 However, as the standards evolve, certain functionality once considered “exotic” enough to be  
123734 part of a separate standard become common enough to be included in a core standard such as  
123735 this. Realtime and networking, for example, have both moved from separate standards (with  
123736 much difficult cross-referencing) into this standard over time, and although no specific areas  
123737 have been identified for inclusion in a future version, such inclusions seem likely.

### 123738 D.3 Profiling Considerations

123739 This section offers guidance to writers of profiles on how the configurable options, limits, and  
 123740 optional behavior of POSIX.1-200x should be cited in profiles. Profile writers should consult the  
 123741 general guidance in POSIX.0 when writing POSIX Standardized Profiles.

123742 The information in this section is an inclusive list of features that should be considered by profile  
 123743 writers. Subsetting of POSIX.1-200x should follow XBD [Section 2.1.5.1](#) (on page 20). A set of  
 123744 profiling options is described in [Appendix E](#) (on page 3607).

#### 123745 D.3.1 Configuration Options

123746 There are two set of options suggested by POSIX.1-200x: those for POSIX-conforming systems  
 123747 and those for X/Open System Interface (XSI) conformance. The requirements for XSI  
 123748 conformance are documented in the Base Definitions volume of POSIX.1-200x and not discussed  
 123749 further here, as they superset the POSIX conformance requirements.

#### 123750 D.3.2 Configuration Options (Shell and Utilities)

123751 There are three broad optional configurations for the Shell and Utilities volume of POSIX.1-200x:  
 123752 basic execution system, development system, and user portability interactive system. The  
 123753 options to support these, and other minor configuration options, are listed in XBD [Chapter 2](#) (on  
 123754 page 15). Profile writers should consult the following list and the comments concerning user  
 123755 requirements addressed by various components in [Section D.2](#) (on page 3586).

##### 123756 POSIX2\_UPE

123757 The system supports the User Portability Utilities option.

123758 This option is a requirement for a user portability interactive system. It is required  
 123759 frequently except for those systems, such as embedded realtime or dedicated application  
 123760 systems, that support little or no interactive time-sharing work by users or operators. XSI-  
 123761 conformant systems support this option.

##### 123762 POSIX2\_SW\_DEV

123763 The system supports the Software Development Utilities option.

123764 This option is required by many systems, even those in which actual software development  
 123765 does not occur. The *make* utility, in particular, is required by many application software  
 123766 packages as they are installed onto the system. If POSIX2\_C\_DEV is supported,  
 123767 POSIX2\_SW\_DEV is almost a mandatory requirement because of *ar* and *make*.

##### 123768 POSIX2\_C\_BIND

123769 The system supports the C-Language Bindings option.

123770 This option is required on some implementations developing complex C applications or on  
 123771 any system installing C applications in source form that require the functions in this option.  
 123772 The *system()* and *popen()* functions, in particular, are widely used by applications; the  
 123773 others are rather more specialized.

##### 123774 POSIX2\_C\_DEV

123775 The system supports the C-Language Development Utilities option.

123776 This option is required by many systems, even those in which actual C-language software  
 123777 development does not occur. The *c99* utility, in particular, is required by many application  
 123778 software packages as they are installed onto the system. The *lex* and *yacc* utilities are used  
 123779 less frequently.

