Wording Tweaks for Concept-enabled Random Number Generation in C++0X

This paper is based on N2813 = Brown: Issue Resolutions for Concept-enabled Random Number Generation in C++0X, with all its change marks removed. That paper, in turn, was based on N2781 = Brown: Concepts for Random Number Generation in C++0X. These three papers should be considered as a cumulative ensemble of proposals that adapt the specification of the Standard Library’s random number facility in light of other recent advances in C++0X.

In N2781 we provided initial concepts-based wording, and in N2813 we then integrated all relevant LWG issues with that wording. The main focus of the present paper is to address some recently-discovered copy-and-paste errors, make some additions to a few requires clauses, and make a few other improvements in wording and presentation.

The text in this document should be considered replacement text for Clause 26.4 [random.numbers] of the Committee Draft (N2800). Wherever possible within the proposed wording herein, adjustments to text are denoted as added, deleted, or changed; editorial and similar remarks not part of the proposed wording are shaded. Changes in the index are not specially marked.

With respect to the recent ballot comments of SC22 N4411, it should be noted that comment JP-63 regarding 26.4.8.5.1 [rand.dist.samp.discrete] and comment UK-306 (which partly overlaps comment US-84) regarding 26.4 [random.numbers] had been in significant part proactively addressed in an earlier version of this document. Those previous resolutions are unchanged by the present paper.

We would like to acknowledge the Fermi National Accelerator Laboratory’s Computing Division, sponsors of our participation in the C++ standards effort, for its support. Thanks also to Daniel Krügler, Alisdair Meredith, and our Fermilab colleagues for their constructive comments on earlier versions of this paper.
For reference purposes, the following list identifies all known papers (culminating in the present paper) that led to the
C++0X Standard Library’s random number facility:

N1398 = “A Proposal to Add an Extensible Random Number Facility to the Standard Library”
N1452 = “A Proposal to Add an Extensible Random Number Facility to the Standard Library (Revision 2)”
N1588 = “On Random-Number Distributions for C++0X”
N1914 = “A Proposal to Add Random-Number Distributions to C++0X”
N1932 = “Random Number Generation in C++0X: A Comprehensive Proposal”

Index .................................................................................. 51
This subclause defines a facility for generating (pseudo-)random numbers.

In addition to a few utilities, four categories of entities are described: uniform random number generators, random number engines, random number engine adaptors, and random number distributions. These categorizations are applicable to types that satisfy the corresponding concepts, to objects instantiated from such types, and to templates producing such types when instantiated. [Note: These entities are specified in such a way as to permit the binding of any uniform random number generator object as the argument to any random number distribution object, thus producing a zero-argument function object such as given by \( \text{bind}(d,e) \). — end note]

Each of the entities specified via this subclause has an associated arithmetic type identified as result_type. With \( T \) as the result_type thus associated with such an entity, that entity is characterized

a) as boolean or equivalently as boolean-valued, if \( T \) is bool;

b) otherwise as integral or equivalently as integer-valued, if `\( \text{numeric_limits<T>::is_integer} \)` is true;

c) otherwise as floating or equivalently as real-valued.

If integer-valued, an entity may optionally be further characterized as signed or unsigned, according to `\( \text{numeric_limits<T>::is_signed} \)`.

Unless otherwise specified, all descriptions of calculations in this subclause use mathematical real numbers.

Throughout this subclause, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further,

a) the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

b) the operator `lshift` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo \( 2^w \).

26.4.1 **Header <random> synopsis**

The order in which concepts are specified, here and in the next subclause, has been adjusted (without further markup) such that each concept is now presented before it is used.

26.4.2 Concepts and related requirements for random number generation

26.4.2.1 Concept SeedSequence

A seed sequence is an object that consumes a sequence of integer-valued data and produces a requested number of
unsigned integer values $i$, $0 \leq i < 2^{32}$, based on the consumed data. [Note: Such an object provides a mechanism to avoid
replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of
random number engines. — end note]

concept SeedSequence<
typename S>
  : Semiregular<S>, DefaultConstructible<S> {
  UnsignedIntegralLike result_type;
  requires IntegralType<result_type>;
  & True<sizeof(uint32_t) <= sizeof(result_type)>;

  template<IntegralLike T>
  requires IntegralType<T>
  S::S(initializer_list<T> il);

  template<InputIterator Iter>
  requires IntegralLike<Iter::value_type>
  & IntegralType<Iter::value_type>
  S::S(Iter begin, Iter end, size_t u = numeric_limits<Iter::value_type>::digits);

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4  Random number generation  
Numerics library 6

```cpp
template<RandomAccessIterator Iter>
void generate(S& q, Iter begin, Iter end);
size_t size(const S& q);
```

```cpp
template<OutputIterator<auto,const result_type&> Iter>
void param(const S& q, Iter dest);
```

```cpp
template<IntegralLike T>
S::S(initializer_list<T> il);
```

```
Effects: Same as S::S(il.begin(), il.end()).
```

```cpp
template<InputIterator Iter>
S::S(Iter begin, Iter end,
size_t u = numeric_limits<Iter::value_type>::digits);
```

```
Effects: Constructs a SeedSequence object having internal state that depends on some or all of the bits of the supplied sequence [begin, end).
```

```cpp
template<RandomAccessIterator Iter>
void generate(S& q, Iter begin, Iter end);
size_t size(const S& q);
```

```
Effects: Does nothing if begin == end. Otherwise, fills the supplied range [begin, end) with 32-bit quantities that depend on the sequence supplied to the constructor and possibly also on the history of generate’s previous invocations.
```

```
Returns: The number of 32-bit units that would be be returned by a call to param().
```

```cpp
template<OutputIterator<auto,const result_type&> Iter>
void param(const S& q, Iter dest);
```

```
Effects: Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of the same type, and that would reproduce in that second object a state indistinguishable from the state of the first object.
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4.2.2 Concept UniformRandomNumberGenerator

A uniform random number generator \( g \) of type \( G \) is a function object returning unsigned integral values such that each value in the range of possible results has (ideally) equal probability of being returned. [Note: The degree to which \( g \)'s results approximate the ideal is often determined statistically. — end note]

```cpp
concept UniformRandomNumberGenerator<
    typename G
> : Callable<G> {
    requires UnsignedIntegralLike<
        result_type,
        &
        IntegralType<
            result_type,
        >;
    static constexpr result_type G::min();
    static constexpr result_type G::max();

    axiom NonemptyRange(G& g) {
        G::min() < G::max();
    }
    axiom InRange(G& g, result_type& r) {
        r = g(), G::min() <= r & r <= G::max();
    }
}
result_type operator()(G& g); // from Callable<G>
```

Complexity: amortized constant.

26.4.2.3 Concept RandomNumberEngine

A random number engine (commonly shortened to engine) \( e \) of type \( E \) is a uniform random number generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this section.

Unless otherwise specified, the complexity of each function specified via the RandomNumberEngine concept (including those specified via any less-refined concept) shall be \( O(\text{size of state}) \).

```cpp
concept RandomNumberEngine<
    typename E
> : Regular<E>, UniformRandomNumberGenerator<E> {
    requires Constructible<
        E,
        result_type
    > explicit E::E(result_type value);
    template<SeedSequence Sseq> explicit E::E(Sseq& q);

    void seed(E& e, void seed(E& e, result_type s); void seed(E& e, Sseq& q){e = E(q);}

    void discard(E& e, unsigned long long z) { for( ; z != 0ULL; --z) e(); }
    template<OutputStreamable OS> OS& operator<<(OS& os, const E& e);
    template<InputStreamable IS> IS& operator>>(IS& is, E& e);

    axiom Uniqueness( E& e, E& f, result_type s, Sseq& q) {
        (seed(e), e) == (seed(f), f);
        (seed(e, s), e) == (seed(f, s), f);
        (seed(e, q), e) == (seed(f, q), f);
    }
}
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
3 At any given time, $e$ has a state $e_i$ for some integer $i \geq 0$. Upon construction, $e$ has an initial state $e_0$. An engine’s state may be established via a constructor, a seed member function, assignment, or a suitable operator $\ll$.

4 $E$’s specification shall define

a) the size of $E$’s state in multiples of the size of result_type, given as an integral constant expression;

b) the transition algorithm $TA$ by which $e$’s state $e_i$ is advanced to its successor state $e_{i+1}$; and

c) the generation algorithm $GA$ by which an engine’s state is mapped to a value of type result_type.

bool operator==(const E& e1, const E& e2); // from Regular<E>

5 Returns: true if $S_1 = S_2$, where $S_1$ and $S_2$ are the infinite sequences of values that would be generated, respectively, by repeated future calls to $e1()$ and $e2()$. Otherwise returns false.

void result_type operator() (E& e); // from UniformRandomNumberGenerator<E>

6 Effects: Sets the $e$’s state to $e_{i+1} = TA(e_i)$.

Returns: $GA(e_i)$.

