Note: this is an early draft. It’s known to be incompleat and incorrekt, and it has lots of bad formatting.

List of Figures
1 General

Naturally the villagers were intrigued and soon a fire was put to the town’s greatest kettle as the soldiers dropped in three smooth stones.

“Now this will be a fine soup”, said the second soldier; “but a pinch of salt and some parsley would make it wonderful!”

—Author Unknown

1.1 Scope

This Technical Specification describes extensions to the C++ Programming Language 1.2 that permit operations on ranges of data. These extensions include changes and additions to the existing library facilities as well as the extension of some core language facilities. In particular, changes and extensions to the Standard Library include:

1. (1.1) The reformulation of the foundational and iterator concept requirements using the syntax of the Concepts TS 1.2.

2. (1.2) The respecification of the Standard Library algorithms in terms of the new concepts.

3. (1.3) The loosening of the algorithm constraints to permit the use of sentinels to denote the end of a range and corresponding changes to algorithm return types where necessary.

4. (1.4) The addition of new concepts describing range and view abstractions; that is, objects with a begin iterator and an end sentinel.

5. (1.5) The addition of new overloads of the Standard Library algorithms that take iterable objects.

6. (1.6) Support of callable objects (as opposed to function objects) passed as arguments to the algorithms.

7. (1.7) The addition of optional projection arguments to the algorithms to permit on-the-fly data transformations.

8. (1.8) Changes to existing iterator primitives and new primitives in support of the addition of sentinels to the library.

9. (1.9) Changes to the existing iterator adaptors and stream iterators to make them model the new iterator concepts.

10. (1.10) New iterator adaptors (counted_iterator and common_iterator) and sentinels (unreachable).

2 Changes to the core language include:

1. (2.1) The extension of the range-based for statement to support the new iterator range requirements (24.11).

3 The scope of this paper does not yet extend to the other parts of the Standard Library that need to change because of the addition of concepts to the language (e.g., the numeric algorithms), nor does it add range support to all the places that could benefit from it (e.g., the containers).

4 This paper does not specify any new range views, actions, or facade or adaptor utilities. See the Future Work appendix (C).
1.2 References

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

(1.1)  — ISO/IEC 14882:2014, Programming Languages - C++

(1.2)  — JTC1/SC22/WG21 N4377, Technical Specification - C++ Extensions for Concepts

(1.3)  — JTC1/SC22/WG21 N4128, Ranges for the Standard Library, Revision 1

(1.4)  — JTC1/SC22/WG21 N3351, A Concept Design for the STL

ISO/IEC 14882:2014 is herein called the C++ Standard, N3351 is called the “The Palo Alto” report, and N4377 is called the Concepts TS.

1.3 Implementation compliance

Conformance requirements for this specification are the same as those defined in 1.3 in the C++ Standard. [Note: Conformance is defined in terms of the behavior of programs. — end note]

1.4 Namespaces, headers, and modifications to standard classes

Since the extensions described in this technical specification are experimental and not part of the C++ standard library, they should not be declared directly within namespace std. Unless otherwise specified, all components described in this document either:

(1.1)  — modify an existing interface in the C++ Standard Library in-place,

(1.2)  — are declared in a namespace whose name appends ::experimental::ranges_v1 to a namespace defined in the C++ Standard Library, such as std or std::chrono, or

(1.3)  — are declared in a subnamespace of a namespace described in the previous bullet, whose name is not the same as an existing subnamespace of namespace std.

[Editor's note: TODO The following note isn’t quite correct since std::experiments::ranges_v1::relops exists.]

[Example: This TS does not define std::experimental::ranges_v1::chrono because the C++ Standard Library defines std::chrono. This paper does not define std::pmr::experimental::ranges_v1 because the C++ Standard Library does not define std::pmr. — end example]

[Editor’s note: The following text is new to this document. It is taken from the Library Fundamentals 2 TS and edited to reflect the fact that much of this document is suggesting parallel constrained facilities that are specified as diffs against the existing unconstrained facilities in namespace std.]

The International Standard, ISO/IEC 14882, together with N4377 (the Concepts TS), provide important context and specification for this paper. This document is written as a set of changes against ISO/IEC 14882. In places, this document suggests changes to be made to components in namespace std in-place. In other places, entire chapters and sections are copied verbatim and modified so as to define similar but different components in namespace std::experimental::ranges_v1. In those cases, effort was made to keep chapter and section numbers the same as in ISO/IEC 14882 for the sake of easy cross-referencing with the understanding that section numbers will change in the final draft.

Instructions to modify or add paragraphs are written as explicit instructions. Modifications made to existing text from the International Standard use underlining to represent added text and strikethrough to represent deleted text. Text in underline is used to denote text that was added since the last time the wording in question was reviewed, and strikethrough denotes text removed.

§ 1.4
This paper assumes that the contents of the `std::experimental::ranges_v1` namespace will become a new constrained version of the C++ Standard Library that will be delivered alongside the existing unconstrained version. The versioning mechanism to make this possible is yet to be determined.

Unless otherwise specified, references to other entities described in this document are assumed to be qualified with `std::experimental::ranges_v1::`, and references to entities described in the International Standard are assumed to be qualified with `std::`.

New headers are provided in the `<experimental/ranges_v1/>` directory. Where the new header has the same name as an existing header (e.g., `<experimental/ranges_v1/algorithm>`), the new header shall include the existing header as if by

```
#include <algorithm>
```

6 Statements

6.5 Iteration statements

6.5.4 The range-based for statement

[Editor’s note: Modify paragraph 1 to allow differently typed begin and end iterators.]

For a range-based for statement of the form

```
for ( for-range-declaration : expression ) statement
```

let range-init be equivalent to the expression surrounded by parentheses

```
( expression )
```

and for a range-based for statement of the form

```
for ( for-range-declaration : braced-init-list ) statement
```

let range-init be equivalent to the `braced-init-list`. In each case, a range-based for statement is equivalent to

```
{ 
  auto && __range = range-init;
  for ( auto __begin = begin-expr,
        __end = end-expr;
        __begin != __end;
        ++__begin ) {
    for-range-declaration = *__begin;
    statement
  }
}
```

```
{ 
  auto && __range = range-init;
  auto __begin = begin-expr;
  auto __end = end-expr;
  for ( ; __begin != __end; ++__begin ) {
    for-range-declaration = *__begin;
    statement
  }
}
```

where `__range`, `__begin`, and `__end` are variables defined for exposition only, and `_RangeT` is the type of the expression, and `begin-expr` and `end-expr` are determined as follows:

(1.1) if `_RangeT` is an array type, `begin-expr` and `end-expr` are `__range` and `__range + __bound`, respectively, where `__bound` is the array bound. If `_RangeT` is an array of unknown size or an array of incomplete type, the program is ill-formed;

(1.2) if `_RangeT` is a class type, the `unqualified-ids begin and end` are looked up in the scope of class `_RangeT` as if by class member access lookup (3.4.5), and if either (or both) finds at least one declaration, `begin-expr` and `end-expr` are `__range.begin()` and `__range.end()`, respectively;

(1.3) otherwise, `begin-expr` and `end-expr` are `begin(_range)` and `end(_range)`, respectively, where `begin` and `end` are looked up in the associated namespaces (3.4.2). [Note: Ordinary unqualified lookup (3.4.1) is not performed. — end note]

§ 6.5.4
Example:

```c
int array[5] = { 1, 2, 3, 4, 5 };
for (int& x : array)
  x *= 2;
```

—end example]
17 Library introduction [library]

17.5.1.3 Requirements [structure.requirements]

Requirements describe constraints that shall be met by a C++ program that extends the standard library. Such extensions are generally one of the following:

1. Template arguments
2. Derived classes
3. Containers, iterators, and algorithms that meet an interface convention or satisfy a concept

The string and iostream components use an explicit representation of operations required of template arguments. They use a class template char_traits to define these constraints.

Interface convention requirements are stated as generally as possible. Instead of stating “class X has to define a member function operator++(),” the interface requires “for any object x of class X, ++x is defined.” That is, whether the operator is a member is unspecified.

Requirements are stated in terms of concepts (??). Concepts are stated in terms of well-defined expressions that define valid terms of the types that satisfy the requirements concept. For every set of well-defined expression requirements there is a table named concept that specifies an initial set of the valid expressions and their semantics. Any generic algorithm (Clause 25) that uses the well-defined expression requirements is described in terms of the valid expressions for its template type parameters.

Template argument requirements are sometimes referenced by name. See 17.5.2.1.

In some cases the semantic requirements are presented as C++ code. Such code is intended as a specification of equivalence of a construct to another construct, not necessarily as the way the construct must be implemented.1

Required operations of any concept defined in this standard need not be total functions; that is, some arguments to a required operation may result in the required semantics failing to be satisfied. [Example: The required < operator of the TotallyOrdered concept (19.3.4) does not meet the semantic requirements of that concept when operating on NaNs. —end example] This does not affect whether a type satisfies the concept.

A declaration may explicitly impose requirements through its associated constraints ([14.10.2] in the Concepts TS). When the associated constraints refer to a concept (??), additional semantic requirements are imposed on the use of the declaration.

If the semantic requirements of a declaration are not satisfied at the point of use, the program is ill-formed, no diagnostic required.

---

1) Although in some cases the code given is unambiguously the optimum implementation.
19 Concepts library [concepts.lib]

[Editor’s note: This chapter is inserted between the chapters [language.support] and [diagnostics]. All subsequence chapters should be renumbered as appropriate, but they aren’t here for the sake of simplicity.)]

19.1 General [concepts.lib.general]

This Clause describes library components that C++ programs may use to perform compile-time validation of template parameters and perform function dispatch based on properties of types. The purpose of these concepts is to establish a foundation for equational reasoning in programs.

The following subclauses describe core language concepts, comparison concepts, object concepts, and function concepts as summarized in Table 2.

Table 2 — Fundamental concepts library summary

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>19.2 Core language concepts</td>

<td></td>
</tr>
<tr>
<td>19.4 Object concepts</td>
<td></td>
</tr>
<tr>
<td>19.5 Function concepts</td>
<td></td>
</tr>
</tbody>
</table>

In this Clause, CamelCase identifiers ending with “Type” denote alias templates.

The concepts in this Clause are defined in the namespace std::experimental::ranges_v1.

19.1.1 Equality Preservation [concepts.lib.general.equality]

An expression is equality preserving if, given equal inputs, the expression results in equal outputs. The inputs to an expression is the set of the expression’s operands. The output of an expression is the expression’s result and all operands modified by the expression. [Note: Not all input values must be valid for a given expression; e.g., for integers a and b, the expression a / b is not well-defined when b is 0. This does not preclude the expression a / b being equality preserving. —end note]

A regular function is a function that is equality preserving, i.e., a function that returns equal output when passed equal input. A regular function that returns a value may copy or move the returned object, or may return a reference. [Note: Regular functions may have side effects. —end note]

Expressions required by this specification to be equality preserving are further required to be stable: two evaluations of such an expression with the same input objects must have equal outputs absent any explicit intervening modification of those input objects. [Note: This requirement allows generic code to reason about the current values of objects based on knowledge of the prior values as observed via equality preserving expressions. It effectively forbids spontaneous changes to an object, changes to an object from another thread of execution, changes to an object as side effects of non-modifying expressions, and changes to an object as side effects of modifying a distinct object if those changes could be observable to a library function via an equality preserving expression that is required to be valid for that object. —end note]

Expressions declared in a requires-expression in this document are required to be equality preserving, except for those annotated with the comment “not required to be equality preserving.” An expression so annotated may be equality preserving, but is not required to be so.
An expression that may alter the value of one or more of its inputs in a manner observable to equality preserving expressions is said to modify those inputs. This document uses a notational convention to specify which expressions declared in a requires-expression modify which inputs: except where otherwise specified, an expression operand that is a non-constant lvalue or rvalue may be modified. Operands that are constant lvalues or rvalues must not be modified.

Where a requires-expression declares an expression that is non-modifying for some constant lvalue operand, additional variants of that expression that accept a non-constant lvalue or (possibly constant) rvalue for the given operand are also required except where such an expression variant is explicitly required with differing semantics. Such implicit expression variants must meet the semantic requirements of the declared expression. The extent to which an implementation validates the syntax of these implicit expression variants is unspecified.

[Editor’s note: The motivation for this relaxation of syntactic checking is to avoid an exponential blow-up in the concept definitions and in compile times that would be required to check every permutation of cv-qualification and value category for expression operands.]

[Example:]

```cpp
#include <utility>

// Example: A non-modifying expression with a non-constant lvalue operand

template <class T>
concept bool C() {
    return requires (T a, T b, const T c, const T d) {
        c == d;  // #1
        a = std::move(b); // #2
        a = c;      // #3
    };
}
```

Expression #1 does not modify either of its operands, #2 modifies both of its operands, and #3 modifies only its first operand a.

Expression #1 implicitly requires additional expression variants that meet the requirements for c == d (including non-modification), as if the expressions

```
a == d; a == b; a == move(b); a == d;
c == a; c == move(a); c == move(d);
move(a) == d; move(a) == b; move(a) == move(b); move(a) == move(d);
move(c) == b; move(c) == move(b); move(c) == d; move(c) == move(d);
```

had been declared as well.

Expression #3 implicitly requires additional expression variants that meet the requirements for a = c (including non-modification of the second operand), as if the expressions a = b and a = move(c) had been declared. Expression #3 does not implicitly require an expression variant with a non-constant rvalue second operand, since expression #2 already specifies exactly such an expression explicitly. — end example]

[Example: The following type T meets the explicitly stated syntactic requirements of concept C above but does not meet the additional implicit requirements:]

```cpp
struct T
{
    bool operator==(const T&) const { return true; }
    bool operator==(T&) = delete;
};
```

T fails to meet the implicit requirements of C, so C<T>() is not satisfied. Since implementations are not required to validate the syntax of implicit requirements, it is unspecified whether or not an implementation diagnoses as ill-formed a program which requires C<T>(). — end example]
19.2 Core language concepts

19.2.1 In general

This section contains the definition of concepts corresponding to language features. These concepts express relationships between types, type classifications, and fundamental type properties.

19.2.2 Concept Same

```
template <class T, class U>
concept bool Same() {
    return see below;
}
```

Same<T, U>() is satisfied if and only if T and U denote the same type.

Remarks: For the purposes of constraint checking, Same<T, U>() implies Same<U, T>().

19.2.3 Concept DerivedFrom

```
template <class T, class U>
concept bool DerivedFrom() {
    return see below;
}
```

DerivedFrom<T, U>() is satisfied if and only if is_base_of<U, T>::value is true.

19.2.4 Concept ConvertibleTo

```
template <class T, class U>
concept bool ConvertibleTo() {
    return see below;
}
```

ConvertibleTo<T, U>() is satisfied if and only if is_convertible<T, U>::value is true.

19.2.5 Concept Common

```
template <class T, class U>
using CommonType = common_type_t<T, U>;

template <class T, class U>
concept bool Common() {
    return requires (T t, U u) {
        typename CommonType<T, U>;
        typename CommonType<U, T>;
        requires Same<CommonType<U, T>, CommonType<T, U>>();
        CommonType<T, U>(std::forward<T>(t));
        CommonType<T, U>(std::forward<U>(u));
    };
}
```

Let C be CommonType<T, U>. Let t1 and t2 be objects of type T, and u1 and u2 be objects of type U. Common<T, U>() is satisfied if and only if

- C(t1) equals C(t2) if and only if t1 equals t2.
- C(u1) equals C(u2) if and only if u1 equals u2.
[Note: Users are free to specialize common_type when at least one parameter is a user-defined type. Those specializations are considered by the Common concept. — end note]

19.2.6 Concept Integral

```cpp
template <class T>
concept bool Integral() {
    return is_integral<T>::value;
}
```

19.2.7 Concept SignedIntegral

```cpp
template <class T>
concept bool SignedIntegral() {
    return Integral<T>() && is_signed<T>::value;
}
```

[Note: SignedIntegral<T>() may be satisfied even for types that are not signed integral types (3.9.1); for example, char. — end note]

19.2.8 Concept UnsignedIntegral

```cpp
template <class T>
concept bool UnsignedIntegral() {
    return Integral<T>() && !SignedIntegral<T>();
}
```

[Note: UnsignedIntegral<T>() may be satisfied even for types that are not unsigned integral types (3.9.1); for example, char. — end note]

19.2.9 Concept Assignable

```cpp
template <class T, class U = T>
concept bool Assignable() {
    requires(T&& a, U&& b) {
        { std::forward<T>(a) = std::forward<U>(b) } -> Same<T&>;
    };
}
```

Let t be an lvalue of type T. If U is an lvalue reference type, let v be an lvalue of type U; otherwise, let v be an rvalue of type U. Then Assignable<T, U>() is satisfied if and only if

1. \( \text{std::addressof(t = v)} == \text{std::addressof(t)} \).

19.2.10 Concept Swappable

[Editor’s note: Remove subclause [swappable.requirements]. Replace references to [swappable.requirements] with [concepts.lib.corelang.swappable].]

```cpp
template <class T>
concept bool Swappable() {
    return requires(T&& t, T&& u) {
        (void)swap(std::forward<T>(t), std::forward<T>(u));
    };
}
```

```cpp
template <class T, class U>
concept bool Swappable() { return Swappable<T>() &&

§ 19.2.10
Swappable<U>() &&
Common<T, U>() &&
requires(T&& t, U&& u) {
    (void)swap(std::forward<T>(t), std::forward<U>(u));
    (void)swap(std::forward<U>(u), std::forward<T>(t));
};

[Note: The casts to void in the required expressions indicate that the value—if any—of the call to swap does not participate in the semantics. Callers are effectively forbidden to rely on the return type or value of a call to swap, and user customizations of swap need not return equal values when given equal operands. —end note]

[Editor's note: The following is copied almost verbatim from [swappable.requirements]]

This subclause provides definitions for swappable types and expressions. In these definitions, let t denote an expression of type T, and let u denote an expression of type U.

An object t is swappable with an object u if and only if Swappable<T, U>() is satisfied. Swappable<T, U>() is satisfied if and only if:

(3.1) the requires clause above is evaluated in the context described below, and
(3.2) these expressions have the following effects:
(3.2.1) the object referred to by t has the value originally held by u and
(3.2.2) the object referred to by u has the value originally held by t.

The context in which the requires clause is evaluated shall ensure that a binary non-member function named "swap" is selected via overload resolution (13.3) on a candidate set that includes:

(4.1) the two swap function templates defined in <utility> (20.2) and
(4.2) the lookup set produced by argument-dependent lookup (3.4.2).

[Note: If T and U are both fundamental types or arrays of fundamental types and the declarations from the header <utility> are in scope, the overall lookup set described above is equivalent to that of the qualified name lookup applied to the expression std::swap(t, u) or std::swap(u, t) as appropriate. —end note]

[Note: It is unspecified whether a library component that has a swappable requirement includes the header <utility> to ensure an appropriate evaluation context. —end note]

An rvalue or lvalue t is swappable if and only if t is swappable with any rvalue or lvalue, respectively, of type T.

[Example: User code can ensure that the evaluation of swap calls is performed in an appropriate context under the various conditions as follows:

#include <utility>

// Requires: std::forward<T>(t) shall be swappable with std::forward<U>(u).
template <class T, class U>
void value_swap(T&& t, U&& u) {
    using std::swap;
    swap(std::forward<T>(t), std::forward<U>(u)); // OK: uses “swappable with” conditions
    // for rvalues and lvalues
}

// Requires: lvalues of T shall be swappable.
template <class T>
void lv_swap(T& t1, T& t2) {
    using std::swap;
}

§ 19.2.10
swap(t1, t2); // OK: uses swappable conditions for
} // lvalues of type T

namespace N {
  struct A { int m; };
  struct Proxy { A* a; };
  Proxy proxy(A& a) { return Proxy{ &a }; }

  void swap(A& x, Proxy p) {
    std::swap(x.m, p.a->m); // OK: uses context equivalent to swappable
    // conditions for fundamental types
  }
  void swap(Proxy p, A& x) { swap(x, p); } // satisfy symmetry constraint
}

int main() {
  int i = 1, j = 2;
  lv_swap(i, j);
  assert(i == 2 && j == 1);

  N::A a1 = { 5 }, a2 = { -5 };
  value_swap(a1, proxy(a2));
  assert(a1.m == -5 && a2.m == 5);
}

— end example —

19.3 Comparison concepts [concepts.lib.compare]

19.3.1 In general [concepts.lib.compare.general]

1 This section describes concepts that establish relationships and orderings on values of possibly differing object types.

19.3.2 Concept Boolean [concepts.lib.compare.boolean]

1 The Boolean concept describes the requirements on a type that is usable in Boolean contexts.

template <class B>
concept bool Boolean() {
  return requires(const B b1, const B b2, const bool a) {
    bool(b1);
    { b1 } -> bool;
    bool(!b1);
    { !b1 } -> bool;
    { b1 && b2 } -> Same<bool>;
    { b1 && a } -> Same<bool>;
    { a && b1 } -> Same<bool>;
    { b1 || b2 } -> Same<bool>;
    { b1 || a } -> Same<bool>;
    { a || b1 } -> Same<bool>;
    { b1 == b2 } -> bool;
    { b1 != b2 } -> bool;
    { b1 == a } -> bool;
    { a == b1 } -> bool;
    { b1 != a } -> bool;
    { a != b1 } -> bool;
  }
}
Given values $b_1$ and $b_2$ of type $B$, then $\text{Boolean}<$\text{B}$>()$ is satisfied if and only if

(2.1) $\text{bool}(b_1) == \&\& \text{bool}(b_2)$, (b1 & b2), and (bool(b1) & bool(b2)) are all equal to (bool(b1) & bool(b2)), and have the same short-circuit evaluation.

(2.2) $\text{bool}(b_1) == \text{bool}(v)$.

(2.3) $\text{bool}(b_1) == \text{bool}(b_2)$, (b1 & b2), and (bool(b1) & bool(b2)) are all equal to (bool(b1) & bool(b2)), and have the same short-circuit evaluation.

(2.4) $\text{bool}(b_1) == \text{bool}(b_2)$.

(2.5) $\text{bool}(b_1 == b_2)$, bool(b1 == bool(b2)), and bool(bool(b1) == b2) are all equal to (bool(b1) == bool(b2)).

(2.6) $\text{bool}(b_1 != b_2)$, bool(b1 != bool(b2)), and bool(bool(b1) != b2) are all equal to (bool(b1) != bool(b2)).

[Example: The types bool, std::true_type, and std::bitset<$N$>::reference are Boolean types. Pointers, smart pointers, and types with explicit conversions to bool are not Boolean types. —end example]

19.3.3 Concept EqualityComparable [concepts.lib.compare.equalitycomparable]

[Editor’s note: Remove table [equalitycomparable] in [utility.arg.requirements]. Replace references to [equalitycomparable] with [concepts.lib.compare.equalitycomparable].]

template <class T>
concept bool EqualityComparable() {
    return requires(const T a, const T b) {
        {a == b} -> Boolean;
        {a != b} -> Boolean;
    };
}

Let $a$ and $b$ be well-formed objects of type $T$. $\text{EqualityComparable}<$\text{T}$>()$ is satisfied if and only if

(1.1) $\text{bool}(a == a)$.

(1.2) $\text{bool}(a == b)$ if and only if $a$ is equal to $b$.

(1.3) $\text{bool}(a != b) == \text{!bool}(a == b)$.

[Note: The requirement that the expression $a == b$ is equality preserving implies that $==$ is transitive and symmetric. —end note]

[Note: Not all arguments will be well-formed for a given type. For example, $NaN$ is not a well-formed floating point value, and many types’ moved-from states are not well-formed. This does not mean that the type does not satisfy EqualityComparable. —end note]
Let \( a \) be an object of type \( T \), \( b \) be an object of type \( U \), and \( C \) be \( \text{CommonType}<T, U> \). Then \( \text{EqualityComparable}<T, U>() \) is satisfied if and only if

\[
\begin{align*}
(4.1) & \quad \text{bool}(a == b) == \text{bool}(C(a) == C(b)). \\
(4.2) & \quad \text{bool}(a != b) == \text{bool}(C(a) != C(b)). \\
(4.3) & \quad \text{bool}(b == a) == \text{bool}(C(b) == C(a)). \\
(4.4) & \quad \text{bool}(b != a) == \text{bool}(C(b) != C(a)).
\end{align*}
\]

19.3.4 Concept TotallyOrdered \[\text{[concepts.lib.compare.totallyordered]}\]

[Editor’s note: Remove table \([\text{lessthancomparable}]\) in \([\text{utility.arg.requirements}]\). Replace uses of \( \text{LessThanComparable} \) with \( \text{TotallyOrdered} \) (acknowledging that this is a breaking change that makes type requirements stricter). Replace references to \([\text{lessthancomparable}]\) with references to \([\text{concepts.lib.compare.totallyordered}]\)]

\[
\begin{align*}
\text{template <class } & \text{T}\text{> concept bool TotallyOrdered() } \\
& \text{\{ return } \text{EqualityComparable}\langle T\rangle() && \\
& \text{\{ requires (const } T & \text{a, const } T & \text{b) }\{ \\
& \{ a < b \} -& \text{Boolean; } \\
& \{ a > b \} -& \text{Boolean; } \\
& \{ a <= b \} -& \text{Boolean; } \\
& \{ a >= b \} -& \text{Boolean; } \\
& \}\};
\end{align*}
\]

Let \( a \), \( b \), and \( c \) be \textit{well-formed} objects of type \( T \). Then \( \text{TotallyOrdered}<T>() \) is satisfied if and only if

\[
\begin{align*}
(1.1) & \quad \text{Exactly one of bool}(a < b), \text{bool}(b < a), \text{or bool}(a == b) \text{ is true.} \\
(1.2) & \quad \text{If bool}(a < b) \text{ and bool}(b < c), \text{then bool}(a < c). \\
(1.3) & \quad \text{bool}(a > b) == \text{bool}(b < a). \\
(1.4) & \quad \text{bool}(a <= b) == !\text{bool}(b < a). \\
(1.5) & \quad \text{bool}(a >= b) == !\text{bool}(a < b).
\end{align*}
\]

\[\text{[Note: Not all arguments will be well-formed for a given type. For example, } NaN \text{ is not a well-formed floating point value, and many types’ moved-from states are not well-formed. This does not mean that the type does not satisfy TotallyOrdered. — end note]}\]

\[
\begin{align*}
\text{template <class } & \text{T, class } U\text{> concept bool TotallyOrdered() } \\
& \text{\{ return } \text{Common}<T, U>() && \\
& \text{TotallyOrdered}<T>() && \\
& \text{TotallyOrdered<U>() && \\
& \text{TotallyOrdered<CommonType}<T, U>() && \\
& \text{EqualityComparable}<T, U>() && \\
& \text{\{ requires (const } T & \text{t, const } U & \text{u) }\{ \\
& \{ t < u \} -& \text{Boolean; } \\
& \{ t > u \} -& \text{Boolean; } \\
& \{ t <= u \} -& \text{Boolean; } \\
& \{ t >= u \} -& \text{Boolean; } \\
& \{ u < t \} -& \text{Boolean; } \\
& \{ u > t \} -& \text{Boolean; }
\end{align*}
\]
Let $t$ be an object of type $T$, $u$ be an object of type $U$, and $C$ be $\text{CommonType}<T, U>$. Then $\text{TotallyOrdered}<T,U>()$ is satisfied if and only if

1. $\text{bool}(t < u) == \text{bool}(C(t) < C(u))$.
2. $\text{bool}(t > u) == \text{bool}(C(t) > C(u))$.
3. $\text{bool}(t <= u) == \text{bool}(C(t) <= C(u))$.
4. $\text{bool}(u <= t) == \text{bool}(C(u) <= C(t))$.
5. $\text{bool}(u > t) == \text{bool}(C(u) > C(t))$.
6. $\text{bool}(u >= t) == \text{bool}(C(u) >= C(t))$.
7. $\text{bool}(t >= u) == \text{bool}(C(t) >= C(u))$.

19.4 Object concepts

This section defines concepts that describe the basis of the value-oriented programming style on which the library is based. [Editor’s note: These concepts reuse many of the names of concepts that traditionally describe features of types to describe families of object types.]

19.4.1 Concept Destructible

[Editor’s note: Remove table [destructible] in [utility.arg.requirements]. Replace references to [destructible] with references to [concepts.lib.objectdestructible].]

The $\text{Destructible}$ concept is the base of the hierarchy of object concepts. It describes properties that all such object types have in common.

```cpp
template <class T>
class bool Destructible() {
    return requires (T t, const T ct, T* p) {
        { t.~T() } noexcept;
        { &t } -> Same<T*>; // not required to be equality preserving
        { &ct } -> Same<const T*>; // not required to be equality preserving
        delete p;
        delete[] p;
    };
}
```

2. The expression requirement $&ct$ does not require implicit expression variants.
3. Given a (possibly $\text{const}$) lvalue $t$ of type $T$ and pointer $p$ of type $T*$, $\text{Destructible}<T>()$ is satisfied if and only if
   1. After evaluating the expression $t.~T()$, $\text{delete} p$, or $\text{delete}[] p$, all resources owned by the denoted object(s) are reclaimed.
   2. $&t == \text{std::addressof}(t)$.
   3. The expression $&t$ is non-modifying.
19.4.2 Concept Constructible

The `Constructible` concept is used to constrain the type of a variable to be either an object type constructible from a given set of argument types, or a reference type that can be bound to those arguments.

```cpp
template <class T, class ...Args>
concept bool __ConstructibleObject = // exposition only
    Destructible<T>() && requires (Args&& ...args) {
        T{std::forward<Args>(args)...}; // not required to be equality preserving
        new T{std::forward<Args>(args)...}; // not required to be equality preserving
    };

template <class T, class ...Args>
concept bool __BindableReference = // exposition only
    is_reference<T>::value && requires (Args&& ...args) {
        T{std::forward<Args>(args)...};
    };

template <class T, class ...Args>
concept bool Constructible() {
    return __ConstructibleObject<T, Args...> ||
        __BindableReference<T, Args...>;
}
```

19.4.3 Concept DefaultConstructible

```cpp
template <class T>
concept bool DefaultConstructible() {
    return Constructible<T>() &&
        requires (const size_t n) {
            new T[n]{}; // not required to be equality preserving
        };
}
```

1 [Note: The array allocation expression `new T[n]` implicitly requires that `T` has a non-explicit default constructor. —end note]

19.4.4 Concept MoveConstructible

```cpp
template <class T>
concept bool MoveConstructible() {
    return Constructible<T, remove_cv_t<T>&&>() &&
        Convertible<remove_cv_t<T>&&, T>();
}
```

1 Let `rv` be an rvalue of type `remove_cv_t<T>`. Then `MoveConstructible<T>()` is satisfied if and only if

1.1 After the definition `T u = rv;`, `u` is equal to the value of `rv` before the construction.

1.2 `T(rv)` or `*new T{rv}` is equal to the value of `rv` before the construction.

2 `rv`'s resulting state is unspecified. [Note: `rv` must still meet the requirements of the library component that is using it. The operations listed in those requirements must work as specified whether `rv` has been moved from or not. —end note]
[Editor’s note: Ideally, `MoveConstructible` would include an array allocation requirement `new T[1]{std::move(t)}`. This is not currently possible since [expr.new]/19 requires an accessible default constructor even when all array elements are initialized.]

### 19.4.5 Concept CopyConstructible

[concepts.lib.object.copyconstructible]

[Editor’s note: Remove table [copyconstructible] in [utility.arg.requirements]. Replace references to [copyconstructible] with references to [concepts.lib.object.copyconstructible].]

```cpp
template <class T>
concept bool CopyConstructible() {
    return MoveConstructible<T>() &&
    Constructible<T, const remove_cv_t<T>&>() &&
    Convertible<remove_cv_t<T>&, T>() &&
    Convertible<remove_cv_t_t<T>&, T>() &&
    Convertible<remove_cv_t_t<T>&& T>();
}
```

1. Let \( v \) be an lvalue of type (possibly `const`) \( \text{remove_cv}_t<T> \) or an rvalue of type `const remove_cv_t<T>`\( T \). Then \( \text{CopyConstructible}<T>() \) is satisfied if and only if

1.1. After the definition \( T \ u = v; \), \( v \) is equal to \( u \).

1.2. \( T\{v\} \) or `*new T{v}` is equal to \( v \) is unchanged.

[Editor’s note: Ideally, `CopyConstructible` would include an array allocation requirement `new T[1]{t}`. This is not currently possible since [expr.new]/19 requires an accessible default constructor even when all array elements are initialized.]

### 19.4.6 Concept Movable

[concepts.lib.object.movable]

[Editor’s note: Remove table [moveassignable] in [utility.arg.requirements]. Replace references to [moveassignable] with references to [concepts.lib.object.movable].]

```cpp
template <class T>
concept bool Movable() {
    return MoveConstructible<T>() &&
    Assignable<T&, T&&>();
}
```

1. Let \( rv \) be an rvalue of type \( T \) and let \( t \) be an lvalue of type \( T \). Then \( \text{Movable}<T>() \) is satisfied if and only if

1.1. After the assignment \( t = rv \), \( t \) is equal to the value of \( rv \) before the assignment.

2. \( rv \)'s resulting state is unspecified. [Note: \( rv \) must still meet the requirements of the library component that is using it. The operations listed in those requirements must work as specified whether \( rv \) has been moved from or not. —end note]

### 19.4.7 Concept Copyable

[concepts.lib.object.copyable]

[Editor’s note: Remove table [copyassignable] in [utility.arg.requirements]. Replace references to [copyassignable] with references to [concepts.lib.object.copyable].]

```cpp
template <class T>
concept bool Copyable() {
    return CopyConstructible<T>() &&
    Movable<T>() &&
    Assignable<T&, const T&>();
}
```
Let \( t \) be an lvalue of type \( T \), and \( v \) be an lvalue of type (possibly \( \text{const} \) \( T \) or an rvalue of type \( \text{const} \) \( T \). Then \( \text{Copyable}\langle T \rangle() \) is satisfied if and only if

\[
\text{— After the assignment } t = v, t \text{ is equal to } v.
\]

19.4.8 Concept Semiregular

\[
\text{template } \langle \text{class } T \rangle
\]

\[
\text{concept bool Semiregular()} \{ \\
\quad \text{return Copyable}\langle T \rangle() \&\& \\
\quad \text{DefaultConstructible}\langle T \rangle(); \\
\}
\]

1 [Note: The \text{Semiregular} concept is satisfied by types that behave similarly to built-in types like \text{int}, except that they may not be comparable with \( \text{==} \). — end note]

19.4.9 Concept Regular

\[
\text{template } \langle \text{class } T \rangle
\]

\[
\text{concept bool Regular()} \{ \\
\quad \text{return Semiregular}\langle T \rangle(); \&\& \\
\quad \text{EqualityComparable}\langle T \rangle(); \\
\}
\]

1 [Note: The \text{Regular} concept is satisfied by types that behave similarly to built-in types like \text{int} and that are comparable with \( \text{==} \). — end note]

19.5 Function concepts

19.5.1 In general

The function concepts in this section describe the requirements on function objects (20.9) and their arguments.

19.5.2 Concept Function

\[
\text{template } \langle \text{class } F, \text{class...Args} \rangle
\]

\[
\text{using ResultType} = \text{result}\text{of}\_t\langle F(\text{Args...})\rangle;
\]

\[
\text{template } \langle \text{class } F, \text{class...Args} \rangle
\]

\[
\text{concept bool Function()} \{ \\
\quad \text{return CopyConstructible}\langle F \rangle() \&\& \\
\quad \text{requires } (F f, \text{Args}&&...\text{args}) \{ \\
\quad \quad \text{typename ResultType}\langle F, \text{Args}...\rangle; \\
\quad \quad \{ f(\text{std}::\text{forward}\langle \text{Args}\rangle(\text{args})...) \} \quad \text{// not required to be equality preserving} \\
\quad \quad \rightarrow \text{Same}\langle \text{ResultType}\langle F, \text{Args}...\rangle\rangle; \\
\quad \}; \\
\}
\]

1 [Note: Since the function call expression of \text{Function} is not required to be equality-preserving (19.1.1), a function that generates random numbers may satisfy \text{Function}. — end note]

19.5.3 Concept RegularFunction

\[
\text{template } \langle \text{class } F, \text{class...Args} \rangle
\]

\[
\text{concept bool RegularFunction()} \{ \\
\quad \text{return Function}\langle F, \text{Args}...\rangle(); \\
\}
\]
The function call expression of RegularFunction shall be equality-preserving (19.1.1). [Note: This requirement supersedes the annotation on the function call expression in the definition of Function. —end note]

[Note: A random number generator does not satisfy RegularFunction. —end note]

[Note: There is no syntactic difference between Function and RegularFunction. —end note]

19.5.4 Concept Predicate

```cpp
template <class F, class...Args>
concept bool Predicate() {
    return RegularFunction<F, Args...>() &&
    Boolean<ResultType<F, Args...>>();
}
```

19.5.5 Concept Relation

```cpp
template <class R, class T>
concept bool Relation() {
    return Predicate<R, T, T>();
}
```

```cpp
template <class R, class T, class U>
concept bool Relation() {
    return Relation<R, T, U>() &&
    Relation<R, U, T>() &&
    Common<T, U>() &&
    Relation<R, CommonType<T, U>, U>() &&
    Predicate<R, T, U>() &&
    Predicate<R, U, T>();
}
```

Let \( r \) be any well-formed object of type \( R \), \( a \) be any well-formed object of type \( T \), \( b \) be any well-formed object of type \( U \), and \( C \) be CommonType\(<T, U>\). Then \( \text{Relation}<R,T,U>() \) is satisfied if and only if

\[
\begin{align}
(1.1) & \quad \text{bool}(r(a, b)) == \text{bool}(r(C(a), C(b))). \\
(1.2) & \quad \text{bool}(r(b, a)) == \text{bool}(r(C(b), C(a))).
\end{align}
\]

19.5.6 Concept StrictWeakOrder

```cpp
template <class R, class T>
concept bool StrictWeakOrder() {
    return Relation<R, T>();
}
```

```cpp
template <class R, class T, class U>
concept bool StrictWeakOrder() {
    return Relation<R, T, U>();
}
```

A Relation satisfies StrictWeakOrder if and only if it imposes a strict weak ordering on its arguments. [Editor’s note: Copied verbatim from [alg.sorting].]

The term strict refers to the requirement of an irreflexive relation (\(!\text{comp}(x, x)\) for all \( x \)), and the term weak to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define \( \text{equiv}(a, b) \) as \(!\text{comp}(a, b) \&\& \neg !\text{comp}(b, a)\), then the requirements are that \( \text{comp} \) and \( \text{equiv} \) both be transitive relations:
(2.1) \[ \text{comp}(a, b) \land \text{comp}(b, c) \Rightarrow \text{comp}(a, c) \]

(2.2) \[ \text{equiv}(a, b) \land \text{equiv}(b, c) \Rightarrow \text{equiv}(a, c) \]

[Note: Under these conditions, it can be shown that]

(2.2.1) \[ \text{equiv} \text{ is an equivalence relation} \]

(2.2.2) \[ \text{comp} \text{ induces a well-defined relation on the equivalence classes determined by equiv} \]

(2.2.3) \[ \text{The induced relation is a strict total ordering.} \quad \text{end note} \]
20 General utilities library [utilities]

20.2 Utility components [utility]

[Editor’s note: "swap" is a customization point found by Argument-Dependent Lookup. Due to the nature of ADL, the swap in namespace std would be considered if either argument has namespace std as an associated type. If std::swap remains unconstrained, then the Swappable concept will erroneously return true for some types that are not in fact swappable. Below, we suggest adding constraints directly to the overloads of swap in namespace std rather than defining new constrained overloads of swap in namespace std::experimental::ranges_v1. The precise mechanism by which swap is constrained such that it is usable in build environments lacking the concepts language feature is unspecified.]

Header <utility> synopsis

1 Change the <utility> synopsis as follows:

```cpp
namespace std {
  // ... as before ..