- 123780 POSIX2\_FORT\_DEV  
 123781 The system supports the FORTRAN Development Utilities option
- 123782 As with C, this option is needed on any system developing or installing FORTRAN  
 123783 applications in source form.
- 123784 POSIX2\_FORT\_RUN  
 123785 The system supports the FORTRAN Runtime Utilities option.
- 123786 This option is required for some FORTRAN applications that need the *asa* utility to convert  
 123787 Hollerith printing statement output. It is unknown how frequently this occurs.
- 123788 POSIX2\_LOCALEDEF  
 123789 The system supports the creation of locales.
- 123790 This option is needed if applications require their own customized locale definitions to  
 123791 operate. It is presently unknown whether many applications are dependent on this.  
 123792 However, the option is virtually mandatory for systems in which internationalized  
 123793 applications are developed.
- 123794 XSI-conformant systems support this option.
- 123795 POSIX2\_PBS  
 123796 The system supports the Batch Environment Services and Utilities option.
- 123797 POSIX2\_PBS\_ACCOUNTING  
 123798 The system supports the optional feature of accounting within the Batch Environment  
 123799 Services and Utilities option. It will be required in servers that implement the optional  
 123800 feature of accounting.
- 123801 POSIX2\_PBS\_CHECKPOINT  
 123802 The system supports the optional feature of checkpoint/restart within the Batch  
 123803 Environment Services and Utilities option.
- 123804 POSIX2\_PBS\_LOCATE  
 123805 The system supports the optional feature of locating batch jobs within the Batch  
 123806 Environment Services and Utilities option.
- 123807 POSIX2\_PBS\_MESSAGE  
 123808 The system supports the optional feature of sending messages to batch jobs within the Batch  
 123809 Environment Services and Utilities option.
- 123810 POSIX2\_PBS\_TRACK  
 123811 The system supports the optional feature of tracking batch jobs within the Batch  
 123812 Environment Services and Utilities option.
- 123813 POSIX2\_CHAR\_TERM  
 123814 The system supports at least one terminal type capable of all operations described in  
 123815 POSIX.1-200x.
- 123816 On systems with POSIX2\_UPE, this option is almost always required. It was developed  
 123817 solely to allow certain specialized vendors and user applications to bypass the requirement  
 123818 for general-purpose asynchronous terminal support. For example, an application and  
 123819 system that was suitable for block-mode terminals, such as IBM 3270s, would not need this  
 123820 option.
- 123821 XSI-conformant systems support this option.

**D.3.3 Configurable Limits**

Very few of the limits need to be increased for profiles. No profile can cite lower values.

{POSIX2\_BC\_BASE\_MAX}

{POSIX2\_BC\_DIM\_MAX}

{POSIX2\_BC\_SCALE\_MAX}

{POSIX2\_BC\_STRING\_MAX}

No increase is anticipated for any of these *bc* values, except for very specialized applications involving huge numbers.

{POSIX2\_COLL\_WEIGHTS\_MAX}

Some natural languages with complex collation requirements require an increase from the default 2 to 4; no higher numbers are anticipated.

{POSIX2\_EXPR\_NEST\_MAX}

No increase is anticipated.

{POSIX2\_LINE\_MAX}

This number is much larger than most historical applications have been able to use. At some future time, applications may be rewritten to take advantage of even larger values.

{POSIX2\_RE\_DUP\_MAX}

No increase is anticipated.

{POSIX2\_VERSION}

This is actually not a limit, but a standard version stamp. Generally, a profile should specify XCU [Chapter 2](#) (on page 2245) by name in the normative references section, not this value.

**D.3.4 Configuration Options (System Interfaces)**

{NGROUPS\_MAX}

A non-zero value indicates that the implementation supports supplementary groups.

This option is needed where there is a large amount of shared use of files, but where a certain amount of protection is needed. Many profiles<sup>9</sup> are known to require this option; it should only be required if needed, but it should never be prohibited.

\_POSIX\_ADVISORY\_INFO

The system provides advisory information for file management.

This option allows the application to specify advisory information that can be used to achieve better or even deterministic response time in file manager or input and output operations.

\_POSIX\_ASYNCHRONOUS\_IO

Support for asynchronous input and output is mandatory in POSIX.1-200x.

\_POSIX\_BARRIERS

Support for barrier synchronization is mandatory in POSIX.1-200x.

This facility allows efficient synchronization of multiple parallel threads in multi-processor systems in which the operation is supported in part by the hardware architecture.