8 Complexity: as specified in 26.4.2.2 [rand.concept.urng] via the UniformRandomNumberGenerator concept.

explicit E::E(result_type s); // from Constructible<E,result_type>

9 Effects: Creates an engine with an initial state that depends on $s$.

template<SeedSequence Sseq> explicit E::E(Sseq& q);

10 Effects: Creates an engine with an initial state that depends on a sequence produced by one call to $q$.generate.

11 Complexity: Same as complexity of $q$.generate when called on a sequence whose length is size of state.

12 Note: This constructor (as well as the corresponding seed() function below) may be particularly useful to applications requiring a large number of independent random sequences.

void seed(E& e);

13 Postcondition: $e == E()$.

14 Complexity: same as $E()$.

void seed(E& e, result_type s);

15 Postcondition: $e == E(s)$.

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
9 Numerics library

26.4 Random number generation

Complexity: same as $E(s)$.

```cpp
template<SeedSequence Sseq> void seed(E& e, Sseq& q);
```

Postcondition: $e == E(q)$ (using the original value of $q$).

Complexity: same as $E(q)$.

```cpp
void discard(E& e, unsigned long long z);
```

Effects:Advances the engine’s state from $e_i$ to $e_i + z$ by any means equivalent to the default implementation specified above.

Complexity: no worse than the complexity of $z$ consecutive calls to operator()().

Note: This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over the default implementation specified above.

```cpp
template<OutputStreamable OS> OS&& operator<<(OS&& os, const E& e);
```

Effects:With $os$.fmtflags set to ios_base::dec|ios_base::left and the fill character set to the space character, writes to $os$ the textual representation of $e$’s current state. In the output, adjacent numbers are separated by one or more space characters.

Returns: the updated $os$.

Postcondition: The $os$.fmtflags and fill character are unchanged.

```cpp
template<InputStreamable IS> IS&& operator>>(IS&& is, E& e);
```

Requires: $is$ provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of $is$, and whose associated types OutputStreamable::charT and OutputStreamable::traits were respectively the same as those of $is$.

Effects: With $is$.fmtflags set to ios_base::dec, sets $e$’s state as determined by reading its textual representation from $is$. If bad input is encountered, ensures that $e$’s state is unchanged by the operation and calls is.setstate(ios::failbit) (which may throw ios::failure [iostate.flags]). If a textual representation written via $os$ $<< x$ was subsequently read via $is$ $>> v$, then $x == v$ provided that there have been no intervening invocations of $x$ or of $v$.

Returns: the updated $is$.

Postcondition: The $is$.fmtflags are unchanged.

26.4.2.4 Concept RandomNumberEngineAdaptor

A random number engine adaptor (commonly shortened to adaptor) $a$ of type $A$ is a random number engine that takes values produced by some other random number engine or engines, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. Engines adapted in this way are termed base engines in this context. The terms unary, binary, and so on, may be used to characterize an adaptor depending on the number $n$ of base engines that adaptor utilizes.

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
The base engines of $A$ are arranged in an arbitrary but fixed order, and that order is consistently used whenever functions are applied to those base engines in turn. In this context, the notation $b_i$ denotes the $i^{th}$ of $A$’s base engines, $1 \leq i \leq n$, and $B_i$ denotes the type of $b_i$.

```cpp
class RandomNumberEngineAdaptor<
    typename A,
    typename B0, typename... Bi>
    : RandomNumberEngine<A>
{
    requires RandomNumberEngine<B0>
    && RandomNumberEngine<Bi>...
    && Constructible<A, const RandomNumberEngine&B0&, const Bi&...>
    && Constructible<A, RandomNumberEngine&B0&&, Bi&&...>;
}
```

$A::A();$ // from RandomNumberEngine<A>

**Effects:** Each $b_i$ is initialized, in turn, as if by its respective default constructor.

```cpp
bool operator==(const A& a1, const A& a2); // from RandomNumberEngine<A>
```

**Returns:** true if each pair of corresponding $b_i$ are equal. Otherwise returns false.

$A::A(result_type s);$ // from RandomNumberEngine<A>

**Effects:** Each $b_i$ is initialized, in turn, with the next available value from the list $s + 0, s + 1, \ldots$.

```cpp
template<SeedSequence Sseq> void A::A(Sseq& q); // from RandomNumberEngine<A>
```

**Effects:** Each $b_i$ is initialized, in turn, with $q$ as argument.

```cpp
void seed(A& a); // from RandomNumberEngine<A>
```

**Effects:** For each $b_i$, in turn, invokes $b_i$.seed().

```cpp
void seed(A& a, result_type s); // from RandomNumberEngine<A>
```

**Effects:** For each $b_i$, in turn, invokes $b_i$.seed(s) with the next available value from the list $s + 0, s + 1, \ldots$.

```cpp
template<SeedSequence Sseq> void seed(A& a, Sseq& q); // from RandomNumberEngine<A>
```

**Effects:** For each $b_i$, in turn, invokes $b_i$.seed(q).

$A$ shall also satisfy the following additional requirements:

a) The complexity of each function shall be at most the sum of the complexities of the corresponding functions applied to each base engine.

b) The state of $A$ shall include the state of each of its base engines. The size of $A$’s state shall be no less than the sum of the base engines’ respective sizes.

c) Copying $A$’s state (e.g., during copy construction or copy assignment) shall include copying, in turn, the state of each base engine of $A$.

d) The textual representation of $A$ shall include, in turn, the textual representation of each of its base engines.

e) Any constructor satisfying the requirement`Constructible<A, const RandomNumberEngine&...>` or satisfying the requirement`Constructible<A, RandomNumberEngine&&...>` shall have $n$ or more parameters such that the underlying type of parameter $i$, $1 \leq i \leq n$, is $B_i$, and such that all remaining parameters, if any, have default
values. The constructor shall create an engine adaptor initializing each \( b_i \), in turn, with a copy of the value of the corresponding argument.

### 26.4.2.5 Concept RandomNumberDistribution

A **random number distribution** (commonly shortened to **distribution**) \( d \) of type \( D \) is a function object returning values that are distributed according to an associated mathematical **probability density function** \( p(z) \) or an associated **discrete probability function** \( P(z_i) \). A distribution’s specification identifies its associated probability function \( p(z) \) or \( P(z_i) \).

An associated probability function is typically expressed using certain externally-supplied quantities known as the **parameters of the distribution**. Such distribution parameters are identified in this context by writing, for example, \( p(z|a,b) \) or \( P(z_i|a,b) \), to name specific parameters, or by writing, for example, \( p(z|\{p\}) \) or \( P(z_i|\{p\}) \), to denote a distribution’s parameters \( p \) taken as a whole.

```cpp
concept RandomNumberDistribution<typename D> : Regular<D> {
    ArithmeticType result_type;
    Regular param_type;
    requires Constructible<D, const param_type&>;

    void reset(D& d);

    template<UniformRandomNumberGenerator URNG> result_type operator()(D& d, URNG& g);
    template<UniformRandomNumberGenerator URNG> result_type operator()(D& d, URNG& g, const param_type& p);

    param_type param(const D& d);
    void param(D& d, const param_type&);

    result_type min(const D& d);
    result_type max(const D& d);

    template<OutputStreamable OS> OS& operator<<(OS& os, const D& d);
    template<InputStreamable IS> IS& operator>>(IS& is, D& d);
}
```

**Requires:**

a) For each of the constructors of \( D \) taking arguments corresponding to parameters of the distribution, \( \text{param}_-\text{type} \) shall provide a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values.

b) For each of the member functions of \( D \) that return values corresponding to parameters of the distribution, \( \text{param}_-\text{type} \) shall provide a corresponding member function with the identical name, type, and semantics.

c) \( \text{param}_-\text{type} \) shall provide a declaration of the form `typedef D distribution_type`.

**Remark:** It is unspecified whether \( \text{param}_-\text{type} \) is declared as a (nested) class or via a `typedef`. In this subclause 26.4 [random.numbers], declarations of \( D::\text{param}_-\text{type} \) are in the form of `typedefs` only for convenience of exposition.

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
D::D(const param_type& p);

Effects: Creates a distribution whose behavior is indistinguishable from that of a distribution newly created directly from the values used to create p.

Complexity: same as p’s construction.

bool operator==(const D& d1, const D& d2); // from Regular<D>

Returns: true if d1.param() == d2.param() and S1 = S2, where S1 and S2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to d1(g1) and d2(g2) whenever g1 == g2. Otherwise returns false.

void reset(D& d);

Effects: Subsequent uses of the distribution do not depend on values produced by any engine prior to invoking reset.

Complexity: constant.

template<UniformRandomNumberGenerator URNG> result_type operator()(D& d, URNG& g);

Effects: With p = param(), the sequence of numbers returned by successive invocations with the same object u is randomly distributed according to the associated probability function p(z | {p}) or P(z_i | {p}).

For distributions x and y of identical type D:

a) The sequence of numbers produced by repeated invocations of x(u) shall be independent of any invocation of os << x or of any const member function of D between any of the invocations x(u).

b) If a textual representation is written using os << x and that representation is restored into the same or a different object y using is >> y, repeated invocations of y(u) shall produce the same sequence of numbers as would repeated invocations of x(u).

Complexity: amortized constant number of invocations of u.

template<UniformRandomNumberGenerator URNG> result_type operator()(D& d, URNG& g, const param_type& p);

Effects: The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated probability function p(z | {p}) or P(z_i | {p}).

param_type param(const D& d);

Returns: a value p such that param(D(p)) == p.