  // 20.2.2, swap:
  template<class T> 
    requires experimental::ranges_v1::Movable<T>()
  void swap(T& a, T& b) noexcept(see below);

  template <class T, size_t N>
    requires requires (remove_all_extents_t<T>& t) { swap(t, t); } 
  void swap(T (&a)[N], T (&b)[N]) noexcept(noexcept(swap(*a, *b)));

  // ... as before ..
}
```

2 Header <experimental/ranges_v1/utility> synopsis

```cpp
namespace std { namespace experimental { namespace ranges_v1 {

  // 20.2.2, swap:
  using std::swap;

  // 20.2.3, exchange:
  template <class Movable T, class U=T>
    requires Assignable<T&, U>()
  T exchange(T& obj, U&& new_val);

  // 20.15.2, struct with named accessors
  template <class T>
  concept bool TagSpecifier() { return see below; }

  template <class F>
  concept bool TaggedType() { return see below; }

}}}
```

§ 20.2
template <class Base, class... Types, TagSpecifier... Tags>
    requires sizeof...(Tags) <= tuple_size<Base>::value
struct tagged;

// 20.15.3, tagged specialized algorithms
template <class Base, class... Tags>
    requires Swappable<Base&>()
void swap(tagged<Base, Tags...>& x, tagged<Base, Tags...>& y) noexcept(see below);

// 20.15.5, tagged pairs
template <class TaggedType T1, class TaggedType T2> using tagged_pair = see below;

template <class TagSpecifier Tag1, class TagSpecifier Tag2, class T1, class T2>
    constexpr tagged_pair<Tag1(V1), Tag2(V2)> make_tagged_pair(T1&& x, T2&& y);

namespace std {
    // 20.15.4, tuple-like access to tagged
    template <class Base, class... Tags>
    struct tuple_size<experimental::ranges_v1::tagged<Base, Tags...>>;

    template <size_t N, class Base, class... Tags>
    struct tuple_element<N, experimental::ranges_v1::tagged<Base, Tags...>>;
}

3 Any entities declared or defined directly in namespace std in header <utility> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/utility> are imported with using-declarations (7.3.3). [Example:

    namespace std { namespace experimental { namespace ranges_v1 {
        using std::pair;
        using std::make_pair;
        // ... others
    }}}

    —end example]

4 Any nested namespaces defined directly in namespace std in header <utility> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/utility> are aliased with a namespace-alias-definition (7.3.2). [Example:

    namespace std { namespace experimental { namespace ranges_v1 {
        namespace rel_ops = std::rel_ops;
    }}}

    —end example]

20.2.2 swap [utility.swap]
[Editor's note: The following edits to the two swap overloads are to be applied to the versions in namespace std.]

template<class T>
    requires experimental::ranges_v1::Movable<T>()
void swap(T& a, T& b) noexcept(see below);

1 Remark: The expression inside noexcept is equivalent to:
is noexcept move constructible<T>::value &&
  is noexcept move assignable<T>::value

is noexcept destructible<T>::value

2  Remark: A library implementor is free to omit the requires clause so long as this function does not participate in overload resolution if the following is false

  is_move_constructible<T>::value &&
  is_move_assignable<T>::value
  is_destructible<T>::value

[Editor’s note: This is to support compilation environments that do not support concepts.]

3  Requires: Type T shall be MoveConstructible (Table 20) and MoveAssignable (Table 22).

Effects: Exchanges values stored in two locations.

template <class T, size_t N>
requires requires (remove_all_extents_t<T>& t) { swap(t, t); }
void swap(T (&a)[N], T (&b)[N]) noexcept(noexcept(swap(*a, *b)));

5  Requires: a[i] shall be swappable with (19.2.10) b[i] for all i in the range [0,N).

6  Remark: A library implementor is free to omit the requires clause so long as this function does not participate in overload resolution if the following expression is ill-formed

  swap(declval<remove_all_extents_t<T>&>(), declval<remove_all_extents_t<T>&>())

[Editor’s note: This is to support compilation environments that do not support concepts.]

7  Effects: swap_ranges(a, a + N, b)

20.2.3  exchange

[utility.exchange]
template <class Moveable T, class U=T>
requires Assignable<T&, U>()
T exchange(T& obj, U& new_val);

Effects: Equivalent to:

T old_val = std::move(obj);
obj = std::forward<U>(new_val);
return old_val;

20.9  Function objects

[function.objects]
Header <experimental/ranges_v1/functional> synopsis

namespace std { namespace experimental { namespace ranges_v1 {
  template <class T = void>
  requires EqualityComparable<T>() || Same<T, void>()
  struct equal_to;

  template <class T = void>
  requires EqualityComparable<T>() || Same<T, void>()
  struct not_equal_to;

  template <class T = void>
  requires TotallyOrdered<T>() || Same<T, void>()
  struct greater;

§ 20.9
template <class T = void>
    requires TotallyOrdered<T>() || Same<T, void>()
struct less;

template <class T = void>
    requires TotallyOrdered<T>() || Same<T, void>()
struct greater_equal;

template <class T = void>
    requires TotallyOrdered<T>() || Same<T, void>()
struct less_equal;

struct identity;
}}}

Any entities declared or defined directly in namespace std in header <functional> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/functional> are imported with using-declarations (7.3.3). [Example:
    namespace std { namespace experimental { namespace ranges_v1 {
    using std::reference_wrapper;
    using std::ref;
    // ... others
    }}}
    —end example]

Any nested namespaces defined directly in namespace std in header <functional> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/functional> are aliased with a namespace-alias-definition (7.3.2). [Example:
    namespace std { namespace experimental { namespace ranges_v1 {
    namespace placeholders = std::placeholders;
    }
    }}}
    —end example]

20.9.6 Comparisons

The library provides basic function object classes for all of the comparison operators in the language (5.9, 5.10).

template <class T = void>
    requires EqualityComparable<T>() || Same<T, void>()
struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
    typedef T first_argument_type;
    typedef T second_argument_type;
    typedef bool result_type;
};

operator() returns x == y.

template <class T = void>
    requires EqualityComparable<T>() || Same<T, void>()
struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
    typedef T first_argument_type;

§ 20.9.6
typedef T second_argument_type;
typedef bool result_type;
}

3 operator() returns  \( x \neq y \).

template <class T = void>
requires TotallyOrdered<T>() || Same<T, void>()
struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
  typedef T first_argument_type;
  typedef T second_argument_type;
  typedef bool result_type;
}

4 operator() returns  \( x > y \).

template <class T = void>
requires TotallyOrdered<T>() || Same<T, void>()
struct less {
  constexpr bool operator()(const T& x, const T& y) const;
  typedef T first_argument_type;
  typedef T second_argument_type;
  typedef bool result_type;
}

5 operator() returns  \( x < y \).

template <class T = void>
requires TotallyOrdered<T>() || Same<T, void>()
struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
  typedef T first_argument_type;
  typedef T second_argument_type;
  typedef bool result_type;
}

6 operator() returns  \( x \geq y \).

template <class T = void>
requires TotallyOrdered<T>() || Same<T, void>()
struct less_equal {
  constexpr bool operator()(const T& x, const T& y) const;
  typedef T first_argument_type;
  typedef T second_argument_type;
  typedef bool result_type;
}

7 operator() returns  \( x \leq y \).

template <> struct equal_to<void> {
  template <class T, class U>
  requires EqualityComparable<T, U>()
  constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) == std::forward<U>(u));
  typedef unspecified is_transparent;
};

§ 20.9.6
operator() returns `std::forward<T>(t) == std::forward<U>(u)`.

```cpp
template <> struct not_equal_to<void> {
    template <class T, class U>
    requires EqualityComparable<T, U>()
    constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) != std::forward<U>(u));

typedef unspecified is_transparent;
};
```

operator() returns `std::forward<T>(t) != std::forward<U>(u)`.

```cpp
template <> struct greater<void> {
    template <class T, class U>
    requires TotallyOrdered<T, U>()
    constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) > std::forward<U>(u));

typedef unspecified is_transparent;
};
```

operator() returns `std::forward<T>(t) > std::forward<U>(u)`.

```cpp
template <> struct less<void> {
    template <class T, class U>
    requires TotallyOrdered<T, U>()
    constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) < std::forward<U>(u));

typedef unspecified is_transparent;
};
```

operator() returns `std::forward<T>(t) < std::forward<U>(u)`.

```cpp
template <> struct greater_equal<void> {
    template <class T, class U>
    requires TotallyOrdered<T, U>()
    constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) >= std::forward<U>(u));

typedef unspecified is_transparent;
};
```

operator() returns `std::forward<T>(t) >= std::forward<U>(u)`.

```cpp
template <> struct less_equal<void> {
    template <class T, class U>
    requires TotallyOrdered<T, U>()
    constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) <= std::forward<U>(u));

typedef unspecified is_transparent;
};
```

operator() returns `std::forward<T>(t) <= std::forward<U>(u)`.

For templates `greater`, `less`, `greater_equal`, and `less_equal`, the specializations for any pointer type yield a total order, even if the built-in operators `<`, `>`, `<=`, `>=` do not.

[Editor’s note: After subsection 20.9.12 [unord.hash] add the following subsection:]
20.9.13 Class identity

struct identity {
    template <class T>
    constexpr T&& operator()(T&& t) const noexcept;
};

operator() returns std::forward<T>(t).

[Editor’s note: REVIEW: From Stephan T. Lavavej: "This identity functor, being a non-template, clashes with any attempt to provide identity<T>::type." <Insert bikeshed naming discussion here>.]

20.15 Tagged tuple-like types

20.15.1 In general

The library provides a template for augmenting a tuple-like type with named element accessor member functions. The library also provides several templates that provide access to tagged objects as if they were tuple objects (see 20.4.2.6).

[Editor’s note: This type exists so that the algorithms can return pair- and tuple-like objects with named accessors, as requested by LEWG. Rather than create a bunch of one-off class types with no relation to pair and tuple, I opted instead to create a general utility. I’ll note that this functionality can be merged into pair and tuple directly with minimal breakage, but I opted for now to keep it separate.]

20.15.2 Class template tagged

Class template tagged augments a tuple-like class type (e.g., pair (20.3), tuple (20.4)) by giving it named accessors. It is used to define the alias templates tagged_pair (20.15.5) and tagged_tuple (20.15.6).

In the class synopsis below, let i be in the range \([0,\text{sizeof...}(\text{Tags}))\) in order and \(T_i\) be the \(i^{th}\) type in Tags, where indexing is zero-based.

// defined in header <experimental/ranges_v1/utility>

namespace std { namespace experimental { namespace ranges_v1 {
    template <class T>
    concept bool TagSpecifier() {
        return implementation-defined;
    }

    template <class F>
    concept bool TaggedType() {
        return implementation-defined;
    }

    template <class Base, class TagSpecifier... Tags>
    requires sizeof...(Tags) <= tuple_size<Base>::value
    struct tagged :
        Base, TagGet<tagged<Base, Tags...>, T_i, i>... { // see below
    using Base::Base;
    tagged() = default;
    tagged(tagged&) = default;
    tagged(const tagged&) = default;
    tagged &operator=(tagged&) = default;
    tagged &operator=(const tagged&) = default;
    template <typename Other>
    requires Constructible<Base, Other>()
}}

§ 20.15.2
3 The size of the Tags parameter pack shall be less than or equal to \( \text{tuple\_size<Base>::value} \).

4 A *tagged getter* is an empty trivial class type that has a named member function that returns a reference to a member of a tuple-like object that is assumed to be derived from the getter class. The tuple-like type of a tagged getter is called its *DerivedCharacteristic*. The index of the tuple element returned from the getter’s member functions is called its *ElementIndex*. The name of the getter’s member function is called its *ElementName*.

5 A tagged getter class with *DerivedCharacteristic* \( D \), *ElementIndex* \( N \), and *ElementName* \( \text{name} \) shall provide the following interface:

```cpp
struct __TAGGED_GETTER {
    constexpr decltype(auto) name() & { return get<N>(static_cast<D&>(*this)); }
    constexpr decltype(auto) name() && { return get<N>(static_cast<D&&>(*this)); }
    constexpr decltype(auto) name() const & { return get<N>(static_cast<const D&>(*this)); }
};
```

6 A *tag specifier* is a type that facilitates a mapping from a tuple-like type and an element index into a *tagged getter* that gives named access to the element at that index. \( \text{TagSpecifier<T>}() \) is satisfied if and only if \( T \) is a tag specifier. The types in the Tags parameter pack shall be tag specifiers. The tag specifiers in the Tags parameter pack shall be unique. [ Note: The mapping mechanism from tag specifier to tagged getter is unspecified. —end note]

7 Let \( \text{TAGGET}(D, T, N) \) name a tagged getter type that gives named access to the \( N \)-th element of the tuple-like type \( D \).

8 It shall not be possible to delete an instance of class template \( \text{tagged} \) through a pointer to any base other than \( \text{Base} \).

9 \( \text{TaggedType<F>}() \) is satisfied if and only if \( F \) is a unary function type with return type \( T \) which satisfies \( \text{TagSpecifier<T>}() \). A *tagged type* is a unary function type whose return type is a tag specifier. Let \( \text{TAGSPEC}(F) \) name the tag specifier of the tagged type \( \text{TaggedType F} \), and let \( \text{TAGELEM}(F) \) name the argument type of the tagged type \( \text{TaggedType F} \).

```cpp
template <typename Other>
tagged(tagged<Other, Tags...> &&that) noexcept(see below);
template <typename Other>
requires Constructible<Base, const Other&>()
tagged(tagged<Other, Tags...> const &that);
template <typename Other>
requires Assignable<Base&, Other>()
tagged& operator=(tagged<Other, Tags...>&& that) noexcept(see below);
template <typename Other>
requires Assignable<Base&, const Other&>()
tagged& operator=(const tagged<Other, Tags...>& that);
template <class U>
requires Assignable<Base&, U>() && !Same<decay_t<U>, tagged>()
tagged& operator=(U&& u) noexcept(see below);
void swap(tagged& that) noexcept(see below);
};
```

```cpp
template <class Base, class... Tags>
requires Swappable<Base&>()
void swap(tagged<Base, Tags...>& x, tagged<Base, Tags...>& y) noexcept(see below);
```
requires Constructible<Base, Other>()
tagged(tagged<Other, Tags...> &&that) noexcept(see below);

Remarks: The expression in the noexcept is equivalent to:
is_nothrow_constructible<Base, Other>::value

Effects: Initializes Base with static_cast<Other&&>(that).

Remarks: The expression in the noexcept is equivalent to:
is_nothrow_constructible<Base, Other>::value

Effects: Initializes Base with static_cast<const Other&>(that).

Effects: Assigns static_cast<Other&&>(that) to static_cast<Base&>(*this).

Returns: *this.

Effects: Assigns static_cast<const Other&>(that) to static_cast<Base&>(*this).

Returns: *this.

Effects: Assigns std::forward<U>(u) to static_cast<Base&>(*this).

Returns: *this.

void swap(tagged& rhs) noexcept(see below)
requires Swappable<Base&>()
Remarks: The expression in the noexcept is equivalent to:
noexcept(swap(declval<Base&>(), declval<Base&>()))

Effects: Calls swap on the result of applying static_cast to *this and that.

Throws: Nothing unless the call to swap on the Base sub-objects throws.

20.15.3 tagged specialized algorithms [tagged.special]

template<class Base, class... Tags>
requires Swappable<Base&>()
void swap(tagged<Base, Tags...>& x, tagged<Base, Tags...>& y)
noexcept(noexcept(x.swap(y))));

Effects: x.swap(y)
20.15.4 Tuple-like access to tagged

namespace std {
    template <class Base, class... Tags>
    struct tuple_size<experimental::ranges_v1::tagged<Base, Tags...>>
        : tuple_size<Base> { };

    template <size_t N, class Base, class... Tags>
    struct tuple_element<N, experimental::ranges_v1::tagged<Base, Tags...>>
        : tuple_element<N, Base> { };}

20.15.5 Alias template tagged_pair

// defined in header <experimental/ranges_v1/utility>

namespace std { namespace experimental { namespace ranges_v1 { // ...
    template <class TaggedType T1, class TaggedType T2>
    using tagged_pair = tagged<pair<TAGELEM(T1), TAGELEM(T2)>,
        TAGSPEC(T1), TAGSPEC(T2)>;
}}}
namespace std { namespace experimental { namespace ranges_v1 {

    template <class TaggedType... Types>
    using tagged_tuple = tagged<
        tuple<TAGELEM(Types)...>,
        TAGSPEC(Types)...>;

    template<class TagSpecifier...Tags, class... Types>
    requires sizeof...(Tags) == sizeof...(Types)
    constexpr tagged_tuple<Tags(VTypes)...>> make_tagged_tuple(Types&&... t);
}}}

1 Any entities declared or defined in namespace std in header <tuple> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/tuple> are imported with using-declarations (7.3.3). [Example:

```cpp
namespace std { namespace experimental { namespace ranges_v1 {
    using std::tuple;
    using std::make_tuple;
    // ... others
}}}
```
—end example]

2 The types in parameter pack Types shall be tagged types (20.15.2).

3 [Example:

```cpp
// See 25.1:
tagged_tuple<tag::in(char*), tag::out(char*)> t{0, 0};
assert(&t.in() == &get<0>(t));
assert(&t.out() == &get<1>(t));
```
—end example]

20.15.6.1 Tagged tuple creation functions [tagged.tuple.creation]

1 In the function descriptions that follow, let $i$ be in the range $[0,\sizeof...\Types)$ in order and let $T_i$ be the $i^{th}$ type in a template parameter pack named Types, where indexing is zero-based.

```cpp
template<
    class TagSpecifier...Tags, class... Types>
requires sizeof...(Tags) == sizeof...(Types)
constexpr tagged_tuple<Tags(VTypes)...>> make_tagged_tuple(Types&&... t);
```

2 Let $U_i$ be $\text{decay}_t<T_i>$ for each $T_i$ in Types. Then each $V_i$ in VTypes is X& if $U_i$ equals $\text{reference}_-\text{wrapper}<X>$, otherwise $V_i$ is $U_i$.

3 Returns: tagged_tuple<Tags(VTypes)...>(std::forward<Types>(t)...) .

4 [Example:

```cpp
int i; float j;
make_tagged_tuple<tag::in1, tag::in2, tag::out>(1, ref(i), cref(j))
```
creates a tagged tuple of type
tagged_tuple<tag::in1(int), tag::in2(int&), tag::out(const float&)>
—end example]

§ 20.15.6.1
24 Iterators library

24.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 23), streams (27.7), and stream buffers (27.6), and ranges (24.10).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 3.

Table 3 — Iterators library summary

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>24.2</td>
<td>Requirements</td>
</tr>
<tr>
<td>24.7</td>

</tr>
<tr>
<td>24.8</td>
<td>Predefined iterators</td>
</tr>
<tr>
<td>24.9</td>
<td>Stream iterators</td>
</tr>
<tr>
<td>24.10</td>
<td>Ranges</td>
</tr>
</tbody>
</table>

24.2 Iterator requirements

24.2.1 In general

Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. All input iterators i support the expression *i, resulting in a value of some object type T, called the value type of the iterator. All output iterators support the expression *i = o where o is a value of some type that is in the set of types that are writable to the particular iterator type of i. All iterators i for which the expression (*i).m is well-defined, support the expression i->m with the same semantics as (*i).m. For every iterator type X for which equality is defined, there is a corresponding signed integer type called the difference type of the iterator.

Since iterators are an abstraction of pointers, their semantics is a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This International Standard defines five seven categories of iterators, according to the operations defined on them: weak input iterators, input iterators, weak output iterators, output iterators, forward iterators, bidirectional iterators and random access iterators, as shown in Table 4.

Table 4 — Relations among iterator categories

<table>
<thead>
<tr>
<th>Random Access</th>
<th>→ Bidirectional</th>
<th>→ Forward</th>
<th>→ Input</th>
<th>→ WeakInput</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>→ WeakOutput</td>
</tr>
</tbody>
</table>

The seven categories of iterators correspond to the iterator concepts WeakInputIterator, InputIterator, WeakOutputIterator, OutputIterator, ForwardIterator, BidirectionalIterator, and RandomAccessIterator, respectively. The generic term iterator refers to any type that satisfies WeakIterator.

ForwardIterator iterators satisfy all the requirements of weak input iterators and can be used whenever a weak input iterator is specified; Forward iterators also satisfy all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also satisfy all the requirements...
of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also satisfy all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified.

5 Iterators that further satisfy the requirements of weak output iterators are called mutable iterators. Non-mutable iterators are referred to as constant iterators.

6 Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. These values are called past-the-end values. Values of an iterator i for which the expression *i is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer x (as with int* x), x must always be assumed to have a singular value of a pointer. —end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and for iterators that satisfy the DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. —end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

7 A sentinel is an abstraction of a past-the-end iterator. Sentinels are Regular types that can be used to denote the end of a range. A sentinel and an iterator denoting a range shall be EqualityComparable. A sentinel denotes an element when an iterator i compares equal to the sentinel, and i points to that element.

8 An iterator or sentinel j is called reachable from an iterator i if and only if there is a finite sequence of applications of the expression ++i that makes i == j. If j is reachable from i, they refer to elements of the same sequence.

9 Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A range is a pair of iterators or an iterator and a sentinel that designate the beginning and end of the computation. A range [i, i) is an empty range; in general, a range [i, j) refers to the elements in the data structure starting with the element pointed to by i and up to but not including the element pointed to by j. Range [i, j) is valid if and only if j is reachable from i. The result of the application of functions in the library to invalid ranges is undefined.

10 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables for the iterators do not have a complexity column.

11 Destruction of an iterator may invalidate pointers and references previously obtained from that iterator.

12 An invalid iterator is an iterator that may be singular.2

13 In the following sections, a and b denote values of type X or const X, difference_type and reference refer to the types iterator_traits<X>::difference_type and iterator_traits<X>::reference ReferenceType<X>, respectively, n denotes a value of difference_type, u, tmp, and m denote identifiers, r denotes a value of X&, t denotes a value of value type T, o denotes a value of some type that is writable to the weak output iterator. [Note: For an iterator type X there must be an instantiation of iterator_traits<X>(24.4.1) the type aliases DifferenceType<X> and ReferenceType<X> must be well-formed. —end note]

24.2.2 ConceptReadable

1 The Readable concept is satisfied by types that are readable by applying operator* including pointers, smart pointers, and iterators.

---

2) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.
template <class I>
concept bool Readable() {
    return Semiregular<I>() &&
    requires (const I i) {
        typename ValueType<I>; // pre: i is dereferenceable
    };
}

2 A Readable type has an associated value type that can be accessed with the ValueType alias template.

    template <class> struct value_type { };
    template <class T>
    struct value_type<T*> :
        enable_if<is_object<T>::value, remove_cv_t<T>> { };
    template <class I>
    requires is_array<I>::value
    struct value_type<I> : value_type<decay_t<I>> { };
    template <class I>
    struct value_type<I const> : value_type<decay_t<I>> { };
    template <class I>
    struct value_type<I volatile> : value_type<decay_t<I>> { };
    template <class> struct value_type<T const> :
        enable_if<is_object<typename T::value_type>::value, typename T::value_type> { };
    template <class> struct value_type<T volatile> :
        enable_if<is_object<typename T::element_type>::value, typename T::element_type> { };

    template <class T>
    using ValueType = typename value_type<T>::type;

3 If a type I has an associated value type, then value_type<I>::type shall name the value type. Otherwise, there shall be no nested type type.

4 The value_type class template may be specialized on user-defined types.

5 When instantiated with a type I that has a nested type value_type, value_type<I>::type names that type, unless it is not an object type (3.9) in which case value_type<I> shall have no nested type type. [Note: Some legacy output iterators define a nested type named value_type that is an alias for void. These types are not Readable and have no associated value types. —end note]

6 When instantiated with a type I that has a nested type element_type, value_type<I>::type names that type, unless it is not an object type (3.9) in which case value_type<I> shall have no nested type type. [Note: Smart pointers like shared_ptr<int> are Readable and have an associated value type. But a smart pointer like shared_ptr<void> is not Readable and has no associated value type. —end note]

24.2.3 Concept MoveWritable [iterators.movewritable]

1 The MoveWritable concept describes the requirements for moving a value into an iterator’s referenced object.

    template <class Out, class T>
    concept bool MoveWritable() {
        return Semiregular<Out>() &&
2 Let \( v \) be an rvalue or a lvalue of type (possibly \( \text{const} \) \( T \)), and let \( o \) be a dereferenceable object of type \( \text{Out} \). Then \( \text{MoveWritable<Out, T>()} \) is satisfied if and only if
\[
\text{(2.1)} \quad \text{If \( \text{Out} \) is \( \text{Readable} \), then after the assignment \( *o = \text{std::move}(v) \), \( *o \) is equal to the value of \( v \) before the assignment.}
\]

3 After the expression \( *o = \text{std::move}(v) \), object \( o \) is not required to be dereferenceable.

4 \( v \)'s state is unspecified. \[[Note: \( v \) must still meet the requirements of the library component that is using it. The operations listed in those requirements must work as specified whether \( v \) has been moved from or not. — end note]\]

5 \[[Note: The only valid use of an \( \text{operator*} \) is on the left side of the assignment statement. Assignment through the same value of the writable type happens only once. — end note]\]

### 24.2.4 Concept Writable

The \( \text{Writable} \) concept describes the requirements for copying a value into an iterator’s referenced object.

```cpp
template <class Out, class T>
concept bool Writable() {
    return MoveWritable<Out, T>() &&
    requires (Out o, const T v) {
        *o = v; // not required to be equality preserving
    };
}
```

2 Let \( v \) be an lvalue of type (possibly \( \text{const} \) \( T \)) or an rvalue of type \( \text{const} \) \( T \), and let \( o \) be a dereferenceable object of type \( \text{Out} \). Then \( \text{Writable<Out, T>()} \) is satisfied if and only if
\[
\text{(2.1)} \quad \text{If \( \text{Out} \) is \( \text{Readable} \), after the assignment \( *o = v \), \( *o \) is equal to the value of \( v \).}
\]

### 24.2.5 Concept IndirectlyMovable

The \( \text{IndirectlyMovable} \) concept describes the move relationship between a \( \text{Readable} \) type and a \( \text{MoveWritable} \) type.

```cpp
template <class I, class Out>
concept bool IndirectlyMovable() {
    return Readable<I>() && MoveWritable<Out, ValueType<I>>();
}
```

2 Let \( i \) be an object of type \( I \), and let \( o \) be a dereferenceable object of type \( \text{Out} \). Then \( \text{IndirectlyMovable<I, Out()>} \) is satisfied if and only if
\[
\text{(2.1)} \quad \text{If \( \text{Out} \) is \( \text{Readable} \), after the assignment \( *o = \text{std::move}(*i) \), \( *o \) is equal to the value of \( *i \) before the assignment.}
\]

### 24.2.6 Concept IndirectlyCopyable

The \( \text{IndirectlyCopyable} \) concept describes the copy relationship between a \( \text{Readable} \) type and a \( \text{Writable} \) type.
template <class I, class Out>
concept bool IndirectlyCopyable() {
  return IndirectlyMovable<I, Out>() && Writable<Out, ValueType<I>>();
}

2 Let \textit{i} be an object of type \texttt{I}, and let \textit{o} be a dereferenceable object of type \texttt{Out}. Then \texttt{IndirectlyCopyable<I, Out>()} is satisfied if and only if

\[(2.1) \quad \text{If } \texttt{Out} \text{ is Readable, after the assignment } \*\textit{o} = \*\textit{i}, \*\textit{o} \text{ is equal to the value of } \*\textit{i}.\]

### 24.2.7 Concept IndirectlySwappable

The \texttt{IndirectlySwappable} concept describes a swappable relationship between the value reference types of two Readable types.

```cpp
template <class I1, class I2 = I1>
concept bool IndirectlySwappable() {
  return Readable<I1>() &&
  Readable<I2>() &&
  Swappable<ReferenceType<I1>, ReferenceType<I2>>();
}
```

### 24.2.8 Concept WeaklyIncrementable

The \texttt{WeaklyIncrementable} concept describes types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be EqualityComparable.

```cpp
template <class I>
concept bool WeaklyIncrementable() {
  return Semiregular<I>() &&
  requires (I i) {
    typename DifferenceType<I>;
    requires SignedIntegral<DifferenceType<I>>();
    { ++i } -> Same<I&>; // not required to be equality preserving
    i++; // not required to be equality preserving
  };
}
```

2 Let \textit{i} be an object of type \texttt{I}. When both pre and post-increment are valid, \textit{i} is said to be \textit{incrementable}. Then \texttt{WeaklyIncrementable<I>()} is satisfied if and only if

\[(2.1) \quad ++\textit{i} \text{ is valid if and only if } \textit{i}++ \text{ is valid.}\]

\[(2.2) \quad \text{If } \textit{i} \text{ is incrementable, then either both } ++\textit{i} \text{ or } \textit{i}++ \text{ moves } \textit{i} \text{ to the next element.}\]

\[(2.3) \quad \text{If } \textit{i} \text{ is incrementable, then } \&++\textit{i} == \&\textit{i}.\]

3 Not all values must be incrementable for a given type. \textit{Note:} For example, \texttt{NaN} is not a well-formed floating point value and hence is not incrementable. Likewise, past-the-end iterators may not be incrementable. This does not mean that their types do not satisfy \texttt{WeaklyIncrementable}. \textit{—end note}\]

[Editor's note: Copied almost verbatim from the \texttt{InputIterator} description. This wording is removed there.]

\[(2.3) \quad \text{If } \textit{i} \text{ is incrementable, then } \&++\textit{i} == \&\textit{i}.\]

\[(2.3) \quad \text{If } \textit{i} \text{ is incrementable, then } \&++\textit{i} == \&\textit{i}.\]

4 \textit{Note:} For \texttt{WeaklyIncrementable} types, \texttt{a} equals \texttt{b} does not imply that \texttt{++a} equals \texttt{++b}. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on weakly incrementable types should never attempt to pass through the same incrementable value twice. They should be single pass algorithms. These algorithms can be used with istreams as the source of the input data through the \texttt{istream_iterator} class template. \textit{—end note}\]
24.2.9 Concept Incrementable

The `Incrementable` concept describes types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be `EqualityComparable`. [Note: This requirement supersedes the annotations on the increment expressions in the definition of `WeaklyIncrementable`. — end note]

```cpp
template <class I>
concept bool Incrementable() {
    return Regular<IsI>() &&
    WeaklyIncrementable<IsI>() &&
    requires(I i) {
        { i++ } -> Same<IsI>;
    };
}
```

Let `a` and `b` be incrementable objects of type `I`. Then `Incrementable<IsI>()` is satisfied if and only if

\( (2.1) \) — If `bool(a == b)` then `bool(a++ == b)`.  
\( (2.2) \) — If `bool(a == b)` then `bool((a++, a) == ++b)`.

[Editor's note: Copied in part from the `ForwardIterator` description. This wording is removed there.]

24.2.10 Concept WeakIterator

The `WeakIterator` requirements concept forms the basis of the iterator concept taxonomy; every iterator satisfies the `WeakIterator` requirements. This set of requirements concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare `==` for the iterator values it uses, or to provide a richer set of iterator movements. (24.2.11, 24.2.14, 24.2.16, 24.2.17, 24.2.18, 24.2.19.)

[Editor’s note: Remove para 2 and Table 106.]

```cpp
template <class I>
concept bool WeakIterator() {
    return WeaklyIncrementable<IsI>() &&
    requires(I i) {
        { *i } -> auto&&; // pre: i is dereferenceable
    };
}
```

[Note: The requirement that the result of dereferencing the iterator is deducible from `auto&&` effectively means that it cannot be `void`. — end note]

24.2.11 Concept Iterator

The `Iterator` concept refines `WeakIterator` (24.2.10) and adds the requirement that the iterator is equality comparable.

In the `Iterator` concept, the set of values over which `==` is (required to be) defined can change over time. Each algorithm places additional requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`. [Example: the call `find(a, b, x)` is defined only if the value of `a` has the property `p` defined as follows: `b` has property `p` and a value `i` has property `p` if `(*i==x)` or if `(*i!=x` and `++i has property `p`). — end example]
```cpp
template <class I>
concept bool Iterator() {
    return WeakIterator<I>() &&
           EqualityComparable<I>();
}

24.2.12 Concept Sentinel

The Sentinel concept defines requirements for a type that is an abstraction of the past-the-end iterator. Its values can be compared to an iterator for equality.

```cpp
template <class T, class I>
concept bool Sentinel() {
    return Regular<T>() &&
           Iterator<I>() &&
           EqualityComparable<T, I>();
}

24.2.13 Concept WeakInputIterator

The WeakInputIterator concept is a refinement of WeakIterator (24.2.10). It defines requirements for a type whose referred to values can be read (from the requirement for Readable (24.2.2)) and which can be both pre- and post-incremented. However, weak input iterators are not required to be comparable for equality.

```cpp
template <class I>
concept bool WeakInputIterator() {
    return WeakIterator<I>() &&
           Readable<I>() &&
           Requires(I i, const I ci) {
              typename IteratorCategory<I>;
              { i++ } -> Readable; // not required to be equality preserving
              Requires Same< ValueType<I>, ValueType<decltype(i++)> >();
              Requires DerivedFrom<IteratorCategory<I>, weak_input_iterator_tag>();
              { *ci } -> const ValueType<I>&;
           };
}

24.2.14 Concept InputIterator

The InputIterator concept is a refinement of Iterator (24.2.11) and WeakInputIterator (24.2.13).

```cpp
template <class I>
concept bool InputIterator() {
    return WeakInputIterator<I>() &&
           Iterator<I>() &&
           DerivedFrom<IteratorCategory<I>, input_iterator_tag>();
}
```

[Editor's note: Remove para 1, 2 and Table 107]

1 The InputIterator concept is a refinement of Iterator (24.2.11) and WeakInputIterator (24.2.13).

2 [Note: For input iterators, Since InputIterator is only WeaklyIncrementable, a == b does not imply ++a == ++b. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on input iterators should never attempt to pass through the same iterator twice. They should be single pass algorithms. Value type `ValueType<I>` is not required to be a CopyAssignable Copyable type (Table 19.4.7). These algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — end note]
24.2.15 Concept WeakOutputIterator [iterators.weakoutput]

The WeakOutputIterator concept is a refinement of WeakIterator (24.2.10). It defines requirements for a type that can be used to write values (from the requirement for Writable (24.2.4)) and which can be both pre- and post-incremented. However, weak output iterators are not required to be comparable for equality.

```
template <class I, class T>
concept bool WeakOutputIterator() {
    return WeakIterator<I>() && Writable<I, T>();
}
```

2 [Note: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single pass algorithms. Equality and inequality might not be defined. Algorithms that take weak output iterators can be used with ostreams as the destination for placing data through the ostream_iterator class as well as with insert iterators and insert pointers. —end note]

24.2.16 Concept OutputIterator [iterators.output]

The OutputIterator concept is a refinement of Iterator (24.2.11) and WeakOutputIterator (24.2.15).

```
template <class I, class T>
concept bool OutputIterator() {
    return WeakOutputIterator<I, T>() && Iterator<I>();
}
```

2 [Note: Output iterators are used by single-pass algorithms that write into a bounded range, like generate. —end note]

24.2.17 Concept ForwardIterator [iterators.forward]

A class or pointer type \( X \) satisfies the requirements of a forward iterator if

1. \( X \) satisfies the requirements of an input iterator (24.2.14),
2. \( X \) satisfies the DefaultConstructible requirements (17.6.3.1),
3. if \( X \) is a mutable iterator, reference is a reference to \( T \); if \( X \) is a const iterator, reference is a reference to const \( T \),
4. the expressions in Table 109 are valid and have the indicated semantics, and
5. objects of type \( X \) offer the multi-pass guarantee, described below.

The ForwardIterator concept refines InputIterator (24.2.14) and adds the multi-pass guarantee, described below.

```
template <class I>
concept bool ForwardIterator() {
    return InputIterator<I>() && Incrementable<I>() && DerivedFrom<IteratorCategory<I>, forward_iterator_tag>();
}
```

§ 24.2.17
The domain of == for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type. \[\text{Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence.} \quad - \quad \text{end note} \]

Two dereferenceable iterators \(a\) and \(b\) of type \(X\) offer the multi-pass guarantee if:

\begin{align*}
(4.1) & \quad a == b \text{ implies } ++a == ++b \text{ and } \\
(4.2) & \quad X \text{ is a pointer type or } \\
& \text{The expression } \{(\text{\texttt{void}})++X(a), \{X \{++x;\}(a), \{a\}\}\} \text{ is equivalent to the expression } *a. \\
\end{align*}

\[\text{Note: The requirement that } a == b \text{ implies } ++a == ++b \text{ (which is not true for input and output weaker iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators.} \quad \text{- end note} \]

[Editor's note: Remove Table 109]

If \(a\) and \(b\) are equal, then either \(a\) and \(b\) are both dereferenceable or else neither is dereferenceable.