9. There are no formally approved profiles of POSIX.1-200x at the time of publication; the reference here is to various profiles generated by private bodies or governments.

- 123862 `_POSIX_CHOWN_RESTRICTED`  
 123863 The system restricts the right to “give away” files to other users. It is mandatory that an  
 123864 implementation be able to support this facility in POSIX.1-200x; however, it is recognized  
 123865 that implementations need not enable the functionality by default.
- 123866 Some applications expect that they can change the ownership of files in this way. It is  
 123867 provided where either security or system account requirements cause this ability to be a  
 123868 problem. It is also known to be specified in many profiles.
- 123869 `_POSIX_CLOCK_SELECTION`  
 123870 Support for clock selection is mandatory in POSIX.1-200x.
- 123871 This facility allows applications to request a high resolution sleep in order to suspend a  
 123872 thread during a relative time interval, or until an absolute time value, using the desired  
 123873 clock. It also allows the application to select the clock used in a `pthread_cond_timedwait()`  
 123874 function call.
- 123875 `_POSIX_CPUTIME`  
 123876 The system supports the Process CPU-Time Clocks option.
- 123877 This option allows applications to use a new clock that measures the execution times of  
 123878 processes or threads, and the possibility to create timers based upon these clocks, for  
 123879 runtime detection (and treatment) of execution time overruns.
- 123880 `_POSIX_FSYNC`  
 123881 The system supports file synchronization requests.
- 123882 This option was created to support historical systems that did not provide the feature.  
 123883 Applications that are expecting guaranteed completion of their input and output operations  
 123884 should require the `_POSIX_SYNC_IO` option. This option should never be prohibited.
- 123885 XSI-conformant systems support this option.
- 123886 `_POSIX_IPV6`  
 123887 The system supports facilities related to Internet Protocol Version 6 (IPv6).
- 123888 This option was created to allow systems to transition to IPv6.
- 123889 `_POSIX_JOB_CONTROL`  
 123890 Support for job control is mandatory in POSIX.1-200x.
- 123891 Most applications that use it can run when it is not present, although with a degraded level  
 123892 of user convenience.
- 123893 `_POSIX_MAPPED_FILES`  
 123894 Support for memory mapped files is mandatory in POSIX.1-200x.
- 123895 This facility provides for the mapping of regular files into the process address space.
- 123896 Both this facility and the Shared Memory Objects option provide shared access to memory  
 123897 objects in the process address space. The `mmap()` and `munmap()` functions provide the  
 123898 functionality of existing practice for mapping regular files. This functionality was deemed  
 123899 unnecessary, if not inappropriate, for embedded systems applications and is expected to be  
 123900 optional in subprofiles.
- 123901 `_POSIX_MEMLOCK`  
 123902 The system supports the locking of the address space.
- 123903 This option was created to support historical systems that did not provide the feature. It  
 123904 should only be required if needed, but it should never be prohibited.