Complexity: no worse than the complexity of D(p).

void param(D& d, const param_type& p);

Postcondition: param(D(), p) == pparam(d) == p.

Complexity: no worse than the complexity of D(p).

result_type min(const D& d);

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
17    Returns: the greatest lower bound on the values potentially returned by \texttt{operator()}, as determined by the current values of the distribution's parameters.

18    Complexity: constant.

    \texttt{result\_type max(const D\& d);} 

19    Returns: the least upper bound on the values potentially returned by \texttt{operator()}, as determined by the current values of the distribution's parameters.

20    Complexity: constant.

    \texttt{template<OutputStreamable OS> OS\& operator<(OS\& os, const D\& d);} 

21    Effects: Writes to \texttt{os} a textual representation for the parameters and the additional internal data of \texttt{d}.

22    Returns: the updated \texttt{os}.

23    Postcondition: The \texttt{os.fmtflags} and fill character are unchanged.

    \texttt{template<InputStreamable IS> IS\& operator>>(IS\& is, D\& d);} 

24    Requires: \texttt{is} provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of \texttt{is}, and whose associated types \texttt{OutputStreamable::charT} and \texttt{OutputStreamable::traits} were respectively the same as those of \texttt{is}.

25    Effects: Restores from \texttt{is} the parameters and the additional internal data of \texttt{d}. If bad input is encountered, ensures that \texttt{d} is unchanged by the operation and calls \texttt{is.setstate(ios::failbit)} (which may throw \texttt{ios::failure [iostate.flags]}).

26    Returns: the updated \texttt{is}.

27    Postcondition: The \texttt{is.fmtflags} are unchanged.

26.4.3 Random number engine class templates

1    Except where specified otherwise, the complexity of all functions specified in the following sections is constant.

2    Except where specified otherwise, no function described in this section 26.4.3 [rand.eng] throws an exception.

3    For every class \texttt{E} instantiated from a template specified in this section 26.4.3 [rand.eng], a concept map \texttt{RandomNumberEngine<E>} shall be defined in namespace \texttt{std} so as to provide mappings from free functions to the corresponding member functions. Descriptions are provided here only for engine operations that are not described in 26.4.2.3 [rand.concept.eng] or for operations where there is additional semantic information. Declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

26.4.3.1 Class template linear_congruential_engine

1    A \texttt{linear_congruential_engine} random number engine produces unsigned integer random numbers. The state \(x_i\) of a \texttt{linear_congruential_engine} object \(x\) is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form \(TA(x_i) = (a \cdot x_i + c) \mod m\); the generation algorithm is \(GA(x_i) = x_{i+1}\).
template<UnsignedIntegralLike UIntType, UIntType a, UIntType c, UIntType m>
  requires IntegralType<UIntType>
  && True<m == 0u || (a < m && c < m)>
class linear_congruential_engine
{
public:
  // types
  typedef UIntType result_type;

  // engine characteristics
  static constexpr result_type multiplier = a;
  static constexpr result_type increment = c;
  static constexpr result_type modulus = m;
  static constexpr result_type min() { return c == 0u ? 1u: 0u; }
  static constexpr result_type max() { return m - 1u; }
  static constexpr result_type default_seed = 1u;

  // constructors and seeding functions
  explicit linear_congruential_engine(result_type s = default_seed);
  template<SeedSequence Sseq> explicit linear_congruential_engine(Sseq& q);
  void seed(result_type s = default_seed);
  template<SeedSequence Sseq> void seed(Sseq& q);

  // generating functions
  result_type operator()();
  void discard(unsigned long long z);
};

If the template parameter \( m \) is 0, the modulus \( m \) used throughout this section 26.4.3.1 [rand.eng.lcong] is \( \text{numeric_limits<result_type>::max()} + 1 \). [Note: \( m \) need not be representable as a value of type \( \text{result_type} \). — end note]

The textual representation consists of the value of \( x_i \).

explicit linear_congruential_engine(result_type s = default_seed);

Effects: Constructs a \( \text{linear_congruential_engine} \) object. If \( c \mod m \) is 0 and \( s \mod m \) is 0, sets the engine’s state to 1, otherwise sets the engine’s state to \( s \mod m \).

template<SeedSequence Sseq> explicit linear_congruential_engine(Sseq& q);

Effects: Constructs a \( \text{linear_congruential_engine} \) object. With \( k = \left\lfloor \frac{\log_2 m}{32} \right\rfloor \) and \( a \) an array (or equivalent) of length \( k + 3 \), invokes \( \text{q.generate} (a + 0, a + k + 3) \) and then computes \( S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^{32j} \right) \mod m \). If \( c \mod m \) is 0 and \( S \) is 0, sets the engine’s state to 1, else sets the engine’s state to \( S \).

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4.3.2 Class template mersenne_twister_engine

1 A mersenne_twister_engine random number engine\(^1\) produces unsigned integer random numbers in the closed interval \([0, 2^w - 1]\). The state \(x_i\) of a mersenne_twister_engine object \(x\) is of size \(n\) and consists of a sequence \(X\) of \(n\) values of the type delivered by \(x\); all subscripts applied to \(X\) are to be taken modulo \(n\).

2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values \(n\) and \(m\), a twist value \(r\), and a conditional xor-mask \(a\). To improve the uniformity of the result, the bits of the raw shift register are additionally tempered (i.e., scrambled) according to a bit-scrambling matrix defined by values \(u, d, s, b, t, c,\) and \(\ell\).

The state transition is performed as follows:

a) Concatenate the upper \(w - r\) bits of \(X_{i-n}\) with the lower \(r\) bits of \(X_{i+1-n}\) to obtain an unsigned integer value \(Y\).

b) With \(\alpha = a \cdot (Y \text{bitand} 1)\), set \(X_i\) to \(X_{i+m-n} \text{xor} (Y \text{rshift} 1) \text{xor} \alpha\).

The sequence \(X\) is initialized with the help of an initialization multiplier \(f\).

3 The generation algorithm determines the unsigned integer values \(z_1, z_2, z_3, z_4\) as follows, then delivers \(z_4\) as its result:

a) Let \(z_1 = X_i \text{xor} ((X_i \text{rshift} u) \text{bitand} d)\).

b) Let \(z_2 = z_1 \text{xor} ((z_1 \text{lshift} w) \text{bitand} b)\).

c) Let \(z_3 = z_2 \text{xor} ((z_2 \text{lshift} w) \text{bitand} c)\).

d) Let \(z_4 = z_3 \text{xor} (z_3 \text{rshift} \ell)\).

\[\text{template<UnsignedIntegralLike\text{UIntegerType}, size_t w, size_t n, size_t m, size_t r,}\]
\[\text{UIntegerType a, size_t u, UintType d, size_t s,}\]
\[\text{UIntegerType b, size_t t,}\]
\[\text{UIntegerType c, size_t l, UintType f>}\]
\[\text{requires IntegralType<UIntegerType>}\]
\[\text{& & True<1u \leq m & & \_umin \leq n}\]
\[\text{& & r \leq w & & u \leq w & & k k \ s \leq w & & k k \ t \leq w & & k k \ l \leq w}\]
\[\text{& & w \leq numeric\_limits<UIntegerType>::digits}\]
\[\text{& & k \ a \ leq (1u<<w) - 1u & & k \ b \ leq (1u<<w) - 1u & & k \ c \ leq (1u<<w) - 1u}\]
\[\text{class mersenne_twister_engine}\]
\{\}

\[\text{public:}\]
\[\text{// types}\]
\[\text{typedef UintType result\_type;}\]

\[\text{// engine characteristics}\]
\[\text{static constexpr size_t word\_size = w;}\]
\[\text{static constexpr size_t state\_size = n;}\]
\[\text{static constexpr size_t shift\_size = m;}\]
\[\text{static constexpr size_t mask\_bits = r;}\]
\[\text{static constexpr UintType xor\_mask = a;}\]
\[\text{static constexpr size_t tempering\_u = u;}\]
\[\text{static constexpr size_t tempering\_d = d;}\]

---

\(^1\)The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
26.4 Random number generation

static constexpr size_t tempering_s = s;
static constexpr UlIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UlIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr size_t initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return \(2^w - 1\); }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
explicit mersenne_twister_engine(result_type value = default_seed);
template<SeedSequence Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<SeedSequence Sseq> void seed(Sseq& q);

// generating functions
result_type operator()();
void discard(unsigned long long z);

4 The textual representation of \(x_i\) consists of the values of \(X_{i-n}, \ldots, X_{i-1}\), in that order.

explicit mersenne_twister_engine(result_type value = default_seed);

5 Effects: Constructs a mersenne_twister_engine object. Sets \(X_{-n}\) to value \(\text{mod } 2^w\). Then, iteratively for \(i = 1-n, \ldots, -1\), sets \(X_i\) to
\[
\left[ f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w-2))) + i \text{ mod } n \right] \text{ mod } 2^w.
\]

Complexity: \(\mathcal{O}(n)\).

template<SeedSequence Sseq> explicit mersenne_twister_engine(Sseq& q);

7 Effects: Constructs a mersenne_twister_engine object. With \(k = [w/32]\) and \(a\) an array (or equivalent) of length \(n \cdot k\), invokes \(q\).generate \((a+0, a+n \cdot k)\) and then, iteratively for \(i = -n, \ldots, -1\), sets \(X_i\) to \(\left( \sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j} \right) \text{ mod } 2^w\). Finally, if the most significant \(w-r\) bits of \(X_{-n}\) are zero, and if each of the other resulting \(X_i\) is 0, changes \(X_{-n}\) to \(2^w-1\).

