Proposed resolution for US104: Allocator-aware regular expressions (rev 3)

Rationale
The standard library contains many data structures that hold user data, such as containers (23), strings (21), string streams (27.8), and string buffers (27.8). These data structures are allocator-aware, using storage allocators (20.2.5) to manage their storage requirements and internal pointer representations. However, regular expressions (28) are not allocator-aware.

Such inconsistent treatment creates complexity by giving C++ programmers another inconsistency to remember. More importantly, the reasons for making the above data structures allocator-aware apply equally well to regular expressions. At Symantec, we have had to engineer around the lack of allocator-support in regular expressions because tr1::regex objects cannot be placed in shared memory as they cannot be assigned a shared memory allocator. While the overall notion of allocators has generated some controversy within the C++ community, it seems clear that as long as other C++ containers are allocator-aware, regular expressions should be also.

Finally, it should be noted that C++0x regular expressions already differ from TR1 regular expressions, so it is possible to rectify this situation for C++0x, but once normatively standardized, it will be extremely difficult if not impossible to make such a breaking change.

Approach
The proposed wording below was arrived at mutatis mutandis from the corresponding wording from string. However, a few comments are in order.

1. Class match_results (28.10) currently uses an allocator. This allocator has no relationship to the allocator used internally in the regular expression, as has always been the case (regarding the current regex as regular expression using the standard allocator). Similar comments apply to string allocators.

2. Although most C++ containers consistently use pointer traits internally, regex_traits use locales, so they cannot be, say, shared using an interprocess allocator. Note that basic_stringstream and basic_stringbuf already use both allocators and locales, so supporting allocators in regular expressions do not introduce any new problems.

Although these locale considerations prevent regular expressions using std::regex_traits from
being shared between processes, there is no reason to prevent users from defining their own allocator-aware regex traits. To facilitate this, based on uses_allocator<traits, Allocator>, std: :basic_regex either default constructs regex_traits (e.g. std::regex_traits) or construct s from an allocator. We allow imbue to throw a regex_error (although std::regex_traits doesn’t) as user-defined regex_traits may not be able to handle all possible locales (e.g., some custom locales).

**Status**
A working implementation is available. In addition, an exemplary user-defined regex_traits is available that allows locales to be passed between process based on their locale names.

**Wording**
In 17.6.3.5p1, change the final sentence to

All of the string types (Clause 21), containers (Clause 23) (except array (Clause 23)), string buffers and string streams (Clause 27), regular expressions (clause 28), and match_results (Clause 28) are parameterized in terms of allocators.

Apply the following changes to clause 28. Note that if this is applied to a TS, include wording to the effect that the text from clause 28 should be included with the following changes.

**28.3 Requirements [re.req]**
In the entry for u.imbue in table 137 add: Report error by throwing exception of type regex_error

At the end of 28.3, add the following paragraph.

Class template basic_regex satisfies the requirements for an Allocator-aware container (Table 99), except that basic_regex does not construct or destroy any objects using allocator_traits<Alloc>::construct and allocator_traits<Alloc>::destroy

**28.4 Header <regex> synopsis**

...  

// 28.8, class template basic_regex:
template <class charT, class traits = regex_traits<charT>,
          class Allocator = allocator<charT>>  
        class basic_regex;  

...  

// 28.8.6, basic_regex swap:
template <class charT, class traits, class Allocator>
void swap(basic_regex<charT, traits, Allocator>& e1,
          basic_regex<charT, traits, Allocator>& e2);

regex_constants::match_default);

// 28.5.3 Implementation-defined error_type [re.err]
Add an error type to regex_constants and table 140 called error_locale with Error Condition: Unable to imbue with a locale.

### 28.8 Class template basic_regex [re.regex]

```cpp
namespace std {
    template <class charT,
        class traits = regex_traits<charT>,
        class Allocator = allocator<charT>>
    class basic_regex {
    public:
        // types:
        typedef charT value_type;
        typedef regex_constants::syntax_option_type flag_type;
        typedef typename traits::locale_type locale_type;
        typedef Allocator allocator_type;

    ...  

    // 28.8.2, construct/copy/destroy:
    basic_regex() : basic_regex(Allocator()) {}
    explicit basic_regex(const Allocator &a);
    explicit basic_regex(const charT* p,
        flag_type f = regex_constants::ECMAScript,
        const Allocator &a = Allocator());
    basic_regex(const charT* p, size_t len, flag_type f,
        const Allocator &a = Allocator());
    basic_regex(const basic_regex&);
    basic_regex(basic_regex&&);
    template <class ST, class SA>
    explicit basic_regex(const basic_string<charT, ST, SA>& p,
        flag_type f = regex_constants::ECMAScript,
        const Allocator &a = Allocator());
    template <class ForwardIterator>
    basic_regex(ForwardIterator first, ForwardIterator last,
        flag_type f = regex_constants::ECMAScript,
        const Allocator &a = Allocator());
    basic_regex(initializer_list<charT>,
        flag_type f = regex_constants::ECMAScript,
        const Allocator &a = Allocator());

    // 28.8.10, allocator (Section number may be chosen editorially):
    allocator_type get_allocator() const noexcept;
```

### 28.8.2 basic_regex constructors [re.regex.construct]

- **basic_regex(const Allocator &a = Allocator());**

  **Effects:** Constructs an object of class basic_regex that does not match any character sequence.
28.8.5 basic_regex locale [re.regex.locale]

locale_type imbue(locale_type loc);

Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default initialized if
uses_allocator<traits, Allocator>) (20.9.2.2) has a base characteristic (20.7.1) of false and
initialized from get_allocator() if uses_allocator<traits, Allocator> has a base
characteristic of true).

instance of the template type argument traits stored within the object. After a call to imbue the
basic_regex object does not match any character sequence.

locale_type getloc() const;

Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default initialized if
uses_allocator<traits, Allocator>) (20.9.2.2) has a base characteristic (20.7.1) of false and initialized
from get_allocator() if uses_allocator<traits, Allocator> has a base characteristic of true).

instance of the template parameter traits stored within the object.