- 123905 `_POSIX_MEMLOCK_RANGE`  
 123906 The system supports the locking of specific ranges of the address space.
- 123907 For applications that have well-defined sections that need to be locked and others that do  
 123908 not, POSIX.1-200x supports an optional set of functions to lock or unlock a range of process  
 123909 addresses. The following are two reasons for having a means to lock down a specific range:
- 123910 1. An asynchronous event handler function that must respond to external events in a  
 123911 deterministic manner such that page faults cannot be tolerated
  - 123912 2. An input/output “buffer” area that is the target for direct-to-process I/O, and the  
 123913 overhead of implicit locking and unlocking for each I/O call cannot be tolerated
- 123914 It should only be required if needed, but it should never be prohibited.
- 123915 `_POSIX_MEMORY_PROTECTION`  
 123916 Support for memory protection is mandatory in POSIX.1-200x.
- 123917 The provision of this facility typically imposes additional hardware requirements.
- 123918 `_POSIX_PRIORITIZED_IO`  
 123919 The system provides prioritization for input and output operations.
- 123920 The use of this option may interfere with the ability of the system to optimize input and  
 123921 output throughput. It should only be required if needed, but it should never be prohibited.
- 123922 `_POSIX_MESSAGE_PASSING`  
 123923 The system supports the passing of messages between processes.
- 123924 This option was created to support historical systems that did not provide the feature. The  
 123925 functionality adds a high-performance XSI interprocess communication facility for local  
 123926 communication. It should only be required if needed, but it should never be prohibited.
- 123927 `_POSIX_MONOTONIC_CLOCK`  
 123928 The system supports the Monotonic Clock option.
- 123929 This option allows realtime applications to rely on a monotonically increasing clock that  
 123930 does not jump backwards, and whose value does not change except for the regular ticking  
 123931 of the clock.
- 123932 `_POSIX_PRIORITY_SCHEDULING`  
 123933 The system provides priority-based process scheduling.
- 123934 Support of this option provides predictable scheduling behavior, allowing applications to  
 123935 determine the order in which processes that are ready to run are granted access to a  
 123936 processor. It should only be required if needed, but it should never be prohibited.
- 123937 `_POSIX_REALTIME_SIGNALS`  
 123938 Support for realtime signals is mandatory in POSIX.1-200x.
- 123939 This facility provides prioritized, queued signals with associated data values.
- 123940 `_POSIX_REGEX`  
 123941 Support for regular expression facilities is mandatory in POSIX.1-200x.
- 123942 `_POSIX_SAVED_IDS`  
 123943 Support for this feature is mandatory in POSIX.1-200x.
- 123944 Certain classes of applications rely on it for proper operation, and there is no alternative  
 123945 short of giving the application root privileges on most implementations that did not provide  
 123946 `_POSIX_SAVED_IDS`.

- 123947 `_POSIX_SEMAPHORES`  
 123948 Support for counting semaphores is mandatory in POSIX.1-200x.
- 123949 `_POSIX_SHARED_MEMORY_OBJECTS`  
 123950 The system supports the mapping of shared memory objects into the process address space.  
 123951 Both this option and the Memory Mapped Files option provide shared access to memory  
 123952 objects in the process address space. The functions defined under this option provide the  
 123953 functionality of existing practice for shared memory objects. This functionality was deemed  
 123954 appropriate for embedded systems applications and, hence, is provided under this option.  
 123955 It should only be required if needed, but it should never be prohibited.
- 123956 `_POSIX_SHELL`  
 123957 Support for the *sh* utility command line interpreter is mandatory in POSIX.1-200x.
- 123958 `_POSIX_SPAWN`  
 123959 The system supports the spawn option.  
 123960 This option provides applications with an efficient mechanism to spawn execution of a new  
 123961 process.
- 123962 `_POSIX_SPINLOCKS`  
 123963 Support for spin locks is mandatory in POSIX.1-200x.  
 123964 This facility provides a simple and efficient synchronization mechanism for threads  
 123965 executing in multi-processor systems.
- 123966 `_POSIX_SPORADIC_SERVER`  
 123967 The system supports the sporadic server scheduling policy.  
 123968 This option provides applications with a new scheduling policy for scheduling aperiodic  
 123969 processes or threads in hard realtime applications.
- 123970 `_POSIX_SYNCHRONIZED_IO`  
 123971 The system supports guaranteed file synchronization.  
 123972 This option was created to support historical systems that did not provide the feature.  
 123973 Applications that are expecting guaranteed completion of their input and output operations  
 123974 should require this option, rather than the File Synchronization option. It should only be  
 123975 required if needed, but it should never be prohibited.
- 123976 `_POSIX_THREADS`  
 123977 Support for multiple threads of control within a single process is mandatory in  
 123978 POSIX.1-200x.
- 123979 `_POSIX_THREAD_ATTR_STACKADDR`  
 123980 The system supports specification of the stack address for a created thread.  
 123981 Applications may take advantage of support of this option for performance benefits, but  
 123982 dependence on this feature should be minimized. This option should never be prohibited.  
 123983 XSI-conformant systems support this option.
- 123984 `_POSIX_THREAD_ATTR_STACKSIZE`  
 123985 The system supports specification of the stack size for a created thread.  
 123986 Applications may require this option in order to ensure proper execution, but such usage  
 123987 limits portability and dependence on this feature should be minimized. It should only be  
 123988 required if needed, but it should never be prohibited.  
 123989 XSI-conformant systems support this option.