If \(a\) and \(b\) are both dereferenceable, then \(a == b\) if and only if \(*a\) and \(*b\) are bound to the same object.

### 24.2.18 Concept BidirectionalIterator

A class or pointer type \(X\) satisfies the requirements of a bidirectional iterator if, in addition to satisfying the requirements for forward iterators, the following expressions are valid as shown in Table 110.

The \texttt{BidirectionalIterator} concept refines \texttt{ForwardIterator} (24.2.17), and adds the ability to move an iterator backward as well as forward.

```cpp
template <class I>
class bool BidirectionalIterator() { 
    return ForwardIterator<\texttt{I}>() && 
        DerivedFrom<\texttt{IteratorCategory<\texttt{I}>}, \texttt{bidirectional\_iterator\_tag}>() && 
        requires (I i) { 
            \{-i\} -> Same<\texttt{I}>&; 
            \{i--\} -> Same<\texttt{I}>; 
        };
}
```

[Editor's note: Remove table 110]

A bidirectional iterator \(r\) is decrementable if and only if there exists some \(s\) such that \(+s == r\). The expressions \(-r\) and \(r--\) are only valid if \(r\) is decrementable.

Let \(a\) and \(b\) be decrementable objects of type \(I\). Then \texttt{BidirectionalIterator<\texttt{I}>()} is satisfied if and only if:

\begin{align*}
(4.1) & \quad &--a == &a. \\
(4.2) & \quad &\text{If } \texttt{bool}(a == b), \text{ then } \texttt{bool}(a-- == b). \\
(4.3) & \quad &\text{If } \texttt{bool}(a == b), \text{ then } \texttt{bool}((a--), a) == --b). \\
(4.4) & \quad &\text{If } a \text{ is incrementable and } \texttt{bool}(a == b), \text{ then } \texttt{bool}(-(++a) == b). \\
(4.5) & \quad &\text{If } \texttt{bool}(a == b), \text{ then } \texttt{bool}((--a) == b). \\
\end{align*}

\[\text{Note: Bidirectional iterators allow algorithms to move iterators backward as well as forward.} \quad \text{- end note} \]

§ 24.2.18
A class or pointer type \( X \) satisfies the requirements of a random access iterator if, in addition to satisfying the requirements for bidirectional iterators, the following expressions are valid as shown in Table 111.

The `RandomAccessIterator` concept refines `BidirectionalIterator` (24.2.18) and adds support for constant-time advancement with `+=`, `+`, `-=`, and `->`, and the computation of distance in constant time with `-`. Random access iterators also support array notation via subscripting.

Let \( a \) and \( b \) be valid iterators of type \( I \) such that \( b \) is reachable from \( a \). Let \( n \) be the smallest value of type `DifferenceType<`\( I \)` such that after \( n \) applications of `++a`, \( \text{bool}(a == b) \). Then `RandomAccessIterator<`\( I \)`\( () \)` is satisfied if and only if:

\[
\begin{align*}
(2.1) \quad & (a += n) \text{ is equal to } b. \\
(2.2) \quad & \& (a += n) \text{ is equal to } \& a. \\
(2.3) \quad & (a + n) \text{ is equal to } (a += n). \\
(2.4) \quad & \text{For any two positive integers } x \text{ and } y, \text{ if } a + (x + y) \text{ is valid, then } a + (x + y) \text{ is equal to } (a + x) + y. \\
(2.5) \quad & a + 0 \text{ is equal to } a. \\
(2.6) \quad & \text{If } (a + (n - 1)) \text{ is valid, then } a + n \text{ is equal to } ++(a + (n - 1)). \\
(2.7) \quad & (b += -n) \text{ is equal to } a. \\
(2.8) \quad & (b -= n) \text{ is equal to } a. \\
(2.9) \quad & \& (b -= n) \text{ is equal to } \& b.
\end{align*}
\]
(2.10) — \((b - n)\) is equal to \((b -= n)\).

(2.11) — If \(b\) is dereferenceable, then \(a[n]\) is valid and is equal to \(*b\).

24.3 Indirect callable requirements [indirectcallables]

24.3.1 In general [indirectcallables.general]

1 There are several concepts that group requirements of algorithms that take callable objects (20.9.2) as arguments.

[Editor’s note: Specifying the algorithms in terms of these indirect callable concepts would ease the transition should we ever decide to support proxy iterators in the future. See the Future Work appendix (C.2).]

24.3.2 Function type [indirectcallables.functiontype]

1 The FunctionType is an alias used to turn a callable type (20.9.1) into a function object type (20.9).

```cpp
// Exposition only
template <class T>
 requires is_member_pointer<decay_t<T>>::value
auto __as_function(T&& t) {
    return mem_fn(t);
}

template <class T>
T __as_function(T&& t) {
    return std::forward<T>(t);
}

template <class T>
 using FunctionType =
defcltype(__as_function(declval<T>()));
```

24.3.3 Indirect callables [indirectcallables.indirectfunc]

1 The indirect callable concepts are used to constrain those algorithms that accept callable objects (20.9.1) as arguments.

```cpp
template <class F, class...Is>
 concept bool IndirectCallable() { =
    return (Readable<Is>() && ... &&
        Function<FunctionType<F>, ValueType<Is>...>());
};

template <class F, class...Is>
 concept bool IndirectRegularCallable() { =
    return (Readable<Is>() && ... &&
        RegularFunction<FunctionType<F>, ValueType<Is>...>());
};

template <class F, class...Is>
 concept bool IndirectCallablePredicate() { =
    return (Readable<Is>() && ... &&
        Predicate<FunctionType<F>, ValueType<Is>...>());
};

template <class F, class I1, class I2 = I1>
 concept bool IndirectCallableRelation() { =
```

§ 24.3.3

42
24.3.4 Class template Projected

The `Projected` class template is intended for use when specifying the constraints of algorithms that accept callable objects and projections. It bundles a `Readable` type `I` and a `projection` function `Proj` into a new `Readable` type whose `reference` type is the result of applying `Proj` to the `ReferenceType` of `I`.

```
template <Readable I, class IndirectRegularCallable<I> Proj>
struct Projected {
    using value_type = decay_t<ResultType<FunctionType<Proj>, ValueType<I>>>;
    ResultType<FunctionType<Proj>, ReferenceType<I>> operator*() const;
};
```

2

[Note: `Projected` is only used to ease constraints specification. Its member function need not be defined. — end note]

24.4 Common algorithm requirements

24.4.1 In general

There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are four relational concepts for rearrangements: `Permutable`, `Mergeable`, `MergeMovable`, and `Sortable`. There is one relational concept for comparing values from different sequences: `IndirectlyComparable`.

24.4.2 Concept IndirectlyComparable

The `IndirectlyComparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```
template <class I1, class I2, class R = equal_to<>, class P1 = identity, class P2 = identity>
concept bool IndirectlyComparable() {=
    return IndirectCallableRelation<R, Projected<I1, P1>, Projected<I2, P2>>();
};
```
24.4.3 Concept Permutable \[\text{commonalgoreq.permutable}\]

The `Permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```cpp
template <class I>
concept bool Permutable() {
    return ForwardIterator<I>() &&
        SemiregularMovable<
            ValueType<I>
        >() &&
        IndirectlyMovable<I, I>();
}
```

24.4.4 Concept Mergeable \[\text{commonalgoreq.mergeable}\]

The `Mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```cpp
template <class I1, class I2, class Out, class R = less<>, class P1 = identity, class P2 = identity>
concept bool Mergeable() {
    return InputIterator<I1>() &&
        InputIterator<I2>() &&
        WeaklyIncrementable<Out>() &&
        IndirectlyCopyable<I1, Out>() &&
        IndirectlyCopyable<I2, Out>() &&
        IndirectCallableStrictWeakOrder<R, Projected<I1, P1>, Projected<I2, P2>>();
}
```

[Note: When `less<>` is used as the relation, the value type must model satisfy `TotallyOrdered`. — end note]

24.4.5 Concept MergeMovable \[\text{commonalgoreq.mergemovable}\]

The `MergeMovable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by moving elements.

```cpp
template <class I1, class I2, class Out, class R = less<>, class P1 = identity, class P2 = identity>
concept bool MergeMovable() {
    return InputIterator<I1>() &&
        InputIterator<I2>() &&
        WeaklyIncrementable<Out>() &&
        IndirectlyMovable<I1, Out>() &&
        IndirectlyMovable<I2, Out>() &&
        IndirectCallableStrictWeakOrder<R, Projected<I1, P1>, Projected<I2, P2>>();
}
```

[Note: When `less<>` is used as the relation, the value type must model satisfy `TotallyOrdered`. — end note]

24.4.6 Concept Sortable \[\text{commonalgoreq.sortable}\]

The `Sortable` concept specifies the common requirements of algorithms that permute sequences of iterators into an ordered sequence (e.g., `sort`).

```cpp
template <class I, class R = less<>, class P = identity>
concept bool Sortable() {
    return ForwardIterator<I>() &&
        Permutable<I>() &&
        IndirectCallableStrictWeakOrder<R, Projected<I, P>>();
}
```

§ 24.4.6
2 [Note: When `less<>` is used as the relation, the value type must satisfy `TotallyOrdered`. — end note]

### 24.5 Iterator range requirements

#### 24.5.1 Concept SizedIteratorRange

The `SizedIteratorRange` concept specifies the requirements on an `Iterator` (24.2.11) and a `Sentinel` that allows the use of the `-` operator to compute the distance between them in constant time.

```cpp
template <class I, class S>
concept bool SizedIteratorRange() { =
    return Sentinel<S, I>() &&
    requires (const I i, const S j) {
        { i - i } -> DifferenceType<I>;
        { j - j } -> DifferenceType<I>;
        { i - j } -> DifferenceType<I>;
        { j - i } -> DifferenceType<I>;
    };
}
```

Let a be a valid iterator of type I and b be a valid sentinel of type S. Let n be the smallest value of type `DifferenceType<I>` such that after n applications of `++a`, `bool(a == b)` is `false`. Then types I and S model `SizedIteratorRange<I,S>()` if and only if:

- (2.1) \((b - a) == n\).
- (2.2) \((a - b) == -n\).
- (2.3) \((a - a) == 0\).
- (2.4) \((b - b) == 0\).

[Note: The `SizedIteratorRange` concept is modeled satisfied by pairs of RandomAccessIterators (24.2.19) and by counted iterators and their sentinels (24.8.6.1). — end note]

[Editor’s note: This concept also gives us a way to demote the category of `move_iterator` to Input while retaining the ability of `move_iterator` pairs to communicate the range’s size to container constructors.]

### 24.6 Header `<experimental/ranges_v1/iterator>` synopsis

```cpp
namespace std {
    namespace experimental {
        namespace ranges_v1 {
            // 24.7, primitives:
            template<class Iterator>
            struct using iterator_traits = see below;
            template<class T>
            struct iterator_traits<T*>
            {
                template<class Category, class T, class Distance = ptdiff_t,
                        class Pointer = T*, class Reference = T&>
                    struct iterator;

                template <class> struct difference_type;
                template <class> struct value_type;
                template <class> struct iterator_category;
                template <class WeaklyIncrementable> using DifferenceType
                    = typename difference_type<WeaklyIncrementable>::type;

}

Any entities declared or defined in namespace std in header <iterator> that are not already defined in namespace std::experimental::ranges_v1 in header <experimental/ranges_v1/iterator> are imported with using-declarations (7.3.3). [Editor's note: There are no such entities, but there may be in the future.]

24.7 Iterator primitives

To simplify the task of defining iterators, the library provides several classes and functions:

24.7.1 Iterator traits associated types

To implement algorithms only in terms of iterators, it is often necessary to determine the value and difference types that correspond to a particular iterator type. Accordingly, it is required that if Iterator is the type

§ 24.7.1
of an iterator `WeaklyIncrementable` is the name of a type that models satisfies the `WeaklyIncrementable` concept (24.2.8), `Readable` is the name of a type that models satisfies the `Readable` concept (24.2.2), and `WeakInputIterator` is the name of a type that models satisfies the `WeakInputIterator` (24.2.13) concept, the types

\[
\begin{align*}
\text{iterator_traits<Iterator>::difference_type} & \\
\text{iterator_traits<Iterator>::value_type} & \\
\text{iterator_traits<Iterator>::iterator_category} &
\end{align*}
\]

\[
\begin{align*}
\text{DifferenceType<WeaklyIncrementable>} & \\
\text{ValueType<Readable>} & \\
\text{IteratorCategory<WeakInputIterator>}
\end{align*}
\]

be defined as the iterator's difference type, value type and iterator category, respectively. In addition, the types

\[
\begin{align*}
\text{ReferenceType<Readable>} & \\
\text{iterator_traits<Iterator>::reference} & \\
\text{iterator_traits<Iterator>::pointer} &
\end{align*}
\]

shall be an alias for `decltype(*declval<Readable>())`.

\[
\begin{align*}
\text{iterator_traits<Iterator>::difference_type} & \\
\text{iterator_traits<Iterator>::value_type} & \\
\text{iterator_traits<Iterator>::reference} & \\
\text{iterator_traits<Iterator>::pointer} &
\end{align*}
\]

shall be defined as the iterator’s reference and pointer types, that is, for an iterator object `a`, the same type as the type of `*a` and `a->`, respectively. In the case of an output iterator, the types

\[
\begin{align*}
\text{iterator_traits<Iterator>::difference_type} & \\
\text{iterator_traits<Iterator>::value_type} & \\
\text{iterator_traits<Iterator>::reference} & \\
\text{iterator_traits<Iterator>::pointer} &
\end{align*}
\]

may be defined as `void`.

2 The template `iterator_traits<Iterator>` is defined as

```cpp
namespace std {
    template<class Iterator> struct iterator_traits {
        typedef typename Iterator::difference_type difference_type;
        typedef typename Iterator::value_type value_type;
        typedef typename Iterator::pointer pointer;
        typedef typename Iterator::reference reference;
        typedef typename Iterator::iterator_category iterator_category;
    };
}
```

3 It is specialized for pointers as

```cpp
namespace std {
    template<class T> struct iterator_traits<T*> {
        typedef ptrdiff_t difference_type;
        typedef T value_type;
        typedef T* pointer;
        typedef T& reference;
        typedef random_access_iterator_tag iterator_category;
    };
}
```

and for pointers to const as

§ 24.7.1
namespace std {
    template<class T> struct iterator_traits<const T*> {
        typedef ptrdiff_t difference_type;
        typedef T value_type;
        typedef const T* pointer;
        typedef const T& reference;
        typedef random_access_iterator_tag iterator_category;
    };
}

4 DifferenceType<T> is implemented as if:

    template <class> struct difference_type { };    
    template <class T>  
    struct difference_type<T*>  
        : enable_if<is_object<T>::value, ptrdiff_t> { };  
    template <>  
    struct difference_type<nullptr_t> {  
        using type = ptrdiff_t; 
    };  
    template<class I>  
        requires is_array<I>::value  
    struct difference_type<I> : difference_type<decay_t<I>> { };  
    template <class I>  
    struct difference_type<I const> : difference_type<decay_t<I>> { };  
    template <class I>  
    struct difference_type<I volatile> : difference_type<decay_t<I>> { };  
    template <class I>  
    struct difference_type<I const volatile> : difference_type<decay_t<I>> { };  
    template <class T>  
        requires requires { typename T::difference_type; }  
    struct difference_type<T> {  
        using type = typename T::difference_type; 
    };  
    template <class T>  
        requires is_integral<T>::value  
    struct difference_type<T> : make_signed< decltype(declval<T>() - declval<T>()) > { 
    };  
    template <class T>  
        using DifferenceType = typename difference_type<T>::type;

[Editor’s note: REVIEW: The difference_type of unsigned Integral types is not large enough to cover the entire range. The Palo Alto report used a separate type trait for WeaklyIncrementable: DistanceType. DifferenceType is only used for RandomAccessIterators. Cue discussion about the pros and cons of the two approaches.]

5 Users may specialize difference_type on user-defined types.

6 IteratorCategory<T> is implemented as if:

    template <class> struct iterator_category { };  
    template <class T>  
    struct iterator_category<T*>  
        : enable_if<is_object<T>::value, random_access_iterator_tag> { };  
    template <class T>  
    struct iterator_category<T const> : iterator_category<T> { };
template <class T>
struct iterator_category<T volatile> : iterator_category<T> { }

template <class T>
struct iterator_category<T const volatile> : iterator_category<T> { }

template <class T>
requires requires { typename T::iterator_category; }
struct iterator_category<T> {
  using type = typename T::iterator_category see below;
};

template <class T>
using IteratorCategory = typename iterator_category<T>::type;

7 Users may specialize iterator_category on user-defined types.

8 If type T has a nested type iterator_category, then the type iterator_category<T>::type is computed as follows:

(8.1) — If T::iterator_category is the same as or derives from std::random_access_iterator_tag, iterator_category<T>::type is ranges_v1::random_access_iterator_tag.

(8.2) — If T::iterator_category is the same as or derives from std::bidirectional_iterator_tag, iterator_category<T>::type is ranges_v1::bidirectional_iterator_tag.

(8.3) — If T::iterator_category is the same as or derives from std::forward_iterator_tag, iterator_category<T>::type is ranges_v1::forward_iterator_tag.

(8.4) — If T::iterator_category is the same as or derives from std::input_iterator_tag, iterator_category<T>::type is ranges_v1::input_iterator_tag.

(8.5) — If T::iterator_category is the same as or derives from std::output_iterator_tag, iterator_category<T> has no nested type.

(8.6) — Otherwise, iterator_category<T>::type is T::iterator_category

9 [ Note: If there is an additional pointer type __far such that the difference of two __far is of type long, an implementation may define

```
template<class T> struct iterator_traits<T __far*> {
  typedef long difference_type;
  typedef T value_type;
  typedef T __far* pointer;
  typedef T __far& reference;
  typedef random_access_iterator_tag iterator_category;
};
```

— end note]

10 For the sake of backwards compatibility, this standard specifies the existence of an iterator_traits alias that collects an iterator’s associated types. It is defined as if:

```
template <WeakInputIterator I> struct __pointer_type { 
  using type = add_pointer_t<ReferenceType<I>>;
};
template <WeakInputIterator I>
requires requires(I i) { i.operator->() } -> auto&&; }
struct __pointer_type<I> { 
  using type = decltype(declval<I>().operator->());
```
template <class> struct __iterator_traits { };

template <WeakIterator I> struct __iterator_traits<I> {
    using difference_type = DifferenceType<I>;
    using value_type = void;
    using reference = void;
    using pointer = void;
    using iterator_category = output_iterator_tag;
};

template <WeakInputIterator I> struct __iterator_traits<I> {
    using difference_type = DifferenceType<I>;
    using value_type = ValueType<I>;
    using reference = ReferenceType<I>;
    using pointer = typename __pointer_type<I>::type;
    using iterator_category = IteratorCategory<I>;
};

template <class I>
using iterator_traits = __iterator_traits<I>;

[Note: iterator_traits is a template alias template to intentionally break code that tries to specialize it. —end note]

[Example: To implement a generic reverse function, a C++ program can do the following:

template <class BidirectionalIterator I>
void reverse(BidirectionalIteratorI first, BidirectionalIteratorI last) {
    typename iterator_traits<BidirectionalIterator>::difference_type<I> n =
        distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BidirectionalIterator>::value_type<I> tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}

—end example]

24.7.2 Standard iterator traits

To facilitate interoperability between new code using iterators conforming to this document and older code using iterators conforming to ISO/IEC 14882, three specializations of std::iterator_traits are provided to map the newer iterator categories to the older ones.

namespace std {
    template <experimental::ranges_v1::WeakIterator Out>
    struct iterator_traits<Out> {
        using difference_type = experimental::ranges_v1::DifferenceType<Out>;
        using value_type = see below;
        using reference = see below;
        using pointer = see below;
        using iterator_category = std::output_iterator_tag;
    };

    The nested type value_type is computed as follows:

If type `Out` has a nested type `value_type`, then `std::iterator_traits<Out>::value_type` is `Out::value_type`.

Otherwise, `std::iterator_traits<Out>::value_type` is `void`.

The nested type `reference` is computed as follows:

If type `Out` has a nested type `reference`, then `std::iterator_traits<Out>::reference` is `Out::reference`.

Otherwise, `std::iterator_traits<Out>::reference` is `void`.

The nested type `pointer` is computed as follows:

If type `Out` has a nested type `pointer`, then `std::iterator_traits<Out>::pointer` is `Out::pointer`.

Otherwise, `std::iterator_traits<Out>::pointer` is `void`.

The nested type `reference` is computed as follows:

If type `In` has a nested type `reference`, then `std::iterator_traits<In>::reference` is `In::reference`.

Otherwise, `std::iterator_traits<In>::reference` is `experimental::ranges_v1::ReferenceType<In>`.

The nested type `pointer` is computed as follows:

If type `In` has a nested type `pointer`, then `std::iterator_traits<In>::pointer` is `In::pointer`.

Otherwise, `std::iterator_traits<In>::pointer` is `experimental::ranges_v1::iterator_traits<In>::pointer`.

Let type `C` be `experimental::ranges_v1::IteratorCategory<In>`. The nested type `std::iterator_traits<In>::iterator_category` is computed as follows:

If `C` is the same as or inherits from `std::input_iterator_tag` or `std::output_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `C`.

If `experimental::ranges_v1::ReferenceType<In>` is not a reference type, `std::iterator_traits<In>::iterator_category` is `std::input_iterator_tag`.

If `C` is the same as or inherits from `experimental::ranges_v1::random_access_iterator_tag`, `std::iterator_traits<In>::iterator_category` is `std::random_access_iterator_tag`. 

§ 24.7.2
(7.4) — If C is the same as or inherits from experimental::ranges_v1::bidirectional_iterator_tag, std::iterator_traits<In>::iterator_category is std::bidirectional_iterator_tag.

(7.5) — If C is the same as or inherits from experimental::ranges_v1::forward_iterator_tag, std::iterator_traits<In>::iterator_category is std::forward_iterator_tag.

(7.6) — Otherwise, std::iterator_traits<In>::iterator_category is std::input_iterator_tag.

24.7.3 Basic iterator [iterator.basic]

The iterator template may be used as a base class to ease the definition of required types for new iterators.

```cpp
namespace std { namespace experimental { namespace ranges_v1 {

    template<class Category, class T, class Distance = ptrdiff_t, class Pointer = T*, class Reference = T&>
    struct iterator {
        typedef T value_type;
        typedef Distance difference_type;
        typedef Pointer pointer;
        typedef Reference reference;
        typedef Category iterator_category;
    };

}}}
```

2 [Note: The Pointer and Reference template parameters, and the nested pointer and reference type aliases are for backward compatibility only; they are never used by any other part of this standard. —end note]

24.7.4 Standard iterator tags [std.iterator.tags]

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces category tag classes which can be used as compile time tags for algorithm selection. [Note: The preferred way to dispatch to more specialized algorithm implementations is with concept-based overloading. —end note] The category tags are: weak_input_iterator_tag, input_iterator_tag, output_iterator_tag, forward_iterator_tag, bidirectional_iterator_tag and random_access_iterator_tag. For every weak input iterator of type Iterator, iterator_traits<Iterator>::iterator_category<IteratorCategory<Iterator>> shall be defined to be the most specific category tag that describes the iterator’s behavior.

```cpp
namespace std { namespace experimental { namespace ranges_v1 {

    struct weak_input_iterator_tag { };  
    struct input_iterator_tag: public weak_input_iterator_tag { };  
    struct output_iterator_tag { };  
    struct forward_iterator_tag: public input_iterator_tag { };  
    struct bidirectional_iterator_tag: public forward_iterator_tag { };  
    struct random_access_iterator_tag: public bidirectional_iterator_tag { };  

}}}
```

2 [Note: The output_iterator_tag is provided for the sake of backward compatibility. —end note]

3 [Example: For a program-defined iterator BinaryTreeIterator, it could be included into the bidirectional iterator category by specializing the iterator_traits<BinaryTreeIterator<T>::difference_type, value_type, and iterator_category] templates:

```cpp
template<class T> struct iterator_traits<BinaryTreeIterator<T> > {  
    typedef std::ptrdiff_t difference_type;
```
typedef T value_type;
typedef T* pointer;
typedef T& reference;
typedef bidirectional_iterator_tag iterator_category;
};

template<class T> struct difference_type<BinaryTreeIterator<T> > {
    using type = std::ptrdiff_t;
};
template<class T> struct value_type<BinaryTreeIterator<T> > {
    using type = T;
};
template<class T> struct iterator_category<BinaryTreeIterator<T> > {
    using type = bidirectional_iterator_tag;
};

Typically, however, it would be easier to derive BinaryTreeIterator<T> from iterator<bidirectional_iterator_tag,T,ptrdiff_t,T*,T&>.

Example: If evolve() is well defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the one possible implementation is as follows:

template <class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
    evolve(first, last,
        typename_iterator_traits<BidirectionalIterator>::iterator_category()
        IteratorCategory<BidirectionalIterator>{});
}

template <class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last, bidirectional_iterator_tag) {
    // more generic, but less efficient algorithm
}

template <class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last, random_access_iterator_tag) {
    // more efficient, but less generic algorithm
}

— end example

Example: If a C++ program wants to define a bidirectional iterator for some data structure containing double and such that it works on a large memory model of the implementation, it can do so with:

class MyIterator :
    public iterator<bidirectional_iterator_tag, double, long,T*,T&> {
        // code implementing ++, etc.
    }

Then there is no need to specialize the iterator_traits::difference_type, value_type, or iterator_category templates. — end example

§ 24.7.4
24.7.5  Iterator operations

Since only random access iterators models of types that satisfy `RandomAccessIterator` provide the `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators and sized iterator ranges, respectively (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```cpp
template <class InputIterator, class Distance>
void advance(InputIterator& i, Distance n);

template <WeakIterator I>
void advance(I& i, DifferenceType<I> n);
```

2

Requires: `n` shall be negative only for bidirectional and random access iterators.

Effects: Increments (or decrements for negative `n`) iterator reference `i` by `n`.

```cpp
template <Iterator I, Sentinel<I> S>
void advance(I& i, S bound);
```

4

Requires: `bound` shall be reachable from `i`.

Effects: Increments iterator reference `i` until `i == bound`.

6

If `I` and `S` are the same type, this function is constant time.

7

If `I` and `S` model the concept `SizedIteratorRange<,>()` is satisfied, this function shall dispatch to `advance(i, bound - i)`.

```cpp
template <Iterator I, Sentinel<I> S>
DifferenceType<I> advance(I& i, DifferenceType<I> n, S bound);
```

8

Requires: `n` shall be negative only for bidirectional and random access iterators. If `n` is negative, `i` shall be reachable from `bound`; otherwise, `bound` shall be reachable from `i`.

9

Effects: Increments (or decrements for negative `n`) iterator reference `i` either `n` times or until `i == bound`, whichever comes first.

10

If `I` and `S` model `SizedIteratorRange<,>()` is satisfied:

10.1

— If `(0 <= n ? n >= D : n <= D)` is true, where `D` is `bound - i`, this function dispatches to `advance(i, bound)`.

10.2

— Otherwise, this function dispatches to `advance(i, n)`.

11

Returns: `n - M`, where `M` is the distance from the starting position of `i` to the ending position.

```cpp
typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);
```

12

Effects:

If `InputIterator` meets the requirements of random access iterator `SizedIteratorRange<,>()` is satisfied, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.

13

Requires: If `InputIterator` meets the requirements of random access iterator `SizedIteratorRange<,>()` is satisfied last shall be reachable from `first` or `first` shall be reachable from `last`; otherwise, `last` shall be reachable from `first`.

§ 24.7.5
template <class ForwardIterator>
ForwardIterator next(ForwardIterator x,
  typename std::iterator_traits<ForwardIterator>::difference_type n = 1);

template <WeakIterator I>
I next(I x, DifferenceType<I> n = 1);

Effects: Equivalent to advance(x, n); return x;

template <Iterator I, Sentinel<I> S>
I next(I x, S bound);

Effects: Equivalent to advance(x, bound); return x;

template <Iterator I, Sentinel<I> S>
I next(I x, DifferenceType<I> n, S bound);

Effects: Equivalent to advance(x, n, bound); return x;

template <class BidirectionalIterator>
BidirectionalIterator prev(BidirectionalIterator x,
  typename std::iterator_traits<BidirectionalIterator>::difference_type n = 1);

template <BidirectionalIterator I>
I prev(I x, DifferenceType<I> n = 1);

Effects: Equivalent to advance(x, -n); return x;

template <BidirectionalIterator I>
I prev(I x, DifferenceType<I> n, I bound);

Effects: Equivalent to advance(x, -n, bound); return x;

24.8 Iterator adaptors

24.8.1 Reverse iterators

Class template reverse_iterator is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence. The fundamental relation between a reverse iterator and its corresponding iterator i is established by the identity: &*(reverse_iterator(i)) == &*(i - 1).

24.8.1.1 Class template reverse_iterator

namespace std {
  namespace experimental {
    namespace ranges_v1 {

      template <class Iterator>
      class reverse_iterator {
        iterator<typename iterator_traits<Iterator>::iterator_category,
          typename iterator_traits<Iterator>::value_type,
          typename iterator_traits<Iterator>::difference_type,
          typename iterator_traits<Iterator>::pointer,
          typename iterator_traits<Iterator>::reference> {

          public:

          typedef Iterator iterator_type;
          typedef typename iterator_traits<Iterator>::difference_type difference_type;
          typedef typename iterator_traits<Iterator>::reference reference;
          typedef typename iterator_traits<Iterator>::pointer pointer;

        }

      }
    }
  }
}

§ 24.8.1.1
using iterator_type = I;
using difference_type = DifferenceType<I>;
using value_type = ValueType<I>;
using iterator_category = IteratorCategory<I>;
using reference = ReferenceType<I>;
using pointer = I;

reverse_iterator();
explicit reverse_iterator(Iterator I x);
template <class BidirectionalIterator U>
  requiresConvertibleTo<U, I>()
reverse_iterator(const reverse_iterator<U>& u);
template <class BidirectionalIterator U>
  requiresConvertibleTo<U, I>()
reverse_iterator& operator=(const reverse_iterator<U>& u);

Iterator I base() const;       // explicit
reference operator*() const;
pointer operator->() const;

reverse_iterator& operator++();
reverse_iterator operator++(int);
reverse_iterator& operator--();
reverse_iterator operator--(int);

reverse_iterator operator+(difference_type n) const
  requiresRandomAccessIterator<I>();
reverse_iterator& operator+=(difference_type n)
  requiresRandomAccessIterator<I>();
reverse_iterator operator-(difference_type n) const
  requiresRandomAccessIterator<I>();
reverse_iterator& operator-=(difference_type n)
  requiresRandomAccessIterator<I>();
unspecified operator[](difference_type n) const
  requiresRandomAccessIterator<I>();

protected:
  Iterator I current;
};

template <class Iterator I1, class Iterator I2>
  requires EqualityComparable<I1, I2>()
bool operator==(const reverse_iterator<I1>& x,
const reverse_iterator<I2>& y);

template <class Iterator I1, class Iterator I2>
  requires TotallyOrdered<I1, I2>()
bool operator<(const reverse_iterator<I1>& x,
const reverse_iterator<I2>& y);

template <class Iterator I1, class Iterator I2>
  requires EqualityComparable<I1, I2>()
bool operator!=(const reverse_iterator<I1>& x,
const reverse_iterator<I2>& y);
template <class Iterator1RandomAccessIterator I1, class Iterator2RandomAccessIterator I2>
requires TotallyOrdered<I1, I2>()
bool operator>=(
    const reverse_iterator<Iterator1 I1>& x,
    const reverse_iterator<Iterator2 I2>& y);

template <class Iterator1RandomAccessIterator I1, class Iterator2RandomAccessIterator I2>
requires TotallyOrdered<I1, I2>()
bool operator<=(
    const reverse_iterator<Iterator1 I1>& x,
    const reverse_iterator<Iterator2 I2>& y);

template <class Iterator1RandomAccessIterator I1, class Iterator2RandomAccessIterator I2>
requires TotallyOrdered<I1, I2>()
bool operator<(
    const reverse_iterator<Iterator1 I1>& x,
    const reverse_iterator<Iterator2 I2>& y);

24.8.1.2 reverse_iterator requirements

1 The template parameter Iterator shall meet all the requirements of a Bidirectional Iterator (24.2.18).

2 Additionally, Iterator shall meet the requirements of a Random Access Iterator (24.2.19) if any of the members operator+ (24.8.1.3.8), operator- (24.8.1.3.10), operator+= (24.8.1.3.9), operator-= (24.8.1.3.11), operator[] (24.8.1.3.12), or the global operators operator< (24.8.1.3.14), operator> (24.8.1.3.16), operator<= (24.8.1.3.18), operator>=(24.8.1.3.17), operator-= (24.8.1.3.19) or operator+= (24.8.1.3.20) are referenced in a way that requires instantiation (14.7.1).

24.8.1.3 reverse_iterator operations

24.8.1.3.1 reverse_iterator constructor

reverse_iterator();

1 Effects: Value initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator I. If I is a literal type, then this constructor shall be a trivial constructor.

explicit reverse_iterator(Iterator I x);

2 Effects: Initializes current with x.

template <class BidirectionalIterator U>
requiresConvertibleTo<I, I>()
reverse_iterator(const reverse_iterator<U>& u);

3 Effects: Initializes current with u.current.
24.8.1.3.2 reverse_iterator::operator=

template <class BidirectionalIterator U>
requiresConvertibleTo<U, I>()
reverse_iterator&
operator=(const reverse_iterator<U>& u);

1 Effects: Assigns u.base() to current.
2 Returns: *this.

24.8.1.3.3 Conversion

Iterator I base() const; // explicit

1 Returns: current.

24.8.1.3.4 operator*

reference operator*() const;

1 Effects:

    Iterator I tmp = current;
    return *--tmp;

24.8.1.3.5 operator->

pointer operator->() const;

1 Returns: std::addressof(operator*()).prev(current).

24.8.1.3.6 operator++

reverse_iterator& operator++();

1 Effects: --current;
2 Returns: *this.

reverse_iterator operator++(int);

3 Effects:

    reverse_iterator tmp = *this;
    --current;
    return tmp;

24.8.1.3.7 operator--

reverse_iterator& operator--();

1 Effects: ++current
2 Returns: *this.

reverse_iterator operator--(int);

3 Effects:

    reverse_iterator tmp = *this;
    ++current;
    return tmp;

§ 24.8.1.3.7
24.8.1.3.8 operator+

reverse_iterator
operator+(typename reverse_iterator<Iterator>::difference_type n) const
requires RandomAccessIterator<Iterator>();

Returns: reverse_iterator(current-n).

24.8.1.3.9 operator+=

reverse_iterator&
operator+=(typename reverse_iterator<Iterator>::difference_type n)
requires RandomAccessIterator<Iterator>();

Effects: current -= n;
Returns: *this.

24.8.1.3.10 operator-

reverse_iterator
operator-(typename reverse_iterator<Iterator>::difference_type n) const
requires RandomAccessIterator<Iterator>();

Returns: reverse_iterator(current+n).

24.8.1.3.11 operator-=

reverse_iterator&
operator-=(typename reverse_iterator<Iterator>::difference_type n)
requires RandomAccessIterator<Iterator>();

Effects: current += n;
Returns: *this.

24.8.1.3.12 operator[]

unspecced operator[](typename reverse_iterator<Iterator>::difference_type n) const
requires RandomAccessIterator<Iterator>();

Returns: current[-n-1].

24.8.1.3.13 operator==

template <class Iterator1, class Iterator2>
requires EqualityComparable<Iterator1, Iterator2>()
bool operator==(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
Returns: x.current == y.current.

24.8.1.3.14 operator<

template <class Iterator1, class Iterator2>
requires TotallyOrdered<Iterator1, Iterator2>()
bool operator<(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
Returns: x.current > y.current.
24.8.1.3.15  operator!=

```
template <class Iterator1, class Iterator2>
    requires EqualityComparable<Iterator1, Iterator2>()
bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1

Returns: x.current != y.current.