28.8.8 basic_regex allocator [re.regex.allocation]

allocator_type get_allocator() const noexcept;

Returns: a copy of the Allocator object used to construct the basic_regex or, if that allocator has been
replaced, a copy of the most recent replacement.

Note: The next few sections simply update signatures as in the header

28.11.2 regex_match [re.algo.match]

template <class BidirectionalIterator, class Allocator, AllocMatch,
  class charT, class traits, class Allocator>

bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
  match_results<BidirectionalIterator, Allocator, AllocMatch>& m,
  const basic_regex<charT, traits, Allocator>& e,
  regex_constants::match_flag_type flags =
  regex_constants::match_default);

(untill after paragraph 3)

template <class BidirectionalIterator, class charT, class traits, class Allocator>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
  const basic_regex<charT, traits, Allocator>& e,
  regex_constants::match_flag_type flags =
  regex_constants::match_default);

(untill after paragraph 4)

template <class charT, class Allocator, AllocMatch, class traits, class Allocator>
bool regex_match(const charT* str,
    match_results<const charT*, Allocator>& m,
    const basic_regex<charT, traits, Allocator>& e,
    regex_constants::match_flag_type flags
    )

template <class ST, class SA, class Allocator, class charT, class traits, class Allocator>
bool regex_match(const basic_string<charT, ST, SA>& s,
    match_results<const basic_string<charT, ST, SA>::const_iterator, Allocator>& m,
    const basic_regex<charT, traits, Allocator>& e,
    regex_constants::match_flag_type flags
    )

28.11.3 regex_search [alg.search]

template <class BidirectionalIterator, class Allocator, class charT, class traits, class Allocator>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
    match_results<BidirectionalIterator, Allocator>& m,
    const basic_regex<charT, traits, Allocator>& e,
    regex_constants::match_flag_type flags
    )

template <class charT, class Allocator, class traits, class Allocator>
bool regex_search(const charT* str,
    match_results<const charT*, Allocator>& m,
    const basic_regex<charT, traits, Allocator>& e,
    regex_constants::match_flag_type flags
    )
bool regex_search(const basic_string<charT, ST, SA>& s, const basic_regex<charT, traits, Allocator>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

// (until after paragraph 5)

template <class BidirectionalIterator, class charT, class traits, class Allocator>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last, const basic_regex<charT, traits, Allocator>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

// (until after paragraph 6)

template <class charT, class traits, class Allocator>
bool regex_search(charT* str, const basic_regex<charT, traits, Allocator>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

// (until after paragraph 7)

template <class ST, class SA, class charT, class traits, class Allocator>
bool regex_search(const basic_string<charT, ST, SA>& s, const basic_regex<charT, traits, Allocator>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

28.11.4 regex_replace [re.alg.replace]

template <class OutputIterator, class BidirectionalIterator, class traits, class charT, class ST, class SA, class Allocator>
OutputIterator regex_replace(OutputIterator out, BidirectionalIterator first, BidirectionalIterator last, const basic_regex<charT, traits, Allocator>& e, const basic_string<charT, ST, SA>& fmt, regex_constants::match_flag_type flags = regex_constants::match_default);

template <class OutputIterator, class BidirectionalIterator, class traits, class charT, class Allocator>
OutputIterator regex_replace(OutputIterator out, BidirectionalIterator first, BidirectionalIterator last, const basic_regex<charT, traits, Allocator>& e, charT* fmt, regex_constants::match_flag_type flags = regex_constants::match_default);

(until after paragraph 2)

template <class traits, class charT, class ST, class SA, class FST, class FSA, class Allocator>
basic_string<charT, ST, SA> regex_replace(const basic_string<charT, ST, SA>& s, const basic_regex<charT, traits, Allocator>& e, const basic_string<charT, FST, FSA>& fmt, regex_constants::match_flag_type flags = regex_constants::match_default);

template <class traits, class charT, class ST, class SA, class Allocator>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s,
    const basic_regex<charT, traits> Allocator >& e,
    const charT* fmt,
    regex_constants::match_flag_type flags =
    regex_constants::match_default);

(\text{until after paragraph 4})

\text{template <class traits, class charT, class ST, class SA, class Allocator > basic_string<charT>}
\text{regex_replace(const charT* s,}
\text{const basic_regex<charT, traits> Allocator >& e,}
\text{const basic_string<charT, ST, SA>& fmt,}
\text{regex_constants::match_flag_type flags =
    regex_constants::match_default);}\

\text{template <class traits, class charT, class Allocator > basic_string<charT>}
\text{regex_replace(const charT* s,}
\text{const basic_regex<charT, traits> Allocator >& e,}
\text{const charT* fmt,}
\text{regex_constants::match_flag_type flags =
    regex_constants::match_default);}\

28.13 Modified ECMAScript regular expression grammar [re.grammar]

\text{Objects of type specialization of basic_regex store within themselves a default-constructed instance of}
\text{their traits template parameter, henceforth referred to as traits\_inst. If is default constructed if}
\text{uses_allocator<traits, Allocator> has a base characteristic (20.7.1) of false and constructed from}
\text{get_allocator() if uses_allocator<traits, Allocator> has a base characteristic of true. This}
\text{traits\_inst object is used to support localization of the regular expression; basic_regex object member}
\text{functions shall not call any locale dependent C or C++ API, including the formatted string input functions.}
\text{Instead they shall call the appropriate traits member function to achieve the required effect.}