- 123990        \_posix\_thread\_priority\_scheduling
- 123991        The system provides priority-based thread scheduling.
- 123992        Support of this option provides predictable scheduling behavior, allowing applications to
- 123993        determine the order in which threads that are ready to run are granted access to a processor.
- 123994        It should only be required if needed, but it should never be prohibited.
- 123995        \_posix\_thread\_prio\_inherit
- 123996        The system provides mutual-exclusion operations with priority inheritance.
- 123997        Support of this option provides predictable scheduling behavior, allowing applications to
- 123998        determine the order in which threads that are ready to run are granted access to a processor.
- 123999        It should only be required if needed, but it should never be prohibited.
- 124000        \_posix\_thread\_prio\_protect
- 124001        The system supports a priority ceiling emulation protocol for mutual-exclusion operations.
- 124002        Support of this option provides predictable scheduling behavior, allowing applications to
- 124003        determine the order in which threads that are ready to run are granted access to a processor.
- 124004        It should only be required if needed, but it should never be prohibited.
- 124005        \_posix\_thread\_process\_shared
- 124006        The system provides shared access among multiple processes to synchronization objects.
- 124007        This option was created to support historical systems that did not provide the feature. It
- 124008        should only be required if needed, but it should never be prohibited.
- 124009        XSI-conformant systems support this option.
- 124010        \_posix\_thread\_safe\_functions
- 124011        Support for thread-safe functions is mandatory in POSIX.1-200x.
- 124012        \_posix\_thread\_sporadic\_server
- 124013        The system supports the thread sporadic server scheduling policy.
- 124014        Support for this option provides applications with a new scheduling policy for scheduling
- 124015        aperiodic threads in hard realtime applications.
- 124016        \_posix\_timeouts
- 124017        Support for timeouts for some blocking services is mandatory in POSIX.1-200x.
- 124018        \_posix\_timers
- 124019        Support for higher resolution clocks with multiple timers per process is mandatory in
- 124020        POSIX.1-200x.
- 124021        This facility is appropriate for applications requiring higher resolution timestamps or
- 124022        needing to control the timing of multiple activities.
- 124023        \_posix\_trace
- 124024        The system supports the Trace option.
- 124025        This option was created to allow applications to perform tracing.
- 124026        \_posix\_trace\_event\_filter
- 124027        The system supports the Trace Event Filter option.
- 124028        This option is dependent on support of the Trace option.
- 124029        \_posix\_trace\_inherit
- 124030        The system supports the Trace Inherit option.
- 124031        This option is dependent on support of the Trace option.

- 124032        \_POSIX\_TRACE\_LOG  
124033            The system supports the Trace Log option.
- 124034            This option is dependent on support of the Trace option.
- 124035        \_POSIX\_TYPED\_MEMORY\_OBJECTS  
124036            The system supports the Typed Memory Objects option.
- 124037            This option was created to allow realtime applications to access different kinds of physical  
124038            memory, and allow processes in these applications to share portions of this memory.

### 124039    D.3.5   Configurable Limits

124040    In general, the configurable limits in the `<limits.h>` header defined in the Base Definitions  
124041    volume of POSIX.1-200x have been set to minimal values; many applications or  
124042    implementations may require larger values. No profile can cite lower values.