26.4.3.3 Class template subtract_with_carry_engine

A subtract_with_carry_engine random number engine produces unsigned integer random numbers.

The state \(x_i\) of a subtract_with_carry_engine object \(x\) is of size \(\mathcal{O}(r)\), and consists of a sequence \(X\) of \(r\) integer values \(0 \le X_i < m = 2^w\); all subscripts applied to \(X\) are to be taken modulo \(r\). The state \(x_i\) additionally consists of an integer \(c\) (known as the carry) whose value is either 0 or 1.

The state transition is performed as follows:

a) Let \(Y = X_{i-s} - X_{i-r} - c\).

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
b) Set \( X_i \) to \( y = Y \mod m \). Set \( c \) to 1 if \( Y < 0 \), otherwise set \( c \) to 0.

[Note: This algorithm corresponds to a modular linear function of the form \( TA(x_i) = (a \cdot x_i) \mod b \), where \( b \) is of the form \( m^r - m^s + 1 \) and \( a = b - (b-1)/m \). — end note]

The generation algorithm is given by \( G\bar{A}(x_i) = y \), where \( y \) is the value produced as a result of advancing the engine’s state as described above.

```cpp
template<UnsignedIntegralLike UIntType, size_t w, size_t s, size_t r>
requires IntegralType<UIntType> && True<0u < s && s < r && 0 < w && w <= numeric_limits<UIntType>::digits>
class subtract_with_carry_engine
{
    public:
        // types
        typedef UIntType result_type;

        // engine characteristics
        static constexpr size_t word_size = w;
        static constexpr size_t short_lag = s;
        static constexpr size_t long_lag = r;
        static constexpr result_type min() { return 0; }
        static constexpr result_type max() { return m - 1; }
        static constexpr result_type default_seed = 19780503u;

        // constructors and seeding functions
        explicit subtract_with_carry_engine(result_type value = default_seed);
        template<SeedSequence Sseq> explicit subtract_with_carry_engine(Sseq& q);
        void seed(result_type value = default_seed);
        template<SeedSequence Sseq> void seed(Sseq& q);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);
};
```

The textual representation consists of the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, followed by \( c \).

```cpp
explicit subtract_with_carry_engine(result_type value = default_seed);
```

**Effects:** Constructs a \( \text{subtract\_with\_carry\_engine} \) object. Sets the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, as specified below. If \( X_{i-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

To set the values \( X_k \), first construct \( e \), a \( \text{linear\_congruential\_engine} \) object, as if by the following definition:

```cpp
linear_congruential_engine<result_type,
    40014u,0u,2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each \( X_k \), obtain new values \( z_0, \ldots, z_{n-1} \) from \( n = \lceil w/32 \rceil \) successive invocations of \( e \) taken modulo \( 2^{32} \). Set \( X_k \) to \( \left( \sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \mod m \).

**Complexity:** Exactly \( n \cdot r \) invocations of \( e \).

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
template<SeedSequence Sseq> explicit subtract_with_carry_engine(Sseq& q);

Effects: Constructs a subtract_with_carry_engine object. With \( k = \lceil w/32 \rceil \) and \( a \) an array (or equivalent) of length \( r \cdot k \), invokes \( q.generate(a+0, a+r \cdot k) \) and then, iteratively for \( i = -r, \ldots, -1 \), sets \( X_i \) to \( \left( \sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \right) \mod m \). If \( X_{-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

### 26.4.4 Random number engine adaptor class templates

Except where specified otherwise, the complexity of all functions specified in the following sections is constant.

Except where specified otherwise, no function described in this section 26.4.4 [rand.adapt] throws an exception.

For every class \( A \) instantiated from a template specified in this section 26.4.4 [rand.adapt], a concept map \( \text{RandomNumberEngineAdaptor}<E> \) shall be defined in namespace \( \text{std} \) so as to provide mappings from free functions to the corresponding member functions. Descriptions are provided here only for adaptor operations that are not described in section 26.4.2.4 [rand.concept.adapt] or for operations where there is additional semantic information. Declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

#### 26.4.4.1 Class template discard_block_engine

A \( \text{discard_block_engine} \) random number engine adaptor produces random numbers selected from those produced by some base engine \( e \). The state \( x_i \) of a \( \text{discard_block_engine} \) engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \) and an additional integer \( n \). The size of the state is the size of \( e \)'s state plus 1.

The transition algorithm discards all but \( r > 0 \) values from each block of \( p \geq r \) values delivered by \( e \). The state transition is performed as follows: If \( n \geq r \), advance the state of \( e \) from \( e_i \) to \( e_i \cdot p - r \) and set \( n \) to 0. In any case, then increment \( n \) and advance \( e \)'s then-current state \( e_j \) to \( e_j + 1 \).

The generation algorithm yields the value returned by the last invocation of \( e() \) while advancing \( e \)'s state as described above.

```cpp
template<RandomNumberEngine Engine, size_t p, size_t r>
requires True<1 <= r && r <= p>
class discard_block_engine
{
  public:
    // types
typedef typename Engine::result_type result_type;

    // engine characteristics
static constexpr size_t block_size = p;
static constexpr size_t used_block = r;
static constexpr result_type min() { return Engine::min; }
static constexpr result_type max() { return Engine::max; }

    // constructors and seeding functions
discard_block_engine();
explicit discard_block_engine(const Engine& e);
explicit discard_block_engine(Engine&& e);
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
explicit discard_block_engine(result_type s);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const;

private:
    Engine e; // exposition only
    int n;    // exposition only
};

4 The textual representation consists of the textual representation of e followed by the value of n.

5 In addition to its behavior pursuant to section 26.4.2.4 [rand.concept.adapt], each constructor that is not a copy constructor sets n to 0.

26.4.4.2 Class template independent_bits_engine

An independent_bits_engine random number engine adaptor combines random numbers that are produced by some base engine e, so as to produce random numbers with a specified number of bits w. The state x_i of an independent_bits_engine engine adaptor object x consists of the state e_i of its base engine e; the size of the state is the size of e’s state.

The transition and generation algorithms are described in terms of the following integral constants:

a) Let \( R = e\text{.max()} - e\text{.min()} + 1 \) and \( m = \lfloor \log_2 R \rfloor \).

b) With n as determined below, let \( w_0 = \lfloor w/n \rfloor \), \( n_0 = n - w \mod n \), \( y_0 = 2^n_0 \lfloor R/2^n_0 \rfloor \), and \( y_1 = 2^{n_0+1} \lfloor R/2^{n_0+1} \rfloor \).

c) Let \( n = \lfloor w/m \rfloor \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lfloor w/m \rfloor \).

[Note: The relation \( w = n_0w_0 + (n - n_0)(w_0 + 1) \) always holds. — end note]

The transition algorithm is carried out by invoking e() as often as needed to obtain \( n_0 \) values less than \( y_0 + e\text{.min()} \) and \( n - n_0 \) values less than \( y_1 + e\text{.min()} \).

4 The generation algorithm uses the values produced while advancing the state as described above to yield a quantity \( S \) obtained as if by the following algorithm:

\[
S = 0; \\
\text{for } (k = 0; k \neq n_0; k += 1) \{ \\
\quad \text{do } u = e() - e\text{.min(); while } (u \geq y_0); \\
\quad S = 2^{n_0} \cdot S + u \mod 2^{n_0}; \\
\} \\
\text{for } (k = n_0; k \neq n; k += 1) \{ \\
\quad \text{do } u = e() - e\text{.min(); while } (u \geq y_1); \\
\}
\]

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
\[ S = 2^{w_0+1} \cdot S + u \mod 2^{w_0+1}; \]

```cpp
template<RandomNumberEngine Engine, size_t w, UnsignedIntegralLike UIntType>
    requires IntegralType<UIntType>
    && True<0u < w && w <= numeric_limits<result_type>::digits>
    class independent_bits_engine
{
public:
    // types
    typedef UIntType result_type;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return \(2^w - 1\); }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<SeedSequence Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<SeedSequence Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const;

private:
    Engine e; // exposition only
};
```

The textual representation consists of the textual representation of \(e\).

### 26.4.4.3 Class template shuffle_order_engine

A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine \(e\), but delivers them in a different sequence. The state \(x_i\) of a `shuffle_order_engine` engine adaptor object \(x\) consists of the state \(e_i\) of its base engine \(e\), an additional value \(Y\) of the type delivered by \(e\), and an additional sequence \(V\) of \(k\) values also of the type delivered by \(e\). The size of the state is the size of \(e\)'s state plus \(k+1\).

The transition algorithm permutes the values produced by \(e\). The state transition is performed as follows:

1. Calculate an integer \(j = \left\lfloor \frac{k(Y - e_{\text{min}})}{e_{\text{max}} - e_{\text{min}} + 1} \right\rfloor\).
b) Set $Y$ to $V_j$ and then set $V_j$ to $e()$.

