Proposal for C2x
WG14 N2680

Title: Specific width length modifier
Author, affiliation: Robert C. Seacord, NCC Group
Date: 2021-3-9
Proposal category: Feature
Target audience: Implementers supporting fixed-width and extended integer types
Abstract: Add specific width length modifier to formatted IO functions
Prior art: C
Specific width length modifier

Reply-to: Robert C. Seacord (rcseacord@gmail.com)
Document No: N2680
Reference Document: N2511, N2465, N2587, N2623
Date: 2020-

Proposal N2465 “intmax_t, a way forward” was presented at the Spring 2020 meeting but failed to gain support. However, there was support for specific width length modifier that was a small component of the broader proposal. N2511 was presented at the October 2020 virtual meeting, but incorrectly only referenced exact-width types. N2587 was presented at the December 2020 virtual meeting but incorrectly assumed constraints on minimum-width integer types that were not present in the C23 working draft.

Change Log

2021-3-9:
- changed “N bits before printing” to “unpromoted type” in four locations

2020-12-21:
- changed bit-width to width
- followed the phrase “positive decimal integer” with “no leading zeros”
- added support for fastest minimum-width integer types using wfN
- [u]intN_t and [u]int_leastN_t designates the same type

2020-10-14:
- removed “exact-width” from proposed text
- clarified applicability to N-bit integers

1. PROBLEM DESCRIPTION

The C Standard allows for implementation-defined extended signed integer types (6.2.5, p4) and corresponding extended unsigned integer types (6.2.5, p6). There is no portable mechanism for specifying the width of extended integer types when passing them as arguments to formatted input and output functions.

Section 7.20.1 of the C Standard defines integer types including minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1). For example, the typedef name intN_t designates a signed integer type with width N, no padding bits, and a two’s complement representation. Consequently, int8_t denotes such a signed integer type with a width of exactly 8 bits. Specific width modifiers provide a more usable mechanism for passing minimum-width and exact-width integer types as arguments to formatted input and output functions than the PRI and SCN macros for format specifiers specified in Section 7.8.1.

The fastest types defined in Section 7.20.1.3, “Fastest minimum-width integer types” cannot be differentiated from other types.
2. SUGGESTED CHANGES

The width of a type can be specified using a **specific width length modifier** in a manner that can be understood by both the implementation and the library. If the library doesn’t support the specified width, the formatted input or output function can return an error.

The length modifier uses a lowercase letter because uppercase letters are reserved for implementation extensions. Avoiding the letters used in the standard and various TRs leaves _qvw_. In this case, we decided to use 'w' to denote the *width* of the value and to preserve 'b' to support *binary* output in the future. 128-bit integers, for example, will appear as follows:

```c
uint128_t all = -1;
printf("the largest set is %w128d\n", all);
```

There is some relevant implementation experience. Microsoft *printf* has `I32` and `I64` for this purpose. The use of `I` is in the space reserved for implementation extensions and other implementations use `I` for other things, but it's still relevant experience should we wish to support `w<width>` for that purpose. Microsoft also uses `w` in extensions, but only with string and character formats so that wouldn’t conflict in any way with a standard use of 'w'. Existing PRI and SCN macros in header `<inttypes.h>` also provides implementation experience.

Small types that are subject to integer promotions will work correctly. Consider the following code fragment:

```c
uint8_t i = 1;
printf("%w8d", i);
```

The argument `i` is promoted to an `int` when passed to the formatted output function. The implementation must anticipate this and correctly process promoted arguments.

In the following code fragment, both arguments are hexadecimal literals of type `int`:

```c
printf("%w8d %w8d", 0xFF, 0x1FF);
```

Only the low order 8 bits are considered when determining the sign and magnitude of the values. Consequently, this code prints the following to the standard output stream:

```
-1 -1
```

This proposal requires that on implementations that define the typedef name `[u]intN_t`, `[u]int_leastN_t` must designate the same type. This constrains these types in a manner that allows the specific width length modifier `wN` to be used for both minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1).

Fastest minimum-width integer types (7.20.1.3) defined in the header `<stdint.h>` can be supported by a two letter `wEN` specific width length modifier if the committee decides it also wants to provide support for these types.

### 7.20.1.2 Minimum-width integer types

Add the following after paragraph 2:

If the typedef name `intN_t` is defined, `int_leastN_t` designates the same type.