24.8.1.3.16  operator>

```
template <class Iterator1, class Iterator2>
    requires TotallyOrdered<Iterator1, Iterator2>()
bool operator>(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1

Returns: x.current < y.current.

24.8.1.3.17  operator>=

```
template <class Iterator1, class Iterator2>
    requires TotallyOrdered<Iterator1, Iterator2>()
bool operator>=
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);
```

1

Returns: x.current >= y.current.

24.8.1.3.18  operator-

```
template <class Iterator1, class Iterator2>
    requires SizedIteratorRange<Iterator2, Iterator1>()
auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y)
-> decltype(y.base() - x.base());
```

1

Returns: y.current - x.current.

24.8.1.3.19  operator+

```
template <class Iterator1>
reverse_iterator<Iterator1>
operator+(
    typename reverse_iterator<Iterator1>::difference_type n,
    const reverse_iterator<Iterator1>& x);
```

1

Returns: reverse_iterator<Iterator1> (x.current - n).
24.8.1.3.21 Non-member function make_reverse_iterator() [reverse.iter.make]

\[
\text{template } <\text{class } \text{Iterator} \text{BidirectionalIterator } I> \\
\text{reverse_iterator<Iterator> make_reverse_iterator(Iterator}_1 i); \\
\]

1 Returns: reverse_iterator<Iterator>(i).

24.8.2 Insert iterators [iterators.insert]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called insert iterators, are provided in the library. With regular iterator classes,

\[
\text{while (first }!\text{ last) } \ast \text{result}++ = \ast \text{first}++; \\
\]

causes a range \([first, last)\) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the insert mode instead of the regular overwrite mode.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators satisfy the requirements of output iterators. \(\text{operator}\*\) returns the insert iterator itself. The assignment \(\text{operator}=(\text{const } T& x)\) is defined on insert iterators to allow writing into them, it inserts \(x\) right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. back_insert_iterator inserts elements at the end of a container, front_insert_iterator inserts elements at the beginning of a container, and insert_iterator inserts elements where the iterator points to in a container. back_inserter, front_inserter, and inserter are three functions making the insert iterators out of a container.

24.8.2.1 Class template back_insert_iterator [back.insert.iterator]

[Editor’s note: REVIEW: Re-specify this in terms of a Container concept? Or Range? Or leave it?]

\[
\text{namespace std }\{ \text{namespace experimental }\{ \text{namespace ranges_v1 }\{ \\
\text{template <class Container> }\{ \\
\text{class back_insert_iterator }\{ \\
\text{public iterator<output_iterator_tag,void,void,void,void>} \} \\
\text{protected: }\{ \\
\text{Container* container; }\} \\
\text{public: }\{ \\
\text{typedef Container using container_type }\text{Container}; \\
\text{using difference_type }= \text{ptrdiff_t}; \\
\text{using iterator_category }= \text{output_iterator_tag}; \\
\text{back_insert_iterator()}; \\
\text{explicit back_insert_iterator(Container& x);} \\
\text{back_insert_iterator<Container>}\& \\
\text{operator=}=(\text{const typename Container::value_type& value}); \\
\text{back_insert_iterator<Container>}\& \\
\text{operator}=(\text{typename Container::value_type& value}); \\
\text{back_insert_iterator<Container>}\& \text{operator}()\}; \\
\text{back_insert_iterator<Container>}\& \text{operator++(int)}\}; \\
\text{template <class Container> }\{ \\
\text{back_insert_iterator<Container> back_inserter(Container& x)}; \\
\text{}}\}
\]

§ 24.8.2.1
24.8.2.2back_insert_iterator operations

24.8.2.2.1back_insert_iterator constructor

\begin{verbatim}
back_insert_iterator();
\end{verbatim}

\begin{verbatim}
Effects: Value-initializes container. This constructor shall be a trivial constructor.
\end{verbatim}

\begin{verbatim}
explicit back_insert_iterator(Container& x);
\end{verbatim}

\begin{verbatim}
Effects: Initializes container with std::addressof(x).
\end{verbatim}

24.8.2.5back_inserter

\begin{verbatim}
template <class Container>
back_insert_iterator<Container> back_inserter(Container& x);
\end{verbatim}

\begin{verbatim}
Returns: back_insert_iterator<Container>(x).
\end{verbatim}

24.8.2.3 Class template front_insert_iterator

\begin{verbatim}
namespace std {
    namespace experimental { 
        namespace ranges_v1 {
            template <class Container>
            class front_insert_iterator {
                public:
                    forward_iterator<output_iterator_tag,void,void,void,void> protected:
                        Container* container;

                    public:
                        typedef Container using container_type = Container;
                        using difference_type = ptrdiff_t;
                        using iterator_category = output_iterator_tag;
                        front_insert_iterator();
                        explicit front_insert_iterator(Container& x);
            }
        }
    }
}
\end{verbatim}
24.8.2.4 front_insert_iterator operations

24.8.2.4.1 front_insert_iterator constructor

front_insert_iterator();
1
   Effects: Value-initializes container. This constructor shall be a trivial constructor.

explicit front_insert_iterator(Container& x);
2
   Effects: Initializes container with std::addressof(x).

24.8.2.4.2 front_insert_iterator::operator=

front_insert_iterator<Container>&
   operator=(const typename Container::value_type& value);
1
   Effects: container->push_front(value);
2
   Returns: *this.

front_insert_iterator<Container>&
   operator=(typename Container::value_type&& value);
3
   Effects: container->push_front(std::move(value));
4
   Returns: *this.

24.8.2.4.3 front_insert_iterator::operator*

front_insert_iterator<Container>& operator*();
1
   Returns: *this.

24.8.2.4.4 front_insert_iterator::operator++

front_insert_iterator<Container>& operator++();
1
   Returns: *this.

front_insert_iterator<Container>&
   operator++(int);

front_insert_iterator<Container> operator++(int);
1
   Returns: *this.

24.8.2.4.5 front_inserter

template <class Container>
   front_insert_iterator<Container> front_inserter(Container& x);
1
   Returns: front_insert_iterator<Container>(x).

§ 24.8.2.4.5
24.8.2.5 Class template insert_iterator

namespace std {
  namespace experimental {
    namespace ranges_v1 {
      template <class Container>
      class insert_iterator {
        public:
          iterator<output_iterator_tag, void, void, void, void>

protected:
          Container* container;
          typename Container::iterator iter;

public:
          typedef Container using container_type = Container;
          using difference_type = ptrdiff_t;
          using iterator_category = output_iterator_tag;
          insert_iterator();
          insert_iterator(Container& x, typename Container::iterator i);
          insert_iterator<Container>& operator=(const typename Container::value_type& value);
          insert_iterator<Container>& operator=(typename Container::value_type&& value);
          insert_iterator<Container>& operator*();
          insert_iterator<Container>& operator++();
          insert_iterator<Container>& operator++(int);
      };

      template <class Container>
      insert_iterator<Container> inserter(Container& x, typename Container::iterator i);
    }
  }
}

24.8.2.6 insert_iterator operations

24.8.2.6.1 insert_iterator constructor

insert_iterator();
1 Effects: Value-initializes container and iter. If Container::iterator is a literal type, then this
constructor shall be a trivial constructor.

insert_iterator(Container& x, typename Container::iterator i);
2 Effects: Initializes container with std::addressof(x) and iter with i.

24.8.2.6.2 insert_iterator::operator=

insert_iterator<Container>&
  operator=(const typename Container::value_type& value);
1 Effects:
    iter = container->insert(iter, value);
    ++iter;
2 Returns: *this.

insert_iterator<Container>&
  operator=(typename Container::value_type&& value);
3 Effects:

§ 24.8.2.6.2
iter = container->insert(iter, std::move(value));
++iter;

Returns: *this.

24.8.2.6.3 insert_iterator::operator*

insert_iterator<Container>& operator*();

Returns: *this.

24.8.2.6.4 insert_iterator::operator++

insert_iterator<Container>& operator++();
insert_iterator<Container>& operator++(int);

Returns: *this.

24.8.2.6.5 inserter

template <class Container>
insert_iterator<Container> inserter(Container& x, typename Container::iterator i);

Returns: insert_iterator<Container>(x, i).

24.8.3 Move iterators

Class template move_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator’s indirection operator to an rvalue reference. Some generic algorithms can be called with move iterators to replace copying with moving. [Editor’s note: This is untrue now. The algorithms that do copying are constrained with IndirectlyCopyable, which will reject move_iterators.]

[Example:

    list<string> s;
    // populate the list s
    vector<string> v1(s.begin(), s.end()); // copies strings into v1
    vector<string> v2(make_move_iterator(s.begin()), make_move_iterator(s.end())); // moves strings into v2

    — end example]

24.8.3.1 Class template move_iterator

namespace std {
namespace experimental {
namespace ranges_v1 {

template <class Iterator, WeakInputIterator I>
requires Same<ReferenceType<I>, ValueType<I>&>()
class move_iterator {

public:

typedef Iterator iterator_type;

typedef typename iterator_traits<Iterator>::difference_type difference_type;

typedef Iterator pointer;

typedef typename iterator_traits<Iterator>::value_type value_type;

typedef typename iterator_traits<Iterator>::iterator_category iterator_category;

typedef value_type&&

§ 24.8.3.1
using iterator_type = I;
using difference_type = DifferenceType<I>;
using value_type = ValueType<I>;
using iterator_category = IteratorCategory<I>;
using reference = ValueType<I>&&;
using pointer = I;

move_iterator();
explicit move_iterator(Iterator I i);
template <class WeakInputIterator U>
    requiresConvertibleTo<U, I>()
move_iterator(const move_iterator<U>& u);
template <class WeakInputIterator U>
    requiresConvertibleTo<U, I>()
move_iterator& operator=(const move_iterator<U>& u);

iterator_type base() const;
reference operator*() const;
pointer operator->() const;
move_iterator& operator++();
move_iterator operator++(int);
move_iterator& operator--();
    requires BidirectionalIterator<I>();
move_iterator operator--(int)
    requires BidirectionalIterator<I>();

move_iterator operator+(difference_type n) const
    requires RandomAccessIterator<I>();
move_iterator& operator+=(difference_type n)
    requires RandomAccessIterator<I>();
move_iterator operator-(difference_type n) const
    requires RandomAccessIterator<I>();
move_iterator& operator-=(difference_type n)
    requires RandomAccessIterator<I>();
unspecified operator[](difference_type n) const
    requires RandomAccessIterator<I>();

private:
    Iterator I current; // exposition only
};

template <class InputIterator I1, class InputIterator I2>
    requires EqualityComparable<I1, I2>()
bool operator==(const move_iterator<InputIterator I1>& x, const move_iterator<InputIterator I2>& y);
template <class InputIterator I1, class InputIterator I2>
    requires EqualityComparable<I1, I2>()
bool operator!=(const move_iterator<InputIterator I1>& x, const move_iterator<InputIterator I2>& y);
template <class RandomAccessIterator I1, class RandomAccessIterator I2>
    requires TotallyOrdered<I1, I2>()
bool operator<(
24.8.3.2 move_iterator requirements

The template parameter Iterator shall meet the requirements for an Input Iterator (24.2.14). Additionally, if any of the bidirectional or random access traversal functions are instantiated, the template parameter shall meet the requirements for a Bidirectional Iterator (24.2.18) or a Random Access Iterator (24.2.19), respectively.

24.8.3.3 move_iterator operations

24.8.3.3.1 move_iterator constructors

move_iterator();

Effects: Constructs a move_iterator, value initializing current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

explicit move_iterator(Iterator I i);

Effects: Constructs a move_iterator, initializing current with i.

template <class WeakInputIterator U>
requiresConvertibleToU, I() move_iterator(const move_iterator<U>& u);

Effects: Constructs a move_iterator, initializing current with u.base().

Requires: U shall be convertible to Iterator.
move_iterator::operator=

```cpp
template <class WeakInputIterator U>
requires ConvertibleTo<U, I>()
move_iterator& operator=(const move_iterator<U>& u);
```

**Effects:** Assigns u.base() to current.

**Requires:** U shall be convertible to Iterator.

move_iterator conversion

```cpp
Iterator base() const;
```

**Returns:** current.

move_iterator::operator*

```cpp
reference operator*() const;
```

**Returns:** std::move(*current).

move_iterator::operator->

```cpp
pointer operator->() const;
```

**Returns:** current.

move_iterator::operator++

```cpp
move_iterator& operator++();
```

**Effects:** ++current.

```cpp
move_iterator operator++(int);
```

**Effects:**
```
move_iterator tmp = *this;
++current;
return tmp;
```

move_iterator::operator--

```cpp
move_iterator& operator--();
```

**Requires:** BidirectionalIterator<I>()

**Effects:** --current.

```cpp
move_iterator operator--(int);
```

**Requires:** BidirectionalIterator<I>()

**Effects:**
```
move_iterator tmp = *this;
--current;
return tmp;
```
24.8.3.3.8  move_iterator::operator+

```cpp
move_iterator operator+(difference_type n) const
  requires RandomAccessIterator<I>();

Returns: move_iterator(current + n).
```

24.8.3.3.9  move_iterator::operator++

```cpp
move_iterator& operator+=(difference_type n)
  requires RandomAccessIterator<I>();

Effects: current += n.

Returns: *this.
```

24.8.3.3.10  move_iterator::operator-

```cpp
move_iterator operator-(difference_type n) const
  requires RandomAccessIterator<I>();

Returns: move_iterator(current - n).
```

24.8.3.3.11  move_iterator::operator--

```cpp
move_iterator& operator--(difference_type n)
  requires RandomAccessIterator<I>();

Effects: current -= n.

Returns: *this.
```

24.8.3.3.12  move_iterator::operator[]

```cpp
unspecified operator[](difference_type n) const
  requires RandomAccessIterator<I>();

Returns: std::move(current[n]).
```

24.8.3.3.13  move_iterator comparisons

```cpp
template <class Iterator1, class Iterator2>
  requires EqualityComparable<Iterator1, Iterator2>()
bool operator==(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Returns: x.base() == y.base().
```

```cpp
template <class Iterator1, class Iterator2>
  requires EqualityComparable<Iterator1, Iterator2>()
bool operator!=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Returns: !(x == y).
```

```cpp
template <class Iterator1, class Iterator2>
  requires TotallyOrdered<Iterator1, Iterator2>()
bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Returns: x.base() < y.base().
```
template <class Iterator1 RandomAccessIterator I1, class Iterator2 RandomAccessIterator I2>

requires TotallyOrdered<I1, I2>()
bool operator<=(
    const move_iterator<Iterator1 I1>& x, const move_iterator<Iterator2 I2>& y);

Returns: !(y < x).

template <class Iterator1 RandomAccessIterator I1, class Iterator2 RandomAccessIterator I2>

requires TotallyOrdered<I1, I2>()
bool operator>(
    const move_iterator<Iterator1 I1>& x, const move_iterator<Iterator2 I2>& y);

Returns: y < x.

template <class Iterator1 RandomAccessIterator I1, class Iterator2 RandomAccessIterator I2>

requires TotallyOrdered<I1, I2>()
bool operator>= (  
    const move_iterator<Iterator1 I1>& x, const move_iterator<Iterator2 I2>& y);

Returns: !(x < y).

24.8.3.14 move_iterator non-member functions

template <class Iterator1 WeakInputIterator I1, class Iterator2 WeakInputIterator I2>

requires SizedIteratorRange<II, II>()
auto DifferenceType<I2> operator- (    
    const move_iterator<Iterator1 I1>& x,    
    const move_iterator<Iterator2 I2>& y)  
    ->decltype(y.base() - x.base());

Returns: x.base() - y.base().

template <class Iterator RandomAccessIterator I>

move_iterator<Iterator I> operator+
    (typename move_iterator<Iterator I>::difference_type DifferenceType<I> n,  
    const move_iterator<Iterator I>& x);

Returns: x + n.

template <class Iterator WeakInputIterator I>

move_iterator<Iterator I> make_move_iterator(Iterator I i);

Returns: move_iterator<Iterator I>(i).

24.8.4 Common iterators

Class template common_iterator is an iterator/sentinel adaptor that is capable of representing a non-bounded range of elements (where the types of the iterator and sentinel differ) as a bounded range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

[Note: The common_iterator type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type, and for use in common_type specializations that are required to make iterator/sentinel pairs model satisfy the EqualityComparable concept. — end note]

[Example:

```cpp
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);
```]
list<int> s;
// populate the list s
using CI =
  common_iterator<counted_iterator<list<int>::iterator>,
  default_sentinel>;
// call fun on a range of 10 ints
fun(CI(make_counted_iterator(s.begin(), 10)),
  CI(default_sentinel()));

— end example

24.8.4.1 Class template common_iterator

namespace std {
  namespace experimental {
    namespace ranges_v1 {
      // exposition only
      template<class A, class B>
        concept bool __WeaklyEqualityComparable =
          EqualityComparable<A>() && EqualityComparable<B>() &&
          requires(const A a, const B b) {
            {a==b} -> Boolean;
            {a!=b} -> Boolean;
            {b==a} -> Boolean;
            {b!=a} -> Boolean;
          }
        // exposition only
      template<class S, class I>
        concept bool __WeakSentinel =
          Iterator<I>() && Regular<S>() &&
          __WeaklyEqualityComparable<I, S>;
        // exposition only
      template <InputIterator I>
        constexpr bool __fwd_iter = false;
      template <ForwardIterator I>
        constexpr bool __fwd_iter<I> = true;

      template <InputIterator I, __WeakSentinel<I> S>
        requires Same<I, S>()
      class common_iterator {
        public:
          using difference_type = DifferenceType<I>;
          using value_type = ValueType<I>;
          using iterator_category =
            conditional_t<ForwardIterator __fwd_iter<I>,
                          std::forward_iterator_tag,
                          std::input_iterator_tag>;
          using reference = ReferenceType<I>;

          common_iterator();
          common_iterator(I i);
          common_iterator(S s);
      
      template <InputIterator U, __WeakSentinel<U> V>
        requires ConvertibleTo<U, I>() && ConvertibleTo<V, S>()
      common_iterator(const common_iterator<U, V>& u);
      template <InputIterator U, __WeakSentinel<U> V>
        requires ConvertibleTo<U, I>() && ConvertibleTo<V, S>()
      common_iterator& operator=(const common_iterator<U, V>& u);
    }
  }
}
}
- `common_iterator();`

  reference operator*() const;

  common_iterator& operator++();

  common_iterator operator++(int);

private:
  bool is_sentinel;  // exposition only
  I iter;            // exposition only
  S sent;           // exposition only
};

template <InputIterator I1, __WeakSentinel<I1> S1, 
          InputIterator I2, __WeakSentinel<I2> S2>
requires EqualityComparable<I1, I2>() & __WeaklyEqualityComparable<I1, S2> &
          __WeaklyEqualityComparable<I2, S1>
bool operator==(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);

template <InputIterator I1, __WeakSentinel<I1> S1, 
          InputIterator I2, __WeakSentinel<I2> S2>
requires EqualityComparable<I1, I2>() & __WeaklyEqualityComparable<I1, S2> &
          __WeaklyEqualityComparable<I2, S1>
bool operator!=(const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);

template <InputIterator I1, __WeakSentinel<I1> S1, 
          InputIterator I2, __WeakSentinel<I2> S2>
requires SizedIteratorRange<I1, I1>() & SizedIteratorRange<I2, I2>() &
          requires (const I1 i1, const S1 s1, const I2 i2, const S2 s2) {
            requires (I1 a, I2 b) {{a1-b12}-DifferenceType<I2>; {b12-a11}->DifferenceType<I2>;
          }
          requires (I1 i, S2 o) {{i1-s2}->DifferenceType<I2>; {s2-i1}->DifferenceType<I2>;
          }
          requires (I2 i, S1 e) {{i2-s11}->DifferenceType<I2>; {s1-i2}->DifferenceType<I2>;
          }
        }
      DifferenceType<I2> operator-;
          (const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
    };

1 [Note: The use of the expository __WeaklyEqualityComparable and __WeakSentinel concepts is to avoid the self-referential requirements that would happen if parameters I and S use common_iterator<I, S> as their common type. — end note]

2 [Note: The ad hoc constraints on common_iterator’s operator- exist for the same reason. — end note]

3 [Note: It is unspecified whether common_iterator’s members iter and sent have distinct addresses or not. — end note]

24.8.4.2 common_iterator operations [common.iter.ops]
24.8.4.2.1 common_iterator constructors [common.iter.op.op.const]

common_iterator();

Effects: Constructs a common_iterator, value-initializing is_sentinel and iter. It is unspecified whether any initialization is performed for sent. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type I.
common_iterator(I i);
  Effects: Constructs a common_iterator, initializing is_sentinel with false and iter with i. It is unspecified whether any initialization is performed for sent.

common_iterator(S s);
  Effects: Constructs a common_iterator, initializing is_sentinel with true and sent with s. It is unspecified whether any initialization is performed for iter.

template <InputIterator U, __WeakSentinel<U> V>
  requires ConvertibleTo<U, I>() && ConvertibleTo<V, S>()
common_iterator(const common_iterator<U, V>& u);
  Effects: Constructs a common_iterator, initializing is_sentinel with u.is_sentinel.

(4.1) — If u.is_sentinel is true, sent is initialized with u.sent. It is unspecified whether any initialization is performed for iter.
(4.2) — If u.is_sentinel is false, iter is initialized with u.iter. It is unspecified whether any initialization is performed for sent.

24.8.4.2.2 common_iterator::operator=
  [common.iter.op=]

template <InputIterator U, __WeakSentinel<U> V>
  requires ConvertibleTo<U, I>() && ConvertibleTo<V, S>()
common_iterator& operator=(const common_iterator<U, V>&& u);
  Effects: Assigns u.is_sentinel to is_sentinel.

(1.1) — If u.is_sentinel is true, assigns u.sent to sent. It is unspecified whether any operation is performed on iter.
(1.2) — If u.is_sentinel is false, assigns u.iter to iter. It is unspecified whether any operation is performed on sent.

2  Returns: *this

~common_iterator();
  Effects: Runs the destructor(s) for any members that are currently initialized.

24.8.4.2.3 common_iterator::operator*  [common.iter.op.star]
reference operator*() const;
  Requires: !is_sentinel
  Returns: *iter.

24.8.4.2.4 common_iterator::operator++  [common.iter.op.incr]
common_iterator& operator++();
  Requires: !is_sentinel
  Effects: ++iter.
  Returns: *this.

common_iterator operator++(int);
4 \textit{Requires:} \!is\_sentinel

5 \textit{Effects:}

\begin{verbatim}
  common_iterator tmp = *this;
  ++iter;
  return tmp;
\end{verbatim}

24.8.4.2.5 \texttt{common\_iterator} comparisons [common.iter.op.comp]

\begin{verbatim}
template <InputIterator I1, __WeakSentinel<I1> S1, 
        InputIterator I2, __WeakSentinel<I2> S2>
  requires EqualityComparable<I1, I2>() && __WeaklyEqualityComparable<I1, S2> &&
  __WeaklyEqualityComparable<I2, S1>
  bool operator==(
    const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
\end{verbatim}

1 \textit{Returns:}

\begin{verbatim}
  x.is_sentinel ?
    (y.is_sentinel || y.iter == x.sent) :
  (y.is_sentinel ?
    x.iter == y.sent :
  x.iter == y.iter);
\end{verbatim}

\begin{verbatim}
template <InputIterator I1, __WeakSentinel<I1> S1, 
        InputIterator I2, __WeakSentinel<I2> S2>
  requires EqualityComparable<I1, I2>() && __WeaklyEqualityComparable<I1, S2> &&
  __WeaklyEqualityComparable<I2, S1>
  bool operator!=(
    const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
\end{verbatim}

2 \textit{Returns:} \!(x == y).

\begin{verbatim}
template <InputIterator I1, __WeakSentinel<I1> S1, 
        InputIterator I2, __WeakSentinel<I2> S2>
  requires SizedIteratorRange<I1, I1>() && SizedIteratorRange<I2, I2>() &&
  requires (I1 i1, S1 s1, const I2 i2, const S2 s2) {
    requires (I1 a, I2 b) (\{a1 - b\}) \rightarrow \text{DifferenceType} <I2> ;
    requires (I1 i, S2 s) (\{k1 - s\}) \rightarrow \text{DifferenceType} <I2> ;
    requires (I2 i, S1 e) (\{k2 - e\}) \rightarrow \text{DifferenceType} <I2> ;
  }
  DifferenceType<I2> operator-(
    const common_iterator<I1, S1>& x, const common_iterator<I2, S2>& y);
\end{verbatim}

3 \textit{Returns:}

\begin{verbatim}
  x.is_sentinel ?
    (y.is_sentinel ? 0 : x.sent - y.iter) :
  (y.is_sentinel ?
    x.iter - y.sent :
  x.iter - y.iter);
\end{verbatim}

24.8.5 \texttt{Default sentinels} [default.sentinels]

24.8.5.1 \texttt{Class default\_sentinel} [default.sent]
namespace std { namespace experimental { namespace ranges_v1 {
    class default_sentinel { 
    }
}}}

1 Class `default_sentinel` is an empty type used to denote the end of a range. It is intended to be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (24.8.6.1)).

24.8.5.2 `default_sentinel` operations [default.sent.ops]

24.8.5.2.1 `default_sentinel` comparisons [default.sent.op.comp]

constexpr bool operator==(default_sentinel x, default_sentinel y) noexcept;

Returns: true

constexpr bool operator!=(default_sentinel x, default_sentinel y) noexcept;

Returns: false

constexpr bool operator<(default_sentinel x, default_sentinel y) noexcept;

Returns: false

constexpr bool operator<=(default_sentinel x, default_sentinel y) noexcept;

Returns: true

constexpr bool operator>(default_sentinel x, default_sentinel y) noexcept;

Returns: false

constexpr bool operator>=(default_sentinel x, default_sentinel y) noexcept;

Returns: true

24.8.5.2.2 `default_sentinel` non-member functions [default.sent.nonmember]

cnstexpr ptrdiff_t operator-(default_sentinel x, default_sentinel y) noexcept;

Returns: 0

24.8.6 Counted iterators [iterators.counted]

Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of its distance from its starting position. It can be used together with class `default_sentinel` in calls to generic algorithms to operate on a range of N elements starting at a given position without needing to know the end position a priori.

1 [Example:

```cpp
list<string> s;
// populate the list s
vector<string> v(make_counted_iterator(s.begin(), 10),
    default_sentinel()); // copies 10 strings into v
```

—end example]

2 Two values i1 and i2 of (possibly differing) types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if next(i1.base(), i1.count()) and next(i2.base(), i2.count()) refer to the same (possibly past-the-end) element.
24.8.6.1 Class template counted_iterator

namespace std { namespace experimental { namespace ranges_v1 {
    template <WeakIterator I>
    class counted_iterator {
    public:
        using iterator_type = I;
        using difference_type = DifferenceType<I>;
        using reference = ReferenceType<I>;

        counted_iterator();
        counted_iterator(I x, DifferenceType<I> n);
        template <WeakIterator U>
            requiresConvertibleTo<I, U>()
        counted_iterator(const counted_iterator<U>& u);

24.8.6.2 counted_iterator operations [counted.iter.ops]
24.8.6.2.1 counted_iterator constructors [counted.iter.op.const]
counted_iterator();

1 Effects: Constructs a counted_iterator, value initializing current and cnt. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type I.

counted_iterator(I i, DifferenceType<I> n);
2 Requires: n >= 0
3 Effects: Constructs a counted_iterator, initializing current with i and cnt with n.

template <WeakIterator U>
requires ConvertibleTo<U, I>()
counted_iterator(const counted_iterator<U>& u);
4 Effects: Constructs a counted_iterator, initializing current with u.base() and cnt with u.count().

24.8.6.2.2 counted_iterator::operator= [counted.iter.op=]
template <WeakIterator U>
requires ConvertibleTo<U, I>()
counted_iterator& operator=(const counted_iterator<U>& u);
1 Effects: Assigns u.base() to current and u.count() to cnt.
24.8.6.2.3  counted_iterator conversion
I base() const;

    Returns: current.

24.8.6.2.4  counted_iterator count
DifferenceType<I> count() const;

    Returns: cnt.

24.8.6.2.5  counted_iterator::operator*
reference operator*() const;

    Returns: *current.

24.8.6.2.6  counted_iterator::operator++
counted_iterator& operator++();
    Requires: cnt > 0
    Effects:
        ++current;
        --cnt;

    Returns: *this.

counted_iterator operator++(int);
    Requires: cnt > 0
    Effects:
        counted_iterator tmp = *this;
        ++current;
        --cnt;
        return tmp;

24.8.6.2.7  counted_iterator::operator--
counted_iterator& operator--();
    requires BidirectionalIterator<I> ()
    Effects:
        --current;
        ++cnt;

    Returns: *this.

counted_iterator operator--(int)
    requires BidirectionalIterator<I> ()
    Effects:
        counted_iterator tmp = *this;
        --current;
        ++cnt;
        return tmp;
24.8.6.2.8 counted_iterator::operator+

counted_iterator operator+(difference_type n) const
requires RandomAccessIterator<I>();
1
   Requires: n <= cnt
2
   Returns: counted_iterator(current + n, cnt - n).

24.8.6.2.9 counted_iterator::operator+=

counted_iterator& operator+=(difference_type n)
requires RandomAccessIterator<I>();
1
   Requires: n <= cnt
2
   Effects:
   current += n;
   cnt -= n;
3
   Returns: *this.

24.8.6.2.10 counted_iterator::operator-

counted_iterator operator-(difference_type n) const
requires RandomAccessIterator<I>();
1
   Requires: -n <= cnt
2
   Returns: counted_iterator(current - n, cnt + n).

24.8.6.2.11 counted_iterator::operator=-

counted_iterator& operator-=(difference_type n)
requires RandomAccessIterator<I>();
1
   Requires: -n <= cnt
2
   Effects:
   current -= n;
   cnt += n;
3
   Returns: *this.

24.8.6.2.12 counted_iterator::operator[]

unspecified operator[](difference_type n) const
requires RandomAccessIterator<I>();
1
   Requires: n <= cnt
2
   Returns: current[n].

24.8.6.2.13 counted_iterator comparisons

template <WeakIterator I1, WeakIterator I2>
requires Common<I1, I2>()
bool operator==(const counted_iterator<I1>& x, const counted_iterator<I2>& y);
1
   Requires: x and y shall refer to elements of the same sequence (24.8.6).
2
   Returns: x.base() == y.base() if EqualityComparable<I1, I2>(); otherwise, x.count() == y.count().
template <WeakIterator I>
bool operator==(
    const counted_iterator<I>& x, default_sentinel y);

Returns: \(x\.\text{count()} == 0\).

template <WeakIterator I>
bool operator==(
    default_sentinel x, const counted_iterator<I>& y);

Returns: \(y\.\text{count()} == 0\).

template <WeakIterator I1, WeakIterator I2>
requires Common<I1, I2>()
bool operator!=(
    const counted_iterator<I1>& x, const counted_iterator<I2>& y);

template <WeakIterator I>
bool operator!=(
    const counted_iterator<I>& x, default_sentinel y);

template <WeakIterator I>
bool operator!=(
    default_sentinel x, const counted_iterator<I>& y);

Requires: For the first overload, \(x\) and \(y\) shall refer to elements of the same sequence (24.8.6).

Returns: \(!\!(x == y)\).

template <RandomAccessWeakIterator I1, RandomAccessWeakIterator I2>
requires TotallyOrdered Common<I1, I2>()
bool operator<(
    const counted_iterator<I1>& x, const counted_iterator<I2>& y);

Requires: \(x\) and \(y\) shall refer to elements of the same sequence (24.8.6).

Returns: \(x\.\text{base()} < y\.\text{base()}\) \(y\.\text{count()} < x\.\text{count()}\).

template <RandomAccessWeakIterator I>
bool operator<(
    const counted_iterator<I>& x, default_sentinel y);

Returns: \(x\.\text{count()} != 0\).

template <RandomAccessWeakIterator I>
bool operator<(
    default_sentinel x, const counted_iterator<I>& y);

Returns: false.

template <RandomAccessWeakIterator I1, RandomAccessWeakIterator I2>
requires TotallyOrdered Common<I1, I2>()
bool operator<=(
    const counted_iterator<I1>& x, const counted_iterator<I2>& y);

template <RandomAccessWeakIterator I>
bool operator<=(
    const counted_iterator<I>& x, default_sentinel y);

template <RandomAccessWeakIterator I>
bool operator<=(
    default_sentinel x, const counted_iterator<I>& y);

§ 24.8.6.2.13
1. **Requires:** For the first overload, x and y shall refer to elements of the same sequence (24.8.6).

2. **Returns:** !(y < x).

```cpp
template <RandomAccessWeakIterator I1, RandomAccessWeakIterator I2>
requires TotallyOrderedCommon<I1, I2>()
bool operator>(
    const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

3. **Requires:** For the first overload, x and y shall refer to elements of the same sequence (24.8.6).

4. **Returns:** y < x.

```cpp
template <RandomAccessWeakIterator I1, RandomAccessWeakIterator I2>
requires TotallyOrderedCommon<I1, I2>()
bool operator>=(
    const counted_iterator<I1>& x, const counted_iterator<I2>& y);
```

5. **Requires:** For the first overload, x and y shall refer to elements of the same sequence (24.8.6).

6. **Returns:** !(x < y).

7. **Returns:** y.count().

8. **Returns:** !x.count().

9. **Returns:** x.base() - y.base() if SizedIteratorRange<I2, I1>; otherwise, y.count() - x.count().
Requires: \( n \leq x\text{.count()} \).
Returns: \( x + n \).

```cpp
template <WeakIterator I>
counted_iterator<I> make_counted_iterator(I i, DifferenceType<I> n);
```

Requires: \( n \geq 0 \).
Returns: \( \text{counted_iterator}<I>(i, n) \).

```cpp
template <WeakIterator I>
void advance(counted_iterator<I>& i, DifferenceType<I> n);
```

Requires: \( n \leq i\text{.count()} \).
Effects:
\[
i = \text{make_counted_iterator}(\text{next}(i\text{.base()}, n), i\text{.count()} - n);
\]

### 24.8.6.3 Specializations of common_type

namespace std {
    template<experimental::ranges_v1::WeakIterator I>
    struct common_type<
        experimental::ranges_v1::counted_iterator<I>,
        experimental::ranges_v1::default_sentinel>
        { using type = experimental::ranges_v1::common_iterator<
            experimental::ranges_v1::counted_iterator<I>,
            experimental::ranges_v1::default_sentinel>;
    };
    template<experimental::ranges_v1::WeakIterator I>
    struct common_type<
        experimental::ranges_v1::default_sentinel,
        experimental::ranges_v1::counted_iterator<I>>
        { using type = experimental::ranges_v1::common_iterator<
            experimental::ranges_v1::counted_iterator<I>,
            experimental::ranges_v1::default_sentinel>;
    };
}

[Note: By specializing common_type this way, counted_iterator and default_sentinel can satisfy the Common requirement of the EqualityComparable concept. — end note]