The generation algorithm yields the last value of $Y$ produced while advancing $e$’s state as described above.

template<typename RandomNumberEngine Engine, size_t k>
requires True<1u <= k>
class shuffle_order_engine
{
    public:
        // types
        typedef typename Engine::result_type result_type;

        // engine characteristics
        static constexpr size_t table_size = k;
        static constexpr result_type min() { return Engine::min; }
        static constexpr result_type max() { return Engine::max; }

        // constructors and seeding functions
        shuffle_order_engine();
        explicit shuffle_order_engine(const Engine& e);
        explicit shuffle_order_engine(Engine&& e);
        explicit shuffle_order_engine(result_type s);
        template<SeedSequence Sseq> explicit shuffle_order_engine(Sseq& q);
        void seed();
        void seed(result_type s);
        template<SeedSequence Sseq> void seed(Sseq& q);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // property functions
        const Engine& base() const;

    private:
        Engine e;  // exposition only
        result_type Y;  // exposition only
        result_type V[k];  // exposition only
    };

4 The textual representation consists of the textual representation of $e$, followed by the $k$ values of $V$, followed by the value of $Y$.

5 In addition to its behavior pursuant to section 26.4.2.4 [rand.concept.adapt], each constructor that is not a copy constructor initializes $V[0], \ldots, V[k-1]$ and $Y$, in that order, with values returned by successive invocations of $e()$.

26.4.5 Engines and engine adaptors with predefined parameters [rand.predef]

typedef linear_congruential_engine<uint_fast32_t, 16807, 0, 2147483647> minstd_rand0;
**26.4 Random number generation**

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `minstd_rand0` shall produce the value 1043618065.

```cpp
typedef linear_congruential_engine<uint_fast32_t, 48271, 0, 2147483647>
    minstd_rand;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `minstd_rand` shall produce the value 399268537.

```cpp
typedef mersenne_twister_engine<uint_fast32_t,
    32,624,397,31,0x9908b0df,11,0xffffffff,7,0x9d2c5680,15,0x4ec60000,18,1812433253>
    mt19937;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `mt19937` shall produce the value 4123659995.

```cpp
typedef mersenne_twister_engine<uint_fast64_t,
    64,312,156,31,0xb5026f5aa96619e9,29,
    0x5555555555555555,17,
    0x71d67ffeda60000,37,
    0xfffff0000000000,43,
    636413238476793005>
    mt19937_64;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `mt19937_64` shall produce the value 9981545732273789042.

```cpp
typedef subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>
    ranlux24_base;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `ranlux24_base` shall produce the value 7937952.

```cpp
typedef subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>
    ranlux48_base;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `ranlux48_base` shall produce the value 61839128582725.

```cpp
typedef discard_block_engine<ranlux24_base, 223, 23>
    ranlux24;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `ranlux24` shall produce the value 9901578.

```cpp
typedef discard_block_engine<ranlux48_base, 389, 11>
    ranlux48;
```

**Required behavior:** The 10000th consecutive invocation of a default-constructed object of type `ranlux48` shall produce the value 249142670248501.

```cpp
typedef shuffle_order_engine<minstd_rand0,256>
    knuth_b;
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
Required behavior: The 10000^{th} consecutive invocation of a default-constructed object of type \texttt{knuth\_b} shall produce the value 1112339016.

```cpp
typedef implementation-defined
default_random_engine;
```

Required behavior: A concept map \texttt{RandomNumberEngine<default\_random\_engine>}, or equivalent, shall be defined in namespace std so as to provide mappings from free functions to the corresponding member functions.

Remark: The choice of engine type named by this \texttt{typedef} is implementation defined. [Note: The implementation may select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations may select different underlying engine types, code that uses this \texttt{typedef} need not generate identical sequences across implementations. — end note]

26.4.6 Class \texttt{random\_device} [rand.device]

A \texttt{random\_device} uniform random number generator produces non-deterministic random numbers. A concept map \texttt{UniformRandomNumberGenerator<random\_device>} shall be defined in namespace std so as to provide mappings from free functions to the corresponding member functions.

If implementation limitations prevent generating non-deterministic random numbers, the implementation may employ a random number engine.

```cpp
class random_device
{
    public:
        // types
        typedef unsigned int result_type;

        // generator characteristics
        static constexpr result_type min() { return numeric_limits<result_type>::min(); }
        static constexpr result_type max() { return numeric_limits<result_type>::max(); }

        // constructors
        explicit random_device(const string& token = implementation-defined);

        // generating functions
        result_type operator()();

        // property functions
        double entropy() const;

        // no copy functions
        random_device(const random_device&) = delete;
        void operator=(const random_device&) = delete;
    };

external random_device(const string& token = implementation-defined);
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
Effects: Constructs a random_device non-deterministic uniform random number generator object. The semantics and default value of the token parameter are implementation-defined.\(^2\)

Throws: A value of an implementation-defined type derived from exception if the random_device could not be initialized.

double entropy() const;

Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate\(^3\) for the random numbers returned by operator(), in the range min() to \(\log_2(\max() + 1)\).

Throws: Nothing.

result_type operator()();

Returns: A non-deterministic random value, uniformly distributed between min() and max(), inclusive. It is implementation-defined how these values are generated.

Throws: A value of an implementation-defined type derived from exception if a random number could not be obtained.

26.4.7 Utilities \([\text{rand.util}]\)

26.4.7.1 Class seed_seq \([\text{rand.util.seedseq}]\)

No function described in this section 26.4.7.1 [rand.util.seedseq] throws an exception.

A concept map SeedSequence<seed_seq> shall be defined in namespace std so as to provide mappings from free functions to the corresponding member functions.

```cpp
class seed_seq
{
public:
    // types
    typedef uint_least32_t result_type;

    // constructors
    seed_seq();
    template<IntegralLike T>
    requires IntegralType<T>
    seed_seq(std::initializer_list<T> il);
    template<InputIterator Iter>
    requires IntegralLike<Iter::value_type>
    && IntegralType<Iter::value_type>
    seed_seq(Iter begin, Iter end);

    // generating functions
    template<RandomAccessIterator Iter>
    requires UnsignedIntegralLike<Iter::value_type>
    result_type operator()()
}
```

\(^2\)The parameter is intended to allow an implementation to differentiate between different sources of randomness.

\(^3\) If a device has \(n\) states whose respective probabilities are \(P_0, \ldots, P_{n-1}\), the device entropy \(S\) is defined as \(S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i\).
25  Numerics library  26.4  Random number generation

```cpp
&& OutputIterator<Iter, const result_type&>
&& IntegralType<Iter::value_type>
&& True<sizeof uint32_t <= sizeof Iter::value_type>
void generate(Iter begin, Iter end);
```

// property functions
size_t size() const;
template<OutputIterator<auto,const result_type&> Iter>
void param(Iter dest) const;

private:
vector<result_type> v;  // exposition only

};

seed_seq();

Effects: Constructs a seed_seq object as if by default-constructing its member v.

```cpp
template<IntegralLike T>
requires IntegralType<T>
seed_seq(std::initializer_list<T> il);
```

Effects: Same as seed_seq(il.begin(), il.end()).

```cpp
template<InputIterator Iter>
requires IntegralLike<Iter::value_type>
&& IntegralType<Iter::value_type>
seed_seq(Iter begin, Iter end);
```

Effects: Constructs a seed_seq object by the following algorithm:

```cpp
for(| InputIterator s = begin; s != end; ++s)
  v.push_back((*s) mod 2^{32});
```

```cpp
template<RandomAccessIterator Iter>
requires UnsignedIntegralLike<Iter::value_type>
&& OutputIterator<Iter, const result_type&>
&& IntegralType<Iter::value_type>
&& True<sizeof uint32_t <= sizeof Iter::value_type>
void generate(Iter begin, Iter end);
```

Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end – begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo 2^{32}, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):

- a) By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n – t)/2 and let q = p + t, where

  \[ t = (n \geq 623) ? 11 : (n \geq 68) ? 7 : (n \geq 39) ? 5 : (n \geq 7) ? 3 : (n – 1)/2; \]

