C++0x Stream Positioning - Revision 1

Solution for library issue 573: C++0x file positioning should handle modern file sizes

Introduction

C and C++ I/O streams predate modern file sizes, which may be too large to be represented by an `int` or a `long`, and predate the introduction of `long long` into the languages. That has resulted in several issues addressed by this paper.

Library issue 573, \emph{C++0x file positioning should handle modern file sizes}, boils down to two problems:

- The specification of types relating to file sizes, positions, and offsets (`fpos_t`, `fpos`, `pos_type`, `off_type`, `streamoff`, `OFF_T`, `streamsize`, `SZ_T`, `streampos`, `wstreampos`, and perhaps more) are so intertwined and difficult to follow that understanding is very difficult.

- It isn't clear that `off_type` (also known as `streamoff` and `OFF_T`) is currently required to support modern file sizes.

In committee reflector message c++std-lib-24002, Howard Hinnant identified a further problem:

- `[filebuf.virtauls]/13, in specifying seek offset for filebuf's, mandate use of std::fseek, which specified offset via a long. This will result in truncation, and thus wrong effects for large files on systems where off_type is long long.

This proposal attempts to resolve all of these problems in a consistent way. Solutions are based on existing practice in several current standard library implementations, although no current implementation implements all of the changes. The changes often affect the way the standard is specified rather than actual interfaces.

As far as is known, the changes will break no existing user code.

Revision history

N2926 - Revision 1:

- Remove library issue 255, \emph{Why do basic\_streambuf\<\>\::pbump() and gbump() take an int?} There is a wider problem; many arguments that operate on the buffer are specified as if they were operating on an underlying
file. This results in numerous argument types specified as \texttt{streamsize} instead of \texttt{size_t}. So the best fix
would be to fix all cases, not just change the \texttt{p bump()} and \texttt{gbump()} cases to make the same mistake made
elsewhere.

- Remove an existing \texttt{streamsize} footnote as it is quite misleading, and the LWG believes it is better to say
nothing about this historical wart.

\textbf{N2884} - Initial version.

\section*{Stream Position, Offset, and Size Types}

The key to resolving the above problems is to understand the specification of stream position, offset, and size types:

\begin{tikzpicture}
    \node [circle, draw] {\texttt{char\_traits<\textless char\textgreater ::pos\_type}};
    \node [circle, draw, below of=char_traits<char>::pos_type] {\texttt{streampos}};
    \node [circle, draw, below of=char_traits<char>::pos_type, xshift=2cm] {\texttt{wstreampos}};
    \node [circle, draw, below of=wstreampos, xshift=-2cm] {\texttt{fpos\=mbstate\_t}};
\end{tikzpicture}

\textbf{Stream Position and Size Types in the Working Paper}

A line from \texttt{A} to \texttt{B} indicates that \texttt{A} is a name for (i.e. typedef or specialization), or is defined in terms of, \texttt{B}.

Several simplifications and clarifications are possible:

- \texttt{OFF\_T} can be replaced by \texttt{streamoff}. \texttt{OFF\_T} is used only in three places in the \texttt{fpos} operations table, and
  replacement by \texttt{streamoff} will increase clarity.

- The requirements for the \texttt{streamoff/OFF\_T} type currently must be deduced indirectly from the \texttt{fpos}
  operational requirements. That is very roundabout, hard to understand, and gives little hint as to the maximum
  file sizes that must be supported. It is much simpler and clearer to state the \texttt{streamoff} size requirements
directly.

- \texttt{SZ\_T} can be eliminated. It is never referenced.

- \texttt{streamsize/SZ\_T} is specified as "signed integral basic type", which isn't a defined term. That should be
  "signed integer type".

- The addition of a non-normative figure and text illustrating the relationship between types is proposed to make
  these relationships easier to understand.

- The addition of example code is proposed to show how to position a stream at a location expressed as a \texttt{long long}.
Proposed Wording

Change 21.2.2 traits typedefs [char.traits typedefs] as indicated:

```cpp
typedef OFF_T unspecified-type off_type;
typedef POS_T unspecified-type pos_type;
```

Requires: Requirements for off_type and pos_type are described in 27.2.2.

Change 21.2.3.1 struct char_traits<char> [char.traits.specializations.char] as indicated:

```cpp
typedef streamoff off_type;
typedef streampos pos_type;
...
```

The type streampos shall be an implementation-defined type that satisfies the requirements for pos_type in 21.2.2.

The type streamoff shall be an implementation-defined type that satisfies the requirements for off_type in 21.2.2.

At the end of 27.1 General [input.output.general], add:

![Diagram of stream position, offset, and size types]

Figure 1: Stream position, offset, and size types [non-normative]

Figure 1 illustrates relationships among various types described in this clause. A line from A to B indicates that A is an alias (e.g., a typedef), or that A is defined in terms of, B.