124043    {AIO\_LISTIO\_MAX}  
124044            The current minimum is likely to be inadequate for most applications. It is expected that  
124045            this value will be increased by profiles requiring support for list input and output  
124046            operations.

124047    {AIO\_MAX}  
124048            The current minimum is likely to be inadequate for most applications. It is expected that  
124049            this value will be increased by profiles requiring support for asynchronous input and  
124050            output operations.

124051    {AIO\_PRIO\_DELTA\_MAX}  
124052            The functionality associated with this limit is needed only by sophisticated applications. It  
124053            is not expected that this limit would need to be increased under a general-purpose profile.

124054    {ARG\_MAX}  
124055            The current minimum is likely to need to be increased for profiles, particularly as larger  
124056            amounts of information are passed through the environment. Many implementations are  
124057            believed to support larger values.

124058    {CHILD\_MAX}  
124059            The current minimum is suitable only for systems where a single user is not running  
124060            applications in parallel. It is significantly too low for any system also requiring windows,  
124061            and if `_POSIX_JOB_CONTROL` is specified, it should be raised.

124062    {CLOCKRES\_MIN}  
124063            It is expected that profiles will require a finer granularity clock, perhaps as fine as 1  $\mu$ s,  
124064            represented by a value of 1 000 for this limit.

124065    {DELAYTIMER\_MAX}  
124066            It is believed that most implementations will provide larger values.

124067    {LINK\_MAX}  
124068            For most applications and usage, the current minimum is adequate. Many implementations  
124069            have a much larger value, but this should not be used as a basis for raising the value unless  
124070            the applications to be used require it.

124071    {LOGIN\_NAME\_MAX}  
124072            This is not actually a limit, but an implementation parameter. No profile should impose a  
124073            requirement on this value.

124074    {MAX\_CANON}  
124075            For most purposes, the current minimum is adequate. Unless high-speed burst serial  
124076            devices are used, it should be left as is.

- 124077 {MAX\_INPUT}  
124078 See {MAX\_CANON}.
- 124079 {MQ\_OPEN\_MAX}  
124080 The current minimum should be adequate for most profiles.
- 124081 {MQ\_PRIO\_MAX}  
124082 The current minimum corresponds to the required number of process scheduling priorities.  
124083 Many realtime practitioners believe that the number of message priority levels ought to be  
124084 the same as the number of execution scheduling priorities.
- 124085 {NAME\_MAX}  
124086 Many implementations now support larger values, and many applications and users  
124087 assume that larger names can be used. Many existing profiles also specify a larger value.  
124088 Specifying this value will reduce the number of conforming implementations, although this  
124089 might not be a significant consideration over time. Values greater than 255 should not be  
124090 required.
- 124091 {NGROUPS\_MAX}  
124092 The value selected will typically be 8 or larger.
- 124093 {OPEN\_MAX}  
124094 The historically common value for this has been 20. Many implementations support larger  
124095 values. If applications that use larger values are anticipated, an appropriate value should be  
124096 specified.
- 124097 {PAGESIZE}  
124098 This is not actually a limit, but an implementation parameter. No profile should impose a  
124099 requirement on this value.
- 124100 {PATH\_MAX}  
124101 Historically, the minimum has been either 1024 or indefinite, depending on the  
124102 implementation. Few applications actually require values larger than 256, but some users  
124103 may create file hierarchies that must be accessed with longer paths. This value should only  
124104 be changed if there is a clear requirement.
- 124105 {PIPE\_BUF}  
124106 The current minimum is adequate for most applications. Historically, it has been larger. If  
124107 applications that write single transactions larger than this are anticipated, it should be  
124108 increased. Applications that write lines of text larger than this probably do not need it  
124109 increased, as the text line is delimited by a <newline>.
- 124110 {POSIX\_VERSION}  
124111 This is actually not a limit, but a standard version stamp. Generally, a profile should specify  
124112 POSIX.1-200x by a name in the normative references section, not this value.
- 124113 {PTHREAD\_DESTRUCTOR\_ITERATIONS}  
124114 It is unlikely that applications will need larger values to avoid loss of memory resources.
- 124115 {PTHREAD\_KEYS\_MAX}  
124116 The current value should be adequate for most profiles.
- 124117 {PTHREAD\_STACK\_MIN}  
124118 This should not be treated as an actual limit, but as an implementation parameter. No  
124119 profile should impose a requirement on this value.
- 124120 {PTHREAD\_THREADS\_MAX}  
124121 It is believed that most implementations will provide larger values.