  - b) With m as the larger of s + 1 and n, transform the elements of the range: iteratively for k = 0,\ldots, m – 1,

```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
calculate values

\[ r_1 = 1664525 \cdot T(k) \oplus T(k + p) \oplus T(k - 1) \]
\[ r_2 = r_1 + \begin{cases} 
    s & , k = 0 \\
    k \mod n + v[k - 1] & , 0 < k \leq s \\
    k \mod n & , s < k 
\end{cases} \]

and, in order, increment \( b \) by \( r_1 \), increment \( b \) by \( r_2 \), and set \( b \) to \( r_2 \).

c) Transform the elements of the range three more times, beginning where the previous step ended: iteratively for \( k = m, \ldots, m + n - 1 \), calculate values

\[ r_3 = 1566083941 \cdot T(k + p + k - 1) \]
\[ r_4 = r_3 - (k \mod n) \]

and, in order, update \( b \) by xor it with \( r_4 \), update \( b \) by xor it with \( r_3 \), and set \( b \) to \( r_4 \).

size_t size() const;

returns: The number of 32-bit units that would be be returned by a call to param().

template<OutputIterator<auto,const result_type&> Iter> 
void param(Iter dest) const;

effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

\[ \text{copy(v.begin(), v.end(), dest);} \]

26.4.7.2 Function template generate_canonical [rand.util.canonical]

each function instantiated from the template described in this section 26.4.7.2 [rand.util.canonical] maps the result of one or more invocations of a supplied uniform random number generator \( g \) to one member of the specified RealType such that, if the values \( g_i \) produced by \( g \) are uniformly distributed, the instantiation’s results \( t_j, 0 \leq t_j < 1 \), are distributed as uniformly as possible as specified below.

[Note: Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random number generator into a value that can be delivered by a random number distribution. — end note]

template<FloatingPointLike RealType, size_t bits, UniformRandomNumberGenerator URNG> 
requires FloatingPointType<RealType>
RealType generate_canonical(URNG& g);

complexity: Exactly \( k = \max(1, \lceil b / \log_2 R \rceil) \) invocations of \( g \), where \( b \) is the lesser of numeric_limits<RealType>::digits and bits, and \( R \) is the value of \( g\).max() - g.min() + 1.

\( b \) is introduced to avoid any attempt to produce more bits of randomness than can be held in RealType.
Effects: Invokes \( g() \) \( k \) times to obtain values \( g_0, \ldots, g_{k-1} \), respectively. Calculates a quantity

\[
S = \sum_{i=0}^{k-1} (g_i - g.min()) \cdot R^i
\]

using arithmetic of type RealType.

Returns: \( S/R^k \).

Throws: What and when \( g \) throws.

### 26.4.8 Random number distribution class templates

For every class \( D \) specified in this section 26.4.8 or instantiated from a template specified in this section, a concept map `RandomNumberDistribution<D>` shall be defined in namespace `std` so as to provide mappings from free functions to the corresponding member functions. Descriptions are provided here only for distribution operations that are not described in 26.4.2.5 or for operations where there is additional semantic information. Declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function \( p(z) \) and of each discrete probability function \( P(z_i) \) specified in this section is 0 everywhere outside its stated domain.

#### 26.4.8.1 Uniform distributions

**Class template uniform_int_distribution**

A `uniform_int_distribution` random number distribution produces random integers \( i, a \leq i \leq b \), distributed according to the constant discrete probability function

\[
P(i|a,b) = 1/(b - a + 1).
\]

```cpp
template<IntegralLike IntType = int>
requires IntegralType<IntType>
class uniform_int_distribution
{
public:
    // types
    typedef IntType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit uniform_int_distribution(IntType a = 0, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
```
26.4 Random number generation

result_type operator()(URNG& g);
template<UniformRandomNumberGenerator URNG>
result_type operator()(URNG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit uniform_int_distribution(IntType a = 0, IntType b = numeric_limits<IntType>::max());

2 Requires: a ≤ b.
3 Effects: Constructs a uniform_int_distribution object; a and b correspond to the respective parameters of
the distribution.
result_type a() const;
4 Returns: The value of the a parameter with which the object was constructed.
result_type b() const;
5 Returns: The value of the b parameter with which the object was constructed.

26.4.8.1.2 Class template uniform_real_distribution

A uniform_real_distribution random number distribution produces random numbers x, a ≤ x < b, distributed
according to the constant probability density function

\[ p(x | a, b) = \frac{1}{b - a}. \]

template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class uniform_real_distribution
{
public:
// types
typedef RealType result_type;
typedef unspecified param_type;

// constructors and reset functions
explicit uniform_real_distribution(RealType a = 0.0, RealType b = 1.0);
explicit uniform_real_distribution(const param_type& parm);
void reset();

// generating functions

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);

template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit uniform_real_distribution(RealType a = 0.0, RealType b = 1.0);

    Requires: a ≤ b and b − a ≤ numeric_limits<RealType>::max().
    Effects: Constructs a uniform_real_distribution object; a and b correspond to the respective parameters of the distribution.

    result_type a() const;
    Returns: The value of the a parameter with which the object was constructed.

    result_type b() const;
    Returns: The value of the b parameter with which the object was constructed.

26.4.8.2 Bernoulli distributions

    26.4.8.2.1 Class bernoulli_distribution

A bernoulli_distribution random number distribution produces bool values b distributed according to the discrete probability function

\[ P(b|p) = \begin{cases} 
    p & \text{if } b = \text{true} \\
    1 - p & \text{if } b = \text{false} 
\end{cases} \]

    class bernoulli_distribution
    {
        public:
            // types
            typedef bool result_type;
            typedef unspecified param_type;

            // constructors and reset functions
            explicit bernoulli_distribution(double p = 0.5);
            explicit bernoulli_distribution(const param_type& parm);
            void reset();
    }
26.4 Random number generation

// generating functions
template<UniformRandomNumberGenerator URNG>
result_type operator() (URNG& g);
template<UniformRandomNumberGenerator URNG>
result_type operator() (URNG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit bernoulli_distribution(double p = 0.5);

2 Requires: 0 ≤ p ≤ 1.
3 Effects: Constructs a bernoulli_distribution object; p corresponds to the parameter of the distribution.

double p() const;
4 Returns: The value of the p parameter with which the object was constructed.

26.4.8.2.2 Class template binomial_distribution [rand.dist.bern.bin]

1 A binomial_distribution random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i|t,p) = \binom{t}{i} \cdot p^i \cdot (1-p)^{t-i}.
\]

template<IntegralLike IntType = int>
requires IntegralType<IntType>
class binomial_distribution
{
public:
    // types
typedef IntType result_type;
typedef unspecified param_type;

    // constructors and reset functions
    explicit binomial_distribution(IntType t = 1, double p = 0.5);
    explicit binomial_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator() (URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator() (URNG& g, const param_type& parm);

    Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit binomial_distribution(IntType t = 1, double p = 0.5);

2

Requires: $0 \leq p \leq 1$ and $0 \leq t$.

3

Effects: Constructs a binomial_distribution object; $t$ and $p$ correspond to the respective parameters of the distribution.

IntType t() const;

4

Returns: The value of the $t$ parameter with which the object was constructed.

double p() const;

5

Returns: The value of the $p$ parameter with which the object was constructed.

26.4.8.2.3 Class template geometric_distribution

A geometric_distribution random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i|p) = p \cdot (1 - p)^i.$$
26.4 Random number generation

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit geometric_distribution(double p = 0.5);

2 Requires: 0 < p < 1.
3 Effects: Constructs a geometric_distribution object; p corresponds to the parameter of the distribution.

double p() const;
4 Returns: The value of the p parameter with which the object was constructed.

26.4.8.2.4 Class template negative_binomial_distribution

A negative_binomial_distribution random number distribution produces random integers \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i.
\]

```cpp
template<IntegralLike IntType = int>
    requires IntegralType<IntType>
    class negative_binomial_distribution
{
    public:
        // types
        typedef IntType result_type;
        typedef unspecified param_type;

        // constructor and reset functions
        explicit negative_binomial_distribution(IntType k = 1, double p = 0.5);
        explicit negative_binomial_distribution(const param_type& parm);
        void reset();

        // generating functions
        template<UniformRandomNumberGenerator URNG>
            result_type operator()(URNG& g);
        template<UniformRandomNumberGenerator URNG>
            result_type operator()(URNG& g, const param_type& parm);

        // property functions
        IntType k() const;

        Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
```
33 Numerics library

26.4 Random number generation

```cpp
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
}

explicit negative_binomial_distribution(IntType k = 1, double p = 0.5);

Requires: 0 < p ≤ 1 and 0 < k.
Effects: Constructs a negative_binomial_distribution object; k and p correspond to the respective parameters of the distribution.

IntType k() const;

Returns: The value of the k parameter with which the object was constructed.

double p() const;

Returns: The value of the p parameter with which the object was constructed.

26.4.8.3 Poisson distributions

26.4.8.3.1 Class template poisson_distribution

A poisson_distribution random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function:

\[
P(i|\mu) = \frac{e^{-\mu} \mu^i}{i!}.
\]

The distribution parameter \( \mu \) is also known as this distribution’s mean.

```cpp
template<IntegralLike IntType = int>
requires IntegralType<IntType>
class poisson_distribution
{
public:
    // types
    typedef IntType result_type;
    typedef unspecified param_type;

    // constructors and reset functions
    explicit poisson_distribution(double mean = 1.0);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
```
26.4 Random number generation

```cpp
result_type operator()(URNG& g, const param_type& parm);

// property functions
double mean() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
}

explicit poisson_distribution(double mean = 1.0);
```

2 Requires: 0 < mean.

3 Effects: Constructs a poisson_distribution object; mean corresponds to the parameter of the distribution.

```cpp
double mean() const;
```