### 24.8.7 Dangling wrapper

#### 24.8.7.1 Class template dangling

Class template dangling is a wrapper for an object that refers to another object whose lifetime may have ended. It is used by algorithms that accept rvalue ranges and return iterators.

```cpp
namespace std { namespace experimental { namespace ranges_v1 {

template <CopyConstructible T>
    class dangling {
        public:
            dangling() requires DefaultConstructible<T>();
            dangling(T t);
            T get_unsafe() const;
        private:
            T value; // exposition only
    };

§ 24.8.7.1 89
template <Range R>
using safe_iterator_t =
    conditional_t<is_lvalue_reference<R>::value, IteratorType<R>, dangling<IteratorType<R>>>;
}}

24.8.7.2 dangling operations [dangling.wrap.ops]

24.8.7.2.1 dangling constructors [dangling.wrap.op.const]
dangling() requires DefaultConstructible<T>();
1
   Effects: Constructs a dangling, value initializing value.

dangling(T t);
2
   Effects: Constructs a dangling, initializing value with t.

24.8.7.2.2 dangling::get_unsafe [dangling.wrap.op.get]
T get_unsafe() const;
1
   Returns: value.

24.8.8 Unreachable sentinel [unreachable.sentinels]

24.8.8.1 Class unreachable sentinel [unreachable.sentinel]
1 Class unreachable is a sentinel type that can be used with any Iterator to denote an infinite range. Comparing an iterator for equality with an object of type unreachable always returns false.

[Example:
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable(), 'n');

Provided a newline character really exists in the buffer, the use of unreachable above potentially make the call to find more efficient since the loop test against the sentinel does not require a conditional branch.
— end example]

namespace std { namespace experimental { namespace ranges_v1 {
    class unreachable { }
    template <Iterator I>
        constexpr bool operator==(I const &, unreachable) noexcept;
    template <Iterator I>
        constexpr bool operator==(unreachable, I const &) noexcept;
    template <Iterator I>
        constexpr bool operator!=(I const &, unreachable) noexcept;
    template <Iterator I>
        constexpr bool operator!=(unreachable, I const &) noexcept;
    template <Iterator I>
        constexpr bool operator!=(unreachable, unreachable) noexcept;
}}

24.8.8.2 unreachable operations [unreachable.sentinel.ops]

24.8.8.2.1 operator== [unreachable.sentinel.op==]
template <Iterator I>
    constexpr bool operator==(I const &, unreachable) noexcept;
template <Iterator I>
    constexpr bool operator==(unreachable, I const &) noexcept;

§ 24.8.8.2.1
Returns: false.

constexpr bool operator==(unreachable, unreachable) noexcept;

Returns: true.

24.8.8.2.2 operator!=

template <Iterator I>
constexpr bool operator!=(I const & x, unreachable y) noexcept;

template <Iterator I>
constexpr bool operator!=(unreachable x, I const & y) noexcept;

constexpr bool operator!=(unreachable x, unreachable y) noexcept;

1 Returns: !(x == y)

24.8.8.3 Specializations of common_type

namespace std {

template<experimental::ranges_v1::Iterator I>
struct common_type<I, experimental::ranges_v1::unreachable> {
    using type = experimental::ranges_v1::common_iterator<I, experimental::ranges_v1::unreachable>;
};

template<experimental::ranges_v1::Iterator I>
struct common_type<experimental::ranges_v1::unreachable, I> {
    using type = experimental::ranges_v1::common_iterator<I, experimental::ranges_v1::unreachable>;
};

} // namespace std

[Note: By specializing common_type this way, any iterator and unreachable can satisfy the Common requirement of the EqualityComparable concept. — end note]

24.9 Stream iterators

To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[Example:

partial_sum(istream_iterator<double, char>(cin),
            istream_iterator<double, char>(),
            ostream_iterator<double, char>(cout, "\n"));

reads a file containing floating point numbers from cin, and prints the partial sums onto cout. — end example]

24.9.1 Class template istream_iterator

The class template istream_iterator is an input iterator (24.2.14) that reads (using operator>>) successive elements from the input stream for which it was constructed. After it is constructed, and every time ++ is used, the iterator reads and stores a value of T. If the iterator fails to read and store a value of T (fail() on the stream returns true), the iterator becomes equal to the end-of-stream iterator value. The constructor with no arguments istream_iterator() always constructs an end-of-stream input iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-stream iterator is not defined. For any other iterator value a const T& is returned. The result of operator-> on an end-of-stream iterator is not defined. For any other iterator value a const T* is returned. The behavior of a program that applies operator++(i) to an end-of-stream iterator is undefined. It is impossible to store things into istream iterators.
Two end-of-stream iterators are always equal. An end-of-stream iterator is not equal to a non-end-of-stream iterator. Two non-end-of-stream iterators are equal when they are constructed from the same stream.

namespace std {
    namespace experimental {
        namespace ranges_v1 {
            template <class T, class charT = char, class traits = char_traits<charT>,
                      class Distance = ptrdiff_t>
            class istream_iterator {
                public:
                    iterator<input_iterator_tag, T, Distance, const T*, const T&> {
                        public:
                            typedef input_iterator_tag iterator_category;
                            typedef Distance difference_type;
                            typedef T value_type;
                            typedef const T& reference;
                            typedef const T* pointer;
                            typedef charT char_type;
                            typedef traits traits_type;
                            typedef basic_istream<charT,traits> istream_type;
                public:
                    istream_iterator();
                    istream_iterator(istream_type& s);
                    istream_iterator(const istream_iterator& x) = default;
                    ~istream_iterator() = default;
                private:
                    basic_istream<charT,traits>* in_stream; // exposition only
                    T value; // exposition only
            };
            template <class T, class charT, class traits, class Distance>
            bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
                            const istream_iterator<T,charT,traits,Distance>& y);
            template <class T, class charT, class traits, class Distance>
            bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
                            const istream_iterator<T,charT,traits,Distance>& y);
        };
    };
}

24.9.1.1 istream_iterator constructors and destructor [istream.iterator.cons]

see below istream_iterator();

1 Effects: Constructs the end-of-stream iterator. If T is a literal type, then this constructor shall be a constexpr constructor.

2 Postcondition: in_stream == 0.

istream_iterator(istream_type& s);

3 Effects: Initializes in_stream with &s. value may be initialized during construction or the first time it is referenced.

4 Postcondition: in_stream == &s.

istream_iterator(const istream_iterator& x) = default;

§ 24.9.1.1
Effects: Constructs a copy of \( x \). If \( T \) is a literal type, then this constructor shall be a trivial copy constructor.

Postcondition: \( \text{in\_stream} == \text{x.in\_stream} \).

\(~\text{istream\_iterator}() = \text{default};\)

Effects: The iterator is destroyed. If \( T \) is a literal type, then this destructor shall be a trivial destructor.

### 24.9.1.2 istream\_iterator operations

\begin{verbatim}
const \&T\& operator\*(\) const;

Returns: value.

const T\* operator\->\() const;

Returns: \&(&\text{operator\*}());
\end{verbatim}

\begin{verbatim}
ist\_stream\_iterator\<T,charT,traits,Distance\>& operator++();

Requires: \text{in\_stream} != 0.

Effects: \(*\text{in\_stream} >> \text{value} \).

Returns: \*this.
\end{verbatim}

\begin{verbatim}
ist\_stream\_iterator\<T,charT,traits,Distance\> operator++(\text{int});

Requires: \text{in\_stream} != 0.

Effects:

\begin{verbatim}
ist\_stream\_iterator\<T,charT,traits,Distance\>\ tmp = \*this;
*\text{in\_stream} >> \text{value};
\return (\tmp);
\end{verbatim}
\end{verbatim}

\begin{verbatim}
template <\text{class T, class charT, class traits, class Distance}>
bool operator==(\const ist\_stream\_iterator\<T,charT,traits,Distance\> \&x,
\const ist\_stream\_iterator\<T,charT,traits,Distance\> \&y);

Returns: \text{x.in\_stream} == \text{y.in\_stream}.
\end{verbatim}

\begin{verbatim}
template <\text{class T, class charT, class traits, class Distance}>
bool operator!=(\const ist\_stream\_iterator\<T,charT,traits,Distance\> \&x,
\const ist\_stream\_iterator\<T,charT,traits,Distance\> \&y);

Returns: !(\text{x} == \text{y}.
\end{verbatim}

### 24.9.2 Class template ostream\_iterator

\begin{verbatim}
ostream\_iterator\ writes (using operator\<<\) successive elements onto the output stream from which it was constructed. If it was constructed with \text{charT}\* as a constructor argument, this string, called a \text{delimiter string}, is written to the stream after every \text{T} is written. It is not possible to get a value out of the output iterator. Its only use is as an output iterator in situations like

\begin{verbatim}
while (\text{first} != \text{last})
*\text{result}++ = \*\text{first}++;
\end{verbatim}
\end{verbatim}

\text{ostream\_iterator} is defined as:
namespace std { namespace experimental { namespace ranges_v1 {

template <class T, class charT = char, class traits = char_traits<charT> >
class ostream_iterator{
  // ... 
public_iterator output_iterator_tag, void, void, void, void} {
  public:
  typedef output_iterator_tag iterator_category;
  typedef ptrdiff_t difference_type;
  typedef charT char_type;
  typedef traits traits_type;
  typedef basic_ostream<charT,traits> ostream_type;
  constexpr ostream_iterator() noexcept;
  ostream_iterator(ostream_type& s);
  ostream_iterator(ostream_type& s, const charT* delimiter);
  ostream_iterator(const ostream_iterator<T,charT,traits>& x);
  ~ostream_iterator();
  ostream_iterator<T,charT,traits>& operator=(const T& value);
  ostream_iterator<T,charT,traits>& operator*();
  ostream_iterator<T,charT,traits>& operator++();
  ostream_iterator<T,charT,traits>& operator++(int);

  private:
  basic_ostream<charT,traits>* out_stream;  // exposition only
  const charT* delim;  // exposition only
};
}
}

24.9.2.1 ostream_iterator constructors and destructor

constexpr ostream_iterator() noexcept;

1 Effects: Initializes out_stream and delim with null.

ostream_iterator(ostream_type& s);

2 Effects: Initializes out_stream with &s and delim with null.

ostream_iterator(ostream_type& s, const charT* delimiter);

3 Effects: Initializes out_stream with &s and delim with delimiter.

ostream_iterator(const ostream_iterator<T,charT,traits>& x);

4 Effects: Constructs a copy of x.

~ostream_iterator();

5 Effects: The iterator is destroyed.

24.9.2.2 ostream_iterator operations

ostream_iterator& operator=(const T& value);

1 Effects:

  *out_stream << value;
  if(delim != 0)
    *out_stream << delim;
  return (*this);

§ 24.9.2.2
§ 24.9.3 95

Requiring: `out_stream! = 0`.

Returns: `*this`.

Returns: `*this`.

Class template `istreambuf_iterator` [istreambuf.iterator]

The class template `istreambuf_iterator` defines an input iterator (24.2.14) that reads successive characters from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. [Note: `operator->` may return a proxy. —end note] Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`streambuf_type::sgetc()` returns `traits::eof()`), the iterator becomes equal to the end-of-stream iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(0)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_`-type value is returned. It is impossible to assign a character via an input iterator.
template <class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
              const istreambuf_iterator<charT,traits>& b);

template <class charT, class traits>
bool operator!=(const istreambuf_iterator<charT,traits>& a,
              const istreambuf_iterator<charT,traits>& b);

24.9.3.1 Class template istreambuf_iterator::proxy

namespace std { namespace experimental { namespace ranges_v1 {
  template <class charT, class traits = char_traits<charT> >
  class istreambuf_iterator<charT, traits>::proxy { // exposition only
    charT keep_;
    basic_streambuf<charT,traits>* sbuf_;
    proxy(charT c, basic_streambuf<charT,traits>* sbuf):
      keep_(c), sbuf_(sbuf) { }
  public:
    charT operator*() { return keep_; }
  };
}}

1 Class istreambuf_iterator<charT,traits>::proxy is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class istreambuf_iterator<charT, traits>::proxy provides a temporary placeholder as the return value of the post-increment operator (operator++). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

24.9.3.2 istreambuf_iterator constructors

constexpr istreambuf_iterator() noexcept;

istreambuf_iterator(basic_istream<charT, traits>& s) noexcept;
istreambuf_iterator(basic_streambuf<charT, traits>* s) noexcept;

Effects: Constructs an istreambuf_iterator<> that uses the basic_streambuf<> object *(s.rdbuf()), or *s, respectively. Constructs an end-of-stream iterator if s.rdbuf() is null.

istreambuf_iterator(const proxy& p) noexcept;

Effects: Constructs a istreambuf_iterator<> that uses the basic_streambuf<> object pointed to by the proxy object’s constructor argument p.

24.9.3.3 istreambuf_iterator::operator*

Returns: The character obtained via the streambuf member sbuf_->sgetc().

24.9.3.4 istreambuf_iterator::operator++

Returns: The iterator pointing to the next character.

§ 24.9.3.4
Effects: sbuf_\rightarrow\text{sbumpc}().

Returns: \textit{*this}.

proxy istreambuf_iterator\langle\texttt{charT,traits}\rangle::\text{operator++(int)};

Returns: proxy(sbuf_\rightarrow\text{sbumpc}(), sbuf_).

24.9.3.5 istreambuf_iterator::equal

bool equal(const istreambuf_iterator\langle\texttt{charT,traits}\rangle& a, const istreambuf_iterator\langle\texttt{charT,traits}\rangle& b) const;

Returns: true if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what streambuf object they use.

24.9.3.6 operator==

template <class charT, class traits>
bool operator==(const istreambuf_iterator\langle\texttt{charT,traits}\rangle& a, const istreambuf_iterator\langle\texttt{charT,traits}\rangle& b);

Returns: a.equal(b).

24.9.3.7 operator!=

template <class charT, class traits>
bool operator!=(const istreambuf_iterator\langle\texttt{charT,traits}\rangle& a, const istreambuf_iterator\langle\texttt{charT,traits}\rangle& b);

Returns: !a.equal(b).

24.9.4 Class template ostreambuf_iterator

namespace std {
namespace experimental {
namespace ranges_v1 {

class ostreambuf_iterator { 
public:

typedef output_iterator_tag iterator_category;

typedef ptrdiff_t difference_type;

typedef charT char_type;

typedef traits traits_type;

typedef basic_streambuf\langle\texttt{charT,traits}\rangle streambuf_type;

typedef basic_ostream\langle\texttt{charT,traits}\rangle ostream_type;

public:

const exprt ostreambuf_iterator() noexcept;

ostreambuf_iterator(ostream_type& s) noexcept;

ostreambuf_iterator(ostreambuf_type* s) noexcept;

ostreambuf_iterator& operator=(charT c);

ostreambuf_iterator& operator*();

ostreambuf_iterator& operator++();

ostreambuf_iterator& operator++(int);

bool failed() const noexcept;

private:

streambuf_type* sbuf_; // exposition only

};
}
}}

§ 24.9.4
The class template `ostreambuf_iterator` writes successive `characters` onto the output stream from which it was constructed. It is not possible to get a character value out of the output iterator.

### 24.9.4.1 `ostreambuf_iterator` constructors

[ostreambuf.iter.cons]

- **constexpr `ostreambuf_iterator()` noexcept;**
  
  *Effects:* Initializes `sbuf_` with null.

- `ostreambuf_iterator(ostream_type& s)` noexcept;
  
  *Requires:* `s.rdbuf()` shall not null pointer.

- `ostreambuf_iterator(streambuf_type* s)` noexcept;
  
  *Requires:* `s` shall not be a null pointer.

### 24.9.4.2 `ostreambuf_iterator` operations

[ostreambuf.iter.ops]

- `ostreambuf_iterator<charT,traits>& operator=(charT c);`
  
  *Effects:* If `failed()` yields `false`, calls `sbuf_->sputc(c)`; otherwise has no effect.

- `ostreambuf_iterator<charT,traits>& operator*();`
  
  *Returns:* `*this`.

- `ostreambuf_iterator<charT,traits>& operator++();`  

- `ostreambuf_iterator<charT,traits>& operator++(int);`
  
  *Returns:* `*this`.

- `bool failed() const noexcept;`
  
  *Returns:* `true` if in any prior use of member `operator=`, the call to `sbuf_->sputc()` returned `traits::eof()`; or `false` otherwise.

### 24.10 Range concepts

[ranges]

#### 24.10.1 General

[ranges.general]

1. This subclause describes components for dealing with ranges of elements.
2. The following subclauses describe range and view requirements, and components for range primitives, predefined ranges, and stream ranges, as summarized in Table 5.
24.10.2 Range requirements

24.10.2.1 In general

Ranges are an abstraction of containers that allow a C++ program to operate on elements of data structures uniformly. In their simplest form, a range object is one on which one can call `begin` and `end` to get an iterator (24.2.11) and a sentinel (24.2.12) or an iterator. To be able to construct template algorithms and range adaptors that work correctly and efficiently on different types of sequences, the library formalizes not just the interfaces but also the semantics and complexity assumptions of ranges.

This International Standard defines three fundamental categories of ranges based on the syntax and semantics supported by each: `range`, `sized range` and `view`, as shown in Table 6.

Table 6 — Relations among range categories

<table>
<thead>
<tr>
<th>Sized Range</th>
<th>←</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `Range` concept requires only that `begin` and `end` return an iterator and a sentinel. [Note: An iterator is a valid sentinel. — end note] The `SizedRange` concept refines `Range` but adds the requirement that the number of elements in the range can be determined in constant time with the `size` function. The `View` concept specifies requirements on a `Range` type with constant-time copy and assign operations.

In addition to the three fundamental range categories, this standard defines a number of convenience refinements of `Range` that group together requirements that appear often in the concepts, algorithms, and range adaptors. `Bounded ranges` are ranges for which `begin` and `end` return objects of the same type. `Random access ranges` are ranges for which `begin` returns a model of `type` that satisfies `RandomAccessIterator` (24.2.19). The range categories `bidirectional ranges`, `forward ranges`, `input ranges`, `output ranges` are defined similarly. [Note: There are no weak input ranges or weak output ranges because of the `EqualityComparable` requirement on iterators and sentinels. — end note] [Editor’s note: TODO: Rethink that because a weak input range would not require (strongly) incrementable iterators.]

24.10.2.2 Ranges

The `Range` concept defines the requirements of a type that allows iteration over its elements by providing a `begin` iterator and an `end` iterator or sentinel. [Note: Most algorithms requiring this concept simply forward to an `Iterator`-based algorithm by calling `begin` and `end`. — end note]

```cpp
template <class T>
requires requires (T& t) {
  { begin(t) } -> Iterator; // possibly required to be equality preserving (see below)
} }
using IteratorType = decltype(begin(declval<T&>()));
```

```cpp
template <class T>
```
requires requires (T& t) {
  typename IteratorType<T>;
  { end(t) } -> Sentinel<IteratorType<T>>;
}

using SentinelType = decltype(end(declval<T &>()));

template <class T>
concept bool Range() {=
  returns requires(T t) {
    typename IteratorType<T>;
    typename SentinelType<T>;
    { begin(t) } -> IteratorType<T>;
    { end(t) } -> SentinelType<T>;
    requires Sentinel<SentinelType<T>, IteratorType<T>>;
  };
}

begin and end are required to be amortized constant time.

Given an lvalue t of type remove_reference_t<T>, Range<T>() is satisfied if and only if

(2.1) — Overload resolution (13.3) on the expressions begin(t) and end(t) selects unary non-member
functions “begin” and “end” from candidate sets that includes the three overloads of begin
and end found in <experimental/ranges_v1/iterator> (24.6) and the lookup sets produced by
argument-dependent lookup (3.4.2).

(2.2) — Both begin(t) and end(t) are amortized constant time and non-modifying. [Note: begin(t) and
end(t) do not require implicit expression variants. — end note]

(2.3) — If IteratorType<T> satisfies ForwardIterator, begin(t) is equality preserving.

[Note: Equality preservation of both begin and end enables passing a Range whose IteratorType satisfies
ForwardIterator to multiple algorithms and making multiple passes over the range by repeated calls to
begin and end. Since begin is not required to be equality preserving when the return type does not satisfy
ForwardIterator, repeated calls might not return equal values or might not be well-defined; begin should
be called at most once for such a range. — end note]

24.10.2.3 Sized ranges

The SizedRange concept describes the requirements of a Range type that knows its size in constant
time with the size function.

// exposition only
template <class T>
concept bool __SizedRangeLike =
  Range<T> &&
  requires(T t) {
    { size(t) } -> Integral;
    requires Convertible<decltype(size(t)),
      DifferenceType<IteratorType<T>>};
  };

template <class T>
struct disable_sized_range;

template <class T>
concept bool SizedRange() {=
  __SizedRangeLike<T> && is_sized_range<T>::value;
  return !disable_sized_range<T>::value &&
}
Range<T>() &
requires (const remove_reference_t<T>& t) {
    { size(t) } -> Integral;
    { size(t) } -> ConvertibleTo<
      DifferenceType<
        IteratorType<T>>;
};

Given an lvalue t of type remove_reference_t<T>, SizedRange<T>() is satisfied if and only if
(2.1) Overload resolution (13.3) on the expression size(t) selects a unary non-member function “size”
from a candidate set that includes the three overloads of size found in <experimental/ranges_v1/iterator> (24.6)
and the lookup set produced by argument-dependent lookup (3.4.2).
(2.2) size(t) returns the number of elements in t.
(2.3) If IteratorType<T> satisfies ForwardIterator, size(t) is well-defined regardless of the evaluation
of begin(t). [Note: size(t) is otherwise not required be well-defined after evaluating begin(t).
For a SizedRange whose IteratorType does not model ForwardIterator, for example, size(t)
might only be well-defined if evaluated before the first call to begin(t). — end note]

For any type T, iedisable_sized_range<T> derives from true_type if T models _SizedRangeLike,
and false_type if T is a non-reference cv-unqualified type, and from
disable_sized_range<remove_cv_t<remove_reference_t<T>>> otherwise.

Users are free to specialize iedisable_sized_range. [Note: Users may want to must specialize
iedisable_sized_range so that its member value is true to override the default in the case of accidental conformance
for Range types that meet only the syntactic requirements of SizedRange
when instantiating a library template that has differing behavior for Range and SizedRange. — end note]

[Note: A possible implementation for iedisable_sized_range is given below:

    // exposition only
    template <class T>
    using __uncvref = remove_cv<remove_reference_t<T>>;

    template <class R>
    struct iedisable_sized_range : false_type
    disable_sized_range<__uncvref<R>> { };

    template <__SizedRangeLike class R>
    requires Same<R, __uncvref<R>>()
    struct iedisable_sized_range<R> : true_type false_type { };
    — end note]

24.10.2.4 Views [ranges.view]

1 The View concept describes specifies the requirements of a Range type that has constant time copy, move
and assignment operators; that is, the cost of these operations is not proportional to the number of elements
in the View.

2 [Example: Examples of Views are:
(2.1) — A Range type that wraps a pair of iterators.
(2.2) — A Range type that holds its elements by shared_ptr and shares ownership with all its copies.
(2.3) — A Range type that generates its elements on demand.

A container (23) is not a View since copying the container copies the elements, which cannot be done in
constant time. — end example]
template <class T>  
struct enable_view { };  

struct view_base { };  

// exposition only  
template <class T>  
constexpr bool __view_predicate = see below;  

template <class T>  
concept bool View() {  
  return Range<T>() && Semiregular<T>() &&  
  __view__view_predicate<T>::value;  
}  

Since the difference between Range and View is largely semantic, the two are differentiated with the help of the is_enable_view trait. Users may specialize the is_enable_view trait to derive from true_type or false_type. By default, __view__view_predicate uses the following heuristics to determine whether a Range type T is a View:

1. If T derives from view_base, is_view<T>::value is true.
2. If a top-level const changes T’s IteratorType’s ReferenceType type, is_view<T>::value is false. [Note: Deep const-ness implies element ownership, whereas shallow const-ness implies reference semantics. —end note]

For a type T, the value of __view_predicate<T> shall be:

3. If enable_view<T> has a member type type, enable_view<T>::type::value;
4. If T is derived from view_base, true;
5. If both T and const T satisfy Range and ReferenceType<IteratorType<T>> is not the same type as ReferenceType<IteratorType<const T>>, false; [Note: Deep const-ness implies element ownership, whereas shallow const-ness implies reference semantics. —end note]
6. Otherwise, true.

[Note: Below is a possible implementation of the is_view trait __view_predicate.

// exposition only  
template <class T>  
concept bool __ContainerLike =  
  Range<T>() && Range<const T>() &&  
  !Same<ReferenceType<IteratorType<T&>>,  
  ReferenceType<IteratorType<const T&>>>();

template <class T>  
struct is_view : false_type { };  
constexpr bool __view_predicate = true;  

template <class T>  
requires requires { typename enable_view<T>::type; }  
constexpr bool __view_predicate<T> = enable_view<T>::type::value;  

template <__ContainerLike T>  
requires !(DerivedFrom<T, view_base>() ||  
  requires { typename enable_view<T>::type; })
constexpr bool __viewPredicate<T> = false;

template <Range T>
  requires Derived<remove_reference_t<T>, view_base> ||
  !ContainerLike<remove_reference_t<T>>
  struct is_view<T> : true_type {};

— end note]

24.10.2.5 Bounded ranges [ranges.bounded]

1 The BoundedRange concept describes specifies requirements of an Range type for which begin and end return objects of the same type. [ Note: The standard containers (23) are models of satisfy BoundedRange. — end note ]

  template <class T>
  concept bool BoundedRange() {—
    return Range<T>() && Same<IteratorType<T>, SentinelType<T>>();
  }

24.10.2.6 Input ranges [ranges.input]

1 The InputRange concept describes specifies requirements of an Range type for which begin returns a model of type that satisfies InputIterator (24.2.14).

  template <class T>
  concept bool InputRange() {—
    return Range<T>() && InputIterator<IteratorType<T>>();
  }

24.10.2.7 Output ranges [ranges.output]

1 The OutputRange concept describes specifies requirements of an Range type for which begin returns a type that satisfies OutputIterator (24.2.16).

  template <class R, class T>
  concept bool OutputRange() {
    return Range<R>() && OutputIterator<IteratorType<R>, T>();
  }

24.10.2.8 Forward ranges [ranges.forward]

1 The ForwardRange concept describes specifies requirements of an InputRange type for which begin returns a model of type that satisfies ForwardIterator (24.2.17).

  template <class T>
  concept bool ForwardRange() {—
    return InputRange<T>() && ForwardIterator<IteratorType<T>>();
  }

24.10.2.9 Bidirectional ranges [ranges.bidirectional]

1 The BidirectionalRange concept describes specifies requirements of a ForwardRange type for which begin returns a model of type that satisfies BidirectionalIterator (24.2.18).

  template <class T>
  concept bool BidirectionalRange() {—
    return ForwardRange<T>() && BidirectionalIterator<IteratorType<T>>();
  }

§ 24.10.2.9
24.10.2.10 Random access ranges

The RandomAccessRange concept describes requirements of a BidirectionalRange type for which begin returns a model of type that satisfies RandomAccessIterator (24.2.19).

```
template <class T>
concept bool RandomAccessRange() {
    return BidirectionalRange<T>() && RandomAccessIterator<IteratorType<T>>();
}
```

24.11 Range access

In addition to being available via inclusion of the <iterator> header, the function templates in 24.11 are available when any of the following headers are included: <array>, <deque>, <forward_list>, <list>, <map>, <regex>, <set>, <string>, <unordered_map>, <unordered_set>, and <vector>.

```
template <class C> auto begin(C& c) -> decltype(c.begin());
template <class C> auto begin(const C& c) -> decltype(c.begin());
    Returns: c.begin().

template <class C> auto end(C& c) -> decltype(c.end());
template <class C> auto end(const C& c) -> decltype(c.end());
    Returns: c.end().

template <class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
    Returns: array.

template <class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;
    Returns: array + N.

template <class Auto C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
    -> decltype(std::begin(c));
    Returns: std::begin(c).

template <class Auto C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
    -> decltype(std::end(c));
    Returns: std::end(c).

template <class Auto C> auto rbegin(C& c) -> decltype(c.rbegin());
template <class Auto C> auto rbegin(const C& c) -> decltype(c.rbegin());
    Returns: c.rbegin().

template <class Auto C> auto rend(C& c) -> decltype(c.rend());
template <class Auto C> auto rend(const C& c) -> decltype(c.rend());
    Returns: c.rend().
```

§ 24.11
template <class Auto E> reverse_iterator<const E*> rbegin(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.end()).

template <class Auto E> reverse_iterator<const E*> rend(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.begin()).

template <class Auto C> auto crbegin(const C& c) -> decltype(std::ranges_v1::rbegin(c));

Returns: std::ranges_v1::rbegin(c).

template <class Auto C> auto crend(const C& c) -> decltype(std::ranges_v1::rend(c));

Returns: std::ranges_v1::rend(c).

24.12 Range primitives

Ranges\{R\}
DifferenceType<IteratorType<R>> distance(R&& r);

Returns: ranges_v1::distance(begin(r), end(r))

SizedRanges\{R\}
DifferenceType<IteratorType<R>> distance(R&& r);

Returns: size(r)
25 Algorithms library

25.1 General

This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 23) and other sequences.

The following subclauses describe components for non-modifying sequence operation, modifying sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 7.

Table 7 — Algorithms library summary

    bool
    prev_permutation(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

3 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

4 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

[Editor’s note: The following paragraphs are removed because they are redundant; these requirements are now enforced in code by the requires clauses.]

5 Throughout this Clause, the names of template parameters are used to express type requirements. If an algorithm’s template parameter is InputIterator, InputIterator1, or InputIterator2, the actual template argument shall satisfy the requirements of an input iterator (24.2.14). If an algorithm’s template parameter is OutputIterator, OutputIterator1, or OutputIterator2, the actual template argument shall satisfy the requirements of an output iterator (24.2.16). If an algorithm’s template parameter is ForwardIterator, ForwardIterator1, or ForwardIterator2, the actual template argument shall satisfy the requirements of a forward iterator (24.2.17). If an algorithm’s template parameter is BidirectionalIterator, BidirectionalIterator1, or BidirectionalIterator2, the actual template argument shall satisfy the requirements of a bidirectional iterator (24.2.18). If an algorithm’s template parameter is RandomAccessIterator, RandomAccessIterator1, or RandomAccessIterator2, the actual template argument shall satisfy the requirements of a random-access iterator (24.2.19).

6 If an algorithm’s Effects section says that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall satisfy the requirements of a mutable iterator (24.2). [Note: This requirement does not affect arguments that are declared as OutputIterator, OutputIterator1, or OutputIterator2, because output iterators must always be mutable. —end note]
Both in-place and copying versions are provided for certain algorithms.\(^3\) When such a version is provided for *algorithm* it is called *algorithm_copy*. Algorithms that take predicates end with the suffix \_if (which follows the suffix \_copy).

The *Predicate* parameter is used whenever an algorithm expects a function object (20.9) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as true. In other words, if an algorithm takes *Predicate pred* as its argument and first as its iterator argument, it should work correctly in the construct `pred(*first)` contextually converted to bool (Clause 4). The function object `pred` shall not apply any non-constant function through the dereferenced iterator.

The *BinaryPredicate* parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type `T` when `T` is part of the signature returns a value testable as true. In other words, if an algorithm takes *BinaryPredicate binary_pred* as its argument and `first1` and `first2` as its iterator arguments, it should work correctly in the construct `binary_pred(*first1, *first2)` contextually converted to bool (Clause 4). *BinaryPredicate* always takes the first iterator’s value_type as its first argument, that is, in those cases when `T` value is part of the signature, it should work correctly in the construct `binary_pred(*first1, value)` contextually converted to bool (Clause 4). `binary_pred` shall not apply any non-constant function through the dereferenced iterators.

### Note

Projections and predicates are typically used as follows:

```cpp
auto&& proj_ = callable_as_function(proj); // see 24.3.2
auto&& pred_ = callable_as_function(pred);
if(pred_(proj_(*first))) // ...
```

### End note

Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as `reference_wrapper<T>` (20.9.3), or some equivalent solution. —end note]

When the description of an algorithm gives an expression such as `*first == value` for a condition, the expression shall evaluate to either true or false in boolean contexts.

In the description of the algorithms operators + and - are used for some of the iterator categories for which they do not have to be defined. In these cases the semantics of `a+n` is the same as that of

```cpp
X tmp = a;
advance(tmp, n);
return tmp;
```

and that of `b-a` is the same as of

```cpp
return distance(a, b);
```

In the description of algorithm return values, sentinel values are sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator as follows:

```cpp
I tmp = first;
while(tmp != last)
++tmp;
return tmp;
```

---

\(^3\) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, `sort_copy` is not included because the cost of sorting is much more significant, and users might as well do `copy` followed by `sort`. 

§ 25.1 128
Overloads of algorithms that take `Range` arguments (24.10.2.2) behave as if they are implemented by calling `begin` and `end` on the `Range` and dispatching to the overload that takes separate iterator and sentinel arguments.

[Editor’s note: Before `alg.nonmodifying`, insert the following section. All subsequent sections should be renumbered as appropriate (but they aren’t here for the purposes of the review).]

## 25.?? Tag specifiers

```cpp
namespace tag {
    struct in { /* implementation-defined */};
    struct in1 { /* implementation-defined */};
    struct in2 { /* implementation-defined */};
    struct out { /* implementation-defined */};
    struct out1 { /* implementation-defined */};
    struct out2 { /* implementation-defined */};
    struct fun { /* implementation-defined */};
    struct min { /* implementation-defined */};
    struct max { /* implementation-defined */};
    struct begin { /* implementation-defined */};
    struct end { /* implementation-defined */};
}
```

In the following description, let `X` be the name of a type in the `tag` namespace above.

`tag:::X` is a tag specifier (20.15.2) such that `TAGGET(D, tag:::X, N)` names a tagged getter (20.15.2) with DerivedCharacteristic `D`, ElementIndex `N`, and ElementName `X`.

[Example: `tag::in` is a type such that `TAGGET(D, tag::in, N)` names a type with the following interface:

```cpp
struct __input_getter {
    constexpr decltype(auto) in() & { return get<N>(static_cast<D&>(*this)); }
    constexpr decltype(auto) in() && { return get<N>(static_cast<D&&>(*this)); }
    constexpr decltype(auto) in() const & { return get<N>(static_cast<const D&>(*this)); }
};
```

—end example]

### 25.2 Non-modifying sequence operations

#### 25.2.1 All of

```cpp
template<class InputIterator, class Predicate>
bool all_of(InputIterator first, InputIterator last, Predicate pred);
```

```cpp
template<InputIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallablePredicate<Projected<I, Proj>> Pred>
bool all_of(I first, S last, Pred pred, Proj proj = Proj{});
```

```cpp
template<InputRange Rng, class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
bool all_of(Rng&& rng, Pred pred, Proj proj = Proj{});
```

1. Returns: true if `[first, last)` is empty or if `pred(*i)` `INVOKE(pred, INVOKE(proj, *i))` is true for every iterator `i` in the range `[first, last)`, and false otherwise.

2. Complexity: At most `last - first` applications of the predicate and `last - first` applications of the projection.
25.2.2 Any of

\[ \text{template}<\text{class InputIterator}, \text{class Predicate}> \]
\[ \text{bool any_of(InputIterator first, InputIterator last, Predicate pred);} \]
\[ \text{template<InputIterator I, Sentinel<I> S, class Proj = identity,} \]
\[ \text{IndirectCallablePredicate<Projected<I, Proj>> Pred}> \]
\[ \text{bool any_of(I first, S last, Pred pred, Proj proj = Proj{});} \]
\[ \text{template<InputRange Rng, class Proj = identity,} \]
\[ \text{IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred}> \]
\[ \text{bool any_of(Rng& rng, Pred pred, Proj proj = Proj{});} \]

1 Returns: false if \([\text{first},\text{last})\) is empty or if there is no iterator \(i\) in the range \([\text{first},\text{last})\) such that \(\text{pred}(\text{proj}(i))\) is true, and true otherwise.

2 Complexity: At most \(\text{last} - \text{first}\) applications of the predicate and \(\text{last} - \text{first}\) applications of the projection.

25.2.3 None of

\[ \text{template}<\text{class InputIterator}, \text{class Predicate}> \]
\[ \text{bool none_of(InputIterator first, InputIterator last, Predicate pred);} \]
\[ \text{template<InputIterator I, Sentinel<I> S, class Proj = identity,} \]
\[ \text{IndirectCallablePredicate<Projected<I, Proj>> Pred}> \]
\[ \text{bool none_of(I first, S last, Pred pred, Proj proj = Proj{});} \]
\[ \text{template<InputRange Rng, class Proj = identity,} \]
\[ \text{IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred}> \]
\[ \text{bool none_of(Rng& rng, Pred pred, Proj proj = Proj{});} \]

1 Returns: true if \([\text{first},\text{last})\) is empty or if \(\text{pred}(\text{proj}(i))\) is false for every iterator \(i\) in the range \([\text{first},\text{last})\), and false otherwise.

2 Complexity: At most \(\text{last} - \text{first}\) applications of the predicate and \(\text{last} - \text{first}\) applications of the projection.

25.2.4 For each

\[ \text{template}<\text{class InputIterator}, \text{class Function}> \]
\[ \text{Function for_each(InputIterator first, InputIterator last, Function f);} \]
\[ \text{template<InputIterator I, Sentinel<I> S, class Proj = identity,} \]
\[ \text{IndirectCallable<Projected<I, Proj>> Fun}> \]
\[ \text{tagged_pair<tag::in(I), tag::fun(Fun)>} \]
\[ \text{for_each(I first, S last, Fun f, Proj proj = Proj{});} \]
\[ \text{template<InputRange Rng, class Proj = identity,} \]
\[ \text{IndirectCallable<Projected<IteratorType<Rng>, Proj>> Fun}> \]
\[ \text{tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::fun(Fun)>} \]
\[ \text{for_each(Rng& rng, Fun f, Proj proj = Proj{});} \]

1 Requires: Function shall meet the requirements of MoveConstructible (Table 20 19.4.4). [Note: Function need not meet the requirements of CopyConstructible (Table 21 19.4.5). -- end note]

2 Effects: Applies \(f\) to the result of dereferencing every iterator \(\text{INVOKE}(f, \text{INVOK}(\text{proj}, \ast i))\) for every iterator \(i\) in the range \([\text{first},\text{last})\), starting from \(\text{first}\) and proceeding to \(\text{last} - 1\). [Note: If the type of \(\text{first}\) satisfies the requirements of a mutable iterator, result of \(\text{INVOK}(\text{proj}, \ast i)\) is a mutable reference. \(f\) may apply nonconstant functions through the dereferenced iterator. -- end note]
Returns: \texttt{std::move(f)} \{last, std::move(f)\}.

Complexity: Applies \texttt{f and proj} exactly \texttt{last - first} times.

Remarks: If \texttt{f} returns a result, the result is ignored.

25.2.5 Find

\begin{verbatim}
    template<class InputIterator, class T>
    InputIterator find(InputIterator first, InputIterator last,
                       const T& value);

    template<class InputIterator, class Predicate>
    InputIterator find_if(InputIterator first, InputIterator last,
                           Predicate pred);

    template<class InputIterator, class Predicate>
    InputIterator find_if_not(InputIterator first, InputIterator last,
                               Predicate pred);

    template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
    requires IndirectCallableRelation<equal_to<>, Projected<I, Proj>, const T*>
    I find(I first, S last, const T& value, Proj proj = Proj());

    template<InputRange Rng, class T, class Proj = identity>
    requires IndirectCallableRelation<equal_to<>, Projected<IteratorType<Rng>, Proj>, const T*>
    IteratorType safe_iterator_t<Rng>
    find(Rng& rng, const T& value, Proj proj = Proj());

    template<InputIterator I, Sentinel<I> S, class Proj = identity,
             IndirectCallablePredicate<Projected<I, Proj>> Pred>
    I find_if(I first, S last, Pred pred, Proj proj = Proj());

    template<InputRange Rng, class Proj = identity,
             IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
    IteratorType safe_iterator_t<Rng>
    find_if(Rng& rng, Pred pred, Proj proj = Proj());

    template<InputIterator I, Sentinel<I> S, class Proj = identity,
             IndirectCallablePredicate<Projected<I, Proj>> Pred>
    I find_if_not(I first, S last, Pred pred, Proj proj = Proj());

    template<InputRange Rng, class Proj = identity,
             IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
    IteratorType safe_iterator_t<Rng>
    find_if_not(Rng& rng, Pred pred, Proj proj = Proj());
\end{verbatim}

Returns: The first iterator \texttt{i} in the range \texttt{[first,last)} for which the following corresponding conditions hold: \texttt{\*i == value, pred(\*i) != false, pred(\*i) == false, INVOKE(proj, \*i) == value, INVOKE(pred, INVOKE(proj, \*i)) != false, INVOKE(pred, INVOKE(proj, \*i)) == false}. Returns \texttt{last} if no such iterator is found.

Complexity: At most \texttt{last - first} applications of the corresponding predicate and projection.

25.2.6 Find end

\begin{verbatim}
    template<class ForwardIterator1, class ForwardIterator2>
    ForwardIterator1
    find_end(ForwardIterator1 first1, ForwardIterator1 last1,

\end{verbatim}
template<ForwardIterator2 first2, ForwardIterator2 last2>
ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
BinaryPredicate pred);

template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
Sentinel<I2> S2, class Proj = identity,
IndirectCallableRelation<I2, Projected<I1, Proj>> Pred = equal_to<>>
I1
find_end(I1 first1, S1 last1, I2 first2, S2 last2,
Pred pred = Pred{}, Proj proj = Proj{});

template<InputRange Rng1, ForwardRange Rng2, 
class Proj1 = identity, 
IndirectCallableRelation<IteratorType<Rng2>, 
Projected<IteratorType<Rng>, Proj>> Pred = equal_to<>>
ITerratorType safe_iterator_t<Rng1>
find_end(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{}, Proj proj = Proj{});

Effects: Finds a subsequence of equal values in a sequence.

Returns: The last iterator \( i \) in the range \([\text{first1}, \text{last1}) - (\text{last2} - \text{first2})\) such that for every non-negative integer \( n < (\text{last2} - \text{first2}) \), the following corresponding conditions hold:
\[
*(i + n) == *(\text{first2} + n), \quad \text{pred}((i + n), *(\text{first2} + n)) \neq \text{false}
\]
INVOKE \( \text{pred} \), INVOKE \( \text{proj} \), \( *(i + n) \), *(first2 + n) \) \neq \text{false}.
Returns \( \text{last1} \) if \([\text{first2}, \text{last2})\) is empty or if no such iterator is found.

Complexity: At most \((\text{last2} - \text{first2}) \times (\text{last1} - \text{first1} - (\text{last2} - \text{first2}) + 1)\) applications of the corresponding predicate and projection.

25.2.7 Find first

[alg.find.first.of]
IndirectCallablePredicate<Projected<IteratorType<Rng1>, Proj1>,
Projected<IteratorType<Rng2>, Proj2>>, Pred = equal_to>>
IteratorType safe_iterator_t<Rng1>

find_first_of(Rng1& rng1, Rng2& rng2, Pred pred = Pred{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

1 Effects: Finds an element that matches one of a set of values.
2 Returns: The first iterator \(i\) in the range \([\text{first1}, \text{last1})\) such that for some iterator \(j\) in the range
\([\text{first2}, \text{last2})\) the following conditions hold: \(*i == *j, \text{pred}(\text{proj1}(\text{proj2}(i)) \neq \text{false}\). Returns \text{last1} if \([\text{first2}, \text{last2})\) is empty or if no such iterator is found.
3 Complexity: At most \((\text{last1}-\text{first1}) * (\text{last2}-\text{first2})\) applications of the corresponding predicate
and the two projections.

25.2.8 Adjacent find

[alg.adjacent.find]

template<class ForwardIterator>
ForwardIterator adjacent_find(ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
ForwardIterator adjacent_find(ForwardIterator first, ForwardIterator last,
BinaryPredicate pred);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallableRelation<Projected<I, Proj>>, Proj> Pred = equal_to>>
I
adjacent_find(I first, S last, Pred pred = Pred{},
Proj proj = Proj{});

1 Returns: The first iterator \(i\) such that both \(i\) and \(i + 1\) are in the range \([\text{first}, \text{last})\) for which the
following corresponding conditions hold: \(*i == *(i + 1), \text{pred}(\text{proj}(\text{proj}(i)), \text{proj}(\text{proj}(i + 1))) \neq \text{false}\). Returns \text{last} if no such iterator is found.
2 Complexity: For a nonempty range, exactly \(\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)\) applications of the corresponding predicate, where \(i\) is adjacent_find’s return value, and no more than twice
as many applications of the projection.

25.2.9 Count

[alg.count]

template<class InputIterator, class T>
typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);

template<class InputIterator, class Predicate>
typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);

template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
requires IndirectCallableRelation<equal_to>, Projected<I, Proj>, const T*
DifferenceType<I>
count(I first, S last, const T& value, Proj proj = Proj{});
template<InputRange Rng, class T, class Proj = identity>
requires IndirectCallableRelation<equal_to<>, Projected<IteratorType<Rng>>, Proj>, const T*>()
DifferenceType<IteratorType<Rng>>
count(Rng&& rng, const T* value, Proj proj = Proj{});

template<InputIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallablePredicate<Projected<I, Proj>> Pred>
DifferenceType<I>
count_if(I first, S last, Pred pred, Proj proj = Proj{});

template<InputRange Rng, class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>>, Proj>> Pred>
DifferenceType<IteratorType<Rng>>
count_if(Rng&& rng, Pred pred, Proj proj = Proj{});

Effects: Returns the number of iterators \(i\) in the range \([\text{first},\text{last})\) for which the following corresponding conditions hold:
\(i == \text{value}, \text{pred}(\text{proj}(i)) != \text{false}\)\n
Complexity: Exactly \(\text{last} - \text{first}\) applications of the corresponding predicate and projection.

25.2.10 Mismatch

```
template<class InputIterator1, class InputIterator2>
pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2);

template<class InputIterator1, class InputIterator2,
         class BinaryPredicate>
pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         BinaryPredicate pred);

template<InputIterator I1, Sentinel<I1> S1, WeakInputIterator I2,
         class Proj1 = identity, class Proj2 = identity,
         IndirectCallablePredicate<Projected<I1, Proj1>, Projected<I2, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(I1), tag::in2(I2)>
mismatch(I1 first1, S1 last1, I2 first2, Pred pred = Pred{},
         Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, WeakInputIterator I2,
         class Proj1 = identity, class Proj2 = identity,
         IndirectCallablePredicate<Projected<IteratorType<Rng1>, Proj1>, Proj2>,

§ 25.2.10
Projected<I2, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng1>), tag::in2(I2)>
mismatch(Rng1&& rng1, I2 first2, Pred pred = Pred{},
          Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
class Proj1 = identity, class Proj2 = identity,
IndirectCallablePredicate<Projected<I1, Proj1>, Proj1>, Projected<I2, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(I1), tag::in2(I2)>
mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = Pred{},
          Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2,
class Proj1 = identity, class Proj2 = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng1>, Proj1>, Proj1>,
Projected<IteratorType<Rng2>, Proj2>> Pred = equal_to<>>
tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng1>), tag::in2(IteratorType safe_iterator_t<Rng2>)>
mismatch(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
          Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

1 Remarks: If last2 was not given in the argument list, it denotes first2 + (last1 - first1) below.
2 Returns: A pair of iterators i and j such that j == first2 + (i - first1) and i is the first iterator in the range [first1,last1) for which the following corresponding conditions hold:
   (2.1) j is in the range [first2, last2).
   (2.2) !(i == *(first2 + (i - first1)))
   (2.3) pred(*i, *(first2 + (i - first1))) == false

Returns the pair first1 + min(last1 - first1, last2 - first2) and first2 + min(last1 - first1, last2 - first2) if such an iterator i is not found.