If the typedef name `uintN_t` is defined, `uint_leastN_t` designates the same type.
7.21.6.1 The `fprintf` function
Add the following to paragraph 7:

```
... 

\( t \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to a `ptrdiff_t` or the corresponding unsigned integer type argument; or that a following \( n \) conversion specifier applies to a pointer to a `ptrdiff_t` argument.

\( wN \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to an integer argument with a specific width where \( N \) is a positive decimal integer with no leading zeros (the argument will have been promoted according to the integer promotions, but its value shall be converted to the unpromoted type); or that a following \( n \) conversion specifier applies to a pointer to an integer type argument with a width of \( N \) bits. All minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1) defined in the header `<stdint.h>` shall be supported. Other supported values of \( N \) are implementation-defined.

\( wfN \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to a fastest minimum-width integer argument with a specific width where \( N \) is a positive decimal integer with no leading zeros (the argument will have been promoted according to the integer promotions, but its value shall be converted to the unpromoted type); or that a following \( n \) conversion specifier applies to a pointer to a fastest minimum-width integer type argument with a width of \( N \) bits. All fastest minimum-width integer types (7.20.1.3) defined in the header `<stdint.h>` shall be supported.

\( L \) Specifies that a following \( a, A, e, E, f, F, g, \) or \( G \) conversion specifier applies to a `long double` argument.
```

Modify paragraph 14 as follows:

The `fprintf` function returns the number of characters transmitted, or a negative value if an output or encoding error occurred or if the implementation does not support a specified width length modifier.

7.21.6.2 The `fscanf` function
Add the following to paragraph 11:

```
... 

\( t \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to an argument with type pointer to `ptrdiff_t` or the corresponding unsigned integer type.

\( wN \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to an argument which is a pointer to an integer with a specific width where \( N \) is a positive decimal integer with no leading zeros. All minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1) defined in the header `<stdint.h>` shall be supported. Other supported values of \( N \) are implementation-defined.

\( wfN \) Specifies that a following \( d, i, o, u, x, \) or \( X \) conversion specifier applies to an argument which is a pointer to a fastest minimum-width integer with a specific width where \( N \) is a
positive decimal integer with no leading zeros. All fastest minimum-width integer types (7.20.1.3) defined in the header `<stdint.h>` shall be supported.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to `long double`.

... Modify paragraph 16 as follows:

The `fscanf` function returns the value of the macro `EOF` if an input failure occurs before the first conversion (if any) has completed. Otherwise, the function returns the number of input items assigned, which can be fewer than provided for, or even zero, in the event of an early matching failure or if the implementation does not support a specific width length modifier.

7.29.2.1 The `fwprintf` function
Add the following to paragraph 7:

... t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a `ptrdiff_t` or the corresponding unsigned integer type argument; or that a following n conversion specifier applies to a pointer to a `ptrdiff_t` argument.

wN Specifies that a following d, i, o, u, x, or X conversion specifier applies to an integer argument with a specific width where N is a positive decimal integer with no leading zeros (the argument will have been promoted according to the integer promotions, but its value shall be converted to the unpromoted type); or that a following n conversion specifier applies to a pointer to an integer type argument with a width of N bits. All minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1) defined in the header `<stdint.h>` shall be supported. Other supported values of N are implementation-defined.

wfN Specifies that a following d, i, o, u, x, or X conversion specifier applies to a fastest minimum-width integer argument with a specific width where N is a positive decimal integer with no leading zeros (the argument will have been promoted according to the integer promotions, but its value shall be converted to the unpromoted type); or that a following n conversion specifier applies to a pointer to a fastest minimum-width integer type argument with a width of N bits. All fastest minimum-width integer types (7.20.1.3) defined in the header `<stdint.h>` shall be supported. Other supported values of N are implementation-defined.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a `long double` argument.

... Modify paragraph 14 as follows:

The `fwprintf` function returns the number of wide characters transmitted, or a negative value if an output or encoding error occurred or if the implementation does not support a specific width length modifier.
7.29.2.2 The `fwscanf` function
Add the following to paragraph 11:

```
... t Specifies that a following d, i, o, u, x, or n conversion specifier applies to an argument with type pointer to `ptrdiff_t` or the corresponding unsigned integer type.

wN Specifies that a following d, i, o, u, x, or X, or n conversion specifier applies to an argument which is a pointer to an integer with a specific width where N is a positive decimal integer with no leading zeros. All minimum-width integer types (7.20.1.2) and exact-width integer types (7.20.1.1) defined in the header `<stdint.h>` shall be supported. Other supported values of N are implementation-defined.

wfN Specifies that a following d, i, o, u, x, or X, or n conversion specifier applies to an argument which is a pointer to a fastest minimum-width integer with a specific width where N is a positive decimal integer with no leading zeros. All fastest minimum-width integer types (7.20.1.3) defined in the header `<stdint.h>` shall be supported.

L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to `long double`.
```

The `fwscanf` function returns the value of the macro `EOF` if an input failure occurs before the first conversion (if any) has completed. Otherwise, the function returns the number of input items assigned, which can be fewer than provided for, or even zero, in the event of an early matching failure or if the implementation does not support a specific width length modifier.