4 Returns: The value of the mean parameter with which the object was constructed.

### 26.4.8.3.2 Class template exponential_distribution

An exponential_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x|\lambda) = \lambda e^{-\lambda x}.
\]

```cpp
template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class exponential_distribution
{
public:
  // types
typedef RealType result_type;
typedef unspecified param_type;

  // constructors and reset functions
  explicit exponential_distribution(RealType lambda = 1.0);
  explicit exponential_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g);
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g, const param_type& parm);

  // property functions
  RealType lambda() const;
  param_type param() const;
  void param(const param_type& parm);
}
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
result_type min() const;
result_type max() const;
};

explicit exponential_distribution(RealType lambda = 1.0);

Requires: 0 < lambda.

Effects: Constructs a exponential_distribution object; lambda corresponds to the parameter of the distribution.

RealType lambda() const;

Returns: The value of the lambda parameter with which the object was constructed.

26.4.8.3.3 Class template gamma_distribution

A gamma_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x|\alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \Gamma(\alpha)} \cdot x^{\alpha-1}.
\]

template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class gamma_distribution
{
public:

// types
typedef RealType result_type;
typedef unspecified param_type;

// constructors and reset functions
explicit gamma_distribution(RealType alpha = 1.0, RealType beta = 1.0);
explicit gamma_distribution(const param_type& parm);
void reset();

// generating functions
template<UniformRandomNumberGenerator URNG>
result_type operator()(URNG& g);
template<UniformRandomNumberGenerator URNG>
result_type operator()(URNG& g, const param_type& parm);

// property functions
RealType alpha() const;
RealType beta() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};
26.4 Random number generation

explicit gamma_distribution(RealType alpha = 1.0, RealType beta = 1.0);

Requires: $0 < \alpha$ and $0 < \beta$.

Effects: Constructs a gamma_distribution object; alpha and beta correspond to the parameters of the distribution.

RealType alpha() const;

Returns: The value of the alpha parameter with which the object was constructed.

RealType beta() const;

Returns: The value of the beta parameter with which the object was constructed.

26.4.8.3.4 Class template weibull_distribution

A weibull_distribution random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x|a,b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).$$

template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class weibull_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit weibull_distribution(RealType a = 1.0, RealType b = 1.0)
    explicit weibull_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
explicit weibull_distribution(RealType a = 1.0, RealType b = 1.0);

Requires: 0 < a and 0 < b.

Effects: Constructs a weibull_distribution object; a and b correspond to the respective parameters of the distribution.

RealType a() const;

Returns: The value of the a parameter with which the object was constructed.

RealType b() const;

Returns: The value of the b parameter with which the object was constructed.

26.4.8.3.5 Class template extreme_value_distribution [rand.dist.pois.extreme]

An extreme_value_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x|a,b) = \frac{1}{b} \exp \left( \frac{a-x}{b} - \exp \left( \frac{a-x}{b} \right) \right).
\]

\[5\] The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4 Random number generation

```cpp
result_type min() const;
result_type max() const;
};

explicit extreme_value_distribution(RealType a = 0.0, RealType b = 1.0);

Requires: 0 < b.

Effects: Constructs an extreme_value_distribution object; a and b correspond to the respective parameters of the distribution.

RealType a() const;

Returns: The value of the a parameter with which the object was constructed.

RealType b() const;

Returns: The value of the b parameter with which the object was constructed.

26.4.8.4 Normal distributions

26.4.8.4.1 Class template normal_distribution

A normal_distribution random number distribution produces random numbers x distributed according to the probability density function

\[ p(x|\mu,\sigma) \propto \exp \left( -\frac{(x-\mu)^2}{2\sigma^2} \right). \]

The distribution parameters \( \mu \) and \( \sigma \) are also known as this distribution’s mean and standard deviation.

```cpp
template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class normal_distribution
{
public:
  // types
  typedef RealType result_type;
  typedef unspecified param_type;

  // constructors and reset functions
  explicit normal_distribution(RealType mean = 0.0, RealType stddev = 1.0);
  explicit normal_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g);
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g, const param_type& parm);

  // property functions
}
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
RealType mean() const;
RealType stddev() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit normal_distribution(RealType mean = 0.0, RealType stddev = 1.0);

Requires: 0 < stddev.
Effects: Constructs a normal_distribution object; mean and stddev correspond to the respective parameters of the distribution.

RealType mean() const;

Returns: The value of the mean parameter with which the object was constructed.

RealType stddev() const;

Returns: The value of the stddev parameter with which the object was constructed.

26.4.8.4.2 Class template lognormal_distribution

A lognormal_distribution random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x|m,s) = \frac{1}{sx\sqrt{2\pi}} \exp \left( -\frac{(\ln x - m)^2}{2s^2} \right).$$

```cpp
template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class lognormal_distribution
{
public:
  // types
  typedef RealType result_type;
  typedef unspecified param_type;

  // constructor and reset functions
  explicit lognormal_distribution(RealType m = 0.0, RealType s = 1.0);
  explicit lognormal_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g);
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g, const param_type& parm);

  Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
```
26.4 Random number generation

// property functions
RealType m() const;
RealType s() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit lognormal_distribution(RealType m = 0.0, RealType s = 1.0);

Requires: 0 < s.

Effects: Constructs a lognormal_distribution object; m and s correspond to the respective parameters of the distribution.

RealType m() const;
Returns: The value of the m parameter with which the object was constructed.

RealType s() const;
Returns: The value of the s parameter with which the object was constructed.

26.4.8.4.3 Class template chi_squared_distribution

A chi_squared_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x|n) = \frac{x^{(n/2)-1}e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.
\]

template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class chi_squared_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit chi_squared_distribution(RealType n = 1);
    explicit chi_squared_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
41 Numerics library 26.4 Random number generation

// property functions
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit chi_squared_distribution(RealType n = 1);

Requires: 0 < n.
Effects: Constructs a chi_squared_distribution object; n corresponds to the parameter of the distribution.

RealType n() const;
Returns: The value of the n parameter with which the object was constructed.

26.4.8.4.4 Class template cauchy_distribution [rand.dist.norm.cauchy]

A cauchy_distribution random number distribution produces random numbers x distributed according to the probability density function

\[ p(x|a,b) = \frac{1}{\pi b \left(1 + \left(\frac{x-a}{b}\right)^2\right)} \] .

template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>

class cauchy_distribution
{
public:
  // types
  typedef RealType result_type;
  typedef unspecified param_type;

  // constructor and reset functions
  explicit cauchy_distribution(RealType a = 0.0, RealType b = 1.0);
  explicit cauchy_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g); 
  template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g, const param_type& parm);

  // property functions
  RealType a() const;
  RealType b() const;

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4 Random number generation

```cpp
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
```

```cpp
explicit cauchy_distribution(RealType a = 0.0, RealType b = 1.0);
```

2  
Requires: 0 < b.
3  
Effects: Constructs a cauchy_distribution object; a and b correspond to the respective parameters of the distribution.

```cpp
RealType a() const;
```

4  
Returns: The value of the a parameter with which the object was constructed.

```cpp
RealType b() const;
```

5  
Returns: The value of the b parameter with which the object was constructed.

26.4.8.4.5 Class template fisher_f_distribution

```cpp
template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class fisher_f_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    explicit fisher_f_distribution(RealType m = 1, RealType n = 1);
    explicit fisher_f_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions

    Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
43  Numerics library

26.4  Random number generation

    RealType m() const;
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit fisher_f_distribution(RealType m = 1, RealType n = 1);

2  Requires: 0 < m and 0 < n.
3  Effects: Constructs a fisher_f_distribution object; m and n correspond to the respective parameters of the distribution.

    RealType m() const;
4  Returns: The value of the m parameter with which the object was constructed.

    RealType n() const;
5  Returns: The value of the n parameter with which the object was constructed.

26.4.8.4.6  Class template student_t_distribution

A student_t_distribution random number distribution produces random numbers x distributed according to the probability density function

\[ p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n+1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}. \]

template<FloatingPointLike RealType = double>
    requires FloatingPointType<RealType>
    class student_t_distribution
{
    public:
        // types
        typedef RealType result_type;
        typedef unspecified param_type;

        // constructor and reset functions
        explicit student_t_distribution(RealType n = 1);
        explicit student_t_distribution(const param_type& parm);
        void reset();

        // generating functions
        template<UniformRandomNumberGenerator URNG>
            result_type operator[](URNG& g);
        template<UniformRandomNumberGenerator URNG>
            result_type operator[](URNG& g, const param_type& parm);

    Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4 Random number generation Numerics library 44

// property functions
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit student_t_distribution(RealType n = 1);

Requires: 0 < n.
Effects: Constructs a student_t_distribution object; n and n correspond to the respective parameters of the distribution.

RealType n() const;
Returns: The value of the n parameter with which the object was constructed.

26.4.8.5 Sampling distributions [rand.dist.samp]

26.4.8.5.1 Class template discrete_distribution [rand.dist.samp.discrete]

A discrete_distribution random number distribution produces random integers \( i \), \( 0 \leq i < n \), distributed according to the discrete probability function

\[ P(i | p_0, \ldots, p_{n-1}) = p_i. \]

Unless specified otherwise, the distribution parameters are calculated as: \( p_k = w_k/S \) for \( k = 0, \ldots, n-1 \), in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

\[ \text{template<IntegralLike IntType = int>}
\text{requires IntegralType<IntType>}
\text{class discrete_distribution}
\{
\text{public:}
\text{// types}
typedef IntType result_type;
typedef unspecified param_type;

\text{// constructor and reset functions}
discrete_distribution();
\text{template<InputIterator Iter>}
\text{requiresConvertible<Iter::value_type, double>}
discrete_distribution(Iter firstW, Iter lastW);
discrete_distribution(initializer_list<double> wl);
\text{template<Callable<auto, double> Func>}
\text{requiresConvertible<Func::result_type, double>}
discrete_distribution(size_t nw, double xmin, double xmax, Func fw);
explicit discrete_distribution(const param_type& parm);
\}

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
void reset();

// generating functions
template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g);
template<UniformRandomNumberGenerator URNG>
  result_type operator()(URNG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};
discrete_distribution();

Effects: Constructs a discrete_distribution object with \( n = 1 \) and \( p_0 = 1 \). [Note: Such an object will always deliver the value 0. — end note]

template<InputIterator Iter>
  requires Convertible<Iter::value_type, double>
  discrete_distribution(Iter firstW, Iter lastW);

Requires: If \( \text{firstW} \ == \text{lastW} \), let \( n = 1 \) and \( w_0 = 1 \). Otherwise, \([\text{firstW}, \text{lastW}]\) shall form a sequence \( w \) of length \( n > 0 \).