Change 27.5 iostreams base classes [iostreams.base], Header <ios> synopsis, as indicated:

```cpp
typedef OFF_T implementation-defined streamoff;
typedef SS_T implementation-defined streamsize;
```

Change 27.5.1 Types [stream.types] as indicated:

```cpp
typedef OFF_T implementation-defined streamoff;
```

The type streamoff is an implementation-defined type that satisfies the requirements of 27.5.3.2, a synonym for a signed integer type of sufficient size to represent the maximum possible file size for the operating system.

```cpp
footnote

footnote] Typically long long.
```

```cpp
typedef SS_T implementation-defined streamsize;
```
The type `streamsize` is a synonym for one of the signed basic integral types a signed integer type. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.

`streamsize` is used in most places where ISO C would use `size_t`. Most of the uses of `streamsize` could use `size_t`, except for the `strstreambuf` constructors, which require negative values. It should probably be the signed type corresponding to `size_t` (which is what Posix 2 calls `off_t`).

Change 27.5.3.2 fpos requirements [fpos.operations], Position type requirements, as indicated:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return Type</th>
<th>Operational semantics</th>
<th>Assertion/Note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>O(p)</td>
<td><code>OFF_T streamoff</code></td>
<td>converts to offset</td>
<td><code>fO(O(p)) == p</code></td>
</tr>
<tr>
<td>O = p - q</td>
<td><code>OFF_T streamoff</code></td>
<td>distance</td>
<td><code>q + o == p</code></td>
</tr>
<tr>
<td><code>streamsize</code> = o</td>
<td><code>streamsize</code></td>
<td>converts</td>
<td><code>streamsize(O(sz)) == sz</code></td>
</tr>
<tr>
<td>O(sz)</td>
<td><code>OFF_T streamoff</code></td>
<td>converts</td>
<td><code>streamsize(O(sz)) == sz</code></td>
</tr>
</tbody>
</table>

At the end of 27.5.3.2 fpos requirements [fpos.operations], add:

```cpp
// open a file
std::fstream file("test.file", std::ios_base::in | std::ios_base::binary);

// seek to position 10 000 000 000 by passing a streamoff
file.seekg(10000000000LL, std::ios_base::beg);
...

// see to position 10 000 000 000 passing a streampos
// constructed from a streamoff
file.seekg(std::streampos(10000000000LL));
...
```

--end example--

Change 27.9.1.5 Overridden virtual functions [filebuf.virtuals], paragraph 13, as indicated:

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out);
```

**Effects:** Let `width` denote `a_codecvt.encoding()`. If `is_open() == false, or off != 0 && width <= 0`, then the positioning operation fails. Otherwise, if `way != basic_ios::cur` or `off != 0`, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if `width > 0`, call as if by calling std::fseek(seekfunc(file, width * off, whence)), otherwise call as if by calling std::fseek(seekfunc(file, 0, whence)), where `seekfunc` has the same behavior as std::fseek except having a second argument type of `off_type`.

Change D.6 Old iostreams members [depr.iostreams] as indicated:

```cpp
typedef `OFF_T` implementation-defined streamoff;
typedef `POS_T` implementation-defined streampos;
```

The type `streamoff` is an implementation-defined type that satisfies the requirements of type `OFF_T`.

The type `streampos` is an implementation-defined type that satisfies the requirements of type `POS_T`.
streampos ([iostream.forward]).

Other possible changes

Issue 573 also raised the question of adding additional member functions to fpos. In light of the proposed WP changes above, that does not appear to be necessary and is not proposed here.

Implementation Experience

Microsoft VC++ 2010 beta 1 implements the proposed wording. The following program runs without error on VC++ 2010 beta 1, but reports failures with earlier releases that did not implement the proposed wording:

```cpp
#include <fstream>
#include <iostream>
#include <iosfwd>

const long long max = 8000000000LL;

int main()
{
  std::fstream file("test.file",
                   std::ios_base::in | std::ios_base::out | std::ios_base::binary | std::ios_base::trunc);
  if ( !file )
    std::cout << "Could not open test.file\n";

  // create the test file
  for (long long i = 0; i < max; ++i)
    file.write(reinterpret_cast<char*>(i), sizeof(i));

  // test seekg with offset
  long long x;
  file.seekg((max-1)*sizeof(x), std::ios_base::beg);
  file.read(reinterpret_cast<char*>(&x), sizeof(x));
  if (x!=(max-1))
    std::cout << "seekg with offset failed to position the file correctly\n";

  // test seekg with pos_type
  std::fstream::pos_type pos((max-2)*sizeof(x));
  file.seekg(pos);
  file.read(reinterpret_cast<char*>(&x), sizeof(x));
  if (x!=(max-2))
    std::cout << "seekg with pos_type failed to position the file correctly\n";

  return 0;
}