3 Complexity: At most last1 - first1 applications of the corresponding predicate and both projections.

25.2.11 Equal

template<class InputIterator1, class InputIterator2>
bool equal(InputIterator1 first1, InputIterator1 last1, 
           InputIterator2 first2);

template<class InputIterator1, class InputIterator2, 
class BinaryPredicate>
bool equal(InputIterator1 first1, InputIterator1 last1, 
           InputIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
bool equal(InputIterator1 first1, InputIterator1 last1, 
           InputIterator2 first2, InputIterator2 last2);

template<class InputIterator1, class InputIterator2, 
class BinaryPredicate>
bool equal(InputIterator1 first1, InputIterator1 last1, 
           InputIterator2 first2, InputIterator2 last2, 
           BinaryPredicate pred);

template<InputIterator I1, Sentinel<I1> S1, WeakInputIterator I2, 
class Pred = equal_to<>>, class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>\()
bool equal(I1 first1, S1 last1,
           I2 first2, Pred pred = Pred{},
           Proj1 proj1 = Proj{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, WeakInputIterator I2, class Pred = equal_to<>,
class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<IteratorType<Rng1>, I2, Pred, Proj1, Proj2>\()
bool equal(Rng1&& rng1, I2 first2,
           Pred pred = Pred{},
           Proj1 proj1 = Proj{}, Proj2 proj2 = Proj2{});

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
class Pred = equal_to<>, class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>\()
bool equal(I1 first1, S1 last1,
           I2 first2, S2 last2,
           Pred pred = Pred{},
           Proj1 proj1 = Proj{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, class Pred = equal_to<>,
class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<IteratorType<Rng1>, IteratorType<Rng2>, Pred, Proj1, Proj2>\()
bool equal(Rng1&& rng1, Rng2&& rng2,
           Pred pred = Pred{},
           Proj1 proj1 = Proj{}, Proj2 proj2 = Proj2{});

Remarks: If last2 was not given in the argument list, it denotes \texttt{first2 + (last1 - first1)} below.

Returns: If \texttt{last1 - first1 != last2 - first2}, return \texttt{false}. Otherwise return \texttt{true} if for every iterator \texttt{i} in the range \texttt{[first1, last1)} the following corresponding condition holds:
\texttt{\texttt{i == *(first2 + (i - first1))}, pred(*i, *(first2 + (i - first1)))) != false}. Otherwise, return \texttt{false}.

Complexity: No applications of the corresponding predicate and projections if \texttt{InputIterator1 and InputIterator2 meet the requirements of random access iterators \texttt{I1 and S1 model SizedIteratorRange <I1,S1>()}} is satisfied, and \texttt{I2 and S2 model SizedIteratorRange <I2,S2>()}} is satisfied, and \texttt{last1 - first1 != last2 - first2}. Otherwise, at most \texttt{min(last1 - first1, last2 - first2)} applications of the corresponding predicate and projections.

25.2.12 Is permutation

template<class ForwardIterator1, class ForwardIterator2>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2);

template<class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, BinaryPredicate pred);

template<class ForwardIterator1, class ForwardIterator2>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
                    ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);

template<class ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
class Pred = equal_to<>, class Proj1 = identity, class Proj2 = identity>

§ 25.2.12
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
bool is_permutation(I1 first1, S1 last1, I2 first2,
    Pred pred = Pred{},
    Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<ForwardRange Rng1, ForwardIterator I2, class Pred = equal_to<>,
    class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<IteratorType<Rng1>, I2, Pred, Proj1, Proj2>
bool is_permutation(Rng1&& rng1, I2 first2, Pred pred = Pred{},
    Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2,
    Sentinel<I2> S2, class Pred = equal_to<>, class Proj1 = identity,
    class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
bool is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
    Pred pred = Pred{},
    Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<ForwardRange Rng1, ForwardRange Rng2, class Pred = equal_to<>,
    class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<IteratorType<Rng1>, IteratorType<Rng2>, Pred, Proj1, Proj2>
bool is_permutation(Rng1&& rng1, Rng2&& rng2, Pred pred = Pred{},
    Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

1 **Requires**: ForwardIterator1 and ForwardIterator2 shall have the same value type. The comparison function shall be an equivalence relation.

2 **Remarks**: If last2 was not given in the argument list, it denotes first2 + (last1 - first1) below.

3 **Returns**: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2,first2 + (last1 - first1)), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin, pred, proj1, proj2) returns true or equal(first1, last1, begin, pred) returns true; otherwise, returns false.

4 **Complexity**: No applications of the corresponding predicate and projections if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators I1 and S1 model SizedIteratorRange<I1,S1>() is satisfied, and I2 and S2 model SizedIteratorRange<I2,S2>() is satisfied, and last1 - first1 != last2 - first2. Otherwise, exactly distance(first1, last1) applications of the corresponding predicate and projections if equal(first1, last1, first2, last2, pred, proj1, proj2) would return true if pred was not given in the argument list or equal(first1, last1, first2, last2, pred) would return true if pred was given in the argument list; otherwise, at worst \(O(N^2)\), where \(N\) has the value distance(first1, last1).

### 25.2.13 Search

template<class ForwardIterator1, class ForwardIterator2>
ForwardIterator1 search(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
    class BinaryPredicate>
ForwardIterator1 search(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2,
    BinaryPredicate pred);
template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, 
    Sentinel<I2> S2, class Pred = equal_to<>, 
    class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>()
I1
    search(I1 first1, S1 last1, I2 first2, S2 last2, 
        Pred pred = Pred{}, 
        Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<ForwardRange Rng1, ForwardRange Rng2, class Pred = equal_to<>, 
    class Proj1 = identity, class Proj2 = identity>
requires IndirectlyComparable<IteratorType<Rng1>, IteratorType<Rng2>, Pred, Proj1, Proj2>()
IteratorType safe_iterator t<Rng1>
    search(Rng1& rng1, Rng2& rng2, Pred pred = Pred{}, 
        Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

Effects: Finds a subsequence of equal values in a sequence.

Returns: The first iterator i in the range [first1, last1) such that for every non-negative integer n less than last1 - first1 the following corresponding conditions hold: *(i + n) == *(first1 + n), pred(*(i + n), *(first1 + n)) != false INVOKE(pred, INVOKE(proj1, *(i + n)), INVOKE(proj2, *(first1 + n))) != false. Returns first1 if [first1, last1) is empty, otherwise returns last1 if no such iterator is found.

Complexity: At most (last1 - first1) * (last2 - first2) applications of the corresponding predicate and projections.

template<class ForwardIterator, class Size, class T>
ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last, Size count, 
        const T& value);

template<class ForwardIterator, class Size, class T, 
    class BinaryPredicate>
ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last, Size count, 
        const T& value, BinaryPredicate pred);

template<ForwardIterator I, Sentinel<I> S, class T, 
    class Pred = equal_to<>, class Proj = identity>
requires IndirectlyComparable<I, const T*, Pred, Proj>()
I
    search_n(I first, S last, DifferenceType<I> count, 
        const T& value, Pred pred = Pred{}, 
        Proj proj = Proj{});

template<ForwardRange Rng, class T, class Pred = equal_to<>, 
    class Proj = identity>
requires IndirectlyComparable<IteratorType<Rng>, const T*, Pred, Proj>()
IteratorType safe_iterator t<Rng>
    search_n(Rng& rng, DifferenceType<IteratorType<Rng>> count, 
        const T& value, Pred pred = Pred{}, Proj proj = Proj{});

Requires: The type Size shall be convertible to integral type (4.7, 12.3).

Effects: Finds a subsequence of equal values in a sequence.

Returns: The first iterator i in the range [first, last-count) such that for every non-negative integer n less than count the following corresponding conditions hold: *(i + n) == value, pred(*(i + 

§ 25.2.13
n), value) != false. Returns last if no such iterator is found.

**Complexity:** At most last - first applications of the corresponding predicate and projection.

### 25.3 Mutating sequence operations

#### [alg.modifying.operations]

#### [alg.copy]

```cpp
template<class InputIterator, class OutputIterator>
OutputIterator copy(InputIterator first, InputIterator last,
                    OutputIterator result);
```

```cpp
template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
requires IndirectlyCopyable<I, O>()
tagged_pair<tag::in(I), tag::out(O)>
copy(I first, S last, O result);
```

```cpp
template<InputRange Rng, WeaklyIncrementable O>
requires IndirectlyCopyable<IteratorType<Rng>, O>()
tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::out(O)>
copy(Rng& rng, O result);
```

1. **Effects:** Copies elements in the range [first, last) into the range [result, result + (last - first)) starting from first and proceeding to last. For each non-negative integer \( n < (last - first) \), performs \( *(result + n) = *(first + n) \).

2. **Returns:** \( result + (last - first) \) \( \{last, result + (last - first)\} \).

3. **Requires:** result shall not be in the range [first, last).

4. **Complexity:** Exactly last - first assignments.

```cpp
template<class InputIterator, class Size, class OutputIterator>
OutputIterator copy_n(InputIterator first, Size n,
                       OutputIterator result);
```

```cpp
template<WeakInputIterator I, WeaklyIncrementable O>
requires IndirectlyCopyable<I, O>()
tagged_pair<tag::in(I), tag::out(O)>
copy_n(I first, iterator_distance_t<__difference_t<I> n, O result);
```

5. **Effects:** For each non-negative integer \( i < n \), performs \( *(result + i) = *(first + i) \).

6. **Returns:** \( result + n \) \( \{first + n, result + n\} \).

7. **Complexity:** Exactly n assignments.

```cpp
template<class InputIterator, class OutputIterator, class Predicate>
OutputIterator copy_if(InputIterator first, InputIterator last,
                       OutputIterator result, Predicate pred);
```

```cpp
template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class Proj = identity,
         IndirectCallablePredicate<Projected<I, Proj>>, Pred>
requires IndirectlyCopyable<I, O>()
tagged_pair<tag::in(I), tag::out(O)>
copy_if(I first, S last, O result, Pred pred, Proj proj = Proj());
```

```cpp
template<InputRange Rng, WeaklyIncrementable O, class Proj = identity,
         IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>>, Pred>
requires IndirectlyCopyable<IteratorType<Rng>, O>()
```

§ 25.3.1
tagged_pair<
  tag::in(IteratorType safe_iterator_t<Rng>),
  tag::out(O)>

   copy_if(Rng & rng, O result, Pred pred, Proj proj = Proj());

**Requires:** The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) shall not overlap.

**Effects:** Copies all of the elements referred to by the iterator \(i\) in the range \([\text{first}, \text{last})\) for which \(\text{INVOKE(pred, INVOKE(proj, *i))}\) is true.

**Returns:** The end of the resulting range \([\text{last}, \text{result} + (\text{last} - \text{first}))\).

**Complexity:** Exactly \(\text{last} - \text{first}\) applications of the corresponding predicate and projection.

**Remarks:** Stable (17.6.5.7).

---

**25.3.2 Move**

**Effects:** Moves elements in the range \([\text{first}, \text{last})\) into the range \([\text{result} - (\text{last} - \text{first}), \text{result)}\) starting from \(\text{last} - 1\) and proceeding to \(\text{first}\). For each positive integer \(n \leq (\text{last} - \text{first})\), performs \(\text{*(result} - n) = \text{std::move(*}(\text{first} + n))\).

**Requires:** \(\text{result}\) shall not be in the range \([\text{first}, \text{last})\).

**Returns:** \(\text{result} - (\text{last} - \text{first})(\text{last}, \text{result} - (\text{last} - \text{first}))\).

**Complexity:** Exactly \(\text{last} - \text{first}\) assignments.

---

4) \text{copy_backward} should be used instead of \text{copy} when \(\text{last}\) is in the range \([\text{result} - (\text{last} - \text{first}), \text{result})\).
Returns: \( \text{result} + (\text{last} - \text{first}) \) \{\text{last}, \text{result} + (\text{last} - \text{first})\}.

Requires: \text{result} shall not be in the range \([\text{first}, \text{last})\).

Complexity: Exactly \( \text{last} - \text{first} \) move assignments.

\[
\text{template<class BidirectionalIterator1, class BidirectionalIterator2>}
\]

\[
\text{BidirectionalIterator2}
\]

\[
\text{move_backward}(\text{BidirectionalIterator1 first},
\]

\[
\text{BidirectionalIterator1 last},
\]

\[
\text{BidirectionalIterator2 result});
\]

\[
\text{template<BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
}
\]

\[
\text{requires IndirectlyMovable<I1, I2>()}
\]

\[
\text{tagged_pair<tag::in1(I1), tag::in2out(I2)>}
\]

\[
\text{move_backward(I1 first, I1 last, I2 result});
\]

\[
\text{template<BidirectionalRange Rng, BidirectionalIterator I>
}
\]

\[
\text{requires IndirectlyMovable<IteratorType<Rng>, I>()}
\]

\[
\text{tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng>), tag::in2out(I)>}
\]

\[
\text{move_backward(Rng& rng, I result)};
\]

Effects: Moves elements in the range \([\text{first}, \text{last})\) into the range \([\text{result} - (\text{last} - \text{first}), \text{result})\) starting from \(\text{last} - 1\) and proceeding to \(\text{first}\). For each positive integer \(n \leq (\text{last} - \text{first})\), performs \(*(*(\text{result} - n)) = \text{std::move}(*((\text{last} - n)))\).

Requires: \text{result} shall not be in the range \([\text{first}, \text{last}]\).

Returns: \(\text{result} - (\text{last} - \text{first})\) \{\text{last}, \text{result} - (\text{last} - \text{first})\}.

Complexity: Exactly \( \text{last} - \text{first} \) assignments.

\[25.3.3\] swap \[\text{[alg.swap]}\]

\[
\text{template<class ForwardIterator1, class ForwardIterator2>
}
\]

\[
\text{ForwardIterator2}
\]

\[
\text{swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,}
\]

\[
\text{ForwardIterator2 first2});
\]

\[
\text{template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2>
}
\]

\[
\text{requires IndirectlySwappable<I1, I2>()}
\]

\[
\text{tagged_pair<tag::in1(I1), tag::in2(I2)>}
\]

\[
\text{swap_ranges(I1 first1, S1 last1, I2 first2});
\]

\[
\text{template<ForwardRange Rng, ForwardIterator I>
}
\]

\[
\text{requires IndirectlySwappable<IteratorType<Rng>, I>()}
\]

\[
\text{tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng>), tag::in2out(I)>}
\]

\[
\text{swap_ranges(Rng& rng, I first2)};
\]

\[
\text{template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2>
}
\]

\[
\text{requires IndirectlySwappable<I1, I2>()}
\]

\[
\text{tagged_pair<tag::in1(I1), tag::in2(I2)>}
\]

\[
\text{swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2});
\]

\[
\text{template<ForwardRange Rng1, ForwardRange Rng2>
}
\]

\[
\text{requires IndirectlySwappable<IteratorType<Rng1>, IteratorType<Rng2>()}
\]

\[
\text{tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng1>), tag::in2(IteratorType safe_iterator_t<Rng2>)>
}
\]

\[
\text{swap_ranges(Rng1& rng1, Rng2& rng2});
\]

\[5\] move\_backward should be used instead of move when last is in the range \([\text{result} - (\text{last} - \text{first}), \text{result})\).
Effects: For the first two overloads, let last2 be first2 + (last1 - first1). For each non-negative integer \( n \leq (last1 - first1) \) \( n < \min(last1 - first1, last2 - first2) \) performs: swap(*(first1 + n), *(first2 + n)).

Requires: The two ranges \([first1,last1)\) and \([first2,first2 + (last1 - first1)]\) \([first2,last2)\) shall not overlap. *(first1 + n) shall be swappable with (19.2.10) *(first2 + n).

Returns: \( first2 - (last1 - first1)(first1 + n, first2 + n) \), where \( n \) is \( \min(last1 - first1, last2 - first2) \).

Complexity: Exactly \( last1 - first1 \min(last1 - first1, last2 - first2) \) swaps.

```cpp
void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

Requires: a and b shall be dereferenceable. *a shall be swappable with (19.2.10) *b.

### 25.3.4 Transform

```
template<class InputIterator, class OutputIterator, class UnaryOperation>
OutputIterator transform(InputIterator first, InputIterator last, OutputIterator result, UnaryOperation op);
```

```
template<class InputIterator1, class InputIterator2, class OutputIterator, class BinaryOperation>
OutputIterator transform(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, OutputIterator result, BinaryOperation binary_op);
```

```
template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class F, class Proj = identity,>
IndirectCallable<Projected<I, Proj>> F,
WeakOutputIterator<IndirectCallableResultType<F, Projected<I, Proj>>, O>
requires Writable<O, IndirectCallableResultType<F, Projected<I, Proj>>>()
tagged_pair<tag::in(I), tag::out(O)>
transform(I first, S last, O result, F op, Proj proj = Proj());
```

```
template<InputRange Rng, WeaklyIncrementable O, class F, class Proj = identity,>
IndirectCallable<Projected<IteratorType<Rng>, Proj>> F,
WeakOutputIterator<IndirectCallableResultType<F, Projected<IteratorType<R>, Proj>>, O>
requires Writable<O, IndirectCallableResultType<F, Projected<IteratorType<R>, Proj>>>()
tagged_pair<tag::in(InputRange safe_iterator_t<Rng>), tag::out(O)>
transform(Rng& rng, O result, F op, Proj proj = Proj());
```

```
template<InputIterator I1, Sentinel<I1> S1, WeakInputIterator I2, WeaklyIncrementable O, class F1, class Proj1 = identity, class Proj2 = identity,>
IndirectCallable<Projected<I1, Proj1>, Projected<I2, Proj2>> F,
WeakOutputIterator<IndirectCallableResultType<F, Projected<I1, Proj1>, Projected<I2, Proj2>>, O>
requires Writable<O, IndirectCallableResultType<F, Projected<I1, Proj1>, Projected<I2, Proj2>>>()
tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
transform(I1 first1, S1 last1, I2 first2, O result,

§ 25.3.4
F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{};

template<InputRange Rng, WeakInputIterator I, WeaklyIncrementable O, class F,
            class Proj1 = identity, class Proj2 = identity>
    IndirectCallable<Projected<IteratorType<Rng>, Proj1>, Projected<I, Proj2>>
    WeakOutputIterator<IndirectCallableResultType<F>,
                        Projected<IteratorType<Rng>, Proj1>, Projected<I, Proj2>>
    requires Writable<O, IndirectCallableResultType<F,
        Projected<IteratorType<Rng>, Proj1>, Projected<I, Proj2>>>()
    tagged_tuple<tag::in1(IteratorType safe_iterator_t<Rng>), tag::in2(I), tag::out(O)>
    transform(Rng& rng1, I first2, O result,
             F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
            class Proj1 = identity, class Proj2 = identity>
    IndirectCallable<Projected<I1, Proj1>, Projected<I2, Proj2>>
    WeakOutputIterator<IndirectCallableResultType<F,
                           Projected<I1, Proj1>, Projected<I2, Proj2>>> O
    requires Writable<O, IndirectCallableResultType<F,
        Projected<I1, Proj1>, Projected<I2, Proj2>>>()
    tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
    transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, class F,
            class Proj1 = identity, class Proj2 = identity>
    IndirectCallable<Projected<IteratorType<Rng1>, Proj1>, Projected<IteratorType<Rng2>, Proj2>>
    WeakOutputIterator<IndirectCallableResultType<F,
                           Projected<IteratorType<Rng1>, Proj1>, Projected<IteratorType<Rng2>, Proj2>>
    requires Writable<O, IndirectCallableResultType<F,
        Projected<IteratorType<Rng1>, Proj1>, Projected<IteratorType<Rng2>, Proj2>>>()
    tagged_tuple<tag::in1(IteratorType safe_iterator_t<Rng1>),
               tag::in2(IteratorType safe_iterator_t<Rng2>),
               tag::out(O)>
    transform(Rng1& rng1, Rng2& rng2, O result,
              F binary_op, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

1 For binary transforms that do not take last2, let last2 be first2 + (last1 - first1). Let N be
   (last1 - first1) for unary transforms, or min(last1 - first1, last2 - first2) for binary
   transforms.

2 Effects: Assigns through every iterator i in the range [result, result + (last1 - first1)N] a new
   corresponding value equal to op(**(first1 + (i - result))) INVOKE(op, INVOKE(proj, *(first1
   + (i - result)))) or binary_op(**(first1 + (i - result))), *(first2 + (i - result))) INVOKE(binary_op,
   INVOKE(proj1, *(first1 + (i - result))), INVOKE(proj2, *(first2 + (i - result))))).

3 Requires: op and binary_op shall not invalidate iterators or subrange, or modify elements in the ranges
   [first1, last1 + first1 + N], [first2, first2 + (last1 - first1)N], and [result, result + (last1
   - first1)N].

4 Returns: result + (last1 - first1)N, result + N or make_tagged_tuple(tag::in1,
   tag::in2, tag::out>(first1 + N, first2 + N, result + N).

5 Complexity: Exactly last1 - first1N applications of op or binary_op.

6) The use of fully closed ranges is intentional.
Remarks: result may be equal to first1 in case of unary transform, or to first1 or first2 in case of binary transform.

### 25.3.5 Replace

[alg.replace]

```cpp
template<class ForwardIterator, class T>
void replace(ForwardIterator first, ForwardIterator last,
            const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
void replace_if(ForwardIterator first, ForwardIterator last,
                Predicate pred, const T& new_value);

template<ForwardIterator I, Sentinel<I> S, Semiregular T2, class Proj = identity>
requires Writable<I, T2> () & IndirectCallableRelation<equal_to<>, Projected<I, Proj>, const T1 *> ()
I
    replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = Proj{});

template<ForwardRange Rng, class T1, Semiregular T2, class Proj = identity>
requires Writable<IteratorType<Rng>, T2> () & IndirectCallableRelation<equal_to<>, Projected<IteratorType<Rng>, Proj>, const T1 *> ()
IteratorType safe_iterator_t<Rng>
    replace(Rng& rng, const T1& old_value, const T2& new_value, Proj prog = Proj{});

template<ForwardIterator I, Sentinel<I> S, Semiregular T, class Proj = identity,
         IndirectCallablePredicate<Projected<I, Proj>> Pred>
requires Writable<I, T> ()
I
    replace_if(I first, S last, Pred pred, const T& new_value, Proj prog = Proj{});

template<ForwardRange Rng, Semiregular T, class Proj = identity,
         IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires Writable<IteratorType<Rng>, T> ()
IteratorType safe_iterator_t<Rng>
    replace_if(Rng& rng, Pred pred, const T& new_value, Proj prog = Proj{});
```

1 Requires: The expression *first = new_value shall be valid.
2 Effects: Substitutes elements referred by the iterator i in the range [first, last) with new_value, when the following corresponding conditions hold: *i == old_value, INVOKE(proj, *i) == old_value, pred(*i) != false. INVOKE(pred, INVOKE(proj, *i)) != false.
3 Returns: last.
4 Complexity: Exactly last - first applications of the corresponding predicate and projection.

```cpp
template<class InputIterator, class OutputIterator, class T>
OutputIterator
    replace_copy(InputIterator first, InputIterator last,
                 OutputIterator result,
                 const T& old_value, const T& new_value);

template<class InputIterator, class OutputIterator, class Predicate, class T>
OutputIterator
    replace_copy_if(InputIterator first, InputIterator last,
                    OutputIterator result,
                    Predicate pred, const T& new_value);
```
template<InputIterator I, Sentinel<I> S, class T1, Semiregular T2, WeakOutputIterator<T2> O, class Proj = identity>
requires IndirectlyCopyable<I, O> () &&
IndirectCallableRelation<equal_to<>, Projected<I, Proj>, const T1 *>()
tagged_pair<in(I), out(O)>
    replace_copy(I first, S last, O result, const T1 &old_value, const T2 &new_value,
                Proj proj = Proj());

template<InputRange Rng, class T1, Semiregular T2, WeakOutputIterator<T2> O, class Proj = identity>
requires IndirectlyCopyable<IteratorType<Rng>, O> () &&
IndirectCallableRelation<equal_to<>, Projected<IteratorType<Rng>, Proj>, const T1 *>()
tagged_pair<in(IteratorType safe_iterator_t<Rng>), out(O)>
    replace_copy(Rng &rng, O result, const T1 &old_value, const T2 &new_value,
                Proj proj = Proj());

template<InputIterator I, Sentinel<I> S, Semiregular T, WeakOutputIterator<T> O, class Proj = identity, IndirectCallablePredicate<Projected<I, Proj>> Pred>
requires IndirectlyCopyable<I, O> ()
tagged_pair<in(I), out(O)>
    replace_copy_if(I first, S last, O result, Pred pred, const T &new_value,
                    Proj proj = Proj());

template<InputRange Rng, Semiregular T, WeakOutputIterator<T> O, class Proj = identity, IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires IndirectlyCopyable<IteratorType<Rng>, O> ()
tagged_pair<in(IteratorType safe_iterator_t<Rng>), out(O)>
    replace_copy_if(Rng &rng, O result, Pred pred, const T &new_value,
                    Proj proj = Proj());

5 Requires: The results of the expressions *first and new_value shall be writable to the result output iterator. The ranges [first,last) and [result,result + (last - first)) shall not overlap.
6 Effects: Assigns to every iterator i in the range [result,result + (last - first)) either new_value or *(first + (i - result)) depending on whether the following corresponding conditions hold:
   *(first + (i - result))) == old_value
   pred(*(first + (i - result))) != false

   INVOCERABLE(proj, *(first + (i - result))) == old_value
   INVOCERABLE(pred, INVOCERABLE(proj, *(first + (i - result)))) != false
7 Returns: {last, result + (last - first)}.
8 Complexity: Exactly last - first applications of the corresponding predicate and projection.

25.3.6 Fill [alg.fill]

   template<class ForwardIterator, class T>
   void fill(ForwardIterator first, ForwardIterator last, const T &value);

   template<class OutputIterator, class Size, class T>
   OutputIterator fill_n(OutputIterator first, Size n, const T &value);

   template<Semiregular class T, OutputIterator<T> O, Sentinel<O> S>
   O fill(O first, S last, const T &value);

§ 25.3.6 145
template<Semiregular class T, OutputRange<T> Rng>
IteratorType safe_iterator_t<Rng>
    fill(Rng& rng, const T& value);

template<Semiregular class T, WeakOutputIterator<T> O>
O fill_n(O first, DifferenceType<O> n, const T& value);

1 Requires: The expression value shall be writable to the output iterator. The type Size shall be convertible to an integral type (4.7, 12.3).

2 Effects: The first algorithm fill assigns value through all the iterators in the range [first, last). The second algorithm fill_n assigns value through all the iterators in the range [first, first + n) if n is positive, otherwise it does nothing.

3 Returns: fill returns last. fill_n returns first + n for non-negative values of n and first for negative values.

4 Complexity: Exactly last - first, n, or 0 assignments, respectively.

25.3.7 Generate

template<class ForwardIterator, class Generator>
void generate(ForwardIterator first, ForwardIterator last, Generator gen);

template<class OutputIterator, class Size, class Generator>
OutputIterator generate_n(OutputIterator first, Size n, Generator gen);

template<Function F, OutputIterator<ResultType<F>> O, Sentinel<O> S>
O generate(O first, S last, F gen);

template<Function F, OutputRange<ResultType<F>> Rng>
IteratorType safe_iterator_t<Rng>
    generate(Rng& rng, F gen);

template<Function F, WeakOutputIterator<ResultType<F>> O, Distance DifferenceType<O> n, F gen>
O generate_n(O first, Distance DifferenceType<O> n, F gen);

1 Effects: The first algorithm generate invokes the function object gen and assigns the return value of gen through all the iterators in the range [first, last). The second algorithm generate_n invokes the function object gen and assigns the return value of gen through all the iterators in the range [first, first + n) if n is positive, otherwise it does nothing.

2 Requires: gen takes no arguments, Size shall be convertible to an integral type (4.7, 12.3).

3 Returns: generate returns last. generate_n returns first + n for non-negative values of n and first for negative values.

4 Complexity: Exactly last - first, n, or 0 invocations of gen and assignments, respectively.

25.3.8 Remove

template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity>
requires Permutable<I>()
    IndirectCallableRelation<equal_to<>, Projected<I, Proj>, const T*>() I remove(I first, S last, const T& value, Proj proj = Proj());

template<ForwardRange Rng, class T, class Proj = identity>
requires Permutable<IteratorType<Rng>>()

§ 25.3.8
IndirectCallableRelation<equal_to<>, Projected<IteratorType<Rng>, Proj>, const T*>\(\)

IteratorType safe_iterator_t<Rng>

\(\)remove(Rng&& rng, const T& value, Proj proj = Proj());

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallablePredicate<Projected<I, Proj>> Pred>
requires Permutable<I>
I remove_if(I first, S last, Pred pred, Proj proj = Proj());

template<ForwardRange Rng, class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires Permutable<IteratorType<Rng>>
IteratorType safe_iterator_t<Rng>

\(\)remove_if(Rng&& rng, Pred pred, Proj proj = Proj());

\begin{enumerate}
\item Requires: The type of \(\star\)first shall satisfy the MoveAssignable requirements (Table 22).
\item Effects: Eliminates all the elements referred to by iterator \(i\) in the range [first, last) for which the following corresponding conditions hold:
\begin{itemize}
\item \(\star_i == \text{value}_\text{INVOKE}(\text{proj}, \*i) == \text{value}\),
\item \(\text{pred}(\*i) \neq \text{false}_\text{INVOKE}(\text{pred}, \text{INVOKE}(\text{proj}, \*i)) \neq \text{false}\).
\end{itemize}
\item Returns: The end of the resulting range.
\item Remarks: Stable (17.6.5.7).
\item Complexity: Exactly last - first applications of the corresponding predicate and projection.
\item Note: each element in the range \([\text{ret}, \text{last})\), where \text{ret} is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range.
\end{enumerate}

\begin{align*}
\text{template<class InputIterator, class OutputIterator, class T>}
\text{OutputIterator}\n&\text{remove_copy(InputIterator first, InputIterator last,}
&\text{OutputIterator result, const T& value);}\\
\text{template<class InputIterator, class OutputIterator, class Predicate>}
\text{OutputIterator}\n&\text{remove_copy_if(InputIterator first, InputIterator last,}
&\text{OutputIterator result, Predicate pred);}\\
\text{template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class T,}
\text{class Proj = identity>}
\text{requires IndirectCopyable\langle I, O\rangle &&}
\text{IndirectCallableRelation<equal_to<>, Projected\langle I, Proj\rangle, const T*> \(\)}\tagged_pair\langle \text{tag::in(I)}, \text{tag::out(O)}\rangle\)
\text{remove_copy(I first, S last, O result, const T& value, Proj proj = Proj{}};\\
\text{template<InputRange Rng, WeaklyIncrementable O, class T, class Proj = identity>}
\text{requires IndirectCopyable\langle IteratorType\langle Rng\rangle, O\rangle &&}
\text{IndirectCallableRelation<equal_to<>, Projected\langle IteratorType\langle Rng\rangle, Proj\rangle, const T*> \(\)}\tagged_pair\langle \text{tag::in(IteratorType safe_iterator_t\langle Rng\rangle)}, \text{tag::out(O)}\rangle\)
\text{remove_copy(Rng&& rng, O result, const T& value, Proj proj = Proj{}};\\
\text{template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O,}
\text{class Proj = identity, IndirectCallablePredicate\langle Projected\langle I, Proj\rangle \rangle Pred>}
\text{requires IndirectCopyable\langle I, O\rangle \(\)}\tagged_pair\langle \text{tag::in(I)}, \text{tag::out(O)}\rangle\)
\text{remove_copy_if(I first, S last, O result, Pred pred, Proj proj = Proj{}};\end{align*}
template<InputRange Rng, WeaklyIncrementable O, class Proj = identity, IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires IndirectlyCopyable<IteratorType<Rng>, O>()
tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::out(O)>
remove_copy_if(Rng& rng, O result, Pred pred, Proj proj = Proj());

Requires: The ranges \([first, last)\) and \([result, result + (last - first))\) shall not overlap. The expression \(*result = *first\) shall be valid.

Effects: Copies all the elements referred to by the iterator \(i\) in the range \([first, last)\) for which the following corresponding conditions do not hold: \(*i == value \text{INVOKE}(proj, *i) == \text{value}, pred(*i) != false \text{INVOKE}(pred, \text{INVOKE}(proj, *i)) != false.\)

Returns: A pair consisting of \(last\) and the end of the resulting range.

Complexity: Exactly \(last - first\) applications of the corresponding predicate and projection.

Remarks: Stable (17.6.5.7).

25.3.9 Unique [alg.unique]

template<class ForwardIterator>
ForwardIterator unique(ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity, IndirectCallableRelation<Projected<I, Proj>> R = equal_to<>>
requires Permutable<I>()
I unique(I first, S last, R comp = R{}, Proj proj = Proj());

template<ForwardRange Rng, class Proj = identity, IndirectCallableRelation<Projected<IteratorType<Rng>, Proj>> R = equal_to<>>
requires Permutable<IteratorType<Rng>>()
IteratorType safe_iterator_t<Rng>
unique(Rng& rng, R comp = R{}, Proj proj = Proj());

Effects: For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator \(i\) in the range \([first + 1, last)\) for which the following conditions hold: \(*(i - 1) == \text{INVOKE}(proj, *(i - 1)) == \text{INVOKE}(proj, *i)\) or \(pred(*(i - 1)), *i) != false \text{INVOKE}(pred, \text{INVOKE}(proj, *(i - 1)), \text{INVOKE}(proj, *i)) != false.\)

Requires: The comparison function shall be an equivalence relation. The type of \(*first\) shall satisfy the MoveAssignable requirements (Table 22).

Returns: The end of the resulting range.

Complexity: For nonempty ranges, exactly \((last - first) - 1\) applications of the corresponding predicate and no more than twice as many applications of the projection.

template<class InputIterator, class OutputIterator>
OutputIterator unique_copy(InputIterator first, InputIterator last, OutputIterator result);

template<class InputIterator, class OutputIterator, class BinaryPredicate>
OutputIterator
unique_copy(InputIterator first, InputIterator last,
          OutputIterator result, BinaryPredicate pred);

template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O,
         class Proj = identity, IndirectCallableRelation<Projected<I>, Proj>> R = equal_to<>
requires IndirectlyCopyable<I, O>() || (ForwardIterator<I>() || Copyable<ValueType<I>>()

  tagged_pair<tag::in(I), tag::out(O)>
  unique_copy(I first, S last, O result, R comp = R{}, Proj proj = Proj{});

 template<InputRange Rng, WeaklyIncrementable O, class Proj = identity,
          IndirectCallableRelation<Projected<IteratorType<Rng>>, Proj>> R = equal_to<>)
requires IndirectlyCopyable<IteratorType<Rng>, O>() || (ForwardIterator<IteratorType<Rng>>() || Copyable<ValueType<IteratorType<Rng>>()

  tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::out(O)>
  unique_copy(Rng& rng, O result, R comp = R{}, Proj proj = Proj{});

5  Requires: The comparison function shall be an equivalence relation. The ranges [first,last) and
{result,result+(last-first)) shall not overlap. The expression *result = *first shall be valid. If neither InputIterator nor OutputIterator meets the requirements of forward iterator then the value type of InputIterator shall be CopyConstructible (Table 21) and CopyAssignable (Table 1) Otherwise CopyConstructible is not required.