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<Callable<auto, double> Func>
  requires Convertible<Func::result_type, double>
  discrete_distribution(size_t nw, double xmin, double xmax, Func fw);

Requires: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/nw \) shall hold.

Effects: Constructs a discrete_distribution object with probabilities given by the formula above, using the following values: If \( nw = 0 \), let \( n = 1 \) and \( w_0 = 1 \). Otherwise, let \( n = nw \) and \( w_k = fw(xmin + k \cdot \delta \cdot 1) \) for \( k = 0, \ldots, n-1 \).

Complexity: The number of invocations of \( fw \) shall not exceed \( n \).

vector<double> probabilities() const;

Returns: A vector<double> whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n-1 \).

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4 Random number generation

26.4.8.5.2 Class template piecewise_constant_distribution

A piecewise_constant_distribution random number distribution produces random numbers $x$, $b_0 \leq x < b_n$, uniformly distributed over each subinterval $[b_i, b_{i+1})$ according to the probability density function

$$p(x|b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i \text{, for } b_i \leq x < b_{i+1}.$$ 

The $n + 1$ distribution parameters $b_i$, also known as this distribution's interval boundaries, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n-1$. Unless specified otherwise, the remaining $n$ distribution parameters are calculated as:

$$\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n-1,$$

in which the values $w_k$, commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: $0 < S = w_0 + \cdots + w_{n-1}$.

```cpp
template<FloatingPointLike RealType = double>
requires FloatingPointType<RealType>
class piecewise_constant_distribution
{
  public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    piecewise_constant_distribution();
    template<InputIterator IterB, InputIterator IterW>
    requires Convertible<IterB::value_type, result_type> && Convertible<IterW::value_type, double>
    piecewise_constant_distribution(IterB firstB, IterB lastB,
                               IterW firstW);
    template<Callable<auto,RealType> Func>
    requires Convertible<Func::result_type, double>
    piecewise_constant_distribution(initializer_list<RealType> bl, Func fw);
    template<Callable<auto, double> Func>
    requires Convertible<Func::result_type, double>
    piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, Func fw);
    explicit piecewise_constant_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    vector<RealType> intervals() const;
    vector<double> densities() const;
    param_type param() const;
}
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
void param(const param_type& parm);
result_type min() const;
result_type max() const;

};
piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with \( n = 1, \rho_0 = 1, b_0 = 0, \) and \( b_1 = 1. \)

template<InputIterator IterB, InputIterator IterW>
requires Convertible<IterB::value_type, result_type> && Convertible<IterW::value_type, double>
piecewise_constant_distribution(IterB firstB, IterB lastB,
    IterW firstW);

Requires: If \( \text{firstB} == \text{lastB} \) or \( ++\text{firstB} == \text{lastB} \), let \( n = 1, w_0 = 1, b_0 = 0, b_1 = 1. \) Otherwise, \( \text{[firstB, lastB]} \) shall form a sequence \( b \) of length \( n + 1 \), the length of the sequence \( w \) starting from \( \text{firstW} \) shall be at least \( n \), and any \( w_k \) for \( k \geq n \) shall be ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<Callable<auto, RealType> Func>
requires Convertible<Func::result_type, double>
piecewise_constant_distribution(initializer_list<RealType> bl, Func fw);

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If \( \text{bl.size()} < 2 \), let \( n = 1, w_0 = 1, b_0 = 0, b_1 = 1. \) Otherwise, let \( \text{[bl.begin(), bl.end()]} \) form a sequence \( b_0, \ldots, b_n \), and let \( w_k = fw((b_k + b_{k+1})/2) \) for \( k = 0, \ldots, n - 1. \)

Complexity: The number of invocations of \( fw \) shall not exceed \( n. \)

template<Callable<auto, double> Func>
requires Convertible<Func::result_type, double>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, Func fw);

Requires: If \( nw = 0, \) let \( n = 1, \) otherwise let \( n = nw. \) The relation \( 0 < \delta = (xmax - xmin)/n \) shall hold.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let \( b_k = xmin + k \cdot \delta \) for \( k = 0, \ldots, n, \) and \( w_k = fw(b_k + \delta/2) \) for \( k = 0, \ldots, n - 1. \)

Complexity: The number of invocations of \( fw \) shall not exceed \( n. \)

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose operator[] member returns \( b_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n. \)

vector<double> densities() const;

Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( \rho_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1. \)

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
26.4 Random number generation

26.4.8.5.3 Class template `piecewise_linear_distribution`

A `piecewise_linear_distribution` random number distribution produces random numbers \( x, b_0 \leq x < b_n \), distributed over each subinterval \( [b_i, b_{i+1}) \) according to the probability density function

\[
p(x | b_0, \ldots, b_n, \rho_0, \ldots, \rho_n) = \rho_i \cdot \frac{x - b_i}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.
\]

The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution’s `interval boundaries`, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n-1 \). Unless specified otherwise, the remaining \( n + 1 \) distribution parameters are calculated as \( \rho_k = w_k / S \) for \( k = 0, \ldots, n \), in which the values \( w_k \), commonly known as the `weights at boundaries`, shall be non-negative, non-
NaN, and non-infinity. Moreover, the following relation shall hold:

\[
0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (\rho_k + \rho_{k+1}) \cdot (b_{k+1} - b_k).
\]

```cpp
template<typename RealType = double>
requires FloatingPointType<RealType>
class piecewise_linear_distribution
{
public:
    // types
    typedef RealType result_type;
    typedef unspecified param_type;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<InputIterator IterB, InputIterator IterW>
    requires Convertible<IterB::value_type, result_type> && Convertible<IterW::value_type, double>
    piecewise_linear_distribution(IterB firstB, IterB lastB,
                                IterW firstW);
    template<Callable<auto, RealType> Func>
    requires Convertible<Func::result_type, double>
    piecewise_linear_distribution(initializer_list<RealType> bl, Func fw);
    template<Callable<auto, double> Func>
    requires Convertible<Func::result_type, double>
    piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, Func fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g);
    template<UniformRandomNumberGenerator URNG>
    result_type operator()(URNG& g, const param_type& parm);

    // property functions
    vector<RealType> intervals() const;
    vector<double> densities() const;
}
```

Wording Tweaks for Concept-enabled Random Number Generation in C++0X (N2836)
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

piecewise_linear_distribution();

Effects: Constructs a piecewise_linear_distribution object with \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1. \)

template<InputIterator IterB, InputIterator IterW>
requires Convertible<IterB::value_type, result_type> && Convertible<IterW::value_type, double>
piecewise_linear_distribution(IterB firstB, IterB lastB,
                             IterW firstW);

Requires: If \( \text{firstB} == \text{lastB} \) or ++firstB == lastB, let \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1. \) Otherwise, \([\text{firstB}, \text{lastB}]\) shall form a sequence \( b \) of length \( n + 1, \) the length of the sequence \( w \) starting from firstW shall be at least \( n + 1, \) and any \( w_k \) for \( k \geq n + 1 \) shall be ignored by the distribution.

Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

template<Callable<auto, RealType> Func>
requires Convertible<Func::result_type, double>
piecewise_linear_distribution(initializer_list<RealType> bl, Func fw);

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: If \( \text{bl.size()} < 2, \) let \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1. \) Otherwise, let \([\text{bl.begin()}, \text{bl.end()}]\) form a sequence \( b_0,\ldots,b_n, \) and let \( w_k = \text{fw}(b_k) \) for \( k = 0,\ldots,n. \)

Complexity: The number of invocations of \( \text{fw} \) shall not exceed \( n + 1. \)

template<Callable<auto, double> Func>
requires Convertible<Func::result_type, double>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, Func fw);

Requires: If \( \text{nw} = 0, \) let \( n = 1, \) otherwise let \( n = \text{nw}. \) The relation \( 0 < \delta = (\text{xmax} - \text{xmin})/n \) shall hold.

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: Let \( b_k = \text{xmin} + k \cdot \delta \) for \( k = 0,\ldots,n, \) and \( w_k = \text{fw}(b_k + \delta) \) for \( k = 0,\ldots,n. \)

Complexity: The number of invocations of \( \text{fw} \) shall not exceed \( n + 1. \)

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose operator[] member returns \( b_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n. \)

vector<double> densities() const;

Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( \rho_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n. \)