- 124122 {RTSIG\_MAX}  
 124123 The current limit was chosen so that the set of POSIX.1 signal numbers can fit within a  
 124124 32-bit field. It is recognized that most existing implementations define many more signals  
 124125 than are specified in POSIX.1 and, in fact, many implementations have already exceeded 32  
 124126 signals (including the “null signal”). Support of {\_POSIX\_RTSIG\_MAX} additional signals  
 124127 may push some implementations over the single 32-bit word line, but is unlikely to push  
 124128 any implementations that are already over that line beyond the 64 signal line.
- 124129 {SEM\_NSEMS\_MAX}  
 124130 The current value should be adequate for most profiles.
- 124131 {SEM\_VALUE\_MAX}  
 124132 The current value should be adequate for most profiles.
- 124133 {SSIZE\_MAX}  
 124134 This limit reflects fundamental hardware characteristics (the size of an integer), and should  
 124135 not be specified unless it is clearly required. Extreme care should be taken to assure that  
 124136 any value that might be specified does not unnecessarily eliminate implementations  
 124137 because of accidents of hardware design.
- 124138 {STREAM\_MAX}  
 124139 This limit is very closely related to {OPEN\_MAX}. It should never be larger than  
 124140 {OPEN\_MAX}, but could reasonably be smaller for application areas where most files are  
 124141 not accessed through *stdio*. Some implementations may limit {STREAM\_MAX} to 20 but  
 124142 allow {OPEN\_MAX} to be considerably larger. Such implementations should be allowed for  
 124143 if the applications permit.
- 124144 {TIMER\_MAX}  
 124145 The current limit should be adequate for most profiles, but it may need to be larger for  
 124146 applications with a large number of asynchronous operations.
- 124147 {TTY\_NAME\_MAX}  
 124148 This is not actually a limit, but an implementation parameter. No profile should impose a  
 124149 requirement on this value.
- 124150 {TZNAME\_MAX}  
 124151 The minimum has been historically adequate, but if longer timezone names are anticipated  
 124152 (particularly such values as UTC-1), this should be increased.

### 124153 D.3.6 Optional Behavior

- 124154 In POSIX.1-200x, there are no instances of the terms unspecified, undefined, implementation-  
 124155 defined, or with the verbs “may” or “need not”, that the standard developers anticipate or  
 124156 sanction as suitable for profile or test method citation. All of these are merely warnings to  
 124157 conforming applications to avoid certain areas that can vary from system to system, and even  
 124158 over time on the same system. In many cases, these terms are used explicitly to support  
 124159 extensions, but profiles should not anticipate and require such extensions; future versions of this  
 124160 standard may do so.

## Subprofiling Considerations (Informative)

124166

124167

124168

124169

124170

124171

This section contains further information to satisfy the requirement that the project scope enable subprofiling of POSIX.1-200x. The approach taken is to include a general requirement in normative text regarding subprofiling and to include an informative section (here) containing a proposed set of subprofiling options.

124172

### E.1 Subprofiling Option Groups

124173

124174

124175

124176

The following Option Groups<sup>10</sup> are defined to support profiling. Systems claiming support to POSIX.1-200x need not implement these options apart from the requirements stated in XBD Section 2.1.3 (on page 16). These Option Groups allow profiles to subset the System Interfaces volume of POSIX.1-200x by collecting sets of related functions.