6  Effects: Copies only the first element from every consecutive group of equal elements referred to by the
iterator i in the range [first,last) for which the following corresponding conditions hold:

7  Returns: T A pair consisting of last and the end of the resulting range.

8  Complexity: For nonempty ranges, exactly last - first - 1 applications of the corresponding predicate
and no more than twice as many applications of the projection.

25.3.10 Reverse [alg.reverse]

template<class BidirectionalIterator>
void reverse(BidirectionalIterator first, BidirectionalIterator last);

template<BidirectionalIterator I, Sentinel<I> S>
I reverse(I first, S last);

template<BidirectionalRange Rng>
requires Permutable<IteratorType<Rng>>()

  IteratorType safe_iterator_t<Rng>
  reverse(Rng& rng);

1  Effects: For each non-negative integer i < (last - first)/2, applies iter_swap to all pairs of iterators first + i, (last - i) - 1.

2  Requires: *first shall be swappable (19.2.10).

3  Returns: last.

4  Complexity: Exactly (last - first)/2 swaps.

template<class BidirectionalIterator, class OutputIterator>
OutputIterator

§ 25.3.10
reverse_copy(BidirectionalIterator first,
    BidirectionalIterator last, OutputIterator result);

template<BidirectionalIterator I, Sentinel<I> S, WeaklyIncrementable O>
    requires IndirectlyCopyable<I, O>()
tagged_pair<tag::in(I), tag::out(O)> reverse_copy(I first, S last, O result);

template<BidirectionalRange Rng, WeaklyIncrementable O>
    requires IndirectlyCopyable<IteratorType<Rng>, O>()
tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::out(O)> reverse_copy(Rng& rng, O result);

Effects: Copies the range [first,last) to the range [result,result+(last-first)) such that for every non-negative integer i < (last - first) the following assignment takes place: *(result + (last - first) - 1 - i) = *(first + i).

Requires: The ranges [first,last) and [result,result+(last-first)) shall not overlap.

Returns: result + (last - first)\{last, result + (last - first)\}.

Complexity: Exactly last - first assignments.

25.3.11 Rotate [alg.rotate]

template<class ForwardIterator>
    ForwardIterator rotate(ForwardIterator first, ForwardIterator middle,
        ForwardIterator last);

template<class ForwardIterator>
    requires Permutable<I>()
tagged_pair<tag::begin(I), tag::end(I)> rotate(I first, I middle, S last);

template<class ForwardRange Rng>
    requires Permutable<IteratorType<Rng>>()
tagged_pair<tag::begin(IteratorType safe_iterator_t<Rng>), tag::end(IteratorType safe_iterator_t<Rng>)> rotate(Rng& rng, IteratorType<Rng> middle);

Effects: For each non-negative integer i < (last - first), places the element from the position first + i into position first + (i + (last - middle)) \% (last - first).

Returns: first + (last - middle)\{first + (last - middle), last\}.

Remarks: This is a left rotate.

Requires: [first,middle) and [middle,last) shall be valid ranges. ForwardIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *first shall satisfy the requirements of MoveConstructible (Table 20) and the requirements of MoveAssignable (Table 22).

Complexity: At most last - first swaps.
requires IndirectlyCopyable<IteratorType<Rng>, O>()
tagged_pair<tag::in(IteratorType safe_iterator_t<Rng>), tag::out(O)>
rotate_copy(Rng& rng, IteratorType<Rng> middle, O result);

**Effects:** Copies the range [first,last) to the range [result,result + (last - first)) such that for each non-negative integer i < (last - first) the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) % (last - first)).

**Returns:** result + (last - first) [last, result + (last - first)].

**Requires:** The ranges [first,last) and [result,result + (last - first)) shall not overlap.

**Complexity:** Exactly last - first assignments.

### 25.3.12 Shuffle

[alg.random.shuffle]

template<
class RandomAccessIterator, class UniformRandomNumberGenerator
>
void shuffle(RandomAccessIterator first,
RandomAccessIterator last,
UniformRandomNumberGenerator&& g);

template<RandomAccessIterator I, Sentinel<I> S, class Gen>
requires Permutable<I>() && ConvertibleTo<ResultType<Gen>, DifferenceType<I>>() &&
UniformRandomNumberGenerator<remove_reference_t<Gen>>()
I shuffle(I first, S last, Gen&& g);

template<RandomAccessRange Rng, class Gen>
requires Permutable<I>() && ConvertibleTo<ResultType<Gen>, DifferenceType<I>>() &&
UniformRandomNumberGenerator<remove_reference_t<Gen>>()
IteratorType safe_iterator_t<Rng>
shuffle(Rng& rng, Gen&& g);

**Effects:** Permutes the elements in the range [first,last) such that each possible permutation of those elements has equal probability of appearance.

**Requires:** RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type UniformRandomNumberGenerator shall meet the requirements of a uniform random number generator (26.5.1.3) type whose return type is convertible to iterator_traits<RandomAccessIterator>::difference_type.

**Complexity:** Exactly (last - first) - 1 swaps.

**Returns:** last

**Remarks:** To the extent that the implementation of this function makes use of random numbers, the object g shall serve as the implementation’s source of randomness.

### 25.3.13 Partitions

[alg.partitions]

template<
class InputIterator, class Predicate
>
bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<InputIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallablePredicate<Projected<I, Proj>> Pred>
bool is_partitioned(I first, S last, Pred pred, Proj proj = Proj{});

template<InputRange Rng, class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>>, Proj>>Pred>
bool is_partitioned(Rng& rng, Pred pred, Proj proj = Proj{});
Requires: InputIterator’s value type shall be convertible to Predicate’s argument type.

Returns: true if [first, last) is empty or if [first, last) is partitioned by pred and proj, i.e. if all elements that satisfy pred appear before those that do not, for every i in [first, last).

Complexity: Linear. At most last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity, IndirectCallablePredicate<Projected<I, Proj>> Pred>
requires Permutable<I>()
I partition(I first, S last, Pred pred, Proj proj = Proj());

template<ForwardRange Rng, class Proj = identity, IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires Permutable<IteratorType<Rng>>()
IteratorType safe_iterator_t<Rng>
partition(Rng& rng, Pred pred, Proj proj = Proj());

Effects: Places all the elements in the range [first, last) that satisfy pred before all the elements that do not satisfy it.

Effects: Permutes the elements in the range [first, last) such that there exists and iterator i such that for every iterator j in the range [first, i) INVOKE(pred, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), INVOKE(pred, INVOKE(proj, *k)) == false

Returns: An iterator i such that for every iterator j in the range [first, i) pred(*j) != false INVOKE(pred, INVOKE(proj, *j)) != false, and for every iterator k in the range [i, last), pred(*k) == false INVOKE(pred, INVOKE(proj, *k)) == false.

Requires: ForwardIterator shall satisfy the requirements of ValueSwappable (19.2.10).

Complexity: If ForwardIterator meets the requirements for a BidirectionalIterator, at most (last - first) / 2 swaps are done; otherwise at most last - first swaps are done. Exactly last - first applications of the predicate and projection are done.

template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<BidirectionalIterator I, Sentinel<I> S, class Proj = identity, IndirectCallablePredicate<Projected<I, Proj>> Pred>
requires Permutable<I>()
I stable_partition(I first, S last, Pred pred, Proj proj = Proj());

template<BidirectionalRange Rng, class Proj = identity, IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires Permutable<IteratorType<Rng>>()
IteratorType safe_iterator_t<Rng>
stable_partition(Rng& rng, Pred pred, Proj proj = Proj());

Effects: Places all the elements in the range [first, last) that satisfy pred before all the elements that do not satisfy it.

§ 25.3.13 152
Effects: Permutes the elements in the range \([\text{first}, \text{last})\) such that there exists and iterator \(i\) such that for every iterator \(j\) in the range \([\text{first}, i)\), \(\text{invoke} (\text{pred}, \text{invoke} (\text{proj}, *j)) \neq false\), and for every iterator \(k\) in the range \([i, \text{last})\), \(\text{invoke} (\text{pred}, \text{invoke} (\text{proj}, *k)) \neq false\). The relative order of the elements in both groups is preserved.

Returns: An iterator \(i\) such that for every iterator \(j\) in the range \([\text{first}, i)\), \(\text{pred}(*j) \neq false\) \(\text{invoke} (\text{pred}, \text{proj}(*j)) \neq false\), and for every iterator \(k\) in the range \([i, \text{last})\), \(\text{pred}(*k) = false\) \(\text{invoke} (\text{pred}, \text{proj}(*k)) = false\). The relative order of the elements in both groups is preserved.

Requires: BidirectionalIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of \(*\text{first}\) shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).

Complexity: At most \((\text{last} - \text{first}) \times \log(\text{last} - \text{first})\) swaps, but only linear number of swaps if there is enough extra memory. Exactly \(\text{last} - \text{first}\) applications of the predicate and projection.

\[
\text{partition_copy} (\text{InputIterator} \text{first}, \text{InputIterator} \text{last}, \text{OutputIterator1} \text{out_true}, \text{OutputIterator2} \text{out_false}, \text{Predicate} \text{pred});
\]

\[
\text{partition_move} (\text{InputIterator} \text{first}, \text{Sentinel}\langle\text{InputIterator}\rangle \text{last}, \text{OutputIterator1} \text{out_true}, \text{OutputIterator2} \text{out_false}, \text{Predicate} \text{pred}, \text{Proj} \text{proj} = \text{Proj}{\{});
\]
template<InputRange Rng, WeaklyIncrementable O1, WeaklyIncrementable O2,
class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
requires IndirectlyMovable<IteratorType<Rng>, O1>() &
IndirectlyMovable<IteratorType<Rng>, O2>()
tagged_tuple<tag::in(IteratorType safe_iterator_t<Rng>), tag::out1(O1), tag::out2(O2)>
partition_move(Rng& rng, O1 out_true, O2 out_false, Pred pred,
Proj proj = Proj());

Requires: The input range shall not overlap with either of the output ranges.

Effects: For each iterator i in [first,last), moves *i to the output range beginning with out_true if INVOKE(pred, INVOKE(proj, *i)) is true, or to the output range beginning with out_false otherwise.

Returns: A tuple p such that get<0>(p) is last, get<1>(p) is the end of the output range beginning at out_true and get<2>(p) is the end of the output range beginning at out_false.

Complexity: Exactly last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
ForwardIterator partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallablePredicate<Projected<I, Proj>> Pred>
I partition_point(I first, S last, Pred pred, Proj proj = Proj());

template<ForwardRange Rng, class Proj = identity,
IndirectCallablePredicate<Projected<IteratorType<Rng>, Proj>> Pred>
IteratorType safe_iterator_t<Rng>
partition_point(Rng& rng, Pred pred, Proj proj = Proj());

Requires: ForwardIterator's value type shall be convertible to Predicate's argument type. [first, last) shall be partitioned by pred and proj, i.e. all elements that satisfy pred shall appear before those that do not there should be an iterator mid such that all_of(first, mid, pred, proj) and none_of(mid, last, pred, proj) are both true.

Returns: An iterator mid such that all_of(first, mid, pred, proj) and none_of(mid, last, pred, proj) are both true.

Complexity: O(log(last - first)) applications of pred and proj.

25.4 Sorting and related operations [alg.sorting]
All the operations in 25.4 have two versions: one that takes a function object of type Compare and one that uses an operator take an optional binary callable predicate of type Comp that defaults to less<>

CompareComp is a function object type (20.9) a callable object (20.9.2). The return value of the function call operation the INVOKE operation applied to an object of type CompareComp, when contextually converted to bool (Clause 4), yields true if the first argument of the call is less than the second, and false otherwise. CompareComp comp is used throughout for algorithms assuming an ordering relation. It is assumed that comp will not apply any non-constant function through the dereferenced iterator.

For all algorithms that take Compare, there is a version that uses operator< instead. That is, comp(*i, *j) != false defaults to *i < *j != false. For algorithms other than those described in 25.4.3 to work correctly, comp has to induce a strict weak ordering on the values.
The term *strict* refers to the requirement of an irreflexive relation ($\neg \text{comp}(x, x)$ for all $x$), and the term *weak* to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define $\text{equiv}(a, b)$ as $\neg \text{comp}(a, b) \&\& \neg \text{comp}(b, a)$, then the requirements are that $\text{comp}$ and $\text{equiv}$ both be transitive relations:

(4.1) $\quad \text{comp}(a, b) \&\& \text{comp}(b, c) \implies \text{comp}(a, c)$

(4.2) $\quad \text{equiv}(a, b) \&\& \text{equiv}(b, c) \implies \text{equiv}(a, c)$ [Note: Under these conditions, it can be shown that]

(4.2.1) $\quad \text{equiv}$ is an equivalence relation

(4.2.2) $\quad \text{comp}$ induces a well-defined relation on the equivalence classes determined by $\text{equiv}$

(4.2.3) $\quad$ The induced relation is a strict total ordering. — end note]

A sequence is *sorted with respect to a comparator and projection* $\text{comp}$ and $\text{proj}$ if for every iterator $i$ pointing to the sequence and every non-negative integer $n$ such that $i + n$ is a valid iterator pointing to an element of the sequence, $\text{comp}(*(i + n), \text{proj}(*(i + n)), \text{proj}(i)) = false$. In other words, $\text{comp}$ must be transitive and irreflexive, and $\text{proj}$ must be a well-defined function that maps each iterator to an element of the sequence.

A sequence $[\text{start}, \text{finish})$ is *partitioned with respect to an expression $f(e)$* if there exists an integer $n$ such that for all $0 \leq i < \text{distance}([\text{start}, \text{finish})$, $f(\text{proj}([\text{start} + i]))$ is true if and only if $i < n$.

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an operator==, but an equivalence relation induced by the strict weak ordering. That is, two elements $a$ and $b$ are considered equivalent if and only if $\neg (a < b) \&\& \neg (b < a)$.

### 25.4.1 Sorting

**[alg.sort]**

**25.4.1.1 sort**

```cpp
template<class RandomAccessIterator>
void sort(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void sort(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>()
I sort(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>()
iteratorType safe_iterator_t<Rng>
sort(Rng& rng, Comp comp = Comp{}, Proj proj = Proj{});
```

1 **Effects:** Sorts the elements in the range $[\text{first}, \text{last})$.

2 **Requires:** $\text{RandomAccessIterator}$ shall satisfy the requirements of $\text{ValueSwappable}$ (19.2.10). The type of $\text{*first}$ shall satisfy the requirements of $\text{MoveConstructible}$ (Table 20) and of $\text{MoveAssignable}$ (Table 22).
Complexity: $\mathcal{O}(N \log(N))$ (where $N = \text{last} - \text{first}$) comparisons.

### 25.4.1.2 stable_sort

```
template<class RandomAccessIterator>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    void stable_sort(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
```

```
template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
    class Proj = identity>
    requires Sortable<I, Comp, Proj>()
    I stable_sort(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});
```

```
template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>
    requires Sortable<IteratorType<Rng>, Comp, Proj>()
    IteratorType safe_iterator_t<Rng>
    stable_sort(Rng& rng, Comp comp = Comp{}, Proj proj = Proj{});
```

1 Effects: Sorts the elements in the range $[\text{first}, \text{last})$.

2 Requires: RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).

3 Complexity: It does at most $N \log^2(N)$ (where $N = \text{last} - \text{first}$) comparisons; if enough extra memory is available, it is $N \log(N)$.

4 Remarks: Stable (17.6.5.7).

### 25.4.1.3 partial_sort

```
template<class RandomAccessIterator>
    void partial_sort(RandomAccessIterator first,
                      RandomAccessIterator middle,
                      RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
    void partial_sort(RandomAccessIterator first,
                      RandomAccessIterator middle,
                      RandomAccessIterator last,
                      Compare comp);
```

```
template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
    class Proj = identity>
    requires Sortable<I, Comp, Proj>()
    I partial_sort(I first, I middle, S last, Comp comp = Comp{}, Proj proj = Proj{});
```

```
template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>
    requires Sortable<IteratorType<Rng>, Comp, Proj>()
    IteratorType safe_iterator_t<Rng>
    partial_sort(Rng& rng, IteratorType<Rng> middle, Comp comp = Comp{},
                 Proj proj = Proj{});
```

1 Effects: Places the first $\text{middle} - \text{first}$ sorted elements from the range $[\text{first}, \text{last})$ into the range $[\text{first}, \text{middle})$. The rest of the elements in the range $[\text{middle}, \text{last})$ are placed in an unspecified order.
Requires: RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).

Complexity: It takes approximately \((last - first) \times \log(middle - first)\) comparisons.

25.4.1.4 partial_sort_copy

```cpp
template<class InputIterator, class RandomAccessIterator>
RandomAccessIterator partial_sort_copy(InputIterator first, InputIterator last,
RandomAccessIterator result_first,
RandomAccessIterator result_last);
```

```cpp
template<class InputIterator, class RandomAccessIterator,
class Compare>
RandomAccessIterator partial_sort_copy(InputIterator first, InputIterator last,
RandomAccessIterator result_first,
RandomAccessIterator result_last,
Compare comp);
```

```cpp
template<InputIterator I1, Sentinel<I1> S1, RandomAccessIterator I2, Sentinel<I2> S2,
class RComp = less<>, class Proj1 = identity, class Proj2 = identity>
requires IndirectlyCopyable<I1, I2>() & Sortable<I2, Comp, Proj2>() &
IndirectCallableStrictWeakOrder<Comp, Projected<I1, Proj1>, Projected<I2, Proj2>>()
I2
partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

```cpp
template<InputRange Rng1, RandomAccessRange Rng2, class RComp = less<>,
class Proj1 = identity, class Proj2 = identity>
requires IndirectlyCopyable<IteratorType<Rng1>, IteratorType<Rng2>>() &
Sortable<IteratorType<Rng2>, Comp, Proj2>() &
IndirectCallableStrictWeakOrder<Comp, Projected<IteratorType<Rng1>, Proj1>,
Projected<IteratorType<Rng2>, Proj2>>()
IteratorType safe_iterator_t<Rng2>
partial_sort_copy(Rng1& rng, Rng2& result_rng, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

1 Effects: Places the first \(\min(last - first, result_last - result_first)\) sorted elements into the range \([result_first, result_first + \min(last - first, result_last - result_first))\).

2 Returns: The smaller of: result_last or result_first + (last - first).

3 Requires: RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *result_first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).

4 Complexity: Approximately \((last - first) \times \log(min(last - first, result_last - result_first))\) comparisons.

25.4.1.5 is_sorted

```cpp
template<class ForwardIterator>
bool is_sorted(ForwardIterator first, ForwardIterator last);
```

```cpp
template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<I, Proj>> Comp = less<>>
```
bool is_sorted(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});  

template<ForwardRange Rng, class Proj = identity,  
  IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>>, Proj>> Comp = less<> 
  bool 
  is_sorted(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{}); 

  *Returns: is_sorted_until(first, last, comp, proj) == last*  

1

Returns: is_sorted_until(first, last, comp) == last  

2

template<class ForwardIterator, class Compare> 
  ForwardIterator is_sorted_until(ForwardIterator first, ForwardIterator last); 

3

Returns: is_sorted_until(first, last, comp) == last  

4

template<class ForwardIterator, class Compare> 
  ForwardIterator is_sorted_until(ForwardIterator first, ForwardIterator last, 
  Compare comp); 

3

Returns: If distance(first, last) < 2, returns last. Otherwise, returns the last iterator i in  
[first,last] for which the range [first,i) is sorted.  

Complexity: Linear.  

25.4.2 Nth element  

[alg.nth.element]  

template<class RandomAccessIterator> 
  void nth_element(RandomAccessIterator first, RandomAccessIterator nth, 
  RandomAccessIterator last); 

1

template<class RandomAccessIterator, class Compare> 
  void nth_element(RandomAccessIterator first, RandomAccessIterator nth, 
  RandomAccessIterator last, Compare comp); 

1

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,  
  class Proj = identity>  
  requires Sortable<I, Comp, Proj>()[I  
  nth_element(I first, I nth, S last, Comp comp, Proj proj = Proj{}); 

1

template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>  
  requires Sortable<IteratorType<Rng>, Comp, Proj>()[IteratorType safe_iterator_t<Rng>  
  nth_element(Rng&& rng, IteratorType<Rng> nth, Comp comp, Proj proj = Proj{}); 

1

After nth_element the element in the position pointed to by nth is the element that would be  
in that position if the whole range were sorted, unless nth == last. Also for every iterator i in  
the range [first,nth) and every iterator j in the range [nth,last) it holds that: (*j < *i) or  
comp(*j, *i) == false  

INVOCATION(comp, INVOCATION(proj, *j), INVOCATION(proj, *i)) == false.
Requires: RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).

Complexity: Linear on average.

25.4.3 Binary search

All of the algorithms in this section are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the implied or explicit comparison function and projection. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

25.4.3.1 lower_bound

template<class ForwardIterator, class T>
ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<ForwardIterator I, Sentinel<I> S, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<I, Proj>> Comp = less<>>
I
lower_bound(I first, S last, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

template<ForwardRange Rng, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<IteratorType<Rng>, Proj>> Comp = less<>>
IteratorType safe_iterator_t<Rng>
lower_bound(Rng& rng, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

Requires: The elements e of [first,last) shall be partitioned with respect to the expression e < value INVOKE(comp, INVOKE(proj, e), value) or comp(e, value).

Returns: The furthermore iterator i in the range [first,last] such that for every iterator j in the range [first,i) the following corresponding conditions hold: *j < value or comp(*j, value) != false INVOKE(comp, INVOKE(proj, *j), value) != false.

Complexity: At most \( \log_2(last - first) + \Theta(1) \) comparisons, applications of the comparison function and projection.

25.4.3.2 upper_bound

template<class ForwardIterator, class T>
ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
const T& value, Compare comp);

template<ForwardIterator I, Sentinel<I> S, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<I, Proj>> Comp = less>
I
  upper_bound(I first, S last, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

template<ForwardRange Rng, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<IteratorType<Rng>, Proj>> Comp = less>
IteratorType safe_iterator_t<Rng>
  upper_bound(Rng& rng, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

1 Requires: The elements e of [first, last) shall be partitioned with respect to the expression !(value < e) || INVOKE(comp, value, INVOKE(proj, e)) or !comp(value, e).

2 Returns: The furthestmost iterator i in the range [first, last) such that for every iterator j in the range [first, i) the following corresponding conditions hold: !(value < *j) or comp(value, *j) == false || INVOKE(comp, value, INVOKE(proj, *j)) == false.

3 Complexity: At most $\log_2(\text{last} - \text{first}) + \mathcal{O}(1)$ comparisons and applications of the comparison function and projection.

25.4.3.3 equal_range

template<class ForwardIterator, class T>
pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<ForwardIterator I, Sentinel<I> S, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<I, Proj>> Comp = less>
tagged_pair<tag::begin(I), tag::end(I)>
equal_range(I first, S last, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

template<ForwardRange Rng, TotallyOrdered class T, class Proj = identity, IndirectCallableStrictWeakOrder<const T*, Projected<IteratorType<Rng>, Proj>> Comp = less>
tagged_pair<tag::begin(IteratorType safe_iterator_t<Rng>),
tag::end(IteratorType safe_iterator_t<Rng>)>
equal_range(Rng& rng, const T& value, Comp comp = Comp{}, Proj proj = Proj{});

1 Requires: The elements e of [first, last) shall be partitioned with respect to the expressions e < value || INVOKE(comp, INVOKE(proj, e), value) and !(value < e) || INVOKE(comp, value, INVOKE(proj, e)) or comp(e, value) and !comp(value, e). Also, for all elements e of [first, last), e < value || INVOKE(comp, INVOKE(proj, e), value) shall imply !(value < e) || INVOKE(comp, value, INVOKE(proj, e)) or comp(e, value) shall imply !comp(value, e).

2 Returns:
  make_pair(lower_bound(first, last, value), upper_bound(first, last, value))
or

§ 25.4.3.3 160
template<class ForwardIterator, class T>
bool binary_search(ForwardIterator first, ForwardIterator last,
const T& value);

template<class ForwardIterator, class T, class Compare>
bool binary_search(ForwardIterator first, ForwardIterator last,
const T& value, Compare comp);

template<ForwardIterator I, Sentinel<I> S, TotallyOrdered class T, class Proj = identity,
IndirectCallableStrictWeakOrder<const T*, Projected<I, Proj>> Comp = less<>>
bool
binary_search(I first, S last, const T& value, Comp comp = Comp{},
Proj std::proj = Proj{});

template<ForwardRange Rng, TotallyOrdered class T, class Proj = identity,
IndirectCallableStrictWeakOrder<const T*, Projected<IteratorType<Rng>, Proj>> Comp = less<>>
bool
binary_search(Rng& rng, const T& value, Comp comp = Comp{},
Proj std::proj = Proj{});

Requires: The elements e of [first, last) are partitioned with respect to
the expressions e <
value std::invoke(comp, std::invoke(proj, e), value) and
!(value < e) std::invoke(comp, value, std::invoke(proj, e)) or
comp(e, value) and !comp(value, e). Also, for all elements e of [first, last), e <
value std::invoke(comp, std::invoke(proj, e), value) shall imply
!(value < e) std::invoke(comp, value, 
std::invoke(proj, e)) or comp(e, value) shall imply !comp(value, e).

Returns: true if there is an iterator i in the range [first, last) that satisfies
the corresponding conditions: !(i < value) && !(value < i) std::invoke(comp, std::invoke(proj, *i), value) == false
&
std::invoke(comp, value, std::invoke(proj, *i)) == false || comp(*i, value) == false
&
comp(value, *i) == false.

Complexity: At most $2 \log_2(last - first) + \Theta(1)$ comparisons applications of
the comparison function and projection.

25.4.4 Merge

template<class InputIterator1, class InputIterator2, 
class OutputIterator>
OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class InputIterator1, class InputIterator2, 
class OutputIterator, class Compare>
OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);
template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, 
  Incrementable O, class Comp = less<>, class Proj1 = identity,
  class Proj2 = identity>
requires Mergeable<I1, I2, 0, Comp, Proj1, Proj2>()
tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
merge(I1 first1, S1 last1, I2 first2, S2 last2, 0 result,
  Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, Incrementable O, class Comp = less<>,
  class Proj1 = identity, class Proj2 = identity>
requires Mergeable<IteratorType<Rng1>, IteratorType<Rng2>, 0, Comp, Proj1, Proj2>()
tagged_tuple<tag::in1(IteratorType_safe_iterator_t<Rng1>),
  tag::in2(IteratorType_safe_iterator_t<Rng2>), tag::out(O)>
merge(Rng1& rng1, Rng2& rng2, O result,
  Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

Effects: Copies all the elements of the two ranges [first1,last1) and [first2,last2) into the range [result,result_last), where result_last is result + (last1 - first1) + (last2 - first2), such that the resulting range satisfies is_sorted(result, result_last) or [Editor's note: TODO The following postcondition isn't well-formed:] is_sorted(result, result_last, comp), respectively.

Requires: The ranges [first1,last1) and [first2,last2) shall be sorted with respect to comp, proj1, and proj2. The resulting range shall not overlap with either of the original ranges.

Returns: result + (last1 - first1) + (last2 - first2) make_tagged_tuple(tag::in1, tag::in2,
tag::out)(last1, last2, result + (last1 - first1) + (last2 - first2)).

Complexity: At most (last1 - first1) + (last2 - first2) - 1 applications of the comparison function and each projection.

Remarks: Stable (17.6.5.7).

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, 
  Incrementable O, class Comp = less<>, class Proj1 = identity,
  class Proj2 = identity>
requires MergeMovable<I1, I2, 0, Comp, Proj1, Proj2>()
tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
merge_move(I1 first1, S1 last1, I2 first2, S2 last2, 0 result,
  Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

Effects: Moves all the elements of the two ranges [first1,last1) and [first2,last2) into the range [result,result_last), where result_last is result + (last1 - first1) + (last2 - first2), such that the resulting range satisfies [Editor's note: TODO The following postcondition isn't well-formed:] is_sorted(result, result_last, comp).

Requires: The ranges [first1,last1) and [first2,last2) shall be sorted with respect to comp, proj1, and proj2. The resulting range shall not overlap with either of the original ranges.
Returns: \texttt{make\_tagged\_tuple\langle\texttt{tag::in1}, \texttt{tag::in2}, \texttt{tag::out}\rangle(last1, last2, result + (last1 - first1) + (last2 - first2)).

Complexity: At most \((last1 - first1) + (last2 - first2) - 1\) applications of the comparison function and each projection.

Remarks: Stable (17.6.5.7).

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
BidirectionalIterator middle,
BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
BidirectionalIterator middle,
BidirectionalIterator last, Compare comp);

template<BidirectionalIterator I, Sentinel<I> S, class Comp = less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>()
I
inplace_merge(I first, I middle, S last, Comp comp = Comp{}, Proj proj = Proj());

template<BidirectionalRange Rng, class Comp = less<>, class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>()
IteratorType safe_iterator_t<Rng>
inplace_merge(Rng&&rng, IteratorType<Rng> middle, Comp comp = Comp{},
Proj proj = Proj());

Effects: Merges two sorted consecutive ranges \([\texttt{first},\texttt{middle})\) and \([\texttt{middle},\texttt{last})\), putting the result of the merge into the range \([\texttt{first},\texttt{last})\). The resulting range will be in non-decreasing order; that is, for every iterator \(i\) in \([\texttt{first},\texttt{last})\) other than \texttt{first}, the condition \(\texttt{i} < \texttt{*(i - 1)}\) or, respectively, \(\texttt{INVOKE}({\texttt{comp}}, \texttt{INVOKE}({\texttt{proj}}, \texttt{i}), \texttt{INVOKE}({\texttt{proj}}, \texttt{*(i - 1)}))\) will be false.

Requires: The ranges \([\texttt{first},\texttt{middle})\) and \([\texttt{middle},\texttt{last})\) shall be sorted with respect to \texttt{operator\_}\texttt{<}\texttt{or} \texttt{comp} and \texttt{proj}. \texttt{BidirectionalIterator} shall satisfy the requirements of \texttt{ValueSwappable} (19.2.10). The type of \texttt{\*first} shall satisfy the requirements of \texttt{MoveConstructible} (Table 20) and of \texttt{MoveAssignable} (Table 22).

Returns: last

Complexity: When enough additional memory is available, \((\texttt{last} - \texttt{first}) - 1\) \texttt{comparison}\_\texttt{applications} of the comparison function and projection. If no additional memory is available, an algorithm with complexity \(N \log(N)\) (where \(N\) is equal to \texttt{last} - \texttt{first}) may be used.

Remarks: Stable (17.6.5.7).

25.4.5 Set operations on sorted structures

This section defines all the basic set operations on sorted structures. They also work with multisets (23.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to multisets in a standard way by defining \texttt{set\_union()} to contain the maximum number of occurrences of every element, \texttt{set\_intersection()} to contain the minimum, and so on.

25.4.5.1 \texttt{includes}

template<class InputIterator1, class InputIterator2>
bool \texttt{includes}(InputIterator1 first1, InputIterator1 last1,
template<class InputIterator1, class InputIterator2, class Compare>
bool includes(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
Compare comp);

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
class Proj1 = identity, class Proj2 = identity,
IndirectCallableStrictWeakOrder<Projected<I1, Proj1>, Projected<I2, Proj2>> Comp = less<>>
bool
includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, class Proj1 = identity,
class Proj2 = identity,
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng1>, Proj1>,
Projected<IteratorType<Rng2>, Proj2>> Comp = less<>>
bool
includes(Rng1&& rng1, Rng2&& rng2, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

25.4.5.2 set_union [set.union]

template<class InputIterator1, class InputIterator2,
class OutputIterator>
OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
WeaklyIncrementable 0, class Comp = less<>,
class Proj1 = identity, class Proj2 = identity>
requires Mergeable<I1, I2, 0, Comp, Proj1, Proj2>[

tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(0)>]
set_union(I1 first1, S1 last1, I2 first2, S2 last2, 0 result, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, WeaklyIncrementable 0,
class Comp = less<>,
class Proj1 = identity, class Proj2 = identity>
requires Mergeable<IteratorType<Rng1>, IteratorType<Rng2>, 0, Comp, Proj1, Proj2>[

tagged_tuple<tag::in1(IteratorTypeInfo_safe_iterator_t<Rng1>),
tag::in2(IteratorTypeInfo_safe_iterator_t<Rng2>),
tag::out(0)>]
set_union(Rng1& rng1, Rng2& rng2, O result, Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

Effects: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

Requires: The resulting range shall not overlap with either of the original ranges.

Returns: The end of the constructed range.

Complexity: At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons applications of the comparison function and projections.

Remarks: If \([\text{first1},\text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2},\text{last2})\) contains \(n\) elements that are equivalent to them, then all \(m\) elements from the first range shall be copied to the output range, in order, and then \(\max(n-m,0)\) elements from the second range shall be copied to the output range, in order.

25.4.5.3 set_intersection

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
OutputIterator set_intersection(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, OutputIterator result);
```

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
OutputIterator set_intersection(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, OutputIterator result, Compare comp);
```

```cpp
template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, WeaklyIncrementable O, class Comp = less<> , class Proj1 = identity, class Proj2 = identity>
requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
O set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

```cpp
template<InputRange Rng1, InputRange Rng2, WeaklyIncrementable O, class Comp = less<> , class Proj1 = identity, class Proj2 = identity>
requires Mergeable<IteratorType<Rng1>, IteratorType<Rng2>, O, Comp, Proj1, Proj2>
O set_intersection(Rng1& rng1, Rng2& rng2, O result,
Comp comp = Comp{}, Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```

Effects: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

Requires: The resulting range shall not overlap with either of the original ranges.

Returns: The end of the constructed range.

Complexity: At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons applications of the comparison function and projections.
Remarks: If \([\text{first}_1, \text{last}_1)\) contains \(m\) elements that are equivalent to each other and \([\text{first}_2, \text{last}_2)\) contains \(n\) elements that are equivalent to them, the first \(\min(m, n)\) elements shall be copied from the first range to the output range, in order.

### 25.4.5.4 set_difference

\[
\text{template<class InputIterator1, class InputIterator2, class OutputIterator>}
\]
\[
\text{OutputIterator set_difference(InputIterator1 \text{first}_1, InputIterator1 \text{last}_1, InputIterator2 \text{first}_2, InputIterator2 \text{last}_2, OutputIterator \text{result});}
\]

\[
\text{template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>}
\]
\[
\text{OutputIterator set_difference(InputIterator1 \text{first}_1, InputIterator1 \text{last}_1, InputIterator2 \text{first}_2, InputIterator2 \text{last}_2, OutputIterator \text{result}, Compare \text{comp});}
\]

\[
\text{template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, WeaklyIncrementable O, class Comp = \text{less\textlangle}, class Proj1 = \text{identity}, class Proj2 = \text{identity}>
\]
\[
\text{requires Mergeable<I1, I2, 0, Comp, Proj1, Proj2>()}
\]
\[
\text{tagged_pair<tag::in1(I1), tag::out(O)>}
\]
\[
\text{set_difference(I1 \text{first}_1, S1 \text{last}_1, I2 \text{first}_2, S2 \text{last}_2, O \text{result},
\text{Comp \text{comp} = Comp{}, Proj1 \text{proj}_1 = Proj1{}, Proj2 \text{proj}_2 = Proj2{});}
\]

\[
\text{template<InputRange Rng1, InputRange Rng2, WeaklyIncrementable O, class Comp = \text{less\textlangle}, class Proj1 = \text{identity}, class Proj2 = \text{identity}>
\]
\[
\text{requires Mergeable<IteratorType<Rng1>, IteratorType<Rng2>, 0, Comp, Proj1, Proj2>()}
\]
\[
\text{tagged_pair<tag::in1(IteratorType safe_iterator_t<Rng1>), tag::out(O)>}
\]
\[
\text{set_difference(Rng1\&& \text{rng}_1, Rng2\&& \text{rng}_2, O \text{result},
\text{Comp \text{comp} = Comp{}, Proj1 \text{proj}_1 = Proj1{}, Proj2 \text{proj}_2 = Proj2{});}
\]

**Effects:** Copies the elements of the range \([\text{first}_1, \text{last}_1)\) which are not present in the range \([\text{first}_2, \text{last}_2)\) to the range beginning at \(\text{result}\). The elements in the constructed range are sorted.

**Requires:** The resulting range shall not overlap with either of the original ranges.

**Returns:** The end of the constructed range \((\text{last}_1, \text{result} + n)\), where \(n\) is the number of elements in the constructed range.

**Complexity:** At most \(2 \times ((\text{last}_1 - \text{first}_1) + (\text{last}_2 - \text{first}_2)) - 1\) comparisons, applications of the comparison function and projections.

**Remarks:** If \([\text{first}_1, \text{last}_1)\) contains \(m\) elements that are equivalent to each other and \([\text{first}_2, \text{last}_2)\) contains \(n\) elements that are equivalent to them, the last \(\max(m - n, 0)\) elements from \([\text{first}_1, \text{last}_1)\) shall be copied to the output range.

### 25.4.5.5 set_symmetric_difference

\[
\text{template<class InputIterator1, class InputIterator2, class OutputIterator>}
\]
\[
\text{OutputIterator set_symmetric_difference(InputIterator1 \text{first}_1, InputIterator1 \text{last}_1, InputIterator2 \text{first}_2, InputIterator2 \text{last}_2, OutputIterator \text{result});}
\]
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
WeaklyIncrementable O, class Comp = less<>, class Proj1 = identity, class Proj2 = identity>
requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
(tagged_tuple<tag::in1(I1), tag::in2(I2), tag::out(O)>
set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = Comp{}, Proj1 proj1 = Proj1{},
Proj2 proj2 = Proj2{});

template<InputRange Rng1, InputRange Rng2, WeaklyIncrementable O,
class Comp = less<>, class Proj1 = identity, class Proj2 = identity>
requires Mergeable<IteratorType<Rng1>, IteratorType<Rng2>, 0, Comp, Proj1, Proj2>
(tagged_tuple<tag::in1(IteratorTypesafe_iterator_t<Rng1>),
tag::in2(IteratorTypesafe_iterator_t<Rng2>),
tag::out(O)>
set_symmetric_difference(Rng1& rng1, Rng2& rng2, O result, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});

Effects: Copies the elements of the range \([\text{first1},\text{last1})\) that are not present in the range \([\text{first2},\text{last2})\), and the elements of the range \([\text{first2},\text{last2})\) that are not present in the range \([\text{first1},\text{last1})\) to the range beginning at result. The elements in the constructed range are sorted.

Requires: The resulting range shall not overlap with either of the original ranges.

Returns: The end of the constructed range \(\text{make_tagged_tuple}(\text{tag::in1}, \text{tag::in2}, \text{tag::out})((\text{last1}, \text{last2})\text{ result} + n)\), where \(n\) is the number of elements in the constructed range.

Complexity: At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of the comparison function and projections.

Remarks: If \([\text{first1},\text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2},\text{last2})\) contains \(n\) elements that are equivalent to them, then \(|m - n|\) of those elements shall be copied to the output range: the last \(m - n\) of these elements from \([\text{first1},\text{last1})\) if \(m > n\), and the last \(n - m\) of these elements from \([\text{first2},\text{last2})\) if \(m < n\).

### 25.4.6 Heap operations

A heap is a particular organization of elements in a range between two random access iterators \([\text{a},\text{b})\). Its two key properties are:

1. There is no element greater than \(*a\) in the range and
2. \(*a\) may be removed by push_heap(), or a new element added by push_heap(), in \(O(\log(N))\) time.

These properties make heaps useful as priority queues.

make_heap() converts a range into a heap and sort_heap() turns a heap into a sorted sequence.
void push_heap(RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
         class Proj = identity>
    requires Sortable<I, Comp, Proj>
    I push_heap(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>
    requires Sortable<IteratorType<Rng>, Comp, Proj>
    IteratorType safe_iterator_t<Rng>
    push_heap(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

1 Effects: Places the value in the location last - 1 into the resulting heap [first, last).
2 Requires: The range [first, last - 1) shall be a valid heap. The type of *first shall satisfy the MoveConstructible requirements (Table 20) and the MoveAssignable requirements (Table 22).
3 Returns: last
4 Complexity: At most log(last - first) comparisons, applications of the comparison function and projection.

25.4.6.2 pop_heap

template<class RandomAccessIterator>
void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
            Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
         class Proj = identity>
    requires Sortable<I, Comp, Proj>
    I pop_heap(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Comp = less<>, class Proj = identity>
    requires Sortable<IteratorType<Rng>, Comp, Proj>
    IteratorType safe_iterator_t<Rng>
    pop_heap(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

1 Requires: The range [first, last) shall be a valid non-empty heap. RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).
2 Effects: Swaps the value in the location first with the value in the location last - 1 and makes [first, last - 1) into a heap.
3 Returns: last
4 Complexity: At most 2 * log(last - first) comparisons, applications of the comparison function and projection.

25.4.6.3 make_heap

template<class RandomAccessIterator>
void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void make_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>
I make_heap(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Comp = less<>,
class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>
IteratorType safe_iterator_t<Rng>
make_heap(Rng& rng, Comp comp = Comp{}, Proj proj = Proj{});

1 Effects: Constructs a heap out of the range [first, last).
2 Requires: The type of *first shall satisfy the MoveConstructible requirements (Table 20) and the MoveAssignable requirements (Table 22).
3 Returns: last
4 Complexity: At most 3 * (last - first) applications of the comparison function and projection.

25.4.6.4 sort_heap [sort.heap]

template<class RandomAccessIterator>
void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void sort_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Comp = less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>
I sort_heap(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Comp = less<>,
class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>
IteratorType safe_iterator_t<Rng>
sort_heap(Rng& rng, Comp comp = Comp{}, Proj proj = Proj{});

1 Effects: Sorts elements in the heap [first, last).
2 Requires: The range [first, last) shall be a valid heap. RandomAccessIterator shall satisfy the requirements of ValueSwappable (19.2.10). The type of *first shall satisfy the requirements of MoveConstructible (Table 20) and of MoveAssignable (Table 22).
3 Returns: last
4 Complexity: At most N log(N) comparisons (where N == last - first).

25.4.6.5 is_heap [is.heap]

template<class RandomAccessIterator>
bool is_heap(RandomAccessIterator first, RandomAccessIterator last);

template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<I, Proj>> Comp = less<>>
bool is_heap(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});
template<RandomAccessRange Rng, class Proj = identity, 
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>>, Proj>> Comp = less<>>
bool
is_heap(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

Returns: is_heap_until(first, last, comp, proj) == last

template<class RandomAccessIterator, class Compare>
bool is_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

Returns: is_heap_until(first, last, comp) == last

template<class RandomAccessIterator>
RandomAccessIterator is_heap_until(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
RandomAccessIterator is_heap_until(RandomAccessIterator first, RandomAccessIterator last, 
Compare comp);

template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity, 
IndirectCallableStrictWeakOrder<Projected<I, Proj>> Comp = less<>>
I is_heap_until(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<RandomAccessRange Rng, class Proj = identity, 
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>>, Proj>> Comp = less<>>
IteratorType safe_iterator_t<Rng>
is_heap_until(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

Returns: If distance(first, last) < 2, returns last. Otherwise, returns the last iterator i in 
[first, last] for which the range [first, i) is a heap.

Complexity: Linear.

25.4.7 Minimum and maximum [alg.min.max]

template<class T> constexpr const T& min(const T& a, const T& b);

template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<TotallyOrdered T>
constexpr const T& min(const T& a, const T& b); 

template<class T, class Comp = less<>>
requires StrictWeakOrder<FunctionType<Comp>, T>()
constexpr const T& min(const T& a, const T& b, Comp comp = Comp{});

Requires: Type T is LessThanComparable (Table 18).

Returns: The smaller value.

Remarks: Returns the first argument when the arguments are equivalent.

template<class T>
constexpr T min(initializer_list<T> t);

template<class T, class Compare>
constexpr T min(initializer_list<T> t, Compare comp);

template<TotallyOrdered T>
requires Semiregular<T>
constexpr T min(initializer_list<T> rng);
\texttt{template<InputRange \_Rng>}
\texttt{\hspace{1cm} \textbf{requires} TotallyOrdered<ValueType<IteratorType<Rng>>>() \&\&}
\texttt{\hspace{1cm} Semiregular<ValueType<IteratorType<Rng>>>}
\texttt{\hspace{1cm} ValueType<IteratorType<Rng>>}
\texttt{\hspace{1cm} \textbf{min}(Rng&& \_rng);}

\texttt{template<Semiregular\_Copyable T, class Comp = \_less\_>
\hspace{1cm} \textbf{requires} StrictWeakOrder<FunctionType<Comp>, T>()

\texttt{\hspace{1cm} \textbf{max}(Rng&& \_rng);}

\texttt{template<Semiregular\_Copyable T, class Comp = \_less\_>
\hspace{1cm} \textbf{requires} StrictWeakOrder<FunctionType<Comp>, T>()
\hspace{1cm} constexpr T \textbf{max}(initializer\_list\_T\_rng, Comp \_comp = \_Comp\_{});}

§ 25.4.7
template<InputRange Rng,
  IndirectCallableStrictWeakOrder<IteratorType<Rng>> Comp = less<>>
requires SemiregularCopyable<ValueType<IteratorType<Rng>>>() &&
ValueType<IteratorType<Rng>>
max(Rng& rng, Comp comp = Comp());

  Requires: Ti is LessThanComparable and CopyConstructible and t.size() > 0.
  Returns: The largest value in the initializer_list or range.
  Remarks: Returns a copy of the leftmost argument when several arguments are equivalent to the largest.

template<class T> constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<TotallyOrdered T>
constexpr tagged_pair<tag::min(const T&), tag::max(const T&)> minmax(const T& a, const T& b);

template<class T, class Comp = less<>>
requires StrictWeakOrder<FunctionType<Comp>, T>()
constexpr tagged_pair<tag::min(T), tag::max(T)> minmax(initializer_list<T> rng);

template<InputRange Rng>
requires TotallyOrdered<ValueType<IteratorType<Rng>>>() &&
Semiregular<ValueType<IteratorType<Rng>>>() &&
tagged_pair<tag::min(ValueType<IteratorType<Rng>>), tag::max(ValueType<IteratorType<Rng>>)> minmax(Rng& rng);

template<SemiregularCopyable T, class Comp = less<>>
requires StrictWeakOrder<FunctionType<Comp>, T>()
constexpr tagged_pair<tag::min(T), tag::max(T)> minmax(initializer_list<T> rng, Comp comp = Comp());

template<InputRange Rng,
  IndirectCallableStrictWeakOrder<IteratorType<Rng>> Comp = less<>>
requires SemiregularCopyable<ValueType<IteratorType<Rng>>>() &&
ValueType<IteratorType<Rng>>
max(Rng& rng, Comp comp = Comp());

  Requires: Ti is LessThanComparable and CopyConstructible and t.size() > 0.
  Returns: The largest value in the initializer_list or range.
  Remarks: Returns a copy of the leftmost argument when several arguments are equivalent to the largest.

template<class T> constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<TotallyOrdered T>
constexpr tagged_pair<tag::min(const T&), tag::max(const T&)> minmax(const T& a, const T& b);

template<class T, class Comp = less<>>
requires StrictWeakOrder<FunctionType<Comp>, T>()
constexpr tagged_pair<tag::min(T), tag::max(T)> minmax(initializer_list<T> rng);

template<InputRange Rng>
requires TotallyOrdered<ValueType<IteratorType<Rng>>>() &&
Semiregular<ValueType<IteratorType<Rng>>>() &&
tagged_pair<tag::min(ValueType<IteratorType<Rng>>), tag::max(ValueType<IteratorType<Rng>>)> minmax(Rng& rng);

template<SemiregularCopyable T, class Comp = less<>>
requires StrictWeakOrder<FunctionType<Comp>, T>()
constexpr tagged_pair<tag::min(T), tag::max(T)> minmax(initializer_list<T> rng, Comp comp = Comp());

template<InputRange Rng,
  IndirectCallableStrictWeakOrder<IteratorType<Rng>> Comp = less<>>
requires SemiregularCopyable<ValueType<IteratorType<Rng>>>() &&
ValueType<IteratorType<Rng>>
max(Rng& rng, Comp comp = Comp());

  Requires: Ti is LessThanComparable and CopyConstructible and t.size() > 0.
  Returns: The largest value in the initializer_list or range.
  Remarks: Returns a copy of the leftmost argument when several arguments are equivalent to the largest.
IndirectCallableStrictWeakOrder<IteratorType<Rng>> Comp = less<>;
requires SemiregularCopyable<ValueType<IteratorType<Rng>>>()
tagged_pair<tag::min(ValueType<IteratorType<Rng>>), tag::max(ValueType<IteratorType<Rng>>)>
minmax(Rng&& rng, Comp comp = Comp{});

Requires: T is LessThanComparable and CopyConstructible and t.size() > 0, distance(begin(rng),
end(rng)) > 0.

Returns: pair<T, T>{x, y}, where x has the smallest and y has the largest value in the initializer
list or range.

Remarks: x is a copy of the leftmost argument when several arguments are equivalent to the smallest.
y is a copy of the rightmost argument when several arguments are equivalent to the largest.

Complexity: At most (3/2) * t.size() * (3/2) * distance(begin(rng), end(rng)) applications of
the corresponding predicate.

template<class ForwardIterator>
ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
ForwardIterator min_element(ForwardIterator first, ForwardIterator last, Compare comp);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<I, Proj>> Comp = less<>>
I min_element(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<ForwardRange Rng, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>, Proj>> Comp = less<>>
IteratorType safe_iterator_t<Rng>
min_element(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

Returns: The first iterator i in the range [first,last) such that for every iterator j in the range
[first,last) the following corresponding conditions hold: !(*j < *i) or comp(*j, *i) == false
INVOKE(comp, INVOKE(proj, *j), INVOKE(proj, *i)) == false. Returns last if first == last.

Complexity: Exactly max((last - first) - 1, 0) applications of the corresponding comparison
function and exactly twice as many applications of the projection.

template<class ForwardIterator>
ForwardIterator max_element(ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
ForwardIterator max_element(ForwardIterator first, ForwardIterator last, Compare comp);

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<I, Proj>> Comp = less<>>
I max_element(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});

template<ForwardRange Rng, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>, Proj>> Comp = less<>>
IteratorType safe_iterator_t<Rng>
max_element(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});

Returns: The first iterator i in the range [first,last) such that for every iterator j in the range
[first,last) the following corresponding conditions hold: !(*i < *j) or comp(*i, *j) == false
INVOKE(comp, INVOKE(proj, *i), INVOKE(proj, *j)) == false. Returns last if first == last.
Complexity: Exactly \( \max((\text{last} - \text{first}) - 1, 0) \) applications of the corresponding comparison function and exactly twice as many applications of the projection.

```cpp
template<class ForwardIterator>
pair<ForwardIterator, ForwardIterator> minmax_element(ForwardIterator first, ForwardIterator last);
template<class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator> minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
```

```cpp
template<ForwardRange Rng, class Proj = identity,
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng>, Proj>> Comp = less<>>
tagged_pair<tag::min(IteratorType safe_iterator_t<Rng>),
tag::max(IteratorType safe_iterator_t<Rng>)> minmax_element(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});
```

Returns: \( \text{make_pair}(\text{first}, \text{first}) \) if \([\text{first}, \text{last})\) is empty, otherwise \( \text{make_pair}(m, M) \), where \( m \) is the first iterator in \([\text{first}, \text{last})\) such that no iterator in the range refers to a smaller element, and where \( M \) is the last iterator in \([\text{first}, \text{last})\) such that no iterator in the range refers to a larger element.

Complexity: At most \( \max(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) \) applications of the corresponding predicate function and at most twice as many applications of the projection, where \( N \) is \text{distance}(\text{first}, \text{last}).

### 25.4.8 Lexicographical Comparison

```cpp
template<class InputIterator1, class InputIterator2>
bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2);
```

```cpp
template<class InputIterator1, class InputIterator2, class Compare>
bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2, Compare comp);
```

```cpp
template<InputRange Rng1, InputRange Rng2, class Proj1 = identity,
class Proj2 = identity,
IndirectCallableStrictWeakOrder<Projected<IteratorType<Rng1>, Proj1>,
Projected<IteratorType<Rng2>, Proj2>> Comp = less<>>
bool lexicographical_compare(Rng1&& rng1, Rng2&& rng2, Comp comp = Comp{},
Proj1 proj1 = Proj1{}, Proj2 proj2 = Proj2{});
```
Returns: true if the sequence of elements defined by the range \([first1, last1)\) is lexicographically less than the sequence of elements defined by the range \([first2, last2)\) and false otherwise.

Complexity: At most \(2 \times \min((last1 - first1), (last2 - first2))\) applications of the corresponding comparison \(\text{and projection}\).

Remarks: If two sequences have the same number of elements and their corresponding elements are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

```cpp
for ( ; first1 != last1 && first2 != last2 ; ++first1, ++first2) {
    if (*first1 < *first2) return true;
    if (*first2 < *first1) return false;
}
return first1 == last1 && first2 != last2;
```

Remarks: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence.

25.4.9 Permutation generators

```cpp
template<class BidirectionalIterator>
bool next_permutation(BidirectionalIterator first,
                      BidirectionalIterator last);
```

```cpp
template<class BidirectionalIterator, class Compare>
bool next_permutation(BidirectionalIterator first,
                      BidirectionalIterator last, Compare comp);
```

```cpp
template<BidirectionalIterator I, Sentinel<I> S, class Comp = less<>,
         class Proj = identity>
requires Sortable<I, Comp, Proj>()
bool next_permutation(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});
```

```cpp
template<BidirectionalRange Rng, class Comp = less<>,
         class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>()
bool
next_permutation(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});
```

Effects: Takes a sequence defined by the range \([first, last)\) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \(\text{operator< or comp and proj}\). If such a permutation exists, it returns true. Otherwise, it transforms the sequence into the smallest permutation, that is, the ascendingly sorted one, and returns false.

Remarks: BidirectionalIterator shall satisfy the requirements of ValueSwappable (19.2.10).
Complexity: At most \((\text{last} - \text{first})/2\) swaps.

```cpp
template<class BidirectionalIterator>
bool prev_permutation(BidirectionalIterator first,
                      BidirectionalIterator last);
```

```cpp
template<class BidirectionalIterator, class Compare>
bool prev_permutation(BidirectionalIterator first,
                      BidirectionalIterator last, Compare comp);
```

```cpp
template<BidirectionalIterator I, Sentinel<I> S, class Comp = less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>()
bool prev_permutation(I first, S last, Comp comp = Comp{}, Proj proj = Proj{});
```

```cpp
template<BidirectionalRange Rng, class Comp = less<>,
class Proj = identity>
requires Sortable<IteratorType<Rng>, Comp, Proj>()
bool prev_permutation(Rng&& rng, Comp comp = Comp{}, Proj proj = Proj{});
```

Effects: Takes a sequence defined by the range \([\text{first}, \text{last})\) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to `operator<` or `comp` and `proj`.

Returns: `true` if such a permutation exists. Otherwise, it transforms the sequence into the largest permutation, that is, the descendingly sorted one, and returns `false`.

Requires: `BidirectionalIterator` shall satisfy the requirements of `ValueSwappable` (19.2.10).

Complexity: At most \((\text{last} - \text{first})/2\) swaps.

### 25.5 C library algorithms

Table 8 describes some of the contents of the header `<cstdlib>`.

<table>
<thead>
<tr>
<th>Type</th>
<th>Name(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type:</td>
<td><code>size_t</code></td>
</tr>
<tr>
<td>Functions:</td>
<td><code>bsearch</code> <code>qsort</code></td>
</tr>
</tbody>
</table>

The contents are the same as the Standard C library header `<stdlib.h>` with the following exceptions:

The function signature:

```c
bsearch(const void *, const void *, size_t, size_t,
        int (*)(const void *, const void *));
```

is replaced by the two declarations:

```c
extern "C" void* bsearch(const void* key, const void* base,
                           size_t nmem, size_t size,
                           int (*compar)(const void*, const void*));
```

```c
extern "C++" void* bsearch(const void* key, const void* base,
                            size_t nmem, size_t size,
                            int (*compar)(const void*, const void*));
```
both of which have the same behavior as the original declaration.

4 The function signature:

```c
qsort(void *, size_t, size_t,
     int (*)(const void *, const void *));
```

is replaced by the two declarations:

```c
extern "C" void qsort(void* base, size_t nmemb, size_t size,
                      int (*compar)(const void*, const void*));
extern "C++" void qsort(void* base, size_t nmemb, size_t size,
                        int (*compar)(const void*, const void*));
```

both of which have the same behavior as the original declaration. The behavior is undefined unless the objects in the array pointed to by `base` are of trivial type.

[Note: Because the function argument `compar()` may throw an exception, `bsearch()` and `qsort()` are allowed to propagate the exception (17.6.5.12). — end note]

See also: ISO C 7.10.5.
26  Numerics library

Header `<experimental/ranges_v1/random>` synopsis

```cpp
namespace std { namespace experimental { namespace ranges_v1 {
  template <class G>
  concept bool UniformRandomNumberGenerator() { return see below; }
}}}
```

26.5  Random number generation

26.5.1  Requirements

26.5.1.3  Uniform random number generator requirements

```cpp
namespace std { namespace experimental { namespace ranges_v1 {
  template <class G>
  concept bool UniformRandomNumberGenerator() { =
    return requires(G g) {
      typename ResultType<G>;
      requires UnsignedIntegral<ResultType<G>>();
      { g() } -> Same<ResultType<G>>; // not required to be equality preserving
      { G::min() } -> Same<ResultType<G>>;
      { G::max() } -> Same<ResultType<G>>;
    }
  }
}}}
```

1 A uniform random number generator `g` of type `G` is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned. [Note: The degree to which `g`’s results approximate the ideal is often determined statistically. —end note]

[Editor’s note: Remove para 2 and 3 and Table 116 (Uniform random number generator requirements).]

2 Let `g` be any object of type `G`. Then type `G` models `UniformRandomNumberGenerator<G>()` is satisfied if and only if

(2.1) — Both `G::min()` and `G::max()` are constant expressions (5.19).

(2.2) — `{G::min() < G::max()}` is false.

(2.3) — `{G::min() <= g() <= G::max()}` is false.

(2.4) — `{g() <= G::max()}`.

(2.5) — `{g()}` has amortized constant complexity.
Annex A  (informative)

Acknowledgements

The design of this specification is based, in part, on a concept specification of the algorithms part of the C++ standard library, known as “The Palo Alto” report (1.2), which was developed by a large group of experts as a test of the expressive power of the idea of concepts.

I would like to thank Andrew Sutton for his work on the Concepts TS (1.2), for his help formalizing the ideas of the range-v3 library [3] on which this work is based, and for his review of this document.

Sean Parent has made major contributions to both the foundations and the wording of this paper.

Stephan T. Lavavej offered a careful review of much of this document, a non-trivial undertaking.

I would also like to thank the members of the Ranges SG who offered feedback on early drafts; especially, Tony Van Eerd, Casey Carter, and Walter Brown.

This work was made possible by a generous grant from the Standard C++ Foundation.
Annex B  (informative)
Compatibility  [diff]

B.1  C++ and Ranges  [diff.cpp]

1 This section details the known breaking changes likely to effect user code when being ported to the version of
of the Standard Library described in this document.

B.1.1  Algorithm Return Types  [diff.cpp.algo__return]

1 The algorithms described in this document permit the type of the end sentinel to differ from the type of the
begin iterator. This is so that the algorithms can operate on ranges for which the physical end position is
not yet known.

2 The physical end position of the input range is determined during the execution of many of the algorithms.
Rather than lose that potentially useful information, the design presented here has such algorithms return
the iterator position of the end of the range. In many cases, this is a breaking change. Some algorithms
that return iterators in today’s STL are changed to return pairs, and algorithms that return pairs today are
changed to return tuples. This is likely to be the most noticeable breaking change.

3 Alternate designs that were less impactful were considered and dismissed. See Section 3.3.6 in N4128 (1.2)
for a discussion of the issues.

B.1.2  Stronger Constraints  [diff.cpp.constraints]

1 In this proposal, many algorithms and utilities get stricter type checking. For example, algorithms con-
strained with LessThanComparable today are constrained by TotallyOrdered in this document. This
concept requires types to provide all the relational operators, not just operator<.

2 The use of coarser-grained, higher-level concepts in algorithm constraints is to make the type checks more
semantic in nature and less syntactic. It also has the benefit of being less verbose while giving algorithm
implementors greater implementation freedom. This approach is in contrast to the previous effort to add
concepts to the Standard Library in the C++0x timeframe, which saw a proliferation of small, purely
syntactic concepts and algorithm constraints that merely restated the algorithms’ implementation details
more verbosely in the algorithms’ function signatures.

3 The potential for breakage must be carefully weighed against the integrity and complexity of the constraints
system. The coarseness of the concepts may need to change in response to real-world usage.

B.1.3  Constrained Functional Objects  [diff.cpp.functional]

1 The algorithm design described in this document assumes that the function objects std::equal_to and
std::less get constraints added to their function call operators. (The former is constrained with Equality-
Comparable and the latter with TotallyOrdered). Similar constraints are added to the other function ob-
jects in <functional>. Also, the so-called transparent relational function objects (less<void> and friends)
have their return type coerced to bool. As with the coarsely-grained algorithm constraints, these function
object constraints are likely to cause user code to break.

2 Real-world experience is needed to assess the seriousness of the breakage. From a correctness point of view,
the constraints are logical and valuable, but it’s possible that for the sake of compatibility we provide both
constrained and unconstrained functional objects.
B.1.4 Iterators and Default-Constructibility

1 In today’s STL, iterators need not be default-constructible. The `Iterator` concept described in this document requires default-constructibility. This could potentially cause breakage in users’ code. Also, it makes the implementation of some types of iterators more complicated. Any iterator that has members that are not default constructible (e.g., an iterator that contains a lambda that has captured by reference) must take special steps to provide default-constructibility (e.g., by wrapping non-default-constructible types in `std::optional`). This can weaken class invariants.

2 The guarantee of default-constructibility simplifies the implementation of much iterator- and range-based code that would otherwise need to wrap iterators in `std::optional`. But the needs of backward-compatibility, the extra complexity to iterator implementors, and the weakened invariants may prove to be too great a burden.

3 We may in fact go even farther and remove the requirement of default-constructibility from the `Semiregular` concept. Time and experience will give us guidance here.

B.1.5 `iterator_traits` cannot be specialized

1 In this STL design, `iterator_traits` changes from being a class template to being a template alias template. This is intentionally break any code that tries to specialize it. In its place are the three class templates `difference_type`, `value_type`, and `iterator_category`. The need for this traits balkanization is because the associated types belong to separate concepts: `difference_type` belongs to `WeaklyIncrementable`; `value_type` belongs to `Readable`; and `iterator_category` belongs to `WeakInputIterator`.

2 This breakage is intentional and inherent in the decomposition of the iterator concepts established by The Palo Alto report (1.2).

B.2 Ranges and the Palo Alto TR (N3351)

1 The Palo Alto report (1.2) presents a comprehensive design for the Standard Template Library constrained with concepts. It served both as a basis for the Concepts Lite language feature and for this document. However, this document diverges from the Palo Alto report in small ways. The differences are in the interests of backwards compatibility, to avoid confusing a large installed base of programmers already familiar with the STL, and to keep the scope of this document as small as possible. This section describes the ways in which the two suggested designs differ.

B.2.1 Sentinels

1 In the design presented in this document, the type of a range’s end delimiter may differ from the iterator representing the range’s start position. The reasons for this change are discribed in N4128 (1.2). This causes a number of difference from the Palo Alto report:

(1.1) — The algorithms get an additional constraint for the sentinel.

(1.2) — The return types of the algorithms are changed as described above (B.1.1).

(1.3) — Some algorithms have operational semantics that require them to know the physical end position (e.g., `reverse`). Those algorithms must make an $O(N)$ probe for the end position before proceeding. This does not change the operational semantics of any code that is valid today (the probe is unnecessary when the types of the begin and end are the same), and even when the probe is needed, in no cases does this change the complexity guarantee of any algorithm.

B.2.2 Callables and Projections

1 Adobe’s Source Libraries [1] pioneered the use of `callables` and `projections` in the standard algorithms. Callables let users pass member pointers where the algorithms expect callables, saving users the trouble of using a binder or a lambda. Projections are extra optional arguments that give users a way to trivially...
transform input data on the fly during the execution of the algorithms. Neither significantly changes the
operational semantics of the algorithms, but they do change the form of the algorithm constraints. To deal
with the extra complexity of the constraints, the design presented here adds higher-level composite concepts
for concisely expressing the necessary relationships between callables, iterators, and projections.

B.2.3 No Distinct DistanceType Associated Type

In the Palo Alto report, the WeaklyIncrementable concept has an associated type called DistanceType,
and the RandomAccessIterator concepts adds another associated type called DifferenceType. The latter
is required to be convertible to the former, but they are not required to be the same type. (DifferenceType
is required to be a signed integral type, but DistanceType need not be signed.) Although sensible from a
soundness point of view, the author of this paper feels this is potentially a rich source of confusion. This paper
hews closer to the current standard by having only one associated type, DifferenceType, and requiring it
to be signed.

B.2.4 Distance Primitive is O(1) for Random Access Iterators

In the Palo Alto report, the distance iterator primitive for computing the distance from one iterator position
to another is not implemented in terms of operator- for random access iterators. distance, according to
the report, should always be $O(N)$. It reads:

The standard mandates a different definition for random access iterators: \( \text{distance}(i, j) = j - i \). We see this as a specification error; the guarantees of the distance operation have been
weakened for an iterator specialization.

In our design, we consider the two operations to be distinct.

The design presented in this document keeps the specialization for random access iterators. To do otherwise
would be to silently break complexity guarantees in an unknown amount of working code.

To address the concern about weakened guarantees of the distance primitive, the design presented here
requires that random access iterators model SizedIteratorRange. The SizedIteratorRange concept
requires that \( b - a \) return the number of times \( a \) would have to be incremented to make it compare equal
to \( b \). Any type purporting to be a random access iterator that fails to meet that requirement is by definition
not a valid random access iterator.

B.2.5 Output Iterators

The Palo Alto report does not define concepts for output iterators, making do with WeaklyIncrementable,
Writable, and (where needed) EqualityComparable. The author of this document sees little downside to
grouping these into the familiar OutputIterator concept and the more frequently-needed WeakOutputIterator.
Even if they are not strictly needed, their absence would be surprising.

B.2.6 No Algorithm Reformulations

Between the standardization of the Standard Library and the Palo Alto report, much new research was done
to further generalize the standard algorithms (see “Element of Programming”, Stepanov, McJones [5]). The
algorithms presented in The Palo Alto report reflect the results of that research in the algorithm constraints,
some of which (e.g., sort, inplace_merge) take iterators with weaker categories than they do in the current
standard. The design presented in this document does not reflect those changes. Although those changes
are desirable, generalizing the algorithms as described in The Palo Alto report feels like it would be best done
in a separate proposal.
Annex C (informative)  
Future Work  

This document brings ranges and concepts to a minimal useful subset of the Standard Library. A proper and full implementation has many more moving parts. In addition, we can use the opportunity this work presents to address long-standing shortcomings in the Standard Library. Some of these future work items are described below.

C.1 Implementation Experience with Concepts  
The ideas presented here have been vetted in the range-v3 ([3]) library, which has seen both heavy development and heavy use over the past year and a half. However, this library is implemented in C++11 with the help of a library-based emulation layer for Concepts Lite. Andrew Sutton’s origin ([7]) library implements many of these ideas using real concepts, but it’s a subset of the work presented here. A critically important piece of this work will be to fully implement this design in C++17 with a compiler that supports Concepts.

C.2 Proxy Iterators  
As early at 1998 when Herb Sutter published his “When is a Container not a Container” ([6]) article, it was known that proxy iterators were a challenge that the current iterator concept hierarchy could not meet. The problem stems from the fact that the ForwardIterator concept as specified in the current standard requires the iterator’s reference type to be a true reference, not a proxy. The Palo Alto report lifts this restriction in its respecification of the iterator concepts but doesn’t actually solve the problem. The majority of algorithms, once you study the constraints, do not accept many interesting proxy iterator types.

The author of this document has researched a possible library-only solution to the problem and implemented it in the range-v3 library. (The details of that solution are described in a series of blog posts beginning with “To Be or Not to Be (an Iterator),” Niebler, 2015 [4].) This document does not reflect the results of that research.

Whether and how to best support proxy iterators is left as future work.

C.3 Iterator Range Type  
This paper does not define a concrete type for storing an iterator and a sentinel that models the Range concept. Such a type, like that presented in “A minimal std::range<Iter>,” [8] by J. Yasskin would be an obvious addition. Algorithms like equal_range and rotate could use a concrete range type instead of pair as their return type, improving composability. It would also be useful to implement a view::all range view that yields a lightweight range object that refers to all the elements of a container.

A future paper will propose such a type.

C.4 Range Views and Actions  
The vast majority of the power of ranges comes from their composability. Views on existing Ranges can combine in chains of operations that evaluate lazily, giving programmers a concise and efficient way to express rich transformations on data. This paper is narrowly focused on the concepts and the algorithms, leaving range views as critically important future work.

If range views are composable, non-mutating, lazy algorithms over ranges, then range actions are composable, (potentially) mutating, eager algorithms over ranges. Such actions would allow users to send a container
through a pipeline to sort it and remove the non-unique elements, for instance. This is something the range views cannot do. Range actions sit along side the views in the programmers toolbox.

C.5 Range Facade and Adaptor Utilities

Until it becomes trivial for users to create their own iterator types, the full potential of iterators will remain unrealized. The range abstraction makes that achievable. With the right library components, it should be possible for users to define a range with a minimal interface (e.g., current, done, and next members), and have iterator types automatically generated. Such a range facade class template is left as future work.

Another common need is to adapt an existing range. For instance, a lazy transform view should be as simple as writing an adaptor that customizes the behavior of a range by passing each element through a transformation function. The specification of a range adaptor class template is also left as future work.

C.6 Infinite Ranges

It is not hard to define a type that represents an “infinite” range. Imagine a random number generator that keeps generating new random numbers for every application of operator++ and operator* of its iterator. Indeed, the very existence of the unreachable sentinel type – which this document proposes – encourages users to think about some ranges as “infinite”. The sad reality is that infinite ranges are disallowed by the iterator concept hierarchy as defined in this document.

The problem with infinite ranges is the requirement that WeaklyIncrementable types have an associated DifferenceType. The DifferenceType must be a built-in integral type, and it must be large enough to hold the distance between any two valid iterators. This is implicit in the fact that the distance iterator primitive returns objects of type DifferenceType.

Given the fact that there are no infinite precision built-in integral types, the presence of DifferenceType in the concept requirements places a hard upper limit on how big ranges can be. This is a severe limitation.

Some observations:

— Not all possible ranges have finitely countable elements.
— Even a range with finitely countable elements may not be countable within the precision of the built-in integral types.
— Not all algorithms require the ability to count increments. Algorithms like distance and count require finitely countable iterators, but find and accumulate do not.

The above observations suggest that there is a factorization of the existing concept hierarchy that could solve the problem. Some Incrementables are finitely countable with a built-in integral DifferenceType, and some are not. The algorithms that require countability must say so with an extra requirement.

Obviously, some algorithms like accumulate should never be asked to operate on a truly infinite sequence, even if they don’t actually maintain counters internally. Such algorithms could still be used with “possibly” infinite sequences. Note that the standard already defines such possibly infinite sequences; for instance, there is no limit in principle to the number of elements in a range delimited with istream_iterators. It’s not hard to imagine other useful possibly- infinite range types: an infinite range that is delimited with a predicate or a sentinel value, for instance. The algorithm requirements should merely enforce that there is no integer overflow possible if the range happens to be larger than can be represented, not necessarily whether the algorithm will terminate or not.

C.7 Common Type

The all-important Common concept relies on the existence of a SFINAE-friendly common_type trait, which did not make it into C++14. Solving the outstanding issues (active issues: #2460, #2465; and defects: #2408) with common_type is left as future work on which the correctness of this document depends.
C.8 Numeric Algorithms and Containers [future.numcont]
1 The numeric algorithms must also be constrained, and additional range-based overloads must be added. Also, the containers should be made range-aware; that is, they should have constructors and insert and append member functions that accept range arguments. These things can be done in a separate proposal.

C.9 Verbosity in Algorithm Constraints [future.constraints]
1 The constraints of some of the algorithms are verbose. Some composite concepts exist that group constraints together to increase uniformity, aid comprehensibility, and reduce verbosity for those algorithms that use them. SeeSortable, Mergeable, and Permutable, for instance. There may be other useful clusters of concepts for other algorithm groups. Finding them and using them to improve the algorithm constraints is an important work item.

C.10 Initializer Lists [future.initlsts]
1 Algorithms that do not mutate their input should accept initializer_list arguments wherever Iterables are allowed. This requires extra overloads in places.

C.11 Move Iterator [future.moveiter]
1 move_iterator is a problematic iterator today. Although it may claim to be Forward or better, in reality, it is likely to give strange results in multi-pass algorithms. That’s because copying values from a move_iterator leaves the input sequence in an unspecified state. Decaying the category of move_iterator to Input seems reasonable, but it pessimizes code that initializes containers with move_iterators, since a container like vector must incrementally grow the buffer when constructing from Input iterators, but it can preallocate an appropriately-sized buffer with Forward iterators.

2 The design presented in this document offers a potential solution. By factoring the difference operation out of the iterator concept hierarchy and into a separate SizedIteratorRange concept, it opens the door to Input iterators that can be differenced to find the size of the range in \(O(1)\). That would remove the pessimization should move_iterator be made Input and not Forward.

3 There may still be reasons why decaying the category of move_iterator is undesirable. An algorithm that does not copy out of the input range would not misbehave when passed move_iterators even if it is multi-pass. If the algorithm does not work with Input iterators, or if the algorithm works more efficiently with Forward iterators or better, then our efforts to “fix” move_iterator has caused real harm. Whether the cure is worse than the disease remains an open question.

4 As an aside, it should be noted that a decomposition of the iterator concept hierarchy along the access/traversal boundary like suggested in “New Iterator Categories Concepts” (Abrahams et. al. [2]) would be a more complete fix, at the probable expense of greater complexity in the concepts and the algorithm constraints.
Annex D  (informative)
Reference implementation for tagged  [tagged]

Below is a reference implementation of the tagged class template described in 20.15.2, and also tagged_pair (20.15.5), tagged_tuple (20.15.6), and tag::in (25.1).

```cpp
namespace std {
    namespace experimental {
        namespace ranges_v1 {

            namespace tag {
                struct __specifier_tag {
                };
            }

            template <class T>
            struct __tag_spec {
            };

            template <class Spec, class Arg>
            struct __tag_spec<Spec(Arg)> { using type = Spec; };

            template <class T>
            struct __tag_elem {
            };

            template <class Spec, class Arg>
            struct __tag_elem<Spec(Arg)> { using type = Arg; };

            template <class T>
            concept bool TagSpecifier() {
                return DerivedFrom<T, tag::__specifier_tag>();
            }

            template <class T>
            concept bool TaggedType() {
                return requires {
                    typename __tag_spec<T>::type;
                    requires TagSpecifier<typename __tag_spec<T>::type>();
                };
            }

            template <class Base, class TagSpecifier...Tags>
            requires sizeof...(Tags) >= tuple_size<Base>::value
            struct tagged {
            }

            template <class Base, class...Tags>
            requires sizeof...(Tags) >= tuple_size<Base>::value
            struct tuple_size<experimental::ranges_v1::tagged<Base, Tags...>>
                : tuple_size<Base> {};

            template <size_t N, class Base, class...Tags>
            struct tuple_element<N, experimental::ranges_v1::tagged<Base, Tags...>>
                : tuple_element<N, Base> {};

            namespace experimental {
                namespace ranges_v1 {

                    struct __getters {
                        private:
                            template <class, class TagSpecifier...>
                                requires sizeof...(Tags) >= tuple_size<Base>::value
                                friend struct tagged;
                    }
                }
            }
        }
    }
}
```
